Comet Lake-LP Intel® Converged Security and Management Engine Firmware 14.0

Consumer Firmware Bring Up Guide

November 2019

Revision 1.1

Intel Confidential

By using this document, in addition to any agreements you have with Intel, you accept the terms set forth below. You may not use or facilitate the use of this document in connection with any infringement or other legal analysis concerning Intel products described herein. You agree to grant Intel a non-exclusive, royalty-free license to any patent claim thereafter drafted which includes subject matter disclosed herein.

INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH Intel® PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS PROVIDED IN INTEL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, INTEL ASSUMES NO LIABILITY WHATSOEVER, AND INTL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF INTEL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

A "Mission Critical Application" is any application in which failure of the Intel Product could result, directly or indirectly, in personal injury or death. SHOULD YOU PURCHASE OR USE INTEL'S PRODUCTS FOR ANY SUCH MISSION CRITICAL APPLICATION, YOU SHALL INDEMNIFY AND HOLD INTEL AND ITS SUBSIDIARIES, SUBCONTRACTORS AND AFFILIATES, AND THE DIRECTORS, OFFICERS, AND EMPLOYEES OF EACH, HARMLESS AGAINST ALL CLAIMS COSTS, DAMAGES, AND EXPENSES AND REASONABLE ATTORNEYS' FEES ARISING OUT OF, DIRECTLY OR INDIRECTLY, ANY CLAIM OF PRODUCT LIABILITY, PERSONAL INJURY, OR DEATH ARISING IN ANY WAY OUT OF SUCH MISSION CRITICAL APPLICATION, WHETHER OR NOT INTEL OR ITS SUBCONTRACTOR WAS NEGLIGENT IN THE DESIGN, MANUFACTURE, OR WARNING OF THE INTEL PRODUCT OR ANY OF ITS PARTS.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined". Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice.

The Comet Lake Platform and Comet Lake PCH products may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Intel® AMT should be used by a knowledgeable IT administrator and requires enabled systems, software, activation, and connection to a corporate network. Intel AMT functionality on mobile systems may be limited in some situations. Your results will depend on your specific implementation. Learn more by visiting Intel® Active Management Technology.

Intel® Small Business Technology (Intel® SBT) requires an Intel® Small Business Technology enabled system and proper configuration. Availability of features will depend upon the setup and configuration by your PC manufacturer. Consult your system manufacturer.

Intel® vPro™ Technology requires setup and activation by a knowledgeable IT administrator. Availability of features and results will depend upon the setup and configuration of your hardware, software and IT environment. Learn more at: http://www.intel.com/technology/vpro.

Any software source code reprinted in this document is furnished under a software license and may only be used or copied in accordance with the terms of that license.

64-bit computing on Intel architecture requires a computer system with a processor, chipset, BIOS, operating system, device drivers and applications enabled for Intel® 64 architecture. Processors will not operate (including 32-bit operation) without an Intel® 64 architecture-enabled BIOS. Performance will vary depending on your hardware and software configurations. Consult with your system vendor for more information.

Intel processor numbers are not a measure of performance. Processor numbers differentiate features within each processor family, not across different processor families. See http://www.intel.com/products/processor_number for details. I2C is a two-wire communications bus/protocol developed by Philips. SMBus is a subset of the I2C bus/protocol and was developed by Intel. Implementations of the I2C bus/protocol may require licenses from various entities, including Philips Electronics N.V. and North American Philips Corporation.

Microsoft*, Windows* and the Windows* logo are trademarks or registered trademarks of Microsoft Corporation in the United States and/or other countries.

Intel, Celeron, Pentium, Intel Xeon, Intel Core, Intel vPro™, and the Intel logo are trademarks of Intel Corporation in the United States and/or other countries. *Other names and brands may be claimed as the property of others.

KVM Remote Control (Keyboard, Video, Mouse) is only available with Intel® Core™ i5 vPro™ and Core™ i7 vPro™ processors with integrated graphics and Intel® Active Management technology activated. Discrete graphics are not supported.

§ §

1 Introduction

This document covers the Intel® Converged Security and Management Engine Firmware (Intel® CSME) 14.0 - Consumer Firmware bring up procedure. Intel® CSME is tied to essential platform functionality — this dependency cannot be avoided for engineering reasons.

The bring up procedure primarily involves building a Serial Peripheral Interface (SPI) Flash image that will contain:

- **[required]** Descriptor region — Contains sizing information for all other SPI Flash image regions, SPI settings (including Vendor Specific Configuration - or VSCC - tables, SPI device parameters), and region access permissions.
- **[required]** BIOS region — Contains firmware for the processor (or host) and/or Embedded Controller (EC).
- **[required]** Intel® CSME FW region — Contains firmware for the Intel® Converged Security and Management Engine.
- **[optional]** GbE region — Contains firmware for Intel LAN solution.

For more details on SPI Flash layout, see the document **Comet Lake-LP SPI Programming Guide** SPI Programming Guide and Appendix A. Once the SPI Flash image is built, it will be programmed to the target based platform and the platform will be booted. This document also covers any tests and checks required to ensure that this boot process is successful and that Intel® CSME Consumer FW is operating as expected.

1.2 Intel® CSME FW Features

This firmware release includes the following applications:

- Platform Clocks – Tune clock silicon to the parameters of a specific board, configure clocks at run time, and power management clocks. **Benefit:** Allows extensive customizability and soft control of “Third generation” clock solution and makes clocks available before CPU powers up.
- Silicon Workaround Capability – Intel® CSME FW will have limited capabilities to perform targeted workarounds for silicon issues. **Benefit:** Allows Intel® ME FW to address some issues that otherwise would require a new silicon stepping.

1.3 Prerequisites

Before this document is read and utilized, it is essential that the reader first review the Consumer FW Release Notes (included with this Intel® CSME Consumer FW kit).

This document is constructed so that the reader can complete the bring up steps as given for the Intel Customer Reference Board (CRB). However, in the case that bring up is being performed on a different Intel® x based platform, this document will highlight any changes that must be imposed onto the bring up steps accordingly.

This document makes only the following limited assumptions regarding hardware:

- The platform is Comet Lake LP/H based
- The platform is equipped with one or more SPI Flash devices with a total capacity sufficient for storing all relevant firmware images.

1.4 Acronyms and Definitions

1.4.1 General

Acronym or Term	Definition
BIOS	Basic Input Output System
DIMM	Dual In-line Memory Module
DMI	Direct Media Interface
EC	Embedded Controller
FPF	Field Programmable Fuses
FW	Firmware
GbE	Gigabit Ethernet
HECI	Host Embedded Controller Interface (aka Intel® MEI)
Intel® ICCS	Intel® Integrated Clock Controller Service
Intel® CSME	Intel® Converged Security and Management Engine (Intel®CSME)
Intel® MEI	Intel® Management Engine Interface (Intel® MEI) (renamed from HECI)
Intel® PTT	Intel® Platform Trusted Technology (Intel® PPT)
Intel® MSS	Intel® Management and Security Status Application
KVM	Keyboard, Video, Mouse
LAN	Local Area Network
MCP	Multi-Chip Package (Central Processing Unit / Platform Controller Hub)
NVM	Non-Volatile Memory
OOB	Out-of-Band
OS	Operating System
PAVP	Protected Audio and Video Path
PCI	Peripheral Component Interconnect
PCIe*	Peripheral Component Interconnect Express
PHY	Physical Layer (Networking)
RTC	Real Time Clock
SBT	Intel® Small Business Technology
SMBus	System Management Bus
SPI Flash	Serial Peripheral Interface Flash
TPM	Trusted Platform Module
VSCC	Vendor Specific Configuration

1.4.2 Intel® Converged Security and Management Engine

Acronym or Term	Definition
3PDS	3rd Party Data Storage
Agent	Software that runs on a client PC with OS running
End User	The person who uses the computer (either Desktop or Mobile). In corporate, the user usually does not have administrator privileges.
Host or Host CPU	The processor that is running the operating system. This is different than the management processor running the Intel® Converged Security and Management Engine Firmware.
Host Service/Application	An application that is running on the host CPU
INF	An information file (.inf) used by Microsoft* operating systems that supports the Plug & Play feature. When installing a driver, this file provides the OS the necessary information about driver filenames, driver components, and supported hardware.
Intel® Management Engine Interface (Intel® MEI)	Interface between the Intel® Converged Security and Management Engine and the Host system
Intel® MEI driver	Intel® ME host driver that runs on the host and interfaces between ISV Agents and the Intel® CSME HW.
IT User	Information Technology User. Typically very technical and uses a management console to ensure functionality of multiple PCs on a network.
LMS	Local Management Service: A SW application which runs on the host machine and provide a secured communication between the ISV agent and the Intel® Management Engine Firmware.
Intel® CSME	Intel® Converged Security and Management Engine: The embedded processor residing in the chipset MCP
MECI	ME-VE Communication Interface
NVM	Non-Volatile Memory: A type of memory that will retain its contents even if power is removed. In the Intel® AMT current implementation, this is achieved using a FLASH memory device.
OOB Interface	Out Of Band interface: This is WSMAN interface over secure or non-secure TCP protocol.
OS not Functional	The Host OS is considered non-functional in Sx power state and any one of the following cases when system is in S0 power state: • OS is hung • After PCI reset • OS watch dog expires • OS is not present
System States	Operating System power states such as S0. See detailed definitions in System States and Power Management section.

1.4.3 System States and Power Management

Acronym or Term	Definition
G3	A system state of Mechanical Off where all power is disconnected from the system. G3 power state does not necessarily indicate that RTC power is removed.
CM0	Intel® Converged Security and Management Engine firmware power state where all hardware power planes are activated. The host power state is S0.
CM3	Intel® Converged Security and Management Engine power state where the host is in Sx. The processor DRAM Controller is turned off and DRAM power stays in off/self refresh mode. There is no UMA usage in CM3 state. Less than 1MB of SRAM used for code and data. Code is executed off of flash takes ~1mS.
CM0-PG	Core Well Powered; Intel® ME Well Powered; (Intel® ME core not consuming power) DRAM available.
CM3-PG	An Intel® ME Firmware power state where no power is applied to the Converged Security and Management Engine subsystem. (Intel® ME firmware is shut down).
OS Hibernate	System state where the OS state is saved on the hard drive.
S0	A system state where power is applied to all HW devices and the system is running normally.
S1, S2, S3	A system state where the host CPU is halted but power remains available to the memory system (memory is in self-refresh mode).
S4	A system state where the host CPU and memory are not active.
S5	A system state where all power to the host system is off, however the power cord (and/or battery in mobile designs) is still connected.
Shut Down	Equivalent to the S5 state.
Snooze Mode	Intel® Converged Security and Management Engine activities are mostly suspended to save power. The Intel® Converged Security and Management Engine monitors HW activities and can restore its activities depending on the HW event.
Standby	System state where the OS state is saved in memory and resumed from the memory when mouse/keyboard is clicked.
Sx	All S states which are different than S0.

1.5 Reference Documents

Document	Doc Number/ Location*
Comet Lake Intel® Converged Security and Management Engine (Intel® ME) and Embedded Controller Interaction Product Specification Revision 0.5	TBD / CDI
Intel® Converged Security and Management Engine BIOS Writers Guide	TBD / *
Intel® Converged Security and Management Engine (Intel® ME) 14 SKU Firmware Consumer *Compliance Guide for Comet Lake PCH-H/LP Chipset Family - Comet Lake Platform Compliancy and Testing Guide - Revision 1.1*	TBD / CDI

Note: * Unless specified otherwise, a document can be ordered by providing its reference number to your Intel Field Applications Engineer.

1.6 Format and Notation

The formats and notations used within this document model are those typically used by BIOS vendors. This section describes the formatting and the notations that will be followed in this document.

Table 1-1. Number Format Notation

Number Format	Notation	Example
Decimal (default)	d	14d. Note that any number without an explicit suffix can be assumed to be decimal.
Binary	b	1110b
Hex	h	0Eh
Hex	0x	0x0E

Table 1-2. Data Format Notation

Data Type	Notation	Size
Bit	b	Smallest unit, 0 or 1
Byte	B	8 bits
Word	W	16 bits or 2 bytes
Double-word	DW	32 bits or 4 bytes
Quad-word	QW	8 bytes or 4 words
Kilobyte	KB	1024 bytes
Megabit	Mb	1,048,576 bits or 128 KB
Megabyte	MB	1,048,576 bytes or 1024 KB
Gigabit	Gb	1,073,741,824 bits
Gigabyte	GB	1024 MB

1.7 Kit Contents

The Intel® ME Consumer FW kit can be downloaded from VIP (https://platformsw.intel.com/). The contents of this kit are detailed below (Note that only key files are listed).

1.8 External Hardware Requirements for Bring Up

Acquire the following hardware tools before moving on to the next step.

Windows* OS System	Flash Burner	DOS Bootable USB Key
Equipment: • Laptop or desktop that supports win32 applications **Purpose:** • Will run firmware image assembly and build process software.	**Equipment:** • (Optional) For platforms that don't boot, a Flash Chip Programmer will be required • For platforms that can boot to DOS or Windows*, a Intel® FPT is provided in this kit **Purpose:** • Will burn firmware images onto the target system Flash device(s).	**Equipment:** • A DOS Bootable USB Key (Size > 512 MB) **Purpose:** • Acting as a bootable device and will be used to run Intel® FPT (fpt.exe) directly on the system that is undergoing Bring Up process. • Or will be used to transfer a firmware image onto a Flash burner.

§ §

2 Image Creation: Intel® Flash Image Tool

Intel® Flash Image Tool (Intel® FIT) can be used to generate either a full SPI Flash binary image with Descriptor, GbE, BIOS, and Intel® CSME Regions. Additionally, it can be used to create a simple image containing only the Intel® CSME Region only for use with custom SPI Flash binary image assembly solutions. Use the steps shown in following sections.

After this image has been created, it will need to be burned onto the target platform's SPI Flash device(s). Section 3, "Programming SPI Flash Devices and Checking Firmware Status"later in this document provides steps to do this.

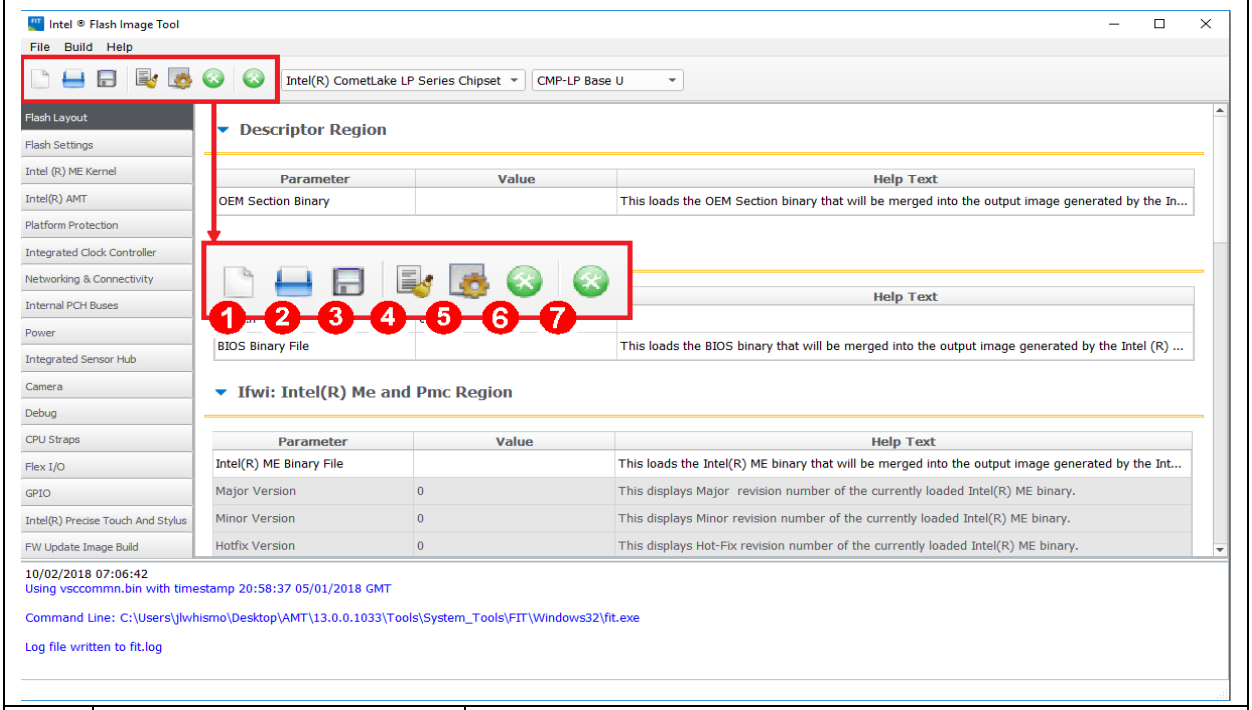
Note: The Flash Image Tool may be updated throughout the release cycles. As a general rule, please ensure you use the tools, images and other content from the same kit and refrain from using different version tools.

2.1 Start Intel®FIT

1. Invoke Flash Image Tool. Using Explorer*, navigate to **[root]\Tools\System Tools\Flash Image Tool**. Verify that the directory contents are correct (see Section 1.7). Double-click **FIT.exe**.
2. **NOTE:** In the tables below, where default settings are listed for CNL LP, if the value is the same one value will be listed. If there is a different default value when the program loads with either platform, both values will be listed to show the difference.

2.2 Step-by-Step Guide to Build SPI Flash Image with Intel® FIT Interface

Table 2-1. - Initial Screen Layout (Sheet 1 of 9)

#	Label	Contents
		


1	**New**	This button labeled 'New' on rollover allows opening of a new session with default values
2	**Open**	This button labeled 'Open' on rollover allows opening of an xml or bin file
3	**Save**	This button labeled 'Save' on rollover allows saving of xml file
4	**Clear Console**	This button labeled 'Clear Console' clears the console area (see page 23)
5	**Build Settings**	This button labeled 'Build Settings' brings up the build settings popup Window see (Table 2-2)
6	**Build Image**	This button labeled 'Build Image' on rollover allows build of the image
7	**Build Image For FWUpdate**	This button labeled 'Build Image For FWUpdate' allows the user to build separate firmware update binaries.

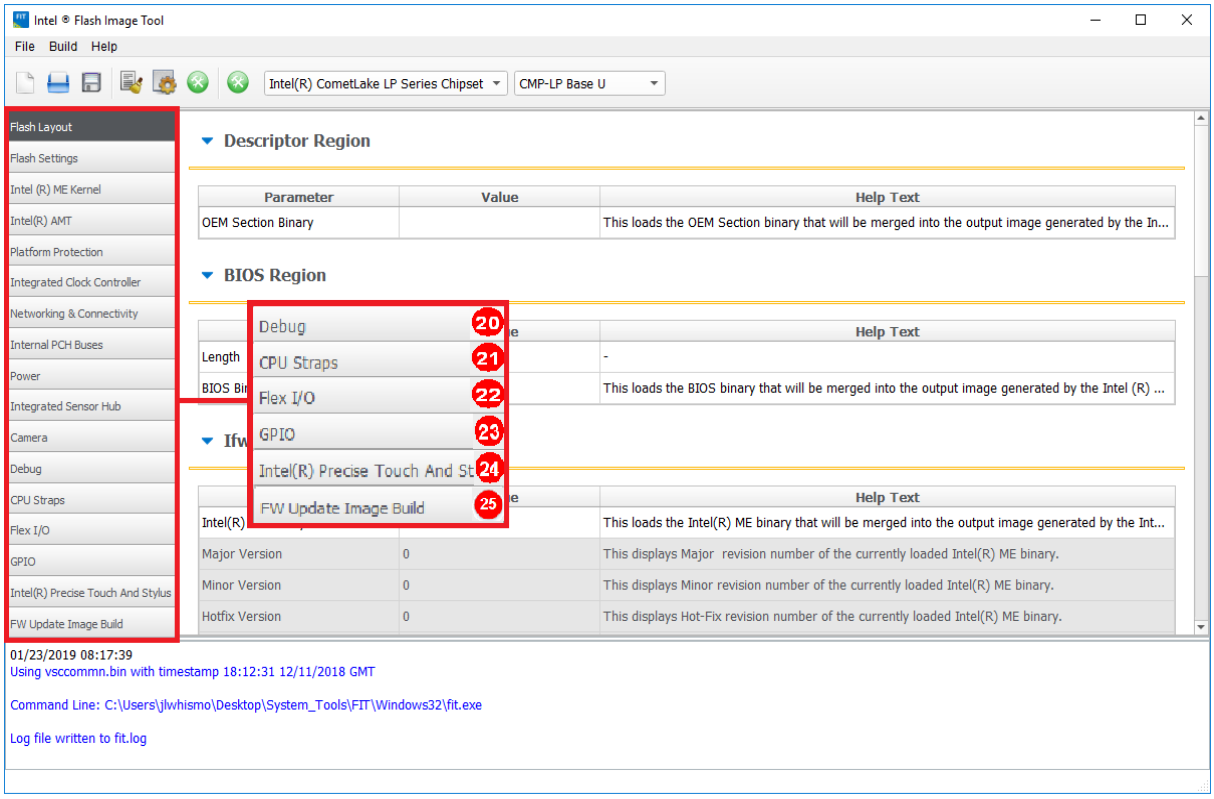
18	**Integrated Sensor Hub Tab**	Integrated Sensor Hub which contains (see Table 2-12): • Integrated Sensor Hub • ISH Image • ISH Data
19	**Camera**	• IPU Security (see Table 2-13): • IPU Debug • IPU PHY

Table 2-1. - Initial Screen Layout (Sheet 8 of 9)

#	Label	Contents
		


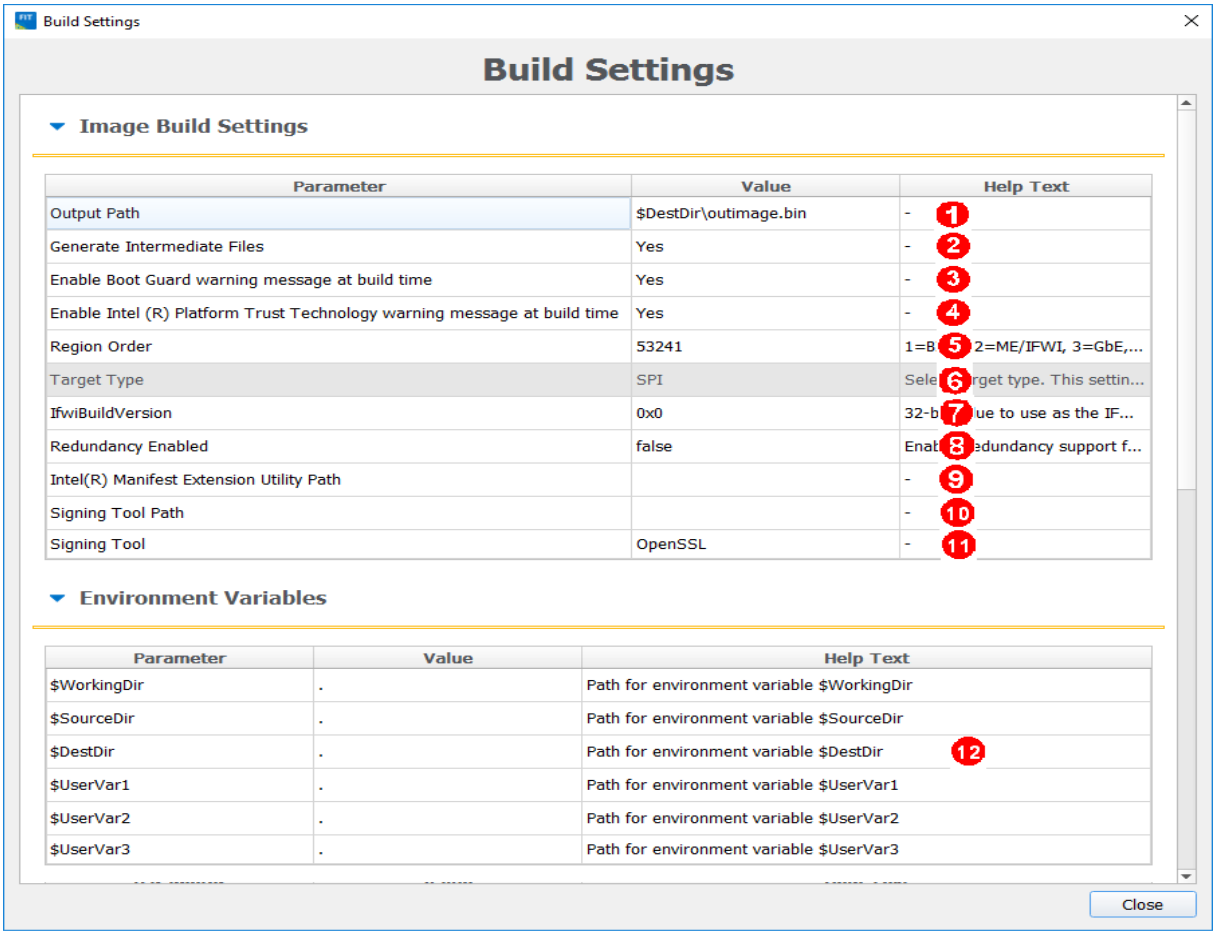
20	**Debug Tab**	Debug which contains (see Table 2-14): • IDLM • Delayed Authentication Mode Configuration • Intel® Trace Hub Technology • Intel® ME Firmware Debugging Overrides • Direct Connection Interface Configuration • eSPI Feature Overrides • Early USB DBC over Type-A Configuration
21	**CPU Straps Tab**	CPU Straps which contain a detailed list of parameters (see Table 2-15) • CPU Straps
22	**Flex I/O Tab**	Flex I/O which contains (see Table 2-16): • Intel® RST for PCIe Configuration • PCIe Lane Reversal Configuration • PCIe Port Configuration • SATA / PCIe Combo Port Configuration • SATA / PCIe Combo Port Select Polarity • USB3 Port Configuration • USB2 Port Configuration

Table 2-1. - Initial Screen Layout (Sheet 9 of 9)

#	Label	Contents
23	**GPIO Tab**	GPIO which contains (see Table 2-17): • LAN / GPIO Select • WLAN / GPIO Select • Platform Power / GPIO • ME Feature Pins • Touch Controller Pins • SMLink1 Pins • GPIO VCCIO Voltage Control
24	**Intel® Precise Touch and Stylus**	Intel® Precise Touch and Stylus which contains (see Table 2-18): • Integrated Touch Configuration • Intel® Integrated Touch and Stylus Configuration
25	**FW Update Image Build**	FW Update Image Build which contains (see Table 2-19): • ME Image • PMC Image • OEM KM Image • ISH Image • INUIT Image • PCHC Image
	Console Window Area	Displays opening messages, log file entries, and build activity messages

Table 2-2. - Build Settings (Sheet 1 of 2)

Click on Build Button in the top menu bar> Build Settings window pop up is displayed:



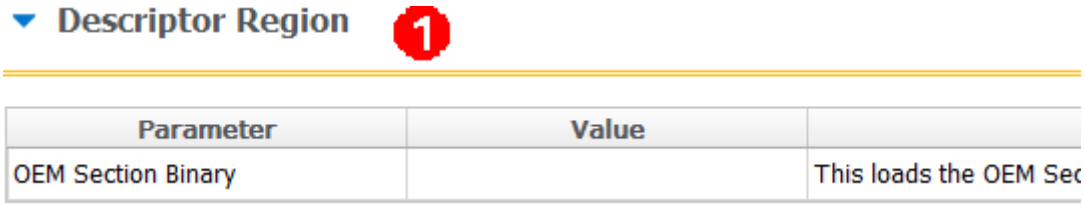
#	Parameter	CRB	Values
1	**Output Path**		Double click to the right of outimage.bin and click to get browse button to specify path and name of file to create for the build - default is outimage.bin in the same folder as Intel® FIT tool
2	**Generate Intermediate Files**	Yes	Yes/No - Yes is default
3	**Enable Boot Guard warning message at build time**	Yes	Yes/No - Yes is default
4	**Enable Intel (R) Platform Trust Technology warning message at build time**	Yes	Yes/No - Yes is default
5	**Region Order**	Yes	53241 - is default

Table 2-2. - Build Settings (Sheet 2 of 2)

Click on Build Button in the top menu bar> Build Settings window pop up is displayed:			
6	**Target Type**	Yes	Target boot media type. This setting is configured from the Intel® FIT toolbar drop downs.
7	**IFWI Build Version**	Yes	32-bit value to use as the IFWI build version number.
8	**Redundancy Enabled**	Yes	This setting enabled Redundancy support for critical layout components.
9	**Intel® Manifest Extension Utility Path**	Yes	
10	**Signing Tool Path**	Yes	
11	**Signing Tool**	Yes	
12			$WorkingDir and $DestDir can be left at the default '.' Click on $SourceDir Value field and type in path where the Image Components are located for the Manageability Engine kit

Table 2-3. - Flash Layout (Sheet 1 of 5)

Click on Flash Layout in the left tabs menu> Descriptor Region is expanded by default:



#	Parameter	Platform	Settings
1	**Descriptor Region**		
	OEM Section Binary This loads the OEM Section binary that will be merged into the output image generated by the Intel® FIT tool.	CML-Y CML-U	OEM Binary (optional)

3	**IFWI: Intel® ME and PMC Region**		
	Intel® ME Binary File Navigate to your **Source Directory** (as specified in Table 2-2) and switch to the Intel® CSME subdirectory. Choose the appropriate Intel® CSME Firmware binary image. This loads the Intel® CSME binary that will be merged into the into the output image generated by the Intel® FIT tool. **Note:** You may choose to build the Intel® CSME Region only. To do so, the **Number of Flash Components** in **Flash Settings> Flash Components** must be set to 0. **Note:** If loading meimage.bin file, check that the ME region is enabled in tool before building image.	CML-Y CML-U	meimage.bin meimage.bin
	Major Version - This displays Major revision number of the currently loaded Intel® ME binary.		
	Minor Version - This displays Minor revision number of the currently loaded Intel® ME binary.		
	Hotfix Version - This displays Hot-Fix revision number of the currently loaded Intel® ME binary.		
	Build Version - This displays Build version number of the currently loaded Intel® ME binary.		
	Chipset Initialization Version - This displays the current Chipset Initialization version contained in the currently loaded Intel® ME binary.		

Table 2-3. - Flash Layout (Sheet 3 of 5)

	Chipset Initialization Binary - This loads the Chipset Initialization binary that will be merged into the output image generated by the Intel® FIT. If specified, this will override the version contained in the Intel® ME binary to align with the values programmed by BIOS. ***Note:*** When BIOS passes new Chipset Initialization settings to ME, a Global Reset is initiated (only required on the first boot, subsequent boots will not incur a global reset). This allows for the new settings to be stored in the ME Region and programmed into the PCH. This global reset can be avoided by loading the proper chipset initialization binary in to the ME Region when building the image that aligns with the values in BIOS. The Chipset Initialization Binary will be included in BIOS RC package. If BIOS contains an older version of Chipset Initialization settings ME will be updated at boot with the older settings regardless of any newer settings being present in firmware. In order to avoid this problem and the additional Global Reset customers should ensure that both BIOS and ME are updated with same Chipset Initialization binary.	CML-Y CML-U	Chipset.bin (Optional) Chipset.bin (Optional)
	ChipsetInit Override Version - This displays the version of the Chipset Initialization Binary override if specified.		
	PMC Binary File - This loads the PMC binary that will be merged into the output image generated by the Intel® FIT tool.	CML-Y CML-U	PMC.bin PMC.bin
	Version - This displays the version of PMC

#	Parameter	Platform	Settings
1	**Flash Components**		

Table 2-4. - Flash Settings (Sheet 2 of 11)

	Number of Components **Values: 0, 1, 2 -** This setting configures the total number of flash components for the platform. **Note:** Choosing a selection of '0' part will cause the Intel® FIT tool to build an output image containing only the Intel® ME region.	CML-Y CML-U	1 1
	Flash component 1 Size **Values: 512KB, 1MB, 2MB, 4MB, 8MB, 16MB, 32MB, 64MB** - This setting determines the size of Flash component 1 for the platform image.	CML-Y CML-U	16MB 16MB
	Flash component 2 Size **Values: 512KB, 1MB, 2MB, 4MB, 8MB, 16MB, 32MB, 64MB** - This setting determines the size of Flash component 2 for the platform image. **Note:** This setting is only applicable when the Number of Flash Components option is set to '2'.	CML-Y CML-U	Greyed Out Greyed Out
	SPI Voltage Select **Values: 1.8 Volts, 3.3 Volts** - This strap sets the internal control signal on the pad for either 1.8 or 3.3 volts. See Comet Lake LP SPI Programming Guide for further details.	CML-Y CML-U	3.3 Volts 3.3 Volts
	SPI Global Protected Range - This sets the default value of the Global Protected Range register in the SPI Flash Controller.	CML-Y CML-U	0x0 0x0
	SPI Idle to Deep Power Down Timeout - This sets SPI Idle to Deep Power Down Timeout Default Specifies the time in microseconds that the Flash Controller waits after all activity is idle before commanding the flash devices to Deep Power down, time = 2^N microseconds.	CML-Y CML-U	0x5 0x5
	SPI Out of Order operation Enabled - When this setting is enabled priority operations may be issued while waiting for write / erase operations to complete on the flash device. When this setting is disabled all write / erase type operations in order.	CML-Y CML-U	Yes Yes
	SPI Resume Hold-off Delay - This specifies the time after the completion of a pri_op before the flash controller sends the resume instruction. If a new pri_op is eligible to be issued prior to the end of this delay time then the pri_op is issued and the timer is reinitialized to tRHD. 3-bit field encodes count with range 0-7. tRHD = count * 2us.	CML-Y CML-U	4us 4us
	SPI Max write / erase Resume to Suspend intervals - This setting specifies the maximum value for the write and erase Resume to Suspend intervals.	CML-Y CML-U	No Ceiling No Ceiling
	SPI Suspend / Resume Enabled - When this setting is enabled writes and erases may be suspended to allow a read to be issued on the flash device. When this setting is disabled no transaction will be allowed to the busy flash device.	CML-Y CML-U	Yes Yes
	SPI Software Binding Enabled - When enabled this settings will allow for SPI re-binding to a new PCH during re-manufacturing flows.	CML-Y CML-U	No No

	RBE SVN Enabled This option enables the Intel FPF Anti-Rollback mechanism for selected firmware components.	CML-Y CML-U	Enabled Enabled
	IDLM SVN Enabled This option enables the Intel FPF Anti-Rollback mechanism for selected firmware components.	CML-Y CML-U	Enabled Enabled

Table 2-8. - Integrated Clock Controller (Sheet 1 of 6)

Click on Integrated Clock Controller in the left tabs menu> Integrated Clock Controller Policies are expanded by default:

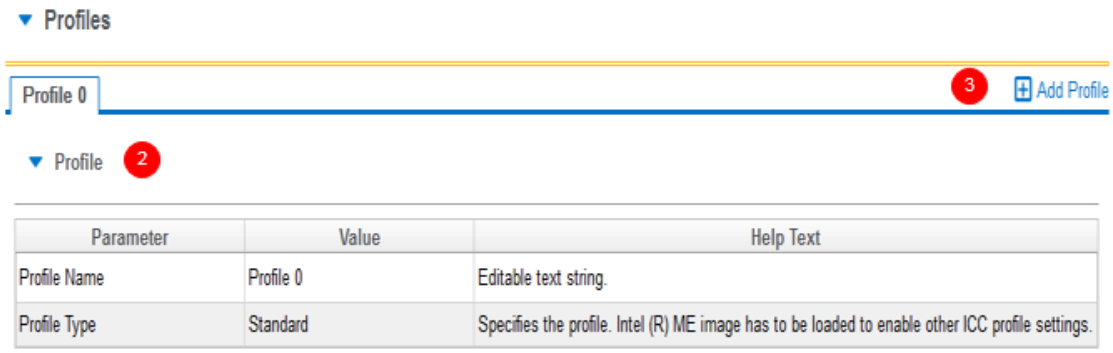
Integrated Clock Controller Policies 1

Parameter	Value	Help
Boot Profile	Profile 0	Profile applied during each boot.
Failsafe Boot Profile	Profile 0	Boot profile used when system instability is detect
Profile Changeable	true	True = Allows user to change boot profile via BIO

#	Parameter	Platform	Settings
1	**Integrated Clock Controller Policies**		
	Boot Profile This parameter allows user to select default profile to be used by the final generated SPI Flash binary image for the target platform at boot time. Selection is limited to the profiles defined under "Integrated Clock Controller | Profiles "up to maximum 16 profiles. Profiles can be added by clicking on "Add profile" button under "Integrated Clock Controller | Profiles". The 'Record #' refers to profile created under the "Integrated Clock Controller | Profiles". Default boot profile for system is Profile 0. Double click on value column of this parameter to choose from available options.	CML-Y CML-U	Profile 0 Profile 0
	Failsafe Profile This parameter specifies the profile index of the fail-safe profile. On boot failure detection or CMOS clear the Intel® ME Firmware will revert to this profile if "**Integrated Clock Controller |Integrated Clock Controller Policies - Profile Changeable "** is set to True. If profile Changeable parameter is set to False, User can not select Failsafe Boot Profile and profile 0 will be selected as a fail safe boot profile by default. The 'Record #' refers to profile created under the "Integrated Clock Controller | Profiles". Default Failsafe boot profile for system is Profile 0. Double click on value column of this parameter to choose from available options.	CML-Y CML-U	Profile 0 Profile 0
	Profile Changeable **Values: true / false** This setting allows the user to change the boot profile via BIOS menu or 3rd party application. ***Note:*** When this set to 'false' both the Failsafe Profile and Boot Profile must match.	CML-Y CML-U	true true

Click on Integrated Clock Controller in the left tabs menu> Profiles are expanded by default:

Table 2-8. - Integrated Clock Controller (Sheet 2 of 6)



#	Parameter	Platform	Settings
2	**Profile 0** **Note:** Intel® CSME image has to be loaded to enable other ICC profile settings. For CML-Y/U, Intel® FIT provides 2 pre- defined ICC profiles to choose from. •**Standard**: This profile provides default settings for standard configuration, no adaptive clocking is allowed. Platform clocks output internal and external are driven from USB3PCIE clock. Default clock frequency is 100 MHz with 0.47%DownSpread. BCLK clock source should be turned off in this case to save power. •**Adaptive**: This profile provides Wimax/3G friendly configuration. This profile will configure the platform based on the Adaptive profile allowing adaptive clocking adjustment for BCLK clock source to reduce EMI interference. It supports default clock frequency of 98.875 MHz with 0.48% Downspread. **For** CML-Y/U**,** Intel® FIT provides 5 pre-defined ICC profiles to choose from. •**Standard** •**Adaptive** **Note**: User can select pre-defined profiles via **"Integrated Clock Controller | Profiles - Profile Type "** parameter User can add up to maximum 16 profiles.To add new profile, please use **"Integrated Clock Controller | Profiles - + Add Profile Button"**	CML-Y CML-U	Standard Standard
	Profile Name This parameter allows user to customize profile name for easy identification. By default it uses pre-defined profile name like Profile 0.	CML-Y CML-U	Profile 0 Profile 0
	Profile Type Available ICC profiles for CML-Y/U are Standard, Adaptive. This parameter indicates which pre- defined profile selected for each profile#. Double click on value column of this parameter to choose from available options.	CML-Y CML-U	Standard Standard
3	**+ Add Profile Button** This button is used to add new ICC profile. User can add up to maximum 16 profiles. New profile will be added under **"Integrated Clock Controller | Profiles"** tab**.**	CML-Y CML-U

	PCH clock output stable to PROCPWRGD high (tPCH45) **Values: 100ms, 50ms, 5ms, 1ms** - This setting configures the minimum timing from XCK_PLL locked to CPUPWRGD high. For further details see Comet Lake LP Platform Controller Hub EDS.	CML-Y CML-U	1ms 1ms
	PCIe Power Stable Timer (tPCH33) **Values: Enabled / Disabled** - This setting configures the enables / disables the t36 timer. When enabled PCH will count 99ms from PWROK assertion before PLTRST# is de-asserted. **Note:** The recommended setting is "Disabled".	CML-Y CML-U	Disabled Disabled
	PROCPWRGD and SYS_PWROK high to SUS_STAT# de-assertion (tPCH46) **Values: 1ms, 2ms, 5ms** - This setting configures the minimum timing from CPUPWRGD assertion to SUS_STAT#. For further details see Comet Lake LP Platform Controller Hub EDS.	CML-Y CML-U	1ms 1ms
	APWROK Timing **Values: 2ms, 4ms, 8ms, 16ms** - This soft strap determines the time between the SLP_A# pin de-asserting and the APWROK timer expiration. For further details see Comet Lake LP Platform Controller Hub EDS.	CML-Y CML-U	2ms 2ms

Click on Internal PCH Buses in the left tabs menu> SMBus / SMLink Configuration is expanded by default:

Table 2-10. - Internal PCH Buses (Sheet 2 of 5)

SMBus / SMLink Configuration 2

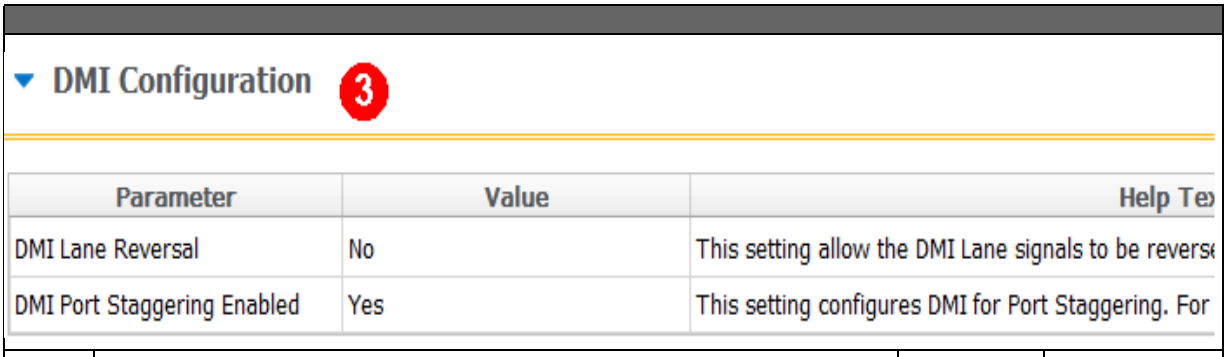
Parameter	Value	
Intel(R) SMBus ASD Address	0x0	This setting configures the Intel(R)
Intel(R) SMBus ASD Address Enabled	No	This setting enables / disables the
Intel(R) SMBus Subsystem Vendor and Device ID for ASF	0x0	This setting configures the Intel(R)
Intel(R) SMBus I2C Address	0x0	This setting configures the Intel(R)
Intel(R) SMBus I2C Address Enabled	No	This setting enables / disables the
Intel(R) SMBus MCTP Address	0x0	This setting configures the Intel(R)
Intel(R) SMBus MCTP Address Enabled	No	This setting enables / disables the
SMBus / SMLink TCO Slave Connection	Intel(R) SMBus	This setting configures the TCO Sl
SMLink0 Enabled	Yes	This setting enables / disables SM
SMLink0 Frequency	1 MHz	This setting determines the freque
SMLink1 I2C Target Address	0x0	This setting configures SMLink1 I2
SMLink1 I2C Target Address Enabled	No	This setting configures SMLink1 I2
SMLink1 GP Target Address	0x0	This setting configures SMLink1 GF
SMLink1 GP Target Address Enabled	No	This setting enables / disables SM
SMLink1 Enabled	No	This setting enables / disables SM
SMLink1 Frequency	100 KHz	This setting determines the freque
Intel(R) SMBus ASD Mode Configuration	Enable as GPP_C2	This setting determines the native
Intel(R) SMLink0 MCTP Address	0x0	This setting configures the Intel(R)

#	Parameter	Platform	Settings
2	**SMBus / SMLink Configuration**		
	Intel® SMBus ASD Address - This setting configures the Intel® SMBus Alert Sending Device Address. For details see Comet Lake LP SPI Programming guide for further details.	CML-Y CML-U	0x00000000 0x00000000
	Intel® SMBus ASD Address Enable **Values: Yes / No** - This setting enables / disables the Intel® SMBus Alert Sending Device. For details see Comet Lake LP SPI Programming guide for further details.	CML-Y CML-U	No No
	Intel® SMBus Subsystem Vendor & Device ID for ASF - This setting configures the Intel® SMBus Subsystem Vendor & Device ID for ASF. For details see Comet Lake LP SPI Programming guide further details.	CML-Y CML-U	0x00000000 0x00000000

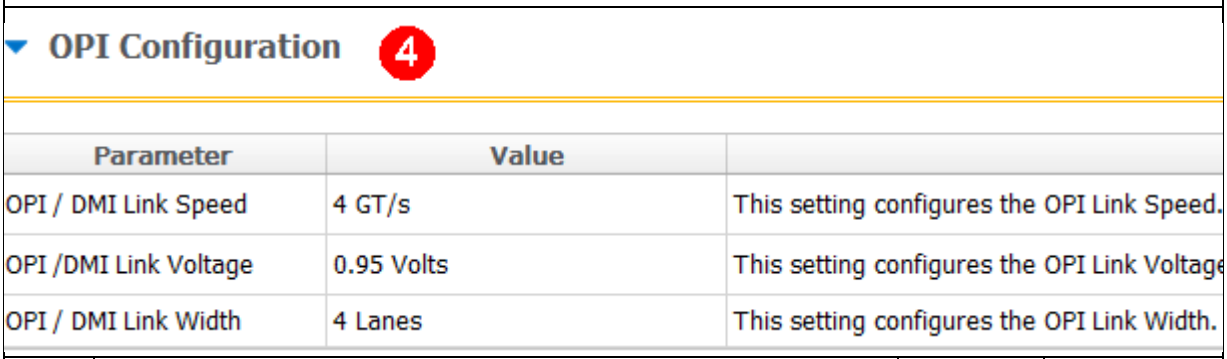
Table 2-10. - Internal PCH Buses (Sheet 3 of 5)

	Intel® SMBus I2C Address - This setting configures the Intel® SMBus I2C Address. **Note:** This setting is only used for testing purposes. The recommended setting is "0000000".	CML-Y CML-U	0x00000000 0x00000000
	Intel® SMBus I2C Address Enabled **Values: Yes/No** - This setting enables / disables the Intel® SMBus I2C Address. Note: This setting is only used for testing purposes. The recommended setting is "No".	CML-Y CML-U	No No
	Intel® SMBus MTCP Address - This setting configures the Intel® SMBus MCTP Address. **Note:** This setting is only used for testing purposes. The default setting is "0000000".	CML-Y CML-U	0x00000000 0x00000000
	Intel® SMBus MCTP Address Enabled **Values: Yes/No** - This setting enables / disables the Intel® SMBus MCTP Address. **Note:** This setting is only used for testing purposes. The recommended setting is "No".	CML-Y CML-U	No No
	SMBus / SMLink TCO Slave Connection **Values: Intel® SMBus, SMLink0** - This setting configures the TCO Slave connection to ether the Intel® SMBus or SMLink0. For further details see Comet Lake LP Platform Controller Hub EDS.	CML-Y CML-U	Intel® SMBus Intel® SMBus
	SMLink0 Enabled **Values: Yes/No** - This setting enables / disables SMLink0 interface. For further details see Comet Lake LP Platform Controller Hub EDS.	CML-Y CML-U	Yes Yes
	SMLink0 Frequency **Values: 100KHz, 400KHz, 1 MHz** - This setting determines the frequency at which the SMLink0 will operate. **Note:** The recommended setting is "1MHz".	CML-Y CML-U	1 MHz 1 MHz
	SMLink1 I2C Target Address - This setting configures SMLink1 I2C Target Address. For further details see Comet Lake LP Platform Controller Hub EDS.	CML-Y CML-U	0x00000000 0x00000000
	SMLink1 I2C Target Address Enabled **Values: Yes/No** - This setting configures SMLink1 I2C Target Address. For further details see Comet Lake LP Platform Controller Hub EDS.	CML-Y CML-U	No No
	SMLink1 Enabled **Values: Yes/No** - This setting enables / disables SMLink1 interface. For further details see Comet Lake LP Platform Controller Hub EDS. **Note:** This setting must be set to "Yes" if using PCH / MCP Thermal reporting.	CML-Y CML-U	No No
	SMLink1 GP Target Address - This setting configures SMLink1 GP Target Address. For further details see Comet Lake LP Platform Controller Hub EDS.	CML-Y CML-U	0x00000000 0x00000000
	SMLink1 GP Target Address Enabled **Values: Yes/No** - This setting enables / disables SMLink1 GP Target Address interface. For further details see Comet Lake LP Platform Controller Hub EDS. **Note:** This setting must be set to "Yes" if using PCH / MCP Thermal reporting.	CML-Y CML-U	Yes Yes
	SMLink1 Frequency **Values: 100KHz, 400KHz, 1 MHz** - This setting determines the frequency at which the SMLink1 will operate. **Note:** The recommended setting is "100KHz".	CML-Y CML-U	100 KHz 100 KHz
	Intel® SMBus ASD Mode Configuration This setting determines the native mode of operation for the Intel® SMBus ASD signal.	CML-Y CML-U	Enable as GPP_C2 Enable as GPP_C2
	Intel® SMLink0 MCTP Address This setting configures the Intel® SMLink0 MCTP Address.	CML-Y CML-U	0x0 0x0
Click on Internal PCH Buses in the left tabs menu> DMI Configuration is expanded by default:			

Table 2-10. - Internal PCH Buses (Sheet 4 of 5)



#	Parameter	Platform	Settings
3	**DMI Configuration**		
	DMI Lane Reversal **Values: Yes / No** - This setting allows the DMI Lane signals to be reversed. For further details see Comet Lake LP Platform Controller Hub EDS.	CML-Y CML-U	No No
	DMI Port Staggering **Values: Yes / No** - This setting configures DMI for Port Staggering. For further details see Comet Lake LP Platform Controller Hub EDS.	CML-Y CML-U	Yes Yes
Click on Internal PCH Buses in the left tabs menu> OPI Configuration is expanded by default:			



#	Parameter	Platform	Settings
4	**OPI Configuration**		
	OPI Link Speed **Values: GT2 / GT4 -** This setting configures the OPI / DMI Link Speed. For further details see Comet Lake PCH EDS.	CML-Y CML-U	4 GT/s 4 GT/s
	OPI Link Voltage **Values: 0.85 Volts, 0.95 Volts -** This setting configures the OPI / DMI Link Voltage. For further details see Comet Lake PCH EDS.	CML-Y CML-U	0.85 Volts 0.95 Volts
	OPI Link Width **Values: 1 Lanes, 2 Lanes, 4 Lanes, 8 Lanes -** This setting configures the OPI / DMI Link Width. For further details see Comet Lake PCH EDS.	CML-Y CML-U	8 Lanes 8 Lanes
Click on Internal PCH Buses in the left tabs menu> eSPI Configuration is expanded by default:

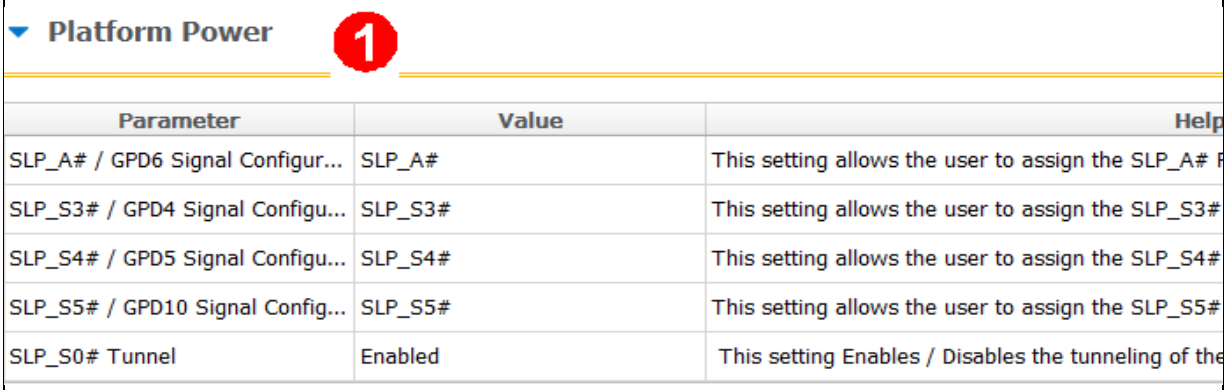
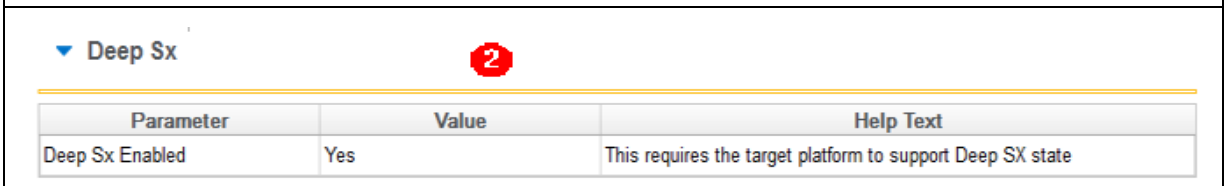
Table 2-11. - Power (Sheet 1 of 2)

Click on Power in the left tabs menu> Platform Power is expanded by default:



#	Parameter	Platform	Settings
1	**Platform Power**		
	SLP_A# / GPD6 Signal Configuration **Values: SLP_A#, GPD6** - This setting allows the customer to assign the SLP_A# Power Control signal as SLP_A# or as GDP6. For further details see Comet Lake LP Platform Controller Hub EDS.	CML-Y CML-U	SLP_A# SLP_A#
	SLP_S3# / GPD4 Signal Configuration **Values: SLP_S3#, GPD4** - This setting allows the customer to assign the SLP_S3# Power Control signal as SLP_S3# or as GDP4. For further details see Comet Lake LP Platform Controller Hub EDS.	CML-Y CML-U	SLP_S3# SLP_S3#
	SLP_S4# / GPD5 Signal Configuration **Values: SLP_S4#, GPD5** - This setting allows the customer to assign the SLP_S4# Power Control signal as SLP_S4# or as GDP5. For further details see Comet Lake LP Platform Controller Hub EDS.	CML-Y CML-U	SLP_S4# SLP_S4#
	SLP_S5# / GPD10 Signal Configuration **Values: SLP_S5#, GPD10** - This setting allows the customer to assign the SLP_S5# Power Control signal as SLP_S5# or as GDP10. For further details see Comet Lake LP Platform Controller Hub EDS.	CML-Y CML-U	SLP_S5# SLP_S5#
	SLP_S0# Tunnel This setting Enables / Disables the tunneling of the SLP_S0# pin over ESPI to the EC when in ESPI mode.	CML-Y CML-U	Disabled Disabled

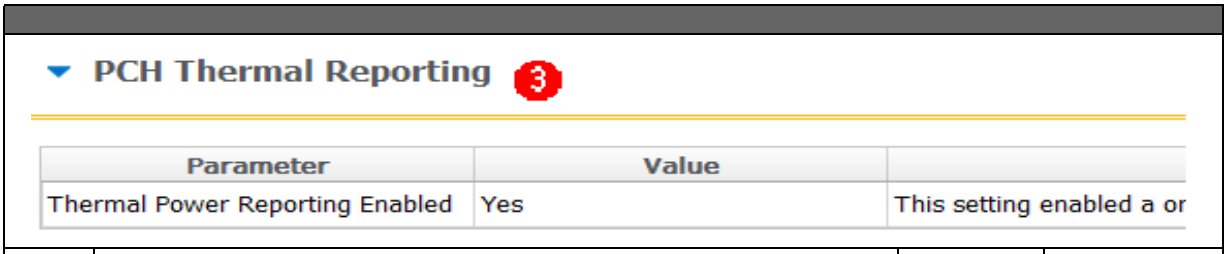
Click on Power in the left tabs menu> Deep Sx is expanded by default:



#	Parameter	Platform	Settings
2	**Deep Sx**		
	Deep Sx Enabled **Values: Yes/ No -** This setting enables / disables support for Deep Sx operation. For further details see Comet Lake LP Platform Controller Hub EDS. **Note:** Support for Deep Sx is board design dependent.	CML-Y CML-U	Yes Yes

Click on Power in the left tabs menu> PCH Thermal Reporting is expanded by default:

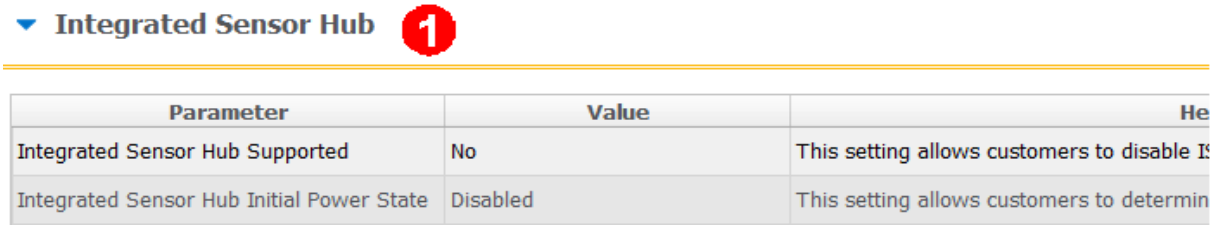
Table 2-11. - Power (Sheet 2 of 2)



#	Parameter	Platform	Settings
3	**PCH Thermal Reporting**		
	Thermal Power Reporting Enabled This setting enabled a once-per-second timer interrupt is enabled which triggers firmware to report power and temperature information as enabled by configuration registers. Note: When this setting is disabled ensure that the once-per-second timer interrupt associated with this feature is also disabled.	CML-Y CML-U	Yes Yes

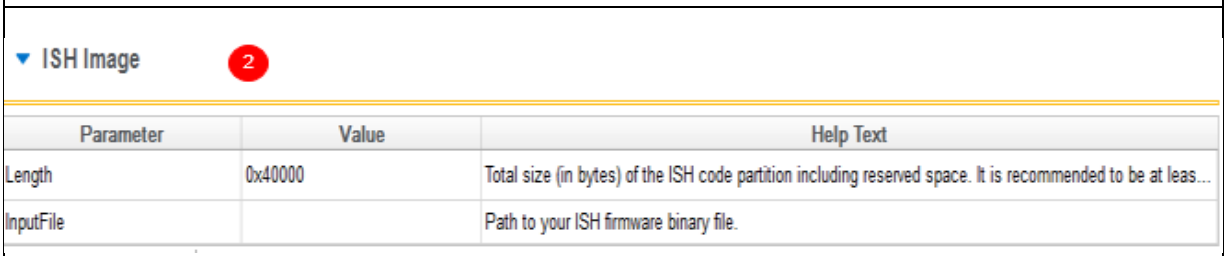
Table 2-12. - Integrated Sensor Hub (Sheet 1 of 2)

Click on Integrated Sensor Hub in the left tabs menu> Integrated Sensor Hub is expanded by default:



#	Parameter	Platform	Settings
1	**Integrated Sensor Hub**		
	Integrated Sensor Hub Supported **Values: Yes / No** This setting allows customers to disable ISH on the platform.	CML-Y CML-U	No No
	Integrated Sensor Hub Power Up State **Values: Enabled / Disabled** Field is enabled for editing if "Integrated Sensor Hub Supported" field above is set to "Yes". This setting allows customers to determine the power up state for ISH.	CML-Y CML-U	Disabled Disabled

Click on Integrated Sensor Hub in the left tabs menu> ISH Image is expanded by default:



#	Parameter	Platform	Settings
2	**ISH Image**		
	Length - Total size (in bytes) of the ISH code partition including reserved space. It is recommended to be at least 256kb.	CML-Y CML-U	
	ISH Input File	CML-Y CML-U	

Click on Integrated Sensor Hub in the left tabs menu> ISH Data is expanded by default:

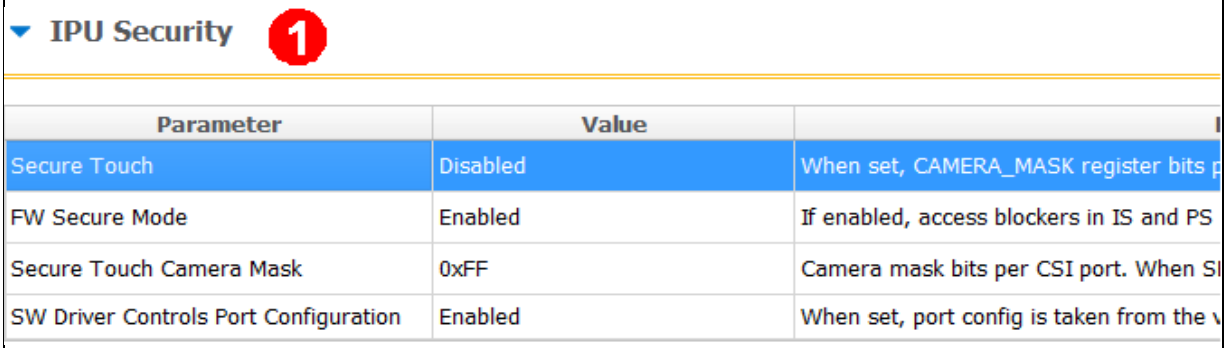
3	**Integrated Sensor Hub - ISH Data**		

Table 2-12. - Integrated Sensor Hub (Sheet 2 of 2)

	PDT Binary File	CML-Y CML-U	Path for PDT Binary file Path for PDT Binary file

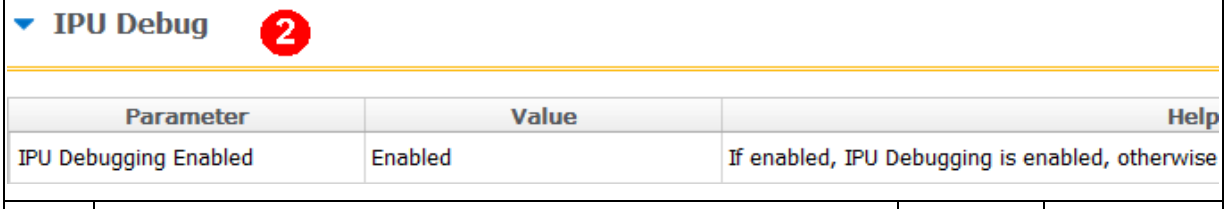
Table 2-13. - Camera (Sheet 1 of 2)

Click on Camera in the left tabs menu> IPU Security is expanded by default:



#	Parameter	Platform	Settings
1	**IPU Security**		
	Secure Touch When set, CAMERA_MASK register bits per CSI port are used to mask the data of cameras. When cleared, camera data is not masked.	CML-Y CML-U	Disabled Disabled
	FW Secure Mode If enabled, access blockers in IS and PS are enabled, and FW is read from IMR. Must be enabled for FW authentication flow and execution of authenticated FW.	CML-Y CML-U	Enabled Enabled
	Secure Touch Camera Mask Camera mask bits per CSI port. When SECURE_TOUCH is set each set bit masks a CSI port for secure touch. When SECURE_TOUCH is cleared this register has no impact on the CSI ports.	CML-Y CML-U	0xFF 0xFF
	SW Driver Controls Port Configuration When set, port config is taken from the value IPU driver configures in IPU. When cleared, port config is taken from: CSI2_PORT_CONFIG_MSB.PORT_ID and CSI2_PORT_CONFIG_LSB.PORT_ID	CML-Y CML-U	Enabled Enabled

Click on Camera in the left tabs menu> IPU Debug is expanded by default:



#	Parameter	Platform	Settings
2	**IPU Debug**		
	IPU Debugging Enabled If enabled, IPU Debugging is enabled, otherwise internal setup is checked to see if the IPU Debugging feature should be enabled or not.	CML-Y CML-U	Enabled Enabled

Click on Camera in the left tabs menu> IPU PHY is expanded by default:

Table 2-13. - Camera (Sheet 2 of 2)

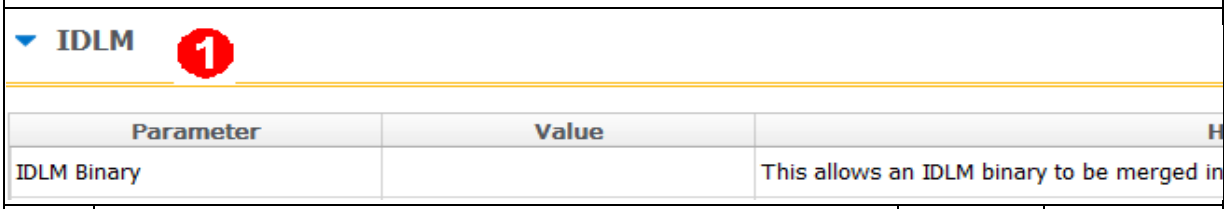
IPU PHY 3

Parameter	Value	He
Port Configuration For 8 LSB Lanes	0x0000	When CSI2_CNL.CR_OVRD is cleared this determ
Port Configuration For 8 MSB Lanes	0x0000	When CSI2_CNL.CR_OVRD is cleared this determ

#	Parameter	Platform	Settings
3	**IPU PHY**		
	Port Configuration for 8 LSB Lanes	CML-Y CML-U	0x0000 0x0000
	Port Configuration for 8 MSB Lanes	CML-Y CML-U	0x0000 0x0000

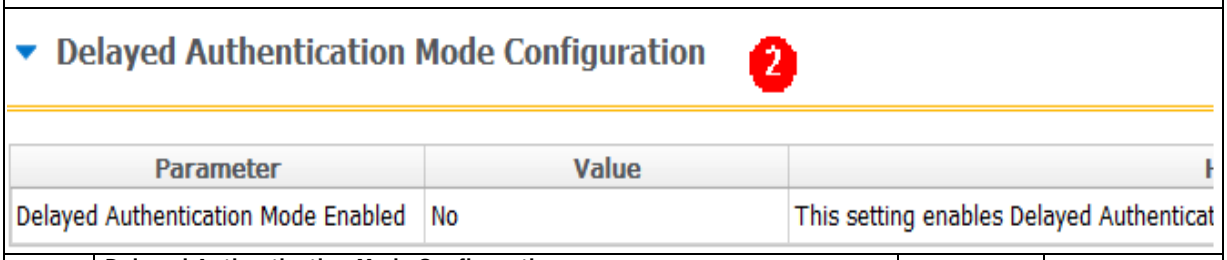
Table 2-14. - Debug (Sheet 1 of 5)

Click on Debug in the left tabs menu> Intel® ME Firmware Debugging Overrides is expanded by default:



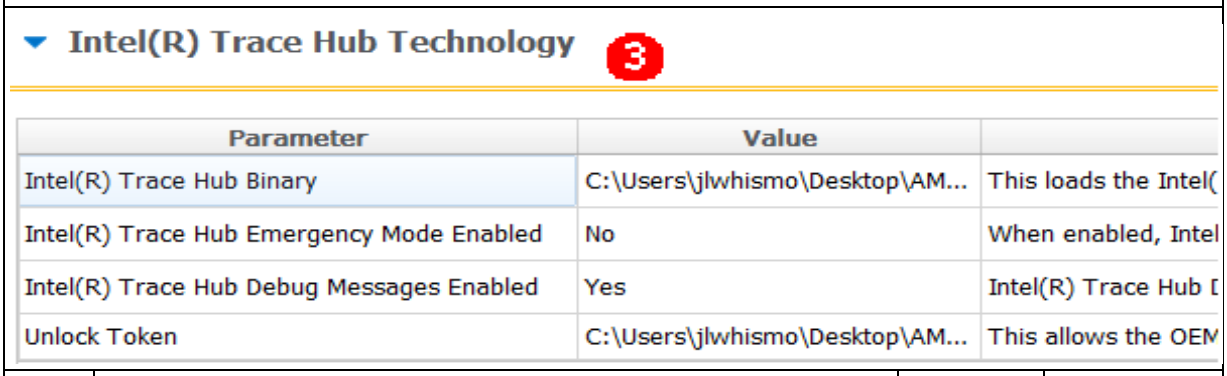
#	Parameter	Platform	Settings
1	**IDLM**		
	IDLM Binary This allows an IDLM binary to be merged into output image built by Intel® FIT.	CML-Y CML-U	

Click on Debug in the left tabs menu> Delayed Authentication Mode Configuration is expanded by default:



2	**Delayed Authentication Mode Configuration**		
	Delayed Authentication Mode Enabled **Values: Yes / No** - This setting enables Delayed Authentication Mode on the platform.	CML-Y CML-U	No No

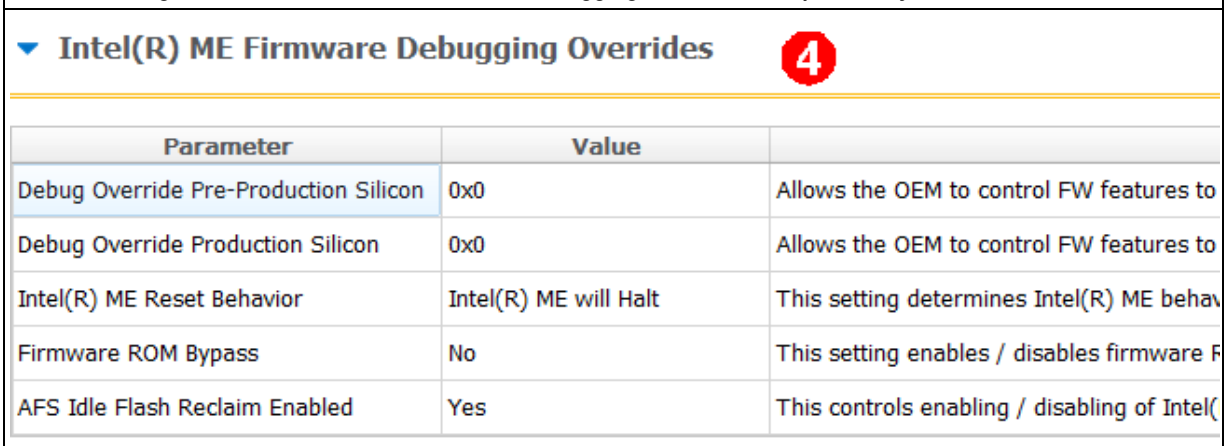
Click on Debug in the left tabs menu> Intel® Trace Hub Technology is expanded by default:



#	Parameter	Platform	Settings
3	**Intel® Trace Hub Technology**		
	Intel® Trace Hub Binary - This loads the Intel® Trace Hub binary that will be merged into the output image generated by the Intel® FIT tool.	CML-Y CML-U	Trace Hub Binary Trace Hub Binary

Table 2-14. - Debug (Sheet 2 of 5)

	Intel® Trace Hub Emergency Mode Enabled **Values: Yes / No** - This setting enable / disables Intel® Trace Hub in the firmware base image.	CML-Y CML-U	No No
	Intel® Trace Hub Debug Message Enabled **Values: Yes / No** - This setting enables/disables the Intel® Trace Hub debug messages. **Note:** When enabling this setting you also need to enable Intel® Trace Hub Soft Enable setting for proper operation.	CML-Y CML-U	Yes Yes
	Unlock Token This allows the OEM to input an Unlock Token binary file for closed chassis debug.	CML-Y CML-U	
Click on Debug in the left tabs menu> Intel® ME Debugging Overrides is expanded by default:			

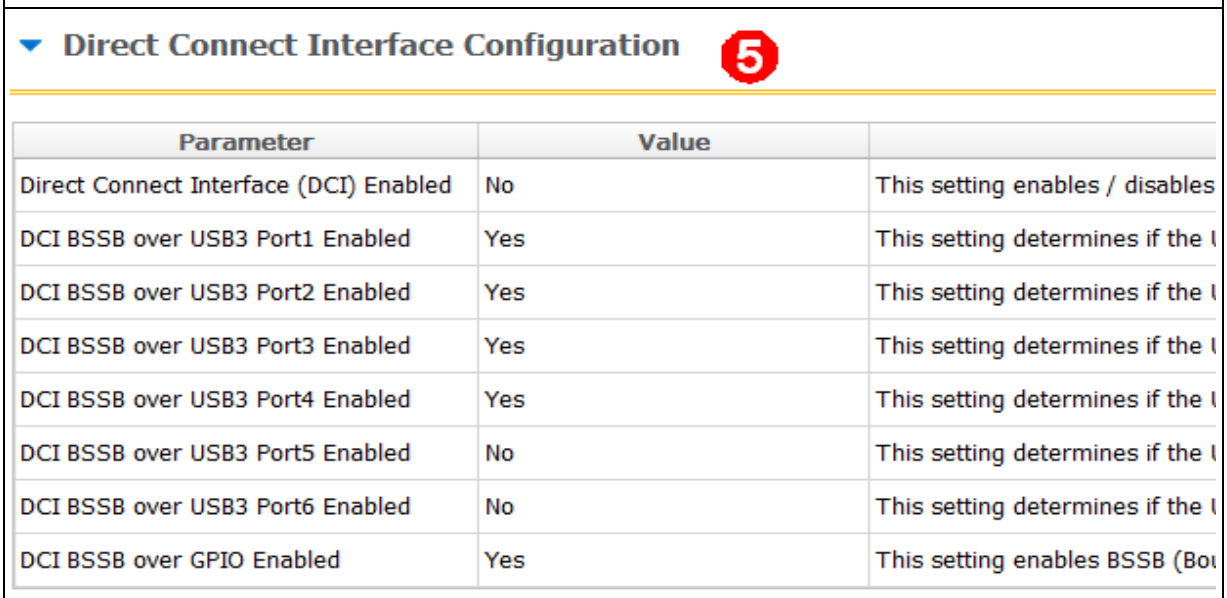


#	Parameter	Platform	Settings
4	**Intel® ME Firmware Debugging Overrides**		
	Debug Override Pre-Production Silicon - Allows the OEM to control FW features to assist with pre-production platform debugging. This control has no effect if used on production silicon. **Bit 0:** Disable DRAM_INIT_DONE (default timeout 60 seconds) **Bit 1:** Disable Host Reset Timer **Bit 2:** Disable CPU_RESET_DONE timeout **Bit 3:** Reserved **Bit 4:** Disable Intel® ME Power Gating **Bit 5:** Reserved **Bit 6:** Secure Boot debug hook. Used to shorten wait time before ENF shutdown. **Bit 7:** Force real FPFs on preproduction (default is to use flash) **Bit 8:** Secure Boot debug hook. Used to reduce S3 or FFS optimization tries. **Bit 9:** Reserved **Bit 10:** Override power package to always enter M3. **Note:** Certain options do not work when the descriptor is locked.	CML-Y CML-U	0x00000000 0x00000000
	Debug Override Production Silicon - Allows the OEM to control FW features to assist with production platform debugging. **Bit 0:** Extend DRAM_INIT_DONE timeout to 30 minutes (default timeout 15 seconds) **Bit 1:** Disable Host Reset Timer **Bit 2:** Disable CPU_RESET_DONE timeout **Note:** Certain options do not work when the descriptor is locked.	CML-Y CML-U	0x00000000 0x00000000
	Intel® ME Reset Behavior This setting determines Intel® ME behavior when boot image errors are encountered. Warning: This setting should be used for debug purposes only. ***Note:*** This may block normal Firmware functional flows.	CML-Y CML-U	Intel® ME will Halt Intel® ME will Halt

Table 2-14. - Debug (Sheet 3 of 5)

	Firmware ROM Bypass **Values: Yes/No** - This setting enables / disables firmware ROM bypass. **Note:** This setting only has affect when the firmware being used has ROM Bypass code present.	CML-Y CML-U	No No
	ASF Idle Flash Reclaim Enabled **Values: Yes / No** This controls enabling / disable the Intel® AFS Idle flash reclaim capabilities. ***Note:*** This setting should be used for debug purposes only.	CML-Y CML-U	Yes Yes

Click on Debug in the left tabs menu> Direct Connection Interface Configuration is expanded by default:



Direct Connect Interface Configuration 5

Parameter	Value	
Direct Connect Interface (DCI) Enabled	No	This setting enables / disables

Table 2-16. - Flex I/O Straps (Sheet 7 of 9)

#	Parameter	Platform	Settings
6	**USB3 Port Configuration** ***Note:*** USB Type-C Mux Control: On Comet Lake PCH, device mode is supported on all USB3.1 Type-C ports. EC/PD/PC needs to send a OOB command to the PCH to properly map the USB 2.0 and USB 3.1 signals to the Host controller or Device mode controller when a connection is detected on the Type-C port. Without these OOB message, the USB2.0/ 3.1 signals may not be correctly mapped and the USB functionality may be impacted. For more detail, see Coffee Lake Platform USB Type-C Mux Control Over eSPI doc # 570737.		
	USB3 / PCIe Combo Port 0 **Values: PCIe, USB3 -** This setting configures the PCIe port to operate as either: PCIe Port 1 or USB3 Port 1 For further details on Flex I/O see Comet Lake LP Platform Controller Hub EDS. ***Note:*** If DCI BSSB for this USB3 Combo port it will be Grayed out. GPP_A16 Individual Voltage Select	3.3 Volts	This setting controls the VCCIO voltage for the GPP_A16 GPIO pin.
GPP_A17 Individual Voltage Select	3.3 Volts	This setting controls the VCCIO voltage for the GPP_A17 GPIO pin.
GPP_A17 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_A18 GPIO pin.
GPP_A19 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_A19 GPIO pin.
GPP_A20 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_A20 GPIO pin.
GPP_A21 Individual Voltage Select	3.3 Volts	This setting controls the VCCIO voltage for the GPP_A21 GPIO pin.
GPP_A22 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_A22 GPIO pin.
GPP_A23 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_A23 GPIO pin.

	GPP_C23 Individual Voltage Select	CML-Y CML-U	3.3 Volts 3.3 Volts

Table 2-17. - GPIO (Sheet 10 of 15)

GPP_D0 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D0 GPIO pin.
GPP_D1 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D1 GPIO pin.
GPP_D2 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D2 GPIO pin.
GPP_D3 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D3 GPIO pin.
GPP_D4 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D4 GPIO pin.
GPP_D5 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D5 GPIO pin.
GPP_D6 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D6 GPIO pin.
GPP_D7 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D7 GPIO pin.
GPP_D8 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D8 GPIO pin.
GPP_D9 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D9 GPIO pin.
GPP_D10 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D10 GPIO pin
GPP_D11 Individual Voltage Select	3.3 Volts	This setting controls the VCCIO voltage for the GPP_D11 GPIO pin
GPP_D12 Individual Voltage Select	3.3 Volts	This setting controls the VCCIO voltage for the GPP_D12 GPIO pin
GPP_D13 Individual Voltage Select	3.3 Volts	This setting controls the VCCIO voltage for the GPP_D13 GPIO pin
GPP_D14 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D14 GPIO pin
GPP_D15 Individual Voltage Select	3.3 Volts	This setting controls the VCCIO voltage for the GPP_D15 GPIO pin
GPP_D16 Individual Voltage Select	3.3 Volts	This setting controls the VCCIO voltage for the GPP_D16 GPIO pin
GPP_D17 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D17 GPIO pin
GPP_D18 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D18 GPIO pin
GPP_D19 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D19 GPIO pin
GPP_D20 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D20 GPIO pin
GPP_D21 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D21 GPIO pin
GPP_D22 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D22 GPIO pin
GPP_D23 Individual Voltage Select	1.8 Volts	This setting controls the VCCIO voltage for the GPP_D23 GPIO pin

#	Parameter	Platform	Settings

2	**Green Build Image for FWUpdate button**	Directs the Intel® FIT tool to build a firmware update image based in the binaries provided under the FW Update Image Build tab.
3	**Console shows status of build and path where saved**	

3 Programming SPI Flash Devices and Checking Firmware Status

Now that the Flash image file has been created, it can be programmed into the SPI Flash device(s) of the target machine. For platforms that don't boot, a Flash Chip Programmer will be required. For platforms that can boot to DOS or Windows*, the Intel® FPT can be used.

3.1 Flash Burner/Programmer

The specific use of a Flash burner/programmer is beyond the scope of this document. Here are some general steps that may be followed:

1. Navigate to your **Output Directory** (as specified in Table 2-2) where your generated SPI Flash image(s) are saved. It is assumed that this image file is named **outimage.bin**.

   If two total SPI Flash devices were specified during the build process, then additional image files will be saved, one for each SPI Flash device. These files are assumed to be named **outimage(1).bin** and **outimage(2).bin**.
2. Utilize a Flash burner/programmer to program the image(s). For multiple SPI Flash devices, the images are numbered sequentially to correspond to the first and second SPI Flash device accordingly.

3.1.1 In-Circuit SPI Flash Programming for CRB

Mobile CRBs have the SPI Flash devices soldered down. As a result, to program the SPI Flash for mobile CRBs, follow these steps:

1. Leave CRB powered on.
2. Connect Flash Programmer (such as DediProg SF600) header to connector **J3F3** which is labelled **"SPI TPM"**. Make sure to line up pin 1 on the header.
3. Program the first image [outimage(1).bin] to the CRB.
4. In Dediprog software, select application memory chip 2 button and load second image if created.
5. Program the second image [outimage(2).bin] to the CRB if created.
6. Once programming is complete, disconnect the Flash Programmer header. Power off and unplug CRB. Remove cell coin battery, wait approximately 10 seconds. Replace cell coin battery, plug CRB back in and power on.

3.2 Flash Programming Tool (Intel® FPT)

Intel® FPT can be used to substitute for a Flash burner/programmer, provided the system is capable of booting to a DOS or Windows* OS.

Note: Intel® FPT will automatically disable the Intel® ME or EFI prior to flashing the image to the platform.

Intel® FPT DOS Version

The DOS versions supported by Intel® FPT are: DOS, Free DOS, and DRMK DOS. Use the following steps to program the SPI Flash devices,

1. Copy all the files in the "(root)\Tools\System Tools\Flash Programming Tool\DOS" directory to the root directory of a bootable USB key.
2. Navigate to your **Output Directory** (as specified in Table 2-2) where your generated SPI Flash image(s) are saved. It is assumed that this image file is named **outimage.bin**. Copy this image file to the root directory of the USB key.
3. Boot the target system to DOS and change to the root directory of the bootable USB key. At the DOS prompt type:

```
fpt.exe -i
```

The system should respond with the number of SPI Flash devices available. For example:

```
--- Flash Devices Found ---
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)
```

Note: If the SPI Flash device does not currently contain a descriptor it may report only a single device.

4. Program the SPI Flash image to the Flash device(s) by issuing the following command at the prompt:

```
fpt.exe -f outimage.bin
```

If the programming was successful, then the following message will be shown.

```
FPT Operation Passed
```

If the programming was **NOT** successful, then repeat this step to try again. If programming problems persist, then check the SPI Flash devices and platform hardware.

5. Execute a platform global reset using Intel® FPT -greset. Next go to Section 3.3 to check the Intel® ME Firmware status.

3.2.1 Intel® FPT Windows* Version

The Windows* OS versions supported by Intel® FPT are: Windows* PE 64, Windows* 7, Windows* 8/8.1. There are two versions of Intel® FPT for Windows*: a 32-bit version and a 64-bit version. Most Windows* OS, Windows* 7 (32-bit or 64-bit), Windows* 8/8.1 (32-bit or 64-bit) can use Windows* version of Intel® FPT. However, Windows* OS which do not support 32 bit compatible mode (Win PE 64-bit) **must use** Intel® FPT Windows* 64-bit version due to compatibility issues.

Use the following steps to program the SPI Flash devices,

1. Navigate to your **Output Directory** (as specified in Table 2-2) where your generated SPI Flash image(s) are saved. It is assumed that this image file is named **outimage.bin**. Copy this image file to Intel® FPT directory located at "(root)\Tools\System Tools\Flash Programming Tool\Windows".
2. Boot the target system to Windows* and open a Command Prompt window. In this window, change to the Intel® FPT directory and at the prompt type:

```
fptw.exe -i
```

   The system should respond with the number of SPI Flash devices available. For example:

```
--- Flash Devices Found ---
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)
```

   Note: If the SPI Flash device does not currently contain a descriptor it may report only a single device.

3. Program the SPI Flash image to the Flash device(s) by issuing the following command at the prompt:

```
fptw.exe -f outimage.bin
```

   If the programming was successful, then the following message will be shown.

```
FPT Operation Passed
```

   If the programming was **NOT** successful, then repeat this step to try again. If programming problems persist, then check the SPI Flash devices and platform hardware.

4. Use fptw.exe -greset to perform a G3 power cycle. Next go to Section 3.3 to check the Intel® ME Firmware status.

3.3 Checking Intel® ME Firmware Status

Use the following steps to check the platform health and Intel® ME FW status,

1. Copy the file **MEInfo.exe** in the "(root)\Tools\System Tools\MEInfo\DOS" directory to the root directory of a bootable USB key.
2. Boot the target system and use F2 or Del to enter the BIOS setup menu. Load default values for BIOS (on Intel® CRBs press F3 to load default values). Save and reboot (on Intel® CRBs press F4 and select Yes).
3. Boot the target system to DOS and change to the root directory of the bootable USB key. At the DOS prompt type:

```
MEInfo.exe -fwsts
```

The system should respond with a message similar to below.

```
Intel® MEInfo Version: 14.0.0.xxxx

Copyright(C) 2005 - 2014, Intel Corporation. All rights reserved.

FW Status Register1: 0x1E000255
FW Status Register2: 0x60002306
FW Status Register3: 0x00000300
FW Status Register4: 0x00004001
FW Status Register5: 0x00000101
FW Status Register6: 0x03C00FC9

  Current State: Normal
  ManufacturingMode: Enabled
  FlashPartition:                  Valid
  OperationalState:                       M0 with UMA
  InitComplete:               Complete
  BUPLoadState:                 Success
  ErrorCode:                No Error
  ModeOfOperation:                        Normal
  Phase:                   HOSTCOMM Module
  ICC:                        Valid OEM data, ICC programmed
  SPI Flash Log:                                  Not Present
  ME File System Corrupted:                                  No
  FPF and ME Config Status:                                  Not committed
```

As in the above example if there are NO errors shown, then

- your platform's health is good
- Intel® ME FW has successfully initialized
- Intel® ME FW is operating normally

Note: This section is only intended to show how to use the MEInfo.exe tool for checking firmware status. For full usage and capabilities of the MEInfo.exe tool, please see the System Tools User Guide.

3.4 Common Bring Up Issues and Troubleshooting Table

Table 3-1. Common Bring Up Issues and Troubleshooting Table

Problem / Issue	Solution / Workaround
System does not boot to DOS	By default, the system will boot to EFI Shell. To boot to DOS, 1. Enter BIOS menu, then go to the 'Boot' screen 2. Change 'Boot Option #1' to be your USB key (ensure USB key is formatted to be DOS bootable) 3. Press 'F4' to save settings and reboot
Hear 3 beeps when platform powers on	Possible device is disconnected or device not found, check • platform power and MCP fan power connectors • DIMM memory modules (if applicable for memory down modules • USB devices (keyboard, mouse, USB key) may be plugged into inactive USB port • missing/incorrect jumpers • missing or poorly socketed MCP
No display on monitor	Ensure Corporate FW SKU supports integrated graphics. Try external graphics card.
USB device not detected or does not work	USB device may be plugged into inactive USB port
System does not boot (Post Code 00)	Incorrect Flash image – possible reasons: • wrong FW selected during Flash image build process • wrong Flash size selected Re-build image with correct settings and re-flash using Flash burner.

§ §

A Appendix — Flash Configurations

This chapter covers only the basic information needed for clock control parameter programming. For a more detailed treatment of Mainstream - Mobile Family clocks, see Intel® *Comet Lake PCH-H / LP Clocks* and *Intel® Converged Security and Management Engine — Platform Compliancy Guide for ME Hardware*.

Figure A-1. Configuration "A" — Desktop / Server / Workstation or Mobile

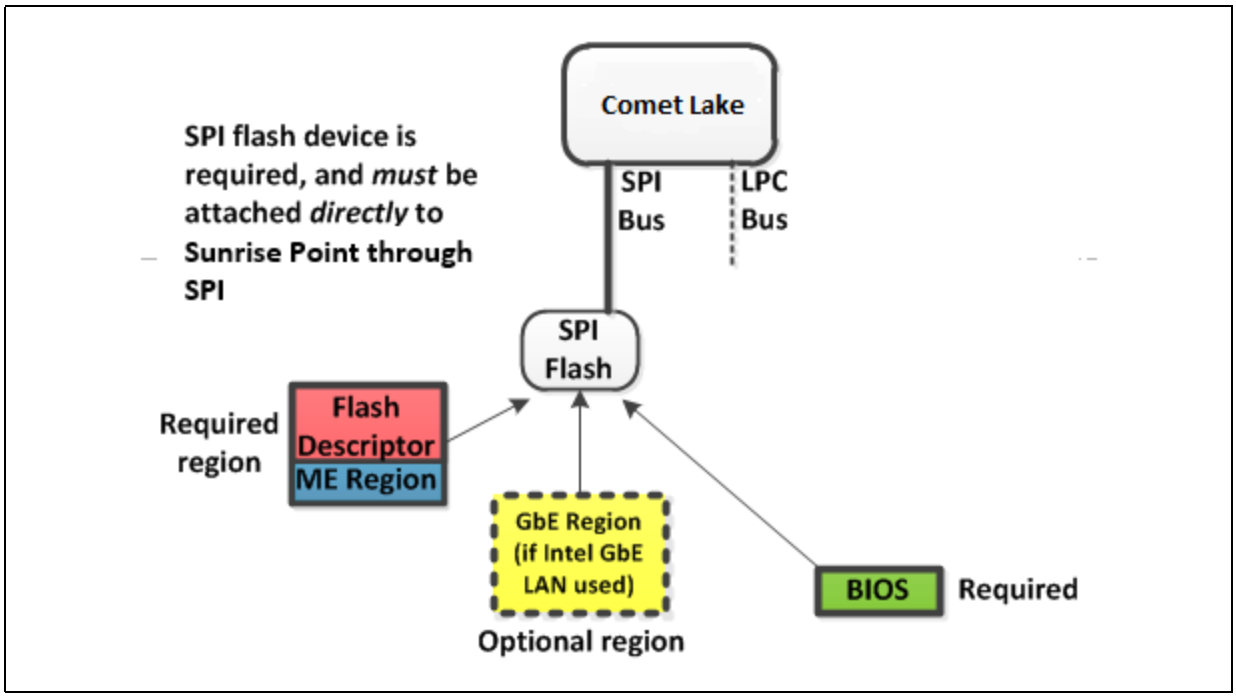

Figure A-2. Configuration "B" — Mobile Only

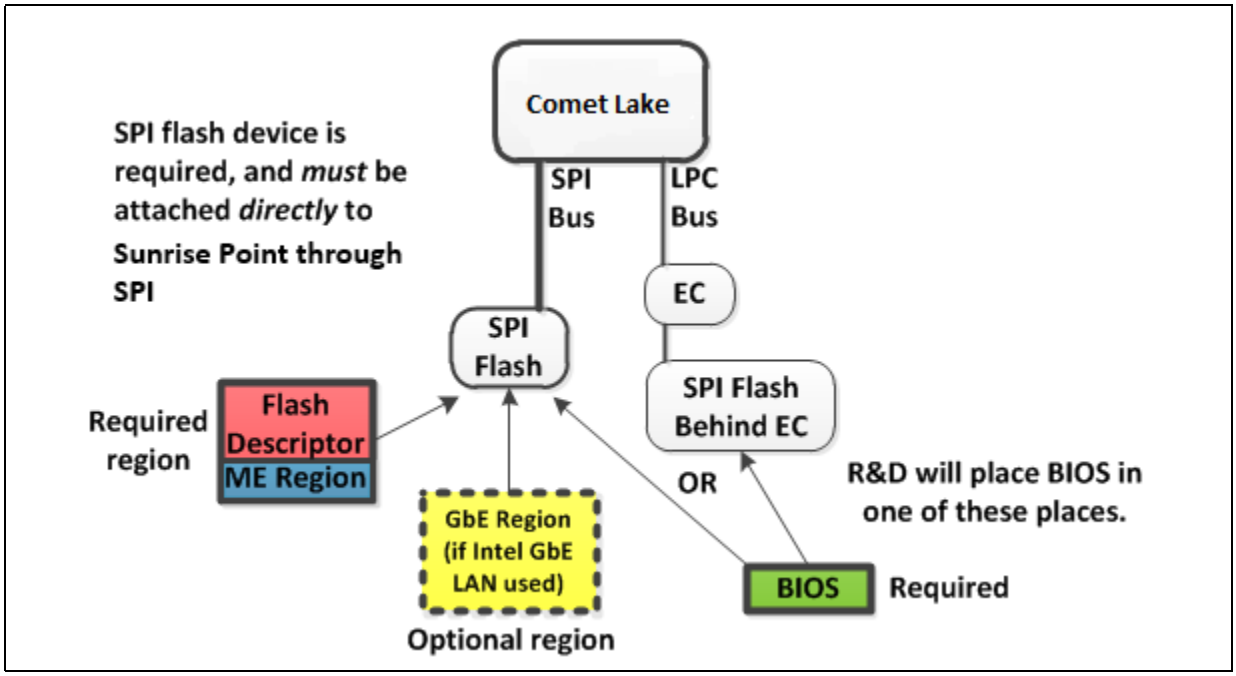

§ §

B Appendix — Intel® ICCS SKU Support Matrix

The following table describes ICC features supported for specific PCH SKU, clock range (maximum and minimum), spread mode supported by Comet Lake-LP SKUs.

Note: Please refer to Comet Lake-H/LP Platform Controller Hub (PCH) External Design Specification (EDS) for details about Comet Lake-H/LP Chipset Clock architecture

In below tables,

Min = Clock Div Max (minimum allowed frequency)

Max = Clock Div Min (maximum allowed frequency)

B.1 Intel® ICCS SKU Matrix - CNP-LP

Note: ICC SKU is divided into 2 categories: Basic and Enhanced. Mark "x" indicates category supported by PCH SKU.

Table B-1. Intel® ICCS SKU Matrix - CNP-LP

PCH SKU	Basic	Enhanced
Premium Y		**x**
Premium U		**x**
Base U		**x**
Features Supported	Standard Clock Configuration	Standard Clock Configuration Adaptive Clock Configuration
Pre-Defined ICC profile supported	Standard	Standard Adaptive
Clock Range Supported	[Min-Max]=100 MHz.	BCLK [Min-Max] = 98 - 100 MHz.
SSC Supported	Down SSC: 0 - 0.5%	Down SSC: 0 - 0.5%

C Appendix — Boot Guard Configuration

C.1 Boot Guard Profiles

The following table describes the profiles available for Boot Guard Configuration.

Table C-1. Profile Description

Index	Profile Name	F	V	M	ENF	PBE	Description
0	**Boot Guard Profile - No_FVME**	0	0	0	00	0	This configuration will invoke Boot Guard during boot with neither Verification nor Measurement. For platforms with all the required Boot Guard components but do not wish to enable Boot Guard boot block verification protection.
1	**Boot Guard VE**	0	1	0	01	1	When Verification is desired but if verification fails the platform will continue to boot with the unverified IBB for a short period, to allow remediation.
2	**Boot Guard VME**	0	1	1	01	1	When Verification and Measured are desired and the asset protection is provided by both TPM protection and a timed remediation period.
3	**Boot Guard VM**	0	1	1	00	1	When Verification and Measured are desired and the asset protection is provided by TPM protection.
4	**Boot Guard FVE**	1	1	0	11	1	Strict Verification enforcement.
5	**Boot Guard FVME**	1	1	1	11	1	Strict Verification and Measured enforcement. Prevents unverified IBB from running.

C.2 Enforcement Policies

Table C-2. Enforcement Policy Description

Error Enforcement Policy (ENF)	Enforcement Mode Name	Description
0	**Unrestricted Mode**	Infinite time before shutdown – don't shutdown the platform, let everything run normally.
1	**Remediation Mode**	**30 minutes** before shutdown – enough time to remediate the system, e.g. update BIOS or other data on flash via host tools.
2	**Reserved**	
3	**Restricted Mode**	**0 minutes** before shutdown – instant shutdown policy.

C.3 OEM Profile Parameters

Table C-3. Profile Parameters Description

Parameter	Description	Settings
Force Boot Guard ACM Enabled (F)	Force Boot Guard Boot determines if the platform starts the Force Boot Guard Boot timer. If it successfully starts it indicates success. When the Force Boot Guard timer stops, it starts the Protect Bios Environment timer, if indicated by the boot policy restrictions. Anchor ACM then jumps to the Initial Boot Block(IBB) with the Force Boot Guard Boot time stopped and the Protect BIOS enable timer running.	**false** - Allow the CPU to jump to the legacy reset vector if the Boot Guard Module cannot be successfully loaded. (default) **true -** Force the Boot Guard ACM to execute.
Verified Boot Enabled (V)	Boot Guard cryptographically verifies the platform Initial Boot Block (IBB) using the boot policy key. On successful verification, Boot Guard executes Initial Boot Block (IBB) using the boot policy key. If the verification fails, Anchor signals or enters Remediation.	**false** - Platform does not perform verified boot (default) **true** - Platform performs verified boot
Measured Boot Enabled (M)	Boot Guard measures the Initial Boot Block (IBB) into the TPM. Boot Guard perform no verification that the IBB is correct or from the platform manufacturer. The Slylake implementation of Boot Guard will support measurements into TPM or Intel's Platform Trust Technology.	**false** - Platform does not perform measured boot (default) **true** - Platform performs measured boot
Protect Bios Environment Enabled (PBE)	Platform manufacturer may want Initial boot block to be protected between verification/ measurement and execution from attacks on buses and non-CPU components. Boot Guard accomplishes this by allowing the initial boot block to be verified and executed in LLC in NEM if PBE is enabled.	**false** - Take no actions to control the environment during execution of the BIOS components (default) **true** - Takes actions to control the environment during the execution of the BIOS components.
Error Enforcement Policy (ENF)	Boot Guard invokes the Enforcement Policy when a fatal error is encountered. The action taken by ENF is determined by the OEM set persistent policies. Like, • Allowing platform to continue to boot • Immediate Shutdown • Shutdown with Timeout intervals When the ENF logic is invoked, PTT or TPM also disconnects.	See Section C-2 for details.

D Appendix — Intel® Platform Trust Technology

D.1 Intel® Platform Trust Technology

The following table describes the platform configurations supported by Intel® Platform Trust Technology.

Note: Intel® Platform Trust Technology does not support the full TPM functionality requirements and should not be used for Intel® vPro™ based platforms.

Table D-1. Intel® Platform Trust Technology Configuration table

Configuration	Platform Protection> Intel® PTT Configuration Intel® PTT initial power up state	Platform Protection> Intel® PTT Configuration Intel® PTT Supported	Platform Protection> Intel® PTT Configuration Intel® PTT Supported [FPF]	Description
Intel® PTT Permanently Disabled in HW via FPF	**Disabled**	**No**	**No**	After the End of Manufacturing command, this setting will permanently set into the FPFs contained in the MCP. If disabled, the specific MCP can never be enabled for Intel® PTT.
Intel® PTT Permanently Disabled in base firmware image	**Disabled**	**No**	**Yes**	This setting allows Intel® PTT to be set to disabled without disabling the MCP FPFs. This is the recommended option to permanently disable Intel® PTT on a platform.
Intel® PTT Ship State Disabled in base firmware image	**Disabled**	**Yes**	**Yes**	Intel® PTT initially shipped in disabled mode, can be enabled by BIOS command.
Intel® PTT Enabled	**Enabled**	**Yes**	**Yes**	This is the recommended option to enable Intel® PTT on a platform.

E Appendix — Integrated Sensor Hub (ISH) Public Key Settings

The following table describes the configuration matrix required for ISH configuration for the Intel® FIT tool. Please see System Tools User Guide within ME kit, Manufacturing Test with Intel® Converged Security and Management Engine (Intel® ME) Firmware 12 and Intel® Integrated Sensor Solution on Comet Lake Mobile, Comet Lake Desktop, (CDI # WIP) for additional details.

CLSMNF = Close Manufacturing switch used with Intel® Flash Programming Tool (FPT)

PV = Production Version

For additional information on FPT see System Tools User Guide included with ME kit under system tools folder.

Table E-1. ISH Public Key Settings

Firmware	MCP	FPF Automatic Commit	FPF MEI command after CLSMNF (Yes/No)	FPF MEI command before CLSMNF (Yes/No)
Pre-production	Production	No	No - Not a valid combination	No - Not a valid combination
Production (PV not set)	Pre-production	No	Yes	No
Production (PV not set)	Production	No	Yes	No
Pre-production	Pre-production	No	Yes	No
Production (PV not set)	Production	Yes	No	No

Note: The Intel® FIT allows integration of binary files within Integrated Sensor Hub section under ISH Image and ISH Data. The Intel® FIT does not generate or create the required files. The table above lists configuration combinations that can be used.
