1 ActnColorMaps Namespace

This is namespace ActnColorMaps.

Topics

Name	Description
Classes (see page 2)	The following table lists classes in this documentation.
Constants (see page 35)	The following table lists constants in this documentation.

Classes

	Name	Description
	TStandardColorMap (see page 2)	TStandarColorMap defines the default look and feel of individual action band components.
	TTwilightColorMap (see page 13)	TTwilightColorMap defines the default look and feel of individual action band components.
	TXPColorMap (see page 23)	TXPColorMap defines the default look and feel of individual action band components.

Constants

Name	Description
cXPBtnFrameColor (see page 35)	This is constant ActnColorMaps.cXPBtnFrameColor.
cXPFrameOuter (see page 35)	This is constant ActnColorMaps.cXPFrameOuter.
cXPSelectedColor (see page 35)	This is constant ActnColorMaps.cXPSelectedColor.

1.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TStandardColorMap (see page 2)	TStandarColorMap defines the default look and feel of individual action band components.
	TTwilightColorMap (see page 13)	TTwilightColorMap defines the default look and feel of individual action band components.
	TXPColorMap (see page 23)	TXPColorMap defines the default look and feel of individual action band components.

1.1.1 TStandardColorMap Class

TStandarColorMap defines the default look and feel of individual action band components.

Class Hierarchy

Pascal

```
TStandardColorMap = class(TCustomActionBarColorMap);
```

C++

```
class TStandardColorMap : public TCustomActionBarColorMap;
```

File

ActnColorMaps

Description

Like XPColorMap, use StandardColorMap to apply a unique look and feel to individual action band components.

Note: To centrally apply a unique look and feel to all action band components or to change the default, use Action Manager's Style property.

See Also

TActionManager (see page 432)

TXPColorMap (see page 23)

TTwilightColorMap (see page 13)

1.1.1.1 TStandardColorMap Members

The following tables list the members exposed by TStandardColorMap.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	Add (see page 497)	This is Add, a member of class TCustomActionBarColorMap.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 498)	Forwards notification messages to all owned components.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	Remove (see page 498)	This is Remove, a member of class TCustomActionBarColorMap.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetColor (see page 6)	This is SetColor, a member of class TStandardColorMap.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetFontColor (see page 499)	This is SetFontColor, a member of class TCustomActionBarColorMap.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	UpdateActionBars (see page 499)	This is UpdateActionBars, a member of class TCustomActionBarColorMap.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.

	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 497)	Provides a custom Assign procedure for TCustomActionBarColorMap (see page 492) objects.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 496)	Creates and initializes a TCustomActionBarColorMap (see page 492) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 496)	Destroys an instance of TCustomActionBarColorMap (see page 492).
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateColors (see page 6)	Updates an action component to reflect the current color property.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignFocus (see page 501)	Changes the look and feel of your applications.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnColorChange (see page 12)	Occurs when one of the action's color properties changes.

Published Properties

	Name	Description
	BtnFrameColor (see page 7)	Changes the look and feel of your applications.
	BtnSelectedColor (see page 7)	Changes the look and feel of your applications.
	BtnSelectedFont (see page 7)	Changes the look and feel of your applications.
	Color (see page 8)	Specifies the background color for action bands.
	DisabledColor (see page 8)	Changes the look and feel of your applications.
	DisabledFontColor (see page 8)	Changes the look and feel of your applications.
	DisabledFontShadow (see page 8)	Changes the look and feel of your applications.
	FontColor (see page 9)	Changes the look and feel of your applications.
	FrameBottomRightInner (see page 9)	Changes the look and feel of your applications.
	FrameBottomRightOuter (see page 9)	Changes the look and feel of your applications.
	FrameTopLeftInner (see page 10)	Changes the look and feel of your applications.
	FrameTopLeftOuter (see page 10)	Changes the look and feel of your applications.
	HighlightColor (see page 10)	Changes the look and feel of your applications.
	HotColor (see page 10)	Changes the look and feel of your applications.
	HotFontColor (see page 11)	Changes the look and feel of your applications.
	MenuColor (see page 11)	Changes the look and feel of your applications.
	Name (see page 2805)	Specifies the name of the component as referenced in code.

	SelectedColor (see page 11)	Changes the look and feel of your applications.
	SelectedFontColor (see page 11)	Changes the look and feel of your applications.
	ShadowColor (see page 12)	Changes the look and feel of your applications.
	Tag (see page 2808)	Stores an integer value as part of a component.
	UnusedColor (see page 12)	Changes the look and feel of your applications.

1.1.1.2 TStandardColorMap Methods

The methods of the TStandardColorMap class are listed here.

Protected Methods

	Name	Description
	SetColor (see page 6)	This is SetColor, a member of class TStandardColorMap.

Public Methods

	Name	Description
	UpdateColors (see page 6)	Updates an action component to reflect the current color property.

1.1.1.2.1 TStandardColorMap.SetColor Method

Pascal

```
procedure SetColor(const Value: TColor); override;
```

C++

```
virtual __fastcall SetColor(const TColor Value);
```

Description

This is SetColor, a member of class TStandardColorMap.

1.1.1.2.2 TStandardColorMap.UpdateColors Method

Updates an action component to reflect the current color property.

Pascal

```
procedure UpdateColors; override;
```

C++

```
virtual __fastcall UpdateColors();
```

Description

UpdateColors is called automatically to update associated action components.

1.1.1.3 TStandardColorMap Properties

The properties of the TStandardColorMap class are listed here.

Published Properties

	Name	Description
	BtnFrameColor (see page 7)	Changes the look and feel of your applications.
	BtnSelectedColor (see page 7)	Changes the look and feel of your applications.
	BtnSelectedFont (see page 7)	Changes the look and feel of your applications.

	Color (see page 8)	Specifies the background color for action bands.
	DisabledColor (see page 8)	Changes the look and feel of your applications.
	DisabledFontColor (see page 8)	Changes the look and feel of your applications.
	DisabledFontShadow (see page 8)	Changes the look and feel of your applications.
	FontColor (see page 9)	Changes the look and feel of your applications.
	FrameBottomRightInner (see page 9)	Changes the look and feel of your applications.
	FrameBottomRightOuter (see page 9)	Changes the look and feel of your applications.
	FrameTopLeftInner (see page 10)	Changes the look and feel of your applications.
	FrameTopLeftOuter (see page 10)	Changes the look and feel of your applications.
	HighlightColor (see page 10)	Changes the look and feel of your applications.
	HotColor (see page 10)	Changes the look and feel of your applications.
	HotFontColor (see page 11)	Changes the look and feel of your applications.
	MenuColor (see page 11)	Changes the look and feel of your applications.
	SelectedColor (see page 11)	Changes the look and feel of your applications.
	SelectedFontColor (see page 11)	Changes the look and feel of your applications.
	ShadowColor (see page 12)	Changes the look and feel of your applications.
	UnusedColor (see page 12)	Changes the look and feel of your applications.

1.1.1.3.1 TStandardColorMap.BtnFrameColor Property

Changes the look and feel of your applications.

Pascal

```
property BtnFrameColor: TColor;
```

C++

```
__property TColor BtnFrameColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.2 TStandardColorMap.BtnSelectedColor Property

Changes the look and feel of your applications.

Pascal

```
property BtnSelectedColor: TColor;
```

C++

```
__property TColor BtnSelectedColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.3 TStandardColorMap.BtnSelectedFont Property

Changes the look and feel of your applications.

Pascal

```
property BtnSelectedFont: TColor;
```

C++

```
__property TColor BtnSelectedFont;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.4 TStandardColorMap.Color Property

Specifies the background color for action bands.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

The Color property determines the background color. You can set Color to one of the constants defined in the Graphics (see page 14387) unit (such as clBlue), or to an explicit RGB integer value.

1.1.1.3.5 TStandardColorMap.DisabledColor Property

Changes the look and feel of your applications.

Pascal

```
property DisabledColor: TColor;
```

C++

```
__property TColor DisabledColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.6 TStandardColorMap.DisabledFontColor Property

Changes the look and feel of your applications.

Pascal

```
property DisabledFontColor: TColor;
```

C++

```
__property TColor DisabledFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.7 TStandardColorMap.DisabledFontShadow Property

Changes the look and feel of your applications.

Pascal

```
property DisabledFontShadow: TColor;
```

C++

```
__property TColor DisabledFontShadow;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.8 TStandardColorMap.FontColor Property

Changes the look and feel of your applications.

Pascal

```
property FontColor: TColor;
```

C++

```
__property TColor FontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.9 TStandardColorMap.FrameBottomRightInner Property

Changes the look and feel of your applications.

Pascal

```
property FrameBottomRightInner: TColor;
```

C++

```
__property TColor FrameBottomRightInner;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.10 TStandardColorMap.FrameBottomRightOuter Property

Changes the look and feel of your applications.

Pascal

```
property FrameBottomRightOuter: TColor;
```

C++

```
__property TColor FrameBottomRightOuter;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.11 TStandardColorMap.FrameTopLeftInner Property

Changes the look and feel of your applications.

Pascal

```
property FrameTopLeftInner: TColor;
```

C++

```
__property TColor FrameTopLeftInner;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.12 TStandardColorMap.FrameTopLeftOuter Property

Changes the look and feel of your applications.

Pascal

```
property FrameTopLeftOuter: TColor;
```

C++

```
__property TColor FrameTopLeftOuter;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.13 TStandardColorMap.HighlightColor Property

Changes the look and feel of your applications.

Pascal

```
property HighlightColor: TColor;
```

C++

```
__property TColor HighlightColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.14 TStandardColorMap.HotColor Property

Changes the look and feel of your applications.

Pascal

```
property HotColor: TColor;
```

C++

```
__property TColor HotColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.15 TStandardColorMap.HotFontColor Property

Changes the look and feel of your applications.

Pascal

```
property HotFontColor: TColor;
```

C++

```
__property TColor HotFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.16 TStandardColorMap.MenuColor Property

Changes the look and feel of your applications.

Pascal

```
property MenuColor: TColor;
```

C++

```
__property TColor MenuColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.17 TStandardColorMap.SelectedColor Property

Changes the look and feel of your applications.

Pascal

```
property SelectedColor: TColor;
```

C++

```
__property TColor SelectedColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.18 TStandardColorMap.SelectedFontColor Property

Changes the look and feel of your applications.

Pascal

```
property SelectedFontColor: TColor;
```

C++

```
__property TColor SelectedFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.19 TStandardColorMap.ShadowColor Property

Changes the look and feel of your applications.

Pascal

```
property ShadowColor: TColor;
```

C++

```
__property TColor ShadowColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.3.20 TStandardColorMap.UnusedColor Property

Changes the look and feel of your applications.

Pascal

```
property UnusedColor: TColor;
```

C++

```
__property TColor UnusedColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.1.4 TStandardColorMap Events

The events of the TStandardColorMap class are listed here.

Published Events

	Name	Description
	OnColorChange (see page 12)	Occurs when one of the action's color properties changes.

1.1.1.4.1 TStandardColorMap.OnColorChange Event

Occurs when one of the action's color properties changes.

Pascal

```
property OnColorChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnColorChange;
```

Description

Applications can't use the protected OnChange event. It is used internally to manage the relationship between the properties of the action and the corresponding properties of the action's clients.

Component writers can use OnChange in descendant objects to respond when the action's properties change.

1.1.2 TTwilightColorMap Class

TTwilightColorMap defines the default look and feel of individual action band components.

Class Hierarchy

Pascal

```
TTwilightColorMap = class(TCustomActionBarColorMap);
```

C++

```
class TTwilightColorMap : public TCustomActionBarColorMap;
```

File

ActnColorMaps

Description

Like XPColorMap, use TwilightColorMap to apply a unique look and feel to individual action band components.

Note: To centrally apply a unique look and feel to all action band components or to change the default, use Action Manager's Style property.

See Also

TActionManager (see page 432)

TXPColorMap (see page 23)

TStandardColorMap (see page 2)

1.1.2.1 TTwilightColorMap Members

The following tables list the members exposed by TTwilightColorMap.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	Add (see page 497)	This is Add, a member of class TCustomActionBarColorMap.

	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 498)	Forwards notification messages to all owned components.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	Remove (see page 498)	This is Remove, a member of class TCustomActionBarColorMap.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetColor (see page 499)	This is SetColor, a member of class TCustomActionBarColorMap.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFontColor (see page 499)	This is SetFontColor, a member of class TCustomActionBarColorMap.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	UpdateActionBars (see page 499)	This is UpdateActionBars, a member of class TCustomActionBarColorMap.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 497)	Provides a custom Assign procedure for TCustomActionBarColorMap (see page 492) objects.
	Assign (see page 2930)	Copies the contents of another, similar object.

	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 496)	Creates and initializes a TCustomActionBarColorMap (see page 492) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 496)	Destroys an instance of TCustomActionBarColorMap (see page 492).
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateColors (see page 17)	Updates an action component to reflect the current color property.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignFocus (see page 501)	Changes the look and feel of your applications.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnColorChange (see page 23)	Occurs when one of the action's color properties changes.

Published Properties

	Name	Description
	BtnFrameColor (see page 17)	Changes the look and feel of your applications.
	BtnSelectedColor (see page 18)	Changes the look and feel of your applications.
	BtnSelectedFont (see page 18)	Changes the look and feel of your applications.
	Color (see page 18)	Specifies the background color for action bands.
	DisabledColor (see page 19)	Changes the look and feel of your applications.
	DisabledFontColor (see page 19)	Changes the look and feel of your applications.
	DisabledFontShadow (see page 19)	Changes the look and feel of your applications.
	FontColor (see page 19)	Changes the look and feel of your applications.
	FrameBottomRightInner (see page 20)	Changes the look and feel of your applications.
	FrameBottomRightOuter (see page 20)	Changes the look and feel of your applications.
	FrameTopLeftInner (see page 20)	Changes the look and feel of your applications.
	FrameTopLeftOuter (see page 20)	Changes the look and feel of your applications.
	HighlightColor (see page 21)	Changes the look and feel of your applications.
	HotColor (see page 21)	Changes the look and feel of your applications.
	HotFontColor (see page 21)	Changes the look and feel of your applications.
	MenuColor (see page 21)	Changes the look and feel of your applications.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SelectedColor (see page 22)	Changes the look and feel of your applications.
	SelectedFontColor (see page 22)	Changes the look and feel of your applications.
	ShadowColor (see page 22)	Changes the look and feel of your applications.
	Tag (see page 2808)	Stores an integer value as part of a component.
	UnusedColor (see page 23)	Changes the look and feel of your applications.

1.1.2.2 TTwilightColorMap Methods

The methods of the TTwilightColorMap class are listed here.

Public Methods

	Name	Description
	UpdateColors (see page 17)	Updates an action component to reflect the current color property.

1.1.2.2.1 TTwilightColorMap.UpdateColors Method

Updates an action component to reflect the current color property.

Pascal

```
procedure UpdateColors; override;
```

C++

```
virtual __fastcall UpdateColors();
```

Description

UpdateColors is called automatically to update associated action components.

1.1.2.3 TTwilightColorMap Properties

The properties of the TTwilightColorMap class are listed here.

Published Properties

	Name	Description
	BtnFrameColor (see page 17)	Changes the look and feel of your applications.
	BtnSelectedColor (see page 18)	Changes the look and feel of your applications.
	BtnSelectedFont (see page 18)	Changes the look and feel of your applications.
	Color (see page 18)	Specifies the background color for action bands.
	DisabledColor (see page 19)	Changes the look and feel of your applications.
	DisabledFontColor (see page 19)	Changes the look and feel of your applications.
	DisabledFontShadow (see page 19)	Changes the look and feel of your applications.
	FontColor (see page 19)	Changes the look and feel of your applications.
	FrameBottomRightInner (see page 20)	Changes the look and feel of your applications.
	FrameBottomRightOuter (see page 20)	Changes the look and feel of your applications.
	FrameTopLeftInner (see page 20)	Changes the look and feel of your applications.
	FrameTopLeftOuter (see page 20)	Changes the look and feel of your applications.
	HighlightColor (see page 21)	Changes the look and feel of your applications.
	HotColor (see page 21)	Changes the look and feel of your applications.
	HotFontColor (see page 21)	Changes the look and feel of your applications.
	MenuColor (see page 21)	Changes the look and feel of your applications.
	SelectedColor (see page 22)	Changes the look and feel of your applications.
	SelectedFontColor (see page 22)	Changes the look and feel of your applications.
	ShadowColor (see page 22)	Changes the look and feel of your applications.
	UnusedColor (see page 23)	Changes the look and feel of your applications.

1.1.2.3.1 TTwilightColorMap.BtnFrameColor Property

Changes the look and feel of your applications.

Pascal

```
property BtnFrameColor: TColor;
```

C++

```
__property TColor BtnFrameColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.2 TTwilightColorMap.BtnSelectedColor Property

Changes the look and feel of your applications.

Pascal

```
property BtnSelectedColor: TColor;
```

C++

```
__property TColor BtnSelectedColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.3 TTwilightColorMap.BtnSelectedFont Property

Changes the look and feel of your applications.

Pascal

```
property BtnSelectedFont: TColor;
```

C++

```
__property TColor BtnSelectedFont;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.4 TTwilightColorMap.Color Property

Specifies the background color for action bands.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

The Color property determines the background color. You can set Color to one of the constants defined in the Graphics unit (such as clBlue), or to an explicit RGB integer value.

1.1.2.3.5 TTwilightColorMap.DisabledColor Property

Changes the look and feel of your applications.

Pascal

```
property DisabledColor: TColor;
```

C++

```
__property TColor DisabledColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.6 TTwilightColorMap.DisabledFontColor Property

Changes the look and feel of your applications.

Pascal

```
property DisabledFontColor: TColor;
```

C++

```
__property TColor DisabledFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.7 TTwilightColorMap.DisabledFontShadow Property

Changes the look and feel of your applications.

Pascal

```
property DisabledFontShadow: TColor;
```

C++

```
__property TColor DisabledFontShadow;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.8 TTwilightColorMap.FontColor Property

Changes the look and feel of your applications.

Pascal

```
property FontColor: TColor;
```

C++

```
__property TColor FontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.9 TTwilightColorMap.FrameBottomRightInner Property

Changes the look and feel of your applications.

Pascal

```
property FrameBottomRightInner: TColor;
```

C++

```
__property TColor FrameBottomRightInner;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.10 TTwilightColorMap.FrameBottomRightOuter Property

Changes the look and feel of your applications.

Pascal

```
property FrameBottomRightOuter: TColor;
```

C++

```
__property TColor FrameBottomRightOuter;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.11 TTwilightColorMap.FrameTopLeftInner Property

Changes the look and feel of your applications.

Pascal

```
property FrameTopLeftInner: TColor;
```

C++

```
__property TColor FrameTopLeftInner;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.12 TTwilightColorMap.FrameTopLeftOuter Property

Changes the look and feel of your applications.

Pascal

```
property FrameTopLeftOuter: TColor;
```

C++

```
__property TColor FrameTopLeftOuter;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.13 TTwilightColorMap.HighlightColor Property

Changes the look and feel of your applications.

Pascal

```
property HighlightColor: TColor;
```

C++

```
__property TColor HighlightColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.14 TTwilightColorMap.HotColor Property

Changes the look and feel of your applications.

Pascal

```
property HotColor: TColor;
```

C++

```
__property TColor HotColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.15 TTwilightColorMap.HotFontColor Property

Changes the look and feel of your applications.

Pascal

```
property HotFontColor: TColor;
```

C++

```
__property TColor HotFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.16 TTwilightColorMap.MenuColor Property

Changes the look and feel of your applications.

Pascal

```
property MenuColor: TColor;
```

C++

```
__property TColor MenuColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.17 TTwilightColorMap.SelectedColor Property

Changes the look and feel of your applications.

Pascal

```
property SelectedColor: TColor;
```

C++

```
__property TColor SelectedColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.18 TTwilightColorMap.SelectedFontColor Property

Changes the look and feel of your applications.

Pascal

```
property SelectedFontColor: TColor;
```

C++

```
__property TColor SelectedFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.19 TTwilightColorMap.ShadowColor Property

Changes the look and feel of your applications.

Pascal

```
property ShadowColor: TColor;
```

C++

```
__property TColor ShadowColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.3.20 TTwilightColorMap.UnusedColor Property

Changes the look and feel of your applications.

Pascal

```
property UnusedColor: TColor;
```

C++

```
__property TColor UnusedColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.2.4 TTwilightColorMap Events

The events of the TTwilightColorMap class are listed here.

Published Events

	Name	Description
	OnColorChange (see page 23)	Occurs when one of the action's color properties changes.

1.1.2.4.1 TTwilightColorMap.OnColorChange Event

Occurs when one of the action's color properties changes.

Pascal

```
property OnColorChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnColorChange;
```

Description

Applications can't use the protected OnChange event. It is used internally to manage the relationship between the properties of the action and the corresponding properties of the action's clients.

Component writers can use OnChange in descendant objects to respond when the action's properties change.

1.1.3 TXPColorMap Class

TXPColorMap defines the default look and feel of individual action band components.

Class Hierarchy

Pascal

```
TXPColorMap = class(TCustomActionBarColorMap);
```

C++

```
class TXPColorMap : public TCustomActionBarColorMap;
```

File

ActnColorMaps

Description

Like StandardColorMap, use XPColorMap to apply a unique look and feel to individual action band components.

Note: To centrally apply a unique look and feel to all action band components or to change the default, use Action Manager's Style property.

See Also

TActionManager (see page 432)

TStandardColorMap (see page 2)

TTwilightColorMap (see page 13)

1.1.3.1 TXPColorMap Members

The following tables list the members exposed by TXPColorMap.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	Add (see page 497)	This is Add, a member of class TCustomActionBarColorMap.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 498)	Forwards notification messages to all owned components.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.

	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	Remove (see page 498)	This is Remove, a member of class TCustomActionBarColorMap.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetColor (see page 499)	This is SetColor, a member of class TCustomActionBarColorMap.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFontColor (see page 499)	This is SetFontColor, a member of class TCustomActionBarColorMap.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	UpdateActionBars (see page 499)	This is UpdateActionBars, a member of class TCustomActionBarColorMap.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 497)	Provides a custom Assign procedure for TCustomActionBarColorMap (see page 492) objects.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 496)	Creates and initializes a TCustomActionBarColorMap (see page 492) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 496)	Destroys an instance of TCustomActionBarColorMap (see page 492).
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.

	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateColors (see page 27)	Updates an action component to reflect the current color property.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignFocus (see page 501)	Changes the look and feel of your applications.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnColorChange (see page 34)	Occurs when one of the action's color properties changes.

Published Properties

	Name	Description
	BtnFrameColor (see page 28)	Changes the look and feel of your applications.
	BtnSelectedColor (see page 28)	Changes the look and feel of your applications.
	BtnSelectedFont (see page 29)	Changes the look and feel of your applications.
	Color (see page 29)	Specifies the background color for action bands.
	DisabledColor (see page 29)	Changes the look and feel of your applications.
	DisabledFontColor (see page 29)	Changes the look and feel of your applications.
	DisabledFontShadow (see page 30)	Changes the look and feel of your applications.
	FontColor (see page 30)	Changes the look and feel of your applications.
	FrameBottomRightInner (see page 30)	Changes the look and feel of your applications.
	FrameBottomRightOuter (see page 30)	Changes the look and feel of your applications.
	FrameTopLeftInner (see page 31)	Changes the look and feel of your applications.
	FrameTopLeftOuter (see page 31)	Changes the look and feel of your applications.
	HighlightColor (see page 31)	Changes the look and feel of your applications.
	HotColor (see page 31)	Changes the look and feel of your applications.
	HotFontColor (see page 32)	Changes the look and feel of your applications.
	MenuColor (see page 32)	Changes the look and feel of your applications.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SelectedColor (see page 32)	Changes the look and feel of your applications.
	SelectedFontColor (see page 33)	Changes the look and feel of your applications.
	ShadowColor (see page 33)	Changes the look and feel of your applications.
	Tag (see page 2808)	Stores an integer value as part of a component.
	UnusedColor (see page 33)	Changes the look and feel of your applications.

1.1.3.2 TXPColorMap Methods

The methods of the TXPColorMap class are listed here.

Public Methods

	Name	Description
	UpdateColors (see page 27)	Updates an action component to reflect the current color property.

1.1.3.2.1 TXPColorMap.UpdateColors Method

Updates an action component to reflect the current color property.

Pascal

```
procedure UpdateColors; override;
```

C++

```
virtual __fastcall UpdateColors();
```

Description

UpdateColors is called automatically to update associated action components.

1.1.3.3 TXPColorMap Properties

The properties of the TXPColorMap class are listed here.

Published Properties

	Name	Description
	BtnFrameColor (see page 28)	Changes the look and feel of your applications.
	BtnSelectedColor (see page 28)	Changes the look and feel of your applications.
	BtnSelectedFont (see page 29)	Changes the look and feel of your applications.
	Color (see page 29)	Specifies the background color for action bands.
	DisabledColor (see page 29)	Changes the look and feel of your applications.
	DisabledFontColor (see page 29)	Changes the look and feel of your applications.
	DisabledFontShadow (see page 30)	Changes the look and feel of your applications.
	FontColor (see page 30)	Changes the look and feel of your applications.
	FrameBottomRightInner (see page 30)	Changes the look and feel of your applications.
	FrameBottomRightOuter (see page 30)	Changes the look and feel of your applications.
	FrameTopLeftInner (see page 31)	Changes the look and feel of your applications.
	FrameTopLeftOuter (see page 31)	Changes the look and feel of your applications.
	HighlightColor (see page 31)	Changes the look and feel of your applications.
	HotColor (see page 31)	Changes the look and feel of your applications.
	HotFontColor (see page 32)	Changes the look and feel of your applications.
	MenuColor (see page 32)	Changes the look and feel of your applications.
	SelectedColor (see page 32)	Changes the look and feel of your applications.
	SelectedFontColor (see page 33)	Changes the look and feel of your applications.
	ShadowColor (see page 33)	Changes the look and feel of your applications.
	UnusedColor (see page 33)	Changes the look and feel of your applications.

1.1.3.3.1 TXPColorMap.BtnFrameColor Property

Changes the look and feel of your applications.

Pascal

```
property BtnFrameColor: TColor;
```

C++

```
__property TColor BtnFrameColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.2 TXPColorMap.BtnSelectedColor Property

Changes the look and feel of your applications.

Pascal

```
property BtnSelectedColor: TColor;
```

C++

```
__property TColor BtnSelectedColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your

applications.

1.1.3.3.3 TXPColorMap.BtnSelectedFont Property

Changes the look and feel of your applications.

Pascal

```
property BtnSelectedFont: TColor;
```

C++

```
__property TColor BtnSelectedFont;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.4 TXPColorMap.Color Property

Specifies the background color for action bands.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

The Color property determines the background color. You can set Color to one of the constants defined in the Graphics unit (such as clBlue), or to an explicit RGB integer value.

1.1.3.3.5 TXPColorMap.DisabledColor Property

Changes the look and feel of your applications.

Pascal

```
property DisabledColor: TColor;
```

C++

```
__property TColor DisabledColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.6 TXPColorMap.DisabledFontColor Property

Changes the look and feel of your applications.

Pascal

```
property DisabledFontColor: TColor;
```

C++

```
__property TColor DisabledFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.7 TXPColorMap.DisabledFontShadow Property

Changes the look and feel of your applications.

Pascal

```
property DisabledFontShadow: TColor;
```

C++

```
__property TColor DisabledFontShadow;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.8 TXPColorMap.FontColor Property

Changes the look and feel of your applications.

Pascal

```
property FontColor: TColor;
```

C++

```
__property TColor FontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.9 TXPColorMap.FrameBottomRightInner Property

Changes the look and feel of your applications.

Pascal

```
property FrameBottomRightInner: TColor;
```

C++

```
__property TColor FrameBottomRightInner;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.10 TXPColorMap.FrameBottomRightOuter Property

Changes the look and feel of your applications.

Pascal

```
property FrameBottomRightOuter: TColor;
```

C++

```
__property TColor FrameBottomRightOuter;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.11 TXPColorMap.FrameTopLeftInner Property

Changes the look and feel of your applications.

Pascal

```
property FrameTopLeftInner: TColor;
```

C++

```
__property TColor FrameTopLeftInner;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.12 TXPColorMap.FrameTopLeftOuter Property

Changes the look and feel of your applications.

Pascal

```
property FrameTopLeftOuter: TColor;
```

C++

```
__property TColor FrameTopLeftOuter;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.13 TXPColorMap.HighlightColor Property

Changes the look and feel of your applications.

Pascal

```
property HighlightColor: TColor;
```

C++

```
__property TColor HighlightColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.14 TXPColorMap.HotColor Property

Changes the look and feel of your applications.

Pascal

```
property HotColor: TColor;
```

C++

```
__property TColor HotColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.15 TXPColorMap.HotFontColor Property

Changes the look and feel of your applications.

Pascal

```
property HotFontColor: TColor;
```

C++

```
__property TColor HotFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.16 TXPColorMap.MenuColor Property

Changes the look and feel of your applications.

Pascal

```
property MenuColor: TColor;
```

C++

```
__property TColor MenuColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.17 TXPColorMap.SelectedColor Property

Changes the look and feel of your applications.

Pascal

```
property SelectedColor: TColor;
```

C++

```
__property TColor SelectedColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.18 TXPColorMap.SelectedFontColor Property

Changes the look and feel of your applications.

Pascal

```
property SelectedFontColor: TColor;
```

C++

```
__property TColor SelectedFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.19 TXPColorMap.ShadowColor Property

Changes the look and feel of your applications.

Pascal

```
property ShadowColor: TColor;
```

C++

```
__property TColor ShadowColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.3.20 TXPColorMap.UnusedColor Property

Changes the look and feel of your applications.

Pascal

```
property UnusedColor: TColor;
```

C++

```
__property TColor UnusedColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

1.1.3.4 TXPColorMap Events

The events of the TXPColorMap class are listed here.

Published Events

	Name	Description
	OnColorChange (see page 34)	Occurs when one of the action's color properties changes.

1.1.3.4.1 TXPColorMap.OnColorChange Event

Occurs when one of the action's color properties changes.

Pascal

```
property OnColorChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnColorChange;
```

Description

Applications can't use the protected OnChange event. It is used internally to manage the relationship between the properties of the action and the corresponding properties of the action's clients.

Component writers can use OnChange in descendant objects to respond when the action's properties change.

1.2 Constants

The following table lists constants in this documentation.

Constants

Name	Description
cXPBtnFrameColor (see page 35)	This is constant ActnColorMaps.cXPBtnFrameColor.
cXPFrameOuter (see page 35)	This is constant ActnColorMaps.cXPFrameOuter.
cXPSelectedColor (see page 35)	This is constant ActnColorMaps.cXPSelectedColor.

1.2.1 ActnColorMaps.cXPBtnFrameColor Constant

Pascal

```
cXPBtnFrameColor = $00C66931;
```

C++

```
cXPBtnFrameColor = 0x00C66931;
```

File

ActnColorMaps

Description

This is constant ActnColorMaps.cXPBtnFrameColor.

1.2.2 ActnColorMaps.cXPFrameOuter Constant

Pascal

```
cXPFrameOuter = $007A868A;
```

C++

```
cXPFrameOuter = 0x007A868A;
```

File

ActnColorMaps

Description

This is constant ActnColorMaps.cXPFrameOuter.

1.2.3 ActnColorMaps.cXPSelectedColor Constant

Pascal

```
cXPSelectedColor = $00EFD3C6;
```

C++

```
cXPSelectedColor = 0x00EFD3C6;
```

File

ActnColorMaps

Description

This is constant ActnColorMaps.cXPSelectedColor.

2 ActnCtrls Namespace

This is namespace ActnCtrls.

Topics

Name	Description
Classes (see page 38)	The following table lists classes in this documentation.
Types (see page 245)	The following table lists types in this documentation.

Classes

	Name	Description
	TActionToolBar (see page 38)	TActionToolBar is a rendering engine that renders action client items as tool buttons.
	TCustomActionCombo (see page 118)	This is class ActnCtrls.TCustomActionCombo.
	TCustomActionDockBar (see page 133)	TCustomActionDockBar is the ancestor for action bands that require the ability to dock.
	TCustomActionToolBar (see page 148)	TCustomActionToolBar is the base class for the TActionToolBar (see page 38) component.
	TCustomButtonControl (see page 168)	TCustomButtonControl is the base class for ActionBand button controls.
	TCustomComboControl (see page 191)	This is class ActnCtrls.TCustomComboControl.
	TCustomDropDownButton (see page 205)	This is class ActnCtrls.TCustomDropDownButton.
	TCustomToolScrollBtn (see page 217)	This is class ActnCtrls.TCustomToolScrollBtn.
	TCustomUtilityButton (see page 228)	This is class ActnCtrls.TCustomUtilityButton.

Types

Name	Description
TCustomToolScrollBtnClass (see page 245)	This is type ActnCtrls.TCustomToolScrollBtnClass.

2.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TActionToolBar (see page 38)	TActionToolBar is a rendering engine that renders action client items as tool buttons.
	TCustomActionCombo (see page 118)	This is class ActnCtrls.TCustomActionCombo.
	TCustomActionDockBar (see page 133)	TCustomActionDockBar is the ancestor for action bands that require the ability to dock.
	TCustomActionToolBar (see page 148)	TCustomActionToolBar is the base class for the TActionToolBar (see page 38) component.
	TCustomButtonControl (see page 168)	TCustomButtonControl is the base class for ActionBand button controls.
	TCustomComboControl (see page 191)	This is class ActnCtrls.TCustomComboControl.
	TCustomDropDownButton (see page 205)	This is class ActnCtrls.TCustomDropDownButton.
	TCustomToolScrollBtn (see page 217)	This is class ActnCtrls.TCustomToolScrollBtn.
	TCustomUtilityButton (see page 228)	This is class ActnCtrls.TCustomUtilityButton.

2.1.1 TActionToolBar Class

TActionToolBar is a rendering engine that renders action client items as tool buttons.

Class Hierarchy

Pascal

```
TActionToolBar = class(TCustomActionToolBar);
```

C++

```
class TActionToolBar : public TCustomActionToolBar;
```

File

ActnCtrls

Description

TActionToolBar is a specialized container (like TPanel) that renders a group of items on screen in the order specified in the Action Manager. All of the items are created dynamically when the TActionToolBar component is connected to an item from the Action Manager.

The items themselves are internal components (similar to TSpeedButton) created by the TActionToolBar and appear consistent with the look and function of a tool bar. The layout of the items on the TActionToolBar is managed automatically and specified by the Action Manager.

Note: If you want to use TActionToolBar on a TControlBar component, you should set the AutoSize property to **False**. When the AutoSize property is set to True (default), the TActionToolBar control wraps its controls and expands itself in size, accordingly. This does not allow the TActionToolBar component to display properly on a TControlBar component. When TActionToolBar is

set to **False**, the TActionToolBar hides items on the end of the bar and displays a dropdown button that provides access to those items. The control displays in the proper size.

2.1.1.1 TActionToolBar Members

The following tables list the members exposed by TActionToolBar.

Protected Events

	Name	Description
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefaultColorMap (see page 460)	This is FDefaultColorMap, a member of class TCustomActionBar.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FSavedWrapState (see page 460)	This is FSavedWrapState, a member of class TCustomActionBar.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.

	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 462)	Aligns any controls for which the control is the parent within a specified area of the control.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	AutoSizingChanged (see page 163)	This is AutoSizingChanged, a member of class TCustomActionToolBar.
	AutoSizingChanged (see page 462)	This is AutoSizingChanged, a member of class TCustomActionBar.
	BackgroundSize (see page 462)	This is BackgroundSize, a member of class TCustomActionBar.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcButtonWidth (see page 163)	This is CalcButtonWidth, a member of class TCustomActionToolBar.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CalcInsertPosition (see page 462)	This is CalcInsertPosition, a member of class TCustomActionBar.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Clear (see page 463)	This is Clear, a member of class TCustomActionBar.
	Click (see page 5743)	Respond to user click.
	CMBorderChanged (see page 23285)	This is CMBorderChanged, a member of class TToolWindow.
	CMColorchanged (see page 163)	This is CMColorchanged, a member of class TCustomActionToolBar.
	CMCtl3DChanged (see page 23286)	This is CMCtl3DChanged, a member of class TToolWindow.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateControl (see page 163)	This is CreateControl, a member of class TCustomActionToolBar.
	CreateControl (see page 463)	This is CreateControl, a member of class TCustomActionBar.
	CreateControls (see page 164)	This is CreateControls, a member of class TCustomActionToolBar.
	CreateControls (see page 463)	This is CreateControls, a member of class TCustomActionBar.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 463)	Returns placement order of custom-aligned child control.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 464)	Returns aligned position of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.

	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
V	DesignWndProc (see page 465)	This is DesignWndProc, a member of class TCustomActionBar.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DisableHiding (see page 164)	This is DisableHiding, a member of class TCustomActionToolBar.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
V	DoControlCreated (see page 465)	This is DoControlCreated, a member of class TCustomActionBar.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
V	DoDropActions (see page 465)	This is DoDropActions, a member of class TCustomActionBar.
V	DoDropCategory (see page 164)	This is DoDropCategory, a member of class TCustomActionToolBar.
V	DoDropCategory (see page 465)	This is DoDropCategory, a member of class TCustomActionBar.
V	DoDropItem (see page 466)	This is DoDropItem, a member of class TCustomActionBar.
V	DoEndDock (see page 146)	OnEndDock event dispatcher.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoGetControlClass (see page 466)	This is DoGetControlClass, a member of class TCustomActionBar.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
V	DoStartDock (see page 147)	OnStartDock event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 466)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
V	DrawBackground (see page 165)	This is DrawBackground, a member of class TCustomActionToolBar.
V	DrawBackground (see page 467)	This is DrawBackground, a member of class TCustomActionBar.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
V	DrawSeparator (see page 165)	This is DrawSeparator, a member of class TCustomActionToolBar.

	EnableHiding (see page 165)	This is EnableHiding, a member of class TCustomActionToolBar.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindAccelItem (see page 467)	This is FindAccelItem, a member of class TCustomActionBar.
	FindItemAt (see page 468)	This is FindItemAt, a member of class TCustomActionBar.
	FindItemCaption (see page 468)	This is FindItemCaption, a member of class TCustomActionBar.
	FindLast (see page 468)	This is FindLast, a member of class TCustomActionBar.
	FindLeastUsedItem (see page 469)	This is FindLeastUsedItem, a member of class TCustomActionBar.
	FindNearestControl (see page 469)	This is FindNearestControl, a member of class TCustomActionBar.
	FindNext (see page 470)	This is FindNext, a member of class TCustomActionBar.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FindNextVisibleItem (see page 470)	This is FindNextVisibleItem, a member of class TCustomActionBar.
	FindPrevious (see page 470)	This is FindPrevious, a member of class TCustomActionBar.
	FindPreviousVisibleItem (see page 470)	This is FindPreviousVisibleItem, a member of class TCustomActionBar.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionControl (see page 471)	This is GetActionControl, a member of class TCustomActionBar.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetBannerWidth (see page 471)	This is GetBannerWidth, a member of class TCustomActionBar.
	GetBarHeight (see page 471)	This is GetBarHeight, a member of class TCustomActionBar.
	GetBarWidth (see page 471)	This is GetBarWidth, a member of class TCustomActionBar.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlClass (see page 165)	This is GetControlClass, a member of class TCustomActionToolBar.
	GetControlClass (see page 471)	This is GetControlClass, a member of class TCustomActionBar.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDefaultColorMapClass (see page 472)	This is GetDefaultColorMapClass, a member of class TCustomActionBar.
	GetDesignMode (see page 472)	This is GetDesignMode, a member of class TCustomActionBar.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 147)	Returns the class used for the control when it is floating.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupClass (see page 166)	This is GetPopupClass, a member of class TCustomActionToolBar.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetPopupMenuClass (see page 472)	This is GetPopupMenuClass, a member of class TCustomActionBar.
	GetScrollBtnClass (see page 166)	This is GetScrollBtnClass, a member of class TCustomActionToolBar.
	GetSiteInfo (see page 147)	Generates an OnGetSiteInfo event

	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasItems (see page 472)	This is HasItems, a member of class TCustomActionBar.
	HideUnusedItems (see page 166)	This is HideUnusedItems, a member of class TCustomActionToolBar.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
V	ItemCount (see page 473)	This is ItemCount, a member of class TCustomActionBar.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 148)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 473)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	NCPaint (see page 473)	This is NCPaint, a member of class TCustomActionBar.
V	NCPaint (see page 23286)	This is NCPaint, a member of class TToolWindow.
V	Notification (see page 473)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 474)	This is Paint, a member of class TCustomActionBar.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 474)	Renders the image of a windowed control.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
V	Reset (see page 166)	This is Reset, a member of class TCustomActionToolBar.

	Reset (see page 475)	This is Reset, a member of class TCustomActionBar.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	ScrollBtnClick (see page 166)	This is ScrollBtnClick, a member of class TCustomActionToolBar.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 475)	This is SetActionClient, a member of class TCustomActionBar.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetAutoSizing (see page 475)	This is SetAutoSizing, a member of class TCustomActionBar.
	SetBiDiMode (see page 475)	Sets the control's bi-directional mode.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetColorMap (see page 476)	This is SetColorMap, a member of class TCustomActionBar.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignMode (see page 476)	This is SetDesignMode, a member of class TCustomActionBar.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetOrientation (see page 167)	This is SetOrientation, a member of class TCustomActionToolBar.
	SetOrientation (see page 477)	This is SetOrientation, a member of class TCustomActionBar.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetPersistentHotKeys (see page 477)	This is SetPersistentHotKeys, a member of class TCustomActionBar.
	SetSpacing (see page 477)	This is SetSpacing, a member of class TCustomActionBar.
	SetupDefaultColorMap (see page 477)	This is SetupDefaultColorMap, a member of class TCustomActionBar.
	SetupDropDownBtn (see page 167)	This is SetupDropDownBtn, a member of class TCustomActionToolBar.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.

V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	VisibleChanging (see page 478)	Provides the interface for a method that responds to changes in the control's visibility.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMNCCalcSize (see page 23286)	This is WMNCCalcSize, a member of class TToolWindow.
	WMNCPaint (see page 23286)	This is WMNCPaint, a member of class TToolWindow.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
R	HRowCount (see page 488)	Indicates the number of columns of items that the action band displays.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Items (see page 488)	Lists the action clients that correspond to the child controls of this action band.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
R	VRowCount (see page 490)	Indicates the number of rows of items that the action band displays.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
R	Widest (see page 491)	This is Widest, a member of class TCustomActionBar.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CalcDockedWidth (see page 146)	This is CalcDockedWidth, a member of class TCustomActionDockBar.
	CalcDockedWidth (see page 163)	This is CalcDockedWidth, a member of class TCustomActionToolBar.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 145)	Creates and initializes a TCustomActionDockBar (see page 133) instance.
	Create (see page 161)	Creates and initializes a TCustomActionToolBar (see page 148) instance.
	Create (see page 459)	Creates and initializes a TCustomActionBar (see page 447) instance.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 5731)	Creates an instance of TControl (see page 5724).
	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 23285)	Creates and initializes a TToolWindow (see page 23274) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 162)	Destroys an instance of TCustomActionToolBar (see page 148).
	Destroy (see page 459)	Destroys an instance of TCustomActionBar (see page 447).
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 146)	Used internally to dock the action band.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 164)	Generates an OnDragDrop event.
	DragDrop (see page 466)	Generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindFirst (see page 467)	Finds the first TActionClientItem (see page 374) in the Items (see page 488) list.
	FindFirstVisibleItem (see page 468)	Finds the first visible TActionClientItem (see page 374) in the Items (see page 488) list.
	FindLastVisibleItem (see page 469)	Finds the last visibleTActionClientItem in the Items (see page 488) list.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
V	RecreateControls (see page 475)	Destroys and recreates all of the action band's action client controls.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 167)	Sets the Left, Top, Width, and Height properties in a single operation.
V	SetBounds (see page 476)	Sets the bounds based on whether the popup is expanded or not
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Style (see page 477)	Identifies the style object that gives the application its default look and feel.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.

	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	ActionClient (see page 479)	Specifies the action client associated with this action band.
R	ActionControls (see page 479)	Lists the controls on the action band.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	AutoSizing (see page 480)	Specifies whether the action band adjusts its size automatically to fit around its child controls.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	Canvas (see page 58)	Represents the drawing surface of the action band.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	ContextBar (see page 485)	Indicates whether items shown in this action band represent the items in a popup menu.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Designable (see page 485)	Specifies whether the action band can be customized (used internally by the IDE).
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignMode (see page 486)	Specifies whether the action band is being customized or being used in the IDE.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
R	HiddenCount (see page 168)	Indicates the number of hidden items on the tool action band.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.

	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	VertSeparator (see page 490)	Indicates whether a vertical separator bar should appear between item lines.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 83)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 84)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 84)	Occurs when an attempt is made to resize the control.
	OnClick (see page 85)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 87)	Adjust resize constraints.
	OnContextPopup (see page 87)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnControlCreated (see page 88)	Occurs when a control is created on the action band.
	OnDblClick (see page 88)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 89)	Occurs when another control is docked to the control.
	OnDockOver (see page 91)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 93)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 95)	Occurs when the user drags an object over a control.
	OnEndDock (see page 97)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 98)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 99)	Occurs when a control receives the input focus.
	OnExit (see page 101)	Occurs when the input focus shifts away from one control to another.
	OnGetControlClass (see page 103)	Occurs when an item is to be placed on the action band.
	OnGetSiteInfo (see page 103)	Returns the control's docking information.
	OnMouseActivate (see page 105)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 106)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 109)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 111)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 113)	Occurs when the action band is painted.
	OnResize (see page 113)	Occurs immediately after the control is resized.
	OnStartDock (see page 114)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 115)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 115)	Occurs when the application tries to undock a control that is docked to the windowed control.

Published Properties

	Name	Description
	ActionManager (see page 52)	Specifies the action manager component that is associated with the action band.
	Align (see page 53)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	AllowHiding (see page 56)	Determines whether the action band can be hidden.
	Anchors (see page 57)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 57)	Specifies the bi-directional mode for the control.
	Caption (see page 58)	Specifies a text string that identifies the control to the user.
	Color (see page 61)	Specifies the background color of the control.
	ColorMap (see page 61)	Indicates the colormap for individual action band components.
	Constraints (see page 62)	Specifies the size constraints for the control.
	Cursor (see page 63)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 65)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 66)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 66)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EdgeBorders (see page 68)	Determines which sides of the control have visible borders.
	EdgeInner (see page 68)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 68)	Determines the border style for the control's outer edge.
	Enabled (see page 69)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 69)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	HorzMargin (see page 70)	Specifies the width of the horizontal margins in pixels.
	HorzSeparator (see page 71)	Indicates whether a horizontal separator bar appears between item lines.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Orientation (see page 71)	Specifies how the action band lays out its child items.
	ParentBackground (see page 71)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 72)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 72)	Determines where a control looks for its color information.
	ParentFont (see page 73)	Determines where a control looks for its font information.
	ParentShowHint (see page 73)	Determines where a control looks to find out if its Help Hint should be shown.
	PersistentHotKeys (see page 74)	Specifies whether keyboard accelerator shortcuts are always displayed.
	PopupMenu (see page 74)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 79)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Spacing (see page 80)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	VertMargin (see page 81)	Specifies the width of the vertical margins in pixels.
	Visible (see page 81)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

2.1.1.2 TActionToolBar Properties

The properties of the TActionToolBar class are listed here.

Public Properties

	Name	Description
	Canvas (see page 58)	Represents the drawing surface of the action band.

Published Properties

	Name	Description
	ActionManager (see page 52)	Specifies the action manager component that is associated with the action band.
	Align (see page 53)	Determines how the control aligns within its container (parent control).
	AllowHiding (see page 56)	Determines whether the action band can be hidden.
	Anchors (see page 57)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 57)	Specifies the bi-directional mode for the control.
	Caption (see page 58)	Specifies a text string that identifies the control to the user.
	Color (see page 61)	Specifies the background color of the control.
	ColorMap (see page 61)	Indicates the colormap for individual action band components.
	Constraints (see page 62)	Specifies the size constraints for the control.
	Cursor (see page 63)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 65)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 66)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 66)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EdgeBorders (see page 68)	Determines which sides of the control have visible borders.
	EdgeInner (see page 68)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 68)	Determines the border style for the control's outer edge.
	Enabled (see page 69)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 69)	Controls the attributes of text written on or in the control.
	HorzMargin (see page 70)	Specifies the width of the horizontal margins in pixels.
	HorzSeparator (see page 71)	Indicates whether a horizontal separator bar appears between item lines.
	Orientation (see page 71)	Specifies how the action band lays out its child items.
	ParentBackground (see page 71)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 72)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 72)	Determines where a control looks for its color information.
	ParentFont (see page 73)	Determines where a control looks for its font information.
	ParentShowHint (see page 73)	Determines where a control looks to find out if its Help Hint should be shown.
	PersistentHotKeys (see page 74)	Specifies whether keyboard accelerator shortcuts are always displayed.
	PopupMenu (see page 74)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 79)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Spacing (see page 80)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	VertMargin (see page 81)	Specifies the width of the vertical margins in pixels.
	Visible (see page 81)	Determines whether the component appears onscreen.

2.1.1.2.1 TActionToolBar.ActionManager Property

Specifies the action manager component that is associated with the action band.

Pascal

```
property ActionManager: TCustomActionManager;
```

C++

```
__property TCustomActionManager ActionManager;
```

Description

Use ActionManager to access the action manager that uses this action band to render UI elements it manages. Typically, this association is created when you drag actions from the action manager and drop them on the action bar. When an action is dropped on an action band and the ActionManager property is not assigned, the ActionManager property is automatically assigned to the action manager that manages the action that was dropped on the action band.

At runtime, you can perform the equivalent operation to dragging an action onto the action band by setting the ActionBar property of one of the action clients that the action manager's ActionBars property lists so that it specifies this component.

See Also

ActionBars (see page 553)

ActionClient (see page 479)

ActionBar (see page 370)

2.1.1.2.2 TActionToolBar.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
```

```
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);

  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

procedure TForm1.Button1Click(Sender: TObject);
var
  ProgressBar: TProgressBar;
```

```
begin
  ProgressBar := TProgressBar.Create(Self);
  with ProgressBar do
  begin
    Parent := Self;
    Align := alBottom;
  end;
end;
{
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
}
var
  PageControl1: TPageControl;
  pts: array[0..3] of TTabSheet;
const
  TabTitles: array[0..3] of ShortString = ('Customer', 'Orders', 'Items', 'Parts' );

procedure TForm1.FormCreate(Sender: TObject);
const
  colorpalette: Array[0..11] of TColor = (
    clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia, clTeal,
    clNavy, clMaroon, clLime, clOlive, clPurple);
var
  i: Integer;
begin
  PageControl1 := TPageControl.Create(Self);
  PageControl1.Parent := Self;
  PageControl1.Align := alClient;
  for i := Low(TabTitles) to High(TabTitles) do
  begin
    pts[i]:= TTabSheet.Create(PageControl1);
    with pts[i] do
    begin
      PageControl := PageControl1;
      Name := 'ts' + TabTitles[i];
      Caption := TabTitles[i];
      Brush.Color := colorPalette[i];
   end;
  end;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  i: Integer;
begin
  for i := Low(TabTitles) to High(TabTitles) do
  begin
    pts[i].Free;
  end;
  PageControl1.Free;
end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

2.1.1.2.3 TActionToolBar.AllowHiding Property

Determines whether the action band can be hidden.

Pascal

```
property AllowHiding: Boolean;
```

C++

```
__property Boolean AllowHiding;
```

Description

Use AllowHiding to specify whether the action band can be hidden at runtime, if the application allows runtime customization by the end user. Setting AllowHiding to true allows the action band to be hidden at runtime. If AllowHiding is set to false, the action cannot be hidden. Certain action bands, such as the main menu action band, should set this AllowHiding to false.

2.1.1.2.4 TActionToolBar.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

2.1.1.2.5 TActionToolBar.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency,

ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

2.1.1.2.6 TActionToolBar.Canvas Property

Represents the drawing surface of the action band.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

TCustomActionBar uses Canvas internally to render the background on which its child controls appear.

2.1.1.2.7 TActionToolBar.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
```

```
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
```

```
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

2.1.1.2.8 TActionToolBar.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

2.1.1.2.9 TActionToolBar.ColorMap Property

Indicates the colormap for individual action band components.

Pascal

```
property ColorMap: TCustomActionBarColorMap;
```

C++

```
__property TCustomActionBarColorMap ColorMap;
```

Description

Use the ColorMap property to change the default colormap for individual action band components. By default, the ColorMap property is set according to the first registered TActionBarStyleEx class. Otherwise, if the action band is linked to an action manager, the property defaults to the ColorMap as specified by the Style property of the action manager.

Note: To centrally set or change the default look and feel of all action band components, use ActionManager's Style property. To centrally control the colors used by all action bands within an application, connect the action bands to a single colormap component.

See Also

TActionManager (see page 432)

TXPColorMap (see page 23)

TStandardColorMap (see page 2)

TTwilightColorMap (see page 13)

Style (see page 556)

2.1.1.2.10 TActionToolBar.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

2.1.1.2.11 TActionToolBar.Cursor Property

Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.

Pascal

```
property Cursor: TCursor;
```

C++

```
__property TCursor Cursor;
```

Description

Change the value of Cursor to provide feedback to the user when the mouse pointer enters the control. The value of Cursor is the index of the cursor in the list of cursors maintained by the global variable, Screen. In addition to the built-in cursors provided by TScreen, applications can add custom cursors to the list.

C++ Examples:

```
/*
This example shows how to add custom cursors to an
application.  The following code makes this cursor available
to the application via the constant crMyCursor, and sets it
as the global cursor to the application.
*/
Graphics::TBitmap *bmpMask, *bmpColor;
TIconInfo *iconInfo;

const crMyCursor = 5;

  void __fastcall TForm1::Button2Click(TObject *Sender)
{
  bmpMask = new Graphics::TBitmap();
  bmpColor = new Graphics::TBitmap();
  iconInfo = new TIconInfo();

  bmpMask->LoadFromFile("../SquareMask.bmp");
  bmpColor->LoadFromFile("../Square.bmp");

  iconInfo->fIcon = false;
  iconInfo->xHotspot = 15;
  iconInfo->yHotspot = 15;
  iconInfo->hbmMask = bmpMask->Handle;
  iconInfo->hbmColor = bmpColor->Handle;

  Screen->Cursors[crMyCursor] = CreateIconIndirect(iconInfo);

  Screen->Cursor = crMyCursor;

  delete bmpMask;
  delete bmpColor;
  delete iconInfo;
}
```

Delphi Examples:

```
{
This example uses a splitter and two image controls to
create a "slide show" effect.  The example displays an image
(the current "slide"), which can be hidden behind a screen
that looks like a venetian blind. When the blind is pulled
down to completely cover the current slide, the slide changes
to a different image.  When the blind is raised, the new
image appears.
To prepare this example, follow these steps:
```

```
1. Place an image control on the form.
Set the picture property to a bitmap of a venetian blind,
Set the Stretch property to True.
Set the Align property to alTop.
2. Add a splitter control to the form.
Set the Align property to alTop.
Set the Cursor property to crVSplit.
Set the OnMoved event handler to the code that appears below.
Set the MinSize property to 1.
3. Add a second image control to the form.
Set the Align property to alClient.
Set the Stretch property to True.
4. Select the form and add the OnCreate and OnDestroy event
   handlers that appear below.
5. Add the global variables below to the unit.
}
var
  CurImage: Integer;
  BMPs: Array[1..5] of TBitmap;

procedure TForm1.Splitter1Moved(Sender: TObject);
begin
  { check if the blind is closed }
  if Image2.Height <= 1 then
  begin
    { the blind is closed, change the current slide }
    CurImage := CurImage + 1;
    if CurImage = 6 then
       CurImage := 1;
    Image2.Picture.Bitmap := BMPs[CurImage];
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  { Initialize the array of slides.
    These must be freed in the OnDestroy event handler. }
  BMPs[1] := TBitmap.Create;
  BMPs[1].LoadFromFile('Factory.bmp');
  BMPs[2] := TBitmap.Create;
  BMPs[2].LoadFromFile('Rhododendron.bmp');
  BMPs[3] := TBitmap.Create;
  BMPs[3].LoadFromFile('littleB_64.bmp');
  BMPs[4] := TBitmap.Create;
  BMPs[4].LoadFromFile('Soap bubbles.bmp');
  BMPs[5] := TBitmap.Create;
  BMPs[5].LoadFromFile('Gone Fishing.bmp');
  CurImage := 1;
  Image2.Picture.Bitmap := BMPs[1];
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  { clean up }
  for I := 1 to 5 do
    BMPs[I].Free;
end;
{
This example shows how to add custom cursors to an
application.  The following code makes this cursor available
to the application via the constant crMyCursor, and sets it
as the global cursor to the application.
}
var
```

```
    bmpMask : TBitmap;
    bmpColor : TBitmap;
    iconInfo : TIconInfo;
  const
    crMyCursor = 5;

  procedure TForm1.Button2Click(Sender: TObject);
  begin
    bmpMask := TBitmap.Create;
    bmpColor := TBitmap.Create;

    bmpMask.LoadFromFile('SquareMask.bmp');
    bmpColor.LoadFromFile('Square.bmp');

    with iconInfo do
    begin
      fIcon := false;
      xHotspot := 15;
      yHotspot := 15;
      hbmMask := bmpMask.Handle;
      hbmColor := bmpColor.Handle;
    end;

    Screen.Cursors[crMyCursor] := CreateIconIndirect(iconInfo);

    Screen.Cursor := crMyCursor;

    bmpMask.Free;
    bmpColor.Free;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  begin
    DestroyIcon(Screen.Cursors[crMyCursor]);
  end;
```

Screen (see page 14385)

ProcessMessages (see page 13691)

2.1.1.2.12 TActionToolBar.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

2.1.1.2.13 TActionToolBar.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

2.1.1.2.14 TActionToolBar.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);

  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
```

```
    else
      return;
    TreeView1->Selected->MoveTo(Item, AttachMode);
  }

  void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
        int X, int Y, TDragState State, bool &Accept)
  {
    Accept = (Source == (TObject *)TreeView1);
  }
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;

Arranging the Order of Persistent Columns

2.1.1.2.15 TActionToolBar.EdgeBorders Property

Determines which sides of the control have visible borders.

Pascal

```
property EdgeBorders: TEdgeBorders;
```

C++

```
__property TEdgeBorders EdgeBorders;
```

Description

Use the EdgeBorders property to add or remove borders. The appearance of the borders can be set with the EdgeInner and EdgeOuter properties.

See Also

EdgeInner (see page 23287)

EdgeOuter (see page 23288)

2.1.1.2.16 TActionToolBar.EdgeInner Property

Determines the border style for the control's inner edge.

Pascal

```
property EdgeInner: TEdgeStyle;
```

C++

```
__property TEdgeStyle EdgeInner;
```

Description

Use EdgeInner to provide the tool window with a three-dimensional beveled look. A tool window has two borders on each side, an outer border drawn next to the outer edge, and an inner border drawn inside the outer border. EdgeInner specifies the appearance of the inner border. It can be raised (esRaised), lowered (esLowered), or left off altogether (esNone).

Note: The EdgeInner property has an effect only on the sides specified by the EdgeBorders property.

Use EdgeInner with EdgeOuter to give the component a three-dimensional look.

See Also

EdgeBorders (see page 23287)

EdgeOuter (see page 23288)

2.1.1.2.17 TActionToolBar.EdgeOuter Property

Determines the border style for the control's outer edge.

Pascal

```
property EdgeOuter: TEdgeStyle;
```

C++

```
__property TEdgeStyle EdgeOuter;
```

Description

Use EdgeOuter to provide the tool window with a three-dimensional beveled look. A tool window has two borders on each side,

an outer border drawn next to the outer edge, and an inner border drawn inside the outer border. EdgeOuter specifies the appearance of the outer border. It can be raised (esRaised), lowered (esLowered), or left off altogether (esNone).

Note: The EdgeInner property has an effect only on the sides specified by the EdgeBorders property.

Use EdgeOuter with EdgeInner to give the component a three-dimensional look.

See Also

EdgeBorders (see page 23287)

EdgeInner (see page 23287)

2.1.1.2.18 TActionToolBar.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

2.1.1.2.19 TActionToolBar.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
```

```
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

ParentFont (see page 5834)

Displaying and Editing Text in a Memo Control

2.1.1.2.20 TActionToolBar.HorzMargin Property

Specifies the width of the horizontal margins in pixels.

Pascal

```
property HorzMargin: Integer;
```

C++

```
__property int HorzMargin;
```

Description

HorzMargin specifies the width of the action band's left and right horizontal margins in pixels.

See Also

VertMargin (see page 490)

VertSeparator (see page 490)

2.1.1.2.21 TActionToolBar.HorzSeparator Property

Indicates whether a horizontal separator bar appears between item lines.

Pascal

```
property HorzSeparator: Boolean;
```

C++

```
__property Boolean HorzSeparator;
```

Description

An action band can arrange its child controls using multiple lines. Items which cannot be displayed on one line wrap to the next in the same way that words wrap on most word processors. Set HorzSeparator to true if you want a separator bar to appear between the lines.

See Also

VertSeparator (see page 490)

HorzMargin (see page 487)

Orientation (see page 488)

2.1.1.2.22 TActionToolBar.Orientation Property

Specifies how the action band lays out its child items.

Pascal

```
property Orientation: TBarOrientation;
```

C++

```
__property TBarOrientation Orientation;
```

Description

The possible values of Orientation are:

Value	Meaning
boLeftToRight	Items are rendered in rows, from left to right.
boRightToLeft	Items are rendered in rows, from right to left.
boTopToBottom	Items are rendered in columns, from top to bottom.
boBottomToTop	Items are rendered in columns, from bottom to top.

See Also

VertSeparator (see page 490)

HorzSeparator (see page 487)

ActionControls (see page 479)

2.1.1.2.23 TActionToolBar.ParentBackground Property

Determines whether control uses parent's theme background.

Pascal

```
property ParentBackground: Boolean;
```

C++

```
__property Boolean ParentBackground;
```

Description

If ParentBackground is true, the control uses the parent's theme background to draw its own background. ParentBackground has no effect unless XP themes are enabled.

2.1.1.2.24 TActionToolBar.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

2.1.1.2.25 TActionToolBar.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

2.1.1.2.26 TActionToolBar.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

2.1.1.2.27 TActionToolBar.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

2.1.1.2.28 TActionToolBar.PersistentHotKeys Property

Specifies whether keyboard accelerator shortcuts are always displayed.

Pascal

```
property PersistentHotKeys: Boolean;
```

C++

```
__property Boolean PersistentHotKeys;
```

Description

Use PersistentHotKeys to specify whether the action band always displays keyboard accelerator shortcuts. Setting PersistentHotKeys to true causes the underline for the keyboard shortcut key to always appear. If PersistentHotKeys is set to false, the underline for the keyboard shortcut key is only displayed if the user has used the keyboard to navigate through the action band's items. If the user is only using the mouse to navigate through the action band's items and PersistentHotKeys is set to false, the underline under the character denoted as the shortcut key is not drawn.

Note: Accelerator shortcuts are specified by preceding the appropriate character in the item's caption with an ampersand.

See Also

Caption (see page 384)

2.1.1.2.29 TActionToolBar.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
```

```
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
```

```
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

2.1.1.2.30 TActionToolBar.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
```

```
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

Displaying Fly-over Help

2.1.1.2.31 TActionToolBar.Spacing Property

Determines where the image and text appear on an action band's rendered control that represents the action client.

Pascal

```
property Spacing: Integer;
```

C++

```
__property int Spacing;
```

Description

Spacing is used internally to set the number of pixels that should appear between the image specified in an action client's ImageIndex and the text specified in its Caption property.

See Also

Caption (see page 384)

ImageIndex (see page 385)

2.1.1.2.32 TActionToolBar.VertMargin Property

Specifies the width of the vertical margins in pixels.

Pascal

```
property VertMargin: Integer;
```

C++

```
__property int VertMargin;
```

Description

VertMargin specifies the width of the action band's top and bottom vertical margins in pixels.

See Also

HorzMargin (see page 487)

HorzSeparator (see page 487)

2.1.1.2.33 TActionToolBar.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
```

```
      pPage->Caption = AnsiString("Page") + IntToStr(i);
      TEdit *pEdit = new TEdit(this);
      pEdit->Parent = pPage;
      pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
      pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
    }
    PageControl1Change(Sender);
  }
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

2.1.1.3 TActionToolBar Events

The events of the TActionToolBar class are listed here.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 83)	Occurs when an object with custom alignment is aligned.

	OnAlignPosition (see page 84)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 84)	Occurs when an attempt is made to resize the control.
	OnClick (see page 85)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 87)	Adjust resize constraints.
	OnContextPopup (see page 87)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnControlCreated (see page 88)	Occurs when a control is created on the action band.
	OnDblClick (see page 88)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 89)	Occurs when another control is docked to the control.
	OnDockOver (see page 91)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 93)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 95)	Occurs when the user drags an object over a control.
	OnEndDock (see page 97)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 98)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 99)	Occurs when a control receives the input focus.
	OnExit (see page 101)	Occurs when the input focus shifts away from one control to another.
	OnGetControlClass (see page 103)	Occurs when an item is to be placed on the action band.
	OnGetSiteInfo (see page 103)	Returns the control's docking information.
	OnMouseActivate (see page 105)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 106)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 109)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 111)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 113)	Occurs when the action band is painted.
	OnResize (see page 113)	Occurs immediately after the control is resized.
	OnStartDock (see page 114)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 115)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 115)	Occurs when the application tries to undock a control that is docked to the windowed control.

2.1.1.3.1 TActionToolBar.OnAlignInsertBefore Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignInsertBefore: TAlignInsertBeforeEvent;
```

C++

```
__property TAlignInsertBeforeEvent OnAlignInsertBefore;
```

Description

OnAlignInsertBefore occurs for each pair of child controls with an Align property of **alCustom**.

It can determine the order in which custom-aligned child controls are placed. OnAlignInsertBefore returns true if **C2** should be presented before **C1**, and false otherwise. It holds a TAlignInsertBeforeEvent type.

CustomAlignInsertBefore triggers the OnAlignInsertBefore event. If this event is defined, CustomAlignInsertBefore returns the value returned by OnAlignInsertBefore. Defining this event allows users to define the order of control alignment without overriding CustomAlignInsertBefore.

See Also

CustomAlignInsertBefore (see page 6137)

Align (see page 5798)

TAlignInsertBeforeEvent (see page 6293)

2.1.1.3.2 TActionToolBar.OnAlignPosition Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignPosition: TAlignPositionEvent;
```

C++

```
__property TAlignPositionEvent OnAlignPosition;
```

Description

OnAlignPosition occurs when child controls with an Align property of **alCustom** are aligned.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition. It holds a TAlignPositionEvent type.

These are the parameters:

Parameter	Meaning
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. OnAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. OnAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, OnAlignPosition does nothing.

CustomAlignPosition (see page 6138)

Align (see page 5798)

Anchors (see page 5802)

TAlignInfo (see page 6269)

TAlignPositionEvent (see page 6293)

2.1.1.3.3 TActionToolBar.OnCanResize Event

Occurs when an attempt is made to resize the control.

Pascal

```
property OnCanResize: TCanResizeEvent;
```

C++

```
__property TCanResizeEvent OnCanResize;
```

Description

Use OnCanResize to adjust the way a control is resized. If necessary, change the new width and height of the control in the OnCanResize event handler. The OnCanResize event handler also allows applications to indicate that the entire resize should be aborted.

If there is no OnCanResize event handler, or if the OnCanResize event handler indicates that the resize attempt can proceed, the OnCanResize event is followed immediately by an OnConstrainedResize event.

See Also

OnConstrainedResize (see page 5853)

SetBounds (see page 5783)

OnResize (see page 5870)

2.1.1.3.4 TActionToolBar.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
```

```
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

2.1.1.3.5 TActionToolBar.OnConstrainedResize Event

Adjust resize constraints.

Pascal

```
property OnConstrainedResize: TConstrainedResizeEvent;
```

C++

```
__property TConstrainedResizeEvent OnConstrainedResize;
```

Description

Use OnConstrainedResize to adjust a control's constraints when an attempt is made to resize it. Upon entry to the OnConstrainedResize event handler, the parameters of the event handler are set to the corresponding properties of the control's Constraints object. The event handler can adjust those values before they are applied to the new height and width that is being applied to the control. (The CanAutoSize method or an OnCanResize event handler may already have adjusted this new height and width).

On exit from the OnConstrainedResize event handler, the constraints are applied to the attempted new height and width. Once the constraints are applied, the control's height and width are changed. After the control's height and width change, an OnResize event occurs to allow any final adjustments or responses.

Note: The OnConstrainedResize handler is called immediately after the OnCanResize handler.

Constraints (see page 5812)

OnResize (see page 5870)

CanAutoSize (see page 5741)

2.1.1.3.6 TActionToolBar.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The

OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

PopupMenu (see page 5835)

AutoPopup (see page 16178)

2.1.1.3.7 TActionToolBar.OnControlCreated Event

Occurs when a control is created on the action band.

Pascal

```
property OnControlCreated: TControlCreatedEvent;
```

C++

```
__property TControlCreatedEvent OnControlCreated;
```

Description

Write an OnControlCreated event handler to enhance or replace the type of UI element that is rendered on the action band.

Sender is the action band component that just created a new control.

AnItem is the new child control that was just created. The OnControlCreated event handler can initialize the properties of this control or replace it with a custom control.

See Also

OnGetControlClass (see page 492)

2.1.1.3.8 TActionToolBar.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

2.1.1.3.9 TActionToolBar.OnDockDrop Event

Occurs when another control is docked to the control.

Pascal

```
property OnDockDrop: TDockDropEvent;
```

C++

```
__property TDockDropEvent OnDockDrop;
```

Description

Write code in the OnDockDrop event to perform actions when another control is docked on the control.

OnDockDrop can only occur if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
```

```
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
```

```
  CanDock := DockClient is TDockableForm;
end;
```

See Also

DockSite (see page 6204)

OnDockOver (see page 6216)

2.1.1.3.10 TActionToolBar.OnDockOver Event

Occurs when another control is dragged over the control.

Pascal

```
property OnDockOver: TDockOverEvent;
```

C++

```
__property TDockOverEvent OnDockOver;
```

Description

Write code in the OnDockOver event to indicate whether a dockable control that is dragged over the windowed control can be accepted as a dock client. OnDockOver occurs after the TDragDockObject has been initialized by an OnGetSiteInfo event.

OnDockOver occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
```

```
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
```

```
  CanDock := DockClient is TDockableForm;
end;
```

2.1.1.3.11 TActionToolBar.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
```

```
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

OnStartDrag (see page 5871)

TDragObject (see page 6031)

2.1.1.3.12 TActionToolBar.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
```

```
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
```

```
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

2.1.1.3.13 TActionToolBar.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

2.1.1.3.14 TActionToolBar.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
```

```
    S := (Sender as TLabel).Name + ' was dropped... and ';
    if Target <> nil then
      S := S + 'accepted!'
    else
      S := S + 'rejected!';
    Status.Caption := S;
  end;
```

2.1.1.3.15 TActionToolBar.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
```

```
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
```

```
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

2.1.1.3.16 TActionToolBar.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
```

```
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

2.1.1.3.17 TActionToolBar.OnGetControlClass Event

Occurs when an item is to be placed on the action band.

Pascal

```
property OnGetControlClass: TGetControlClassEvent;
```

C++

```
__property TGetControlClassEvent OnGetControlClass;
```

Description

Write an OnGetControlClass event handler to specify the class of item that the action band should create to represent a specified action client.

Sender is the action band that needs to generate a child control to represent an action client.

AnItem is the action client that the new control should represent.

ControlClass returns the class reference for the new control. This should be a descendant of TCustomActionControl.

See Also

TCustomActionControl (see page 507)

OnControlCreated (see page 491)

2.1.1.3.18 TActionToolBar.OnGetSiteInfo Event

Returns the control's docking information.

Pascal

```
property OnGetSiteInfo: TGetSiteInfoEvent;
```

C++

```
__property TGetSiteInfoEvent OnGetSiteInfo;
```

Description

Write code in the OnGetSiteInfo event handler to initialize a TDragDockObject with information about where a dragged object can be docked, if at all. OnGetSiteInfo occurs before the OnDockOver event.

OnGetSiteInfo occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
```

```
    //OnDockDrop gets called AFTER the client has actually docked,
    //so we check for DockClientCount = 1 before making the dock panel visible.
    if (Sender as TPanel).DockClientCount = 1 then
      ShowDockPanel(Sender as TPanel, True, nil);
    (Sender as TPanel).DockManager.ResetBounds(True);
    //Make DockManager repaints it's clients.
  end;

  procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
    Source: TDragDockObject; X, Y: Integer; State: TDragState;
    var Accept: Boolean);
  var
    ARect: TRect;
  begin
    Accept := Source.Control is TDockableForm;
    if Accept then
    begin
      //Modify the DockRect to preview dock area.
      ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
      ARect.BottomRight := LeftDockPanel.ClientToScreen(
        Point(Self.ClientWidth div 3, LeftDockPanel.Height));
      Source.DockRect := ARect;
    end;
  end;

  procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
    NewTarget: TWinControl; var Allow: Boolean);
  begin
    //OnUnDock gets called BEFORE the client is undocked, in order to optionally
    //disallow the undock. DockClientCount is never 0 when called from this event.
    if (Sender as TPanel).DockClientCount = 1 then
      ShowDockPanel(Sender as TPanel, False, nil);
  end;

  procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
    DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
    var CanDock: Boolean);
  begin
    //if CanDock is true, the panel will not automatically draw the preview rect.
    CanDock := DockClient is TDockableForm;
  end;
```

2.1.1.3.19 TActionToolBar.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse

button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

2.1.1.3.20 TActionToolBar.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area

of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
      end;
    if X > StartX then
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
      end
    else
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
      end;
  end;
end;
```

2.1.1.3.21 TActionToolBar.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.

2.1.1.3.22 TActionToolBar.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

Responding to a Mouse-up Action

2.1.1.3.23 TActionToolBar.OnPaint Event

Occurs when the action band is painted.

Pascal

```
property OnPaint: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPaint;
```

Description

Write an OnPaint event handler to change the way the action band renders itself.

See Also

Canvas (see page 481)

2.1.1.3.24 TActionToolBar.OnResize Event

Occurs immediately after the control is resized.

Pascal

```
property OnResize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnResize;
```

Description

Use OnResize to make any final adjustments after a control is resized.

To modify the way a control responds when an attempt is made to resize it, use OnCanResize or OnConstrainedResize.

Note: Some controls call this event handler when the control is first created.

Delphi Examples:

```
{
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
}
procedure TForm1.FormResize(Sender: TObject);
begin
  Button1.Left := Form1.ClientWidth-Button1.Width;
end;
```

See Also

OnCanResize (see page 5851)

SetBounds (see page 5783)

AutoSize (see page 5803)

OnConstrainedResize (see page 5853)

2.1.1.3.25 TActionToolBar.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

See Also

OnEndDock (see page 5859)

TDragDockObjectEx (see page 6018)

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

2.1.1.3.26 TActionToolBar.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

2.1.1.3.27 TActionToolBar.OnUnDock Event

Occurs when the application tries to undock a control that is docked to the windowed control.

Pascal

```
property OnUnDock: TUnDockEvent;
```

C++

```
__property TUnDockEvent OnUnDock;
```

Description

Write an OnUnDock event handler to adjust the windowed control when a dock client is undocked. The OnUnDock event handler can make any necessary adjustments, or it can block the undock attempt by setting the Allow parameter to false.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

2.1.2 TCustomActionCombo Class

Class Hierarchy

Pascal

```
TCustomActionCombo = class(TCustomComboBoxEx);
```

C++

```
class TCustomActionCombo : public TCustomComboBoxEx;
```

File

ActnCtrls

Description

This is class ActnCtrls.TCustomActionCombo.

2.1.2.1 TCustomActionCombo Members

The following tables list the members exposed by TCustomActionCombo.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.

	OnChange (see page 21197)	Occurs when the user changes the text displayed in the edit region.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnCloseUp (see page 21199)	Occurs when the drop-down list closes up due to some user action.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnDropDown (see page 21199)	Occurs when the user opens the drop-down list.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnSelect (see page 21201)	Occurs when the user selects a string in the drop-down list.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefEditProc (see page 21167)	This is FDefEditProc, a member of class TCustomCombo.
	FDefListProc (see page 21167)	This is FDefListProc, a member of class TCustomCombo.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FDropHandle (see page 21168)	This is FDropHandle, a member of class TCustomCombo.
	FDroppingDown (see page 21168)	This is FDroppingDown, a member of class TCustomCombo.
	FEditHandle (see page 21168)	This is FEditHandle, a member of class TCustomCombo.

	FEditInstance (see page 21168)	This is FEditInstance, a member of class TCustomCombo.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFocusChanged (see page 21168)	This is FFocusChanged, a member of class TCustomCombo.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FIsFocused (see page 21169)	This is FIsFocused, a member of class TCustomCombo.
	FListHandle (see page 21169)	This is FListHandle, a member of class TCustomCombo.
	FListInstance (see page 21169)	This is FListInstance, a member of class TCustomCombo.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FSaveIndex (see page 21169)	This is FSaveIndex, a member of class TCustomCombo.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActionChange (see page 3692)	Responds when the action for which this combo box is a client changes.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustDropDown (see page 21171)	Adjusts the size and position of the drop down list.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
V	BeginAutoDrag (see page 131)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21171)	Generates an OnChange (see page 21197) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	CloseUp (see page 21172)	Generates an OnCloseUp (see page 21199) event.
	CMColorChanged (see page 3693)	Responds when the Color property changes.
	CMParentColorChanged (see page 3693)	Responds when the ParentColor property changes.
	CNNotify (see page 3693)	Responds to notifications of changes in the combo box.
	ComboExWndProc (see page 3694)	Responds to Windows messages sent to the combo box.
V	ComboWndProc (see page 131)	This is ComboWndProc, a member of class TCustomActionCombo.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.

	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 3694)	Initializes the window-creation parameter record.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 3694)	Creates the underlying Windows control that implements the extended combo box.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CreateWnd (see page 21174)	Creates the Windows control that represents the combo box.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
V	DesignWndProc (see page 132)	This is DesignWndProc, a member of class TCustomActionCombo.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWindowHandle (see page 21174)	Destroys all of the windows controls that implement the combo box.
V	DestroyWnd (see page 3695)	Destroys the Windows control that represents the combo box.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 132)	OnDragOver event dispatcher.

	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DropDown (see page 21175)	Generates an OnDropDown (see page 21199) event.
V	EditWndProc (see page 21175)	Responds to Windows messages that are sent to the edit control portion of the combo box.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
V	GetActionLinkClass (see page 3695)	Returns the action link class that is associated with extended combo boxes.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
A	GetCount (see page 5942)	Returns the number of items in the list.
V	GetCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetDroppedDown (see page 21176)	Returns the value of the DroppedDown (see page 21185) property.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetItemCount (see page 3696)	Returns the number of items in the Items property list.
A	GetItemCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
V	GetItemHt (see page 3696)	Returns the height, in pixels, allocated for each item in the drop-down list.
A	GetItemHt (see page 21177)	Returns the value of the ItemHeight (see page 21186) property.
A	GetItemIndex (see page 5942)	Returns the value of the ItemIndex (see page 5944) property.
V	GetItemIndex (see page 21177)	Returns the value of the ItemIndex property.
V	GetItemsClass (see page 3696)	Returns the class used to implement the Items property.
A	GetItemsClass (see page 21177)	Indicates the class that implements the Items (see page 21187) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSelLength (see page 21178)	Returns the value of the SelLength (see page 21190) property.
	GetSelStart (see page 21178)	Returns the value of the SelStart (see page 21193) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).

	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	ListWndProc (see page 21178)	Responds to Windows messages that are sent to the drop-down list portion of the combo box.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 21179)	Initializes the combo box after its form is loaded into memory.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 3697)	Responds to notifications that objects are about to be inserted or removed.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Select (see page 21179)	Generates an OnSelect (see page 21201) event.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.

	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropDownCount (see page 3697)	Sets the value of the DropDownCount property.
	SetDropDownCount (see page 21180)	Sets the value of the DropDownCount (see page 21185) property.
	SetDroppedDown (see page 21180)	Sets the value of the DroppedDown (see page 21185) property.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetItemHeight (see page 21181)	Sets the value of the ItemHeight (see page 21186) property.
	SetItemIndex (see page 5943)	Sets the value of the ItemIndex (see page 5944) property.
	SetItemIndex (see page 21181)	Sets the value of the ItemIndex property.
	SetItems (see page 21181)	Sets the value of the Items (see page 21187) property.
	SetMaxLength (see page 21182)	Sets the value of the MaxLength (see page 21189) property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelLength (see page 21182)	Sets the value of the SelLength (see page 21190) property.
	SetSelStart (see page 21182)	Sets the value of the SelStart (see page 21193) property.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.

	WMHelp (see page 3697)	This is WMHelp, a member of class TCustomComboBoxEx.
	WMLButtonDown (see page 3698)	Responds when the user clicks the left mouse button on the combo box.
V	WndProc (see page 3698)	Processes messages received by the combo box.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WndProc (see page 21183)	Processes messages received by the combo box.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DropDownCount (see page 21185)	Specifies the maximum number of items displayed in the drop-down list.
R	EditHandle (see page 21185)	Returns the window handle for the edit portion of the combo box.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	ItemCount (see page 21186)	Specifies the number of items in the drop-down list.
	ItemHeight (see page 21186)	Specifies the height, in pixels, of the items in the drop-down list.
R	ListHandle (see page 21189)	Provides access to the window handle of the list of items in the combo box.
	MaxLength (see page 21189)	Specifies the maximum number of characters the user can type into the edit portion of the combo box.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentColor (see page 21190)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnBeginEdit (see page 3702)	Occurs when the user starts editing the text of the combo box.
	OnEndEdit (see page 3702)	Occurs when the user finishes editing the text of the combo box.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
A	AddItem (see page 5940)	Adds an item to the list control.
V	AddItem (see page 21170)	Adds an item to the drop-down list of items.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
A	Clear (see page 5940)	Deletes all of the items from the list control.
V	Clear (see page 21172)	Deletes all text from the edit box and all items from the Items (see page 21187) list.
A	ClearSelection (see page 5940)	Removes the selection, leaving all items unselected.
V	ClearSelection (see page 21172)	Deselects any selected items in the drop-down list.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
A	CopySelection (see page 5941)	Copies the selected item or items to another TCustomListControl (see page 5928) descendant.
V	CopySelection (see page 21173)	Copies the selected item in the drop-down list to another list control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 3691)	Creates and initializes a TCustomComboBoxEx (see page 3678) instance.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 21166)	Creates and initializes a TCustomCombo (see page 21154) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
A	DeleteSelected (see page 5941)	Deletes all the selected items.
V	DeleteSelected (see page 21174)	Deletes the selected item from the drop-down list.
V	Destroy (see page 2766)	Disposes of the component and its owned components.

	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 3691)	Destroys the combo box and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
	Destroy (see page 21166)	Destroys the combo box and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 132)	OnDragDrop event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 3695)	Indicates whether the combo box has input focus.
	Focused (see page 6150)	Determines whether the control has input focus.
	Focused (see page 21175)	Indicates whether the combo box has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	MoveSelection (see page 5942)	Moves all selected items to another list control.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
A	SelectAll (see page 5943)	Selects all items or all text in the selected item.
V	SelectAll (see page 21180)	Selects the entire block of text in the edit box.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.

V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AutoCompleteOptions (see page 3699)	Specifies options that control autocompletion.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 21184)	Provides access to the drawing surface of the combo box.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DropDownCount (see page 3699)	Specifies the maximum number of items displayed in the drop-down list.
	DroppedDown (see page 21185)	Indicates whether the drop-down list is currently displayed.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.

	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	Images (see page 3700)	Specifies the images that appear next to items in the combo box list.
	ItemIndex (see page 5944)	Specifies the index of the selected item.
	Items (see page 21187)	Provides access to the list of items (strings) in the list portion of the combo box.
	ItemsEx (see page 3700)	Lists the items that appear in the list portion of the combo box.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	SelLength (see page 21190)	Specifies the length, in characters, of the selected text in the edit portion of the combo box.
	SelStart (see page 21193)	Specifies the position of the first selected character in the edit portion of the combo box.
	SelText (see page 3701)	Represents the selected text in the edit region.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	Style (see page 3701)	Determines the display style of the combo box.
	StyleEx (see page 3701)	Determines the appearance and behavior of the items in the list.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TabStop (see page 21196)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

2.1.2.2 TCustomActionCombo Methods

The methods of the TCustomActionCombo class are listed here.

Protected Methods

	Name	Description
	BeginAutoDrag (see page 131)	Begin Automatic Drag.
	ComboWndProc (see page 131)	This is ComboWndProc, a member of class TCustomActionCombo.
	DesignWndProc (see page 132)	This is DesignWndProc, a member of class TCustomActionCombo.
	DragOver (see page 132)	OnDragOver event dispatcher.

Public Methods

	Name	Description
	DragDrop (see page 132)	OnDragDrop event dispatcher.

2.1.2.2.1 TCustomActionCombo.BeginAutoDrag Method

Begin Automatic Drag.

Pascal

```
procedure BeginAutoDrag; override;
```

C++

```
virtual __fastcall BeginAutoDrag();
```

Description

BeginAutoDrag is called automatically when a user drags a control whose DragMode is dmAutomatic. Do not call BeginAutoDrag in application code.

As implemented in TControl, BeginAutoDrag calls BeginDrag, passing in the global Mouse variable's DragImmediate and DragThreshold properties.

See Also

DragKind (see page 5819)

DragMode (see page 5819)

EndDrag (see page 5757)

Mouse (see page 6321)

DragImmediate (see page 6100)

DragThreshold (see page 6101)

Mouse (see page 6321)

2.1.2.2.2 TCustomActionCombo.ComboWndProc Method

Pascal

```
procedure ComboWndProc(var Message: TMessage; ComboWnd: HWND; ComboProc: Pointer); override;
```

C++

```
virtual __fastcall ComboWndProc(TMessage Message, HWND ComboWnd, void * ComboProc);
```

Description

This is ComboWndProc, a member of class TCustomActionCombo.

2.1.2.2.3 TCustomActionCombo.DesignWndProc Method

Pascal

```
function DesignWndProc(var Message: TMessage): Boolean; override;
```

C++

```
virtual __fastcall Boolean DesignWndProc(TMessage Message);
```

Description

This is DesignWndProc, a member of class TCustomActionCombo.

2.1.2.2.4 TCustomActionCombo.DragDrop Method

OnDragDrop event dispatcher.

Pascal

```
procedure DragDrop(Source: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DragDrop(TObject * Source, int X, int Y);
```

Description

When creating a component that descends from TControl, override DragDrop to add additional code that executes before the OnDragDrop event handler is called.

The Source parameter is the object that was dropped onto the control. The X and Y parameters are the mouse coordinates where the object was dropped.

See Also

DragCanceled (see page 5754)

OnDragDrop (see page 5855)

2.1.2.2.5 TCustomActionCombo.DragOver Method

OnDragOver event dispatcher.

Pascal

```
procedure DragOver(Source: TObject; X: Integer; Y: Integer; State: TDragState; var Accept:
Boolean); override;
```

C++

```
virtual __fastcall DragOver(TObject * Source, int X, int Y, TDragState State, Boolean Accept);
```

Description

Override DragOver to add additional code that executes before the OnDragOver event handler is called.

DragOver sets the Accept parameter to true to indicate that the user can drop the dragged object on the control. It sets Accept to false to indicate that the user cannot drop the dragged object on the control.

The Source parameter is the object being dragged. The State parameter indicates how the dragged object is moving in relation

to the control. X and Y indicate the current position of the mouse.

See Also

DragDrop (see page 5754)

OnDragOver (see page 5857)

2.1.3 TCustomActionDockBar Class

TCustomActionDockBar is the ancestor for action bands that require the ability to dock.

Class Hierarchy

Pascal

```
TCustomActionDockBar = class(TCustomActionBar);
```

C++

```
class TCustomActionDockBar : public TCustomActionBar;
```

File

ActnCtrls

Description

TCustomActionDockBar is the ancestor for all action bands that require the ability to dock.

See Also

TActionToolBar (see page 38)

TActionMainMenuBar (see page 585)

2.1.3.1 TCustomActionDockBar Members

The following tables list the members exposed by TCustomActionDockBar.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.

	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefaultColorMap (see page 460)	This is FDefaultColorMap, a member of class TCustomActionBar.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FSavedWrapState (see page 460)	This is FSavedWrapState, a member of class TCustomActionBar.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.

	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 462)	Aligns any controls for which the control is the parent within a specified area of the control.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	AutoSizingChanged (see page 462)	This is AutoSizingChanged, a member of class TCustomActionBar.
	BackgroundSize (see page 462)	This is BackgroundSize, a member of class TCustomActionBar.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CalcInsertPosition (see page 462)	This is CalcInsertPosition, a member of class TCustomActionBar.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Clear (see page 463)	This is Clear, a member of class TCustomActionBar.
	Click (see page 5743)	Respond to user click.
	CMBorderChanged (see page 23285)	This is CMBorderChanged, a member of class TToolWindow.
	CMCtl3DChanged (see page 23286)	This is CMCtl3DChanged, a member of class TToolWindow.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateControl (see page 463)	This is CreateControl, a member of class TCustomActionBar.
	CreateControls (see page 463)	This is CreateControls, a member of class TCustomActionBar.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 463)	Returns placement order of custom-aligned child control.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 464)	Returns aligned position of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.

	DesignWndProc (see page 465)	This is DesignWndProc, a member of class TCustomActionBar.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoControlCreated (see page 465)	This is DoControlCreated, a member of class TCustomActionBar.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoDropActions (see page 465)	This is DoDropActions, a member of class TCustomActionBar.
	DoDropCategory (see page 465)	This is DoDropCategory, a member of class TCustomActionBar.
	DoDropItem (see page 466)	This is DoDropItem, a member of class TCustomActionBar.
	DoEndDock (see page 146)	OnEndDock event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoGetControlClass (see page 466)	This is DoGetControlClass, a member of class TCustomActionBar.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 147)	OnStartDock event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 466)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawBackground (see page 467)	This is DrawBackground, a member of class TCustomActionBar.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindAccelItem (see page 467)	This is FindAccelItem, a member of class TCustomActionBar.
	FindItemAt (see page 468)	This is FindItemAt, a member of class TCustomActionBar.
	FindItemCaption (see page 468)	This is FindItemCaption, a member of class TCustomActionBar.
	FindLast (see page 468)	This is FindLast, a member of class TCustomActionBar.
	FindLeastUsedItem (see page 469)	This is FindLeastUsedItem, a member of class TCustomActionBar.
	FindNearestControl (see page 469)	This is FindNearestControl, a member of class TCustomActionBar.
	FindNext (see page 470)	This is FindNext, a member of class TCustomActionBar.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FindNextVisibleItem (see page 470)	This is FindNextVisibleItem, a member of class TCustomActionBar.
	FindPrevious (see page 470)	This is FindPrevious, a member of class TCustomActionBar.
	FindPreviousVisibleItem (see page 470)	This is FindPreviousVisibleItem, a member of class TCustomActionBar.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionControl (see page 471)	This is GetActionControl, a member of class TCustomActionBar.

	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetBannerWidth (see page 471)	This is GetBannerWidth, a member of class TCustomActionBar.
	GetBarHeight (see page 471)	This is GetBarHeight, a member of class TCustomActionBar.
	GetBarWidth (see page 471)	This is GetBarWidth, a member of class TCustomActionBar.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlClass (see page 471)	This is GetControlClass, a member of class TCustomActionBar.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDefaultColorMapClass (see page 472)	This is GetDefaultColorMapClass, a member of class TCustomActionBar.
	GetDesignMode (see page 472)	This is GetDesignMode, a member of class TCustomActionBar.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 147)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetPopupMenuClass (see page 472)	This is GetPopupMenuClass, a member of class TCustomActionBar.
	GetSiteInfo (see page 147)	Generates an OnGetSiteInfo event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasItems (see page 472)	This is HasItems, a member of class TCustomActionBar.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	ItemCount (see page 473)	This is ItemCount, a member of class TCustomActionBar.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 148)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.

	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	NCPaint (see page 473)	This is NCPaint, a member of class TCustomActionBar.
V	NCPaint (see page 23286)	This is NCPaint, a member of class TToolWindow.
V	Notification (see page 473)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 474)	This is Paint, a member of class TCustomActionBar.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 474)	Renders the image of a windowed control.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
V	Reset (see page 475)	This is Reset, a member of class TCustomActionBar.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
V	SetActionClient (see page 475)	This is SetActionClient, a member of class TCustomActionBar.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetAutoSizing (see page 475)	This is SetAutoSizing, a member of class TCustomActionBar.
V	SetBiDiMode (see page 475)	Sets the control's bi-directional mode.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
V	SetColorMap (see page 476)	This is SetColorMap, a member of class TCustomActionBar.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDesignMode (see page 476)	This is SetDesignMode, a member of class TCustomActionBar.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.

	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetOrientation (see page 477)	This is SetOrientation, a member of class TCustomActionBar.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetPersistentHotKeys (see page 477)	This is SetPersistentHotKeys, a member of class TCustomActionBar.
	SetSpacing (see page 477)	This is SetSpacing, a member of class TCustomActionBar.
	SetupDefaultColorMap (see page 477)	This is SetupDefaultColorMap, a member of class TCustomActionBar.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 478)	Provides the interface for a method that responds to changes in the control's visibility.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMNCCalcSize (see page 23286)	This is WMNCCalcSize, a member of class TToolWindow.
	WMNCPaint (see page 23286)	This is WMNCPaint, a member of class TToolWindow.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.

	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
R	HRowCount (see page 488)	Indicates the number of columns of items that the action band displays.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Items (see page 488)	Lists the action clients that correspond to the child controls of this action band.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
R	VRowCount (see page 490)	Indicates the number of rows of items that the action band displays.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
R	Widest (see page 491)	This is Widest, a member of class TCustomActionBar.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnControlCreated (see page 491)	Occurs when a control is created on the action band.
	OnGetControlClass (see page 492)	Occurs when an item is to be placed on the action band.
	OnPaint (see page 492)	Occurs when the action band is painted.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.

	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CalcDockedWidth (see page 146)	This is CalcDockedWidth, a member of class TCustomActionDockBar.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 145)	Creates and initializes a TCustomActionDockBar (see page 133) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 459)	Destroys an instance of TCustomActionBar (see page 447).
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 146)	Used internally to dock the action band.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 466)	Generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindFirst (see page 467)	Finds the first TActionClientItem (see page 374) in the Items (see page 488) list.
	FindFirstVisibleItem (see page 468)	Finds the first visible TActionClientItem (see page 374) in the Items (see page 488) list.
	FindLastVisibleItem (see page 469)	Finds the last visibleTActionClientItem in the Items (see page 488) list.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
V	RecreateControls (see page 475)	Destroys and recreates all of the action band's action client controls.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 476)	Sets the bounds based on whether the popup is expanded or not
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Style (see page 477)	Identifies the style object that gives the application its default look and feel.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	ActionClient (see page 479)	Specifies the action client associated with this action band.
R	ActionControls (see page 479)	Lists the controls on the action band.
	ActionManager (see page 480)	Specifies the action manager component that is associated with the action band.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	AllowHiding (see page 480)	Determines whether the action band can be hidden.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AutoSizing (see page 480)	Specifies whether the action band adjusts its size automatically to fit around its child controls.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 481)	Represents the drawing surface of the action band.
	Caption (see page 481)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	Color (see page 483)	Specifies the background color of the control.

	ColorMap (see page 484)	Indicates the colormap for individual action band components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ContextBar (see page 485)	Indicates whether items shown in this action band represent the items in a popup menu.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Designable (see page 485)	Specifies whether the action band can be customized (used internally by the IDE).
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignMode (see page 486)	Specifies whether the action band is being customized or being used in the IDE.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	EdgeBorders (see page 23287)	Determines which sides of the control have visible borders.
	EdgeInner (see page 23287)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 23288)	Determines the border style for the control's outer edge.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	Font (see page 486)	Controls the attributes of text written on or in the control.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HorzMargin (see page 487)	Specifies the width of the horizontal margins in pixels.
	HorzSeparator (see page 487)	Indicates whether a horizontal separator bar appears between item lines.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	Orientation (see page 488)	Specifies how the action band lays out its child items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	PersistentHotKeys (see page 489)	Specifies whether keyboard accelerator shortcuts are always displayed.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.

	Spacing (see page 489)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	VertMargin (see page 490)	Specifies the width of the vertical margins in pixels.
	VertSeparator (see page 490)	Indicates whether a vertical separator bar should appear between item lines.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

2.1.3.2 TCustomActionDockBar.Create Constructor

Creates and initializes a TCustomActionDockBar (see page 133) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomActionDockBar(TComponent * AOwner);
```

Description

Create generates a TCustomActionDockBar (see page 133) and initializes its properties.

```
__fastcall virtual TCustomActionDockBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall (HWND ParentWindow) : Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

2.1.3.3 TCustomActionDockBar Methods

The methods of the TCustomActionDockBar class are listed here.

Protected Methods

	Name	Description
	DoEndDock (see page 146)	OnEndDock event dispatcher.
	DoStartDock (see page 147)	OnStartDock event dispatcher.
	GetFloatingDockSiteClass (see page 147)	Returns the class used for the control when it is floating.
	GetSiteInfo (see page 147)	Generates an OnGetSiteInfo event
	Loaded (see page 148)	Initializes the control after it is loaded from a stream.

Public Methods

	Name	Description
	CalcDockedWidth (see page 146)	This is CalcDockedWidth, a member of class TCustomActionDockBar.
	Dock (see page 146)	Used internally to dock the action band.

2.1.3.3.1 TCustomActionDockBar.CalcDockedWidth Method

Pascal

```
function CalcDockedWidth: Integer; virtual;
```

C++

```
virtual __fastcall int CalcDockedWidth();
```

Description

This is CalcDockedWidth, a member of class TCustomActionDockBar.

2.1.3.3.2 TCustomActionDockBar.Dock Method

Used internally to dock the action band.

Pascal

```
procedure Dock(NewDockSite: TWinControl; ARect: TRect); override;
```

C++

```
virtual __fastcall Dock(TWinControl * NewDockSite, TRect ARect);
```

Description

Do not call Dock. It is called automatically to implement many of the details of docking the action band to a dock site.

To dock the action band programmatically, use ManualDock instead.

The NewDockSite parameter specifies the docking site to which the action band is being docked. The ARect parameter indicates the new dimensions of the action band when it is docked to NewDockSite.

See Also

ManualDock (see page 5771)

2.1.3.3.3 TCustomActionDockBar.DoEndDock Method

OnEndDock event dispatcher.

Pascal

```
procedure DoEndDock(Target: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DoEndDock(TObject * Target, int X, int Y);
```

Description

OnEndDock calls any event handler attached to the OnEndDock event. When creating a component that descends from TControl, override OnEndDock to provide other responses in addition to the inherited event-handler call when the user finishes a drag-and-dock operation.

See Also

DoStartDock (see page 5753)

OnEndDock (see page 5859)

2.1.3.3.4 TCustomActionDockBar.DoStartDock Method

OnStartDock event dispatcher.

Pascal

```
procedure DoStartDock(var DragObject: TDragObject); override;
```

C++

```
virtual __fastcall DoStartDock(TDragObject DragObject);
```

Description

DoStartDock calls any event handler attached to the OnStartDock event. When creating a component that descends from TControl, override DoStartDock to provide other responses in addition to the inherited event-handler call when the user starts a drag-and-dock operation.

See Also

DoEndDock (see page 5750)

OnStartDock (see page 5871)

2.1.3.3.5 TCustomActionDockBar.GetFloatingDockSiteClass Method

Returns the class used for the control when it is floating.

Pascal

```
function GetFloatingDockSiteClass: TWinControlClass; override;
```

C++

```
virtual __fastcall TWinControlClass GetFloatingDockSiteClass();
```

Description

GetFloatingDockSiteClass is the read implementation of the FloatingDockSiteClass property. Override this method to change the implementation of FloatingDockSiteClass.

See Also

FloatingDockSiteClass (see page 5823)

2.1.3.3.6 TCustomActionDockBar.GetSiteInfo Method

Generates an OnGetSiteInfo event

Pascal

```
procedure GetSiteInfo(Client: TControl; var InfluenceRect: TRect; MousePos: TPoint; var
```

```
CanDock: Boolean); override;
```

C++

```
virtual __fastcall GetSiteInfo(TControl * Client, TRect InfluenceRect, TPoint MousePos,
Boolean CanDock);
```

Description

GetSiteInfo is called automatically during drag-and-dock operations to initialize a TDragDockObject with information about where a dragged object can be docked, if at all.

Client is a potential docking client.

InfluenceRect returns the area in which the client would be docked.

MousePos is the current mouse position.

CanDock returns whether the client can dock to the windowed control.

As implemented in TWinControl, GetSiteInfo generates an influence rectangle equal to BoundsRect expanded by 10 pixels on every side, and then calls the OnGetSiteInfo event handler.

See Also

OnGetSiteInfo (see page 6223)

BoundsRect (see page 5803)

2.1.3.3.7 TCustomActionDockBar.Loaded Method

Initializes the control after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the control's form is loaded into memory so that the control can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method in order to initialize the control from its associated Action. To change the properties the control copies from its action, override the ActionChange method.

See Also

Loaded (see page 2782)

Action (see page 5797)

ActionChange (see page 5737)

2.1.4 TCustomActionToolBar Class

TCustomActionToolBar is the base class for the TActionToolBar (see page 38) component.

Class Hierarchy

Pascal

```
TCustomActionToolBar = class(TCustomActionDockBar);
```

C++

```
class TCustomActionToolBar : public TCustomActionDockBar;
```

File

ActnCtrls

Description

TCustomActionToolBar is the base class for components that generate tool bars based on the actions that an Action Manager specifies. TCustomActionToolBar descendants generate internal components for the controls in the tool bar, where each component represents an action in the Action manager. The layout of these items is managed automatically, and specified by the Action Manager.

See Also

TCoolBar (see page 3603)

TActionToolBar (see page 38)

TActionManager (see page 432)

2.1.4.1 TCustomActionToolBar Members

The following tables list the members exposed by TCustomActionToolBar.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.

	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefaultColorMap (see page 460)	This is FDefaultColorMap, a member of class TCustomActionBar.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FSavedWrapState (see page 460)	This is FSavedWrapState, a member of class TCustomActionBar.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 462)	Aligns any controls for which the control is the parent within a specified area of the control.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.

	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	AutoSizingChanged (see page 163)	This is AutoSizingChanged, a member of class TCustomActionToolBar.
	BackgroundSize (see page 462)	This is BackgroundSize, a member of class TCustomActionBar.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcButtonWidth (see page 163)	This is CalcButtonWidth, a member of class TCustomActionToolBar.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CalcInsertPosition (see page 462)	This is CalcInsertPosition, a member of class TCustomActionBar.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Clear (see page 463)	This is Clear, a member of class TCustomActionBar.
	Click (see page 5743)	Respond to user click.
	CMBorderChanged (see page 23285)	This is CMBorderChanged, a member of class TToolWindow.
	CMColorchanged (see page 163)	This is CMColorchanged, a member of class TCustomActionToolBar.
	CMCtl3DChanged (see page 23286)	This is CMCtl3DChanged, a member of class TToolWindow.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateControl (see page 163)	This is CreateControl, a member of class TCustomActionToolBar.
	CreateControls (see page 164)	This is CreateControls, a member of class TCustomActionToolBar.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 463)	Returns placement order of custom-aligned child control.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 464)	Returns aligned position of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 465)	This is DesignWndProc, a member of class TCustomActionBar.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DisableHiding (see page 164)	This is DisableHiding, a member of class TCustomActionToolBar.

	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
V	DoControlCreated (see page 465)	This is DoControlCreated, a member of class TCustomActionBar.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
V	DoDropActions (see page 465)	This is DoDropActions, a member of class TCustomActionBar.
V	DoDropCategory (see page 164)	This is DoDropCategory, a member of class TCustomActionToolBar.
V	DoDropItem (see page 466)	This is DoDropItem, a member of class TCustomActionBar.
V	DoEndDock (see page 146)	OnEndDock event dispatcher.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoGetControlClass (see page 466)	This is DoGetControlClass, a member of class TCustomActionBar.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
V	DoStartDock (see page 147)	OnStartDock event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 466)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
V	DrawBackground (see page 165)	This is DrawBackground, a member of class TCustomActionToolBar.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
V	DrawSeparator (see page 165)	This is DrawSeparator, a member of class TCustomActionToolBar.
	EnableHiding (see page 165)	This is EnableHiding, a member of class TCustomActionToolBar.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindAccelItem (see page 467)	This is FindAccelItem, a member of class TCustomActionBar.
	FindItemAt (see page 468)	This is FindItemAt, a member of class TCustomActionBar.
	FindItemCaption (see page 468)	This is FindItemCaption, a member of class TCustomActionBar.
V	FindLast (see page 468)	This is FindLast, a member of class TCustomActionBar.
	FindLeastUsedItem (see page 469)	This is FindLeastUsedItem, a member of class TCustomActionBar.
	FindNearestControl (see page 469)	This is FindNearestControl, a member of class TCustomActionBar.
V	FindNext (see page 470)	This is FindNext, a member of class TCustomActionBar.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FindNextVisibleItem (see page 470)	This is FindNextVisibleItem, a member of class TCustomActionBar.
V	FindPrevious (see page 470)	This is FindPrevious, a member of class TCustomActionBar.
	FindPreviousVisibleItem (see page 470)	This is FindPreviousVisibleItem, a member of class TCustomActionBar.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
V	GetActionControl (see page 471)	This is GetActionControl, a member of class TCustomActionBar.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.

	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetBannerWidth (see page 471)	This is GetBannerWidth, a member of class TCustomActionBar.
	GetBarHeight (see page 471)	This is GetBarHeight, a member of class TCustomActionBar.
	GetBarWidth (see page 471)	This is GetBarWidth, a member of class TCustomActionBar.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlClass (see page 165)	This is GetControlClass, a member of class TCustomActionToolBar.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDefaultColorMapClass (see page 472)	This is GetDefaultColorMapClass, a member of class TCustomActionBar.
	GetDesignMode (see page 472)	This is GetDesignMode, a member of class TCustomActionBar.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 147)	Returns the class used for the control when it is floating.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupClass (see page 166)	This is GetPopupClass, a member of class TCustomActionToolBar.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetPopupMenuClass (see page 472)	This is GetPopupMenuClass, a member of class TCustomActionBar.
	GetScrollBtnClass (see page 166)	This is GetScrollBtnClass, a member of class TCustomActionToolBar.
	GetSiteInfo (see page 147)	Generates an OnGetSiteInfo event
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasItems (see page 472)	This is HasItems, a member of class TCustomActionBar.
	HideUnusedItems (see page 166)	This is HideUnusedItems, a member of class TCustomActionToolBar.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	ItemCount (see page 473)	This is ItemCount, a member of class TCustomActionBar.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.

	Loaded (see page 148)	Initializes the control after it is loaded from a stream.
	Loaded (see page 473)	Initializes the control after it is loaded from a stream.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	NCPaint (see page 473)	This is NCPaint, a member of class TCustomActionBar.
	NCPaint (see page 23286)	This is NCPaint, a member of class TToolWindow.
	Notification (see page 473)	Responds to notifications that components are being created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 474)	This is Paint, a member of class TCustomActionBar.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 474)	Renders the image of a windowed control.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Reset (see page 166)	This is Reset, a member of class TCustomActionToolBar.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	ScrollBtnClick (see page 166)	This is ScrollBtnClick, a member of class TCustomActionToolBar.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 475)	This is SetActionClient, a member of class TCustomActionBar.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetAutoSizing (see page 475)	This is SetAutoSizing, a member of class TCustomActionBar.
	SetBiDiMode (see page 475)	Sets the control's bi-directional mode.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.

	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetColorMap (see page 476)	This is SetColorMap, a member of class TCustomActionBar.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignMode (see page 476)	This is SetDesignMode, a member of class TCustomActionBar.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetOrientation (see page 167)	This is SetOrientation, a member of class TCustomActionToolBar.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetPersistentHotKeys (see page 477)	This is SetPersistentHotKeys, a member of class TCustomActionBar.
	SetSpacing (see page 477)	This is SetSpacing, a member of class TCustomActionBar.
	SetupDefaultColorMap (see page 477)	This is SetupDefaultColorMap, a member of class TCustomActionBar.
	SetupDropDownBtn (see page 167)	This is SetupDropDownBtn, a member of class TCustomActionToolBar.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 478)	Provides the interface for a method that responds to changes in the control's visibility.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMNCCalcSize (see page 23286)	This is WMNCCalcSize, a member of class TToolWindow.
	WMNCPaint (see page 23286)	This is WMNCPaint, a member of class TToolWindow.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.

	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
R	HRowCount (see page 488)	Indicates the number of columns of items that the action band displays.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Items (see page 488)	Lists the action clients that correspond to the child controls of this action band.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
R	VRowCount (see page 490)	Indicates the number of rows of items that the action band displays.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
R	Widest (see page 491)	This is Widest, a member of class TCustomActionBar.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnControlCreated (see page 491)	Occurs when a control is created on the action band.
	OnGetControlClass (see page 492)	Occurs when an item is to be placed on the action band.
	OnPaint (see page 492)	Occurs when the action band is painted.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
V	CalcDockedWidth (see page 163)	This is CalcDockedWidth, a member of class TCustomActionToolBar.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 161)	Creates and initializes a TCustomActionToolBar (see page 148) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 162)	Destroys an instance of TCustomActionToolBar (see page 148).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Dock (see page 146)	Used internally to dock the action band.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
V	DragDrop (see page 164)	Generates an OnDragDrop event.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.

	FindFirst (see page 467)	Finds the first TActionClientItem (see page 374) in the Items (see page 488) list.
	FindFirstVisibleItem (see page 468)	Finds the first visible TActionClientItem (see page 374) in the Items (see page 488) list.
	FindLastVisibleItem (see page 469)	Finds the last visibleTActionClientItem in the Items (see page 488) list.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	Realign (see page 6171)	Forces the control to realign children.
V	RecreateControls (see page 475)	Destroys and recreates all of the action band's action client controls.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 167)	Sets the Left, Top, Width, and Height properties in a single operation.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Style (see page 477)	Identifies the style object that gives the application its default look and feel.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	ActionClient (see page 479)	Specifies the action client associated with this action band.
R	ActionControls (see page 479)	Lists the controls on the action band.
	ActionManager (see page 480)	Specifies the action manager component that is associated with the action band.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	AllowHiding (see page 480)	Determines whether the action band can be hidden.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AutoSizing (see page 480)	Specifies whether the action band adjusts its size automatically to fit around its child controls.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 481)	Represents the drawing surface of the action band.
	Caption (see page 481)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.

R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	Color (see page 483)	Specifies the background color of the control.
	ColorMap (see page 484)	Indicates the colormap for individual action band components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ContextBar (see page 485)	Indicates whether items shown in this action band represent the items in a popup menu.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Designable (see page 485)	Specifies whether the action band can be customized (used internally by the IDE).
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignMode (see page 486)	Specifies whether the action band is being customized or being used in the IDE.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	EdgeBorders (see page 23287)	Determines which sides of the control have visible borders.
	EdgeInner (see page 23287)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 23288)	Determines the border style for the control's outer edge.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	Font (see page 486)	Controls the attributes of text written on or in the control.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
R	HiddenCount (see page 168)	Indicates the number of hidden items on the tool action band.
	HorzMargin (see page 487)	Specifies the width of the horizontal margins in pixels.
	HorzSeparator (see page 487)	Indicates whether a horizontal separator bar appears between item lines.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	Orientation (see page 488)	Specifies how the action band lays out its child items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.

	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	PersistentHotKeys (see page 489)	Specifies whether keyboard accelerator shortcuts are always displayed.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	Spacing (see page 489)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	VertMargin (see page 490)	Specifies the width of the vertical margins in pixels.
	VertSeparator (see page 490)	Indicates whether a vertical separator bar should appear between item lines.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

2.1.4.2 TCustomActionToolBar.Create Constructor

Creates and initializes a TCustomActionToolBar (see page 148) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomActionToolBar(TComponent * AOwner);
```

Description

Create generates a TCustomActionToolBar (see page 148) and initializes its properties.

```
__fastcall virtual TCustomActionToolBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall (HWND ParentWindow) : Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

2.1.4.3 TCustomActionToolBar.Destroy Destructor

Destroys an instance of TCustomActionToolBar (see page 148).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomActionToolBar();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TCustomActionToolBar (see page 148) reference is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

Destroy (see page 5732)

2.1.4.4 TCustomActionToolBar Methods

The methods of the TCustomActionToolBar class are listed here.

Protected Methods

	Name	Description
V	AutoSizingChanged (see page 163)	This is AutoSizingChanged, a member of class TCustomActionToolBar.
	CalcButtonWidth (see page 163)	This is CalcButtonWidth, a member of class TCustomActionToolBar.
	CMColorchanged (see page 163)	This is CMColorchanged, a member of class TCustomActionToolBar.
V	CreateControl (see page 163)	This is CreateControl, a member of class TCustomActionToolBar.
V	CreateControls (see page 164)	This is CreateControls, a member of class TCustomActionToolBar.
	DisableHiding (see page 164)	This is DisableHiding, a member of class TCustomActionToolBar.
V	DoDropCategory (see page 164)	This is DoDropCategory, a member of class TCustomActionToolBar.
V	DrawBackground (see page 165)	This is DrawBackground, a member of class TCustomActionToolBar.
V	DrawSeparator (see page 165)	This is DrawSeparator, a member of class TCustomActionToolBar.
	EnableHiding (see page 165)	This is EnableHiding, a member of class TCustomActionToolBar.
V	GetControlClass (see page 165)	This is GetControlClass, a member of class TCustomActionToolBar.
V	GetPopupClass (see page 166)	This is GetPopupClass, a member of class TCustomActionToolBar.
	GetScrollBtnClass (see page 166)	This is GetScrollBtnClass, a member of class TCustomActionToolBar.
	HideUnusedItems (see page 166)	This is HideUnusedItems, a member of class TCustomActionToolBar.
V	Reset (see page 166)	This is Reset, a member of class TCustomActionToolBar.
	ScrollBtnClick (see page 166)	This is ScrollBtnClick, a member of class TCustomActionToolBar.
V	SetOrientation (see page 167)	This is SetOrientation, a member of class TCustomActionToolBar.
	SetupDropDownBtn (see page 167)	This is SetupDropDownBtn, a member of class TCustomActionToolBar.

Public Methods

	Name	Description
V	CalcDockedWidth (see page 163)	This is CalcDockedWidth, a member of class TCustomActionToolBar.
V	DragDrop (see page 164)	Generates an OnDragDrop event.
V	SetBounds (see page 167)	Sets the Left, Top, Width, and Height properties in a single operation.

2.1.4.4.1 TCustomActionToolBar.AutoSizingChanged Method

Pascal

```
procedure AutoSizingChanged; override;
```

C++

```
virtual __fastcall AutoSizingChanged();
```

Description

This is AutoSizingChanged, a member of class TCustomActionToolBar.

2.1.4.4.2 TCustomActionToolBar.CalcButtonWidth Method

Pascal

```
function CalcButtonWidth: Integer;
```

C++

```
__fastcall int CalcButtonWidth();
```

Description

This is CalcButtonWidth, a member of class TCustomActionToolBar.

2.1.4.4.3 TCustomActionToolBar.CalcDockedWidth Method

Pascal

```
function CalcDockedWidth: Integer; override;
```

C++

```
virtual __fastcall int CalcDockedWidth();
```

Description

This is CalcDockedWidth, a member of class TCustomActionToolBar.

2.1.4.4.4 TCustomActionToolBar.CMColorchanged Method

Pascal

```
procedure CMColorchanged(var Message: TMessage); message CM_COLORCHANGED;
```

C++

```
__fastcall CMColorchanged(TMessage Message);
```

Description

This is CMColorchanged, a member of class TCustomActionToolBar.

2.1.4.4.5 TCustomActionToolBar.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TCustomActionToolBar.

2.1.4.4.6 TCustomActionToolBar.CreateControls Method

Pascal

```
procedure CreateControls; override;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TCustomActionToolBar.

2.1.4.4.7 TCustomActionToolBar.DisableHiding Method

Pascal

```
procedure DisableHiding;
```

C++

```
__fastcall DisableHiding();
```

Description

This is DisableHiding, a member of class TCustomActionToolBar.

2.1.4.4.8 TCustomActionToolBar.DoDropCategory Method

Pascal

```
procedure DoDropCategory(Source: TCategoryDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropCategory(TCategoryDragObject Source, const int X, const int Y);
```

Description

This is DoDropCategory, a member of class TCustomActionToolBar.

2.1.4.4.9 TCustomActionToolBar.DragDrop Method

Generates an OnDragDrop event.

Pascal

```
procedure DragDrop(Source: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DragDrop(TObject * Source, int X, int Y);
```

Description

DragDrop is called automatically when the user drags and drops a control onto the tool bar. This method generates an OnDragDrop event, and then updates its list of hidden controls to reflect the presence of the new child control.

Source is the dragged control that is dropped onto the tool bar.

X and Y are the mouse coordinates where Source was dropped.

See Also

DragCanceled (see page 5754)

OnDragDrop (see page 5855)

HiddenCount (see page 168)

2.1.4.4.10 TCustomActionToolBar.DrawBackground Method

Pascal

```
procedure DrawBackground; override;
```

C++

```
virtual __fastcall DrawBackground();
```

Description

This is DrawBackground, a member of class TCustomActionToolBar.

2.1.4.4.11 TCustomActionToolBar.DrawSeparator Method

Pascal

```
procedure DrawSeparator(const Pos: Integer; const Offset: Integer); virtual;
```

C++

```
virtual __fastcall DrawSeparator(const int Pos, const int Offset);
```

Description

This is DrawSeparator, a member of class TCustomActionToolBar.

2.1.4.4.12 TCustomActionToolBar.EnableHiding Method

Pascal

```
procedure EnableHiding;
```

C++

```
__fastcall EnableHiding();
```

Description

This is EnableHiding, a member of class TCustomActionToolBar.

2.1.4.4.13 TCustomActionToolBar.GetControlClass Method

Pascal

```
function GetControlClass(AnItem: TActionClientItem): TCustomActionControlClass; override;
```

C++

```
virtual __fastcall TCustomActionControlClass GetControlClass(TActionClientItem AnItem);
```

Description

This is GetControlClass, a member of class TCustomActionToolBar.

2.1.4.4.14 TCustomActionToolBar.GetPopupClass Method

Pascal

```
function GetPopupClass: TCustomActionBarClass; virtual;
```

C++

```
virtual __fastcall TCustomActionBarClass GetPopupClass();
```

Description

This is GetPopupClass, a member of class TCustomActionToolBar.

2.1.4.4.15 TCustomActionToolBar.GetScrollBtnClass Method

Pascal

```
function GetScrollBtnClass: TCustomToolScrollBtnClass;
```

C++

```
__fastcall TCustomToolScrollBtnClass GetScrollBtnClass();
```

Description

This is GetScrollBtnClass, a member of class TCustomActionToolBar.

2.1.4.4.16 TCustomActionToolBar.HideUnusedItems Method

Pascal

```
procedure HideUnusedItems;
```

C++

```
__fastcall HideUnusedItems();
```

Description

This is HideUnusedItems, a member of class TCustomActionToolBar.

2.1.4.4.17 TCustomActionToolBar.Reset Method

Pascal

```
procedure Reset; override;
```

C++

```
virtual __fastcall Reset();
```

Description

This is Reset, a member of class TCustomActionToolBar.

2.1.4.4.18 TCustomActionToolBar.ScrollBtnClick Method

Pascal

```
procedure ScrollBtnClick(Sender: TObject);
```

C++

```
__fastcall ScrollBtnClick(TObject * Sender);
```

Description

This is ScrollBtnClick, a member of class TCustomActionToolBar.

2.1.4.4.19 TCustomActionToolBar.SetBounds Method

Sets the Left, Top, Width, and Height properties in a single operation.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the component's boundary properties at one time. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately, but SetBounds changes all four properties at once, ensuring that the tool bar will not repaint between changes.

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

SetBounds overrides the inherited method to manage the hidden controls properly when the toolbar is resized.

See Also

SetBounds (see page 6178)

Left (see page 5830)

Top (see page 5844)

Width (see page 5849)

Height (see page 5825)

HiddenCount (see page 168)

2.1.4.4.20 TCustomActionToolBar.SetOrientation Method

Pascal

```
procedure SetOrientation(const Value: TBarOrientation); override;
```

C++

```
virtual __fastcall SetOrientation(const TBarOrientation Value);
```

Description

This is SetOrientation, a member of class TCustomActionToolBar.

2.1.4.4.21 TCustomActionToolBar.SetupDropDownBtn Method

Pascal

```
procedure SetupDropDownBtn;
```

C++

```
__fastcall SetupDropDownBtn();
```

Description

This is SetupDropDownBtn, a member of class TCustomActionToolBar.

2.1.4.5 TCustomActionToolBar Properties

The properties of the TCustomActionToolBar class are listed here.

Public Properties

	Name	Description
R	HiddenCount (see page 168)	Indicates the number of hidden items on the tool action band.

2.1.4.5.1 TCustomActionToolBar.HiddenCount Property

Indicates the number of hidden items on the tool action band.

Pascal

```
property HiddenCount: Integer;
```

C++

```
__property int HiddenCount;
```

Description

Access HiddenCount to determine how many of the action tool bar's items are hidden. Hidden items are items that do not appear on the tool bar because the user has not used them recently. When HiddenCount is greater than 0, the tool bar displays an indicator that the user can click to display the hidden items.

See Also

ActionControls (see page 479)

AllowHiding (see page 480)

2.1.5 TCustomButtonControl Class

TCustomButtonControl is the base class for ActionBand button controls.

Class Hierarchy

Pascal

```
TCustomButtonControl = class(TCustomActionControl);
```

C++

```
class TCustomButtonControl : public TCustomActionControl;
```

File

ActnCtrls

Description

TCustomButtonControl is a base class for several ActionBand components. Most notably, the standard menu button (TStandardMenuButton) derives from this class.

Do not create instances of TCustomButtonControl. If you would like to replace the standard menu button behaviors, use the class TCustomMenuButton as a parent class for your replacement class.

See Also

TCustomMenuButton (see page 790)

TCustomMenuItem (see page 816)

TStandardMenuButton (see page 20444)

TStandardMenuItem (see page 20465)

2.1.5.1 TCustomButtonControl Members

The following tables list the members exposed by TCustomButtonControl.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.

	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFlat (see page 178)	This is FFlat, a member of class TCustomButtonControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FState (see page 178)	This is FState, a member of class TCustomButtonControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMDialogChar (see page 180)	This is CMDialogChar, a member of class TCustomButtonControl.
	CMEnabledChanged (see page 180)	This is CMEnabledChanged, a member of class TCustomButtonControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
	CMMouseEnter (see page 180)	This is CMMouseEnter, a member of class TCustomButtonControl.
	CMMouseLeave (see page 180)	This is CMMouseLeave, a member of class TCustomButtonControl.
	CMTextChanged (see page 180)	This is CMTextChanged, a member of class TCustomButtonControl.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
V	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.

	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 521)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
V	DrawBackground (see page 181)	Draws a background image on the control.
V	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
V	DrawFrame (see page 181)	This is DrawFrame, a member of class TCustomButtonControl.
V	DrawGlyph (see page 522)	Draws a symbol on the control.
V	DrawLargeGlyph (see page 181)	This is DrawLargeGlyph, a member of class TCustomButtonControl.
V	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
V	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
V	DrawText (see page 523)	Draws text on the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
V	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
V	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
V	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
V	GetShowShortCut (see page 181)	This is GetShowShortCut, a member of class TCustomButtonControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
V	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.

	Loaded (see page 182)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 182)	OnMouseDown event dispatcher.
	MouseMove (see page 183)	Respond to mouse moving over control area..
	MouseUp (see page 183)	OnMouseUp event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Paint (see page 184)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 184)	This is SetActionClient, a member of class TCustomButtonControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetGlyphLayout (see page 185)	This is SetGlyphLayout, a member of class TCustomButtonControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelected (see page 185)	This is SetSelected, a member of class TCustomButtonControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMLButtonDblClk (see page 185)	This is WMLButtonDblClk, a member of class TCustomButtonControl.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseInControl (see page 189)	This is MouseInControl, a member of class TCustomButtonControl.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
V	CalcBounds (see page 179)	Calculates the size of the control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 179)	Executes the control's function.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 177)	Creates an instance of TCustomButtonControl (see page 168).
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 516)	Destroys an instance of TCustomActionControl (see page 507).
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
V	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.

	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	Keyed (see page 525)	Executes the control's function in response to a keyboard action.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
	SetBounds (see page 184)	Sets the Left, Top, Width, and Height properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).

	AllowAllUp (see page 186)	Indicates whether all the buttons in a given group can be up at the same time.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 186)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	Down (see page 189)	Tells whether the button is down (selected) or up (unselected).
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
	Flat (see page 189)	Dictates whether the button should have a 2D look instead of the usual 3D look.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	Selected (see page 533)	Indicates whether the control is currently selected.
R	Separator (see page 533)	Indicates whether the control is a separator.
	ShowCaption (see page 189)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
	ShowShortCut (see page 190)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	State (see page 190)	Describes the current state of the button.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.

	TrackButton (see page 190)	Specifies which mouse button activates the button control.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

2.1.5.2 TCustomButtonControl.Create Constructor

Creates an instance of TCustomButtonControl (see page 168).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomButtonControl(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomButtonControl (see page 168). However, you should never attempt to instantiate a TCustomButtonControl (see page 168). This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the button control. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner (see page 2807)

Create (see page 5731)

Destroy

2.1.5.3 TCustomButtonControl Fields

The fields of the TCustomButtonControl class are listed here.

Protected Fields

	Name	Description
	FFlat (see page 178)	This is FFlat, a member of class TCustomButtonControl.
	FState (see page 178)	This is FState, a member of class TCustomButtonControl.

2.1.5.3.1 TCustomButtonControl.FFlat Field

Pascal

```
FFlat: Boolean;
```

C++

```
Boolean FFlat;
```

Description

This is FFlat, a member of class TCustomButtonControl.

2.1.5.3.2 TCustomButtonControl.FState Field

Pascal

```
FState: TButtonState;
```

C++

```
TButtonState FState;
```

Description

This is FState, a member of class TCustomButtonControl.

2.1.5.4 TCustomButtonControl Methods

The methods of the TCustomButtonControl class are listed here.

Protected Methods

	Name	Description
	CMDialogChar (see page 180)	This is CMDialogChar, a member of class TCustomButtonControl.
	CMEnabledChanged (see page 180)	This is CMEnabledChanged, a member of class TCustomButtonControl.
	CMMouseEnter (see page 180)	This is CMMouseEnter, a member of class TCustomButtonControl.
	CMMouseLeave (see page 180)	This is CMMouseLeave, a member of class TCustomButtonControl.
	CMTextChanged (see page 180)	This is CMTextChanged, a member of class TCustomButtonControl.
V	DrawBackground (see page 181)	Draws a background image on the control.
V	DrawFrame (see page 181)	This is DrawFrame, a member of class TCustomButtonControl.
V	DrawLargeGlyph (see page 181)	This is DrawLargeGlyph, a member of class TCustomButtonControl.
V	GetShowShortCut (see page 181)	This is GetShowShortCut, a member of class TCustomButtonControl.
V	Loaded (see page 182)	Initializes the control after it is loaded from a stream.
V	MouseDown (see page 182)	OnMouseDown event dispatcher.
V	MouseMove (see page 183)	Respond to mouse moving over control area..
V	MouseUp (see page 183)	OnMouseUp event dispatcher.

	Paint (see page 184)	Render control surface.
	SetActionClient (see page 184)	This is SetActionClient, a member of class TCustomButtonControl.
	SetGlyphLayout (see page 185)	This is SetGlyphLayout, a member of class TCustomButtonControl.
	SetSelected (see page 185)	This is SetSelected, a member of class TCustomButtonControl.
	WMLButtonDblClk (see page 185)	This is WMLButtonDblClk, a member of class TCustomButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 179)	Calculates the size of the control.
	Click (see page 179)	Executes the control's function.
	SetBounds (see page 184)	Sets the Left, Top, Width, and Height properties all at once.

2.1.5.4.1 TCustomButtonControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds (see page 518)

2.1.5.4.2 TCustomButtonControl.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl is almost identical to the inherited method. The only difference is that if the button control is being manipulated at design time, extra actions are taken to ensure that the control is properly selected.

See Also

Click (see page 518)

Click (see page 5743)

UsageCount (see page 388)

2.1.5.4.3 TCustomButtonControl.CMDialogChar Method

Pascal

```
procedure CMDialogChar(var Message: TCMDialogChar); message CM_DIALOGCHAR;
```

C++

```
__fastcall CMDialogChar(TCMDialogChar Message);
```

Description

This is CMDialogChar, a member of class TCustomButtonControl.

2.1.5.4.4 TCustomButtonControl.CMEnabledChanged Method

Pascal

```
procedure CMEnabledChanged(var Message: TMessage); message CM_ENABLEDCHANGED;
```

C++

```
__fastcall CMEnabledChanged(TMessage Message);
```

Description

This is CMEnabledChanged, a member of class TCustomButtonControl.

2.1.5.4.5 TCustomButtonControl.CMMouseEnter Method

Pascal

```
procedure CMMouseEnter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseEnter(TMessage Message);
```

Description

This is CMMouseEnter, a member of class TCustomButtonControl.

2.1.5.4.6 TCustomButtonControl.CMMouseLeave Method

Pascal

```
procedure CMMouseLeave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseLeave(TMessage Message);
```

Description

This is CMMouseLeave, a member of class TCustomButtonControl.

2.1.5.4.7 TCustomButtonControl.CMTextChanged Method

Pascal

```
procedure CMTextChanged(var Message: TMessage); message CM_TEXTCHANGED;
```

C++

```
__fastcall CMTextChanged(TMessage Message);
```

Description

This is CMTextChanged, a member of class TCustomButtonControl.

2.1.5.4.8 TCustomButtonControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph (see page 522)

DrawText (see page 523)

2.1.5.4.9 TCustomButtonControl.DrawFrame Method

Pascal

```
procedure DrawFrame(ARect: TRect; Down: Boolean); virtual;
```

C++

```
virtual __fastcall DrawFrame(TRect ARect, Boolean Down);
```

Description

This is DrawFrame, a member of class TCustomButtonControl.

2.1.5.4.10 TCustomButtonControl.DrawLargeGlyph Method

Pascal

```
procedure DrawLargeGlyph(Location: TPoint); override;
```

C++

```
virtual __fastcall DrawLargeGlyph(TPoint Location);
```

Description

This is DrawLargeGlyph, a member of class TCustomButtonControl.

2.1.5.4.11 TCustomButtonControl.GetShowShortCut Method

Pascal

```
function GetShowShortCut: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetShowShortCut();
```

Description

This is GetShowShortCut, a member of class TCustomButtonControl.

2.1.5.4.12 TCustomButtonControl.Loaded Method

Initializes the control after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the control's form is loaded into memory so that the control can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method in order to initialize the control from its associated Action. To change the properties the control copies from its action, override the ActionChange method.

See Also

Loaded (see page 2782)

Action (see page 5797)

ActionChange (see page 5737)

2.1.5.4.13 TCustomButtonControl.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

See Also

MouseMove (see page 5773)

MouseUp (see page 5774)

OnMouseDown (see page 5862)

2.1.5.4.14 TCustomButtonControl.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

See Also

MouseDown (see page 5773)

MouseUp (see page 5774)

OnMouseMove (see page 5865)

2.1.5.4.15 TCustomButtonControl.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

See Also

MouseDown (see page 5773)

MouseMove (see page 5773)

OnMouseUp (see page 5867)

2.1.5.4.16 TCustomButtonControl.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas (see page 6053)

2.1.5.4.17 TCustomButtonControl.SetActionClient Method

Pascal

```
procedure SetActionClient(Value: TActionClientItem); override;
```

C++

```
virtual __fastcall SetActionClient(TActionClientItem Value);
```

Description

This is SetActionClient, a member of class TCustomButtonControl.

2.1.5.4.18 TCustomButtonControl.SetBounds Method

Sets the Left, Top, Width, and Height properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

This override of the method inherited from TControl simultaneously sets all boundary properties at once, and thus avoiding the possibility of a control redraw between the time one value sets and another. In addition, some layout calculations are also performed.

See Also

SetBounds (see page 5783)

2.1.5.4.19 TCustomButtonControl.SetGlyphLayout Method

Pascal

```
procedure SetGlyphLayout(const Value: TButtonLayout); override;
```

C++

```
virtual __fastcall SetGlyphLayout(const TButtonLayout Value);
```

Description

This is SetGlyphLayout, a member of class TCustomButtonControl.

2.1.5.4.20 TCustomButtonControl.SetSelected Method

Pascal

```
procedure SetSelected(Value: Boolean); override;
```

C++

```
virtual __fastcall SetSelected(Boolean Value);
```

Description

This is SetSelected, a member of class TCustomButtonControl.

2.1.5.4.21 TCustomButtonControl.WMLButtonDblClk Method

Pascal

```
procedure WMLButtonDblClk(var Message: TWMLButtonDown); message WM_LBUTTONDBLCLK;
```

C++

```
__fastcall WMLButtonDblClk(TWMLButtonDown Message);
```

Description

This is WMLButtonDblClk, a member of class TCustomButtonControl.

2.1.5.5 TCustomButtonControl Properties

The properties of the TCustomButtonControl class are listed here.

Protected Properties

	Name	Description
	MouseInControl (see page 189)	This is MouseInControl, a member of class TCustomButtonControl.

Public Properties

	Name	Description
	AllowAllUp (see page 186)	Indicates whether all the buttons in a given group can be up at the same time.
	Caption (see page 186)	Specifies a text string that identifies the control to the user.
	Down (see page 189)	Tells whether the button is down (selected) or up (unselected).
	Flat (see page 189)	Dictates whether the button should have a 2D look instead of the usual 3D look.
	ShowCaption (see page 189)	Indicates whether the control's caption should be shown.
	ShowShortCut (see page 190)	Indicates whether the control's short cut should be shown.
	State (see page 190)	Describes the current state of the button.
	TrackButton (see page 190)	Specifies which mouse button activates the button control.

2.1.5.5.1 TCustomButtonControl.AllowAllUp Property

Indicates whether all the buttons in a given group can be up at the same time.

Pascal

```
property AllowAllUp: Boolean;
```

C++

```
__property Boolean AllowAllUp;
```

Description

Set AllowAllUp to true to allow all buttons in a given group to be deselected simultaneously. If AllowAllUp is false, then the button group in question must have exactly one button selected at any given time. Groups of buttons designed this way are sometimes called "radio buttons."

See Also

AllowAllUp (see page 2354)

AllowAllUp (see page 5127)

2.1.5.5.2 TCustomButtonControl.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
```

```
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
```

```
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

2.1.5.5.3 TCustomButtonControl.Down Property

Tells whether the button is down (selected) or up (unselected).

Pascal

```
property Down: Boolean;
```

C++

```
__property Boolean Down;
```

Description

Use Down to determine if the button is down or not. This property can also be used to change the state of the button by changing its value. This property works the same as the Down properties in TSpeedButton and TToolButton.

See Also

Down (see page 2357)

Down (see page 5128)

2.1.5.5.4 TCustomButtonControl.Flat Property

Dictates whether the button should have a 2D look instead of the usual 3D look.

Pascal

```
property Flat: Boolean;
```

C++

```
__property Boolean Flat;
```

Description

Set Flat to true if you want the button to display the button without the edge bevel that gives buttons a 3D look. This property's behavior should be identical to that of the Flat property of TSpeedButton.

See Also

Flat (see page 2357)

2.1.5.5.5 TCustomButtonControl.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TCustomButtonControl.

2.1.5.5.6 TCustomButtonControl.ShowCaption Property

Indicates whether the control's caption should be shown.

Pascal

```
property ShowCaption: Boolean;
```

C++

```
__property Boolean ShowCaption;
```

Description

Read ShowCaption to determine whether or not the custom action control's caption, a text description of the control's function, should be shown.

2.1.5.5.7 TCustomButtonControl.ShowShortCut Property

Indicates whether the control's short cut should be shown.

Pascal

```
property ShowShortCut: Boolean;
```

C++

```
__property Boolean ShowShortCut;
```

Description

Read ShowShortCut to determine whether or not the custom action control's short cut keystrokes should be shown.

2.1.5.5.8 TCustomButtonControl.State Property

Describes the current state of the button.

Pascal

```
property State: TButtonState;
```

C++

```
__property TButtonState State;
```

Description

Use State as an indicator of the state of the button control. The possible values are as follows:

Value	State Description
bsUp	The button control is up, or unselected.
bsDisabled	The button is not enabled, which generally means it is greyed out. It cannot be selected by the user.
bsDown	The button control is down, or selected.
bsExclusive	The button is a "radio button." It is one of a group of buttons, exactly one of which must be selected at any given time. Selecting another button will cause the previously selected button to become deselected.

2.1.5.5.9 TCustomButtonControl.TrackButton Property

Specifies which mouse button activates the button control.

Pascal

```
property TrackButton: TMouseButton;
```

C++

```
__property TMouseButton TrackButton;
```

Description

Use TrackButton to specify which mouse button activates the button control.

See Also

TMouseButton (see page 6288)

2.1.6 TCustomComboControl Class

Class Hierarchy

Pascal

```
TCustomComboControl = class(TCustomActionControl);
```

C++

```
class TCustomComboControl : public TCustomActionControl;
```

File

ActnCtrls

Description

This is class ActnCtrls.TCustomComboControl.

2.1.6.1 TCustomComboControl Members

The following tables list the members exposed by TCustomComboControl.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.

	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
	CMVisiblechanged (see page 201)	This is CMVisiblechanged, a member of class TCustomComboControl.
	ComboClick (see page 202)	This is ComboClick, a member of class TCustomComboControl.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 521)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawBackground (see page 521)	Draws a background image on the control.
	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
	DrawGlyph (see page 522)	Draws a symbol on the control.
	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.
	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
	DrawText (see page 523)	Draws text on the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.

	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Paint (see page 202)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 202)	This is SetActionClient, a member of class TCustomComboControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 203)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 204)	Sets the parent of the control.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.

	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	VisibleChanging (see page 204)	Provides the interface for a method that responds to changes in the control's visibility.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
V	CalcBounds (see page 201)	Calculates the size of the control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 201)	Executes the control's function in response to a mouse click.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 199)	Creates an instance of TCustomActionControl.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 200)	Destroys an instance of TCustomActionControl.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
V	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	Keyed (see page 525)	Executes the control's function in response to a keyboard action.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
	SetBounds (see page 202)	Sets the Left, Top, Width, and Height properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.

	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComboBox (see page 205)	This is ComboBox, a member of class TCustomComboControl.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	Selected (see page 533)	Indicates whether the control is currently selected.
R	Separator (see page 533)	Indicates whether the control is a separator.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.

	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

2.1.6.2 TCustomComboControl.Create Constructor

Creates an instance of TCustomActionControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomComboControl(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomActionControl. However, you should never attempt to instantiate a TCustomActionControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the TCustomActionControl instance. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner (see page 2807)

Create (see page 5731)

Destroy (see page 516)

2.1.6.3 TCustomComboControl.Destroy Destructor

Destroys an instance of TCustomActionControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomComboControl();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

Create (see page 515)

Free (see page 22300)

2.1.6.4 TCustomComboControl Methods

The methods of the TCustomComboControl class are listed here.

Protected Methods

	Name	Description
	CMVisiblechanged (see page 201)	This is CMVisiblechanged, a member of class TCustomComboControl.
	ComboClick (see page 202)	This is ComboClick, a member of class TCustomComboControl.
V	Paint (see page 202)	Render control surface.
V	SetActionClient (see page 202)	This is SetActionClient, a member of class TCustomComboControl.
V	SetDragMode (see page 203)	Sets the drag mode for the control.
V	SetParent (see page 204)	Sets the parent of the control.
V	VisibleChanging (see page 204)	Provides the interface for a method that responds to changes in the control's visibility.

Public Methods

	Name	Description
V	CalcBounds (see page 201)	Calculates the size of the control.

	Click (see page 201)	Executes the control's function in response to a mouse click.
	SetBounds (see page 202)	Sets the Left, Top, Width, and Height properties all at once.

2.1.6.4.1 TCustomComboControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as the presence of an icon, caption, and shortcuts. CalcBounds computes the boundaries of the control considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds (see page 5783)

2.1.6.4.2 TCustomComboControl.Click Method

Executes the control's function in response to a mouse click.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TControl executes the control's function in response to a user's mouse click. Usage data, which is used to determine whether a control is used frequently enough to be shown by default, is updated as well.

See Also

Click (see page 5743)

UsageCount (see page 388)

Keyed (see page 525)

2.1.6.4.3 TCustomComboControl.CMVisiblechanged Method

Pascal

```
procedure CMVisiblechanged(var Message: TMessage); message CM_VISIBLECHANGED;
```

C++

```
__fastcall CMVisiblechanged(TMessage Message);
```

Description

This is CMVisiblechanged, a member of class TCustomComboControl.

2.1.6.4.4 TCustomComboControl.ComboClick Method

Pascal

```
procedure ComboClick(Sender: TObject);
```

C++

```
__fastcall ComboClick(TObject * Sender);
```

Description

This is ComboClick, a member of class TCustomComboControl.

2.1.6.4.5 TCustomComboControl.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas (see page 6053)

2.1.6.4.6 TCustomComboControl.SetActionClient Method

Pascal

```
procedure SetActionClient(Value: TActionClientItem); override;
```

C++

```
virtual __fastcall SetActionClient(TActionClientItem Value);
```

Description

This is SetActionClient, a member of class TCustomComboControl.

2.1.6.4.7 TCustomComboControl.SetBounds Method

Sets the Left, Top, Width, and Height properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the component's boundary properties at one time. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately, but SetBounds changes all four properties at once ensuring that the control will not repaint between changes.

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

Calling SetBounds does not necessarily result in the Left, Top, Width, and Height properties changing to the specified values. Before the properties are changed, the AutoSize or Constraints property may limit the changes, and an OnCanResize (or OnConstrainedResize) event handler may change the new values. After the control's Left, Top, Width, and Height properties are changed, SetBounds generates an OnResize event.

Note: Component writers can change the Left, Top, Width, and Height properties while bypassing all resize events and constraint or autosize logic by using the UpdateBoundsRect method instead.

See Also

Height (see page 5825)

Left (see page 5830)

Top (see page 5844)

Width (see page 5849)

BoundsRect (see page 5803)

AutoSize (see page 5803)

Constraints (see page 5812)

OnCanResize (see page 5851)

OnConstrainedResize (see page 5853)

OnResize (see page 5870)

UpdateBoundsRect (see page 5789)

2.1.6.4.8 TCustomComboControl.SetDragMode Method

Sets the drag mode for the control.

Pascal

```
procedure SetDragMode(Value: TDragMode); override;
```

C++

```
virtual __fastcall SetDragMode(TDragMode Value);
```

Description

SetDragMode is the protected write implementation for the DragMode property. Override SetDragMode to execute additional code when the value of the DragMode property changes.

See Also

DragMode (see page 5819)

2.1.6.4.9 TCustomComboControl.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

See Also

Destroy (see page 5732)

InsertControl (see page 6160)

Parent (see page 5832)

RemoveControl (see page 6172)

2.1.6.4.10 TCustomComboControl.VisibleChanging Method

Provides the interface for a method that responds to changes in the control's visibility.

Pascal

```
procedure VisibleChanging; override;
```

C++

```
virtual __fastcall VisibleChanging();
```

Description

VisibleChanging is called before the value of a control's Visible property changes. As implemented in TControl, it does nothing. Override VisibleChanging to respond to changes in the control's visibility. For example, if a control should not change its visibility, override VisibleChanging to raise an exception when an attempt is made to alter the control's visibility.

See Also

Visible (see page 5847)

2.1.6.5 TCustomComboControl Properties

The properties of the TCustomComboControl class are listed here.

Public Properties

	Name	Description
	ComboBox (see page 205)	This is ComboBox, a member of class TCustomComboControl.

2.1.6.5.1 TCustomComboControl.ComboBox Property

Pascal

```
property ComboBox: TCustomActionCombo;
```

C++

```
__property TCustomActionCombo ComboBox;
```

Description

This is ComboBox, a member of class TCustomComboControl.

2.1.7 TCustomDropDownButton Class

Class Hierarchy

Pascal

```
TCustomDropDownButton = class(TCustomButtonControl);
```

C++

```
class TCustomDropDownButton : public TCustomButtonControl;
```

File

ActnCtrls

Description

This is class ActnCtrls.TCustomDropDownButton.

2.1.7.1 TCustomDropDownButton Members

The following tables list the members exposed by TCustomDropDownButton.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.

	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFlat (see page 178)	This is FFlat, a member of class TCustomButtonControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FState (see page 178)	This is FState, a member of class TCustomButtonControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.

	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMDialogChar (see page 180)	This is CMDialogChar, a member of class TCustomButtonControl.
	CMEnabledChanged (see page 180)	This is CMEnabledChanged, a member of class TCustomButtonControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
	CMMouseEnter (see page 180)	This is CMMouseEnter, a member of class TCustomButtonControl.
	CMMouseLeave (see page 180)	This is CMMouseLeave, a member of class TCustomButtonControl.
	CMTextChanged (see page 180)	This is CMTextChanged, a member of class TCustomButtonControl.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
V	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 521)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
V	DrawBackground (see page 181)	Draws a background image on the control.
V	DrawBackground (see page 521)	Draws a background image on the control.
V	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
V	DrawFrame (see page 215)	This is DrawFrame, a member of class TCustomDropDownButton.
V	DrawGlyph (see page 522)	Draws a symbol on the control.
V	DrawLargeGlyph (see page 181)	This is DrawLargeGlyph, a member of class TCustomButtonControl.
V	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.
V	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
V	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
V	DrawText (see page 523)	Draws text on the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
V	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.

	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupClass (see page 215)	This is GetPopupClass, a member of class TCustomDropDownButton.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
	GetShowShortCut (see page 181)	This is GetShowShortCut, a member of class TCustomButtonControl.
	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
	Loaded (see page 182)	Initializes the control after it is loaded from a stream.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 216)	OnMouseDown event dispatcher.
	MouseMove (see page 183)	Respond to mouse moving over control area..
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseOverDropDown (see page 216)	This is MouseOverDropDown, a member of class TCustomDropDownButton.
	MouseUp (see page 183)	OnMouseUp event dispatcher.
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Paint (see page 216)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.

V	SetActionClient (see page 184)	This is SetActionClient, a member of class TCustomButtonControl.
V	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
V	SetGlyphLayout (see page 185)	This is SetGlyphLayout, a member of class TCustomButtonControl.
V	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetSelected (see page 185)	This is SetSelected, a member of class TCustomButtonControl.
V	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMLButtonDblClk (see page 185)	This is WMLButtonDblClk, a member of class TCustomButtonControl.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.

	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
R	DroppedDown (see page 217)	This is DroppedDown, a member of class TCustomDropDownButton.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseInControl (see page 189)	This is MouseInControl, a member of class TCustomButtonControl.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
V	CalcBounds (see page 214)	Calculates the size of the control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 215)	Executes the control's function.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 177)	Creates an instance of TCustomButtonControl (see page 168).
V	Create (see page 515)	Creates an instance of TCustomActionControl (see page 507).
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6051)	Creates an instance of TGraphicControl (see page 6044).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.

	Destroy (see page 516)	Destroys an instance of TCustomActionControl (see page 507).
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	DropDownClick (see page 215)	This is DropDownClick, a member of class TCustomDropDownButton.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.

	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
V	Keyed (see page 525)	Executes the control's function in response to a keyboard action.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 184)	Sets the Left, Top, Width, and Height properties all at once.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	AllowAllUp (see page 186)	Indicates whether all the buttons in a given group can be up at the same time.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 186)	Specifies a text string that identifies the control to the user.
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.

	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	Down (see page 189)	Tells whether the button is down (selected) or up (unselected).
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
	Flat (see page 189)	Dictates whether the button should have a 2D look instead of the usual 3D look.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	Selected (see page 533)	Indicates whether the control is currently selected.
R	Separator (see page 533)	Indicates whether the control is a separator.
	ShowCaption (see page 189)	Indicates whether the control's caption should be shown.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
	ShowShortCut (see page 190)	Indicates whether the control's short cut should be shown.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	State (see page 190)	Describes the current state of the button.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.
	TrackButton (see page 190)	Specifies which mouse button activates the button control.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

2.1.7.2 TCustomDropDownButton Methods

The methods of the TCustomDropDownButton class are listed here.

Protected Methods

	Name	Description
	DrawFrame (see page 215)	This is DrawFrame, a member of class TCustomDropDownButton.
	GetPopupClass (see page 215)	This is GetPopupClass, a member of class TCustomDropDownButton.
	MouseDown (see page 216)	OnMouseDown event dispatcher.
	MouseOverDropDown (see page 216)	This is MouseOverDropDown, a member of class TCustomDropDownButton.
	Paint (see page 216)	Render control surface.

Public Methods

	Name	Description
	CalcBounds (see page 214)	Calculates the size of the control.
	Click (see page 215)	Executes the control's function.
	DropDownClick (see page 215)	This is DropDownClick, a member of class TCustomDropDownButton.

2.1.7.2.1 TCustomDropDownButton.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds (see page 518)

2.1.7.2.2 TCustomDropDownButton.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl is almost identical to the inherited method. The only difference is that if the button control is being manipulated at design time, extra actions are taken to ensure that the control is properly selected.

See Also

Click (see page 518)

Click (see page 5743)

UsageCount (see page 388)

2.1.7.2.3 TCustomDropDownButton.DrawFrame Method

Pascal

```
procedure DrawFrame(ARect: TRect; Down: Boolean); override;
```

C++

```
virtual __fastcall DrawFrame(TRect ARect, Boolean Down);
```

Description

This is DrawFrame, a member of class TCustomDropDownButton.

2.1.7.2.4 TCustomDropDownButton.DropDownClick Method

Pascal

```
procedure DropDownClick; virtual;
```

C++

```
virtual __fastcall DropDownClick();
```

Description

This is DropDownClick, a member of class TCustomDropDownButton.

2.1.7.2.5 TCustomDropDownButton.GetPopupClass Method

Pascal

```
function GetPopupClass: TCustomActionBarClass; virtual;
```

C++

```
virtual __fastcall TCustomActionBarClass GetPopupClass();
```

Description

This is GetPopupClass, a member of class TCustomDropDownButton.

2.1.7.2.6 TCustomDropDownButton.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

See Also

MouseMove (see page 5773)

MouseUp (see page 5774)

OnMouseDown (see page 5862)

2.1.7.2.7 TCustomDropDownButton.MouseOverDropDown Method

Pascal

```
function MouseOverDropDown: Boolean;
```

C++

```
__fastcall Boolean MouseOverDropDown();
```

Description

This is MouseOverDropDown, a member of class TCustomDropDownButton.

2.1.7.2.8 TCustomDropDownButton.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas (see page 6053)

2.1.7.3 TCustomDropDownButton Properties

The properties of the TCustomDropDownButton class are listed here.

Protected Properties

	Name	Description
	DroppedDown (see page 217)	This is DroppedDown, a member of class TCustomDropDownButton.

2.1.7.3.1 TCustomDropDownButton.DroppedDown Property

Pascal

```
property DroppedDown: Boolean;
```

C++

```
__property Boolean DroppedDown;
```

Description

This is DroppedDown, a member of class TCustomDropDownButton.

2.1.8 TCustomToolScrollBtn Class

Class Hierarchy

Pascal

```
TCustomToolScrollBtn = class(TCustomUtilityButton);
```

C++

```
class TCustomToolScrollBtn : public TCustomUtilityButton;
```

File

ActnCtrls

Description

This is class ActnCtrls.TCustomToolScrollBtn.

2.1.8.1 TCustomToolScrollBtn Members

The following tables list the members exposed by TCustomToolScrollBtn.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFlat (see page 178)	This is FFlat, a member of class TCustomButtonControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FState (see page 178)	This is FState, a member of class TCustomButtonControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMDialogChar (see page 180)	This is CMDialogChar, a member of class TCustomButtonControl.
	CMEnabledChanged (see page 180)	This is CMEnabledChanged, a member of class TCustomButtonControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
	CMMouseEnter (see page 180)	This is CMMouseEnter, a member of class TCustomButtonControl.
	CMMouseEnter (see page 238)	This is CMMouseEnter, a member of class TCustomUtilityButton.
	CMMouseLeave (see page 180)	This is CMMouseLeave, a member of class TCustomButtonControl.
	CMMouseLeave (see page 239)	This is CMMouseLeave, a member of class TCustomUtilityButton.
	CMTextChanged (see page 180)	This is CMTextChanged, a member of class TCustomButtonControl.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
V	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.

	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 521)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawArrows (see page 227)	This is DrawArrows, a member of class TCustomToolScrollBtn.
	DrawBackground (see page 181)	Draws a background image on the control.
	DrawBackground (see page 521)	Draws a background image on the control.
	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
	DrawFrame (see page 181)	This is DrawFrame, a member of class TCustomButtonControl.
	DrawGlyph (see page 522)	Draws a symbol on the control.
	DrawLargeGlyph (see page 181)	This is DrawLargeGlyph, a member of class TCustomButtonControl.
	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.
	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
	DrawText (see page 523)	Draws text on the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
	GetShowShortCut (see page 181)	This is GetShowShortCut, a member of class TCustomButtonControl.
	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
	Loaded (see page 182)	Initializes the control after it is loaded from a stream.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.

	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
V	MouseDown (see page 182)	OnMouseDown event dispatcher.
V	MouseDown (see page 239)	OnMouseDown event dispatcher.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
V	MouseMove (see page 183)	Respond to mouse moving over control area..
	MouseMove (see page 5773)	Respond to mouse moving over control area..
V	MouseUp (see page 183)	OnMouseUp event dispatcher.
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	OnDelay (see page 240)	This is OnDelay, a member of class TCustomUtilityButton.
V	Paint (see page 184)	Render control surface.
V	Paint (see page 240)	Render control surface.
V	Paint (see page 526)	Render control surface.
V	Paint (see page 6052)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
V	SetActionClient (see page 184)	This is SetActionClient, a member of class TCustomButtonControl.
V	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
V	SetGlyphLayout (see page 185)	This is SetGlyphLayout, a member of class TCustomButtonControl.
V	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetSelected (see page 185)	This is SetSelected, a member of class TCustomButtonControl.
V	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.

	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMLButtonDblClk (see page 185)	This is WMLButtonDblClk, a member of class TCustomButtonControl.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseInControl (see page 189)	This is MouseInControl, a member of class TCustomButtonControl.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 243)	Occurs when the user clicks the control.
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
V	CalcBounds (see page 179)	Calculates the size of the control.
V	CalcBounds (see page 518)	Calculates the size of the control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 179)	Executes the control's function.
V	Click (see page 238)	Executes the control's function.
V	Click (see page 518)	Executes the control's function in response to a mouse click.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 227)	Creates an instance of TCustomButtonControl.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 237)	Destroys an instance of TCustomActionControl.
V	Destroy (see page 516)	Destroys an instance of TCustomActionControl (see page 507).
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
V	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
V	Keyed (see page 525)	Executes the control's function in response to a keyboard action.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 184)	Sets the Left, Top, Width, and Height properties all at once.

V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	AllowAllUp (see page 186)	Indicates whether all the buttons in a given group can be up at the same time.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	ArrowSize (see page 240)	This is ArrowSize, a member of class TCustomUtilityButton.
	ArrowType (see page 241)	This is ArrowType, a member of class TCustomUtilityButton.
	AutoScroll (see page 241)	This is AutoScroll, a member of class TCustomUtilityButton.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 186)	Specifies a text string that identifies the control to the user.
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	Color (see page 241)	Specifies the background color of the control.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Direction (see page 242)	This is Direction, a member of class TCustomUtilityButton.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	Down (see page 189)	Tells whether the button is down (selected) or up (unselected).
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.

R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
	Flat (see page 189)	Dictates whether the button should have a 2D look instead of the usual 3D look.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	RepeatRate (see page 242)	This is RepeatRate, a member of class TCustomUtilityButton.
	Selected (see page 533)	Indicates whether the control is currently selected.
R	Separator (see page 533)	Indicates whether the control is a separator.
	ShowCaption (see page 189)	Indicates whether the control's caption should be shown.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
	ShowShortCut (see page 190)	Indicates whether the control's short cut should be shown.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	State (see page 190)	Describes the current state of the button.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.
	TrackButton (see page 190)	Specifies which mouse button activates the button control.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

2.1.8.2 TCustomToolScrollBtn.Create Constructor

Creates an instance of TCustomButtonControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomToolScrollBtn(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomButtonControl. However, you should never attempt to instantiate a TCustomButtonControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the button control. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner (see page 2807)

Create (see page 5731)

Destroy

2.1.8.3 TCustomToolScrollBtn Methods

The methods of the TCustomToolScrollBtn class are listed here.

Protected Methods

	Name	Description
	DrawArrows (see page 227)	This is DrawArrows, a member of class TCustomToolScrollBtn.

2.1.8.3.1 TCustomToolScrollBtn.DrawArrows Method

Pascal

```
procedure DrawArrows; override;
```

C++

```
virtual __fastcall DrawArrows();
```

Description

This is DrawArrows, a member of class TCustomToolScrollBtn.

2.1.9 TCustomUtilityButton Class

Class Hierarchy

Pascal

```
TCustomUtilityButton = class(TCustomButtonControl);
```

C++

```
class TCustomUtilityButton : public TCustomButtonControl;
```

File

ActnCtrls

Description

This is class ActnCtrls.TCustomUtilityButton.

2.1.9.1 TCustomUtilityButton Members

The following tables list the members exposed by TCustomUtilityButton.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.

	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFlat (see page 178)	This is FFlat, a member of class TCustomButtonControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FState (see page 178)	This is FState, a member of class TCustomButtonControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMDialogChar (see page 180)	This is CMDialogChar, a member of class TCustomButtonControl.
	CMEnabledChanged (see page 180)	This is CMEnabledChanged, a member of class TCustomButtonControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
	CMMouseEnter (see page 238)	This is CMMouseEnter, a member of class TCustomUtilityButton.
	CMMouseLeave (see page 239)	This is CMMouseLeave, a member of class TCustomUtilityButton.
	CMTextChanged (see page 180)	This is CMTextChanged, a member of class TCustomButtonControl.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.

	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 521)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawArrows (see page 239)	This is DrawArrows, a member of class TCustomUtilityButton.
	DrawBackground (see page 181)	Draws a background image on the control.
	DrawBackground (see page 521)	Draws a background image on the control.
	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
	DrawFrame (see page 181)	This is DrawFrame, a member of class TCustomButtonControl.
	DrawGlyph (see page 522)	Draws a symbol on the control.
	DrawLargeGlyph (see page 181)	This is DrawLargeGlyph, a member of class TCustomButtonControl.
	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.
	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
	DrawText (see page 523)	Draws text on the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.

	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
V	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
V	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
V	GetShowShortCut (see page 181)	This is GetShowShortCut, a member of class TCustomButtonControl.
V	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
V	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
V	Loaded (see page 182)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
V	MouseDown (see page 239)	OnMouseDown event dispatcher.
V	MouseMove (see page 183)	Respond to mouse moving over control area..
	MouseMove (see page 5773)	Respond to mouse moving over control area..
V	MouseUp (see page 183)	OnMouseUp event dispatcher.
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	OnDelay (see page 240)	This is OnDelay, a member of class TCustomUtilityButton.
V	Paint (see page 240)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
V	SetActionClient (see page 184)	This is SetActionClient, a member of class TCustomButtonControl.
V	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
V	SetGlyphLayout (see page 185)	This is SetGlyphLayout, a member of class TCustomButtonControl.
V	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.

V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetSelected (see page 185)	This is SetSelected, a member of class TCustomButtonControl.
V	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMLButtonDblClk (see page 185)	This is WMLButtonDblClk, a member of class TCustomButtonControl.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseInControl (see page 189)	This is MouseInControl, a member of class TCustomButtonControl.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.

	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 243)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
V	CalcBounds (see page 179)	Calculates the size of the control.
V	CalcBounds (see page 518)	Calculates the size of the control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 238)	Executes the control's function.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 237)	Creates an instance of TCustomButtonControl.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 237)	Destroys an instance of TCustomActionControl.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
V	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
V	Keyed (see page 525)	Executes the control's function in response to a keyboard action.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 184)	Sets the Left, Top, Width, and Height properties all at once.

V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	AllowAllUp (see page 186)	Indicates whether all the buttons in a given group can be up at the same time.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	ArrowSize (see page 240)	This is ArrowSize, a member of class TCustomUtilityButton.
	ArrowType (see page 241)	This is ArrowType, a member of class TCustomUtilityButton.
	AutoScroll (see page 241)	This is AutoScroll, a member of class TCustomUtilityButton.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 186)	Specifies a text string that identifies the control to the user.
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	Color (see page 241)	Specifies the background color of the control.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Direction (see page 242)	This is Direction, a member of class TCustomUtilityButton.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	Down (see page 189)	Tells whether the button is down (selected) or up (unselected).
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.

R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
	Flat (see page 189)	Dictates whether the button should have a 2D look instead of the usual 3D look.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	RepeatRate (see page 242)	This is RepeatRate, a member of class TCustomUtilityButton.
	Selected (see page 533)	Indicates whether the control is currently selected.
R	Separator (see page 533)	Indicates whether the control is a separator.
	ShowCaption (see page 189)	Indicates whether the control's caption should be shown.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
	ShowShortCut (see page 190)	Indicates whether the control's short cut should be shown.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	State (see page 190)	Describes the current state of the button.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.
	TrackButton (see page 190)	Specifies which mouse button activates the button control.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

2.1.9.2 TCustomUtilityButton.Create Constructor

Creates an instance of TCustomButtonControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomUtilityButton(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomButtonControl. However, you should never attempt to instantiate a TCustomButtonControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the button control. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner (see page 2807)

Create (see page 5731)

Destroy

2.1.9.3 TCustomUtilityButton.Destroy Destructor

Destroys an instance of TCustomActionControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomUtilityButton();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

Create (see page 515)

Free (see page 22300)

2.1.9.4 TCustomUtilityButton Methods

The methods of the TCustomUtilityButton class are listed here.

Protected Methods

	Name	Description
	CMMouseEnter (see page 238)	This is CMMouseEnter, a member of class TCustomUtilityButton.
	CMMouseLeave (see page 239)	This is CMMouseLeave, a member of class TCustomUtilityButton.
V	DrawArrows (see page 239)	This is DrawArrows, a member of class TCustomUtilityButton.
V	MouseDown (see page 239)	OnMouseDown event dispatcher.
	OnDelay (see page 240)	This is OnDelay, a member of class TCustomUtilityButton.
V	Paint (see page 240)	Render control surface.

Public Methods

	Name	Description
V	Click (see page 238)	Executes the control's function.

2.1.9.4.1 TCustomUtilityButton.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl is almost identical to the inherited method. The only difference is that if the button control is being manipulated at design time, extra actions are taken to ensure that the control is properly selected.

See Also

Click (see page 518)

Click (see page 5743)

UsageCount (see page 388)

2.1.9.4.2 TCustomUtilityButton.CMMouseEnter Method

Pascal

```
procedure CMMouseEnter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseEnter(TMessage Message);
```

Description

This is CMMouseEnter, a member of class TCustomUtilityButton.

2.1.9.4.3 TCustomUtilityButton.CMMouseLeave Method

Pascal

```
procedure CMMouseLeave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseLeave(TMessage Message);
```

Description

This is CMMouseLeave, a member of class TCustomUtilityButton.

2.1.9.4.4 TCustomUtilityButton.DrawArrows Method

Pascal

```
procedure DrawArrows; virtual;
```

C++

```
virtual __fastcall DrawArrows();
```

Description

This is DrawArrows, a member of class TCustomUtilityButton.

2.1.9.4.5 TCustomUtilityButton.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

See Also

MouseMove (see page 5773)

MouseUp (see page 5774)

OnMouseDown (see page 5862)

2.1.9.4.6 TCustomUtilityButton.OnDelay Method

Pascal

```
procedure OnDelay(Sender: TObject);
```

C++

```
__fastcall OnDelay(TObject * Sender);
```

Description

This is OnDelay, a member of class TCustomUtilityButton.

2.1.9.4.7 TCustomUtilityButton.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas (see page 6053)

2.1.9.5 TCustomUtilityButton Properties

The properties of the TCustomUtilityButton class are listed here.

Public Properties

	Name	Description
	ArrowSize (see page 240)	This is ArrowSize, a member of class TCustomUtilityButton.
	ArrowType (see page 241)	This is ArrowType, a member of class TCustomUtilityButton.
	AutoScroll (see page 241)	This is AutoScroll, a member of class TCustomUtilityButton.
	Color (see page 241)	Specifies the background color of the control.
	Direction (see page 242)	This is Direction, a member of class TCustomUtilityButton.
	RepeatRate (see page 242)	This is RepeatRate, a member of class TCustomUtilityButton.

2.1.9.5.1 TCustomUtilityButton.ArrowSize Property

Pascal

```
property ArrowSize: Integer;
```

C++

```
__property int ArrowSize;
```

Description

This is ArrowSize, a member of class TCustomUtilityButton.

2.1.9.5.2 TCustomUtilityButton.ArrowType Property

Pascal

```
property ArrowType: TArrowType;
```

C++

```
__property TArrowType ArrowType;
```

Description

This is ArrowType, a member of class TCustomUtilityButton.

2.1.9.5.3 TCustomUtilityButton.AutoScroll Property

Pascal

```
property AutoScroll: Boolean;
```

C++

```
__property Boolean AutoScroll;
```

Description

This is AutoScroll, a member of class TCustomUtilityButton.

2.1.9.5.4 TCustomUtilityButton.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
```

```
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

2.1.9.5.5 TCustomUtilityButton.Direction Property

Pascal

```
property Direction: TScrollDirection;
```

C++

```
__property TScrollDirection Direction;
```

Description

This is Direction, a member of class TCustomUtilityButton.

2.1.9.5.6 TCustomUtilityButton.RepeatRate Property

Pascal

```
property RepeatRate: Integer;
```

C++

```
__property int RepeatRate;
```

Description

This is RepeatRate, a member of class TCustomUtilityButton.

2.1.9.6 TCustomUtilityButton Events

The events of the TCustomUtilityButton class are listed here.

Public Events

	Name	Description
	OnClick (see page 243)	Occurs when the user clicks the control.

2.1.9.6.1 TCustomUtilityButton.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
```

```
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

2.2 Types

The following table lists types in this documentation.

Types

Name	Description
TCustomToolScrollBtnClass (see page 245)	This is type ActnCtrls.TCustomToolScrollBtnClass.

2.2.1 ActnCtrls.TCustomToolScrollBtnClass Type

Pascal

```
TCustomToolScrollBtnClass = class of TCustomToolScrollBtn;
```

C++

```
TCustomToolScrollBtn TCustomToolScrollBtnClass;
```

File

ActnCtrls

Description

This is type ActnCtrls.TCustomToolScrollBtnClass.

3 ActnList Namespace

This is namespace ActnList.

Topics

Name	Description
Classes (see page 249)	The following table lists classes in this documentation.
Functions (see page 334)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 337)	The following table lists structs, records, enums in this documentation.
Types (see page 338)	The following table lists types in this documentation.
Constants (see page 341)	The following table lists constants in this documentation.

Classes

	Name	Description
	TAction (see page 249)	TAction is the generic class for action objects that implement user commands across a range of different controls.
	TActionLink (see page 265)	TActionLink is the base class for action links that connect actions to commonly used properties of VCL objects, components and controls.
	TActionList (see page 280)	TActionList maintains a list of actions that can be used by components and controls, such as menu items and buttons.
	TActionListEnumerator (see page 287)	This is class ActnList.TActionListEnumerator.
	TContainedAction (see page 289)	TContainedAction is the base class for actions that can be grouped by category and that can appear in action lists or action managers.
	TCustomAction (see page 297)	TCustomAction is the base class for actions meant to be used with menu items and controls.
	TCustomActionList (see page 315)	TCustomActionList is the base class for action list objects that manage a set of actions.
	TShortCutList (see page 328)	TShortCutList manages an array of keyboard shortcuts.

Constants

Name	Description
CreateActionProc (see page 341)	This is constant ActnList.CreateActionProc.
EnumRegisteredActionsProc (see page 341)	This is constant ActnList.EnumRegisteredActionsProc.
RegisterActionsProc (see page 342)	This is constant ActnList.RegisterActionsProc.
UnRegisterActionsProc (see page 342)	This is constant ActnList.UnRegisterActionsProc.

Functions

	Name	Description
	CreateAction (see page 334)	Creates an action of a specified type.

	EnumRegisteredActions (see page 334)	Iterates through the list of registered actions, passing them to a user-defined callback.
	RegisterActions (see page 335)	Registers action classes so that they appear in the list of predefined actions in the action list editor or customize dialog.
	UnRegisterActions (see page 336)	Unregisters a set of actions.

Structs, Records, Enums

	Name	Description
	TActionListState (see page 337)	This is record ActnList.TActionListState.

Types

Name	Description
TActionEvent (see page 338)	This is type ActnList.TActionEvent.
TActionLinkClass (see page 338)	This is type ActnList.TActionLinkClass.
TContainedActionClass (see page 339)	This is type ActnList.TContainedActionClass.
TEnumActionProc (see page 339)	This is type ActnList.TEnumActionProc.
THintEvent (see page 339)	THintEvent is the type of the OnHint event handler.

3.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TAction (see page 249)	TAction is the generic class for action objects that implement user commands across a range of different controls.
	TActionLink (see page 265)	TActionLink is the base class for action links that connect actions to commonly used properties of VCL objects, components and controls.
	TActionList (see page 280)	TActionList maintains a list of actions that can be used by components and controls, such as menu items and buttons.
	TActionListEnumerator (see page 287)	This is class ActnList.TActionListEnumerator.
	TContainedAction (see page 289)	TContainedAction is the base class for actions that can be grouped by category and that can appear in action lists or action managers.
	TCustomAction (see page 297)	TCustomAction is the base class for actions meant to be used with menu items and controls.
	TCustomActionList (see page 315)	TCustomActionList is the base class for action list objects that manage a set of actions.
	TShortCutList (see page 328)	TShortCutList manages an array of keyboard shortcuts.

3.1.1 TAction Class

TAction is the generic class for action objects that implement user commands across a range of different controls.

Class Hierarchy

Pascal

```
TAction = class(TCustomAction);
```

C++

```
class TAction : public TCustomAction;
```

File

ActnList

Description

TAction is a generic action component. It can be added to action managers or action lists when there is no predefined action class that implements the desired response to user commands. Unlike predefined action classes, which have built-in methods that respond when users click the client controls, TAction has no built-in response to user commands. Instead, when using TAction, you can provide the response when the action "fires" by writing an OnExecute (see page 261) event handler, and configure the properties of TAction to reflect current conditions by writing an OnUpdate (see page 263) event handler.

Action objects are used to centralize the response to user commands (actions) and to represent user interface elements in applications that use action bands.

TAction can also act as a base class for predefined action classes. You can derive from TAction if you wish to retain the

published scope of TCustomAction (see page 297) members, or derive from TCustomAction (see page 297) if you wish to modify their scope.

For predefined actions that augment the behavior of TAction, see the action classes in the QStdActns unit.

For predefined actions that augment the behavior of TAction, see the action classes in the StdActns (see page 20505) , DBActns (see page 7649) , and ExtActns (see page 11829) units.

3.1.1.1 TAction Members

The following tables list the members exposed by TAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.

	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

3.1.1.2 TAction.Create Constructor

Creates and initializes a TAction (see page 249) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TAction(TComponent * AOwner);
```

Description

Applications do not usually create action objects explicitly. Actions are created automatically when you add them to an action manager or action list component at design time. When instantiating TAction (see page 249) at runtime, assign a TActionList (see page 280) or TActionManager component to the new action's ActionList (see page 295) property after calling Create.

See Also

ActionList (see page 295)

3.1.1.3 TAction Properties

The properties of the TAction class are listed here.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

3.1.1.3.1 TAction.AutoCheck Property

Controls whether the Checked property toggles when the action executes.

Pascal

```
property AutoCheck: Boolean;
```

C++

```
__property Boolean AutoCheck;
```

Description

AutoCheck causes the checked property to toggle when the action executes. This allows the action's Checked property to remain in sync with the client's Checked property (or equivalent). If the client is a menu item (where the Checked property does not necessarily toggle), AutoCheck is propagated to the AutoCheck property of the menu item.

See Also

Checked (see page 308)

Execute (see page 304)

AutoCheck (see page 16134)

3.1.1.3.2 TAction.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

3.1.1.3.3 TAction.Checked Property

Indicates whether client controls and menu items appear checked.

Pascal

```
property Checked: Boolean;
```

C++

```
__property Boolean Checked;
```

Description

Checked specifies the checked state for the action. The value of Checked is propagated to client controls and menu items.

Note: If the action has a GroupIndex value greater than 0, then setting Checked to true causes all other actions in the group to have their Checked property set to false.

Note: Use the AutoCheck property to ensure that the action's Checked property stays synchronized with client's Checked properties.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

GroupIndex (see page 311)

AutoCheck (see page 308)

3.1.1.3.4 TAction.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

3.1.1.3.5 TAction.GroupIndex Property

Indicates whether the action acts like a radio button with other actions in the same action list.

Pascal

```
property GroupIndex: Integer;
```

C++

```
__property int GroupIndex;
```

Description

GroupIndex is used to define groups of actions that act like radio buttons. When GroupIndex is greater than 0, it identifies the

group to which the action belongs. When the Checked property of any action in that group is set to true, the Checked property of all other actions in the group is set to false. That is, only one action in the group can be checked at a time.

Note: All actions in a group must be listed by the same action list or action manager.

See Also

Checked (see page 308)

GroupIndex (see page 2360)

3.1.1.3.6 TAction.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

3.1.1.3.7 TAction.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be

associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

3.1.1.3.8 TAction.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

3.1.1.3.9 TAction.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

3.1.1.3.10 TAction.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

3.1.1.3.11 TAction.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

3.1.1.3.12 TAction.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

3.1.1.3.13 TAction.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

3.1.1.4 TAction Events

The events of the TAction class are listed here.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

3.1.1.4.1 TAction.OnExecute Event

Occurs when the client event that is linked to it fires.

Pascal

```
property OnExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExecute;
```

Description

Write an OnExecute event handler when you want to respond when the user triggers the client object's default event (typically an OnClick event). For most target clients, OnExecute is triggered on a Click method, and is associated with the OnClick event.

OnExecute also occurs when the user types the shortcut (or one of the secondary shortcuts) associated with the action or its client.

Warning: If you assign an OnExecute event handler to a predefined action, the default behavior of that action will not occur.

C++ Examples:

```
/*
This example requires a TApplicationEvents, a TActionList
and a TListBox in the form.  Select the TApplicationEvents,
double click on the OnActionExecute event and add the
following code to the handler.  Create an TAction named
```

```
MyAction in a TActionList.  The TActionList must have no
OnExecute event handler, and the TAction has an OnExecute
event handler called MyActionExecute.  Then set an object's
(such as a button) Action to MyAction.  The Handled
parameter of the event handler returns false by default. If
the handler handles the event, it should change Handled to
true, thereby preventing further attempts to handle the
action.
*/
void __fastcall TAppEventForm::ApplicationEventsActionExecute(
      TBasicAction *Action, bool &Handled)
{
    lbOther->Items->Add("Event OnActionExecute");
}

void __fastcall TAppEventForm::ActionExecute(TObject *Sender)
{
    ShowMessage("Action executed");
}
/*
When a client component or control is clicked, the OnExecute
event occurs for it’s associated action. For example, the
following code illustrates the OnExecute event handler for
an action that toggles the visibility of a toolbar when the
action is executed. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TActionList must have no OnExecute event handler, and the
TAction has an OnExecute event handler called Action1Execute.
Then set an object's (such as a button or menu item) Action
to Action1.  Set the TToolbar color to something that will
make it obvious when it is visible.  Also remember to uncheck
Project|Options|Applications|Enable runtime themes.
*/
void __fastcall TMainForm::Action1Execute(TObject *Sender)
{
  // Toggle Toolbar1's visibility
  ToolBar1->Visible = !ToolBar1->Visible;
  if (ToolBar1->Visible)
    lbOther->Items->Add("Event Action1Execute: toolbar visible");
  else
    lbOther->Items->Add("Event Action1Execute: toolbar not visible");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents, a TActionList
and a TListBox in the form.  Select the TApplicationEvents,
double click on the OnActionExecute event and add the
following code to the handler.  Create an TAction named
MyAction in a TActionList.  The TActionList must have no
OnExecute event handler, and the TAction has an OnExecute
event handler called MyActionExecute.  Then set an object's
(such as a button) Action to MyAction.  The Handled
parameter of the event handler returns false by default. If
the handler handles the event, it should change Handled to
true, thereby preventing further attempts to handle the
action.
}
procedure TMainForm.ApplicationEventsActionExecute(Action: TBasicAction;
  var Handled: Boolean);
begin
  lbOther.Items.Add('Event OnActionExecute');
end;

procedure TMainForm.MyActionExecute(Sender: TObject);
```

```
begin
  ShowMessage('Action executed');
end;
{
When a client component or control is clicked, the OnExecute
event occurs for it’s associated action. For example, the
following code illustrates the OnExecute event handler for
an action that toggles the visibility of a toolbar when the
action is executed. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TActionList must have no OnExecute event handler, and the
TAction has an OnExecute event handler called Action1Execute.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Execute(Sender: TObject);
begin
    { Toggle Toolbar1’s visibility }
    ToolBar1.Visible := not ToolBar1.Visible;
  if ToolBar1.Visible then
    lbOther.Items.Add('Event Action1Execute: toolbar visible')
  else
    lbOther.Items.Add('Event Action1Execute: toolbar not visible')
end;
```

See Also

OnClick (see page 5851)

ShortCut (see page 314)

3.1.1.4.2 TAction.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

3.1.1.4.3 TAction.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

UpdateAction (see page 2790)

3.1.2 TActionLink Class

TActionLink is the base class for action links that connect actions to commonly used properties of VCL objects, components and controls.

Class Hierarchy

Pascal

```
TActionLink = class(TBasicActionLink);
```

C++

```
class TActionLink : public TBasicActionLink;
```

File

ActnList

Description

Most applications do not work directly with TActionLink objects. Instead, the clients of actions already include a specialized TActionLink descendant that manages the relationship between the client object and an action. TActionLink introduces methods to manage the relationship between properties on an action object and the corresponding properties of the client object. Descendant classes override these methods, implementing them for the particular properties of a class of client.

Component writers can use TActionLink as a base class for new action link classes that manage the relationship between actions and families of client objects that are not controls or menu items.

TActionLink introduces interfaces for methods that support the following properties, most of which are linked with properties of the same name:

Caption

Checked

Enabled

HelpContext

Hint

ImageIndex

ShortCut

Visible

3.1.2.1 TActionLink Members

The following tables list the members exposed by TActionLink.

Protected Fields

	Name	Description
	FAction (see page 2722)	This is FAction, a member of class TBasicActionLink.

Protected Methods

	Name	Description
	AssignClient (see page 2723)	This is AssignClient, a member of class TBasicActionLink.
	Change (see page 2723)	This is Change, a member of class TBasicActionLink.
	IsCaptionLinked (see page 268)	Indicates whether the Caption properties for the action and client are linked.
	IsCheckedLinked (see page 269)	Indicates whether the Checked properties for the action and client are linked.
	IsEnabledLinked (see page 269)	Indicates whether the Enabled properties for the action and client are linked.
	IsGroupIndexLinked (see page 270)	Indicates whether the GroupIndex property for the action controls client behavior.
	IsHelpContextLinked (see page 270)	Indicates whether the HelpContext properties for the action and client controls are linked.
	IsHelpLinked (see page 271)	Indicates whether the help properties for the action and client are linked.
	IsHintLinked (see page 271)	Indicates whether the Hint properties for the action and client are linked.
	IsImageIndexLinked (see page 272)	Indicates whether the image index for the action and the client are linked.
	IsOnExecuteLinked (see page 2723)	This is IsOnExecuteLinked, a member of class TBasicActionLink.
	IsShortCutLinked (see page 272)	Indicates whether the ShortCut properties for the action and client are linked.
	IsVisibleLinked (see page 273)	Indicates whether the Visible properties for the action and client are linked.
	SetAction (see page 2724)	This is SetAction, a member of class TBasicActionLink.
	SetAutoCheck (see page 274)	Introduces an interface for setting the AutoCheck property of a client.
	SetCaption (see page 274)	Introduces an interface for setting the caption on a client.
	SetChecked (see page 274)	Introduces an interface for setting the checked state of a client.
	SetEnabled (see page 275)	Introduces an interface for setting the enabled state of a client.
	SetGroupIndex (see page 275)	Introduces an interface for setting the GroupIndex property of a client.
	SetHelpContext (see page 276)	Introduces an interface for setting the help context of a client.
	SetHelpKeyword (see page 276)	Introduces an interface for setting the help keyword of a client.
	SetHelpType (see page 277)	Introduces an interface for setting the HelpType property of a client.
	SetHint (see page 278)	Introduces an interface for setting the hint for a client.
	SetImageIndex (see page 278)	Introduces an interface for setting the image index for a client.
	SetOnExecute (see page 2724)	This is SetOnExecute, a member of class TBasicActionLink.
	SetShortCut (see page 279)	Introduces an interface for setting the shortcut for a client.
	SetVisible (see page 279)	Introduces an interface for setting the visible state of a client.

Public Events

	Name	Description
	OnChange (see page 2725)	Occurs when an OnChange event is triggered on the action.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2721)	Instantiates and initializes a TBasicActionLink (see page 2720) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2722)	Destroys an instance of an action link object.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 2723)	Invokes the action's Execute method.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Update (see page 2724)	Invokes the action's Update method.

Public Properties

	Name	Description
	Action (see page 2725)	Indicates which action the link connects to its client.

3.1.2.2 TActionLink Methods

The methods of the TActionLink class are listed here.

Protected Methods

	Name	Description
	IsCaptionLinked (see page 268)	Indicates whether the Caption properties for the action and client are linked.
	IsCheckedLinked (see page 269)	Indicates whether the Checked properties for the action and client are linked.

	IsEnabledLinked (see page 269)	Indicates whether the Enabled properties for the action and client are linked.
	IsGroupIndexLinked (see page 270)	Indicates whether the GroupIndex property for the action controls client behavior.
	IsHelpContextLinked (see page 270)	Indicates whether the HelpContext properties for the action and client controls are linked.
	IsHelpLinked (see page 271)	Indicates whether the help properties for the action and client are linked.
	IsHintLinked (see page 271)	Indicates whether the Hint properties for the action and client are linked.
	IsImageIndexLinked (see page 272)	Indicates whether the image index for the action and the client are linked.
	IsShortCutLinked (see page 272)	Indicates whether the ShortCut properties for the action and client are linked.
	IsVisibleLinked (see page 273)	Indicates whether the Visible properties for the action and client are linked.
	SetAutoCheck (see page 274)	Introduces an interface for setting the AutoCheck property of a client.
	SetCaption (see page 274)	Introduces an interface for setting the caption on a client.
	SetChecked (see page 274)	Introduces an interface for setting the checked state of a client.
	SetEnabled (see page 275)	Introduces an interface for setting the enabled state of a client.
	SetGroupIndex (see page 275)	Introduces an interface for setting the GroupIndex property of a client.
	SetHelpContext (see page 276)	Introduces an interface for setting the help context of a client.
	SetHelpKeyword (see page 276)	Introduces an interface for setting the help keyword of a client.
	SetHelpType (see page 277)	Introduces an interface for setting the HelpType property of a client.
	SetHint (see page 278)	Introduces an interface for setting the hint for a client.
	SetImageIndex (see page 278)	Introduces an interface for setting the image index for a client.
	SetShortCut (see page 279)	Introduces an interface for setting the shortcut for a client.
	SetVisible (see page 279)	Introduces an interface for setting the visible state of a client.

3.1.2.2.1 TActionLink.IsCaptionLinked Method

Indicates whether the Caption properties for the action and client are linked.

Pascal

```
function IsCaptionLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsCaptionLinked();
```

Description

TActionLink (see page 265) descendants call IsCaptionLinked to determine whether they need to propagate changes to the Caption property of the action so that they are reflected by the client object. When IsCaptionLinked returns true, the action controls the Caption property: Changes to the Caption property of the action are reflected by changes to the corresponding property of the client object. When IsCaptionLinked returns false, the client object does not reflect the Caption property of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink (see page 265), IsCaptionLinked merely checks that the Action property specifies a descendant of TCustomAction (see page 297) (that is, it is an action that has a Caption property). Descendant classes override IsCaptionLinked to determine whether the Caption property is linked with the appropriate client property.

See Also

Caption (see page 308)

Caption (see page 5806)

SetCaption (see page 274)

Action (see page 2725)

3.1.2.2.2 TActionLink.IsCheckedLinked Method

Indicates whether the Checked properties for the action and client are linked.

Pascal

```
function IsCheckedLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsCheckedLinked();
```

Description

TActionLink (see page 265) descendants call IsCheckedLinked to determine whether they need to propagate changes to the Checked property of the action so that they are reflected by the client object. When IsCheckedLinked returns true, the action controls the Checked property: Changes to the Checked property of the action are reflected by changes to the corresponding property of the client object. When IsCheckedLinked returns false, the client object does not reflect the Checked property of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink (see page 265), IsCheckedLinked merely checks that the Action property specifies a descendant of TCustomAction (see page 297) (that is, it is an action that has a Checked property). Descendant classes override IsCheckedLinked to determine whether the Checked property is linked with the appropriate client property.

See Also

Checked (see page 308)

SetChecked (see page 274)

Action (see page 2725)

3.1.2.2.3 TActionLink.IsEnabledLinked Method

Indicates whether the Enabled properties for the action and client are linked.

Pascal

```
function IsEnabledLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsEnabledLinked();
```

Description

TActionLink (see page 265) descendants call IsEnabledLinked to determine whether they need to propagate changes to the Enabled property of the action so that they are reflected by the client object. When IsEnabledLinked returns true, the action controls the Enabled property: Changes to the Enabled property of the action are reflected by changes to the corresponding property of the client object. When IsEnabledLinked returns false, the client object does not reflect the Enabled property of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink (see page 265), IsEnabledLinked merely checks that the Action property specifies a descendant of TCustomAction (see page 297) (that is, it is an action that has an Enabled property). Descendant classes override IsEnabledLinked to determine whether the Enabled property is linked with the appropriate client property.

See Also

Enabled (see page 310)

Enabled (see page 5821)

SetEnabled (see page 275)

Action (see page 2725)

3.1.2.2.4 TActionLink.IsGroupIndexLinked Method

Indicates whether the GroupIndex property for the action controls client behavior.

Pascal

```
function IsGroupIndexLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsGroupIndexLinked();
```

Description

TActionLink (see page 265) descendants can call IsGroupIndexLinked to determine whether they need to propagate changes to the GroupIndex property of the action so that they are reflected by the client object. When IsGroupIndexLinked returns true, the action controls the GroupIndex property: Changes to the GroupIndex property of the action are reflected in the client object. When IsGroupIndexLinked returns false, the client object is not influenced by the GroupIndex property of its action.

As implemented in TActionLink (see page 265), IsGroupIndexLinked merely checks that the Action property specifies a descendant of TCustomAction (see page 297), and if so, returns true.

See Also

GroupIndex (see page 311)

SetGroupIndex (see page 275)

Action (see page 2725)

3.1.2.2.5 TActionLink.IsHelpContextLinked Method

Indicates whether the HelpContext properties for the action and client controls are linked.

Pascal

```
function IsHelpContextLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsHelpContextLinked();
```

Description

TActionLink (see page 265) descendants can call IsHelpContextLinked to determine whether they need to propagate changes to the HelpContext property of the action so that they are reflected by the client object. When IsHelpContextLinked returns true, the action controls the HelpContext property: Changes to the HelpContext property of the action are reflected in the client object. When IsHelpContextLinked returns false, the client object is not influenced by the HelpContext property of its action.

As implemented in TActionLink (see page 265), IsHelpContextLinked merely checks that the Action property specifies a descendant of TCustomAction (see page 297), and if so, returns true.

See Also

HelpContext (see page 311)

SetHelpContext (see page 276)

Action (see page 2725)

IsHelpLinked (see page 271)

3.1.2.2.6 TActionLink.IsHelpLinked Method

Indicates whether the help properties for the action and client are linked.

Pascal

```
function IsHelpLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsHelpLinked();
```

Description

TActionLink (see page 265) descendants call IsHelpLinked to determine whether they need to propagate changes to the HelpContext, HelpKeyword, and HelpType properties of the action so that they are reflected by client objects. When IsHelpLinked returns true, the action controls these properties: Changes to any of the help properties of the action are reflected by changes to the corresponding property of the client object. When IsHelpLinked returns false, the client object does not reflect the help properties of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink (see page 265), IsHelpLinked merely checks that the Action property specifies a descendant of TCustomAction (see page 297) (that is, it is an action that has HelpContext, HelpKeyword, and HelpType properties). Descendant classes override IsHelpLinked to determine whether these properties are linked with the appropriate client property.

Action (see page 2725)

3.1.2.2.7 TActionLink.IsHintLinked Method

Indicates whether the Hint properties for the action and client are linked.

Pascal

```
function IsHintLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsHintLinked();
```

Description

TActionLink (see page 265) descendants call IsHintLinked to determine whether they need to propagate changes to the Hint property of the action so that they are reflected by the client object. When IsHintLinked returns true, the action controls the Hint property: Changes to the Hint property of the action are reflected by changes to the corresponding property of the client object.

When IsHintLinked returns false, the client object does not reflect the Hint property of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink (see page 265), IsHintLinked merely checks that the Action property specifies a descendant of TCustomAction (see page 297) (that is, it is an action that has a Hint property). Descendant classes override IsHintLinked to determine whether the Hint property is linked with the appropriate client property.

See Also

Hint (see page 312)

Hint (see page 5827)

Hint (see page 16148)

SetHint (see page 278)

Action (see page 2725)

3.1.2.2.8 TActionLink.IsImageIndexLinked Method

Indicates whether the image index for the action and the client are linked.

Pascal

```
function IsImageIndexLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsImageIndexLinked();
```

Description

TActionLink (see page 265) descendants call IsImageIndexLinked to determine whether they need to propagate changes to the ImageIndex property of the action so that they are reflected by the client object. When IsImageIndexLinked returns true, the action controls the ImageIndex property: Changes to the ImageIndex property of the action are reflected by changes to the corresponding property of the client object. When IsImageIndexLinked returns false, the client object does not reflect the ImageIndex property of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink (see page 265), IsImageIndexLinked merely checks that the Action property specifies a descendant of TCustomAction (see page 297) (that is, it is an action that has an ImageIndex property). Descendant classes override IsImageIndexLinked to determine whether the ImageIndex property is linked with the appropriate client property.

See Also

ImageIndex (see page 313)

ImageIndex (see page 16148)

SetImageIndex (see page 278)

Action (see page 2725)

3.1.2.2.9 TActionLink.IsShortCutLinked Method

Indicates whether the ShortCut properties for the action and client are linked.

Pascal

```
function IsShortCutLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsShortCutLinked();
```

Description

TActionLink (see page 265) descendants call IsShortCutLinked to determine whether they need to propagate changes to the ShortCut property of the action so that they are reflected by the client object. When IsShortCutLinked returns true, the action controls the ShortCut property: Changes to the ShortCut property of the action are reflected by changes to the corresponding property of the client object. When IsShortCutLinked returns false, the client object does not reflect the ShortCut property of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink (see page 265), IsShortCutLinked merely checks that the Action property specifies a descendant of TCustomAction (see page 297) (that is, it is an action that has a ShortCut property). Descendant classes override IsShortCutLinked to determine whether the ShortCut property is linked with the appropriate client property.

See Also

ShortCut (see page 314)

ShortCut (see page 16152)

SetShortCut (see page 279)

Action (see page 2725)

3.1.2.2.10 TActionLink.IsVisibleLinked Method

Indicates whether the Visible properties for the action and client are linked.

Pascal

```
function IsVisibleLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsVisibleLinked();
```

Description

TActionLink (see page 265) descendants call IsVisibleLinked to determine whether they need to propagate changes to the Visible property of the action so that they are reflected by the client object. When IsVisibleLinked returns true, the action controls the Visible property: Changes to the Visible property of the action are reflected by changes to the corresponding property of the client object. When IsVisibleLinked returns false, the client object does not reflect the Visible property of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink (see page 265), IsVisibleLinked merely checks that the Action property specifies a descendant of TCustomAction (see page 297) (that is, it is an action that has a Visible property). Descendant classes override IsVisibleLinked to determine whether the Visible property is linked with the appropriate client property.

See Also

Visible (see page 314)

Visible (see page 5847)

SetShortCut (see page 279)

Action (see page 2725)

3.1.2.2.11 TActionLink.SetAutoCheck Method

Introduces an interface for setting the AutoCheck property of a client.

Pascal

```
procedure SetAutoCheck(Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetAutoCheck(Boolean Value);
```

Description

The associated action calls SetAutoCheck when its AutoCheck property changes so that the action link can propagate the new value to the client object.

Value specifies the new value of the AutoCheck property.

As implemented in TActionLink (see page 265), SetAutoCheck does nothing. Descendant classes override SetAutoCheck to set the client property that corresponds to the action's AutoCheck property.

See Also

AutoCheck (see page 308)

AutoCheck (see page 16134)

Action (see page 2725)

3.1.2.2.12 TActionLink.SetCaption Method

Introduces an interface for setting the caption on a client.

Pascal

```
procedure SetCaption(const Value: string); virtual;
```

C++

```
virtual __fastcall SetCaption(const AnsiString Value);
```

Description

The associated action calls SetCaption when its Caption property changes so that the action link can propagate the new Caption value to the client object.

Value specifies the string to which the caption should be set.

As implemented in TActionLink (see page 265), SetCaption does nothing. Descendant classes override SetCaption to set the client property that corresponds to the action's Caption property if the IsCaptionLinked (see page 268) method returns true.

See Also

Caption (see page 308)

Caption (see page 5806)

IsCaptionLinked (see page 268)

Action (see page 2725)

3.1.2.2.13 TActionLink.SetChecked Method

Introduces an interface for setting the checked state of a client.

Pascal

```
procedure SetChecked(Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetChecked(Boolean Value);
```

Description

The associated action calls SetChecked when its Checked property changes so that the action link can propagate the new Checked value to the client object.

Value specifies the new value of the Checked property.

As implemented in TActionLink (see page 265), SetChecked does nothing. Descendant classes override SetChecked to set the client property that corresponds to the action's Checked property if the IsCheckedLinked (see page 269) method returns true.

See Also

Checked (see page 308)

Action (see page 2725)

IsCheckedLinked (see page 269)

3.1.2.2.14 TActionLink.SetEnabled Method

Introduces an interface for setting the enabled state of a client.

Pascal

```
procedure SetEnabled(Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetEnabled(Boolean Value);
```

Description

The associated action calls SetEnabled when its Enabled property changes so that the action link can propagate the new Enabled value to the client object.

Value specifies the new value of the Enabled property.

As implemented in TActionLink (see page 265), SetEnabled does nothing. Descendant classes override SetEnabled to set the client property that corresponds to the action's Enabled property if the IsEnabledLinked (see page 269) method returns true.

See Also

Enabled (see page 310)

Enabled (see page 5821)

Action (see page 2725)

IsEnabledLinked (see page 269)

3.1.2.2.15 TActionLink.SetGroupIndex Method

Introduces an interface for setting the GroupIndex property of a client.

Pascal

```
procedure SetGroupIndex(Value: Integer); virtual;
```

C++

```
virtual __fastcall SetGroupIndex(int Value);
```

Description

The associated action calls SetGroupIndex when its GroupIndex property changes so that the action link can propagate the new GroupIndex value to the client object.

Value specifies the new value of the GroupIndex property.

As implemented in TActionLink (see page 265), SetGroupIndex does nothing. It is not strictly necessary for descendant classes to override SetGroupIndex to set the client property that corresponds to the action's GroupIndex property, because the action itself implements the GroupIndex feature. That is, when an action's Checked property is set to true, it unchecks other actions in the same action list if they have the same GroupIndex value.

See Also

GroupIndex (see page 311)

GroupIndex (see page 16146)

Action (see page 2725)

GroupIndex (see page 2360)

Checked (see page 308)

IsGroupIndexLinked (see page 270)

3.1.2.2.16 TActionLink.SetHelpContext Method

Introduces an interface for setting the help context of a client.

Pascal

```
procedure SetHelpContext(Value: THelpContext); virtual;
```

C++

```
virtual __fastcall SetHelpContext(THelpContext Value);
```

Description

The associated action calls SetHelpContext when its HelpContext property changes so that the action link can propagate the new HelpContext value to the client object.

Value specifies the new value of the HelpContext property.

As implemented in TActionLink (see page 265), SetHelpContext does nothing. Descendant classes override SetHelpContext to set the client property that corresponds to the action's HelpContext property if the IsHelpLinked (see page 271) method returns true.

See Also

HelpContext (see page 311)

Action (see page 2725)

IsHelpLinked (see page 271)

3.1.2.2.17 TActionLink.SetHelpKeyword Method

Introduces an interface for setting the help keyword of a client.

Pascal

```
procedure SetHelpKeyword(const Value: string); virtual;
```

C++

```
virtual __fastcall SetHelpKeyword(const AnsiString Value);
```

Description

The associated action calls SetHelpKeyword when its HelpKeyword property changes so that the action link can propagate the new HelpKeyword value to the client object.

Value specifies the new value of the HelpKeyword property.

As implemented in TActionLink (see page 265), SetHelpKeyword does nothing. Descendant classes override SetHelpKeyword to set the client property that corresponds to the action's HelpKeyword property if the IsHelpLinked (see page 271) method returns true.

See Also

HelpKeyword (see page 311)

HelpKeyword (see page 5826)

HelpKeyword

Action (see page 2725)

IsHelpLinked (see page 271)

3.1.2.2.18 TActionLink.SetHelpType Method

Introduces an interface for setting the HelpType property of a client.

Pascal

```
procedure SetHelpType(Value: THelpType); virtual;
```

C++

```
virtual __fastcall SetHelpType(THelpType Value);
```

Description

The associated action calls SetHelpType when its HelpType property changes so that the action link can propagate the new HelpType value to the client object.

Value specifies the new value of the HelpType property.

As implemented in TActionLink (see page 265), SetHelpType does nothing. Descendant classes override SetHelpType to set the client property that corresponds to the action's HelpType property if the IsHelpLinked (see page 271) method returns true.

See Also

HelpType (see page 312)

HelpType (see page 5827)

HelpType

Action (see page 2725)

IsHelpLinked (see page 271)

3.1.2.2.19 TActionLink.SetHint Method

Introduces an interface for setting the hint for a client.

Pascal

```
procedure SetHint(const Value: string); virtual;
```

C++

```
virtual __fastcall SetHint(const AnsiString Value);
```

Description

The associated action calls SetHint when its Hint property changes so that the action link can propagate the new Hint value to the client object.

Value specifies the new value of the Hint property.

As implemented in TActionLink (see page 265), SetHint does nothing. Descendant classes override SetHint to set the client property that corresponds to the action's Hint property if the IsHintLinked (see page 271) method returns true.

See Also

Hint (see page 312)

Hint (see page 5827)

Hint (see page 16148)

Action (see page 2725)

IsHintLinked (see page 271)

3.1.2.2.20 TActionLink.SetImageIndex Method

Introduces an interface for setting the image index for a client.

Pascal

```
procedure SetImageIndex(Value: Integer); virtual;
```

C++

```
virtual __fastcall SetImageIndex(int Value);
```

Description

The associated action calls SetImageIndex when its ImageIndex property changes so that the action link can propagate the new ImageIndex value to the client object.

Value specifies the new value of the ImageIndex property.

As implemented in TActionLink (see page 265), SetImageIndex does nothing. Descendant classes override SetImageIndex to set the client property that corresponds to the action's ImageIndex property if the IsImageIndexLinked (see page 272) method returns true.

See Also

ImageIndex (see page 313)

ImageIndex (see page 16148)

Action (see page 2725)

IsImageIndexLinked (see page 272)

3.1.2.2.21 TActionLink.SetShortCut Method

Introduces an interface for setting the shortcut for a client.

Pascal

```
procedure SetShortCut(Value: TShortCut); virtual;
```

C++

```
virtual __fastcall SetShortCut(TShortCut Value);
```

Description

The associated action calls SetShortCut when its ShortCut property changes so that the action link can propagate the new ShortCut value to the client object.

Value specifies the new value of the ShortCut property.

As implemented in TActionLink (see page 265), SetShortCut does nothing. Descendant classes override SetShortCut to set the client property that corresponds to the action's ShortCut property if the IsShortCutLinked (see page 272) method returns true.

See Also

ShortCut (see page 314)

ShortCut (see page 16152)

Action (see page 2725)

IsShortCutLinked (see page 272)

3.1.2.2.22 TActionLink.SetVisible Method

Introduces an interface for setting the visible state of a client.

Pascal

```
procedure SetVisible(Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetVisible(Boolean Value);
```

Description

The associated action calls SetVisible when its Visible property changes so that the action link can propagate the new Visible value to the client object.

Value specifies the new value of the Visible property.

As implemented in TActionLink (see page 265), SetVisible does nothing. Descendant classes override SetVisible to set the client property that corresponds to the action's Visible property if the IsVisibleLinked (see page 273) method returns true.

See Also

Visible (see page 314)

Visible (see page 5847)

Action (see page 2725)

IsVisibleLinked (see page 273)

3.1.3 TActionList Class

TActionList maintains a list of actions that can be used by components and controls, such as menu items and buttons.

Class Hierarchy

Pascal

```
TActionList = class(TCustomActionList);
```

C++

```
class TActionList : public TCustomActionList;
```

File

ActnList

Description

Use Action lists to centralize the response to user commands (actions). Action list components maintain a list of actions that are available to the client controls in an application. Add action list components to your form or data module from the standard page of the component palette. Double-click the action list to display the action list editor, from which you can add, delete, and rearrange actions.

Note: TActionList is intended primarily for managing the actions in cross-platform applications. While it is always possible to maintain the actions for an application using TActionList, it can be simpler to use an action manager instead.

3.1.3.1 TActionList Members

The following tables list the members exposed by TActionList.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAction (see page 320)	Adds an action to the list.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 320)	Generates an OnChange (see page 326) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
V	GetChildren (see page 321)	Calls a specified method for each child action of the action list.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 322)	Responds to notifications when objects are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RemoveAction (see page 323)	Removes an action from the list.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetChildOrder (see page 323)	Sets the order that actions are passed to a callback by the GetChildren (see page 321) method.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetImages (see page 323)	Sets the value of the Images (see page 325) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.

	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetState (see page 324)	This is SetState, a member of class TCustomActionList.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 319)	Creates and initializes a TCustomActionList (see page 315) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 319)	Disposes of the instance of an action list object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 321)	Generates an OnExecute (see page 327) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 321)	Returns a TComponent enumerator.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsShortCut (see page 322)	Evaluates an input key combination to determine whether it is a shortcut for one of the actions in the list.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	UpdateAction (see page 324)	Generates an OnUpdate (see page 327) event.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionCount (see page 324)	Indicates the number of actions in the action list.
	Actions (see page 325)	Lists the actions maintained by the action list.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 285)	Occurs when a change occurs in the action list.
	OnExecute (see page 285)	Occurs when a client object triggers an action in the list.
	OnStateChange (see page 286)	Occurs after an OnChange event.
	OnUpdate (see page 286)	Occurs when the application is idle so that the action list can update a specific action in the list.

Published Properties

	Name	Description
	Images (see page 284)	Lists the images available for actions in the action list.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	State (see page 284)	Indicates whether the actions in the action list respond when the user triggers a client object.
	Tag (see page 2808)	Stores an integer value as part of a component.

3.1.3.2 TActionList Properties

The properties of the TActionList class are listed here.

Published Properties

	Name	Description
	Images (see page 284)	Lists the images available for actions in the action list.
	State (see page 284)	Indicates whether the actions in the action list respond when the user triggers a client object.

3.1.3.2.1 TActionList.Images Property

Lists the images available for actions in the action list.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Images is a list of bitmaps that can be displayed to the left of any action in the action list. An action is associated with an image from this image list by its ImageIndex property. This image can then appear on client controls such as menu items, tool buttons, and so on.

See Also

Actions (see page 325)

ImageIndex (see page 313)

3.1.3.2.2 TActionList.State Property

Indicates whether the actions in the action list respond when the user triggers a client object.

Pascal

```
property State: TActionListState;
```

C++

```
__property TActionListState State;
```

Description

Use State to turn an action list on or off. State can have any of the following values:

Value	Meaning
asNormal	Actions perform their normal response when triggered by client objects or hotkeys.

asSuspended	The actions in the action list do not respond when client objects tell them to "fire". The Enabled property for all actions in the list is unchanged.
asSuspendedEnabled	The actions in the action list do not respond when client objects tell them to "fire". The Enabled property for all actions in the list is set to true. Used for designing ActionBars.

See Also

Execute (see page 304)

Enabled (see page 310)

3.1.3.3 TActionList Events

The events of the TActionList class are listed here.

Published Events

	Name	Description
	OnChange (see page 285)	Occurs when a change occurs in the action list.
	OnExecute (see page 285)	Occurs when a client object triggers an action in the list.
	OnStateChange (see page 286)	Occurs after an OnChange event.
	OnUpdate (see page 286)	Occurs when the application is idle so that the action list can update a specific action in the list.

3.1.3.3.1 TActionList.OnChange Event

Occurs when a change occurs in the action list.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to update your application in response to changes in the action list. Changes to the action list that trigger an OnChange event include changes to an action category or to the action list's image list.

Note: The action list automatically informs the actions in the list when an OnChange event occurs. You need only provide an OnChange event handler for application-specific responses.

3.1.3.3.2 TActionList.OnExecute Event

Occurs when a client object triggers an action in the list.

Pascal

```
property OnExecute: TActionEvent;
```

C++

```
__property TActionEvent OnExecute;
```

Description

Write an OnExecute event handler to respond when an action in the list fires.

When the user invokes a client object, the action list's OnExecute event is the first event to occur in response. If the OnExecute

event handler sets its Handled parameter to true, the action is considered handled, and processing stops there. This blocks the execution of any other event handlers or any built-in response by a predefined action class in response to the user action.

If the OnExecute event handler does not set its Handled parameter to true, the application's OnActionExecute event occurs next. If the OnActionExecute event does not respond to the user input, the action object's OnExecute event occurs. Finally, if the action does not have an OnExecute event handler, the application locates a target object and executes any predefined response implemented by the action object.

See Also

Execute (see page 304)

OnExecute (see page 2716)

OnActionExecute (see page 13725)

3.1.3.3.3 TActionList.OnStateChange Event

Occurs after an OnChange event.

Pascal

```
property OnStateChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnStateChange;
```

Description

Write an OnStateChange event handler to respond after the OnChange event occurs.

See Also

OnChange (see page 326)

3.1.3.3.4 TActionList.OnUpdate Event

Occurs when the application is idle so that the action list can update a specific action in the list.

Pascal

```
property OnUpdate: TActionEvent;
```

C++

```
__property TActionEvent OnUpdate;
```

Description

Write an OnUpdate event handler to configure the properties of a specified action in the list so that it reflects current conditions.

When the application is idle, it cycles through every action in turn giving it a chance to update itself to reflect current conditions. For each action, the first event to occur in this sequence is the action list's OnUpdate event. If the OnUpdate event handler sets its Handled parameter to true, the action is considered updated, and processing stops there. This blocks the execution of any other event handlers or any built-in response by a predefined action class.

If the OnUpdate event handler does not set its Handled parameter to true, the application's OnActionUpdate event occurs next. If the OnActionUpdate event does not update the action, the action object's OnUpdate event occurs. Finally, if the action does not have an OnUpdate event handler, the application executes any predefined update method implemented by the action object.

See Also

OnUpdate (see page 2718)

OnActionUpdate (see page 13726)

3.1.4 TActionListEnumerator Class

Class Hierarchy

ActnList.TActionListEnumerator

Pascal

```
TActionListEnumerator = class;
```

C++

```
class TActionListEnumerator;
```

File

ActnList

Description

This is class ActnList.TActionListEnumerator.

3.1.4.1 TActionListEnumerator Members

The following tables list the members exposed by TActionListEnumerator.

Public Methods

	Name	Description
	Create (see page 287)	This is Create, a member of class TActionListEnumerator.
	GetCurrent (see page 288)	This is GetCurrent, a member of class TActionListEnumerator.
	MoveNext (see page 288)	This is MoveNext, a member of class TActionListEnumerator.

Public Properties

	Name	Description
R	Current (see page 288)	This is Current, a member of class TActionListEnumerator.

3.1.4.2 TActionListEnumerator.Create Constructor

Pascal

```
constructor Create(AActionList: TCustomActionList);
```

C++

```
__fastcall TActionListEnumerator(TCustomActionList AActionList);
```

Description

This is Create, a member of class TActionListEnumerator.

3.1.4.3 TActionListEnumerator Methods

The methods of the TActionListEnumerator class are listed here.

Public Methods

	Name	Description
	GetCurrent (see page 288)	This is GetCurrent, a member of class TActionListEnumerator.
	MoveNext (see page 288)	This is MoveNext, a member of class TActionListEnumerator.

3.1.4.3.1 TActionListEnumerator.GetCurrent Method

Pascal

```
function GetCurrent: TContainedAction;
```

C++

```
__fastcall TContainedAction GetCurrent();
```

Description

This is GetCurrent, a member of class TActionListEnumerator.

3.1.4.3.2 TActionListEnumerator.MoveNext Method

Pascal

```
function MoveNext: Boolean;
```

C++

```
__fastcall Boolean MoveNext();
```

Description

This is MoveNext, a member of class TActionListEnumerator.

3.1.4.4 TActionListEnumerator Properties

The properties of the TActionListEnumerator class are listed here.

Public Properties

	Name	Description
R	Current (see page 288)	This is Current, a member of class TActionListEnumerator.

3.1.4.4.1 TActionListEnumerator.Current Property

Pascal

```
property Current: TContainedAction;
```

C++

```
__property TContainedAction Current;
```

Description

This is Current, a member of class TActionListEnumerator.

3.1.5 TContainedAction Class

TContainedAction is the base class for actions that can be grouped by category and that can appear in action lists or action managers.

Class Hierarchy

Pascal

```
TContainedAction = class(TBasicAction);
```

C++

```
class TContainedAction : public TBasicAction;
```

File

ActnList

Description

TContainedAction introduces properties and methods that enable actions to appear in an action list or action manager. The properties of TContainedAction contain information about the relationship between the action and its action list or action manager. Methods of TContainedAction override those of the base class to take into account the action list or action manager that owns the action.

Objects of type TContainedAction can be associated with a category of action types. This category is used at design time, to organize the actions in an action list or action manager, and at runtime to organize them in the customize dialog.

See Also

TActionList (see page 280)

TActionManager (see page 432)

3.1.5.1 TContainedAction Members

The following tables list the members exposed by TContainedAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.

	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.

	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 293)	Responds when the client control "fires".
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

3.1.5.2 TContainedAction.Destroy Destructor

Destroys the instance of the contained action.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TContainedAction();
```

Description

If the action is contained in an action list or action manager, Destroy removes the action from that list. Then it calls the inherited Destroy.

3.1.5.3 TContainedAction Methods

The methods of the TContainedAction class are listed here.

Protected Methods

	Name	Description
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.

Public Methods

	Name	Description
	Execute (see page 293)	Responds when the client control "fires".
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	Update (see page 295)	Indicates whether the action updates itself.

3.1.5.3.1 TContainedAction.Execute Method

Responds when the client control "fires".

Pascal

```
function Execute: Boolean; override;
```

C++

```
virtual __fastcall Boolean Execute();
```

Description

Execute is called automatically when a client control "fires" (for example, when the user clicks a button or selects a menu item). It returns true if an event handler is found to handle the action, false otherwise.

Execute first attempts to handle the action by generating an OnExecute event on the action list that contains this action (if the action belongs to an action list). If the action list's OnExecute event handler does not handle the action, Execute generates an OnActionExecute event on the application itself. If neither the action list nor the application handles the action in response to these events, Execute generates an OnExecute event on itself. If this action has no OnExecute event handler, it instructs the application to locate the current target control and call the ExecuteTarget method, which is the mechanism by which predefined action classes perform their function.

See Also

OnExecute (see page 2716)

OnExecute (see page 327)

OnActionExecute (see page 13725)

ExecuteTarget (see page 2712)

3.1.5.3.2 TContainedAction.GetParentComponent Method

Returns the action list or action manager that contains the action.

Pascal

```
function GetParentComponent: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetParentComponent();
```

Description

GetParentComponent is called by the streaming system that loads and saves components. It ensures that objects are loaded and saved with their parent objects. TContainedAction (see page 289) overrides the inherited method to identify the associated action list or action manager as the action's parent.

See Also

ActionList (see page 295)

3.1.5.3.3 TContainedAction.HasParent Method

Indicates whether the action is contained in an action list or action manager.

Pascal

```
function HasParent: Boolean; override;
```

C++

```
virtual __fastcall Boolean HasParent();
```

Description

HasParent is called by the streaming system that loads and saves components. It ensures that objects are loaded and saved with their parent objects. TContainedAction (see page 289) overrides the inherited method to return true if the action is contained in an action list or action manager.

See Also

ActionList (see page 295)

GetParentComponent (see page 293)

3.1.5.3.4 TContainedAction.ReadState Method

Pascal

```
procedure ReadState(Reader: TReader); override;
```

C++

```
virtual __fastcall ReadState(TReader Reader);
```

Description

This is ReadState, a member of class TContainedAction.

3.1.5.3.5 TContainedAction.SetParentComponent Method

Pascal

```
procedure SetParentComponent(AParent: TComponent); override;
```

C++

```
virtual __fastcall SetParentComponent(TComponent * AParent);
```

Description

This is SetParentComponent, a member of class TContainedAction.

3.1.5.3.6 TContainedAction.Update Method

Indicates whether the action updates itself.

Pascal

```
function Update: Boolean; override;
```

C++

```
virtual __fastcall Boolean Update();
```

Description

Update is called automatically when the application is idle to give the action a chance to update itself according to current conditions. It returns true if an event handler is found to update the action, false otherwise.

Update first attempts to update the action by generating an OnUpdate event on the action list that contains this action (if the action belongs to an action list). If the action list's OnUpdate event handler does not update the action, Update generates an OnActionUpdate event on the application itself. If neither the action list nor the application updates the action in response to these events, Update generates an OnUpdate event on itself. If this action has no OnUpdate event handler, it instructs the application to locate the current target control and call the UpdateTarget method, which is the mechanism by which predefined action classes update themselves.

See Also

OnUpdate (see page 2718)

OnActionUpdate (see page 13726)

OnUpdate (see page 327)

UpdateTarget (see page 2715)

3.1.5.4 TContainedAction Properties

The properties of the TContainedAction class are listed here.

Public Properties

	Name	Description
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.

Published Properties

	Name	Description
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.

3.1.5.4.1 TContainedAction.ActionList Property

Indicates the action list or action manager that contains the action.

Pascal

```
property ActionList: TCustomActionList;
```

C++

```
__property TCustomActionList ActionList;
```

Description

ActionList indicates which action list or action manager contains the action. Only contained actions (instances of TContainedAction (see page 289) or its descendants) can appear in an action list or action manager. An action list provides a visual interface for working with actions, which are then available to be associated with client controls in the application. An action manager uses the actions as an abstract representation of user interface elements, which it generates dynamically at runtime.

When creating an action dynamically at runtime, set the ActionList property to add the action to an action list or action manager.

See Also

Category (see page 296)

TActionList (see page 280)

TActionManager (see page 432)

3.1.5.4.2 TContainedAction.Category Property

Specifies the category under which the action appears in its action list or action manager.

Pascal

```
property Category: string;
```

C++

```
__property AnsiString Category;
```

Description

Category is the group, or category, to which the action belongs. An action manager or action list displays its actions grouped by category. In addition, action bars associated with an action manager can generate user interface elements that correspond to action categories.

Action categories group actions by similarities, usually of behavior or functionality. At design-time you can modify or set the Category for an action by selecting the action from the action list or object tree view, and choosing Category in the Object Inspector.

ActionList (see page 295)

TActionMainMenuBar (see page 585)

TActionToolBar (see page 38)

TActionManager (see page 432)

3.1.5.4.3 TContainedAction.Index Property

Specifies the index of the action in its action list or action manager.

Pascal

```
property Index: Integer;
```

C++

```
__property int Index;
```

Description

Index indicates the position of the action in its action list or action manager. You can change an action's Index at design time by

dragging it to a new position in the action list editor or customize dialog.

The index of actions in an action manager determines the order in which they appear in user interface elements such as menus and tool bars.

ActionList (see page 295)

Actions (see page 325)

3.1.6 TCustomAction Class

TCustomAction is the base class for actions meant to be used with menu items and controls.

Class Hierarchy

Pascal

```
TCustomAction = class(TContainedAction);
```

C++

```
class TCustomAction : public TContainedAction;
```

File

ActnList

Description

TCustomAction introduces support for the properties and methods of menu items and controls that are linked to action objects. Use TCustomAction as a base class when deriving your own actions that publish specific properties of associated controls.

Action objects centralize the response to user commands (actions) and represent user interface elements in applications that use action bars. They provide an easy way to synchronize, for example, the enabled state and caption of a speed button and a menu item, and handle the response when users click on these components. Each such component, called the client, has its properties dynamically updated by the action and forwards user actions to the action for a response.

You can work with actions at design-time in the action list editor of an action list or the customize dialog of an action manager. The action list or action manager is a container for actions, which it organizes into categories.

Component and control properties and events that are supported in TCustomAction, either directly or through an ancestor, are:

Caption (see page 308)

Checked (see page 308)

Enabled (see page 310)

HelpContext (see page 311)

Hint (see page 312)

ImageIndex (see page 313)

ShortCut (see page 314)

Visible (see page 314)

OnHint (see page 315)

OnUpdate

OnExecute

TAction (see page 249)

TActionLink (see page 265)

3.1.6.1 TCustomAction Members

The following tables list the members exposed by TCustomAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.

	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.

	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 304)	Responds when a client control "fires".
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
	Update (see page 295)	Indicates whether the action updates itself.
	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Properties

	Name	Description
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

3.1.6.2 TCustomAction.Create Constructor

Instantiates and initializes a TCustomAction (see page 297) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAction(TComponent * AOwner);
```

Description

Applications do not need to call the constructor directly. Actions are created automatically when you add them to an action manager or action list component at design time. If you want to create an action at runtime, assign a TActionList (see page 280) or TActionManager component to its ActionList (see page 295) property after calling Create.

AOwner is the component that is responsible for freeing the action. It becomes the value of the Owner property.

See Also

ActionList (see page 295)

Destroy (see page 302)

Owner (see page 2807)

3.1.6.3 TCustomAction.Destroy Destructor

Frees an instance of TCustomAction (see page 297).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAction();
```

Description

Do not call the destructor directly in an application. Instead, call Free. Free ensures that the action is not nil before calling the destructor.

If the action is contained in an action list or action manager, Destroy removes the action from that list.

See Also

Create (see page 301)

Actions (see page 325)

3.1.6.4 TCustomAction Fields

The fields of the TCustomAction class are listed here.

Protected Fields

	Name	Description
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

3.1.6.4.1 TCustomAction.FImage Field

Pascal

```
FImage: TObject;
```

C++

```
TObject * FImage;
```

Description

This is FImage, a member of class TCustomAction.

3.1.6.4.2 TCustomAction.FMask Field

Pascal

```
FMask: TObject;
```

C++

```
TObject * FMask;
```

Description

This is FMask, a member of class TCustomAction.

3.1.6.5 TCustomAction Methods

The methods of the TCustomAction class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 303)	Copies the properties of this action to a destination object.
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetName (see page 307)	Sets the value of the Name property.

Public Methods

	Name	Description
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 304)	Responds when a client control "fires".

3.1.6.5.1 TCustomAction.AssignTo Method

Copies the properties of this action to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

AssignTo is overridden so that existing objects of type TCustomAction (see page 297) can be copied to other action objects of the same type. AssignTo ensures the correct assignment of property values.

See Also

Assign (see page 2930)

3.1.6.5.2 TCustomAction.DoHint Method

Generates an OnHint (see page 315) event.

Pascal

```
function DoHint(var HintStr: string): Boolean; dynamic;
```

C++

```
__fastcall Boolean DoHint(AnsiString HintStr);
```

Description

Typically, Applications do not call the DoHint method. It is called automatically when the user pauses the mouse over one of the action's client controls or menu items.

DoHint checks for an OnHint (see page 315) event handler and passes HintStr to it, if the handler exists. DoHint returns true if no event handler is assigned or if the OnHint (see page 315) event handler indicates that the hint should be displayed using the default popup window.

See Also

OnHint (see page 315)

3.1.6.5.3 TCustomAction.Execute Method

Responds when a client control "fires".

Pascal

```
function Execute: Boolean; override;
```

C++

```
virtual __fastcall Boolean Execute();
```

Description

Execute is called automatically when a client control "fires" (for example, when the user clicks a button or selects a menu item). It returns true if an event handler is found to handle the action, false if there was no event handler or if the action was not enabled.

Execute first ensures that the action is updated. Then, if the Enabled (see page 310) property is true, it attempts to handle the action by generating an OnExecute event on the action list that contains this action (if the action belongs to an action list). If the action list's OnExecute event handler does not handle the action, Execute generates an OnActionExecute event on the application itself. If neither the action list nor the application handles the action in response to these events, Execute generates an OnExecute event on itself. If this action has no OnExecute event handler, Execute instructs the application to locate the current target control and call the ExecuteTarget method, which is the mechanism by which predefined action classes perform their function.

C++ Examples:

```
/*
This code displays a Save Picture dialog box with the
TBitmap default extension that is added automatically to
files that are given no extension. Confirm that the
bitmap file has been saved under the filename and path
specified.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  AnsiString NewFileName, OldFileName;
  TFileStream *NewFile, *OldFile;
  SavePictureDialog1->DefaultExt = GraphicExtension(__classid(Graphics::TBitmap));
  SavePictureDialog1->Filter = GraphicFilter(__classid(Graphics::TBitmap));
  OldFileName = "factory.bmp";
  if (SavePictureDialog1->Execute())
  {
    NewFileName = SavePictureDialog1->FileName;
```

```
    OldFile = new TFileStream(OldFileName, (fmOpenRead | fmShareDenyWrite));
    try
    {
      NewFile = new TFileStream(NewFileName, (fmCreate | fmShareDenyRead));
      try
      {
        NewFile->CopyFrom(OldFile, OldFile->Size);
      }
      __finally
      {
        FreeAndNil(&NewFile);
      };
    }
    __finally
    {
      FreeAndNil(&OldFile);
    };
  };
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Image1->Picture->LoadFromFile("../factory.bmp");
}
```

Delphi Examples:

```
{
This code displays a Save Picture dialog box with the
TBitmap default extension that is added automatically to
files that are given no extension. Confirm that the
bitmap file has been saved under the filename and path
specified.
}
procedure TForm1.Button1Click(Sender: TObject);
var NewFileName, OldFileName: string;
    NewFile, OldFile: TFileStream;
begin
  SavePictureDialog1.DefaultExt := GraphicExtension(TBitmap);
  SavePictureDialog1.Filter := GraphicFilter(TBitmap);
  OldFileName := 'factory.bmp';
  if SavePictureDialog1.Execute then
  begin
    NewFileName := SavePictureDialog1.FileName;
    OldFile := TFileStream.Create(
      OldFileName, fmOpenRead or fmShareDenyWrite);
    try
      NewFile := TFileStream.Create(
        NewFileName, fmCreate or fmShareDenyRead);
      try
        NewFile.CopyFrom(OldFile, OldFile.Size);
      finally
        FreeAndNil(NewFile);
      end;
    finally
      FreeAndNil(OldFile);
    end;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  Image1.Picture.LoadFromFile('factory.bmp');
end;
```

See Also

Enabled (see page 310)

OnExecute (see page 2716)

OnExecute (see page 327)

OnActionExecute (see page 13725)

ExecuteTarget (see page 2712)

3.1.6.5.4 TCustomAction.HandleShortCut Method

Executes the action when the user types on of its short cuts.

Pascal

```
function HandleShortCut: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean HandleShortCut();
```

Description

Applications can't call the protected HandleShortCut method. The action list's IsShortCut method calls HandleShortCut when it finds a match between a shortcut key combination and the action's ShortCut (see page 314) or SecondaryShortCuts (see page 314) property.

As implemented in TCustomAction (see page 297), HandleShortCut calls Execute (see page 304) to cause the action to perform its function. HandleShortCut returns the value that Execute (see page 304) returns.

Descendant classes can override HandleShortCut to respond in other ways when the user types the action's shortcut keys.

See Also

IsShortCut (see page 322)

ShortCut (see page 314)

SecondaryShortCuts (see page 314)

Execute (see page 304)

3.1.6.5.5 TCustomAction.SetHelpContext Method

Pascal

```
procedure SetHelpContext(Value: THelpContext); virtual;
```

C++

```
virtual __fastcall SetHelpContext(THelpContext Value);
```

Description

This is SetHelpContext, a member of class TCustomAction.

3.1.6.5.6 TCustomAction.SetHelpKeyword Method

Pascal

```
procedure SetHelpKeyword(const Value: string); virtual;
```

C++

```
virtual __fastcall SetHelpKeyword(const AnsiString Value);
```

Description

This is SetHelpKeyword, a member of class TCustomAction.

3.1.6.5.7 TCustomAction.SetName Method

Sets the value of the Name property.

Pascal

```
procedure SetName(const Value: TComponentName); override;
```

C++

```
virtual __fastcall SetName(const TComponentName Value);
```

Description

SetName is the protected write implementation of the Name property. It calls the ChangeName method, which performs the actual name change. TCustomAction (see page 297) overrides SetName so that it also changes the Caption (see page 308) property if Caption (see page 308) is the same as Name.

3.1.6.6 TCustomAction Properties

The properties of the TCustomAction class are listed here.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Properties

	Name	Description
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

3.1.6.6.1 TCustomAction.AutoCheck Property

Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.

Pascal

```
property AutoCheck: Boolean;
```

C++

```
__property Boolean AutoCheck;
```

Description

AutoCheck causes the checked property to toggle when the action executes. This allows the action's Checked (see page 308) property to remain in sync with the client's Checked (see page 308) property (or equivalent). If the client is a menu item (where the Checked (see page 308) property does not necessarily toggle), AutoCheck is propagated to the AutoCheck property of the menu item.

See Also

Checked (see page 308)

Execute (see page 304)

AutoCheck (see page 16134)

3.1.6.6.2 TCustomAction.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

3.1.6.6.3 TCustomAction.Checked Property

Indicates whether client controls and menu items appear checked.

Pascal

```
property Checked: Boolean;
```

C++

```
__property Boolean Checked;
```

Description

Checked specifies the checked state for the action. The value of Checked is propagated to client controls and menu items.

Note: If the action has a GroupIndex (see page 311) value greater than 0, then setting Checked to true causes all other actions in the group to have their Checked property set to false.

Note: Use the AutoCheck (see page 308) property to ensure that the action's Checked property stays synchronized with client's Checked properties.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
```

```
end;
```

See Also

GroupIndex (see page 311)

AutoCheck (see page 308)

3.1.6.6.4 TCustomAction.DisableIfNoHandler Property

Indicates whether client components should be disabled if no handler is found.

Pascal

```
property DisableIfNoHandler: Boolean;
```

C++

```
__property Boolean DisableIfNoHandler;
```

Description

DisableIfNoHandler specifies whether the Enabled (see page 310) property of client components should be set to false if no handler can be found for the action.

When the user triggers one of the action's clients, the application makes a series of attempts to determine how the action should respond. This includes checking a number of event handlers, and, if it fails to find an event handler, locating a target control and checking for a predefined response that applies to that target control. When DisableIfNoHandler is true, if the application completes this sequence without finding any way for the action to respond to the user input, The action's Enabled (see page 310) property is set to false.

In addition, for some predefined actions, DisableIfNoHandler causes the action to disable itself if an event handler is required for the action to perform a meaningful task. For example, if you do not supply an OnAccept event handler to TFileOpen, then if DisableIfNoHandler is true, the action disables itself because there is no way for the application to respond when the user selects a file name in the dialog.

See Also

Enabled (see page 310)

HandlesTarget (see page 2713)

3.1.6.6.5 TCustomAction.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

3.1.6.6.6 TCustomAction.GroupIndex Property

Indicates whether the action acts like a radio button with other actions in the same action list.

Pascal

```
property GroupIndex: Integer;
```

C++

```
__property int GroupIndex;
```

Description

GroupIndex is used to define groups of actions that act like radio buttons. When GroupIndex is greater than 0, it identifies the group to which the action belongs. When the Checked (see page 308) property of any action in that group is set to true, the Checked (see page 308) property of all other actions in the group is set to false. That is, only one action in the group can be checked at a time.

Note: All actions in a group must be listed by the same action list or action manager.

See Also

Checked (see page 308)

GroupIndex (see page 2360)

3.1.6.6.7 TCustomAction.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType (see page 312) property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

3.1.6.6.8 TCustomAction.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType (see page 312) property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

3.1.6.6.9 TCustomAction.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext (see page 311) or the HelpKeyword (see page 311) property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

3.1.6.6.10 TCustomAction.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

3.1.6.6.11 TCustomAction.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

3.1.6.6.12 TCustomAction.SavedEnabledState Property

Saves the value of the Enabled (see page 310) property when the action is suspended.

Pascal

```
property SavedEnabledState: Boolean;
```

C++

```
__property Boolean SavedEnabledState;
```

Description

TCustomAction (see page 297) uses SavedEnabledState internally to save the value of the Enabled (see page 310) property when its action list has a state of asSuspendedEnabled.

See Also

Enabled (see page 310)

State (see page 326)

3.1.6.6.13 TCustomAction.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut (see page 314) property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut (see page 314) property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute (see page 304) method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

3.1.6.6.14 TCustomAction.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

3.1.6.6.15 TCustomAction.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

3.1.6.7 TCustomAction Events

The events of the TCustomAction class are listed here.

Public Events

	Name	Description
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.

3.1.6.7.1 TCustomAction.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

3.1.7 TCustomActionList Class

TCustomActionList is the base class for action list objects that manage a set of actions.

Class Hierarchy

Pascal

```
TCustomActionList = class(TComponent);
```

C++

```
class TCustomActionList : public TComponent;
```

File

ActnList

Description

Action lists manage a collection of action objects so that they are available to the components in an application. These action objects centralize the response of the application to user input, and update the properties of all controls that trigger that response.

TCustomActionList descendants provide the user interface for working with actions at design time. These include TActionList (see page 280), which lets you set up actions using the action list editor, and TActionManager, which lets you configure actions using the customize dialog.

Action lists maintain a list of actions that can be grouped by category. Actions (see page 325) in an action list are TContainedAction (see page 289) or descendant types.

See Also

TActionList (see page 280)

TContainedAction (see page 289)

TActionManager (see page 432)

3.1.7.1 TCustomActionList Members

The following tables list the members exposed by TCustomActionList.

Protected Events

	Name	Description
	OnChange (see page 326)	Occurs when a change occurs in the action list.
	OnExecute (see page 327)	Occurs when a client object triggers an action in the list.
	OnUpdate (see page 327)	Occurs when the application is idle so that the action list can update a specific action in the list.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAction (see page 320)	Adds an action to the list.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 320)	Generates an OnChange (see page 326) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
V	GetChildren (see page 321)	Calls a specified method for each child action of the action list.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 322)	Responds to notifications when objects are created or destroyed.

	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RemoveAction (see page 323)	Removes an action from the list.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 323)	Sets the order that actions are passed to a callback by the GetChildren (see page 321) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetImages (see page 323)	Sets the value of the Images (see page 325) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetState (see page 324)	This is SetState, a member of class TCustomActionList.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnStateChange (see page 327)	Occurs after an OnChange (see page 326) event.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 319)	Creates and initializes a TCustomActionList (see page 315) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 319)	Disposes of the instance of an action list object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 321)	Generates an OnExecute (see page 327) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 321)	Returns a TComponent enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsShortCut (see page 322)	Evaluates an input key combination to determine whether it is a shortcut for one of the actions in the list.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	UpdateAction (see page 324)	Generates an OnUpdate (see page 327) event.

Public Properties

	Name	Description
R	ActionCount (see page 324)	Indicates the number of actions in the action list.
	Actions (see page 325)	Lists the actions maintained by the action list.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Images (see page 325)	Lists the images available for actions in the action list.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.

	State (see page 326)	Indicates whether the actions in the action list respond when the user triggers a client object.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

3.1.7.2 TCustomActionList.Create Constructor

Creates and initializes a TCustomActionList (see page 315) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomActionList(TComponent * AOwner);
```

Description

Call Create to instantiate an action list at runtime. Action lists added to forms at design time are created automatically.

The AOwner parameter is the owner of the action list, typically this is a form or data module.

See Also

Destroy (see page 319)

3.1.7.3 TCustomActionList.Destroy Destructor

Disposes of the instance of an action list object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomActionList();
```

Description

You normally do not need to call the destructor for an action list if it has an owner. The action list is destroyed automatically by its owner, which was passed to its constructor when it was created. In situations where the custom action list object needs to be manually destroyed, do so by calling its Free method.

See Also

Create (see page 319)

3.1.7.4 TCustomActionList Methods

The methods of the TCustomActionList class are listed here.

Protected Methods

	Name	Description
	AddAction (see page 320)	Adds an action to the list.

	Change (see page 320)	Generates an OnChange (see page 326) event.
	GetChildren (see page 321)	Calls a specified method for each child action of the action list.
	Notification (see page 322)	Responds to notifications when objects are created or destroyed.
	RemoveAction (see page 323)	Removes an action from the list.
	SetChildOrder (see page 323)	Sets the order that actions are passed to a callback by the GetChildren (see page 321) method.
	SetImages (see page 323)	Sets the value of the Images (see page 325) property.
	SetState (see page 324)	This is SetState, a member of class TCustomActionList.

Public Methods

	Name	Description
	ExecuteAction (see page 321)	Generates an OnExecute (see page 327) event.
	GetEnumerator (see page 321)	Returns a TComponent enumerator.
	IsShortCut (see page 322)	Evaluates an input key combination to determine whether it is a shortcut for one of the actions in the list.
	UpdateAction (see page 324)	Generates an OnUpdate (see page 327) event.

3.1.7.4.1 TCustomActionList.AddAction Method

Adds an action to the list.

Pascal

```
procedure AddAction(Action: TContainedAction);
```

C++

```
__fastcall AddAction(TContainedAction Action);
```

Description

Applications can't call this protected method. AddAction is used internally to add an action to the Actions (see page 325) property array.

To add an action to an action list, set the action's ActionList property.

See Also

Actions (see page 325)

RemoveAction (see page 323)

ActionList (see page 295)

3.1.7.4.2 TCustomActionList.Change Method

Generates an OnChange (see page 326) event.

Pascal

```
procedure Change; virtual;
```

C++

```
virtual __fastcall Change();
```

Description

Change is called when a change, such as a modification to the categories of the actions in the list, occurs in the action list.

Change:

1. Invokes an OnChange (see page 326) handler, if one has been assigned.
2. Informs all actions in the list that something has changed so that they can update themselves.

See Also

OnChange (see page 326)

3.1.7.4.3 TCustomActionList.ExecuteAction Method

Generates an OnExecute (see page 327) event.

Pascal

```
function ExecuteAction(Action: TBasicAction): Boolean; override;
```

C++

```
virtual __fastcall Boolean ExecuteAction(TBasicAction Action);
```

Description

Typically, applications do not call the ExecuteAction method. Instead, the action indicated by the Action parameter calls ExecuteAction in response to a user command. It is possible, however, to call ExecuteAction to generate an OnExecute (see page 327) event even though no client control has been triggered.

ExecuteAction invokes the OnExecute (see page 327) event handler for the action list. It returns true if the event handler handles the action, false otherwise.

See Also

OnExecute (see page 327)

3.1.7.4.4 TCustomActionList.GetChildren Method

Calls a specified method for each child action of the action list.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren is used by the component streaming system. For each action in the action list, GetChildren calls the method passed in Proc. The actions are passed to the callback in the order that they are loaded or saved by the component streaming system.

3.1.7.4.5 TCustomActionList.GetEnumerator Method

Returns a TComponent enumerator.

Pascal

```
function GetEnumerator: TActionListEnumerator;
```

C++

```
__fastcall TActionListEnumerator GetEnumerator();
```

Description

GetEnumerator returns a TComponentEnumerator reference, which enumerates the components contained within a specified containing component.

To process all these sub components, call the TComponentEnumerator GetCurrent method within a While MoveNext do loop.

See Also

TComponentEnumerator (see page 2812)

3.1.7.4.6 TCustomActionList.IsShortCut Method

Evaluates an input key combination to determine whether it is a shortcut for one of the actions in the list.

Pascal

```
function IsShortCut(var Message: TWMKey): Boolean;
```

C++

```
__fastcall Boolean IsShortCut(TWMKey Message);
```

Description

Typically, applications do not need to call IsShortCut. When the form's IsShortCut method does not evaluate a shortcut key by some other means (such as an event handler), it calls IsShortCut for every associated action list until it finds one that can handle the shortcut.

The action list's IsShortCut method, in turn, checks the specified keystroke against the ShortCut property and SecondaryShortCuts properties of each action in the list. If it finds a match, it tells the action to handle the shortcut, and then returns true. If IsShortCut can't find an action to handle the shortcut, it returns false.

Message encapsulates the Windows keystroke message that is to be checked to see if it is a shortcut.

Key is the key code for the potential shortcut key.

Shift specifies the state of the Shift, Alt, and Ctrl keys that may be combined with Key.

KeyText is the string representation of the potential shortcut key.

See Also

ShortCut (see page 314)

SecondaryShortCuts (see page 314)

IsShortCut (see page 13880)

3.1.7.4.7 TCustomActionList.Notification Method

Responds to notifications when objects are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification notifies the action list that the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

TCustomActionList (see page 315) overrides Notification to update the Images (see page 325) property when images from the list are destroyed and the Actions (see page 325) property when actions in the list are destroyed.

See Also

Images (see page 325)

3.1.7.4.8 TCustomActionList.RemoveAction Method

Removes an action from the list.

Pascal

```
procedure RemoveAction(Action: TContainedAction);
```

C++

```
__fastcall RemoveAction(TContainedAction Action);
```

Description

Applications can't call this protected method. RemoveAction is used internally to remove an action from the Actions (see page 325) property array. RemoveAction removes the action and sets its ActionList property to nil (Delphi) or NULL (C++).

To remove an action from an action list, change the action's ActionList property.

See Also

Actions (see page 325)

AddAction (see page 320)

ActionList (see page 295)

3.1.7.4.9 TCustomActionList.SetChildOrder Method

Sets the order that actions are passed to a callback by the GetChildren (see page 321) method.

Pascal

```
procedure SetChildOrder(Component: TComponent; Order: Integer); override;
```

C++

```
virtual __fastcall SetChildOrder(TComponent * Component, int Order);
```

Description

SetChildOrder specifies the order in which the component streaming system loads and saves the action components owned by this action list. It ensures that the actions are loaded and saved in the same order that they appear in the Actions (see page 325) property array. You should not need to call this method directly.

See Also

GetChildren (see page 321)

Actions (see page 325)

3.1.7.4.10 TCustomActionList.SetImages Method

Sets the value of the Images (see page 325) property.

Pascal

```
procedure SetImages(Value: TCustomImageList); virtual;
```

C++

```
virtual __fastcall SetImages(TCustomImageList Value);
```

Description

SetImages is the protected write implementation of the Images (see page 325) property. It registers the action list with the

image list specified by Value so that it will be informed of any changes to the image list.

See Also

Images (see page 325)

3.1.7.4.11 TCustomActionList.SetState Method

Pascal

```
procedure SetState(const Value: TActionListState); virtual;
```

C++

```
virtual __fastcall SetState(const TActionListState Value);
```

Description

This is SetState, a member of class TCustomActionList.

3.1.7.4.12 TCustomActionList.UpdateAction Method

Generates an OnUpdate (see page 327) event.

Pascal

```
function UpdateAction(Action: TBasicAction): Boolean; override;
```

C++

```
virtual __fastcall Boolean UpdateAction(TBasicAction Action);
```

Description

Typically, applications do not call the UpdateAction method. Instead, the action indicated by the Action parameter calls UpdateAction when informed by the application that it can update itself. It is possible, however, to call UpdateAction to generate an OnUpdate (see page 327) event even though this has not been initiated by the application.

UpdateAction invokes the OnUpdate (see page 327) event handler for the action list. It returns true if the event handler updates the action, false otherwise.

See Also

OnUpdate (see page 327)

3.1.7.5 TCustomActionList Properties

The properties of the TCustomActionList class are listed here.

Public Properties

	Name	Description
R	ActionCount (see page 324)	Indicates the number of actions in the action list.
	Actions (see page 325)	Lists the actions maintained by the action list.
	Images (see page 325)	Lists the images available for actions in the action list.
	State (see page 326)	Indicates whether the actions in the action list respond when the user triggers a client object.

3.1.7.5.1 TCustomActionList.ActionCount Property

Indicates the number of actions in the action list.

Pascal

```
property ActionCount: Integer;
```

C++

```
__property int ActionCount;
```

Description

ActionCount indicates how many actions are contained in the action list.

See Also

Actions (see page 325)

3.1.7.5.2 TCustomActionList.Actions Property

Lists the actions maintained by the action list.

Pascal

```
property Actions [Index: Integer]: TContainedAction;
```

C++

```
__property TContainedAction Actions[int Index];
```

Description

Actions is an indexed property containing a list of the actions in the action list component.

Index identifies the action by index, where 0 is the index of the first action, 1 is the index of the second action, and so on. The upper limit for Index is given by the ActionCount (see page 324) property.

See Also

ActionCount (see page 324)

operator_sb

3.1.7.5.3 TCustomActionList.Images Property

Lists the images available for actions in the action list.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Images is a list of bitmaps that can be displayed to the left of any action in the action list. An action is associated with an image from this image list by its ImageIndex property. This image can then appear on client controls such as menu items, tool buttons, and so on.

See Also

Actions (see page 325)

ImageIndex (see page 313)

3.1.7.5.4 TCustomActionList.State Property

Indicates whether the actions in the action list respond when the user triggers a client object.

Pascal

```
property State: TActionListState;
```

C++

```
__property TActionListState State;
```

Description

Use State to turn an action list on or off. State can have any of the following values:

Value	Meaning
asNormal	Actions (see page 325) perform their normal response when triggered by client objects or hotkeys.
asSuspended	The actions in the action list do not respond when client objects tell them to "fire". The Enabled property for all actions in the list is unchanged.
asSuspendedEnabled	The actions in the action list do not respond when client objects tell them to "fire". The Enabled property for all actions in the list is set to true. Used for designing ActionBars.

See Also

Execute (see page 304)

Enabled (see page 310)

3.1.7.6 TCustomActionList Events

The events of the TCustomActionList class are listed here.

Protected Events

	Name	Description
	OnChange (see page 326)	Occurs when a change occurs in the action list.
	OnExecute (see page 327)	Occurs when a client object triggers an action in the list.
	OnUpdate (see page 327)	Occurs when the application is idle so that the action list can update a specific action in the list.

Public Events

	Name	Description
	OnStateChange (see page 327)	Occurs after an OnChange (see page 326) event.

3.1.7.6.1 TCustomActionList.OnChange Event

Occurs when a change occurs in the action list.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to update your application in response to changes in the action list. Changes to the action list

that trigger an OnChange event include changes to an action category or to the action list's image list.

Note: The action list automatically informs the actions in the list when an OnChange event occurs. You need only provide an OnChange event handler for application-specific responses.

3.1.7.6.2 TCustomActionList.OnExecute Event

Occurs when a client object triggers an action in the list.

Pascal

```
property OnExecute: TActionEvent;
```

C++

```
__property TActionEvent OnExecute;
```

Description

Write an OnExecute event handler to respond when an action in the list fires.

When the user invokes a client object, the action list's OnExecute event is the first event to occur in response. If the OnExecute event handler sets its Handled parameter to true, the action is considered handled, and processing stops there. This blocks the execution of any other event handlers or any built-in response by a predefined action class in response to the user action.

If the OnExecute event handler does not set its Handled parameter to true, the application's OnActionExecute event occurs next. If the OnActionExecute event does not respond to the user input, the action object's OnExecute event occurs. Finally, if the action does not have an OnExecute event handler, the application locates a target object and executes any predefined response implemented by the action object.

See Also

Execute (see page 304)

OnExecute (see page 2716)

OnActionExecute (see page 13725)

3.1.7.6.3 TCustomActionList.OnStateChange Event

Occurs after an OnChange (see page 326) event.

Pascal

```
property OnStateChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnStateChange;
```

Description

Write an OnStateChange event handler to respond after the OnChange (see page 326) event occurs.

See Also

OnChange (see page 326)

3.1.7.6.4 TCustomActionList.OnUpdate Event

Occurs when the application is idle so that the action list can update a specific action in the list.

Pascal

```
property OnUpdate: TActionEvent;
```

C++

```
__property TActionEvent OnUpdate;
```

Description

Write an OnUpdate event handler to configure the properties of a specified action in the list so that it reflects current conditions.

When the application is idle, it cycles through every action in turn giving it a chance to update itself to reflect current conditions. For each action, the first event to occur in this sequence is the action list's OnUpdate event. If the OnUpdate event handler sets its Handled parameter to true, the action is considered updated, and processing stops there. This blocks the execution of any other event handlers or any built-in response by a predefined action class.

If the OnUpdate event handler does not set its Handled parameter to true, the application's OnActionUpdate event occurs next. If the OnActionUpdate event does not update the action, the action object's OnUpdate event occurs. Finally, if the action does not have an OnUpdate event handler, the application executes any predefined update method implemented by the action object.

See Also

OnUpdate (see page 2718)

OnActionUpdate (see page 13726)

3.1.8 TShortCutList Class

TShortCutList manages an array of keyboard shortcuts.

Class Hierarchy

Pascal

```
TShortCutList = class(TStringList);
```

C++

```
class TShortCutList : public TStringList;
```

File

ActnList

Description

TShortCutList is a specialized list for storing TShortCut values. TShortCutList is the type of the SecondaryShortCuts property.

TShortCutList is a descendant of TStringList, which manages a collection of strings. As such, TShortCutList adds, deletes, and searches for shortcuts using their text representation. (You can convert between a shortcut and its text representation using the TextToShortCut and SHortCutToText functions). TShortCutList stores the shortcut that corresponds to a text representation as the value of the Objects property for that string. Do not change the value of the Objects property, or the short cut list will not operate correctly.

See Also

TextToShortCut

ShortCutToText

TShortCut

TCustomAction (see page 297)

3.1.8.1 TShortCutList Members

The following tables list the members exposed by TShortCutList.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 3013)	This is Changed, a member of class TStringList.
	Changing (see page 3013)	This is Changing, a member of class TStringList.
	CompareStrings (see page 3014)	Compares two strings.
	CompareStrings (see page 3048)	Compares two strings.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 3049)	Reads and writes the Strings (see page 3080) property as if it were published.
	Error (see page 3052)	This is the overview for the Error method overload.
	ExtractName (see page 3053)	Returns the name portion of a string that is a name value pair.
	Get (see page 3017)	Returns a string given its index.
	Get (see page 3053)	Returns a string given its index.
	GetCapacity (see page 3017)	Returns the currently allocated size of the list of strings.
	GetCapacity (see page 3054)	Returns the currently allocated size of the list of strings.
	GetCount (see page 3018)	Returns the number of strings in the list
	GetCount (see page 3054)	Returns the number of strings in the list
	GetObject (see page 3018)	Returns the object associated with the string at a specified index.
	GetObject (see page 3055)	Returns the object associated with the string at a specified index.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTextStr (see page 3056)	Returns the value of the Text (see page 3084) property.
	InsertItem (see page 3020)	This is InsertItem, a member of class TStringList.
	Put (see page 3022)	Changes the value of the string with a specified index.
	Put (see page 3064)	Changes the value of the string with a specified index.
	PutObject (see page 3022)	Changes the object associated with the string at a specified index.
	PutObject (see page 3065)	Changes the object associated with the string at a specified index.
	SetCapacity (see page 3022)	Changes the amount of memory allocated to hold strings in the list.
	SetCapacity (see page 3068)	Changes the amount of memory allocated to hold strings in the list.
	SetTextStr (see page 3069)	Sets the Text (see page 3084) property.
	SetUpdateState (see page 3023)	Performs internal adjustments before or after a series of updates.
	SetUpdateState (see page 3069)	Performs internal adjustments before or after a series of updates.

Protected Properties

	Name	Description
	UpdateCount (see page 3085)	Indicates the number of calls to BeginUpdate (see page 3045) that have not been matched by a call to EndUpdate (see page 3050).

Public Events

	Name	Description
	OnChange (see page 3028)	Occurs immediately after the list of strings changes.
	OnChanging (see page 3028)	Occurs immediately before the list of strings changes.

Public Methods

	Name	Description
	Add (see page 332)	Adds a new shortcut to the list.

V	AddObject (see page 3012)	Adds a string to the list, and associates an object with the string.
V	AddObject (see page 3036)	Adds a string to the list, and associates an object with the string.
V	AddStrings (see page 3039)	Adds a group of strings to the list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 3041)	Adds a string to the list.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	Assign (see page 3043)	Sets the strings in the list, and possibly associated objects, from a source object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginUpdate (see page 3045)	Enables the TStrings (see page 3029) object to track when the list of strings is changing.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 3013)	Deletes all the strings from the list.
A	Clear (see page 3047)	Introduces an abstract (Delphi) or pure virtual (C++) method to empty the list and any associated objects.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	CustomSort (see page 3014)	Sorts the strings in the list in a customized order.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Delete (see page 3015)	Removes the string specified by the Index parameter.
A	Delete (see page 3049)	Introduces an abstract (Delphi) or pure virtual (C++) method to delete a specified string from the list.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 3009)	Destroys an instance of TStringList (see page 3006).
V	Destroy (see page 3032)	Destroys the TPersistent instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 3050)	Enables the TStrings (see page 3029) object to keep track of when the list of strings has finished changing.
	Equals (see page 3051)	Compares the list of strings to the list from another TStrings (see page 3029) object and returns true if the two lists match.
V	Exchange (see page 3015)	Swaps the position of two strings in the list.
V	Exchange (see page 3053)	Swaps the position of two strings in the list.
	FieldAddress (see page 22299)	Returns the address of a published object field.
V	Find (see page 3016)	Locates the index for a string in a sorted list and indicates whether a string with that value already exists in the list.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 3054)	Returns a TStrings (see page 3029) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetText (see page 3055)	Allocates a text buffer and fills it with the value of the Text (see page 3084) property.
V	IndexOf (see page 3019)	Returns the position of a string in the list.
V	IndexOf (see page 3056)	Returns the position of a string in the list.
V	IndexOfName (see page 3057)	Returns the position of the first name-value pair with the specified name.
V	IndexOfObject (see page 3059)	Returns the index of the first string in the list associated with a given object.
	IndexOfShortCut (see page 332)	Returns the position of a shortcut in the list.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	Insert (see page 3019)	Inserts a string to the list at the position specified by Index.
A	Insert (see page 3059)	Introduces abstract (Delphi) or pure virtual (C++) method to insert a string at a specified position.
V	InsertObject (see page 3020)	Inserts a string into the list at the specified position, and associates it with an object.
V	InsertObject (see page 3060)	Inserts a string into the list at the specified position, and associates it with an object.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	LoadFromFile (see page 3061)	Fills the list with the lines of text in a specified file.
V	LoadFromStream (see page 3062)	Fills the list with lines of text read from a stream.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	Move (see page 3063)	Changes the position of a string in the list.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SaveToFile (see page 3065)	Saves the strings in the list to the specified file.
V	SaveToStream (see page 3067)	Writes the value of the Text (see page 3084) property to a stream object.
V	SetText (see page 3068)	Sets the Text (see page 3084) property.
V	Sort (see page 3023)	Sorts the strings in the list in ascending order.

Public Properties

	Name	Description
	Capacity (see page 3070)	Indicates the number of strings the TStrings (see page 3029) object can hold.
	CaseSensitive (see page 3025)	Controls (see page 5711) whether strings are located, sorted, and identified as duplicates in a case-sensitive or case-insensitive manner.
	CommaText (see page 3070)	Lists the strings in the TStrings (see page 3029) object in system data format (SDF).
R	Count (see page 3071)	Introduces an abstract property to represent the number of strings in the list.
	DelimitedText (see page 3074)	Represents all the strings in the TStrings (see page 3029) object as a single delimited string.
	Delimiter (see page 3074)	Specifies the delimiter used by the DelimitedText (see page 3074) property.
	Duplicates (see page 3025)	Specifies whether duplicate strings can be added to sorted lists.
	LineBreak (see page 3075)	Defines the line break character(s).
R	Names (see page 3075)	Indicates the name part of strings that are name-value pairs.
	NameValueSeparator (see page 3077)	Indicates the character used to separate names from values.
	Objects (see page 3077)	Represents a set of objects that are associated one with each of the strings in the Strings (see page 3080) property.
	QuoteChar (see page 3080)	Specifies the quote character used by the DelimitedText (see page 3074) property.
R	ShortCuts (see page 333)	Lists the shortcuts in the list.
	Sorted (see page 3026)	Specifies whether the strings in the list should be automatically sorted.
	StrictDelimiter (see page 3080)	Determines how the Delimiter (see page 3074) property is used.
	Strings (see page 3080)	References the strings in the list by their positions.
	StringsAdapter (see page 3084)	Implements an IStringsAdapter (see page 3208) interface for the TStrings (see page 3029) object.
	Text (see page 3084)	Lists the strings in the TStrings (see page 3029) object as a single string with the individual strings delimited by carriage returns and line feeds.
	ValueFromIndex (see page 3085)	Represents the value part of a string with a given index, on strings that are name-value pairs.
	Values (see page 3086)	Represents the value part of a string associated with a given name, on strings that are name-value pairs.

3.1.8.2 TShortCutList Methods

The methods of the TShortCutList class are listed here.

Public Methods

	Name	Description
	Add (see page 332)	Adds a new shortcut to the list.
	IndexOfShortCut (see page 332)	Returns the position of a shortcut in the list.

3.1.8.2.1 TShortCutList.Add Method

Adds a new shortcut to the list.

Pascal

```
function Add(const S: String): Integer; override;
```

C++

```
virtual __fastcall int Add(const AnsiString S);
```

Description

Call Add to add a shortcut to the list. If the list is sorted, the shortcut is added to the appropriate position in the sort order. If the list is not sorted, the shortcut is added to the end of the list. Add returns the position of the shortcut in the list, where the first item in the list has a value of 0.

S is the string representation of the shortcut to add. You can obtain this from a shortcut using the global ShortCutToText function. TShortCutList (see page 328) saves the string S as a new string in the list and the corresponding shortcut as an Object associated with that string.

Note: For sorted lists, Add raises an EListError exception if the string S already appears in the list and Duplicates is set to dupError. If Duplicates is set to dupIgnore, trying to add a duplicate string to a sorted list does nothing.

See Also

Append (see page 3041)

Delete (see page 3015)

Duplicates (see page 3025)

Insert (see page 3019)

Sorted (see page 3026)

TextToShortCut (see page 16196)

ShortCutToText (see page 16195)

Objects

3.1.8.2.2 TShortCutList.IndexOfShortCut Method

Returns the position of a shortcut in the list.

Pascal

```
function IndexOfShortCut(const Shortcut: TShortCut): Integer;
```

C++

```
__fastcall int IndexOfShortCut(const TShortCut Shortcut);
```

Description

Call IndexOfShortCut to locate a shortcut in the list. IndexOfShortCut returns the position of the first occurrence of Shortcut in the list, where 0 is the position of the first shortcut, 1 is the position of the second shortcut, and so on. If the shortcut does not appear in the list, IndexOfShortCut returns –1.

Note: To locate a shortcut based on its string representation rather than the shortcut value, use the Find or IndexOf method instead.

See Also

Find (see page 3016)

IndexOf (see page 3019)

3.1.8.3 TShortCutList Properties

The properties of the TShortCutList class are listed here.

Public Properties

	Name	Description
	ShortCuts (see page 333)	Lists the shortcuts in the list.

3.1.8.3.1 TShortCutList.ShortCuts Property

Lists the shortcuts in the list.

Pascal

```
property ShortCuts [Index: Integer]: TShortCut;
```

C++

```
__property TShortCut ShortCuts[int Index];
```

Description

Use ShortCuts to access the shortcuts in the list by position. The Index parameter indicates the index of the shortcut, where 0 is the index of the first shortcut, 1 is the index of the second shortcut, and so on.

ShortCuts is the same as the Objects property, except that the value is given as a TShortCut value instead of as a reference to an object instance.

Warning: Do not set the Objects property, or the short cut list will fail to work correctly.

ShortCuts is a read-only property. To add or delete shortcuts in the list, use the Add (see page 332) and Delete methods. To locate a specific shortcut in the list, use the IndexOfShortCut (see page 332) method.

Count

3.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CreateAction (see page 334)	Creates an action of a specified type.
	EnumRegisteredActions (see page 334)	Iterates through the list of registered actions, passing them to a user-defined callback.
	RegisterActions (see page 335)	Registers action classes so that they appear in the list of predefined actions in the action list editor or customize dialog.
	UnRegisterActions (see page 336)	Unregisters a set of actions.

3.2.1 ActnList.CreateAction Function

Creates an action of a specified type.

Pascal

```
function CreateAction(AOwner: TComponent; ActionClass: TBasicActionClass): TBasicAction;
```

C++

```
TBasicAction CreateAction(TComponent * AOwner, TBasicActionClass ActionClass);
```

File

ActnList

Description

CreateAction creates an action of type ActionClass. AOwner is typically the form or data module. CreateAction is called automatically when you add an action to an action list or action manager at design time. Calling this function does the same thing as calling ActionClass.Create (Delphi) or the constructor of the specified action class (C++). The only exception is that CreateAction uses the Resource parameter of the RegisterActions (see page 335) procedure to initialize the values of the new action object.

See Also

RegisterActions (see page 335)

EnumRegisteredActions (see page 334)

3.2.2 ActnList.EnumRegisteredActions Function

Iterates through the list of registered actions, passing them to a user-defined callback.

Pascal

```
procedure EnumRegisteredActions(Proc: TEnumActionProc; Info: Pointer);
```

C++

```
EnumRegisteredActions(TEnumActionProc Proc, void * Info);
```

File

ActnList

Description

EnumRegisteredActions iterates the list of registered actions, passing them to the user-defined callback, Proc.

Category is the category of the action. For TContainedAction (see page 289) descendants, this is the Category property; for ancestor classes you can pass in an empty string. The ActionClass parameter describes the class type of the action object. The Info parameter of the callback is the same as the Info parameter passed to EnumRegisteredActions. It allows the user to pass custom information to the callback.

See Also

RegisterActions (see page 335)

TContainedAction (see page 289)

3.2.3 ActnList.RegisterActions Function

Registers action classes so that they appear in the list of predefined actions in the action list editor or customize dialog.

Pascal

```
procedure RegisterActions(const CategoryName: string; const AClasses: array of
TBasicActionClass; Resource: TComponentClass);
```

C++

```
RegisterActions(const AnsiString CategoryName, const array of TBasicActionClass AClasses,
TComponentClass Resource);
```

File

ActnList

Description

RegisterActions allows a class to appear in the action list editor or customize dialog as a selection when you choose New Action or Add Standard Action. Predefined actions are registered automatically. To install your own action classes so that they can be added to an action list or action manager, call RegisterActions to register them.

The CategoryName parameter specifies the value of the actions' Category property.

The AClasses parameter is an array of custom action class names.

Note: In C++, the AClasses_Size parameter specifies the index of the last entry in the AClasses array (one less than the number of classes to register).

The Resource parameter lets you assign default values to the properties of the actions being registered. Resource is the class of a TDataModule descendant that contains instances of the action classes listed by AClasses, where the properties of those instances are set to the default values. This parameter can be set to nil (Delphi) or NULL (C++) if there is no need to assign default values.

See Also

UnRegisterActions (see page 336)

TBasicAction

TContainedAction (see page 289)

3.2.4 ActnList.UnRegisterActions Function

Unregisters a set of actions.

Pascal

```
procedure UnRegisterActions(const AClasses: array of TBasicActionClass);
```

C++

```
UnRegisterActions(const array of TBasicActionClass AClasses);
```

File

ActnList

Description

UnRegisterActions unregisters a set of actions that were registered with the RegisterActions (see page 335) procedure. The AClasses parameter is a list of registered action classes (descendants of TBasicAction) that are to be unregistered. In C++, the AClasses_Size parameter indicates the index of the last action class specified in AClasses (one less than the total number of classes).

See Also

RegisterActions (see page 335)

3.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TActionListState (see page 337)	This is record ActnList.TActionListState.

3.3.1 ActnList.TActionListState Enumeration

Pascal

```
TActionListState = (
  asNormal,
  asSuspended,
  asSuspendedEnabled
);
```

C++

```
enum TActionListState {
  asNormal,
  asSuspended,
  asSuspendedEnabled
};
```

File

ActnList

Description

This is record ActnList.TActionListState.

3.4 Types

The following table lists types in this documentation.

Types

Name	Description
TActionEvent (see page 338)	This is type ActnList.TActionEvent.
TActionLinkClass (see page 338)	This is type ActnList.TActionLinkClass.
TContainedActionClass (see page 339)	This is type ActnList.TContainedActionClass.
TEnumActionProc (see page 339)	This is type ActnList.TEnumActionProc.
THintEvent (see page 339)	THintEvent is the type of the OnHint event handler.

3.4.1 ActnList.TActionEvent Type

Pascal

```
TActionEvent = procedure (Action: TBasicAction; var Handled: Boolean) of object;
```

C++

```
(Action: TBasicAction; var Handled: Boolean) ( TActionEvent)();
```

File

ActnList

Description

This is type ActnList.TActionEvent.

3.4.2 ActnList.TActionLinkClass Type

Pascal

```
TActionLinkClass = class of TActionLink;
```

C++

```
TActionLink TActionLinkClass;
```

File

ActnList

Description

This is type ActnList.TActionLinkClass.

3.4.3 ActnList.TContainedActionClass Type

Pascal

```
TContainedActionClass = class of TContainedAction;
```

C++

```
TContainedAction TContainedActionClass;
```

File

ActnList

Description

This is type ActnList.TContainedActionClass.

3.4.4 ActnList.TEnumActionProc Type

Pascal

```
TEnumActionProc = procedure (const Category: string; ActionClass: TBasicActionClass; Info:
Pointer) of object;
```

C++

```
(const Category: string; ActionClass: TBasicActionClass; Info: Pointer) ( TEnumActionProc)();
```

File

ActnList

Description

This is type ActnList.TEnumActionProc.

3.4.5 ActnList.THintEvent Type

THintEvent is the type of the OnHint event handler.

Pascal

```
THintEvent = procedure (var HintStr: string; var CanShow: Boolean) of object;
```

C++

```
(var HintStr: string; var CanShow: Boolean) ( THintEvent)();
```

File

ActnList

Description

HintStr is the string that will appear in the pop-up help hint. The event handler can change this string to change the hint that appears to the user.

CanShow indicates whether the hint specified by HintStr should be shown using the default popup window after the event

handler exits. Set this to false to suppress the default behavior when the event handler displays the hint.

3.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
CreateActionProc (see page 341)	This is constant ActnList.CreateActionProc.
EnumRegisteredActionsProc (see page 341)	This is constant ActnList.EnumRegisteredActionsProc.
RegisterActionsProc (see page 342)	This is constant ActnList.RegisterActionsProc.
UnRegisterActionsProc (see page 342)	This is constant ActnList.UnRegisterActionsProc.

3.5.1 ActnList.CreateActionProc Constant

Pascal

```
CreateActionProc: function (AOwner: TComponent; ActionClass: TBasicActionClass): TBasicAction
= nil;
```

C++

```
function (AOwner: TComponent; ActionClass: TBasicActionClass): TBasicAction CreateActionProc =
nil;
```

File

ActnList

Description

This is constant ActnList.CreateActionProc.

3.5.2 ActnList.EnumRegisteredActionsProc Constant

Pascal

```
EnumRegisteredActionsProc: procedure (Proc: TEnumActionProc; Info: Pointer) = nil;
```

C++

```
procedure (Proc: TEnumActionProc; Info: Pointer) EnumRegisteredActionsProc = nil;
```

File

ActnList

Description

This is constant ActnList.EnumRegisteredActionsProc.

3.5.3 ActnList.RegisterActionsProc Constant

Pascal

```
RegisterActionsProc: procedure (const CategoryName: string; const AClasses: array of
TBasicActionClass; Resource: TComponentClass) = nil;
```

C++

```
procedure (const CategoryName: string; const AClasses: array of TBasicActionClass; Resource:
TComponentClass) RegisterActionsProc = nil;
```

File

ActnList

Description

This is constant ActnList.RegisterActionsProc.

3.5.4 ActnList.UnRegisterActionsProc Constant

Pascal

```
UnRegisterActionsProc: procedure (const AClasses: array of TBasicActionClass) = nil;
```

C++

```
procedure (const AClasses: array of TBasicActionClass) UnRegisterActionsProc = nil;
```

File

ActnList

Description

This is constant ActnList.UnRegisterActionsProc.

4 ActnMan Namespace

This is namespace ActnMan.

Topics

Name	Description
Classes (see page 346)	The following table lists classes in this documentation.
Interfaces (see page 560)	The following table lists interfaces in this documentation.
Functions (see page 563)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 564)	The following table lists structs, records, enums in this documentation.
Types (see page 568)	The following table lists types in this documentation.
Variables (see page 575)	The following table lists variables in this documentation.
Constants (see page 577)	The following table lists constants in this documentation.

Classes

	Name	Description
	TActionBarItem (see page 346)	TActionBarItem objects are used by the action manager to represent all of the action bars connected to the action manager in an application.
	TActionBars (see page 352)	TActionBars is a collection of TActionBarItem (see page 346) objects used internally by the action manager to represent all of the action bars connected to the action manager in an application.
	TActionBarStyle (see page 358)	TActionBarStyle is the base class for styles in ActionManager.
	TActionBarStyleList (see page 360)	This is class ActnMan.TActionBarStyleList.
	TActionClient (see page 364)	TActionClient is the ancestor for TActionBartItem and TActionClientItem (see page 374) classes.
	TActionClientItem (see page 374)	TActionClientItem is a streamable wrapper that represents an action or category of actions in the action manager.
	TActionClientLink (see page 389)	This is class ActnMan.TActionClientLink.
	TActionClients (see page 400)	TActionClients is a container for TActionClient (see page 364) objects.
	TActionClientsCollection (see page 408)	TActionClientsCollection is a collection of action clients that maintains information about the action manager that owns the collection.
	TActionDragBaseClass (see page 415)	TActionDragBaseClass is a base class used for managing drag operations.
	TActionDragObject (see page 418)	This is class ActnMan.TActionDragObject.
	TActionItemDragObject (see page 422)	This is class ActnMan.TActionItemDragObject.
	TActionListCollection (see page 425)	TActionListCollection is a collection that maintains information about action lists and their captions.
	TActionListItem (see page 428)	TActionListItem represents an item in a action list collection.
	TActionManager (see page 432)	TActionManager provides a mechanism to manage and display all actions contained in an application.

	TCategoryDragObject (see page 444)	This is class ActnMan.TCategoryDragObject.
	TCustomActionBar (see page 447)	TCustomActionBar is the base class for all action bands.
	TCustomActionBarColorMap (see page 492)	TCustomActionBarColorMap is the base class for the action band colormaps that controls the color of the action band and the items that appear on it.
	TCustomActionClass (see page 506)	This is class ActnMan.TCustomActionClass.
	TCustomActionControl (see page 507)	TCustomActionControl is the base class for ActionBand custom controls.
	TCustomActionManager (see page 537)	TCustomActionManager is the base class for the TActionManager (see page 432) component.
	TXToolDockForm (see page 559)	This is class ActnMan.TXToolDockForm.

Constants

Name	Description
caAllChanges (see page 577)	This is constant ActnMan.caAllChanges.
cDefaultSchedule (see page 577)	This is constant ActnMan.cDefaultSchedule.
CM_ENTERMENULOOP (see page 578)	This is constant ActnMan.CM_ENTERMENULOOP.
CM_ITEMCLICKED (see page 578)	This is constant ActnMan.CM_ITEMCLICKED.
CM_ITEMDROPPOINT (see page 578)	This is constant ActnMan.CM_ITEMDROPPOINT.
CM_ITEMKEYED (see page 579)	This is constant ActnMan.CM_ITEMKEYED.
CM_ITEMSELECTED (see page 579)	This is constant ActnMan.CM_ITEMSELECTED.
CM_RESETBAR (see page 579)	This is constant ActnMan.CM_RESETBAR.
CM_SCROLLCLICKED (see page 580)	This is constant ActnMan.CM_SCROLLCLICKED.
ControlDragMode (see page 580)	This is constant ActnMan.ControlDragMode.

Functions

	Name	Description
	NotifyDesigner (see page 563)	This is function ActnMan.NotifyDesigner.

Interfaces

	Name	Description
	IActionBarDesigner (see page 560)	This is class ActnMan.IActionBarDesigner.

Structs, Records, Enums

	Name	Description
	TBackgroundLayout (see page 564)	This is record ActnMan.TBackgroundLayout.
	TBarEdge (see page 564)	This is record ActnMan.TBarEdge.
	TBarOrientation (see page 565)	This is record ActnMan.TBarOrientation.
	TCaptionOptions (see page 565)	This is record ActnMan.TCaptionOptions.
	TChangesAllowed (see page 566)	This is record ActnMan.TChangesAllowed.
	TCMItemMsg (see page 566)	This is record ActnMan.TCMItemMsg.

Types

Name	Description
TActionBarItemClass (see page 568)	This is type ActnMan.TActionBarItemClass.
TActionBarsClass (see page 568)	This is type ActnMan.TActionBarsClass.
TActionClientClass (see page 569)	This is type ActnMan.TActionClientClass.
TActionClientItemClass (see page 569)	This is type ActnMan.TActionClientItemClass.
TActionClientLinkClass (see page 569)	This is type ActnMan.TActionClientLinkClass.
TActionClientsClass (see page 570)	This is type ActnMan.TActionClientsClass.
TActionProc (see page 570)	This is type ActnMan.TActionProc.
TChangesAllowedSet (see page 570)	This is type ActnMan.TChangesAllowedSet.
TColorMapUpdateProc (see page 571)	This is type ActnMan.TColorMapUpdateProc.
TControlCreatedEvent (see page 571)	This is type ActnMan.TControlCreatedEvent.
TCustomActionBarClass (see page 571)	This is type ActnMan.TCustomActionBarClass.
TCustomActionControlClass (see page 572)	This is type ActnMan.TCustomActionControlClass.
TCustomColorMapClass (see page 572)	This is type ActnMan.TCustomColorMapClass.

TGetBarItemClassEvent (see page 572)	This is type ActnMan.TGetBarItemClassEvent.
TGetBarsClassEvent (see page 573)	This is type ActnMan.TGetBarsClassEvent.
TGetClientItemClassEvent (see page 573)	This is type ActnMan.TGetClientItemClassEvent.
TGetClientsClassEvent (see page 573)	This is type ActnMan.TGetClientsClassEvent.
TGetControlClassEvent (see page 574)	This is type ActnMan.TGetControlClassEvent.
TMergeRange (see page 574)	This is type ActnMan.TMergeRange.
TStyleChanged (see page 574)	This is type ActnMan.TStyleChanged.

Variables

Name	Description
ActionBarDesigner (see page 575)	This is variable ActnMan.ActionBarDesigner.
ActionBarStyles (see page 575)	This is variable ActnMan.ActionBarStyles.
DefaultActnBarStyle (see page 575)	This is variable ActnMan.DefaultActnBarStyle.

4.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TActionBarItem (see page 346)	TActionBarItem objects are used by the action manager to represent all of the action bars connected to the action manager in an application.
	TActionBars (see page 352)	TActionBars is a collection of TActionBarItem (see page 346) objects used internally by the action manager to represent all of the action bars connected to the action manager in an application.
	TActionBarStyle (see page 358)	TActionBarStyle is the base class for styles in ActionManager.
	TActionBarStyleList (see page 360)	This is class ActnMan.TActionBarStyleList.
	TActionClient (see page 364)	TActionClient is the ancestor for TActionBartItem and TActionClientItem (see page 374) classes.
	TActionClientItem (see page 374)	TActionClientItem is a streamable wrapper that represents an action or category of actions in the action manager.
	TActionClientLink (see page 389)	This is class ActnMan.TActionClientLink.
	TActionClients (see page 400)	TActionClients is a container for TActionClient (see page 364) objects.
	TActionClientsCollection (see page 408)	TActionClientsCollection is a collection of action clients that maintains information about the action manager that owns the collection.
	TActionDragBaseClass (see page 415)	TActionDragBaseClass is a base class used for managing drag operations.
	TActionDragObject (see page 418)	This is class ActnMan.TActionDragObject.
	TActionItemDragObject (see page 422)	This is class ActnMan.TActionItemDragObject.
	TActionListCollection (see page 425)	TActionListCollection is a collection that maintains information about action lists and their captions.
	TActionListItem (see page 428)	TActionListItem represents an item in a action list collection.
	TActionManager (see page 432)	TActionManager provides a mechanism to manage and display all actions contained in an application.
	TCategoryDragObject (see page 444)	This is class ActnMan.TCategoryDragObject.
	TCustomActionBar (see page 447)	TCustomActionBar is the base class for all action bands.
	TCustomActionBarColorMap (see page 492)	TCustomActionBarColorMap is the base class for the action band colormaps that controls the color of the action band and the items that appear on it.
	TCustomActionClass (see page 506)	This is class ActnMan.TCustomActionClass.
	TCustomActionControl (see page 507)	TCustomActionControl is the base class for ActionBand custom controls.
	TCustomActionManager (see page 537)	TCustomActionManager is the base class for the TActionManager (see page 432) component.
	TXToolDockForm (see page 559)	This is class ActnMan.TXToolDockForm.

4.1.1 TActionBarItem Class

TActionBarItem objects are used by the action manager to represent all of the action bars connected to the action manager in an application.

Class Hierarchy

Pascal

```
TActionBarItem = class(TActionClient);
```

C++

```
class TActionBarItem : public TActionClient;
```

File

ActnMan

Description

TActionBarItem is used to wrap a category of actions into a streamable format that is managed by an action manager. TActionBarItem is used as a mechanism to store layout (ordering) information for a set of actions. This layout information is used by the action manager to render the actions in the UI.

Instances of TActionBarItem are created automatically by the TActionManager (see page 432) component when an action or category of actions is added to an action band.

Note: Do not create or destroy instances of TActionBarItem directly, always allow the action manager to handle this for you.

See Also

TActionManager (see page 432)

4.1.1.1 TActionBarItem Members

The following tables list the members exposed by TActionBarItem.

Protected Methods

	Name	Description
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	ClearActionBar (see page 367)	This is ClearActionBar, a member of class TActionClient.
V	ColorChanged (see page 349)	This is ColorChanged, a member of class TActionBarItem.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FreeChildren (see page 368)	This is FreeChildren, a member of class TActionClient.
V	GetDisplayName (see page 350)	Returns the name of the collection item as it appears in the collection editor.
V	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	HasVisibleItems (see page 368)	This is HasVisibleItems, a member of class TActionClient.
	IsChildItem (see page 368)	This is IsChildItem, a member of class TActionClient.
V	SetChangesAllowed (see page 369)	This is SetChangesAllowed, a member of class TActionClient.
V	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
V	SetColor (see page 369)	This is SetColor, a member of class TActionClient.
V	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
V	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.
V	SetVisible (see page 350)	This is SetVisible, a member of class TActionBarItem.

Protected Properties

	Name	Description
R	ActionBars (see page 351)	This is ActionBars, a member of class TActionBarItem.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 367)	Copies the contents of another object to the current one.
V	Assign (see page 2930)	Copies the contents of another, similar object.

V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 349)	Creates and initializes a TActionBarItem (see page 346) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 366)	Destroys the action client and frees its memory.
V	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	HasBackground (see page 368)	Indicates whether a background image exists.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Refresh (see page 350)	Causes the controls on the ActionBar (see page 351) to be realigned.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Accessible (see page 370)	This is Accessible, a member of class TActionClient.
	ChildActionBar (see page 372)	Specifies the action band that is used to render the TActionClients (see page 400) object specified in the Items (see page 373) property.
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	HasItems (see page 373)	Specifies whether the action client has sub-items associated with the action client.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
R	OwningCollection (see page 373)	This is OwningCollection, a member of class TActionClient.

Published Properties

	Name	Description
	ActionBar (see page 351)	Specifies the action band the action client is rendered on.
	AutoSize (see page 351)	Specifies whether the ActionBar (see page 351) control associated with this item sizes itself automatically to accommodate its contents.

	Background (see page 370)	Specifies the image that is drawn on the action client's action band for the action client.
	BackgroundLayout (see page 371)	Specifies how the image specified in the Background (see page 370) property is rendered on the action band used by the action client to render any sub-items that are contained by the action client.
	ChangesAllowed (see page 371)	Indicates which kinds of changes to the action client are permissible.
	Color (see page 372)	Specifies the background color for TClientAction when it is rendered on a action band.
	ContextItems (see page 372)	Specifies the TActionClients (see page 400) object that is rendered as a popup menu when a item is right clicked.
	GlyphLayout (see page 352)	Describes where the images should be for all the actions on the ActionBand associated with TActionBarItem (see page 346).
	Items (see page 373)	Specifies the TActionClients (see page 400) object that contains the sub-items of the action client.
	Tag (see page 374)	This is Tag, a member of class TActionClient.
	Visible (see page 374)	Determines whether the action client is visible.

4.1.1.2 TActionBarItem.Create Constructor

Creates and initializes a TActionBarItem (see page 346) object.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TActionBarItem(TCollection Collection);
```

Description

The Create method takes as a parameter the name of a TCollection instance. Create is called automatically by action manager when a new instance of a TActionBarItem (see page 346) is required.

4.1.1.3 TActionBarItem Methods

The methods of the TActionBarItem class are listed here.

Protected Methods

	Name	Description
	ColorChanged (see page 349)	This is ColorChanged, a member of class TActionBarItem.
	GetDisplayName (see page 350)	Returns the name of the collection item as it appears in the collection editor.
	SetVisible (see page 350)	This is SetVisible, a member of class TActionBarItem.

Public Methods

	Name	Description
	Refresh (see page 350)	Causes the controls on the ActionBar (see page 351) to be realigned.

4.1.1.3.1 TActionBarItem.ColorChanged Method

Pascal

```
procedure ColorChanged; override;
```

C++

```
virtual __fastcall ColorChanged();
```

Description

This is ColorChanged, a member of class TActionBarItem.

4.1.1.3.2 TActionBarItem.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName (see page 2761)

GetNamePath (see page 2759)

4.1.1.3.3 TActionBarItem.Refresh Method

Causes the controls on the ActionBar (see page 351) to be realigned.

Pascal

```
procedure Refresh; override;
```

C++

```
virtual __fastcall Refresh();
```

Description

If the TActionBarItem (see page 346) is associated with an ActionBar (see page 351), Refresh causes the controls on the ActionBar (see page 351) to be realigned.

4.1.1.3.4 TActionBarItem.SetVisible Method

Pascal

```
procedure SetVisible(const Value: Boolean); override;
```

C++

```
virtual __fastcall SetVisible(const Boolean Value);
```

Description

This is SetVisible, a member of class TActionBarItem.

4.1.1.4 TActionBarItem Properties

The properties of the TActionBarItem class are listed here.

Protected Properties

	Name	Description
R	ActionBars (see page 351)	This is ActionBars, a member of class TActionBarItem.

Published Properties

	Name	Description
	ActionBar (see page 351)	Specifies the action band the action client is rendered on.
	AutoSize (see page 351)	Specifies whether the ActionBar (see page 351) control associated with this item sizes itself automatically to accommodate its contents.
	GlyphLayout (see page 352)	Describes where the images should be for all the actions on the ActionBand associated with TActionBarItem (see page 346).

4.1.1.4.1 TActionBarItem.ActionBar Property

Specifies the action band the action client is rendered on.

Pascal

```
property ActionBar: TCustomActionBar;
```

C++

```
__property TCustomActionBar ActionBar;
```

Description

ActionBar is used internally to specify the action band that the action client is rendered on.

4.1.1.4.2 TActionBarItem.ActionBars Property

Pascal

```
property ActionBars: TActionBars;
```

C++

```
__property TActionBars ActionBars;
```

Description

This is ActionBars, a member of class TActionBarItem.

4.1.1.4.3 TActionBarItem.AutoSize Property

Specifies whether the ActionBar (see page 351) control associated with this item sizes itself automatically to accommodate its contents.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

Use AutoSize to specify whether the TActionBar control associated with this item sizes itself automatically. For example, AutoSize controls whether or not TCustomActionToolbars wrap. When AutoSize is true, the control resizes automatically when its contents change.

By default, AutoSize is false.

4.1.1.4.4 TActionBarItem.GlyphLayout Property

Describes where the images should be for all the actions on the ActionBand associated with TActionBarItem (see page 346).

Pascal

```
property GlyphLayout: TButtonLayout;
```

C++

```
__property TButtonLayout GlyphLayout;
```

Description

GlyphLayout describes where the image should be placed on the control. The description is in terms of a TButtonLayout value; see the documentation for that type for more information.

4.1.2 TActionBars Class

TActionBars is a collection of TActionBarItem (see page 346) objects used internally by the action manager to represent all of the action bars connected to the action manager in an application.

Class Hierarchy

Pascal

```
TActionBars = class(TActionClientsCollection);
```

C++

```
class TActionBars : public TActionClientsCollection;
```

File

ActnMan

Description

TActionBars is used by the action manager to maintain current layout information about all the action bars connected to the action manager in an application. TActionBars allows the action manager to write this information to disk in a file or to a stream. TActionBars also allows the action manager to reconstruct all of the action bars based on information contained in a specified file or a stream.

Creating Dynamic Menus

Creating Most Recently Used Lists

Hiding Unused Items and Categories in Action Bands

4.1.2.1 TActionBars Members

The following tables list the members exposed by TActionBars.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	DoShowHint (see page 355)	This is DoShowHint, a member of class TActionBars.
	GetActionManager (see page 412)	Initializes the collection after the constructor is finished.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
	InternalRethinkHotkeys (see page 412)	Adjusts the captions of child items so that every item has an accelerator and there are no duplicate accelerator keys.
	Loaded (see page 356)	This is Loaded, a member of class TActionBars.
V	Notify (see page 356)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
	ActionClients (see page 413)	Lists the action clients in this collection.
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	ParentItem (see page 415)	Indicates the action client object that uses this collection to maintain its subitems.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 355)	Creates a new TActionBarItem (see page 346) instance and adds it to the Items array.
V	AfterConstruction (see page 411)	Initializes the collection after the constructor is finished.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 355)	Creates and initializes a TActionBars (see page 352) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IterateClients (see page 412)	Executes a callback for every child item in the collection and any child items of those children.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ActionBars (see page 357)	Contains a collection of all of the action bars connected to the action manager.
R	ActionManager (see page 414)	Indicates the action manager that owns the TActionClientsCollection (see page 408) object.
	AutoHotKeys (see page 414)	Specifies whether accelerator keys are auto-generated for items that do not have them assigned.
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 2751)	Lists the items in the collection.

Published Properties

	Name	Description
	Customizable (see page 357)	Indicates whether the action clients collection is customizable.
	HintShortCuts (see page 357)	A forward to the application object's property of the same name.
	SessionCount (see page 358)	Returns the number of times the application has been run.
	ShowHints (see page 358)	Indicates whether hints should be shown for items in the collection.

4.1.2.2 TActionBars.Create Constructor

Creates and initializes a TActionBars (see page 352) object.

Pascal

```
constructor Create(AOwner: TPersistent; ItemClass: TCollectionItemClass);
```

C++

```
__fastcall TActionBars(TPersistent * AOwner, TCollectionItemClass ItemClass);
```

Description

The Create method takes as parameters the owner and the name of a TCollectionItemClass instance. Create is called automatically by action manager when an instance of a TActionBars (see page 352) is required.

4.1.2.3 TActionBars Methods

The methods of the TActionBars class are listed here.

Protected Methods

	Name	Description
	DoShowHint (see page 355)	This is DoShowHint, a member of class TActionBars.
	Loaded (see page 356)	This is Loaded, a member of class TActionBars.
	Notify (see page 356)	Responds when items are added to or removed from the collection.

Public Methods

	Name	Description
	Add (see page 355)	Creates a new TActionBarItem (see page 346) instance and adds it to the Items array.

4.1.2.3.1 TActionBars.Add Method

Creates a new TActionBarItem (see page 346) instance and adds it to the Items array.

Pascal

```
function Add: TActionBarItem;
```

C++

```
__fastcall TActionBarItem Add();
```

Description

Add is called automatically when an action band is connected to an action manager component.

4.1.2.3.2 TActionBars.DoShowHint Method

Pascal

```
procedure DoShowHint(AClient: TActionClient);
```

C++

```
__fastcall DoShowHint(TActionClient AClient);
```

Description

This is DoShowHint, a member of class TActionBars.

4.1.2.3.3 TActionBars.Loaded Method

Pascal

```
procedure Loaded;
```

C++

```
__fastcall Loaded();
```

Description

This is Loaded, a member of class TActionBars.

4.1.2.3.4 TActionBars.Notify Method

Responds when items are added to or removed from the collection.

Pascal

```
procedure Notify(Item: TCollectionItem; Action: TCollectionNotification); override;
```

C++

```
virtual __fastcall Notify(TCollectionItem Item, TCollectionNotification Action);
```

Description

Notify is called automatically when the items in the collection change.

Item is the item that was just added to or that is about to be removed from the collection.

Action indicates whether item was added, is about to be removed, or is about to be deleted:

As implemented in TCollection, Notify calls Added when Action is cnAdded and calls Deleting when Action is cnDeleting. TCollection ignores the cnExtracting action. Descendant classes can override Notify to modify this behavior.

See Also

Added (see page 2736)

Deleting (see page 2741)

4.1.2.4 TActionBars Properties

The properties of the TActionBars class are listed here.

Public Properties

	Name	Description
R	ActionBars (see page 357)	Contains a collection of all of the action bars connected to the action manager.

Published Properties

	Name	Description
	Customizable (see page 357)	Indicates whether the action clients collection is customizable.
	HintShortCuts (see page 357)	A forward to the application object's property of the same name.
	SessionCount (see page 358)	Returns the number of times the application has been run.
	ShowHints (see page 358)	Indicates whether hints should be shown for items in the collection.

4.1.2.4.1 TActionBars.ActionBars Property

Contains a collection of all of the action bars connected to the action manager.

Pascal

```
property ActionBars [const Index: Integer]: TActionBarItem;
```

C++

```
__property TActionBarItem ActionBars[int const Index];
```

Description

The ActionBars property contains a collection of all of the action bands connected to the action manager. When an action is dropped on an action band or the ActionManager (see page 414) property of an action band is set to the action manager component, the action band (in the form of a TActionBarItem (see page 346)) is automatically added to this collection.

See Also

ActionManager (see page 414)

operator_[]

4.1.2.4.2 TActionBars.Customizable Property

Indicates whether the action clients collection is customizable.

Pascal

```
property Customizable: Boolean;
```

C++

```
__property Boolean Customizable;
```

Description

The default setting for Customizable is true, which indicates that the collection can be customized. Set Customizable to false if you don't want to allow users to change the items in this collection using the customize dialog. Collections that are not customizable appear grayed out in the customize dialog.

4.1.2.4.3 TActionBars.HintShortCuts Property

A forward to the application object's property of the same name.

Pascal

```
property HintShortCuts: Boolean;
```

C++

```
__property Boolean HintShortCuts;
```

Description

The application object contains a property called HintShortCuts which determines whether or not the application's popup hint windows display shortcut information. The HintShortCuts property in TActionBars (see page 352) is simply another way to access the application's HintShortCuts property.

See Also

HintShortCuts (see page 13716)

4.1.2.4.4 TActionBars.SessionCount Property

Returns the number of times the application has been run.

Pascal

```
property SessionCount: Integer;
```

C++

```
__property int SessionCount;
```

Description

The SessionCount property stores the number of times the application has been run. SessionCount is used internally, by the action manager, in the calculation to determine whether a TActionClientItem (see page 374) is hidden or displayed on an action bar.

See Also

PrioritySchedule (see page 555)

LastSession (see page 385)

UsageCount (see page 388)

4.1.2.4.5 TActionBars.ShowHints Property

Indicates whether hints should be shown for items in the collection.

Pascal

```
property ShowHints: Boolean;
```

C++

```
__property Boolean ShowHints;
```

Description

Set ShowHints to false if you don't want hints shown for objects in the collection. The default value is true.

See Also

ShowHint (see page 13721)

4.1.3 TActionBarStyle Class

TActionBarStyle is the base class for styles in ActionManager.

Class Hierarchy

Pascal

```
TActionBarStyle = class;
```

C++

```
class TActionBarStyle;
```

File

ActnMan

Description

TActionBarStyle provides the base methods for defining styles in the ActionManager component.

See Also

TActionManager (see page 432)

4.1.3.1 TActionBarStyle Members

The following tables list the members exposed by TActionBarStyle.

Public Methods

	Name	Description
	GetColorMapClass (see page 359)	Returns the class type of the colormap for an action bar.
	GetControlClass (see page 359)	Returns the control class type on an action bar item.
	GetStyleName (see page 360)	Returns the style associated with action manager.

4.1.3.2 TActionBarStyle Methods

The methods of the TActionBarStyle class are listed here.

Public Methods

	Name	Description
	GetColorMapClass (see page 359)	Returns the class type of the colormap for an action bar.
	GetControlClass (see page 359)	Returns the control class type on an action bar item.
	GetStyleName (see page 360)	Returns the style associated with action manager.

4.1.3.2.1 TActionBarStyle.GetColorMapClass Method

Returns the class type of the colormap for an action bar.

Pascal

```
function GetColorMapClass(ActionBar: TCustomActionBar): TCustomColorMapClass; virtual;
abstract;
```

C++

```
virtual __fastcall TCustomColorMapClass GetColorMapClass(TCustomActionBar ActionBar) = 0;
```

Description

Returns the class type TCustomActionBarColorMap (see page 492), which is a colormap associated with an action bar. Override this method to customize the appearance of your applications.

4.1.3.2.2 TActionBarStyle.GetControlClass Method

Returns the control class type on an action bar item.

Pascal

```
function GetControlClass(ActionBar: TCustomActionBar; AnItem: TActionClientItem):
TCustomActionControlClass; virtual; abstract;
```

C++

```
virtual __fastcall TCustomActionControlClass GetControlClass(TCustomActionBar ActionBar,
TActionClientItem AnItem) = 0;
```

Description

Returns the control class type on an item in the action bar, such as a button or menu item.

4.1.3.2.3 TActionBarStyle.GetStyleName Method

Returns the style associated with action manager.

Pascal

```
function GetStyleName: string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetStyleName() = 0;
```

Description

Returns the value of the Style property.

4.1.4 TActionBarStyleList Class

Class Hierarchy

System::TObject → Classes.TPersistent → Classes.TStrings → Classes.TStringList → ActnMan.TActionBarStyleList

Pascal

```
TActionBarStyleList = class(TStringList);
```

C++

```
class TActionBarStyleList : public TStringList;
```

File

ActnMan

Description

This is class ActnMan.TActionBarStyleList.

4.1.4.1 TActionBarStyleList Members

The following tables list the members exposed by TActionBarStyleList.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 3013)	This is Changed, a member of class TStringList.
	Changing (see page 3013)	This is Changing, a member of class TStringList.
	CompareStrings (see page 3014)	Compares two strings.
	CompareStrings (see page 3048)	Compares two strings.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.

V	DefineProperties (see page 3049)	Reads and writes the Strings (see page 3080) property as if it were published.
	Error (see page 3052)	This is the overview for the Error method overload.
	ExtractName (see page 3053)	Returns the name portion of a string that is a name value pair.
V	Get (see page 3017)	Returns a string given its index.
A	Get (see page 3053)	Returns a string given its index.
V	GetCapacity (see page 3017)	Returns the currently allocated size of the list of strings.
V	GetCapacity (see page 3054)	Returns the currently allocated size of the list of strings.
V	GetCount (see page 3018)	Returns the number of strings in the list
A	GetCount (see page 3054)	Returns the number of strings in the list
V	GetObject (see page 3018)	Returns the object associated with the string at a specified index.
V	GetObject (see page 3055)	Returns the object associated with the string at a specified index.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetTextStr (see page 3056)	Returns the value of the Text (see page 3084) property.
V	InsertItem (see page 3020)	This is InsertItem, a member of class TStringList.
V	Put (see page 3022)	Changes the value of the string with a specified index.
V	Put (see page 3064)	Changes the value of the string with a specified index.
V	PutObject (see page 3022)	Changes the object associated with the string at a specified index.
V	PutObject (see page 3065)	Changes the object associated with the string at a specified index.
V	SetCapacity (see page 3022)	Changes the amount of memory allocated to hold strings in the list.
V	SetCapacity (see page 3068)	Changes the amount of memory allocated to hold strings in the list.
V	SetTextStr (see page 3069)	Sets the Text (see page 3084) property.
V	SetUpdateState (see page 3023)	Performs internal adjustments before or after a series of updates.
V	SetUpdateState (see page 3069)	Performs internal adjustments before or after a series of updates.

Protected Properties

	Name	Description
R	UpdateCount (see page 3085)	Indicates the number of calls to BeginUpdate (see page 3045) that have not been matched by a call to EndUpdate (see page 3050).

Public Events

	Name	Description
	OnChange (see page 3028)	Occurs immediately after the list of strings changes.
	OnChanging (see page 3028)	Occurs immediately before the list of strings changes.

Public Methods

	Name	Description
V	Add (see page 3010)	Adds a new string to the list.
V	Add (see page 3033)	Adds a string at the end of the list.
V	AddObject (see page 3012)	Adds a string to the list, and associates an object with the string.
V	AddObject (see page 3036)	Adds a string to the list, and associates an object with the string.
V	AddStrings (see page 3039)	Adds a group of strings to the list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 3041)	Adds a string to the list.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	Assign (see page 3043)	Sets the strings in the list, and possibly associated objects, from a source object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginUpdate (see page 3045)	Enables the TStrings (see page 3029) object to track when the list of strings is changing.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

V	Clear (see page 3013)	Deletes all the strings from the list.
A	Clear (see page 3047)	Introduces an abstract (Delphi) or pure virtual (C++) method to empty the list and any associated objects.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	CustomSort (see page 3014)	Sorts the strings in the list in a customized order.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Delete (see page 3015)	Removes the string specified by the Index parameter.
A	Delete (see page 3049)	Introduces an abstract (Delphi) or pure virtual (C++) method to delete a specified string from the list.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 3009)	Destroys an instance of TStringList (see page 3006).
V	Destroy (see page 3032)	Destroys the TPersistent instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 3050)	Enables the TStrings (see page 3029) object to keep track of when the list of strings has finished changing.
	Equals (see page 3051)	Compares the list of strings to the list from another TStrings (see page 3029) object and returns true if the two lists match.
V	Exchange (see page 3015)	Swaps the position of two strings in the list.
V	Exchange (see page 3053)	Swaps the position of two strings in the list.
	FieldAddress (see page 22299)	Returns the address of a published object field.
V	Find (see page 3016)	Locates the index for a string in a sorted list and indicates whether a string with that value already exists in the list.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 3054)	Returns a TStrings (see page 3029) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetText (see page 3055)	Allocates a text buffer and fills it with the value of the Text (see page 3084) property.
V	IndexOf (see page 3019)	Returns the position of a string in the list.
V	IndexOf (see page 3056)	Returns the position of a string in the list.
V	IndexOfName (see page 3057)	Returns the position of the first name-value pair with the specified name.
V	IndexOfObject (see page 3059)	Returns the index of the first string in the list associated with a given object.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	Insert (see page 3019)	Inserts a string to the list at the position specified by Index.
A	Insert (see page 3059)	Introduces abstract (Delphi) or pure virtual (C++) method to insert a string at a specified position.
V	InsertObject (see page 3020)	Inserts a string into the list at the specified position, and associates it with an object.
V	InsertObject (see page 3060)	Inserts a string into the list at the specified position, and associates it with an object.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	LoadFromFile (see page 3061)	Fills the list with the lines of text in a specified file.
V	LoadFromStream (see page 3062)	Fills the list with lines of text read from a stream.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	Move (see page 3063)	Changes the position of a string in the list.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SaveToFile (see page 3065)	Saves the strings in the list to the specified file.

V	SaveToStream (see page 3067)	Writes the value of the Text (see page 3084) property to a stream object.
V	SetText (see page 3068)	Sets the Text (see page 3084) property.
V	Sort (see page 3023)	Sorts the strings in the list in ascending order.

Public Properties

	Name	Description
	Capacity (see page 3070)	Indicates the number of strings the TStrings (see page 3029) object can hold.
	CaseSensitive (see page 3025)	Controls (see page 5711) whether strings are located, sorted, and identified as duplicates in a case-sensitive or case-insensitive manner.
	CommaText (see page 3070)	Lists the strings in the TStrings (see page 3029) object in system data format (SDF).
R	Count (see page 3071)	Introduces an abstract property to represent the number of strings in the list.
	DelimitedText (see page 3074)	Represents all the strings in the TStrings (see page 3029) object as a single delimited string.
	Delimiter (see page 3074)	Specifies the delimiter used by the DelimitedText (see page 3074) property.
	Duplicates (see page 3025)	Specifies whether duplicate strings can be added to sorted lists.
	LineBreak (see page 3075)	Defines the line break character(s).
R	Names (see page 3075)	Indicates the name part of strings that are name-value pairs.
	NameValueSeparator (see page 3077)	Indicates the character used to separate names from values.
	Objects (see page 3077)	Represents a set of objects that are associated one with each of the strings in the Strings (see page 3080) property.
	QuoteChar (see page 3080)	Specifies the quote character used by the DelimitedText (see page 3074) property.
	Sorted (see page 3026)	Specifies whether the strings in the list should be automatically sorted.
	StrictDelimiter (see page 3080)	Determines how the Delimiter (see page 3074) property is used.
	Strings (see page 3080)	References the strings in the list by their positions.
	StringsAdapter (see page 3084)	Implements an IStringsAdapter (see page 3208) interface for the TStrings (see page 3029) object.
R	Style (see page 363)	This is Style, a member of class TActionBarStyleList.
	Text (see page 3084)	Lists the strings in the TStrings (see page 3029) object as a single string with the individual strings delimited by carriage returns and line feeds.
	ValueFromIndex (see page 3085)	Represents the value part of a string with a given index, on strings that are name-value pairs.
	Values (see page 3086)	Represents the value part of a string associated with a given name, on strings that are name-value pairs.

4.1.4.2 TActionBarStyleList Properties

The properties of the TActionBarStyleList class are listed here.

Public Properties

	Name	Description
R	Style (see page 363)	This is Style, a member of class TActionBarStyleList.

4.1.4.2.1 TActionBarStyleList.Style Property

Pascal

```
property Style [Index: Integer]: TActionBarStyle;
```

C++

```
__property TActionBarStyle Style[int Index];
```

Description

This is Style, a member of class TActionBarStyleList.

4.1.5 TActionClient Class

TActionClient is the ancestor for TActionBartItem and TActionClientItem (see page 374) classes.

Class Hierarchy

System::TObject → Classes.TPersistent → Classes.TCollectionItem → ActnMan.TActionClient

Pascal

```
TActionClient = class(TCollectionItem);
```

C++

```
class TActionClient : public TCollectionItem;
```

File

ActnMan

Description

TActionClient is the ancestor for the TActionBartItem and TActionClientItem (see page 374) classes.

See Also

TActionManager (see page 432)

TActionClients (see page 400)

4.1.5.1 TActionClient Members

The following tables list the members exposed by TActionClient.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	ClearActionBar (see page 367)	This is ClearActionBar, a member of class TActionClient.
	ColorChanged (see page 367)	This is ColorChanged, a member of class TActionClient.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FreeChildren (see page 368)	This is FreeChildren, a member of class TActionClient.
	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	HasVisibleItems (see page 368)	This is HasVisibleItems, a member of class TActionClient.
	IsChildItem (see page 368)	This is IsChildItem, a member of class TActionClient.
	SetChangesAllowed (see page 369)	This is SetChangesAllowed, a member of class TActionClient.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetColor (see page 369)	This is SetColor, a member of class TActionClient.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.
	SetVisible (see page 369)	This is SetVisible, a member of class TActionClient.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 367)	Copies the contents of another object to the current one.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 366)	Creates and initializes an action client object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 366)	Destroys the action client and frees its memory.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	HasBackground (see page 368)	Indicates whether a background image exists.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Refresh (see page 369)	Causes the action client to be redrawn.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Accessible (see page 370)	This is Accessible, a member of class TActionClient.
	ActionBar (see page 370)	Specifies the action band the action client is rendered on.
	ChildActionBar (see page 372)	Specifies the action band that is used to render the TActionClients (see page 400) object specified in the Items (see page 373) property.
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	HasItems (see page 373)	Specifies whether the action client has sub-items associated with the action client.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
R	OwningCollection (see page 373)	This is OwningCollection, a member of class TActionClient.

Published Properties

	Name	Description
	Background (see page 370)	Specifies the image that is drawn on the action client's action band for the action client.
	BackgroundLayout (see page 371)	Specifies how the image specified in the Background (see page 370) property is rendered on the action band used by the action client to render any sub-items that are contained by the action client.
	ChangesAllowed (see page 371)	Indicates which kinds of changes to the action client are permissible.
	Color (see page 372)	Specifies the background color for TClientAction when it is rendered on a action band.
	ContextItems (see page 372)	Specifies the TActionClients (see page 400) object that is rendered as a popup menu when a item is right clicked.
	Items (see page 373)	Specifies the TActionClients (see page 400) object that contains the sub-items of the action client.
	Tag (see page 374)	This is Tag, a member of class TActionClient.
	Visible (see page 374)	Determines whether the action client is visible.

4.1.5.2 TActionClient.Create Constructor

Creates and initializes an action client object.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TActionClient(TCollection Collection);
```

Description

The Create method takes as a parameter the name of a TCollection instance. Create is called automatically by action manager when a new instance of a TActionClient (see page 364) is required.

4.1.5.3 TActionClient.Destroy Destructor

Destroys the action client and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TActionClient();
```

Description

Destroy eliminates the TActionClient (see page 364) instance.

See Also

Free (see page 22300)

4.1.5.4 TActionClient Methods

The methods of the TActionClient class are listed here.

Protected Methods

	Name	Description
	ClearActionBar (see page 367)	This is ClearActionBar, a member of class TActionClient.
V	ColorChanged (see page 367)	This is ColorChanged, a member of class TActionClient.
	FreeChildren (see page 368)	This is FreeChildren, a member of class TActionClient.
	HasVisibleItems (see page 368)	This is HasVisibleItems, a member of class TActionClient.
	IsChildItem (see page 368)	This is IsChildItem, a member of class TActionClient.
V	SetChangesAllowed (see page 369)	This is SetChangesAllowed, a member of class TActionClient.
V	SetColor (see page 369)	This is SetColor, a member of class TActionClient.
V	SetVisible (see page 369)	This is SetVisible, a member of class TActionClient.

Public Methods

	Name	Description
V	Assign (see page 367)	Copies the contents of another object to the current one.
	HasBackground (see page 368)	Indicates whether a background image exists.
V	Refresh (see page 369)	Causes the action client to be redrawn.

4.1.5.4.1 TActionClient.Assign Method

Copies the contents of another object to the current one.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Use the Assign procedure to copy the contents of the Source object to the current one. This procedure is an override of the inherited TPersistent method, and is designed to accurately copy the properties of one TActionClient (see page 364) to another if both objects are TActionClients (see page 400). If not, the inherited method is called. See the documentation for the inherited method for more details about the Assign method.

See Also

Assign (see page 2930)

4.1.5.4.2 TActionClient.ClearActionBar Method

Pascal

```
procedure ClearActionBar;
```

C++

```
__fastcall ClearActionBar();
```

Description

This is ClearActionBar, a member of class TActionClient.

4.1.5.4.3 TActionClient.ColorChanged Method

Pascal

```
procedure ColorChanged; virtual;
```

C++

```
virtual __fastcall ColorChanged();
```

Description

This is ColorChanged, a member of class TActionClient.

4.1.5.4.4 TActionClient.FreeChildren Method

Pascal

```
procedure FreeChildren;
```

C++

```
__fastcall FreeChildren();
```

Description

This is FreeChildren, a member of class TActionClient.

4.1.5.4.5 TActionClient.HasBackground Method

Indicates whether a background image exists.

Pascal

```
function HasBackground: Boolean;
```

C++

```
__fastcall Boolean HasBackground();
```

Description

Use the HasBackground method to determine whether or not a TActionClient (see page 364) has a background image.

4.1.5.4.6 TActionClient.HasVisibleItems Method

Pascal

```
function HasVisibleItems: Boolean;
```

C++

```
__fastcall Boolean HasVisibleItems();
```

Description

This is HasVisibleItems, a member of class TActionClient.

4.1.5.4.7 TActionClient.IsChildItem Method

Pascal

```
function IsChildItem(AClient: TActionClient): Boolean;
```

C++

```
__fastcall Boolean IsChildItem(TActionClient AClient);
```

Description

This is IsChildItem, a member of class TActionClient.

4.1.5.4.8 TActionClient.Refresh Method

Causes the action client to be redrawn.

Pascal

```
procedure Refresh; virtual;
```

C++

```
virtual __fastcall Refresh();
```

Description

Use Refresh to redraw the action client immediately.

4.1.5.4.9 TActionClient.SetChangesAllowed Method

Pascal

```
procedure SetChangesAllowed(const Value: TChangesAllowedSet); virtual;
```

C++

```
virtual __fastcall SetChangesAllowed(const TChangesAllowedSet Value);
```

Description

This is SetChangesAllowed, a member of class TActionClient.

4.1.5.4.10 TActionClient.SetColor Method

Pascal

```
procedure SetColor(const Value: TColor); virtual;
```

C++

```
virtual __fastcall SetColor(const TColor Value);
```

Description

This is SetColor, a member of class TActionClient.

4.1.5.4.11 TActionClient.SetVisible Method

Pascal

```
procedure SetVisible(const Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetVisible(const Boolean Value);
```

Description

This is SetVisible, a member of class TActionClient.

4.1.5.5 TActionClient Properties

The properties of the TActionClient class are listed here.

Public Properties

	Name	Description
	Accessible (see page 370)	This is Accessible, a member of class TActionClient.
	ActionBar (see page 370)	Specifies the action band the action client is rendered on.
	ChildActionBar (see page 372)	Specifies the action band that is used to render the TActionClients (see page 400) object specified in the Items (see page 373) property.
R	HasItems (see page 373)	Specifies whether the action client has sub-items associated with the action client.
R	OwningCollection (see page 373)	This is OwningCollection, a member of class TActionClient.

Published Properties

	Name	Description
	Background (see page 370)	Specifies the image that is drawn on the action client's action band for the action client.
	BackgroundLayout (see page 371)	Specifies how the image specified in the Background (see page 370) property is rendered on the action band used by the action client to render any sub-items that are contained by the action client.
	ChangesAllowed (see page 371)	Indicates which kinds of changes to the action client are permissible.
	Color (see page 372)	Specifies the background color for TClientAction when it is rendered on a action band.
	ContextItems (see page 372)	Specifies the TActionClients (see page 400) object that is rendered as a popup menu when a item is right clicked.
	Items (see page 373)	Specifies the TActionClients (see page 400) object that contains the sub-items of the action client.
	Tag (see page 374)	This is Tag, a member of class TActionClient.
	Visible (see page 374)	Determines whether the action client is visible.

4.1.5.5.1 TActionClient.Accessible Property

Pascal

```
property Accessible: IAccessible;
```

C++

```
__property IAccessible Accessible;
```

Description

This is Accessible, a member of class TActionClient.

4.1.5.5.2 TActionClient.ActionBar Property

Specifies the action band the action client is rendered on.

Pascal

```
property ActionBar: TCustomActionBar;
```

C++

```
__property TCustomActionBar ActionBar;
```

Description

ActionBar is used internally to specify the action band that the action client is rendered on.

4.1.5.5.3 TActionClient.Background Property

Specifies the image that is drawn on the action client's action band for the action client.

Pascal

```
property Background: TPicture;
```

C++

```
__property TPicture Background;
```

Description

Use Background to specify the image that is drawn on the action client's action band for the action client object itself.

See Also

BackgroundLayout (see page 371)

4.1.5.5.4 TActionClient.BackgroundLayout Property

Specifies how the image specified in the Background (see page 370) property is rendered on the action band used by the action client to render any sub-items that are contained by the action client.

Pascal

```
property BackgroundLayout: TBackgroundLayout;
```

C++

```
__property TBackgroundLayout BackgroundLayout;
```

Description

The values of BackgroundLayout are as follows:.

blNormal	Image is drawn normally, starting at coordinate 0,0 of the action band and the sub-item captions are rendered with a transparent background.
blStretch	Image is stretch drawn to fit the client area of the action band, starting at coordinate 0,0 of the action band and sub-item captions are rendered with a transparent background.
blTile	Image is tiled to fill the action band, sub-items are rendered with a transparent background
blLeftBanner	Image is appended to the left side of the action band.
blRightBanner	Image is appended to the right side of the action band.

See Also

Background (see page 370)

4.1.5.5.5 TActionClient.ChangesAllowed Property

Indicates which kinds of changes to the action client are permissible.

Pascal

```
property ChangesAllowed: TChangesAllowedSet;
```

C++

```
__property TChangesAllowedSet ChangesAllowed;
```

Description

Although action clients are part of a customizable user interface, allowing all changes may not necessarily be desirable. Use the ChangesAllowed property to indicate which changes to the action client are allowable. Possible values in the set are:

Value	Description
caModify	The item can be modified internally. For example, the visible caption can be changed.
caMove	The item can be relocated on the action band.
caDelete	The item can be removed from the action band.

Note: The property is a set, and can have multiple values at the same time. In fact, the default is to allow all three values (all changes are possible).

4.1.5.5.6 TActionClient.ChildActionBar Property

Specifies the action band that is used to render the TActionClients (see page 400) object specified in the Items (see page 373) property.

Pascal

```
property ChildActionBar: TCustomActionBar;
```

C++

```
__property TCustomActionBar ChildActionBar;
```

Description

ChildActionBar is used internally by the action manager and is automatically assigned when a TActionClient (see page 364) contains a nested TActionClients (see page 400) object. An example of this would be when the action client is a menu item that contains sub-menu items. The action band used to render the sub-items is automatically created for the sub-menu items and its reference is assigned to the ChildActionBar property.

See Also

Items (see page 373)

4.1.5.5.7 TActionClient.Color Property

Specifies the background color for TClientAction when it is rendered on a action band.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

The Color property determines the background color. You can set Color to one of the constants defined in the Graphics (see page 14387) unit (such as clBlue), or to an explicit RGB integer value.

4.1.5.5.8 TActionClient.ContextItems Property

Specifies the TActionClients (see page 400) object that is rendered as a popup menu when a item is right clicked.

Pascal

```
property ContextItems: TActionClients;
```

C++

```
__property TActionClients ContextItems;
```

Description

Use ContextItems to specify the TActionClients (see page 400) object that is rendered as a popup menu when a item is right clicked.

4.1.5.5.9 TActionClient.HasItems Property

Specifies whether the action client has sub-items associated with the action client.

Pascal

```
property HasItems: Boolean;
```

C++

```
__property Boolean HasItems;
```

Description

HasItems is used internally to determine if the action client has a TActionClients (see page 400) object assigned to the Items (see page 373) property.

See Also

Items (see page 373)

4.1.5.5.10 TActionClient.Items Property

Specifies the TActionClients (see page 400) object that contains the sub-items of the action client.

Pascal

```
property Items: TActionClients;
```

C++

```
__property TActionClients Items;
```

Description

If a TActionClientItem (see page 374) is used to represent a category of actions and not just a single action, the Items property is automatically set to the TActionClients (see page 400) object that contains the sub-items by the action manager. An example of this would be when an action category such as the standard actions "Edit" category is placed on a main menu action band. The Items property would contain the standard actions such as TEditCopy, TEditPaste, and TEditCut in a TActionClients (see page 400) object.

4.1.5.5.11 TActionClient.OwningCollection Property

Pascal

```
property OwningCollection: TActionClientsCollection;
```

C++

```
__property TActionClientsCollection OwningCollection;
```

Description

This is OwningCollection, a member of class TActionClient.

4.1.5.5.12 TActionClient.Tag Property

Pascal

```
property Tag: Integer;
```

C++

```
__property int Tag;
```

Description

This is Tag, a member of class TActionClient.

4.1.5.5.13 TActionClient.Visible Property

Determines whether the action client is visible.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action client.

4.1.6 TActionClientItem Class

TActionClientItem is a streamable wrapper that represents an action or category of actions in the action manager.

Class Hierarchy

Pascal

```
TActionClientItem = class(TActionClient);
```

C++

```
class TActionClientItem : public TActionClient;
```

File

ActnMan

Description

TActionClientItem is used internally to wrap a category of actions, standard action, or a user defined custom action into a streamable format that is managed by an action manager. TActionClientItem is used as a mechanism to store layout (ordering) information for an action. This layout information contained by the action client item is used by the action manager to render the action onto an action band as a visual representation of the action.

Instances of TActionClientItem are created automatically by the TActionManager (see page 432) component when an action or category of actions is added to an action band.

Note: Do not create or destroy instances of TActionClientItem directly, always allow the action manager to handle this for you.

TActionManager (see page 432)

Creating Dynamic Menus

Creating Most Recently Used Lists

Hiding Unused Items and Categories in Action Bands

4.1.6.1 TActionClientItem Members

The following tables list the members exposed by TActionClientItem.

Protected Methods

	Name	Description
	ActionChange (see page 378)	This is ActionChange, a member of class TActionClientItem.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	ClearActionBar (see page 367)	This is ClearActionBar, a member of class TActionClient.
V	ColorChanged (see page 379)	This is ColorChanged, a member of class TActionClientItem.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FreeChildren (see page 368)	This is FreeChildren, a member of class TActionClient.
	GetActionLinkClass (see page 379)	This is GetActionLinkClass, a member of class TActionClientItem.
V	GetDisplayName (see page 379)	Returns the name of the collection item as it appears in the collection editor.
V	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	HasVisibleItems (see page 368)	This is HasVisibleItems, a member of class TActionClient.
	IsChildItem (see page 368)	This is IsChildItem, a member of class TActionClient.
	ResetUsageData (see page 380)	This is ResetUsageData, a member of class TActionClientItem.
V	SetChangesAllowed (see page 380)	This is SetChangesAllowed, a member of class TActionClientItem.
V	SetCollection (see page 381)	Sets the value of the Collection property.
V	SetColor (see page 369)	This is SetColor, a member of class TActionClient.
V	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
V	SetIndex (see page 381)	Moves the collection item to a specified position in the parent collection.
V	SetVisible (see page 381)	This is SetVisible, a member of class TActionClientItem.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 378)	Copies the contents of another TActionClientItem (see page 374) to the object where the method is executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 377)	Creates and initializes a TActionClientItem (see page 374) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 377)	Destroys the action client and frees its memory.

V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	HasBackground (see page 368)	Indicates whether a background image exists.
	HasGlyph (see page 379)	Indicates whether or not there is a glyph (small icon) associated with an action on the action band.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 380)	Updates the action associated with the action client item.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Refresh (see page 380)	Causes the size of the action client item's control (if any) to be recalculated.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Unused (see page 382)	Determines whether a TActionClientItem (see page 374) is unused and should be hidden on an action band.

Public Properties

	Name	Description
	Accessible (see page 370)	This is Accessible, a member of class TActionClient.
	ActionBar (see page 370)	Specifies the action band the action client is rendered on.
R	ActionClients (see page 383)	Returns the TActionClients (see page 400) object that contains the TActionClientItem (see page 374).
	ActionLink (see page 383)	Refers to the action client item's action link.
	CheckUnused (see page 384)	Indicates whether the TActionClientItem (see page 374) object should be checked to see if it is unused and, if so, hidden from view.
	ChildActionBar (see page 372)	Specifies the action band that is used to render the TActionClients (see page 400) object specified in the Items (see page 373) property.
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	Control (see page 384)	Specifies the action band control that is rendered on an action band for the TActionClientItem (see page 374) object.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	HasItems (see page 373)	Specifies whether the action client has sub-items associated with the action client.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
R	OwningCollection (see page 373)	This is OwningCollection, a member of class TActionClient.
R	ParentItem (see page 386)	Refers to the parent item of the action client item.
R	Separator (see page 386)	Returns whether the TActionClientItem (see page 374) is rendered as a separator control on an action band.
R	ShortCutText (see page 387)	Contains the text label (like "Ctrl+S") for the shortcut.

Published Properties

	Name	Description
	Action (see page 382)	Specifies the action category or action that the TActionClientItem (see page 374) represents.

	Background (see page 370)	Specifies the image that is drawn on the action client's action band for the action client.
	BackgroundLayout (see page 371)	Specifies how the image specified in the Background (see page 370) property is rendered on the action band used by the action client to render any sub-items that are contained by the action client.
	Caption (see page 384)	Specifies the caption the action manager uses when the TActionClientItem (see page 374) is rendered on an action band.
	ChangesAllowed (see page 371)	Indicates which kinds of changes to the action client are permissible.
	Color (see page 372)	Specifies the background color for TClientAction when it is rendered on a action band.
	ContextItems (see page 372)	Specifies the TActionClients (see page 400) object that is rendered as a popup menu when a item is right clicked.
	HelpContext (see page 385)	This is HelpContext, a member of class TActionClientItem.
	ImageIndex (see page 385)	Contains the ImageIndex property for the client action item.
	Items (see page 373)	Specifies the TActionClients (see page 400) object that contains the sub-items of the action client.
	LastSession (see page 385)	Specifies the date an action client was last used.
	MergeIndex (see page 386)	Used to help merge action lists.
	ShortCut (see page 387)	Contains the ShortCut property for the action client item.
	ShowCaption (see page 387)	Determines whether the caption for the TActionClientItem (see page 374) is drawn.
	ShowGlyph (see page 388)	Indicates whether an image should be shown for the action.
	ShowShortCut (see page 388)	Determines whether the underbar character underneath the shortcut character is displayed.
	Tag (see page 374)	This is Tag, a member of class TActionClient.
	UsageCount (see page 388)	Specifies the total number of times an item has been used.
	Visible (see page 374)	Determines whether the action client is visible.

4.1.6.2 TActionClientItem.Create Constructor

Creates and initializes a TActionClientItem (see page 374) object.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TActionClientItem(TCollection Collection);
```

Description

The Create method takes as a parameter the name of a TCollection instance. Create is called automatically by action manager when a new instance of a TActionClientItem (see page 374) is required.

4.1.6.3 TActionClientItem.Destroy Destructor

Destroys the action client and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TActionClientItem();
```

Description

Destroy eliminates the TActionClientItem (see page 374) instance. Destroyis called automatically when the action manager needs to destroy the instance of a TActionClientItem (see page 374) object.

4.1.6.4 TActionClientItem Methods

The methods of the TActionClientItem class are listed here.

Protected Methods

	Name	Description
	ActionChange (see page 378)	This is ActionChange, a member of class TActionClientItem.
V	ColorChanged (see page 379)	This is ColorChanged, a member of class TActionClientItem.
	GetActionLinkClass (see page 379)	This is GetActionLinkClass, a member of class TActionClientItem.
V	GetDisplayName (see page 379)	Returns the name of the collection item as it appears in the collection editor.
	ResetUsageData (see page 380)	This is ResetUsageData, a member of class TActionClientItem.
V	SetChangesAllowed (see page 380)	This is SetChangesAllowed, a member of class TActionClientItem.
V	SetCollection (see page 381)	Sets the value of the Collection property.
V	SetIndex (see page 381)	Moves the collection item to a specified position in the parent collection.
V	SetVisible (see page 381)	This is SetVisible, a member of class TActionClientItem.

Public Methods

	Name	Description
V	Assign (see page 378)	Copies the contents of another TActionClientItem (see page 374) to the object where the method is executed.
	HasGlyph (see page 379)	Indicates whether or not there is a glyph (small icon) associated with an action on the action band.
V	InitiateAction (see page 380)	Updates the action associated with the action client item.
V	Refresh (see page 380)	Causes the size of the action client item's control (if any) to be recalculated.
	Unused (see page 382)	Determines whether a TActionClientItem (see page 374) is unused and should be hidden on an action band.

4.1.6.4.1 TActionClientItem.ActionChange Method

Pascal

```
procedure ActionChange(Sender: TObject; CheckDefaults: Boolean); dynamic;
```

C++

```
__fastcall ActionChange(TObject * Sender, Boolean CheckDefaults);
```

Description

This is ActionChange, a member of class TActionClientItem.

4.1.6.4.2 TActionClientItem.Assign Method

Copies the contents of another TActionClientItem (see page 374) to the object where the method is executed.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Use Assign to copy the contents of one TActionClientItem (see page 374) instance to another.

4.1.6.4.3 TActionClientItem.ColorChanged Method

Pascal

```
procedure ColorChanged; override;
```

C++

```
virtual __fastcall ColorChanged();
```

Description

This is ColorChanged, a member of class TActionClientItem.

4.1.6.4.4 TActionClientItem.GetActionLinkClass Method

Pascal

```
function GetActionLinkClass: TActionClientLinkClass; dynamic;
```

C++

```
__fastcall TActionClientLinkClass GetActionLinkClass();
```

Description

This is GetActionLinkClass, a member of class TActionClientItem.

4.1.6.4.5 TActionClientItem.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName (see page 2761)

GetNamePath (see page 2759)

4.1.6.4.6 TActionClientItem.HasGlyph Method

Indicates whether or not there is a glyph (small icon) associated with an action on the action band.

Pascal

```
function HasGlyph: Boolean;
```

C++

```
__fastcall Boolean HasGlyph();
```

Description

Use HasGlyph to determine whether the action associated with the TActionClientItem (see page 374) has a glyph or not. A glyph is a symbol that represents the action, and is often placed next to the action's caption. One common example in

applications is a small pair of scissors, which is frequently used to represent the Cut action.

4.1.6.4.7 TActionClientItem.InitiateAction Method

Updates the action associated with the action client item.

Pascal

```
procedure InitiateAction; virtual;
```

C++

```
virtual __fastcall InitiateAction();
```

Description

InitiateAction is used by the application to update the action periodically, so that the visible button or menu item accurately reflects the internal state of the program. To learn more about what happens when InitiateAction is called, see the documentation for TControl's InitiateAction method, which is a very similar method.

See Also

InitiateAction (see page 5769)

4.1.6.4.8 TActionClientItem.Refresh Method

Causes the size of the action client item's control (if any) to be recalculated.

Pascal

```
procedure Refresh; override;
```

C++

```
virtual __fastcall Refresh();
```

Description

Use Refresh to cause the size of the action client item's control, if there is one, to be recalculated. In general, the intent of Refresh methods is to cause the control to be redrawn.

See Also

CalcBounds (see page 518)

4.1.6.4.9 TActionClientItem.ResetUsageData Method

Pascal

```
procedure ResetUsageData;
```

C++

```
__fastcall ResetUsageData();
```

Description

This is ResetUsageData, a member of class TActionClientItem.

4.1.6.4.10 TActionClientItem.SetChangesAllowed Method

Pascal

```
procedure SetChangesAllowed(const Value: TChangesAllowedSet); override;
```

C++

```
virtual __fastcall SetChangesAllowed(const TChangesAllowedSet Value);
```

Description

This is SetChangesAllowed, a member of class TActionClientItem.

4.1.6.4.11 TActionClientItem.SetCollection Method

Sets the value of the Collection property.

Pascal

```
procedure SetCollection(Value: TCollection); override;
```

C++

```
virtual __fastcall SetCollection(TCollection Value);
```

Description

SetCollection is the protected write implementation of the Collection property.

Value specifies the collection to which this item should be added.

SetCollection removes this item from the collection to which it currently belongs and adds it to the collection specified by Value.

See Also

Collection (see page 2761)

4.1.6.4.12 TActionClientItem.SetIndex Method

Moves the collection item to a specified position in the parent collection.

Pascal

```
procedure SetIndex(Value: Integer); override;
```

C++

```
virtual __fastcall SetIndex(int Value);
```

Description

SetIndex is the protected write implementation of the Index property. The Value parameter specifies the new (0-based) position for the item in its parent collection.

See Also

Index (see page 2762)

4.1.6.4.13 TActionClientItem.SetVisible Method

Pascal

```
procedure SetVisible(const Value: Boolean); override;
```

C++

```
virtual __fastcall SetVisible(const Boolean Value);
```

Description

This is SetVisible, a member of class TActionClientItem.

4.1.6.4.14 TActionClientItem.Unused Method

Determines whether a TActionClientItem (see page 374) is unused and should be hidden on an action band.

Pascal

```
function Unused: Boolean;
```

C++

```
__fastcall Boolean Unused();
```

Description

Unused is called internally to specify whether a TActionClientItem (see page 374) is unused and should be hidden or can be displayed on an action band.

4.1.6.5 TActionClientItem Properties

The properties of the TActionClientItem class are listed here.

Public Properties

	Name	Description
R	ActionClients (see page 383)	Returns the TActionClients (see page 400) object that contains the TActionClientItem (see page 374).
	ActionLink (see page 383)	Refers to the action client item's action link.
	CheckUnused (see page 384)	Indicates whether the TActionClientItem (see page 374) object should be checked to see if it is unused and, if so, hidden from view.
	Control (see page 384)	Specifies the action band control that is rendered on an action band for the TActionClientItem (see page 374) object.
R	ParentItem (see page 386)	Refers to the parent item of the action client item.
R	Separator (see page 386)	Returns whether the TActionClientItem (see page 374) is rendered as a separator control on an action band.
R	ShortCutText (see page 387)	Contains the text label (like "Ctrl+S") for the shortcut.

Published Properties

	Name	Description
	Action (see page 382)	Specifies the action category or action that the TActionClientItem (see page 374) represents.
	Caption (see page 384)	Specifies the caption the action manager uses when the TActionClientItem (see page 374) is rendered on an action band.
	HelpContext (see page 385)	This is HelpContext, a member of class TActionClientItem.
	ImageIndex (see page 385)	Contains the ImageIndex property for the client action item.
	LastSession (see page 385)	Specifies the date an action client was last used.
	MergeIndex (see page 386)	Used to help merge action lists.
	ShortCut (see page 387)	Contains the ShortCut property for the action client item.
	ShowCaption (see page 387)	Determines whether the caption for the TActionClientItem (see page 374) is drawn.
	ShowGlyph (see page 388)	Indicates whether an image should be shown for the action.
	ShowShortCut (see page 388)	Determines whether the underbar character underneath the shortcut character is displayed.
	UsageCount (see page 388)	Specifies the total number of times an item has been used.

4.1.6.5.1 TActionClientItem.Action Property

Specifies the action category or action that the TActionClientItem (see page 374) represents.

Pascal

```
property Action: TContainedAction;
```

C++

```
__property TContainedAction Action;
```

Description

When an action category or action is added to an action band, the specified action is automatically assigned to the Action property of the TActionClientItem (see page 374) object by the action manager.

Note: If the TActionClientItem (see page 374) represents an action band separator control, the Action property is nil (Delphi) or NULL (C++).

See Also

Caption (see page 384)

4.1.6.5.2 TActionClientItem.ActionClients Property

Returns the TActionClients (see page 400) object that contains the TActionClientItem (see page 374).

Pascal

```
property ActionClients: TActionClients;
```

C++

```
__property TActionClients ActionClients;
```

Description

The ActionClients property is used internally to return the TActionClients (see page 400) object that contains the TActionClientItem (see page 374).

See Also

TActionClients (see page 400)

4.1.6.5.3 TActionClientItem.ActionLink Property

Refers to the action client item's action link.

Pascal

```
property ActionLink: TActionClientLink;
```

C++

```
__property TActionClientLink ActionLink;
```

Description

Objects do not generally deal with actions directly. Instead, there is an action link object (subclassed from TActionClientLink (see page 389) and, less directly, TActionLink) which is responsible for managing the connection between the action and the object. ActionLink is a reference to that object. For more information about action links, see the help topic for TActionLink referenced in the "See also" field above.

See Also

TActionLink (see page 265)

4.1.6.5.4 TActionClientItem.Caption Property

Specifies the caption the action manager uses when the TActionClientItem (see page 374) is rendered on an action band.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the caption that is displayed for the UI element that is rendered on an action band. By default, the Caption is blank and the action manager uses the caption of the underlying action that the TActionClientItem (see page 374) represents. Changing the Caption property of the TActionClientItem (see page 374) does not change the caption of the underlying action. If an action band contains a TCustomizeBandAction standard action, the user of the application can change this property. Because the caption can be changed at runtime, the default caption that will be used, should be set in the action itself and not in the TActionClientItem (see page 374) object.

Note: Setting the Caption property to a dash character causes the TActionClientItem (see page 374) to be rendered as a separator control, such as a menu item separator, by the action band.

4.1.6.5.5 TActionClientItem.CheckUnused Property

Indicates whether the TActionClientItem (see page 374) object should be checked to see if it is unused and, if so, hidden from view.

Pascal

```
property CheckUnused: Boolean;
```

C++

```
__property Boolean CheckUnused;
```

Description

Unused (see page 382) contents of ActionBands can be hidden from the user. Use CheckUnused to determine whether a particular action client item goes through this kind of checking. The default value is true, which means that the item can be hidden. Note that CheckUnused is merely an indicator, not a control. If you want the object to be visible regardless of how much it is used, do not change CheckUnused. Instead, set UsageCount (see page 388) to -1.

See Also

LastSession (see page 385)

PrioritySchedule (see page 555)

SessionCount (see page 358)

UsageCount (see page 388)

4.1.6.5.6 TActionClientItem.Control Property

Specifies the action band control that is rendered on an action band for the TActionClientItem (see page 374) object.

Pascal

```
property Control: TCustomActionControl;
```

C++

```
__property TCustomActionControl Control;
```

Description

The Control property is used internally to specify the specific action band control that is rendered on an action band for the TActionClientItem (see page 374).

4.1.6.5.7 TActionClientItem.HelpContext Property

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

This is HelpContext, a member of class TActionClientItem.

4.1.6.5.8 TActionClientItem.ImageIndex Property

Contains the ImageIndex property for the client action item.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action manager that contains the action client item. It identifies an image that is associated with controls and menu items that is drawn when this client action item is rendered on an action band by the action manager.

See Also

Images (see page 325)

4.1.6.5.9 TActionClientItem.LastSession Property

Specifies the date an action client was last used.

Pascal

```
property LastSession: Integer;
```

C++

```
__property int LastSession;
```

Description

LastSession is used internally to specify the session number that the TActionClientItem (see page 374) last used in the application. The action manager uses LastSession to in its calculations to determine whether or not to hide or display the TActionClientItem (see page 374) on an action band.

See Also

PrioritySchedule (see page 555)

UsageCount (see page 388)

SessionCount (see page 358)

4.1.6.5.10 TActionClientItem.MergeIndex Property

Used to help merge action lists.

Pascal

```
property MergeIndex: TMergeRange;
```

C++

```
__property TMergeRange MergeIndex;
```

Description

MergeIndex is intended to help merge existing lists of action items with those of the TActionManager (see page 432) object without redundancy. At present, this feature is not yet fully implemented, but it may become useful in a future release.

4.1.6.5.11 TActionClientItem.ParentItem Property

Refers to the parent item of the action client item.

Pascal

```
property ParentItem: TActionClient;
```

C++

```
__property TActionClient ParentItem;
```

Description

Use ParentItem to refer to the parent item of the TActionClientItem (see page 374) object.

4.1.6.5.12 TActionClientItem.Separator Property

Returns whether the TActionClientItem (see page 374) is rendered as a separator control on an action band.

Pascal

```
property Separator: Boolean;
```

C++

```
__property Boolean Separator;
```

Description

If the Caption (see page 384) property is set to a dash character, Separator is automatically set to true . Separator is called internally by the action manager to determine whether the TActionClientItem (see page 374) is rendered as a separator control on an action band.

See Also

Caption (see page 384)

4.1.6.5.13 TActionClientItem.ShortCut Property

Contains the ShortCut property for the action client item.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

Use ShortCut to specify the ShortCut that is displayed in the caption for the UI element that is rendered on an action band. By default, the ShortCut is blank and the action manager uses the ShortCut of the underlying action that the TActionClientItem (see page 374) represents. Changing the ShortCut property of the TActionClientItem (see page 374) does not change the ShortCut of the underlying action. If an action band contains a TCustomizeBandAction standard action, the user of the application can change this property. Because the shortcut key can be changed at runtime, the default shortcut key that will be used, should be set in the action itself and not in the TActionClientItem (see page 374) object.

See Also

ShortCut (see page 314)

PersistentHotKeys (see page 489)

4.1.6.5.14 TActionClientItem.ShortCutText Property

Contains the text label (like "Ctrl+S") for the shortcut.

Pascal

```
property ShortCutText: string;
```

C++

```
__property AnsiString ShortCutText;
```

Description

ShortCutText contains a text description of the shortcut is activated. For example, the ShortCutText property for a save action might read "Ctrl+S". Note that this property is read-only; it is set automatically elsewhere.

See Also

ShortCut (see page 387)

4.1.6.5.15 TActionClientItem.ShowCaption Property

Determines whether the caption for the TActionClientItem (see page 374) is drawn.

Pascal

```
property ShowCaption: Boolean;
```

C++

```
__property Boolean ShowCaption;
```

Description

ShowCaption determines whether the caption of the TActionClient (see page 364) is displayed on an action band's UI element. Set ShowCaption to false to hide the item's caption when the item is rendered on an action band. Note that the CaptionOptions

property of TActionClients (see page 400) objects takes precedence over ShowCaption. See the documentation for TActionClients (see page 400)' CaptionOptions for more details.

See Also

Caption (see page 384)

CaptionOptions (see page 407)

4.1.6.5.16 TActionClientItem.ShowGlyph Property

Indicates whether an image should be shown for the action.

Pascal

```
property ShowGlyph: Boolean;
```

C++

```
__property Boolean ShowGlyph;
```

Description

An item on an action band may have an image associated with it. ShowGlyph determines whether or not that image should be shown when the item is drawn.

See Also

Images (see page 325)

4.1.6.5.17 TActionClientItem.ShowShortCut Property

Determines whether the underbar character underneath the shortcut character is displayed.

Pascal

```
property ShowShortCut: Boolean;
```

C++

```
__property Boolean ShowShortCut;
```

Description

ShowShortCut is set and used internally to determine whether the underbar character underneath the shortcut character is displayed. The value of ShowShortCut is determined by the value set in the PersistentHotKeys property of the action band that will render the TActionClientItem (see page 374).

See Also

PersistentHotKeys (see page 489)

4.1.6.5.18 TActionClientItem.UsageCount Property

Specifies the total number of times an item has been used.

Pascal

```
property UsageCount: Integer;
```

C++

```
__property int UsageCount;
```

Description

UsageCount is used internally to specify the total number of times that the TActionClientItem (see page 374) has been used in the application. The action manager maintains this value and uses UsageCount to in its calculations to determine whether or not to hide or display the TActionClientItem (see page 374) on an action band.

See Also

LastSession (see page 385)

PrioritySchedule (see page 555)

SessionCount (see page 358)

CheckUnused (see page 384)

4.1.7 TActionClientLink Class

Class Hierarchy

Pascal

```
TActionClientLink = class(TActionLink);
```

C++

```
class TActionClientLink : public TActionLink;
```

File

ActnMan

Description

This is class ActnMan.TActionClientLink.

4.1.7.1 TActionClientLink Members

The following tables list the members exposed by TActionClientLink.

Protected Fields

	Name	Description
	FAction (see page 2722)	This is FAction, a member of class TBasicActionLink.
	FClient (see page 391)	This is FClient, a member of class TActionClientLink.

Protected Methods

	Name	Description
	AssignClient (see page 392)	This is AssignClient, a member of class TActionClientLink.
	Change (see page 2723)	This is Change, a member of class TBasicActionLink.
	DoShowHint (see page 392)	This is DoShowHint, a member of class TActionClientLink.
	IsCaptionLinked (see page 392)	Indicates whether the Caption properties for the action and client are linked.
	IsCheckedLinked (see page 269)	Indicates whether the Checked properties for the action and client are linked.
	IsEnabledLinked (see page 393)	Indicates whether the Enabled properties for the action and client are linked.
	IsGroupIndexLinked (see page 270)	Indicates whether the GroupIndex property for the action controls client behavior.
	IsHelpContextLinked (see page 393)	Indicates whether the HelpContext properties for the action and client controls are linked.

	IsHelpLinked (see page 271)	Indicates whether the help properties for the action and client are linked.
	IsHintLinked (see page 394)	Indicates whether the Hint properties for the action and client are linked.
	IsImageIndexLinked (see page 394)	Indicates whether the image index for the action and the client are linked.
	IsOnExecuteLinked (see page 395)	This is IsOnExecuteLinked, a member of class TActionClientLink.
	IsShortCutLinked (see page 395)	Indicates whether the ShortCut properties for the action and client are linked.
	IsVisibleLinked (see page 396)	Indicates whether the Visible properties for the action and client are linked.
	SetAction (see page 2724)	This is SetAction, a member of class TBasicActionLink.
	SetAutoCheck (see page 274)	Introduces an interface for setting the AutoCheck property of a client.
	SetCaption (see page 396)	Introduces an interface for setting the caption on a client.
	SetChecked (see page 397)	Introduces an interface for setting the checked state of a client.
	SetEnabled (see page 397)	Introduces an interface for setting the enabled state of a client.
	SetGroupIndex (see page 275)	Introduces an interface for setting the GroupIndex property of a client.
	SetHelpContext (see page 398)	Introduces an interface for setting the help context of a client.
	SetHelpKeyword (see page 276)	Introduces an interface for setting the help keyword of a client.
	SetHelpType (see page 277)	Introduces an interface for setting the HelpType property of a client.
	SetHint (see page 398)	Introduces an interface for setting the hint for a client.
	SetImageIndex (see page 399)	Introduces an interface for setting the image index for a client.
	SetOnExecute (see page 399)	This is SetOnExecute, a member of class TActionClientLink.
	SetShortCut (see page 399)	Introduces an interface for setting the shortcut for a client.
	SetVisible (see page 400)	Introduces an interface for setting the visible state of a client.

Public Events

	Name	Description
	OnChange (see page 2725)	Occurs when an OnChange event is triggered on the action.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2721)	Instantiates and initializes a TBasicActionLink (see page 2720) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2722)	Destroys an instance of an action link object.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 2723)	Invokes the action's Execute method.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Update (see page 2724)	Invokes the action's Update method.

Public Properties

	Name	Description
	Action (see page 2725)	Indicates which action the link connects to its client.

4.1.7.2 TActionClientLink Fields

The fields of the TActionClientLink class are listed here.

Protected Fields

	Name	Description
	FClient (see page 391)	This is FClient, a member of class TActionClientLink.

4.1.7.2.1 TActionClientLink.FClient Field

Pascal

```
FClient: TActionClientItem;
```

C++

```
TActionClientItem FClient;
```

Description

This is FClient, a member of class TActionClientLink.

4.1.7.3 TActionClientLink Methods

The methods of the TActionClientLink class are listed here.

Protected Methods

	Name	Description
V	AssignClient (see page 392)	This is AssignClient, a member of class TActionClientLink.
V	DoShowHint (see page 392)	This is DoShowHint, a member of class TActionClientLink.
V	IsCaptionLinked (see page 392)	Indicates whether the Caption properties for the action and client are linked.
V	IsEnabledLinked (see page 393)	Indicates whether the Enabled properties for the action and client are linked.
V	IsHelpContextLinked (see page 393)	Indicates whether the HelpContext properties for the action and client controls are linked.
V	IsHintLinked (see page 394)	Indicates whether the Hint properties for the action and client are linked.
V	IsImageIndexLinked (see page 394)	Indicates whether the image index for the action and the client are linked.
V	IsOnExecuteLinked (see page 395)	This is IsOnExecuteLinked, a member of class TActionClientLink.
V	IsShortCutLinked (see page 395)	Indicates whether the ShortCut properties for the action and client are linked.
V	IsVisibleLinked (see page 396)	Indicates whether the Visible properties for the action and client are linked.
V	SetCaption (see page 396)	Introduces an interface for setting the caption on a client.
V	SetChecked (see page 397)	Introduces an interface for setting the checked state of a client.
V	SetEnabled (see page 397)	Introduces an interface for setting the enabled state of a client.
V	SetHelpContext (see page 398)	Introduces an interface for setting the help context of a client.

	SetHint (see page 398)	Introduces an interface for setting the hint for a client.
	SetImageIndex (see page 399)	Introduces an interface for setting the image index for a client.
	SetOnExecute (see page 399)	This is SetOnExecute, a member of class TActionClientLink.
	SetShortCut (see page 399)	Introduces an interface for setting the shortcut for a client.
	SetVisible (see page 400)	Introduces an interface for setting the visible state of a client.

4.1.7.3.1 TActionClientLink.AssignClient Method

Pascal

```
procedure AssignClient(AClient: TObject); override;
```

C++

```
virtual __fastcall AssignClient(TObject * AClient);
```

Description

This is AssignClient, a member of class TActionClientLink.

4.1.7.3.2 TActionClientLink.DoShowHint Method

Pascal

```
function DoShowHint(var HintStr: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean DoShowHint(AnsiString HintStr);
```

Description

This is DoShowHint, a member of class TActionClientLink.

4.1.7.3.3 TActionClientLink.IsCaptionLinked Method

Indicates whether the Caption properties for the action and client are linked.

Pascal

```
function IsCaptionLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsCaptionLinked();
```

Description

TActionLink descendants call IsCaptionLinked to determine whether they need to propagate changes to the Caption property of the action so that they are reflected by the client object. When IsCaptionLinked returns true, the action controls the Caption property: Changes to the Caption property of the action are reflected by changes to the corresponding property of the client object. When IsCaptionLinked returns false, the client object does not reflect the Caption property of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink, IsCaptionLinked merely checks that the Action property specifies a descendant of TCustomAction (that is, it is an action that has a Caption property). Descendant classes override IsCaptionLinked to determine whether the Caption property is linked with the appropriate client property.

See Also

Caption (see page 308)

Caption (see page 5806)

SetCaption (see page 274)

Action (see page 2725)

4.1.7.3.4 TActionClientLink.IsEnabledLinked Method

Indicates whether the Enabled properties for the action and client are linked.

Pascal

```
function IsEnabledLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsEnabledLinked();
```

Description

TActionLink descendants call IsEnabledLinked to determine whether they need to propagate changes to the Enabled property of the action so that they are reflected by the client object. When IsEnabledLinked returns true, the action controls the Enabled property: Changes to the Enabled property of the action are reflected by changes to the corresponding property of the client object. When IsEnabledLinked returns false, the client object does not reflect the Enabled property of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink, IsEnabledLinked merely checks that the Action property specifies a descendant of TCustomAction (that is, it is an action that has an Enabled property). Descendant classes override IsEnabledLinked to determine whether the Enabled property is linked with the appropriate client property.

See Also

Enabled (see page 310)

Enabled (see page 5821)

SetEnabled (see page 275)

Action (see page 2725)

4.1.7.3.5 TActionClientLink.IsHelpContextLinked Method

Indicates whether the HelpContext properties for the action and client controls are linked.

Pascal

```
function IsHelpContextLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsHelpContextLinked();
```

Description

TActionLink descendants can call IsHelpContextLinked to determine whether they need to propagate changes to the HelpContext property of the action so that they are reflected by the client object. When IsHelpContextLinked returns true, the action controls the HelpContext property: Changes to the HelpContext property of the action are reflected in the client object. When IsHelpContextLinked returns false, the client object is not influenced by the HelpContext property of its action.

As implemented in TActionLink, IsHelpContextLinked merely checks that the Action property specifies a descendant of TCustomAction, and if so, returns true.

See Also

HelpContext (see page 311)

SetHelpContext (see page 276)

Action (see page 2725)

IsHelpLinked (see page 271)

4.1.7.3.6 TActionClientLink.IsHintLinked Method

Indicates whether the Hint properties for the action and client are linked.

Pascal

```
function IsHintLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsHintLinked();
```

Description

TActionLink descendants call IsHintLinked to determine whether they need to propagate changes to the Hint property of the action so that they are reflected by the client object. When IsHintLinked returns true, the action controls the Hint property: Changes to the Hint property of the action are reflected by changes to the corresponding property of the client object. When IsHintLinked returns false, the client object does not reflect the Hint property of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink, IsHintLinked merely checks that the Action property specifies a descendant of TCustomAction (that is, it is an action that has a Hint property). Descendant classes override IsHintLinked to determine whether the Hint property is linked with the appropriate client property.

See Also

Hint (see page 312)

Hint (see page 5827)

Hint (see page 16148)

SetHint (see page 278)

Action (see page 2725)

4.1.7.3.7 TActionClientLink.IsImageIndexLinked Method

Indicates whether the image index for the action and the client are linked.

Pascal

```
function IsImageIndexLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsImageIndexLinked();
```

Description

TActionLink descendants call IsImageIndexLinked to determine whether they need to propagate changes to the ImageIndex property of the action so that they are reflected by the client object. When IsImageIndexLinked returns true, the action controls the ImageIndex property: Changes to the ImageIndex property of the action are reflected by changes to the corresponding property of the client object. When IsImageIndexLinked returns false, the client object does not reflect the ImageIndex property

of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink, IsImageIndexLinked merely checks that the Action property specifies a descendant of TCustomAction (that is, it is an action that has an ImageIndex property). Descendant classes override IsImageIndexLinked to determine whether the ImageIndex property is linked with the appropriate client property.

See Also

ImageIndex (see page 313)

ImageIndex (see page 16148)

SetImageIndex (see page 278)

Action (see page 2725)

4.1.7.3.8 TActionClientLink.IsOnExecuteLinked Method

Pascal

```
function IsOnExecuteLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsOnExecuteLinked();
```

Description

This is IsOnExecuteLinked, a member of class TActionClientLink.

4.1.7.3.9 TActionClientLink.IsShortCutLinked Method

Indicates whether the ShortCut properties for the action and client are linked.

Pascal

```
function IsShortCutLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsShortCutLinked();
```

Description

TActionLink descendants call IsShortCutLinked to determine whether they need to propagate changes to the ShortCut property of the action so that they are reflected by the client object. When IsShortCutLinked returns true, the action controls the ShortCut property: Changes to the ShortCut property of the action are reflected by changes to the corresponding property of the client object. When IsShortCutLinked returns false, the client object does not reflect the ShortCut property of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink, IsShortCutLinked merely checks that the Action property specifies a descendant of TCustomAction (that is, it is an action that has a ShortCut property). Descendant classes override IsShortCutLinked to determine whether the ShortCut property is linked with the appropriate client property.

See Also

ShortCut (see page 314)

ShortCut (see page 16152)

SetShortCut (see page 279)

Action (see page 2725)

4.1.7.3.10 TActionClientLink.IsVisibleLinked Method

Indicates whether the Visible properties for the action and client are linked.

Pascal

```
function IsVisibleLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsVisibleLinked();
```

Description

TActionLink descendants call IsVisibleLinked to determine whether they need to propagate changes to the Visible property of the action so that they are reflected by the client object. When IsVisibleLinked returns true, the action controls the Visible property: Changes to the Visible property of the action are reflected by changes to the corresponding property of the client object. When IsVisibleLinked returns false, the client object does not reflect the Visible property of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink, IsVisibleLinked merely checks that the Action property specifies a descendant of TCustomAction (that is, it is an action that has a Visible property). Descendant classes override IsVisibleLinked to determine whether the Visible property is linked with the appropriate client property.

See Also

Visible (see page 314)

Visible (see page 5847)

SetShortCut (see page 279)

Action (see page 2725)

4.1.7.3.11 TActionClientLink.SetCaption Method

Introduces an interface for setting the caption on a client.

Pascal

```
procedure SetCaption(const Value: string); override;
```

C++

```
virtual __fastcall SetCaption(const AnsiString Value);
```

Description

The associated action calls SetCaption when its Caption property changes so that the action link can propagate the new Caption value to the client object.

Value specifies the string to which the caption should be set.

As implemented in TActionLink, SetCaption does nothing. Descendant classes override SetCaption to set the client property that corresponds to the action's Caption property if the IsCaptionLinked method returns true.

See Also

Caption (see page 308)

Caption (see page 5806)

IsCaptionLinked (see page 268)

Action (see page 2725)

4.1.7.3.12 TActionClientLink.SetChecked Method

Introduces an interface for setting the checked state of a client.

Pascal

```
procedure SetChecked(Value: Boolean); override;
```

C++

```
virtual __fastcall SetChecked(Boolean Value);
```

Description

The associated action calls SetChecked when its Checked property changes so that the action link can propagate the new Checked value to the client object.

Value specifies the new value of the Checked property.

As implemented in TActionLink, SetChecked does nothing. Descendant classes override SetChecked to set the client property that corresponds to the action's Checked property if the IsCheckedLinked method returns true.

See Also

Checked (see page 308)

Action (see page 2725)

IsCheckedLinked (see page 269)

4.1.7.3.13 TActionClientLink.SetEnabled Method

Introduces an interface for setting the enabled state of a client.

Pascal

```
procedure SetEnabled(Value: Boolean); override;
```

C++

```
virtual __fastcall SetEnabled(Boolean Value);
```

Description

The associated action calls SetEnabled when its Enabled property changes so that the action link can propagate the new Enabled value to the client object.

Value specifies the new value of the Enabled property.

As implemented in TActionLink, SetEnabled does nothing. Descendant classes override SetEnabled to set the client property that corresponds to the action's Enabled property if the IsEnabledLinked method returns true.

See Also

Enabled (see page 310)

Enabled (see page 5821)

Action (see page 2725)

IsEnabledLinked (see page 269)

4.1.7.3.14 TActionClientLink.SetHelpContext Method

Introduces an interface for setting the help context of a client.

Pascal

```
procedure SetHelpContext(Value: THelpContext); override;
```

C++

```
virtual __fastcall SetHelpContext(THelpContext Value);
```

Description

The associated action calls SetHelpContext when its HelpContext property changes so that the action link can propagate the new HelpContext value to the client object.

Value specifies the new value of the HelpContext property.

As implemented in TActionLink, SetHelpContext does nothing. Descendant classes override SetHelpContext to set the client property that corresponds to the action's HelpContext property if the IsHelpLinked method returns true.

See Also

HelpContext (see page 311)

Action (see page 2725)

IsHelpLinked (see page 271)

4.1.7.3.15 TActionClientLink.SetHint Method

Introduces an interface for setting the hint for a client.

Pascal

```
procedure SetHint(const Value: string); override;
```

C++

```
virtual __fastcall SetHint(const AnsiString Value);
```

Description

The associated action calls SetHint when its Hint property changes so that the action link can propagate the new Hint value to the client object.

Value specifies the new value of the Hint property.

As implemented in TActionLink, SetHint does nothing. Descendant classes override SetHint to set the client property that corresponds to the action's Hint property if the IsHintLinked method returns true.

See Also

Hint (see page 312)

Hint (see page 5827)

Hint (see page 16148)

Action (see page 2725)

IsHintLinked (see page 271)

4.1.7.3.16 TActionClientLink.SetImageIndex Method

Introduces an interface for setting the image index for a client.

Pascal

```
procedure SetImageIndex(Value: Integer); override;
```

C++

```
virtual __fastcall SetImageIndex(int Value);
```

Description

The associated action calls SetImageIndex when its ImageIndex property changes so that the action link can propagate the new ImageIndex value to the client object.

Value specifies the new value of the ImageIndex property.

As implemented in TActionLink, SetImageIndex does nothing. Descendant classes override SetImageIndex to set the client property that corresponds to the action's ImageIndex property if the IsImageIndexLinked method returns true.

See Also

ImageIndex (see page 313)

ImageIndex (see page 16148)

Action (see page 2725)

IsImageIndexLinked (see page 272)

4.1.7.3.17 TActionClientLink.SetOnExecute Method

Pascal

```
procedure SetOnExecute(Value: TNotifyEvent); override;
```

C++

```
virtual __fastcall SetOnExecute(TNotifyEvent Value);
```

Description

This is SetOnExecute, a member of class TActionClientLink.

4.1.7.3.18 TActionClientLink.SetShortCut Method

Introduces an interface for setting the shortcut for a client.

Pascal

```
procedure SetShortCut(Value: TShortCut); override;
```

C++

```
virtual __fastcall SetShortCut(TShortCut Value);
```

Description

The associated action calls SetShortCut when its ShortCut property changes so that the action link can propagate the new ShortCut value to the client object.

Value specifies the new value of the ShortCut property.

As implemented in TActionLink, SetShortCut does nothing. Descendant classes override SetShortCut to set the client property

that corresponds to the action's ShortCut property if the IsShortCutLinked method returns true.

See Also

ShortCut (see page 314)

ShortCut (see page 16152)

Action (see page 2725)

IsShortCutLinked (see page 272)

4.1.7.3.19 TActionClientLink.SetVisible Method

Introduces an interface for setting the visible state of a client.

Pascal

```
procedure SetVisible(Value: Boolean); override;
```

C++

```
virtual __fastcall SetVisible(Boolean Value);
```

Description

The associated action calls SetVisible when its Visible property changes so that the action link can propagate the new Visible value to the client object.

Value specifies the new value of the Visible property.

As implemented in TActionLink, SetVisible does nothing. Descendant classes override SetVisible to set the client property that corresponds to the action's Visible property if the IsVisibleLinked method returns true.

See Also

Visible (see page 314)

Visible (see page 5847)

Action (see page 2725)

IsVisibleLinked (see page 273)

4.1.8 TActionClients Class

TActionClients is a container for TActionClient (see page 364) objects.

Class Hierarchy

Pascal

```
TActionClients = class(TActionClientsCollection);
```

C++

```
class TActionClients : public TActionClientsCollection;
```

File

ActnMan

Description

Each TActionClients object holds a collection of TClientAction objects. The TActionClients object is used internally by the TActionManager (see page 432) component to maintain information about the action clients managed by the an action manager. Instances of the TActionClients object should never be created directly or the methods contained in TActionClients called directly.

TActionClient (see page 364)

Creating Dynamic Menus

Creating Most Recently Used Lists

Hiding Unused Items and Categories in Action Bands

4.1.8.1 TActionClients Members

The following tables list the members exposed by TActionClients.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	DoHideUnused (see page 404)	This is DoHideUnused, a member of class TActionClients.
	DoShowCaptions (see page 404)	This is DoShowCaptions, a member of class TActionClients.
	GetActionManager (see page 412)	Initializes the collection after the constructor is finished.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
	InternalRethinkHotkeys (see page 412)	Adjusts the captions of child items so that every item has an accelerator and there are no duplicate accelerator keys.
V	Notify (see page 405)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
	ToggleSmallIcons (see page 405)	This is ToggleSmallIcons, a member of class TActionClients.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	ParentItem (see page 415)	Indicates the action client object that uses this collection to maintain its subitems.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 404)	Creates a new TActionClient (see page 364) instance and adds it to the Items array.
V	AfterConstruction (see page 411)	Initializes the collection after the constructor is finished.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 404)	Copies the contents of one TActionClients (see page 400) object to another.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 403)	Creates and initializes a TActionClients (see page 400) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IterateClients (see page 412)	Executes a callback for every child item in the collection and any child items of those children.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	VisibleCount (see page 405)	Returns the number of visible TActionClient (see page 364) objects.

Public Properties

	Name	Description
	ActionClients (see page 406)	Provides indexed access to the TActionClient (see page 364) objects in the collection.
R	ActionManager (see page 406)	Contains a reference to the TActionManager (see page 432) component that maintains the TActionClients (see page 400) collection.
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 2751)	Lists the items in the collection.

Published Properties

	Name	Description
	AutoHotKeys (see page 407)	Specifies whether accelerator keys are auto-generated for items that do not have them assigned.
	CaptionOptions (see page 407)	Contains options for how captions should be displayed.
	Customizable (see page 407)	Indicates whether the action clients collection is customizable.
	HideUnused (see page 408)	Determines whether unused TClientAction objects are displayed in an action band.
	SmallIcons (see page 408)	Determines whether the small icons associated with the TActionClient (see page 364) objects contained by the TClientActions object are displayed in an action band.

4.1.8.2 TActionClients.Create Constructor

Creates and initializes a TActionClients (see page 400) object.

Pascal

```
constructor Create(AOwner: TPersistent; ItemClass: TCollectionItemClass);
```

C++

```
__fastcall TActionClients(TPersistent * AOwner, TCollectionItemClass ItemClass);
```

Description

The Create method takes as a parameter the name of a TPersistent instance. Create is called automatically by the action manager when a new instance of a TActionClientItem (see page 374) is required.

4.1.8.3 TActionClients Methods

The methods of the TActionClients class are listed here.

Protected Methods

	Name	Description
	DoHideUnused (see page 404)	This is DoHideUnused, a member of class TActionClients.
	DoShowCaptions (see page 404)	This is DoShowCaptions, a member of class TActionClients.
V	Notify (see page 405)	Responds when items are added to or removed from the collection.
	ToggleSmallIcons (see page 405)	This is ToggleSmallIcons, a member of class TActionClients.

Public Methods

	Name	Description
	Add (see page 404)	Creates a new TActionClient (see page 364) instance and adds it to the Items array.
V	Assign (see page 404)	Copies the contents of one TActionClients (see page 400) object to another.
	VisibleCount (see page 405)	Returns the number of visible TActionClient (see page 364) objects.

4.1.8.3.1 TActionClients.Add Method

Creates a new TActionClient (see page 364) instance and adds it to the Items array.

Pascal

```
function Add: TActionClientItem;
```

C++

```
__fastcall TActionClientItem Add();
```

Description

Add is used internally to create a TActionClient (see page 364) object in the TActionClients (see page 400) collection. The new TActionClient (see page 364) object is placed at the end of the Items array.

See Also

Add (see page 2736)

4.1.8.3.2 TActionClients.Assign Method

Copies the contents of one TActionClients (see page 400) object to another.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

This is simply an implementation of Assign (which copies information between objects) specifically for TActionClients (see page 400) objects. See the documentation for the inherited methods for more information.

See Also

Assign (see page 2736)

Assign (see page 2930)

4.1.8.3.3 TActionClients.DoHideUnused Method

Pascal

```
procedure DoHideUnused(AClient: TActionClient);
```

C++

```
__fastcall DoHideUnused(TActionClient AClient);
```

Description

This is DoHideUnused, a member of class TActionClients.

4.1.8.3.4 TActionClients.DoShowCaptions Method

Pascal

```
procedure DoShowCaptions(AClient: TActionClient);
```

C++

```
__fastcall DoShowCaptions(TActionClient AClient);
```

Description

This is DoShowCaptions, a member of class TActionClients.

4.1.8.3.5 TActionClients.Notify Method

Responds when items are added to or removed from the collection.

Pascal

```
procedure Notify(Item: TCollectionItem; Action: TCollectionNotification); override;
```

C++

```
virtual __fastcall Notify(TCollectionItem Item, TCollectionNotification Action);
```

Description

Notify is called automatically when the items in the collection change.

Item is the item that was just added to or that is about to be removed from the collection.

Action indicates whether item was added, is about to be removed, or is about to be deleted:

As implemented in TCollection, Notify calls Added when Action is cnAdded and calls Deleting when Action is cnDeleting. TCollection ignores the cnExtracting action. Descendant classes can override Notify to modify this behavior.

See Also

Added (see page 2736)

Deleting (see page 2741)

4.1.8.3.6 TActionClients.ToggleSmallIcons Method

Pascal

```
procedure ToggleSmallIcons(Clients: TActionClients; Small: Boolean);
```

C++

```
__fastcall ToggleSmallIcons(TActionClients Clients, Boolean Small);
```

Description

This is ToggleSmallIcons, a member of class TActionClients.

4.1.8.3.7 TActionClients.VisibleCount Method

Returns the number of visible TActionClient (see page 364) objects.

Pascal

```
function VisibleCount: Integer;
```

C++

```
__fastcall int VisibleCount();
```

Description

VisibleCount is used internally to return the number of visible TActionClient (see page 364) objects that can be rendered on an

action band.

4.1.8.4 TActionClients Properties

The properties of the TActionClients class are listed here.

Public Properties

	Name	Description
	ActionClients (see page 406)	Provides indexed access to the TActionClient (see page 364) objects in the collection.
R	ActionManager (see page 406)	Contains a reference to the TActionManager (see page 432) component that maintains the TActionClients (see page 400) collection.

Published Properties

	Name	Description
	AutoHotKeys (see page 407)	Specifies whether accelerator keys are auto-generated for items that do not have them assigned.
	CaptionOptions (see page 407)	Contains options for how captions should be displayed.
	Customizable (see page 407)	Indicates whether the action clients collection is customizable.
	HideUnused (see page 408)	Determines whether unused TClientAction objects are displayed in an action band.
	SmallIcons (see page 408)	Determines whether the small icons associated with the TActionClient (see page 364) objects contained by the TClientActions object are displayed in an action band.

4.1.8.4.1 TActionClients.ActionClients Property

Provides indexed access to the TActionClient (see page 364) objects in the collection.

Pascal

```
property ActionClients [const Index: Integer]: TActionClientItem;
```

C++

```
__property TActionClientItem ActionClients[int const Index];
```

Description

The ActionClients property is used internally by the action manager to provide access to the individual TClientAction objects managed by the action manager. The TActionClients (see page 400) property should never be accessed directly.

See Also

TActionClient (see page 364)

TActionManager (see page 432)

operator_[]

4.1.8.4.2 TActionClients.ActionManager Property

Contains a reference to the TActionManager (see page 432) component that maintains the TActionClients (see page 400) collection.

Pascal

```
property ActionManager: TCustomActionManager;
```

C++

```
__property TCustomActionManager ActionManager;
```

Description

ActionManager is automatically set to the TActionManager (see page 432) component that created the TActionClients (see page 400) object.

See Also

TActionManager (see page 432)

4.1.8.4.3 TActionClients.AutoHotKeys Property

Specifies whether accelerator keys are auto-generated for items that do not have them assigned.

Pascal

```
property AutoHotKeys: Boolean;
```

C++

```
__property Boolean AutoHotKeys;
```

Description

Use AutoHotKeys to specify whether accelerator keys are auto-generated for items that do not have them assigned. If AutoHotKeys is set to True, accelerator keys are automatically assigned to each action client item that does not have one assigned.

4.1.8.4.4 TActionClients.CaptionOptions Property

Contains options for how captions should be displayed.

Pascal

```
property CaptionOptions: TCaptionOptions;
```

C++

```
__property TCaptionOptions CaptionOptions;
```

Description

CaptionOptions contains the rules for displaying captions on action client items in the collection. If CaptionOptions is set to coNone, no captions will be displayed for any item. If it is set to coSelective, a determination will be made separately for each item based on the value of its ShowCaption property. A value of coAll will cause all items to display captions. Note that this property takes precedence over the ShowCaption property of individual TActionClientItem (see page 374) objects.

See Also

ShowCaption (see page 387)

Caption (see page 432)

4.1.8.4.5 TActionClients.Customizable Property

Indicates whether the action clients collection is customizable.

Pascal

```
property Customizable: Boolean;
```

C++

```
__property Boolean Customizable;
```

Description

The default setting for Customizable is true, which indicates that the collection can be customized. Set Customizable to false if you don't want to allow users to change the items in this collection using the customize dialog. Collections that are not customizable appear grayed out in the customize dialog.

4.1.8.4.6 TActionClients.HideUnused Property

Determines whether unused TClientAction objects are displayed in an action band.

Pascal

```
property HideUnused: Boolean;
```

C++

```
__property Boolean HideUnused;
```

Description

HideUnused is used internally to determine whether unused or less frequently used TClientAction objects contained by the TActionClient (see page 364) object are displayed in an action band by the action manager component.

4.1.8.4.7 TActionClients.SmallIcons Property

Determines whether the small icons associated with the TActionClient (see page 364) objects contained by the TClientActions object are displayed in an action band.

Pascal

```
property SmallIcons: Boolean;
```

C++

```
__property Boolean SmallIcons;
```

Description

Use SmallIcons to specify whether small icons are used in place of large icons when an action band renders a UI element. Setting SmallIcons to true causes the small version of the icon to be displayed.

4.1.9 TActionClientsCollection Class

TActionClientsCollection is a collection of action clients that maintains information about the action manager that owns the collection.

Class Hierarchy

Pascal

```
TActionClientsCollection = class(TOwnedCollection);
```

C++

```
class TActionClientsCollection : public TOwnedCollection;
```

File

ActnMan

Description

TActionClientsCollection is the base class for collections that list action client objects (TActionClient (see page 364) descendants) for an action manager or for another action client. Each TActionClientsCollection descendant contains a specific type of TActionClient (see page 364) descenant:

TActionClients (see page 400) contains TActionClientItem (see page 374) objects. Each TActionClientItem (see page 374) represents an action the user can execute.

TActionBars (see page 352) contains TActionBarItem (see page 346) objects. Each TActionBarItem (see page 346) represents a set of actions that appear on a menu or tool bar.

In addition to listing its collection of TActionClient (see page 364) descendants, TActionClientsCollection maintains information about the action manager that owns the collection and lets the Object Inspector display the collection's name at design time.

See Also

TPersistent (see page 2928)

TPersistent (see page 2928)

TActionClient (see page 364)

TCustomActionManager (see page 537)

TActionClient (see page 364)

TActionClients (see page 400)

TActionBars (see page 352)

4.1.9.1 TActionClientsCollection Members

The following tables list the members exposed by TActionClientsCollection.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetActionManager (see page 412)	Initializes the collection after the constructor is finished.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
	InternalRethinkHotkeys (see page 412)	Adjusts the captions of child items so that every item has an accelerator and there are no duplicate accelerator keys.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.

V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
	ActionClients (see page 413)	Lists the action clients in this collection.
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	ParentItem (see page 415)	Indicates the action client object that uses this collection to maintain its subitems.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 2736)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
V	AfterConstruction (see page 411)	Initializes the collection after the constructor is finished.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 2734)	Creates and initializes a collection.
	Create (see page 2914)	Creates and initializes a TOwnedCollection (see page 2912) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IterateClients (see page 412)	Executes a callback for every child item in the collection and any child items of those children.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ActionManager (see page 414)	Indicates the action manager that owns the TActionClientsCollection (see page 408) object.
	AutoHotKeys (see page 414)	Specifies whether accelerator keys are auto-generated for items that do not have them assigned.
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
	Customizable (see page 415)	Indicates whether the action clients collection is customizable.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 2751)	Lists the items in the collection.

4.1.9.2 TActionClientsCollection Methods

The methods of the TActionClientsCollection class are listed here.

Protected Methods

	Name	Description
	GetActionManager (see page 412)	Initializes the collection after the constructor is finished.
	InternalRethinkHotkeys (see page 412)	Adjusts the captions of child items so that every item has an accelerator and there are no duplicate accelerator keys.

Public Methods

	Name	Description
V	AfterConstruction (see page 411)	Initializes the collection after the constructor is finished.
	IterateClients (see page 412)	Executes a callback for every child item in the collection and any child items of those children.

4.1.9.2.1 TActionClientsCollection.AfterConstruction Method

Initializes the collection after the constructor is finished.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

AfterConstruction is called immediately after the last constructor has finished executing. TActionClientsCollection (see page 408) overrides this method to perform some final initializations.

See Also

AfterConstruction (see page 22289)

Customizable (see page 415)

4.1.9.2.2 TActionClientsCollection.GetActionManager Method

Initializes the collection after the constructor is finished.

Pascal

```
function GetActionManager: TCustomActionManager;
```

C++

```
__fastcall TCustomActionManager GetActionManager();
```

Description

GetActionManager is the protected read implementation of the ActionManager (see page 414) property.

This method returns the value of the Owner property, after casting it to a TCustomActionManager (see page 537) object.

See Also

ActionManager (see page 414)

Owner (see page 2807)

4.1.9.2.3 TActionClientsCollection.InternalRethinkHotkeys Method

Adjusts the captions of child items so that every item has an accelerator and there are no duplicate accelerator keys.

Pascal

```
function InternalRethinkHotkeys(ForceRethink: Boolean): Boolean;
```

C++

```
__fastcall Boolean InternalRethinkHotkeys(Boolean ForceRethink);
```

Description

TActionClientsCollection (see page 408) calls InternalRethinkHotkeys internally to assign accelerator keys to its child items. This method tries to ensure that all child items have accelerator keys on their captions, and that no two child items have the same accelerator key.

If any of the child items has its own set of child items, and that collection of child items has its AutoHotKeys (see page 414) property set to true, then InternalRethinkHotkeys causes the accelerator keys to be assigned for those items as well.

See Also

Caption (see page 384)

ActionClients (see page 413)

AutoHotKeys (see page 407)

4.1.9.2.4 TActionClientsCollection.IterateClients Method

Executes a callback for every child item in the collection and any child items of those children.

Pascal

```
procedure IterateClients(Clients: TActionClientsCollection; ActionProc: TActionProc);
```

C++

```
__fastcall IterateClients(TActionClientsCollection Clients, TActionProc ActionProc);
```

Description

Use IterateClients to perform some operation on every action client in a collection, including action clients that are children of the action clients in the collection. IterateClients executes the callback for each item in an action clients collection, and then, if the child item has its own children, calls itself recursively for that set of grandchildren.

Clients is the collection of action clients on which to execute the callback.

ActionProc is the callback to execute. For every action client listed by Clients (or one of its children), IterateClients calls ActionProc with the AClient parameter set to the action client. If ActionProc is nil (Delphi) or NULL (C++), IterateClients causes the action clients to repaint themselves by calling their Refresh method.

Note: IterateClients does not start by executing the items in this collection's ActionClients (see page 413) property, but rather by executing the items in the ActionClients (see page 413) property of the Clients parameter.

See Also

ActionClients (see page 413)

Refresh (see page 369)

4.1.9.3 TActionClientsCollection Properties

The properties of the TActionClientsCollection class are listed here.

Protected Properties

	Name	Description
	ActionClients (see page 413)	Lists the action clients in this collection.
	ParentItem (see page 415)	Indicates the action client object that uses this collection to maintain its subitems.

Public Properties

	Name	Description
R	ActionManager (see page 414)	Indicates the action manager that owns the TActionClientsCollection (see page 408) object.
	AutoHotKeys (see page 414)	Specifies whether accelerator keys are auto-generated for items that do not have them assigned.
	Customizable (see page 415)	Indicates whether the action clients collection is customizable.

4.1.9.3.1 TActionClientsCollection.ActionClients Property

Lists the action clients in this collection.

Pascal

```
property ActionClients [const Index: Integer]: TActionClient;
```

C++

```
__property TActionClient ActionClients[int const Index];
```

Description

ActionClients lists the child items that make up this collection. This is the same as the Items property, except that the value is of type TActionClient (see page 364) instead of TCollectionItem.

Index is the index of the child item, where 0 specifies the first item, 1 specifies the second item, and so on. The Count property provides an upper bound to the value of Index.

ActionClients is the default property for TActionClientsCollection (see page 408). This means you do not need to use the property name in Delphi code. That is, the line

```
Client := ActionManager.ActionBars.ActionClients[0];
```

can also be written

```
Client := ActionManager .ActionBars[0];
```

Note: To add action clients to this list, use the Add method. To remove action clients from this list, use the Delete method.

See Also

Items (see page 2751)

Count (see page 2749)

Add (see page 2736)

Delete (see page 2741)

operator_[]

4.1.9.3.2 TActionClientsCollection.ActionManager Property

Indicates the action manager that owns the TActionClientsCollection (see page 408) object.

Pascal

```
property ActionManager: TCustomActionManager;
```

C++

```
__property TCustomActionManager ActionManager;
```

Description

ActionManager is a reference to the action manager that owns the TActionClientsCollection (see page 408) object. This is the same as the value of the Owner property, except that the type of this property is TCustomActionManager (see page 537).

The TActionClientsCollection (see page 408) descendant represents either the set of action bands that belong to ActionManager (the value of its ActionBars property), or the set of action client items that belong to one of those action bands.

See Also

ActionBars (see page 553)

Owner (see page 2807)

4.1.9.3.3 TActionClientsCollection.AutoHotKeys Property

Specifies whether accelerator keys are auto-generated for items that do not have them assigned.

Pascal

```
property AutoHotKeys: Boolean;
```

C++

```
__property Boolean AutoHotKeys;
```

Description

Use AutoHotKeys to specify whether accelerator keys are auto-generated for items that do not have them assigned. If AutoHotKeys is set to True, accelerator keys are automatically assigned to each action client item that does not have one assigned.

4.1.9.3.4 TActionClientsCollection.Customizable Property

Indicates whether the action clients collection is customizable.

Pascal

```
property Customizable: Boolean;
```

C++

```
__property Boolean Customizable;
```

Description

The default setting for Customizable is true, which indicates that the collection can be customized. Set Customizable to false if you don't want to allow users to change the items in this collection using the customize dialog. Collections that are not customizable appear grayed out in the customize dialog.

4.1.9.3.5 TActionClientsCollection.ParentItem Property

Indicates the action client object that uses this collection to maintain its subitems.

Pascal

```
property ParentItem: TActionClient;
```

C++

```
__property TActionClient ParentItem;
```

Description

ParentItem is the TActionClient (see page 364) descendant that uses this object to implement its Items property. ParentItem corresponds to an action band, while the items in this collection correspond to the child items of that action band.

If the TActionClientsCollection (see page 408) object does not represent the child items of a TActionClient (see page 364) descendant, ParentItem is nil (Delphi) or NULL (C++). For example, on the TActionClientsCollection (see page 408) object that implements the ActionBars property of an action manager, the value of ParentItem is nil (Delphi) or NULL (C++).

See Also

ActionManager (see page 414)

Items (see page 373)

ActionBars (see page 553)

4.1.10 TActionDragBaseClass Class

TActionDragBaseClass is a base class used for managing drag operations.

Class Hierarchy

Pascal

```
TActionDragBaseClass = class(TDragObjectEx);
```

C++

```
class TActionDragBaseClass : public TDragObjectEx;
```

File

ActnMan

Description

TActionDragBaseClass is created automatically to manage drag operations in action bands.

See Also

TDragControlObject (see page 6003)

4.1.10.1 TActionDragBaseClass Members

The following tables list the members exposed by TActionDragBaseClass.

Protected Methods

	Name	Description
	Finished (see page 6035)	Responds when the mouse is released indicating the drag operation is complete.
	GetDragCursor (see page 6035)	Indicates which cursor should be displayed in response to mouse moves.
	GetDragImages (see page 6035)	Returns an image list containing the image to be displayed while dragging.
	MainWndProc (see page 6037)	This is MainWndProc, a member of class TDragObject.
	WndProc (see page 6038)	This is WndProc, a member of class TDragObject.

Public Methods

	Name	Description
	AfterConstruction (see page 6033)	Responds after the last constructor has executed.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 6034)	Copies the properties of another drag control object.
	BeforeDestruction (see page 6034)	Responds before the first destructor executes.
	BeforeDestruction (see page 6043)	Allows the application to detect that the drag object needs to be freed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetName (see page 6036)	Returns a string that identifies the drag operation.
	HideDragImage (see page 6036)	Provides the interface for a method that hides the current drag image.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	Instance (see page 6037)	Returns the instance (module) handle of the EXE or DLL that created the drag object.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	ShowDragImage (see page 6037)	Provides the interface for a method that hides the current drag image.

Public Properties

	Name	Description
	ActionManager (see page 417)	Contains a reference to the TActionManager (see page 432) component.
	AlwaysShowDragImages (see page 6038)	This is AlwaysShowDragImages, a member of class TDragObject.
	Cancelling (see page 6038)	Specifies whether the drag operation is being canceled.
	DragHandle (see page 6039)	Specifies the window handle of the dragged object.
	DragPos (see page 6039)	Specifies the position of the dragged object.
	DragTarget (see page 6039)	Specifies the dragged object's target.
	DragTargetPos (see page 6040)	Specifies the position of the drag object relative to the drag target.
R	Dropped (see page 6040)	Drag ended with drop.
R	MouseDeltaX (see page 6040)	Specifies the x-coordinate of the mouse position relative to the position of the dragged object's target.
R	MouseDeltaY (see page 6041)	Specifies the y-coordinate of the mouse position relative to the position of the dragged object's target.
	RightClickCancels (see page 6041)	This is RightClickCancels, a member of class TDragObject.

4.1.10.2 TActionDragBaseClass Properties

The properties of the TActionDragBaseClass class are listed here.

Public Properties

	Name	Description
	ActionManager (see page 417)	Contains a reference to the TActionManager (see page 432) component.

4.1.10.2.1 TActionDragBaseClass.ActionManager Property

Contains a reference to the TActionManager (see page 432) component.

Pascal

```
property ActionManager: TCustomActionManager;
```

C++

```
__property TCustomActionManager ActionManager;
```

Description

ActionManager is automatically set to the TActionManager (see page 432) component for managing action band drag actions.

See Also

TActionManager (see page 432)

4.1.11 TActionDragObject Class

Class Hierarchy

Pascal

```
TActionDragObject = class(TActionDragBaseClass);
```

C++

```
class TActionDragObject : public TActionDragBaseClass;
```

File

ActnMan

Description

This is class ActnMan.TActionDragObject.

4.1.11.1 TActionDragObject Members

The following tables list the members exposed by TActionDragObject.

Protected Fields

	Name	Description
	FActionClasses (see page 421)	This is FActionClasses, a member of class TActionDragObject.

Protected Methods

	Name	Description
V	Finished (see page 6035)	Responds when the mouse is released indicating the drag operation is complete.
V	GetDragCursor (see page 6035)	Indicates which cursor should be displayed in response to mouse moves.
V	GetDragImages (see page 6035)	Returns an image list containing the image to be displayed while dragging.
	MainWndProc (see page 6037)	This is MainWndProc, a member of class TDragObject.
V	WndProc (see page 6038)	This is WndProc, a member of class TDragObject.

Public Methods

	Name	Description
	AddAction (see page 421)	This is AddAction, a member of class TActionDragObject.
	AddActionClass (see page 421)	This is AddActionClass, a member of class TActionDragObject.
V	AfterConstruction (see page 6033)	Responds after the last constructor has executed.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 6034)	Copies the properties of another drag control object.
V	BeforeDestruction (see page 6034)	Responds before the first destructor executes.
V	BeforeDestruction (see page 6043)	Allows the application to detect that the drag object needs to be freed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 419)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 420)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetName (see page 6036)	Returns a string that identifies the drag operation.
V	HideDragImage (see page 6036)	Provides the interface for a method that hides the current drag image.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	Instance (see page 6037)	Returns the instance (module) handle of the EXE or DLL that created the drag object.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	ShowDragImage (see page 6037)	Provides the interface for a method that hides the current drag image.

Public Properties

	Name	Description
R	ActionCount (see page 422)	This is ActionCount, a member of class TActionDragObject.
	ActionManager (see page 417)	Contains a reference to the TActionManager (see page 432) component.
R	Actions (see page 422)	This is Actions, a member of class TActionDragObject.
	AlwaysShowDragImages (see page 6038)	This is AlwaysShowDragImages, a member of class TDragObject.
	Cancelling (see page 6038)	Specifies whether the drag operation is being canceled.
	DragHandle (see page 6039)	Specifies the window handle of the dragged object.
	DragPos (see page 6039)	Specifies the position of the dragged object.
	DragTarget (see page 6039)	Specifies the dragged object's target.
	DragTargetPos (see page 6040)	Specifies the position of the drag object relative to the drag target.
R	Dropped (see page 6040)	Drag ended with drop.
R	MouseDeltaX (see page 6040)	Specifies the x-coordinate of the mouse position relative to the position of the dragged object's target.
R	MouseDeltaY (see page 6041)	Specifies the y-coordinate of the mouse position relative to the position of the dragged object's target.
	RightClickCancels (see page 6041)	This is RightClickCancels, a member of class TDragObject.

4.1.11.2 TActionDragObject.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TActionDragObject();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

4.1.11.3 TActionDragObject.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TActionDragObject();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

4.1.11.4 TActionDragObject Fields

The fields of the TActionDragObject class are listed here.

Protected Fields

	Name	Description
	FActionClasses (see page 421)	This is FActionClasses, a member of class TActionDragObject.

4.1.11.4.1 TActionDragObject.FActionClasses Field

Pascal

```
FActionClasses: Boolean;
```

C++

```
Boolean FActionClasses;
```

Description

This is FActionClasses, a member of class TActionDragObject.

4.1.11.5 TActionDragObject Methods

The methods of the TActionDragObject class are listed here.

Public Methods

	Name	Description
	AddAction (see page 421)	This is AddAction, a member of class TActionDragObject.
	AddActionClass (see page 421)	This is AddActionClass, a member of class TActionDragObject.

4.1.11.5.1 TActionDragObject.AddAction Method

Pascal

```
procedure AddAction(AnAction: TContainedAction);
```

C++

```
__fastcall AddAction(TContainedAction AnAction);
```

Description

This is AddAction, a member of class TActionDragObject.

4.1.11.5.2 TActionDragObject.AddActionClass Method

Pascal

```
procedure AddActionClass(AnActionClass: TCustomActionClass);
```

C++

```
__fastcall AddActionClass(TCustomActionClass AnActionClass);
```

Description

This is AddActionClass, a member of class TActionDragObject.

4.1.11.6 TActionDragObject Properties

The properties of the TActionDragObject class are listed here.

Public Properties

	Name	Description
R	ActionCount (see page 422)	This is ActionCount, a member of class TActionDragObject.
R	Actions (see page 422)	This is Actions, a member of class TActionDragObject.

4.1.11.6.1 TActionDragObject.ActionCount Property

Pascal

```
property ActionCount: Integer;
```

C++

```
__property int ActionCount;
```

Description

This is ActionCount, a member of class TActionDragObject.

4.1.11.6.2 TActionDragObject.Actions Property

Pascal

```
property Actions [Index: Integer]: TContainedAction;
```

C++

```
__property TContainedAction Actions[int Index];
```

Description

This is Actions, a member of class TActionDragObject.

4.1.12 TActionItemDragObject Class

Class Hierarchy

Pascal

```
TActionItemDragObject = class(TActionDragBaseClass);
```

C++

```
class TActionItemDragObject : public TActionDragBaseClass;
```

File

ActnMan

Description

This is class ActnMan.TActionItemDragObject.

4.1.12.1 TActionItemDragObject Members

The following tables list the members exposed by TActionItemDragObject.

Protected Methods

	Name	Description
	Finished (see page 424)	Responds when the mouse is released indicating the drag operation is complete.
	GetDragCursor (see page 6035)	Indicates which cursor should be displayed in response to mouse moves.
	GetDragImages (see page 6035)	Returns an image list containing the image to be displayed while dragging.
	MainWndProc (see page 6037)	This is MainWndProc, a member of class TDragObject.
	WndProc (see page 6038)	This is WndProc, a member of class TDragObject.

Public Methods

	Name	Description
	AfterConstruction (see page 6033)	Responds after the last constructor has executed.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 6034)	Copies the properties of another drag control object.
	BeforeDestruction (see page 6034)	Responds before the first destructor executes.
	BeforeDestruction (see page 6043)	Allows the application to detect that the drag object needs to be freed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetName (see page 6036)	Returns a string that identifies the drag operation.
	HideDragImage (see page 6036)	Provides the interface for a method that hides the current drag image.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Instance (see page 6037)	Returns the instance (module) handle of the EXE or DLL that created the drag object.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ShowDragImage (see page 6037)	Provides the interface for a method that hides the current drag image.

Public Properties

	Name	Description
	ActionManager (see page 417)	Contains a reference to the TActionManager (see page 432) component.
	AlwaysShowDragImages (see page 6038)	This is AlwaysShowDragImages, a member of class TDragObject.

	Cancelling (see page 6038)	Specifies whether the drag operation is being canceled.
	ClientItem (see page 425)	This is ClientItem, a member of class TActionItemDragObject.
	DragHandle (see page 6039)	Specifies the window handle of the dragged object.
	DragPos (see page 6039)	Specifies the position of the dragged object.
	DragTarget (see page 6039)	Specifies the dragged object's target.
	DragTargetPos (see page 6040)	Specifies the position of the drag object relative to the drag target.
R	Dropped (see page 6040)	Drag ended with drop.
R	MouseDeltaX (see page 6040)	Specifies the x-coordinate of the mouse position relative to the position of the dragged object's target.
R	MouseDeltaY (see page 6041)	Specifies the y-coordinate of the mouse position relative to the position of the dragged object's target.
	RightClickCancels (see page 6041)	This is RightClickCancels, a member of class TDragObject.

4.1.12.2 TActionItemDragObject Methods

The methods of the TActionItemDragObject class are listed here.

Protected Methods

	Name	Description
V	Finished (see page 424)	Responds when the mouse is released indicating the drag operation is complete.

4.1.12.2.1 TActionItemDragObject.Finished Method

Responds when the mouse is released indicating the drag operation is complete.

Pascal

```
procedure Finished(Target: TObject; X: Integer; Y: Integer; Accepted: Boolean); override;
```

C++

```
virtual __fastcall Finished(TObject * Target, int X, int Y, Boolean Accepted);
```

Description

Finished does nothing as implemented in TDragObject. Override this method to provide more meaningful behavior. The Target is the object that accepted the drag. If the drag operation is canceled or a drag-and-dock operation ends with the dragged object in a free-floating position, Target is nil (Delphi) or NULL (C++). X and Y indicate the position where the drag ended. Accepted is true if the Target accepted the dragged object.

Finished is overridden and implemented in TBaseDragControlObject.

See Also

Finished (see page 5723)

4.1.12.3 TActionItemDragObject Properties

The properties of the TActionItemDragObject class are listed here.

Public Properties

	Name	Description
	ClientItem (see page 425)	This is ClientItem, a member of class TActionItemDragObject.

4.1.12.3.1 TActionItemDragObject.ClientItem Property

Pascal

```
property ClientItem: TActionClientItem;
```

C++

```
__property TActionClientItem ClientItem;
```

Description

This is ClientItem, a member of class TActionItemDragObject.

4.1.13 TActionListCollection Class

TActionListCollection is a collection that maintains information about action lists and their captions.

Class Hierarchy

Pascal

```
TActionListCollection = class(TOwnedCollection);
```

C++

```
class TActionListCollection : public TOwnedCollection;
```

File

ActnMan

Description

ActionBand components, unlike other menu bar and tool bar components, do not use a single action list object. Instead, they have access to multiple lists through their action manager object. Those lists are contained in a TActionListCollection object, which is mostly just an array of action lists and their corresponding captions. Each list/caption pair is encapsulated by a TActionListItem (see page 428) object in the list.

You probably won't need to create your own instances or subclasses of TActionListCollection. Your TActionManager (see page 432) object will handle them for you.

See Also

TCollection (see page 2731)

TCustomActionManager (see page 537)

TActionManager (see page 432)

TActionListItem (see page 428)

4.1.13.1 TActionListCollection Members

The following tables list the members exposed by TActionListCollection.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 2736)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 2734)	Creates and initializes a collection.
	Create (see page 2914)	Creates and initializes a TOwnedCollection (see page 2912) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.

V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ActionManager (see page 427)	Refers to the action manager associated with the collection.
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 2751)	Lists the items in the collection.
	ListItems (see page 428)	A list of action lists and their associated captions.

4.1.13.2 TActionListCollection Properties

The properties of the TActionListCollection class are listed here.

Public Properties

	Name	Description
R	ActionManager (see page 427)	Refers to the action manager associated with the collection.
	ListItems (see page 428)	A list of action lists and their associated captions.

4.1.13.2.1 TActionListCollection.ActionManager Property

Refers to the action manager associated with the collection.

Pascal

```
property ActionManager: TCustomActionManager;
```

C++

```
__property TCustomActionManager ActionManager;
```

Description

Use ActionManager to refer to the action list collection's action manager object.

See Also

TCustomActionManager (see page 537)

TActionManager (see page 432)

4.1.13.2.2 TActionListCollection.ListItems Property

A list of action lists and their associated captions.

Pascal

```
property ListItems [Index: Integer]: TActionListItem;
```

C++

```
__property TActionListItem ListItems[int Index];
```

Description

ListItems is a list of TActionListItem (see page 428) objects, which each contain an action list and the associated caption.

See Also

TActionListItem (see page 428)

operator_[]

4.1.14 TActionListItem Class

TActionListItem represents an item in a action list collection.

Class Hierarchy

Pascal

```
TActionListItem = class(TCollectionItem);
```

C++

```
class TActionListItem : public TCollectionItem;
```

File

ActnMan

Description

A TActionListItem is an element of an action list collection. It consists of two parts: an action list and a caption associated with that list. Because the caption is not part of the list itself, it is possible to have the list appear in two different places with different names.

TActionListItem objects are created through an action manager object; you do not need to create them yourself.

See Also

TActionListCollection (see page 425)

TActionManager (see page 432)

4.1.14.1 TActionListItem Members

The following tables list the members exposed by TActionListItem.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 430)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	Owner (see page 431)	This is Owner, a member of class TActionListItem.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 430)	A method for copying the contents of one TActionListItem (see page 428) to another.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2757)	Creates and initializes a TCollectionItem (see page 2755) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Properties

	Name	Description
	ActionList (see page 431)	Specifies an action list.
	Caption (see page 432)	The name displayed in the ActionBand components containing the action list.

4.1.14.2 TActionListItem Methods

The methods of the TActionListItem class are listed here.

Protected Methods

	Name	Description
V	GetDisplayName (see page 430)	Returns the name of the collection item as it appears in the collection editor.
	Owner (see page 431)	This is Owner, a member of class TActionListItem.

Public Methods

	Name	Description
V	Assign (see page 430)	A method for copying the contents of one TActionListItem (see page 428) to another.

4.1.14.2.1 TActionListItem.Assign Method

A method for copying the contents of one TActionListItem (see page 428) to another.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Use Assign to copy the contents from one TActionListItem (see page 428) to another. See the documentation for the inherited method for more information.

See Also

Assign (see page 2930)

4.1.14.2.2 TActionListItem.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName (see page 2761)

GetNamePath (see page 2759)

4.1.14.2.3 TActionListItem.Owner Method

Pascal

```
function Owner: TActionListCollection;
```

C++

```
__fastcall TActionListCollection Owner();
```

Description

This is Owner, a member of class TActionListItem.

4.1.14.3 TActionListItem Properties

The properties of the TActionListItem class are listed here.

Published Properties

	Name	Description
	ActionList (see page 431)	Specifies an action list.
	Caption (see page 432)	The name displayed in the ActionBand components containing the action list.

4.1.14.3.1 TActionListItem.ActionList Property

Specifies an action list.

Pascal

```
property ActionList: TCustomActionList;
```

C++

```
__property TCustomActionList ActionList;
```

Description

ActionList is a reference to the TActionList item's action list, which is the primary reason for the TActionListItem (see page 428)'s existence.

See Also

TActionList (see page 280)

TCustomActionList (see page 315)

4.1.14.3.2 TActionListItem.Caption Property

The name displayed in the ActionBand components containing the action list.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

The Caption string is the name displayed by the action band components when referring to ActionList (see page 431). Visibility of the caption is controlled by the CaptionOptions property of the associatedTActionClients object and the ShowCaption field of the associated TActionClientItem (see page 374) object. Refer to the documentation for these properties for more information.

See Also

CaptionOptions (see page 407)

ShowCaption (see page 387)

4.1.15 TActionManager Class

TActionManager provides a mechanism to manage and display all actions contained in an application.

Class Hierarchy

Pascal

```
TActionManager = class(TCustomActionManager);
```

C++

```
class TActionManager : public TCustomActionManager;
```

File

ActnMan

Description

The Action Manager component allows you to specify layout information for custom user-defined actions and standard actions that are contained in an application and a set of controls that can "render" this information as UI elements.

The Action Manager allows you to add any of the standard actions to your application and drag and drop any action in your application on to an action band, where it will automatically render as a UI element.

The Action Manager contains all of the layout information necessary to create menus, toolbars and Navigation bars (Outlook bars) automatically from this information. The layout information includes:

Order of appearance

Reference to an action which includes the action's Caption, ShortCut, Visible etc.

Color

Background

The Action manager stores this information in a streamable object (TActionClientItem (see page 374)) that can be written to disk, as a text or binary file. The Action Manager then uses this information to reconstruct the UI elements when the application is started again and display them on an action band component. Because the Action Manager is able to maintain state information, it is also adds the ability to allow the user of the application to customize the UI elements that are displayed on the action bands. This is easily done by dragging the standard action, TCustomizeBandAction, from the action manager editor and dropping it on an action band.

Additionally, the Action Manager maintains usage data about the items. This allows you to automatically hide infrequently used items in the UI (User Interface), making for a cleaner more effective UI.

What Is an Action?

4.1.15.1 TActionManager Members

The following tables list the members exposed by TActionManager.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAction (see page 320)	Adds an action to the list.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 320)	Generates an OnChange (see page 326) event.
V	Change (see page 545)	Generates an OnChange event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CreateActionBars (see page 545)	This is CreateActionBars, a member of class TCustomActionManager.

	DefineProperties (see page 545)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindActionBar (see page 547)	This is FindActionBar, a member of class TCustomActionManager.
	FindActionClient (see page 547)	This is FindActionClient, a member of class TCustomActionManager.
	FindClient (see page 547)	This is FindClient, a member of class TCustomActionManager.
	GetActionBarItemClass (see page 548)	This is GetActionBarItemClass, a member of class TCustomActionManager.
	GetActionBarsClass (see page 548)	This is GetActionBarsClass, a member of class TCustomActionManager.
	GetActionClientItemClass (see page 548)	This is GetActionClientItemClass, a member of class TCustomActionManager.
	GetActionClientsClass (see page 549)	This is GetActionClientsClass, a member of class TCustomActionManager.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 321)	Calls a specified method for each child action of the action list.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetUsage (see page 549)	This is GetUsage, a member of class TCustomActionManager.
	HasLinkedActionLists (see page 549)	This is HasLinkedActionLists, a member of class TCustomActionManager.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 549)	Initializes the component after the form file has been read into memory.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	LoadMenu (see page 551)	This is LoadMenu, a member of class TCustomActionManager.
	Notification (see page 322)	Responds to notifications when objects are created or destroyed.
	Notification (see page 551)	Responds to notifications when objects are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RemoveAction (see page 323)	Removes an action from the list.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 323)	Sets the order that actions are passed to a callback by the GetChildren (see page 321) method.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetImages (see page 323)	Sets the value of the Images (see page 325) property.
	SetImages (see page 552)	Sets the value of the Images property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetState (see page 324)	This is SetState, a member of class TCustomActionList.
	SetState (see page 553)	This is SetState, a member of class TCustomActionManager.
	SetupActionBars (see page 553)	This is SetupActionBars, a member of class TCustomActionManager.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Loading (see page 555)	This is Loading, a member of class TCustomActionManager.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddAction (see page 543)	Inserts a new action into an existing actionband.
	AddCategory (see page 543)	Adds all of the actions from a category to an action band.
	AddSeparator (see page 544)	Adds a separator to an action band.
	AfterConstruction (see page 544)	Loads the layout information needed to reconstruct the action bands by the action manager from a file.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 544)	Provides a custom Assign procedure for TCustomActionManager (see page 537) objects.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 319)	Creates and initializes a TCustomActionList (see page 315) object.
	Create (see page 541)	Instantiates and initializes a TCustomActionManager (see page 537) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DeleteActionItems (see page 546)	Removes items from an ActionBars (see page 553) collection.
	DeleteItem (see page 546)	Deletes an action band item.
	Destroy (see page 319)	Disposes of the instance of an action list object.
	Destroy (see page 542)	Disposes of the instance of an action manager object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 321)	Generates an OnExecute (see page 327) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.

	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindItemByAction (see page 547)	Returns the first item linked to an action.
	FindItemByCaption (see page 548)	Returns the first item with a matching caption.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 321)	Returns a TComponent enumerator.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsShortCut (see page 322)	Evaluates an input key combination to determine whether it is a shortcut for one of the actions in the list.
	LoadFromFile (see page 550)	Loads the layout information needed to reconstruct the action bands by the action manager from a file.
	LoadFromStream (see page 550)	Loads the layout information needed to reconstruct the action bands by the action manager from a stream.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	ResetActionBar (see page 551)	Resets the action bands to their default state.
	ResetUsageData (see page 551)	Resets the usage data of the action bands.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 552)	Saves layout information needed to reconstruct the action bands by the action manager to a file.
	SaveToStream (see page 552)	Saves layout information needed to reconstruct the action bands by the action manager to a stream.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	UpdateAction (see page 324)	Generates an OnUpdate (see page 327) event.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionCount (see page 324)	Indicates the number of actions in the action list.
	Actions (see page 325)	Lists the actions maintained by the action list.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	DefaultActionBars (see page 554)	Contains a collection of the application default action bands.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 441)	Occurs when a change occurs in the action list.
	OnExecute (see page 442)	Occurs when a client object triggers an action in the list.
	OnGetBarItemClass (see page 442)	Occurs before TActionManager creates TActionBars items.
	OnGetBarsClass (see page 442)	Occurs before TActionManager creates its ActionBars collection.
	OnGetClientItemClass (see page 443)	Occurs before TActionManager creates any ActionClientItems.
	OnGetClientsClass (see page 443)	Occurs when attempting to add items to an ActionClient.
	OnStateChange (see page 443)	Occurs after an OnChange event.
	OnStyleChanged (see page 444)	Occurs after a change in the Style (see page 440) property.
	OnUpdate (see page 444)	Occurs when the application is idle so that the action list can update a specific action in the list.

Published Properties

	Name	Description
	ActionBars (see page 438)	Contains a collection of all the action bands in the application.
	FileName (see page 438)	Specifies the name of the file that the action manager component uses to read and write layout information.
	Images (see page 438)	Lists the images available for actions in the action list.
	LinkedActionLists (see page 439)	Contains a collection of action lists available from action bands and menus.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	PrioritySchedule (see page 439)	Specifies a schedule that indicates how long it takes to mark an item as unused.
	State (see page 440)	Indicates whether the actions in the action list respond when the user triggers a client object.
	Style (see page 440)	Identifies the style object that gives the application its default look and feel.
	Tag (see page 2808)	Stores an integer value as part of a component.

4.1.15.2 TActionManager Properties

The properties of the TActionManager class are listed here.

Published Properties

	Name	Description
	ActionBars (see page 438)	Contains a collection of all the action bands in the application.
	FileName (see page 438)	Specifies the name of the file that the action manager component uses to read and write layout information.
	Images (see page 438)	Lists the images available for actions in the action list.

	LinkedActionLists (see page 439)	Contains a collection of action lists available from action bands and menus.
	PrioritySchedule (see page 439)	Specifies a schedule that indicates how long it takes to mark an item as unused.
	State (see page 440)	Indicates whether the actions in the action list respond when the user triggers a client object.
	Style (see page 440)	Identifies the style object that gives the application its default look and feel.

4.1.15.2.1 TActionManager.ActionBars Property

Contains a collection of all the action bands in the application.

Pascal

```
property ActionBars: TActionBars;
```

C++

```
__property TActionBars ActionBars;
```

Description

ActionBars is used internally by the action manager component to maintain a collection of all the action bands connected to the action manager in the application. An action band is automatically added to the collection when an action or category of actions is dropped on an action band or the ActionManager property in an action band component is set in the Object Inspector.

See Also

DefaultActionBars (see page 554)

4.1.15.2.2 TActionManager.FileName Property

Specifies the name of the file that the action manager component uses to read and write layout information.

Pascal

```
property FileName: TFileName;
```

C++

```
__property TFileName FileName;
```

Description

Use FileName to specify the name of the file that the action manager will use to read and write layout information for the action bands that are connected to the action manager. The action manager uses this file to store the current state of the action bands that are connected to the action manager when the application is closed. When an application is started, the action manager uses the layout information contained in this file to reconstruct the action bands back to the state when the application last closed. All customizations made to the action bands are saved in this file.

4.1.15.2.3 TActionManager.Images Property

Lists the images available for actions in the action list.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Images is a list of bitmaps that can be displayed to the left of any action in the action list. An action is associated with an image from this image list by its ImageIndex property. This image can then appear on client controls such as menu items, tool buttons,

and so on.

See Also

Actions (see page 325)

ImageIndex (see page 313)

4.1.15.2.4 TActionManager.LinkedActionLists Property

Contains a collection of action lists available from action bands and menus.

Pascal

```
property LinkedActionLists: TActionListCollection;
```

C++

```
__property TActionListCollection LinkedActionLists;
```

Description

LinkedActionLists is a linked list of TActionListCollection objects. LinkedActionLists are simple data structures with two fields. One field is a TCustomActionList object, which is a list of possible actions. The other field is a caption, which defines the action list's description appearing on the action band or menu.

Use LinkedActionLists to merge in action lists from other sources outside the action manager. Those action lists will become accessible from action bands and menus. Application users can exploit this feature, for example, to reorganize items from a traditional main menu bar.

See Also

TActionListCollection (see page 425)

4.1.15.2.5 TActionManager.PrioritySchedule Property

Specifies a schedule that indicates how long it takes to mark an item as unused.

Pascal

```
property PrioritySchedule: TStringList;
```

C++

```
__property TStringList PrioritySchedule;
```

Description

Based on usage statistics and layout space, the action manager uses PrioritySchedule to determine when a UI element representing a TActionClientItem is hidden or displayed on an action band. (This is not the same as the TActionClientItem's visibility, as set by the TActionClientItem's Visible property.)

To determine when to display or hide a UI element that is rendered by the action band for a specific TActionClientItem, the action manager maintains a total count for each item of the total number of sessions, the session number it was used in, and the current session number. The number of sessions is defined as the number of times the application has been launched.

To determine if an item should be displayed, the program looks up the value of UsageCount in the left hand column in PrioritySchedule. If UsageCount is greater than the maximum tabulated value, that maximum is used for calculation purposes. The corresponding value in the right hand column is the number of sessions an item can be unused before it becomes hidden.

An action band will always show as many controls as it has space to show; the action band will wrap rows or columns, if necessary. TActionClientItems with their UsageCount property set to -1, will always be shown. You can use the UsageCount property to ensure that specific action band controls are always shown.

The default PrioritySchedule is as follows:

Number of sessions in which the action band item was used	Number of sessions the item will remain unhidden after its last use
0, 1	3
2	6
3	9
4, 5	12
6 – 8	17
9 – 13	23
14 – 24	29
25 or more	31

See Also

SessionCount (see page 358)

LastSession (see page 385)

UsageCount (see page 388)

4.1.15.2.6 TActionManager.State Property

Indicates whether the actions in the action list respond when the user triggers a client object.

Pascal

```
property State: TActionListState;
```

C++

```
__property TActionListState State;
```

Description

Use State to turn an action list on or off. State can have any of the following values:

Value	Meaning
asNormal	Actions perform their normal response when triggered by client objects or hotkeys.
asSuspended	The actions in the action list do not respond when client objects tell them to "fire". The Enabled property for all actions in the list is unchanged.
asSuspendedEnabled	The actions in the action list do not respond when client objects tell them to "fire". The Enabled property for all actions in the list is set to true. Used for designing ActionBars.

See Also

Execute (see page 304)

Enabled (see page 310)

4.1.15.2.7 TActionManager.Style Property

Identifies the style object that gives the application its default look and feel.

Pascal

```
property Style: TActionBarStyle;
```

C++

```
__property TActionBarStyle Style;
```

Description

Use Style to access the application's Style object. This object manages which type of controls are used on the action bands to present a particular thematic look. To change the overall appearance of action bands in your application, change the style property accordingly. Delphi includes two styles by default: Standard and XP style. You can further augment these styles by using colormap components to control the colors that render the different style of controls.

To register new styles create a descendant of TActionBarStyleEx and register it using RegisterActnBarStyle.

See Also

TActionBarStyleEx (see page 583)

TStandardColorMap (see page 2)

TXPColorMap (see page 23)

RegisterActnBarStyle (see page 837)

4.1.15.3 TActionManager Events

The events of the TActionManager class are listed here.

Published Events

	Name	Description
	OnChange (see page 441)	Occurs when a change occurs in the action list.
	OnExecute (see page 442)	Occurs when a client object triggers an action in the list.
	OnGetBarItemClass (see page 442)	Occurs before TActionManager creates TActionBars items.
	OnGetBarsClass (see page 442)	Occurs before TActionManager creates its ActionBars collection.
	OnGetClientItemClass (see page 443)	Occurs before TActionManager creates any ActionClientItems.
	OnGetClientsClass (see page 443)	Occurs when attempting to add items to an ActionClient.
	OnStateChange (see page 443)	Occurs after an OnChange event.
	OnStyleChanged (see page 444)	Occurs after a change in the Style (see page 440) property.
	OnUpdate (see page 444)	Occurs when the application is idle so that the action list can update a specific action in the list.

4.1.15.3.1 TActionManager.OnChange Event

Occurs when a change occurs in the action list.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to update your application in response to changes in the action list. Changes to the action list that trigger an OnChange event include changes to an action category or to the action list's image list.

Note: The action list automatically informs the actions in the list when an OnChange event occurs. You need only provide an

OnChange event handler for application-specific responses.

4.1.15.3.2 TActionManager.OnExecute Event

Occurs when a client object triggers an action in the list.

Pascal

```
property OnExecute: TActionEvent;
```

C++

```
__property TActionEvent OnExecute;
```

Description

Write an OnExecute event handler to respond when an action in the list fires.

When the user invokes a client object, the action list's OnExecute event is the first event to occur in response. If the OnExecute event handler sets its Handled parameter to true, the action is considered handled, and processing stops there. This blocks the execution of any other event handlers or any built-in response by a predefined action class in response to the user action.

If the OnExecute event handler does not set its Handled parameter to true, the application's OnActionExecute event occurs next. If the OnActionExecute event does not respond to the user input, the action object's OnExecute event occurs. Finally, if the action does not have an OnExecute event handler, the application locates a target object and executes any predefined response implemented by the action object.

See Also

Execute (see page 304)

OnExecute (see page 2716)

OnActionExecute (see page 13725)

4.1.15.3.3 TActionManager.OnGetBarItemClass Event

Occurs before TActionManager creates TActionBars items.

Pascal

```
property OnGetBarItemClass: TGetBarItemClassEvent;
```

C++

```
__property TGetBarItemClassEvent OnGetBarItemClass;
```

Description

Write an OnGetBarItemClass event handler to change the type of the class used for the ActionBarItem. The OnGetBarItemClass event occurs after a find action fetches the item's class, but before the class is sent to the action client. OnGetBarItemClass provides an opportunity to change the class used for the items within the TActionBars collection.

4.1.15.3.4 TActionManager.OnGetBarsClass Event

Occurs before TActionManager creates its ActionBars collection.

Pascal

```
property OnGetBarsClass: TGetBarsClassEvent;
```

C++

```
__property TGetBarsClassEvent OnGetBarsClass;
```

Description

Write an OnGetBarsClass event handler to change the type of the TActionBars collection to a descedant of TActionBars. OnGetBarsClass provides an opportunity to change the class used for the TActionBars collection. By implementing this event and returning a descendant of TActionBars, the developer can add new properties and new functionality to the collection for use within action bands.

4.1.15.3.5 TActionManager.OnGetClientItemClass Event

Occurs before TActionManager creates any ActionClientItems.

Pascal

```
property OnGetClientItemClass: TGetClientItemClassEvent;
```

C++

```
__property TGetClientItemClassEvent OnGetClientItemClass;
```

Description

Write an OnGetClientItemClass event handler to change the type of the TactionClientItem class that is created and used by the ActionManager. OnGetClientItemClass provides an opportunity to return a descendant of TactionClientItem, which has new properties, events and methods for use within action bands.

4.1.15.3.6 TActionManager.OnGetClientsClass Event

Occurs when attempting to add items to an ActionClient.

Pascal

```
property OnGetClientsClass: TGetClientsClassEvent;
```

C++

```
__property TGetClientsClassEvent OnGetClientsClass;
```

Description

Write an OnGetClientsClass event handler to change the type of the TactionClients class that is created and used by the ActionManager. OnGetClientsClass provides an opportunity to return a descendant of TActionClients which implements new properties, events and methods for use within action bands.

4.1.15.3.7 TActionManager.OnStateChange Event

Occurs after an OnChange event.

Pascal

```
property OnStateChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnStateChange;
```

Description

Write an OnStateChange event handler to respond after the OnChange event occurs.

See Also

OnChange (see page 326)

4.1.15.3.8 TActionManager.OnStyleChanged Event

Occurs after a change in the Style (see page 440) property.

Pascal

```
property OnStyleChanged: TStyleChanged;
```

C++

```
__property TStyleChanged OnStyleChanged;
```

Description

Write an OnStyleChanged event handler to respond after the Style (see page 440) property changes.

See Also

Style Property

4.1.15.3.9 TActionManager.OnUpdate Event

Occurs when the application is idle so that the action list can update a specific action in the list.

Pascal

```
property OnUpdate: TActionEvent;
```

C++

```
__property TActionEvent OnUpdate;
```

Description

Write an OnUpdate event handler to configure the properties of a specified action in the list so that it reflects current conditions.

When the application is idle, it cycles through every action in turn giving it a chance to update itself to reflect current conditions. For each action, the first event to occur in this sequence is the action list's OnUpdate event. If the OnUpdate event handler sets its Handled parameter to true, the action is considered updated, and processing stops there. This blocks the execution of any other event handlers or any built-in response by a predefined action class.

If the OnUpdate event handler does not set its Handled parameter to true, the application's OnActionUpdate event occurs next. If the OnActionUpdate event does not update the action, the action object's OnUpdate event occurs. Finally, if the action does not have an OnUpdate event handler, the application executes any predefined update method implemented by the action object.

OnUpdate (see page 2718)

OnActionUpdate (see page 13726)

4.1.16 TCategoryDragObject Class

Class Hierarchy

Pascal

```
TCategoryDragObject = class(TActionDragObject);
```

C++

```
class TCategoryDragObject : public TActionDragObject;
```

File

ActnMan

Description

This is class ActnMan.TCategoryDragObject.

4.1.16.1 TCategoryDragObject Members

The following tables list the members exposed by TCategoryDragObject.

Protected Fields

	Name	Description
	FActionClasses (see page 421)	This is FActionClasses, a member of class TActionDragObject.

Protected Methods

	Name	Description
V	Finished (see page 6035)	Responds when the mouse is released indicating the drag operation is complete.
V	GetDragCursor (see page 6035)	Indicates which cursor should be displayed in response to mouse moves.
V	GetDragImages (see page 6035)	Returns an image list containing the image to be displayed while dragging.
	MainWndProc (see page 6037)	This is MainWndProc, a member of class TDragObject.
V	WndProc (see page 6038)	This is WndProc, a member of class TDragObject.

Public Methods

	Name	Description
	AddAction (see page 421)	This is AddAction, a member of class TActionDragObject.
	AddActionClass (see page 421)	This is AddActionClass, a member of class TActionDragObject.
V	AfterConstruction (see page 6033)	Responds after the last constructor has executed.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 6034)	Copies the properties of another drag control object.
V	BeforeDestruction (see page 6034)	Responds before the first destructor executes.
V	BeforeDestruction (see page 6043)	Allows the application to detect that the drag object needs to be freed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 446)	This is Create, a member of class TCategoryDragObject.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 420)	Disposes of an object instance.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetName (see page 6036)	Returns a string that identifies the drag operation.
V	HideDragImage (see page 6036)	Provides the interface for a method that hides the current drag image.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	Instance (see page 6037)	Returns the instance (module) handle of the EXE or DLL that created the drag object.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	ShowDragImage (see page 6037)	Provides the interface for a method that hides the current drag image.

Public Properties

	Name	Description
R	ActionCount (see page 422)	This is ActionCount, a member of class TActionDragObject.
	ActionManager (see page 417)	Contains a reference to the TActionManager (see page 432) component.
R	Actions (see page 422)	This is Actions, a member of class TActionDragObject.
	AlwaysShowDragImages (see page 6038)	This is AlwaysShowDragImages, a member of class TDragObject.
	Cancelling (see page 6038)	Specifies whether the drag operation is being canceled.
R	Category (see page 447)	This is Category, a member of class TCategoryDragObject.
	DragHandle (see page 6039)	Specifies the window handle of the dragged object.
	DragPos (see page 6039)	Specifies the position of the dragged object.
	DragTarget (see page 6039)	Specifies the dragged object's target.
	DragTargetPos (see page 6040)	Specifies the position of the drag object relative to the drag target.
R	Dropped (see page 6040)	Drag ended with drop.
R	MouseDeltaX (see page 6040)	Specifies the x-coordinate of the mouse position relative to the position of the dragged object's target.
R	MouseDeltaY (see page 6041)	Specifies the y-coordinate of the mouse position relative to the position of the dragged object's target.
	RightClickCancels (see page 6041)	This is RightClickCancels, a member of class TDragObject.

4.1.16.2 TCategoryDragObject.Create Constructor

Pascal

```
constructor Create(ACategory: string);
```

C++

```
__fastcall TCategoryDragObject(AnsiString ACategory);
```

Description

This is Create, a member of class TCategoryDragObject.

4.1.16.3 TCategoryDragObject Properties

The properties of the TCategoryDragObject class are listed here.

Public Properties

	Name	Description
	Category (see page 447)	This is Category, a member of class TCategoryDragObject.

4.1.16.3.1 TCategoryDragObject.Category Property

Pascal

```
property Category: string;
```

C++

```
__property AnsiString Category;
```

Description

This is Category, a member of class TCategoryDragObject.

4.1.17 TCustomActionBar Class

TCustomActionBar is the base class for all action bands.

Class Hierarchy

Pascal

```
TCustomActionBar = class(TToolWindow);
```

C++

```
class TCustomActionBar : public TToolWindow;
```

File

ActnMan

Description

TCustomActionBar is the base class for all the action bands that the action manager component uses as rendering engines to display actions and categories of actions as UI elements.

See Also

TActionMainMenuBar (see page 585)

TActionToolBar (see page 38)

4.1.17.1 TCustomActionBar Members

The following tables list the members exposed by TCustomActionBar.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.

	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefaultColorMap (see page 460)	This is FDefaultColorMap, a member of class TCustomActionBar.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

	FSavedWrapState (see page 460)	This is FSavedWrapState, a member of class TCustomActionBar.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 462)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
V	AutoSizingChanged (see page 462)	This is AutoSizingChanged, a member of class TCustomActionBar.
	BackgroundSize (see page 462)	This is BackgroundSize, a member of class TCustomActionBar.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CalcInsertPosition (see page 462)	This is CalcInsertPosition, a member of class TCustomActionBar.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
V	Clear (see page 463)	This is Clear, a member of class TCustomActionBar.
	Click (see page 5743)	Respond to user click.
	CMBorderChanged (see page 23285)	This is CMBorderChanged, a member of class TToolWindow.
	CMCtl3DChanged (see page 23286)	This is CMCtl3DChanged, a member of class TToolWindow.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
V	CreateControl (see page 463)	This is CreateControl, a member of class TCustomActionBar.
V	CreateControls (see page 463)	This is CreateControls, a member of class TCustomActionBar.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 463)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 464)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 465)	This is DesignWndProc, a member of class TCustomActionBar.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoControlCreated (see page 465)	This is DoControlCreated, a member of class TCustomActionBar.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoDropActions (see page 465)	This is DoDropActions, a member of class TCustomActionBar.
	DoDropCategory (see page 465)	This is DoDropCategory, a member of class TCustomActionBar.
	DoDropItem (see page 466)	This is DoDropItem, a member of class TCustomActionBar.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoGetControlClass (see page 466)	This is DoGetControlClass, a member of class TCustomActionBar.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 466)	OnDragOver event dispatcher.
	DrawBackground (see page 467)	This is DrawBackground, a member of class TCustomActionBar.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindAccelItem (see page 467)	This is FindAccelItem, a member of class TCustomActionBar.
	FindItemAt (see page 468)	This is FindItemAt, a member of class TCustomActionBar.
	FindItemCaption (see page 468)	This is FindItemCaption, a member of class TCustomActionBar.
	FindLast (see page 468)	This is FindLast, a member of class TCustomActionBar.
	FindLeastUsedItem (see page 469)	This is FindLeastUsedItem, a member of class TCustomActionBar.
	FindNearestControl (see page 469)	This is FindNearestControl, a member of class TCustomActionBar.
	FindNext (see page 470)	This is FindNext, a member of class TCustomActionBar.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FindNextVisibleItem (see page 470)	This is FindNextVisibleItem, a member of class TCustomActionBar.
	FindPrevious (see page 470)	This is FindPrevious, a member of class TCustomActionBar.

	FindPreviousVisibleItem (see page 470)	This is FindPreviousVisibleItem, a member of class TCustomActionBar.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
V	GetActionControl (see page 471)	This is GetActionControl, a member of class TCustomActionBar.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
V	GetBannerWidth (see page 471)	This is GetBannerWidth, a member of class TCustomActionBar.
V	GetBarHeight (see page 471)	This is GetBarHeight, a member of class TCustomActionBar.
V	GetBarWidth (see page 471)	This is GetBarWidth, a member of class TCustomActionBar.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlClass (see page 471)	This is GetControlClass, a member of class TCustomActionBar.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDefaultColorMapClass (see page 472)	This is GetDefaultColorMapClass, a member of class TCustomActionBar.
V	GetDesignMode (see page 472)	This is GetDesignMode, a member of class TCustomActionBar.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetPopupMenuClass (see page 472)	This is GetPopupMenuClass, a member of class TCustomActionBar.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasItems (see page 472)	This is HasItems, a member of class TCustomActionBar.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
V	ItemCount (see page 473)	This is ItemCount, a member of class TCustomActionBar.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.

	Loaded (see page 473)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	NCPaint (see page 473)	This is NCPaint, a member of class TCustomActionBar.
	Notification (see page 473)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 474)	This is Paint, a member of class TCustomActionBar.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 474)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Reset (see page 475)	This is Reset, a member of class TCustomActionBar.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 475)	This is SetActionClient, a member of class TCustomActionBar.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetAutoSizing (see page 475)	This is SetAutoSizing, a member of class TCustomActionBar.
	SetBiDiMode (see page 475)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetColorMap (see page 476)	This is SetColorMap, a member of class TCustomActionBar.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignMode (see page 476)	This is SetDesignMode, a member of class TCustomActionBar.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.

	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetOrientation (see page 477)	This is SetOrientation, a member of class TCustomActionBar.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetPersistentHotKeys (see page 477)	This is SetPersistentHotKeys, a member of class TCustomActionBar.
V	SetSpacing (see page 477)	This is SetSpacing, a member of class TCustomActionBar.
	SetupDefaultColorMap (see page 477)	This is SetupDefaultColorMap, a member of class TCustomActionBar.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	VisibleChanging (see page 478)	Provides the interface for a method that responds to changes in the control's visibility.
	WMNCCalcSize (see page 23286)	This is WMNCCalcSize, a member of class TToolWindow.
	WMNCPaint (see page 23286)	This is WMNCPaint, a member of class TToolWindow.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.

	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
R	HRowCount (see page 488)	Indicates the number of columns of items that the action band displays.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Items (see page 488)	Lists the action clients that correspond to the child controls of this action band.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
R	VRowCount (see page 490)	Indicates the number of rows of items that the action band displays.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
R	Widest (see page 491)	This is Widest, a member of class TCustomActionBar.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnControlCreated (see page 491)	Occurs when a control is created on the action band.
	OnGetControlClass (see page 492)	Occurs when an item is to be placed on the action band.
	OnPaint (see page 492)	Occurs when the action band is painted.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 459)	Creates and initializes a TCustomActionBar (see page 447) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 459)	Destroys an instance of TCustomActionBar (see page 447).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
V	DragDrop (see page 466)	Generates an OnDragDrop event.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
V	FindFirst (see page 467)	Finds the first TActionClientItem (see page 374) in the Items (see page 488) list.
	FindFirstVisibleItem (see page 468)	Finds the first visible TActionClientItem (see page 374) in the Items (see page 488) list.
	FindLastVisibleItem (see page 469)	Finds the last visibleTActionClientItem in the Items (see page 488) list.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.

	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
V	RecreateControls (see page 475)	Destroys and recreates all of the action band's action client controls.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 476)	Sets the bounds based on whether the popup is expanded or not

	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Style (see page 477)	Identifies the style object that gives the application its default look and feel.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	ActionClient (see page 479)	Specifies the action client associated with this action band.
R	ActionControls (see page 479)	Lists the controls on the action band.
	ActionManager (see page 480)	Specifies the action manager component that is associated with the action band.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	AllowHiding (see page 480)	Determines whether the action band can be hidden.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AutoSizing (see page 480)	Specifies whether the action band adjusts its size automatically to fit around its child controls.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 481)	Represents the drawing surface of the action band.
	Caption (see page 481)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	Color (see page 483)	Specifies the background color of the control.
	ColorMap (see page 484)	Indicates the colormap for individual action band components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ContextBar (see page 485)	Indicates whether items shown in this action band represent the items in a popup menu.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Designable (see page 485)	Specifies whether the action band can be customized (used internally by the IDE).

	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignMode (see page 486)	Specifies whether the action band is being customized or being used in the IDE.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	EdgeBorders (see page 23287)	Determines which sides of the control have visible borders.
	EdgeInner (see page 23287)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 23288)	Determines the border style for the control's outer edge.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	Font (see page 486)	Controls the attributes of text written on or in the control.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HorzMargin (see page 487)	Specifies the width of the horizontal margins in pixels.
	HorzSeparator (see page 487)	Indicates whether a horizontal separator bar appears between item lines.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	Orientation (see page 488)	Specifies how the action band lays out its child items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	PersistentHotKeys (see page 489)	Specifies whether keyboard accelerator shortcuts are always displayed.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	Spacing (see page 489)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	VertMargin (see page 490)	Specifies the width of the vertical margins in pixels.
	VertSeparator (see page 490)	Indicates whether a vertical separator bar should appear between item lines.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

4.1.17.2 TCustomActionBar.Create Constructor

Creates and initializes a TCustomActionBar (see page 447) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomActionBar(TComponent * AOwner);
```

Description

Create generates a TCustomActionBar (see page 447) and initializes its properties.

AOwner is the component, typically the form, that becomes the value of the Owner property. The Owner of a component is responsible for freeing it and for initiating the process that loads it from or saves it to a form file.

See Also

Owner (see page 2807)

4.1.17.3 TCustomActionBar.Destroy Destructor

Destroys an instance of TCustomActionBar (see page 447).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomActionBar();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TCustomActionBar (see page 447) reference is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

Destroy (see page 5732)

4.1.17.4 TCustomActionBar Fields

The fields of the TCustomActionBar class are listed here.

Protected Fields

	Name	Description
	FDefaultColorMap (see page 460)	This is FDefaultColorMap, a member of class TCustomActionBar.
	FSavedWrapState (see page 460)	This is FSavedWrapState, a member of class TCustomActionBar.

4.1.17.4.1 TCustomActionBar.FDefaultColorMap Field

Pascal

```
FDefaultColorMap: TCustomActionBarColorMap;
```

C++

```
TCustomActionBarColorMap FDefaultColorMap;
```

Description

This is FDefaultColorMap, a member of class TCustomActionBar.

4.1.17.4.2 TCustomActionBar.FSavedWrapState Field

Pascal

```
FSavedWrapState: Boolean;
```

C++

```
Boolean FSavedWrapState;
```

Description

This is FSavedWrapState, a member of class TCustomActionBar.

4.1.17.5 TCustomActionBar Methods

The methods of the TCustomActionBar class are listed here.

Protected Methods

	Name	Description
	AlignControls (see page 462)	Aligns any controls for which the control is the parent within a specified area of the control.
	AutoSizingChanged (see page 462)	This is AutoSizingChanged, a member of class TCustomActionBar.
	BackgroundSize (see page 462)	This is BackgroundSize, a member of class TCustomActionBar.
	CalcInsertPosition (see page 462)	This is CalcInsertPosition, a member of class TCustomActionBar.
	Clear (see page 463)	This is Clear, a member of class TCustomActionBar.
	CreateControl (see page 463)	This is CreateControl, a member of class TCustomActionBar.
	CreateControls (see page 463)	This is CreateControls, a member of class TCustomActionBar.

	CustomAlignInsertBefore (see page 463)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 464)	Returns aligned position of custom-aligned child control.
	DesignWndProc (see page 465)	This is DesignWndProc, a member of class TCustomActionBar.
	DoControlCreated (see page 465)	This is DoControlCreated, a member of class TCustomActionBar.
	DoDropActions (see page 465)	This is DoDropActions, a member of class TCustomActionBar.
	DoDropCategory (see page 465)	This is DoDropCategory, a member of class TCustomActionBar.
	DoDropItem (see page 466)	This is DoDropItem, a member of class TCustomActionBar.
	DoGetControlClass (see page 466)	This is DoGetControlClass, a member of class TCustomActionBar.
	DragOver (see page 466)	OnDragOver event dispatcher.
	DrawBackground (see page 467)	This is DrawBackground, a member of class TCustomActionBar.
	FindAccelItem (see page 467)	This is FindAccelItem, a member of class TCustomActionBar.
	FindItemAt (see page 468)	This is FindItemAt, a member of class TCustomActionBar.
	FindItemCaption (see page 468)	This is FindItemCaption, a member of class TCustomActionBar.
	FindLast (see page 468)	This is FindLast, a member of class TCustomActionBar.
	FindLeastUsedItem (see page 469)	This is FindLeastUsedItem, a member of class TCustomActionBar.
	FindNearestControl (see page 469)	This is FindNearestControl, a member of class TCustomActionBar.
	FindNext (see page 470)	This is FindNext, a member of class TCustomActionBar.
	FindNextVisibleItem (see page 470)	This is FindNextVisibleItem, a member of class TCustomActionBar.
	FindPrevious (see page 470)	This is FindPrevious, a member of class TCustomActionBar.
	FindPreviousVisibleItem (see page 470)	This is FindPreviousVisibleItem, a member of class TCustomActionBar.
	GetActionControl (see page 471)	This is GetActionControl, a member of class TCustomActionBar.
	GetBannerWidth (see page 471)	This is GetBannerWidth, a member of class TCustomActionBar.
	GetBarHeight (see page 471)	This is GetBarHeight, a member of class TCustomActionBar.
	GetBarWidth (see page 471)	This is GetBarWidth, a member of class TCustomActionBar.
	GetControlClass (see page 471)	This is GetControlClass, a member of class TCustomActionBar.
	GetDefaultColorMapClass (see page 472)	This is GetDefaultColorMapClass, a member of class TCustomActionBar.
	GetDesignMode (see page 472)	This is GetDesignMode, a member of class TCustomActionBar.
	GetPopupMenuClass (see page 472)	This is GetPopupMenuClass, a member of class TCustomActionBar.
	HasItems (see page 472)	This is HasItems, a member of class TCustomActionBar.
	ItemCount (see page 473)	This is ItemCount, a member of class TCustomActionBar.
	Loaded (see page 473)	Initializes the control after it is loaded from a stream.
	NCPaint (see page 473)	This is NCPaint, a member of class TCustomActionBar.
	Notification (see page 473)	Responds to notifications that components are being created or destroyed.
	Paint (see page 474)	This is Paint, a member of class TCustomActionBar.
	PaintWindow (see page 474)	Renders the image of a windowed control.
	Reset (see page 475)	This is Reset, a member of class TCustomActionBar.
	SetActionClient (see page 475)	This is SetActionClient, a member of class TCustomActionBar.
	SetAutoSizing (see page 475)	This is SetAutoSizing, a member of class TCustomActionBar.
	SetBiDiMode (see page 475)	Sets the control's bi-directional mode.
	SetColorMap (see page 476)	This is SetColorMap, a member of class TCustomActionBar.
	SetDesignMode (see page 476)	This is SetDesignMode, a member of class TCustomActionBar.
	SetOrientation (see page 477)	This is SetOrientation, a member of class TCustomActionBar.
	SetPersistentHotKeys (see page 477)	This is SetPersistentHotKeys, a member of class TCustomActionBar.
	SetSpacing (see page 477)	This is SetSpacing, a member of class TCustomActionBar.
	SetupDefaultColorMap (see page 477)	This is SetupDefaultColorMap, a member of class TCustomActionBar.
	VisibleChanging (see page 478)	Provides the interface for a method that responds to changes in the control's visibility.

Public Methods

	Name	Description
	DragDrop (see page 466)	Generates an OnDragDrop event.
	FindFirst (see page 467)	Finds the first TActionClientItem (see page 374) in the Items (see page 488) list.
	FindFirstVisibleItem (see page 468)	Finds the first visible TActionClientItem (see page 374) in the Items (see page 488) list.

	FindLastVisibleItem (see page 469)	Finds the last visibleTActionClientItem in the Items (see page 488) list.
	RecreateControls (see page 475)	Destroys and recreates all of the action band's action client controls.
	SetBounds (see page 476)	Sets the bounds based on whether the popup is expanded or not
	Style (see page 477)	Identifies the style object that gives the application its default look and feel.

4.1.17.5.1 TCustomActionBar.AlignControls Method

Aligns any controls for which the control is the parent within a specified area of the control.

Pascal

```
procedure AlignControls(AControl: TControl; var Rect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect Rect);
```

Description

Use AlignControls to align all controls within an area of a form, panel, group box, scroll box, or any container control. Specify the area in which to align the controls as the value of the Rect parameter.

AlignControls uses the Align property value for each child control to determine how to align it. The AControl parameter can be nil (Delphi) or NULL (C++). If you specify a control in AControl, that control takes precedence in alignment over other, similarly-aligned controls.

See Also

Align (see page 5798)

4.1.17.5.2 TCustomActionBar.AutoSizingChanged Method

Pascal

```
procedure AutoSizingChanged; virtual;
```

C++

```
virtual __fastcall AutoSizingChanged();
```

Description

This is AutoSizingChanged, a member of class TCustomActionBar.

4.1.17.5.3 TCustomActionBar.BackgroundSize Method

Pascal

```
function BackgroundSize: TPoint;
```

C++

```
__fastcall TPoint BackgroundSize();
```

Description

This is BackgroundSize, a member of class TCustomActionBar.

4.1.17.5.4 TCustomActionBar.CalcInsertPosition Method

Pascal

```
function CalcInsertPosition(Control: TCustomActionControl; X: Integer; Y: Integer): Integer;
```

C++

```
__fastcall int CalcInsertPosition(TCustomActionControl Control, int X, int Y);
```

Description

This is CalcInsertPosition, a member of class TCustomActionBar.

4.1.17.5.5 TCustomActionBar.Clear Method

Pascal

```
procedure Clear; virtual;
```

C++

```
virtual __fastcall Clear();
```

Description

This is Clear, a member of class TCustomActionBar.

4.1.17.5.6 TCustomActionBar.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; virtual;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TCustomActionBar.

4.1.17.5.7 TCustomActionBar.CreateControls Method

Pascal

```
procedure CreateControls; virtual;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TCustomActionBar.

4.1.17.5.8 TCustomActionBar.CustomAlignInsertBefore Method

Returns placement order of custom-aligned child control.

Pascal

```
function CustomAlignInsertBefore(C1: TControl; C2: TControl): Boolean; override;
```

C++

```
virtual __fastcall Boolean CustomAlignInsertBefore(TControl * C1, TControl * C2);
```

Description

CustomAlignInsertBefore determines the order in which custom-aligned child controls are placed. The control calls CustomAlignInsertBefore once for each pair of child controls with an Align property of **alCustom**. CustomAlignInsertBefore

returns true if **C2** should be presented before **C1**, and false otherwise.

Once the custom-aligned child controls are sorted, their specific positions are determined by calls to CustomAlignPosition.

CustomAlignInsertBefore triggers the OnAlignInsertBefore event. If this event is defined, CustomAlignInsertBefore returns the value returned by OnAlignInsertBefore. Defining this event allows users to define the order of control alignment without overriding CustomAlignInsertBefore.

As implemented in TWinControl, CustomAlignInsertBefore returns false if OnAlignInsertBefore is not implemented, so the controls are placed in the order they appear in the Controls property.

See Also

CustomAlignPosition (see page 6138)

Align (see page 5798)

Controls (see page 6197)

OnAlignInsertBefore (see page 6213)

4.1.17.5.9 TCustomActionBar.CustomAlignPosition Method

Returns aligned position of custom-aligned child control.

Pascal

```
procedure CustomAlignPosition(Control: TControl; var NewLeft: Integer; var NewTop: Integer;
var NewWidth: Integer; var NewHeight: Integer; var AlignRect: TRect; AlignInfo: TAlignInfo);
override;
```

C++

```
virtual __fastcall CustomAlignPosition(TControl * Control, int NewLeft, int NewTop, int
NewWidth, int NewHeight, TRect AlignRect, TAlignInfo AlignInfo);
```

Description

CustomAlignPosition determines the specific position of custom-aligned child controls. CustomAlignPosition is called once for each child control with an Align property of **alCustom**, in an order previously determined by calls to CustomAlignInsertBefore.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition.

These are the parameters:

Control	The child control being placed.
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. CustomAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. CustomAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, CustomAlignPosition does nothing.	

See Also

CustomAlignInsertBefore (see page 6137)

Align (see page 5798)

OnAlignPosition (see page 6214)

TAlignInfo (see page 6269)

4.1.17.5.10 TCustomActionBar.DesignWndProc Method

Pascal

```
function DesignWndProc(var Message: TMessage): Boolean; override;
```

C++

```
virtual __fastcall Boolean DesignWndProc(TMessage Message);
```

Description

This is DesignWndProc, a member of class TCustomActionBar.

4.1.17.5.11 TCustomActionBar.DoControlCreated Method

Pascal

```
procedure DoControlCreated(var Control: TCustomActionControl); virtual;
```

C++

```
virtual __fastcall DoControlCreated(TCustomActionControl Control);
```

Description

This is DoControlCreated, a member of class TCustomActionBar.

4.1.17.5.12 TCustomActionBar.DoDropActions Method

Pascal

```
procedure DoDropActions(Source: TActionDragObject; const X: Integer; const Y: Integer);
virtual;
```

C++

```
virtual __fastcall DoDropActions(TActionDragObject Source, const int X, const int Y);
```

Description

This is DoDropActions, a member of class TCustomActionBar.

4.1.17.5.13 TCustomActionBar.DoDropCategory Method

Pascal

```
procedure DoDropCategory(Source: TCategoryDragObject; const X: Integer; const Y: Integer);
virtual;
```

C++

```
virtual __fastcall DoDropCategory(TCategoryDragObject Source, const int X, const int Y);
```

Description

This is DoDropCategory, a member of class TCustomActionBar.

4.1.17.5.14 TCustomActionBar.DoDropItem Method

Pascal

```
procedure DoDropItem(Source: TActionItemDragObject; const X: Integer; const Y: Integer);
virtual;
```

C++

```
virtual __fastcall DoDropItem(TActionItemDragObject Source, const int X, const int Y);
```

Description

This is DoDropItem, a member of class TCustomActionBar.

4.1.17.5.15 TCustomActionBar.DoGetControlClass Method

Pascal

```
function DoGetControlClass(AnItem: TActionClientItem): TCustomActionControlClass; dynamic;
```

C++

```
__fastcall TCustomActionControlClass DoGetControlClass(TActionClientItem AnItem);
```

Description

This is DoGetControlClass, a member of class TCustomActionBar.

4.1.17.5.16 TCustomActionBar.DragDrop Method

Generates an OnDragDrop event.

Pascal

```
procedure DragDrop(Source: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DragDrop(TObject * Source, int X, int Y);
```

Description

DragDrop is called automatically when the user drops a control onto the TCustomActionBar (see page 447) descendant. When creating an action band that descends from TCustomActionBar (see page 447), override DragDrop to add additional code that executes when the OnDragDrop event handler is called.

The Source parameter is the object that was dropped onto the control. The X and Y parameters are the mouse coordinates where the object was dropped.

See Also

DragCanceled (see page 5754)

OnDragDrop (see page 5855)

4.1.17.5.17 TCustomActionBar.DragOver Method

OnDragOver event dispatcher.

Pascal

```
procedure DragOver(Source: TObject; X: Integer; Y: Integer; State: TDragState; var Accept:
Boolean); override;
```

C++

```
virtual __fastcall DragOver(TObject * Source, int X, int Y, TDragState State, Boolean Accept);
```

Description

Override DragOver to add additional code that executes before the OnDragOver event handler is called.

DragOver sets the Accept parameter to true to indicate that the user can drop the dragged object on the control. It sets Accept to false to indicate that the user cannot drop the dragged object on the control.

The Source parameter is the object being dragged. The State parameter indicates how the dragged object is moving in relation to the control. X and Y indicate the current position of the mouse.

See Also

DragDrop (see page 5754)

OnDragOver (see page 5857)

4.1.17.5.18 TCustomActionBar.DrawBackground Method

Pascal

```
procedure DrawBackground; virtual;
```

C++

```
virtual __fastcall DrawBackground();
```

Description

This is DrawBackground, a member of class TCustomActionBar.

4.1.17.5.19 TCustomActionBar.FindAccelItem Method

Pascal

```
function FindAccelItem(const Accel: Word): TActionClientItem;
```

C++

```
__fastcall TActionClientItem FindAccelItem(const Word Accel);
```

Description

This is FindAccelItem, a member of class TCustomActionBar.

4.1.17.5.20 TCustomActionBar.FindFirst Method

Finds the first TActionClientItem (see page 374) in the Items (see page 488) list.

Pascal

```
function FindFirst: TActionClientItem; virtual;
```

C++

```
virtual __fastcall TActionClientItem FindFirst();
```

Description

Use FindFirst to find the first TActionClientItem (see page 374) in the custom action bar's Items (see page 488) property.

See Also

Items (see page 488)

FindFirstVisibleItem (see page 468)

FindLastVisibleItem (see page 469)

4.1.17.5.21 TCustomActionBar.FindFirstVisibleItem Method

Finds the first visible TActionClientItem (see page 374) in the Items (see page 488) list.

Pascal

```
function FindFirstVisibleItem: TActionClientItem;
```

C++

```
__fastcall TActionClientItem FindFirstVisibleItem();
```

Description

Use FindFirst (see page 467) to find the first visible TActionClientItem (see page 374) in the custom action bar's Items (see page 488) property.

See Also

Items (see page 488)

FindFirst (see page 467)

FindLastVisibleItem (see page 469)

4.1.17.5.22 TCustomActionBar.FindItemAt Method

Pascal

```
function FindItemAt(const P: TPoint): TCustomActionControl;
```

C++

```
__fastcall TCustomActionControl FindItemAt(const TPoint P);
```

Description

This is FindItemAt, a member of class TCustomActionBar.

4.1.17.5.23 TCustomActionBar.FindItemCaption Method

Pascal

```
function FindItemCaption(const ACaption: string): TCustomActionControl;
```

C++

```
__fastcall TCustomActionControl FindItemCaption(const AnsiString ACaption);
```

Description

This is FindItemCaption, a member of class TCustomActionBar.

4.1.17.5.24 TCustomActionBar.FindLast Method

Pascal

```
function FindLast: TActionClientItem; virtual;
```

C++

```
virtual __fastcall TActionClientItem FindLast();
```

Description

This is FindLast, a member of class TCustomActionBar.

4.1.17.5.25 TCustomActionBar.FindLastVisibleItem Method

Finds the last visibleTActionClientItem in the Items (see page 488) list.

Pascal

```
function FindLastVisibleItem: TActionClientItem;
```

C++

```
__fastcall TActionClientItem FindLastVisibleItem();
```

Description

Use FindFirst (see page 467) to find the last visible TActionClientItem (see page 374) in the custom action bar's Items (see page 488) property.

See Also

Items (see page 488)

FindFirst (see page 467)

FindFirstVisibleItem (see page 468)

4.1.17.5.26 TCustomActionBar.FindLeastUsedItem Method

Pascal

```
function FindLeastUsedItem(const Visible: Boolean = True): TActionClientItem;
```

C++

```
__fastcall TActionClientItem FindLeastUsedItem(const Boolean Visible = True);
```

Description

This is FindLeastUsedItem, a member of class TCustomActionBar.

4.1.17.5.27 TCustomActionBar.FindNearestControl Method

Pascal

```
function FindNearestControl(const Point: TPoint): TCustomActionControl;
```

C++

```
__fastcall TCustomActionControl FindNearestControl(const TPoint Point);
```

Description

This is FindNearestControl, a member of class TCustomActionBar.

4.1.17.5.28 TCustomActionBar.FindNext Method

Pascal

```
function FindNext(AClient: TActionClientItem; const Wrap: Boolean = True): TActionClientItem;
virtual;
```

C++

```
virtual __fastcall TActionClientItem FindNext(TActionClientItem AClient, const Boolean Wrap =
True);
```

Description

This is FindNext, a member of class TCustomActionBar.

4.1.17.5.29 TCustomActionBar.FindNextVisibleItem Method

Pascal

```
function FindNextVisibleItem(AClient: TActionClientItem): TActionClientItem;
```

C++

```
__fastcall TActionClientItem FindNextVisibleItem(TActionClientItem AClient);
```

Description

This is FindNextVisibleItem, a member of class TCustomActionBar.

4.1.17.5.30 TCustomActionBar.FindPrevious Method

Pascal

```
function FindPrevious(AClient: TActionClientItem; const Wrap: Boolean = True):
TActionClientItem; virtual;
```

C++

```
virtual __fastcall TActionClientItem FindPrevious(TActionClientItem AClient, const Boolean
Wrap = True);
```

Description

This is FindPrevious, a member of class TCustomActionBar.

4.1.17.5.31 TCustomActionBar.FindPreviousVisibleItem Method

Pascal

```
function FindPreviousVisibleItem(AClient: TActionClientItem): TActionClientItem;
```

C++

```
__fastcall TActionClientItem FindPreviousVisibleItem(TActionClientItem AClient);
```

Description

This is FindPreviousVisibleItem, a member of class TCustomActionBar.

4.1.17.5.32 TCustomActionBar.GetActionControl Method

Pascal

```
function GetActionControl(const Index: Integer): TCustomActionControl; virtual;
```

C++

```
virtual __fastcall TCustomActionControl GetActionControl(const int Index);
```

Description

This is GetActionControl, a member of class TCustomActionBar.

4.1.17.5.33 TCustomActionBar.GetBannerWidth Method

Pascal

```
function GetBannerWidth(BarEdge: TBarEdge): Integer; virtual;
```

C++

```
virtual __fastcall int GetBannerWidth(TBarEdge BarEdge);
```

Description

This is GetBannerWidth, a member of class TCustomActionBar.

4.1.17.5.34 TCustomActionBar.GetBarHeight Method

Pascal

```
function GetBarHeight: Integer; virtual;
```

C++

```
virtual __fastcall int GetBarHeight();
```

Description

This is GetBarHeight, a member of class TCustomActionBar.

4.1.17.5.35 TCustomActionBar.GetBarWidth Method

Pascal

```
function GetBarWidth: Integer; virtual;
```

C++

```
virtual __fastcall int GetBarWidth();
```

Description

This is GetBarWidth, a member of class TCustomActionBar.

4.1.17.5.36 TCustomActionBar.GetControlClass Method

Pascal

```
function GetControlClass(AnItem: TActionClientItem): TCustomActionControlClass; virtual;
```

C++

```
virtual __fastcall TCustomActionControlClass GetControlClass(TActionClientItem AnItem);
```

Description

This is GetControlClass, a member of class TCustomActionBar.

4.1.17.5.37 TCustomActionBar.GetDefaultColorMapClass Method

Pascal

```
function GetDefaultColorMapClass: TCustomColorMapClass; virtual;
```

C++

```
virtual __fastcall TCustomColorMapClass GetDefaultColorMapClass();
```

Description

This is GetDefaultColorMapClass, a member of class TCustomActionBar.

4.1.17.5.38 TCustomActionBar.GetDesignMode Method

Pascal

```
function GetDesignMode: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetDesignMode();
```

Description

This is GetDesignMode, a member of class TCustomActionBar.

4.1.17.5.39 TCustomActionBar.GetPopupMenuClass Method

Pascal

```
function GetPopupMenuClass: TCustomActionBarClass;
```

C++

```
__fastcall TCustomActionBarClass GetPopupMenuClass();
```

Description

This is GetPopupMenuClass, a member of class TCustomActionBar.

4.1.17.5.40 TCustomActionBar.HasItems Method

Pascal

```
function HasItems: Boolean;
```

C++

```
__fastcall Boolean HasItems();
```

Description

This is HasItems, a member of class TCustomActionBar.

4.1.17.5.41 TCustomActionBar.ItemCount Method

Pascal

```
function ItemCount: Integer; virtual;
```

C++

```
virtual __fastcall int ItemCount();
```

Description

This is ItemCount, a member of class TCustomActionBar.

4.1.17.5.42 TCustomActionBar.Loaded Method

Initializes the control after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the control's form is loaded into memory so that the control can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method in order to initialize the control from its associated Action. To change the properties the control copies from its action, override the ActionChange method.

See Also

Loaded (see page 2782)

Action (see page 5797)

ActionChange (see page 5737)

4.1.17.5.43 TCustomActionBar.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TCustomActionBar.

4.1.17.5.44 TCustomActionBar.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu (see page 5835)

Notification (see page 2783)

4.1.17.5.45 TCustomActionBar.Paint Method

Pascal

```
procedure Paint; virtual;
```

C++

```
virtual __fastcall Paint();
```

Description

This is Paint, a member of class TCustomActionBar.

4.1.17.5.46 TCustomActionBar.PaintWindow Method

Renders the image of a windowed control.

Pascal

```
procedure PaintWindow(DC: HDC); override;
```

C++

```
virtual __fastcall PaintWindow(HDC DC);
```

Description

Call PaintWindow to repaint the control. PaintWindow sends a WM_PAINT message to the windowed control's DefaultHandler method, setting the message record's WParam field to the value passed in DC and the other parameter and result fields to zeros.

See Also

DefaultHandler (see page 6139)

PaintTo (see page 6167)

DoubleBuffered (see page 6205)

4.1.17.5.47 TCustomActionBar.RecreateControls Method

Destroys and recreates all of the action band's action client controls.

Pascal

```
procedure RecreateControls; virtual;
```

C++

```
virtual __fastcall RecreateControls();
```

Description

Call RecreateControls to recreate all of the action client child controls contained by the action band from scratch. RecreateControls destroys the action client controls and creates a new component according to the current property settings.

4.1.17.5.48 TCustomActionBar.Reset Method

Pascal

```
procedure Reset; virtual;
```

C++

```
virtual __fastcall Reset();
```

Description

This is Reset, a member of class TCustomActionBar.

4.1.17.5.49 TCustomActionBar.SetActionClient Method

Pascal

```
procedure SetActionClient(const Value: TActionClient); virtual;
```

C++

```
virtual __fastcall SetActionClient(const TActionClient Value);
```

Description

This is SetActionClient, a member of class TCustomActionBar.

4.1.17.5.50 TCustomActionBar.SetAutoSizing Method

Pascal

```
procedure SetAutoSizing(const Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetAutoSizing(const Boolean Value);
```

Description

This is SetAutoSizing, a member of class TCustomActionBar.

4.1.17.5.51 TCustomActionBar.SetBiDiMode Method

Sets the control's bi-directional mode.

Pascal

```
procedure SetBiDiMode(Value: TBiDiMode); override;
```

C++

```
virtual __fastcall SetBiDiMode(TBiDiMode Value);
```

Description

SetBiDiMode is the write implementation of the control's BiDiMode property. Override this method to change the implementation of BiDiMode.

See Also

BiDiMode (see page 5803)

4.1.17.5.52 TCustomActionBar.SetBounds Method

Sets the bounds based on whether the popup is expanded or not

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

SetBounds calls the inherited method after altering the AWidth and AHeight parameters (if necessary) to include the width and height of the expanded popup menu. For more information about SetBounds, see the documentation for the inherited method.

See Also

SetBounds (see page 6178)

4.1.17.5.53 TCustomActionBar.SetColorMap Method

Pascal

```
procedure SetColorMap(const Value: TCustomActionBarColorMap); virtual;
```

C++

```
virtual __fastcall SetColorMap(const TCustomActionBarColorMap Value);
```

Description

This is SetColorMap, a member of class TCustomActionBar.

4.1.17.5.54 TCustomActionBar.SetDesignMode Method

Pascal

```
procedure SetDesignMode(const Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetDesignMode(const Boolean Value);
```

Description

This is SetDesignMode, a member of class TCustomActionBar.

4.1.17.5.55 TCustomActionBar.SetOrientation Method

Pascal

```
procedure SetOrientation(const Value: TBarOrientation); virtual;
```

C++

```
virtual __fastcall SetOrientation(const TBarOrientation Value);
```

Description

This is SetOrientation, a member of class TCustomActionBar.

4.1.17.5.56 TCustomActionBar.SetPersistentHotKeys Method

Pascal

```
procedure SetPersistentHotKeys(const Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetPersistentHotKeys(const Boolean Value);
```

Description

This is SetPersistentHotKeys, a member of class TCustomActionBar.

4.1.17.5.57 TCustomActionBar.SetSpacing Method

Pascal

```
procedure SetSpacing(Value: Integer); virtual;
```

C++

```
virtual __fastcall SetSpacing(int Value);
```

Description

This is SetSpacing, a member of class TCustomActionBar.

4.1.17.5.58 TCustomActionBar.SetupDefaultColorMap Method

Pascal

```
function SetupDefaultColorMap: TCustomActionBarColorMap;
```

C++

```
__fastcall TCustomActionBarColorMap SetupDefaultColorMap();
```

Description

This is SetupDefaultColorMap, a member of class TCustomActionBar.

4.1.17.5.59 TCustomActionBar.Style Method

Identifies the style object that gives the application its default look and feel.

Pascal

```
function Style: TActionBarStyle; virtual;
```

C++

```
virtual __fastcall TActionBarStyle Style();
```

Description

Use Style to access the application's Style object. This object has a number of methods that influence which type of controls are created on the action band.

See Also

Style (see page 556)

4.1.17.5.60 TCustomActionBar.VisibleChanging Method

Provides the interface for a method that responds to changes in the control's visibility.

Pascal

```
procedure VisibleChanging; override;
```

C++

```
virtual __fastcall VisibleChanging();
```

Description

VisibleChanging is called before the value of a control's Visible property changes. As implemented in TControl, it does nothing. Override VisibleChanging to respond to changes in the control's visibility. For example, if a control should not change its visibility, override VisibleChanging to raise an exception when an attempt is made to alter the control's visibility.

See Also

Visible (see page 5847)

4.1.17.6 TCustomActionBar Properties

The properties of the TCustomActionBar class are listed here.

Protected Properties

	Name	Description
R	HRowCount (see page 488)	Indicates the number of columns of items that the action band displays.
R	Items (see page 488)	Lists the action clients that correspond to the child controls of this action band.
R	VRowCount (see page 490)	Indicates the number of rows of items that the action band displays.
R	Widest (see page 491)	This is Widest, a member of class TCustomActionBar.

Public Properties

	Name	Description
	ActionClient (see page 479)	Specifies the action client associated with this action band.
R	ActionControls (see page 479)	Lists the controls on the action band.
	ActionManager (see page 480)	Specifies the action manager component that is associated with the action band.
	AllowHiding (see page 480)	Determines whether the action band can be hidden.
	AutoSizing (see page 480)	Specifies whether the action band adjusts its size automatically to fit around its child controls.
R	Canvas (see page 481)	Represents the drawing surface of the action band.
	Caption (see page 481)	Specifies a text string that identifies the control to the user.
	Color (see page 483)	Specifies the background color of the control.
	ColorMap (see page 484)	Indicates the colormap for individual action band components.
	ContextBar (see page 485)	Indicates whether items shown in this action band represent the items in a popup menu.

	Designable (see page 485)	Specifies whether the action band can be customized (used internally by the IDE).
	DesignMode (see page 486)	Specifies whether the action band is being customized or being used in the IDE.
	Font (see page 486)	Controls the attributes of text written on or in the control.
	HorzMargin (see page 487)	Specifies the width of the horizontal margins in pixels.
	HorzSeparator (see page 487)	Indicates whether a horizontal separator bar appears between item lines.
	Orientation (see page 488)	Specifies how the action band lays out its child items.
	PersistentHotKeys (see page 489)	Specifies whether keyboard accelerator shortcuts are always displayed.
	Spacing (see page 489)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	VertMargin (see page 490)	Specifies the width of the vertical margins in pixels.
	VertSeparator (see page 490)	Indicates whether a vertical separator bar should appear between item lines.

4.1.17.6.1 TCustomActionBar.ActionClient Property

Specifies the action client associated with this action band.

Pascal

```
property ActionClient: TActionClient;
```

C++

```
__property TActionClient ActionClient;
```

Description

Use ActionClient to access the action client that corresponds to this action band. Action clients are the components that the action manager uses to represent nodes in a hierarchy whose leaves correspond to actions. This association between action client and action bar is set up by specifying this action bar as the value of the action client's ActionBar property. The action client can be found as one of the items listed by the action manager's ActionBars property.

See Also

TActionManager (see page 432)

ActionBars (see page 553)

ActionBar (see page 370)

4.1.17.6.2 TCustomActionBar.ActionControls Property

Lists the controls on the action band.

Pascal

```
property ActionControls [const Index: Integer]: TCustomActionControl;
```

C++

```
__property TCustomActionControl ActionControls[int const Index];
```

Description

Use ActionControls to access any of the controls available on the action band. Each control in the list is the user interface element generated to represent one of the TActionClientItem (see page 374) objects that the action manager stores for children of this action band. The TActionClientItem (see page 374) objects are children of the component that is the value of this action band's ActionClient (see page 479) property.

Index is the index of the child control, where 0 specifies the first control, 1 specifies the second control, and so on.

See Also

ActionClient (see page 479)

ContextBar (see page 485)

4.1.17.6.3 TCustomActionBar.ActionManager Property

Specifies the action manager component that is associated with the action band.

Pascal

```
property ActionManager: TCustomActionManager;
```

C++

```
__property TCustomActionManager ActionManager;
```

Description

Use ActionManager to access the action manager that uses this action band to render UI elements it manages. Typically, this association is created when you drag actions from the action manager and drop them on the action bar. When an action is dropped on an action band and the ActionManager property is not assigned, the ActionManager property is automatically assigned to the action manager that manages the action that was dropped on the action band.

At runtime, you can perform the equivalent operation to dragging an action onto the action band by setting the ActionBar property of one of the action clients that the action manager's ActionBars property lists so that it specifies this component.

See Also

ActionBars (see page 553)

ActionClient (see page 479)

ActionBar (see page 370)

4.1.17.6.4 TCustomActionBar.AllowHiding Property

Determines whether the action band can be hidden.

Pascal

```
property AllowHiding: Boolean;
```

C++

```
__property Boolean AllowHiding;
```

Description

Use AllowHiding to specify whether the action band can be hidden at runtime, if the application allows runtime customization by the end user. Setting AllowHiding to true allows the action band to be hidden at runtime. If AllowHiding is set to false, the action cannot be hidden. Certain action bands, such as the main menu action band, should set this AllowHiding to false.

4.1.17.6.5 TCustomActionBar.AutoSizing Property

Specifies whether the action band adjusts its size automatically to fit around its child controls.

Pascal

```
property AutoSizing: Boolean;
```

C++

```
__property Boolean AutoSizing;
```

Description

Use AutoSizing to specify whether the action band resizes dynamically to fit around the controls that the ActionControls (see

page 479) property lists. Set AutoSizing to true to cause the action band to resize itself so that child controls fit neatly into its client area. Set AutoSizing to false if you want the action band to be fixed in size.

4.1.17.6.6 TCustomActionBar.Canvas Property

Represents the drawing surface of the action band.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

TCustomActionBar (see page 447) uses Canvas internally to render the background on which its child controls appear.

4.1.17.6.7 TCustomActionBar.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
```

```
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
```

```
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

4.1.17.6.8 TCustomActionBar.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

4.1.17.6.9 TCustomActionBar.ColorMap Property

Indicates the colormap for individual action band components.

Pascal

```
property ColorMap: TCustomActionBarColorMap;
```

C++

```
__property TCustomActionBarColorMap ColorMap;
```

Description

Use the ColorMap property to change the default colormap for individual action band components. By default, the ColorMap property is set according to the first registered TActionBarStyleEx class. Otherwise, if the action band is linked to an action manager, the property defaults to the ColorMap as specified by the Style (see page 477) property of the action manager.

Note: To centrally set or change the default look and feel of all action band components, use ActionManager (see page 480)'s

Style (see page 477) property. To centrally control the colors used by all action bands within an application, connect the action bands to a single colormap component.

See Also

TActionManager (see page 432)

TXPColorMap (see page 23)

TStandardColorMap (see page 2)

TTwilightColorMap (see page 13)

Style (see page 556)

4.1.17.6.10 TCustomActionBar.ContextBar Property

Indicates whether items shown in this action band represent the items in a popup menu.

Pascal

```
property ContextBar: Boolean;
```

C++

```
__property Boolean ContextBar;
```

Description

ContextBar controls which items this action band lists in its ActionControls (see page 479) property. The action band's associated action client (the value of the ActionClient (see page 479) property) can contain two lists of items:

One list (the action client's Items (see page 488) property) lists all the child items the action band can display when it is a regular UI element such as a main menu or tool bar. TCustomActionBar (see page 447) uses this list when ContextBar is false.

The other list (the action client's ContextItems property) lists all the child items that should appear if the action band appears in response to a right click. (For example, the ContextItems property is used when the action band represents a context menu). TCustomActionBar (see page 447) uses this list when ContextBar is true.

See Also

Items (see page 488)

ContextItems (see page 372)

ActionClient (see page 479)

ActionControls (see page 479)

4.1.17.6.11 TCustomActionBar.Designable Property

Specifies whether the action band can be customized (used internally by the IDE).

Pascal

```
property Designable: Boolean;
```

C++

```
__property Boolean Designable;
```

Description

Designable is used internally to control whether or not the action band can be customized either at runtime using the customize dialog, or at design time within the IDE. For example, the action band automatically supports drag-and-drop operations only

when Designable is true.

4.1.17.6.12 TCustomActionBar.DesignMode Property

Specifies whether the action band is being customized or being used in the IDE.

Pascal

```
property DesignMode: Boolean;
```

C++

```
__property Boolean DesignMode;
```

Description

DesignMode is used internally to determine whether the action band is being customized, either at runtime using the customize dialog, or at design time within the IDE. For example, the action band automatically supports drag-and-drop operations only when DesignMode is true.

4.1.17.6.13 TCustomActionBar.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
```

```
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

See Also

DesktopFont (see page 5818)

ParentFont (see page 5834)

Displaying and Editing Text in a Memo Control

4.1.17.6.14 TCustomActionBar.HorzMargin Property

Specifies the width of the horizontal margins in pixels.

Pascal

```
property HorzMargin: Integer;
```

C++

```
__property int HorzMargin;
```

Description

HorzMargin specifies the width of the action band's left and right horizontal margins in pixels.

See Also

VertMargin (see page 490)

VertSeparator (see page 490)

4.1.17.6.15 TCustomActionBar.HorzSeparator Property

Indicates whether a horizontal separator bar appears between item lines.

Pascal

```
property HorzSeparator: Boolean;
```

C++

```
__property Boolean HorzSeparator;
```

Description

An action band can arrange its child controls using multiple lines. Items (see page 488) which cannot be displayed on one line wrap to the next in the same way that words wrap on most word processors. Set HorzSeparator to true if you want a separator bar to appear between the lines.

See Also

VertSeparator (see page 490)

HorzMargin (see page 487)

Orientation (see page 488)

4.1.17.6.16 TCustomActionBar.HRowCount Property

Indicates the number of columns of items that the action band displays.

Pascal

```
property HRowCount: Integer;
```

C++

```
__property int HRowCount;
```

Description

If the action band arranges its items in columns (that is, when the Orientation (see page 488) property is boTopToBottom or boBottomToTop), the action band uses HRowCount internally to determine how many columns are needed to display all of the items that are not hidden.

See Also

VertSeparator (see page 490)

VRowCount (see page 490)

Orientation (see page 488)

4.1.17.6.17 TCustomActionBar.Items Property

Lists the action clients that correspond to the child controls of this action band.

Pascal

```
property Items: TActionClients;
```

C++

```
__property TActionClients Items;
```

Description

Items is used internally to access the components that the action manager lists to represent the child controls of this action band. Each action client object in the Items collection corresponds to one of the controls that the ActionControls (see page 479) property lists. The entire collection of items belongs to the action client specified by this action band's ActionClient (see page 479) property.

See Also

ActionControls (see page 479)

ActionClient (see page 479)

ContextBar (see page 485)

4.1.17.6.18 TCustomActionBar.Orientation Property

Specifies how the action band lays out its child items.

Pascal

```
property Orientation: TBarOrientation;
```

C++

```
__property TBarOrientation Orientation;
```

Description

The possible values of Orientation are:

Value	Meaning
boLeftToRight	Items (see page 488) are rendered in rows, from left to right.
boRightToLeft	Items (see page 488) are rendered in rows, from right to left.
boTopToBottom	Items (see page 488) are rendered in columns, from top to bottom.
boBottomToTop	Items (see page 488) are rendered in columns, from bottom to top.

See Also

VertSeparator (see page 490)

HorzSeparator (see page 487)

ActionControls (see page 479)

4.1.17.6.19 TCustomActionBar.PersistentHotKeys Property

Specifies whether keyboard accelerator shortcuts are always displayed.

Pascal

```
property PersistentHotKeys: Boolean;
```

C++

```
__property Boolean PersistentHotKeys;
```

Description

Use PersistentHotKeys to specify whether the action band always displays keyboard accelerator shortcuts. Setting PersistentHotKeys to true causes the underline for the keyboard shortcut key to always appear. If PersistentHotKeys is set to false, the underline for the keyboard shortcut key is only displayed if the user has used the keyboard to navigate through the action band's items. If the user is only using the mouse to navigate through the action band's items and PersistentHotKeys is set to false, the underline under the character denoted as the shortcut key is not drawn.

Note: Accelerator shortcuts are specified by preceding the appropriate character in the item's caption with an ampersand.

See Also

Caption (see page 384)

4.1.17.6.20 TCustomActionBar.Spacing Property

Determines where the image and text appear on an action band's rendered control that represents the action client.

Pascal

```
property Spacing: Integer;
```

C++

```
__property int Spacing;
```

Description

Spacing is used internally to set the number of pixels that should appear between the image specified in an action client's ImageIndex and the text specified in its Caption (see page 481) property.

See Also

Caption (see page 384)

ImageIndex (see page 385)

4.1.17.6.21 TCustomActionBar.VertMargin Property

Specifies the width of the vertical margins in pixels.

Pascal

```
property VertMargin: Integer;
```

C++

```
__property int VertMargin;
```

Description

VertMargin specifies the width of the action band's top and bottom vertical margins in pixels.

See Also

HorzMargin (see page 487)

HorzSeparator (see page 487)

4.1.17.6.22 TCustomActionBar.VertSeparator Property

Indicates whether a vertical separator bar should appear between item lines.

Pascal

```
property VertSeparator: Boolean;
```

C++

```
__property Boolean VertSeparator;
```

Description

An action band can arrange its child controls using multiple columns. Items (see page 488) which cannot be displayed on one column wrap to the next. Set VertSeparator to true if you want a separator bar to appear between the columns.

See Also

HorzSeparator (see page 487)

Orientation (see page 488)

4.1.17.6.23 TCustomActionBar.VRowCount Property

Indicates the number of rows of items that the action band displays.

Pascal

```
property VRowCount: Integer;
```

C++

```
__property int VRowCount;
```

Description

If the action band arranges its items in rows (that is, when the Orientation (see page 488) property is boLeftToRight or boRightToLeft), the action band uses VRowCount internally to determine how many rows are needed to display all of the items that are not hidden.

See Also

HorzSeparator (see page 487)

HRowCount (see page 488)

Orientation (see page 488)

4.1.17.6.24 TCustomActionBar.Widest Property

Pascal

```
property Widest: Integer;
```

C++

```
__property int Widest;
```

Description

This is Widest, a member of class TCustomActionBar.

4.1.17.7 TCustomActionBar Events

The events of the TCustomActionBar class are listed here.

Public Events

	Name	Description
	OnControlCreated (see page 491)	Occurs when a control is created on the action band.
	OnGetControlClass (see page 492)	Occurs when an item is to be placed on the action band.
	OnPaint (see page 492)	Occurs when the action band is painted.

4.1.17.7.1 TCustomActionBar.OnControlCreated Event

Occurs when a control is created on the action band.

Pascal

```
property OnControlCreated: TControlCreatedEvent;
```

C++

```
__property TControlCreatedEvent OnControlCreated;
```

Description

Write an OnControlCreated event handler to enhance or replace the type of UI element that is rendered on the action band.

Sender is the action band component that just created a new control.

AnItem is the new child control that was just created. The OnControlCreated event handler can initialize the properties of this control or replace it with a custom control.

See Also

OnGetControlClass (see page 492)

4.1.17.7.2 TCustomActionBar.OnGetControlClass Event

Occurs when an item is to be placed on the action band.

Pascal

```
property OnGetControlClass: TGetControlClassEvent;
```

C++

```
__property TGetControlClassEvent OnGetControlClass;
```

Description

Write an OnGetControlClass event handler to specify the class of item that the action band should create to represent a specified action client.

Sender is the action band that needs to generate a child control to represent an action client.

AnItem is the action client that the new control should represent.

ControlClass returns the class reference for the new control. This should be a descendant of TCustomActionControl (see page 507).

See Also

TCustomActionControl (see page 507)

OnControlCreated (see page 491)

4.1.17.7.3 TCustomActionBar.OnPaint Event

Occurs when the action band is painted.

Pascal

```
property OnPaint: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPaint;
```

Description

Write an OnPaint event handler to change the way the action band renders itself.

See Also

Canvas (see page 481)

4.1.18 TCustomActionBarColorMap Class

TCustomActionBarColorMap is the base class for the action band colormaps that controls the color of the action band and the items that appear on it.

Class Hierarchy

Pascal

```
TCustomActionBarColorMap = class(TComponent);
```

C++

```
class TCustomActionBarColorMap : public TComponent;
```

File

ActnMan

Description

TCustomActionBarColorMap provides the properties, methods, and events for colormaps, such as StandardColorMap and XPColorMap. Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

See Also

TActionManager (see page 432)

TCustomActionManager (see page 537)

TXPColorMap (see page 23)

TStandardColorMap (see page 2)

TTwilightColorMap (see page 13)

4.1.18.1 TCustomActionBarColorMap Members

The following tables list the members exposed by TCustomActionBarColorMap.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	Add (see page 497)	This is Add, a member of class TCustomActionBarColorMap.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 498)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	Remove (see page 498)	This is Remove, a member of class TCustomActionBarColorMap.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetColor (see page 499)	This is SetColor, a member of class TCustomActionBarColorMap.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFontColor (see page 499)	This is SetFontColor, a member of class TCustomActionBarColorMap.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	UpdateActionBars (see page 499)	This is UpdateActionBars, a member of class TCustomActionBarColorMap.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnColorChange (see page 506)	Occurs when one of the action's color properties changes.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 497)	Provides a custom Assign procedure for TCustomActionBarColorMap (see page 492) objects.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 496)	Creates and initializes a TCustomActionBarColorMap (see page 492) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 496)	Destroys an instance of TCustomActionBarColorMap (see page 492).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateColors (see page 499)	Occurs when an ActionBand component receives a CM_WININICHANGE message.

Public Properties

	Name	Description
	BtnFrameColor (see page 500)	Changes the look and feel of your applications.
	BtnSelectedColor (see page 500)	Changes the look and feel of your applications.
	BtnSelectedFont (see page 501)	Changes the look and feel of your applications.

	Color (see page 501)	Specifies the background color for action bands.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignFocus (see page 501)	Changes the look and feel of your applications.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisabledColor (see page 501)	Changes the look and feel of your applications.
	DisabledFontColor (see page 502)	Changes the look and feel of your applications.
	DisabledFontShadow (see page 502)	Changes the look and feel of your applications.
	FontColor (see page 502)	Changes the look and feel of your applications.
	FrameBottomRightInner (see page 502)	Changes the look and feel of your applications.
	FrameBottomRightOuter (see page 503)	Changes the look and feel of your applications.
	FrameTopLeftInner (see page 503)	Changes the look and feel of your applications.
	FrameTopLeftOuter (see page 503)	Changes the look and feel of your applications.
	HighlightColor (see page 503)	Changes the look and feel of your applications.
	HotColor (see page 504)	Changes the look and feel of your applications.
	HotFontColor (see page 504)	Changes the look and feel of your applications.
	MenuColor (see page 504)	Changes the look and feel of your applications.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SelectedColor (see page 505)	Changes the look and feel of your applications.
	SelectedFontColor (see page 505)	Changes the look and feel of your applications.
	ShadowColor (see page 505)	Changes the look and feel of your applications.
	UnusedColor (see page 505)	Changes the look and feel of your applications.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

4.1.18.2 TCustomActionBarColorMap.Create Constructor

Creates and initializes a TCustomActionBarColorMap (see page 492) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomActionBarColorMap(TComponent * AOwner);
```

Description

Applications do not usually create action objects explicitly. Actions are created automatically when you add them to an action manager or action list component at design time.

4.1.18.3 TCustomActionBarColorMap.Destroy Destructor

Destroys an instance of TCustomActionBarColorMap (see page 492).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomActionBarColorMap();
```

Description

Do not call Destroy directly in an application. Instead, call Free, which checks that the TCustomActionBarColorMap (see page 492) reference is not nil before calling Destroy.

See Also

Create (see page 496)

Free (see page 22300)

4.1.18.4 TCustomActionBarColorMap Methods

The methods of the TCustomActionBarColorMap class are listed here.

Protected Methods

	Name	Description
	Add (see page 497)	This is Add, a member of class TCustomActionBarColorMap.
V	Notification (see page 498)	Forwards notification messages to all owned components.
	Remove (see page 498)	This is Remove, a member of class TCustomActionBarColorMap.
V	SetColor (see page 499)	This is SetColor, a member of class TCustomActionBarColorMap.
V	SetFontColor (see page 499)	This is SetFontColor, a member of class TCustomActionBarColorMap.
	UpdateActionBars (see page 499)	This is UpdateActionBars, a member of class TCustomActionBarColorMap.

Public Methods

	Name	Description
V	Assign (see page 497)	Provides a custom Assign procedure for TCustomActionBarColorMap (see page 492) objects.
V	UpdateColors (see page 499)	Occurs when an ActionBand component receives a CM_WININICHANGE message.

4.1.18.4.1 TCustomActionBarColorMap.Add Method

Pascal

```
procedure Add(ActionBar: TCustomActionBar);
```

C++

```
__fastcall Add(TCustomActionBar ActionBar);
```

Description

This is Add, a member of class TCustomActionBarColorMap.

4.1.18.4.2 TCustomActionBarColorMap.Assign Method

Provides a custom Assign procedure for TCustomActionBarColorMap (see page 492) objects.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Use this override of the inherited TPersistent procedure to assign the properties of one TCustomActionBarColorMap (see page 492) object to another. The ActionBars, Images, PrioritySchedule, and LinkedActionLists items of the current TCustomActionBarColorMap (see page 492) all refer to the same objects as in the Source. In the case of the FileName property, it becomes a copy of the Source property of the same name. If Source is not an action manager, the inherited procedure is called.

See Also

Assign (see page 2930)

4.1.18.4.3 TCustomActionBarColorMap.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

4.1.18.4.4 TCustomActionBarColorMap.Remove Method

Pascal

```
procedure Remove(ActionBar: TCustomActionBar);
```

C++

```
__fastcall Remove(TCustomActionBar ActionBar);
```

Description

This is Remove, a member of class TCustomActionBarColorMap.

4.1.18.4.5 TCustomActionBarColorMap.SetColor Method

Pascal

```
procedure SetColor(const Value: TColor); virtual;
```

C++

```
virtual __fastcall SetColor(const TColor Value);
```

Description

This is SetColor, a member of class TCustomActionBarColorMap.

4.1.18.4.6 TCustomActionBarColorMap.SetFontColor Method

Pascal

```
procedure SetFontColor(const Value: TColor); virtual;
```

C++

```
virtual __fastcall SetFontColor(const TColor Value);
```

Description

This is SetFontColor, a member of class TCustomActionBarColorMap.

4.1.18.4.7 TCustomActionBarColorMap.UpdateActionBars Method

Pascal

```
procedure UpdateActionBars(UpdateProc: TColorMapUpdateProc; Color: TColor);
```

C++

```
__fastcall UpdateActionBars(TColorMapUpdateProc UpdateProc, TColor Color);
```

Description

This is UpdateActionBars, a member of class TCustomActionBarColorMap.

4.1.18.4.8 TCustomActionBarColorMap.UpdateColors Method

Occurs when an ActionBand component receives a CM_WININICHANGE message.

Pascal

```
procedure UpdateColors; virtual;
```

C++

```
virtual __fastcall UpdateColors();
```

Description

UpdateColors is called automatically when an ActionBand component receives a CM_WININICHANGE message.

4.1.18.5 TCustomActionBarColorMap Properties

The properties of the TCustomActionBarColorMap class are listed here.

Public Properties

	Name	Description
	BtnFrameColor (see page 500)	Changes the look and feel of your applications.
	BtnSelectedColor (see page 500)	Changes the look and feel of your applications.
	BtnSelectedFont (see page 501)	Changes the look and feel of your applications.
	Color (see page 501)	Specifies the background color for action bands.
	DesignFocus (see page 501)	Changes the look and feel of your applications.
	DisabledColor (see page 501)	Changes the look and feel of your applications.
	DisabledFontColor (see page 502)	Changes the look and feel of your applications.
	DisabledFontShadow (see page 502)	Changes the look and feel of your applications.
	FontColor (see page 502)	Changes the look and feel of your applications.
	FrameBottomRightInner (see page 502)	Changes the look and feel of your applications.
	FrameBottomRightOuter (see page 503)	Changes the look and feel of your applications.
	FrameTopLeftInner (see page 503)	Changes the look and feel of your applications.
	FrameTopLeftOuter (see page 503)	Changes the look and feel of your applications.
	HighlightColor (see page 503)	Changes the look and feel of your applications.
	HotColor (see page 504)	Changes the look and feel of your applications.
	HotFontColor (see page 504)	Changes the look and feel of your applications.
	MenuColor (see page 504)	Changes the look and feel of your applications.
	SelectedColor (see page 505)	Changes the look and feel of your applications.
	SelectedFontColor (see page 505)	Changes the look and feel of your applications.
	ShadowColor (see page 505)	Changes the look and feel of your applications.
	UnusedColor (see page 505)	Changes the look and feel of your applications.

4.1.18.5.1 TCustomActionBarColorMap.BtnFrameColor Property

Changes the look and feel of your applications.

Pascal

```
property BtnFrameColor: TColor;
```

C++

```
__property TColor BtnFrameColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.2 TCustomActionBarColorMap.BtnSelectedColor Property

Changes the look and feel of your applications.

Pascal

```
property BtnSelectedColor: TColor;
```

C++

```
__property TColor BtnSelectedColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.3 TCustomActionBarColorMap.BtnSelectedFont Property

Changes the look and feel of your applications.

Pascal

```
property BtnSelectedFont: TColor;
```

C++

```
__property TColor BtnSelectedFont;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.4 TCustomActionBarColorMap.Color Property

Specifies the background color for action bands.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

The Color property determines the background color. You can set Color to one of the constants defined in the Graphics (see page 14387) unit (such as clBlue), or to an explicit RGB integer value.

4.1.18.5.5 TCustomActionBarColorMap.DesignFocus Property

Changes the look and feel of your applications.

Pascal

```
property DesignFocus: TColor;
```

C++

```
__property TColor DesignFocus;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.6 TCustomActionBarColorMap.DisabledColor Property

Changes the look and feel of your applications.

Pascal

```
property DisabledColor: TColor;
```

C++

```
__property TColor DisabledColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.7 TCustomActionBarColorMap.DisabledFontColor Property

Changes the look and feel of your applications.

Pascal

```
property DisabledFontColor: TColor;
```

C++

```
__property TColor DisabledFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.8 TCustomActionBarColorMap.DisabledFontShadow Property

Changes the look and feel of your applications.

Pascal

```
property DisabledFontShadow: TColor;
```

C++

```
__property TColor DisabledFontShadow;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.9 TCustomActionBarColorMap.FontColor Property

Changes the look and feel of your applications.

Pascal

```
property FontColor: TColor;
```

C++

```
__property TColor FontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.10 TCustomActionBarColorMap.FrameBottomRightInner Property

Changes the look and feel of your applications.

Pascal

```
property FrameBottomRightInner: TColor;
```

C++

```
__property TColor FrameBottomRightInner;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.11 TCustomActionBarColorMap.FrameBottomRightOuter Property

Changes the look and feel of your applications.

Pascal

```
property FrameBottomRightOuter: TColor;
```

C++

```
__property TColor FrameBottomRightOuter;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.12 TCustomActionBarColorMap.FrameTopLeftInner Property

Changes the look and feel of your applications.

Pascal

```
property FrameTopLeftInner: TColor;
```

C++

```
__property TColor FrameTopLeftInner;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.13 TCustomActionBarColorMap.FrameTopLeftOuter Property

Changes the look and feel of your applications.

Pascal

```
property FrameTopLeftOuter: TColor;
```

C++

```
__property TColor FrameTopLeftOuter;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.14 TCustomActionBarColorMap.HighlightColor Property

Changes the look and feel of your applications.

Pascal

```
property HighlightColor: TColor;
```

C++

```
__property TColor HighlightColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.15 TCustomActionBarColorMap.HotColor Property

Changes the look and feel of your applications.

Pascal

```
property HotColor: TColor;
```

C++

```
__property TColor HotColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.16 TCustomActionBarColorMap.HotFontColor Property

Changes the look and feel of your applications.

Pascal

```
property HotFontColor: TColor;
```

C++

```
__property TColor HotFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.17 TCustomActionBarColorMap.MenuColor Property

Changes the look and feel of your applications.

Pascal

```
property MenuColor: TColor;
```

C++

```
__property TColor MenuColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.18 TCustomActionBarColorMap.SelectedColor Property

Changes the look and feel of your applications.

Pascal

```
property SelectedColor: TColor;
```

C++

```
__property TColor SelectedColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.19 TCustomActionBarColorMap.SelectedFontColor Property

Changes the look and feel of your applications.

Pascal

```
property SelectedFontColor: TColor;
```

C++

```
__property TColor SelectedFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.20 TCustomActionBarColorMap.ShadowColor Property

Changes the look and feel of your applications.

Pascal

```
property ShadowColor: TColor;
```

C++

```
__property TColor ShadowColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.5.21 TCustomActionBarColorMap.UnusedColor Property

Changes the look and feel of your applications.

Pascal

```
property UnusedColor: TColor;
```

C++

```
__property TColor UnusedColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

4.1.18.6 TCustomActionBarColorMap Events

The events of the TCustomActionBarColorMap class are listed here.

Public Events

	Name	Description
	OnColorChange (see page 506)	Occurs when one of the action's color properties changes.

4.1.18.6.1 TCustomActionBarColorMap.OnColorChange Event

Occurs when one of the action's color properties changes.

Pascal

```
property OnColorChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnColorChange;
```

Description

Applications can't use the protected OnChange event. It is used internally to manage the relationship between the properties of the action and the corresponding properties of the action's clients.

Component writers can use OnChange in descendant objects to respond when the action's properties change.

4.1.19 TCustomActionClass Class

Class Hierarchy

Pascal

```
TCustomActionClass = class(TCustomAction);
```

C++

```
class TCustomActionClass : public TCustomAction;
```

File

ActnMan

Description

This is class ActnMan.TCustomActionClass.

4.1.20 TCustomActionControl Class

TCustomActionControl is the base class for ActionBand custom controls.

Class Hierarchy

Pascal

```
TCustomActionControl = class(TGraphicControl);
```

C++

```
class TCustomActionControl : public TGraphicControl;
```

File

ActnMan

Description

TCustomActionControl is a base class for several ActionBand components. Most notably, the standard menu item (TStandardMenuItem) and menu button (TStandardMenuButton) derive from this class.

Do not create instances of TCustomActionControl. If you would like to replace the standard menu item and/or menu button behaviors, use the classes TCustomMenuItem and/or TCustomMenuButton as parent classes for your replacement classes.

See Also

TCustomMenuButton (see page 790)

TCustomMenuItem (see page 816)

TStandardMenuButton (see page 20444)

TStandardMenuItem (see page 20465)

4.1.20.1 TCustomActionControl Members

The following tables list the members exposed by TCustomActionControl.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.

	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 521)	OnDragOver event dispatcher.
	DrawBackground (see page 521)	Draws a background image on the control.
	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
	DrawGlyph (see page 522)	Draws a symbol on the control.
	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.
	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
	DrawText (see page 523)	Draws text on the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.

	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Paint (see page 526)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.

	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.

	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
V	CalcBounds (see page 518)	Calculates the size of the control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 518)	Executes the control's function in response to a mouse click.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 515)	Creates an instance of TCustomActionControl (see page 507).
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 516)	Destroys an instance of TCustomActionControl (see page 507).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
V	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.

	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
V	Keyed (see page 525)	Executes the control's function in response to a keyboard action.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.

R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	Selected (see page 533)	Indicates whether the control is currently selected.
R	Separator (see page 533)	Indicates whether the control is a separator.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.
	Transparent (see page 534)	Shows whether the control is transparent or not.

	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

4.1.20.2 TCustomActionControl.Create Constructor

Creates an instance of TCustomActionControl (see page 507).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomActionControl(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomActionControl (see page 507). However, you should never attempt to instantiate a TCustomActionControl (see page 507). This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the TCustomActionControl (see page 507) instance. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner (see page 2807)

Create (see page 5731)

Destroy (see page 516)

4.1.20.3 TCustomActionControl.Destroy Destructor

Destroys an instance of TCustomActionControl (see page 507).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomActionControl();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create (see page 515) method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

Create (see page 515)

Free (see page 22300)

4.1.20.4 TCustomActionControl Methods

The methods of the TCustomActionControl class are listed here.

Protected Methods

	Name	Description
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
V	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
V	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
V	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
V	DragOver (see page 521)	OnDragOver event dispatcher.
V	DrawBackground (see page 521)	Draws a background image on the control.
V	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
V	DrawGlyph (see page 522)	Draws a symbol on the control.
V	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.

	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
	DrawText (see page 523)	Draws text on the control.
	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
	Paint (see page 526)	Render control surface.
	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.

Public Methods

	Name	Description
	CalcBounds (see page 518)	Calculates the size of the control.
	Click (see page 518)	Executes the control's function in response to a mouse click.
	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
	Keyed (see page 525)	Executes the control's function in response to a keyboard action.

4.1.20.4.1 TCustomActionControl.BeginAutoDrag Method

Begin Automatic Drag.

Pascal

```
procedure BeginAutoDrag; override;
```

C++

```
virtual __fastcall BeginAutoDrag();
```

Description

BeginAutoDrag is called automatically when a user drags a control whose DragMode is dmAutomatic. Do not call BeginAutoDrag in application code.

As implemented in TControl, BeginAutoDrag calls BeginDrag, passing in the global Mouse variable's DragImmediate and DragThreshold properties.

See Also

DragKind (see page 5819)

DragMode (see page 5819)

EndDrag (see page 5757)

Mouse (see page 6321)

DragImmediate (see page 6100)

DragThreshold (see page 6101)

Mouse (see page 6321)

4.1.20.4.2 TCustomActionControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; virtual;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as the presence of an icon, caption, and shortcuts. CalcBounds computes the boundaries of the control considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds (see page 5783)

4.1.20.4.3 TCustomActionControl.CalcLayout Method

Pascal

```
procedure CalcLayout; virtual;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TCustomActionControl.

4.1.20.4.4 TCustomActionControl.Click Method

Executes the control's function in response to a mouse click.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TControl executes the control's function in response to a user's mouse click. Usage data, which is used to determine whether a control is used frequently enough to be shown by default, is updated as well.

See Also

Click (see page 5743)

UsageCount (see page 388)

Keyed (see page 525)

4.1.20.4.5 TCustomActionControl.CMDesignHitTest Method

Pascal

```
procedure CMDesignHitTest(var Message: TCMDesignHitTest); message CM_DESIGNHITTEST;
```

C++

```
__fastcall CMDesignHitTest(TCMDesignHitTest Message);
```

Description

This is CMDesignHitTest, a member of class TCustomActionControl.

4.1.20.4.6 TCustomActionControl.CMFontChanged Method

Pascal

```
procedure CMFontChanged(var Message: TMessage); message CM_FONTCHANGED;
```

C++

```
__fastcall CMFontChanged(TMessage Message);
```

Description

This is CMFontChanged, a member of class TCustomActionControl.

4.1.20.4.7 TCustomActionControl.CMItemDropPoint Method

Pascal

```
procedure CMItemDropPoint(var Message: TCMItemMsg); message CM_ITEMDROPPOINT;
```

C++

```
__fastcall CMItemDropPoint(TCMItemMsg Message);
```

Description

This is CMItemDropPoint, a member of class TCustomActionControl.

4.1.20.4.8 TCustomActionControl.CMItemSelected Method

Pascal

```
procedure CMItemSelected(var Message: TCMItemMsg); message CM_ITEMSELECTED;
```

C++

```
__fastcall CMItemSelected(TCMItemMsg Message);
```

Description

This is CMItemSelected, a member of class TCustomActionControl.

4.1.20.4.9 TCustomActionControl.DesignWndProc Method

Pascal

```
function DesignWndProc(var Message: TMessage): Boolean; override;
```

C++

```
virtual __fastcall Boolean DesignWndProc(TMessage Message);
```

Description

This is DesignWndProc, a member of class TCustomActionControl.

4.1.20.4.10 TCustomActionControl.DoDragDrop Method

Pascal

```
procedure DoDragDrop(DragObject: TObject; X: Integer; Y: Integer); virtual;
```

C++

```
virtual __fastcall DoDragDrop(TObject * DragObject, int X, int Y);
```

Description

This is DoDragDrop, a member of class TCustomActionControl.

4.1.20.4.11 TCustomActionControl.DoStartDrag Method

OnStartDrag event dispatcher.

Pascal

```
procedure DoStartDrag(var DragObject: TDragObject); override;
```

C++

```
virtual __fastcall DoStartDrag(TDragObject DragObject);
```

Description

DoStartDrag calls any event handler attached to the OnStartDrag event. When creating a component that descends from TControl, override DoStartDrag to provide other responses in addition to the inherited event-handler call when the user starts a drag-and-drop operation.

See Also

DoEndDrag (see page 5751)

OnStartDrag (see page 5871)

4.1.20.4.12 TCustomActionControl.DragDrop Method

Performs actions and generates an OnDragDrop event.

Pascal

```
procedure DragDrop(Source: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DragDrop(TObject * Source, int X, int Y);
```

Description

This override of the method inherited from TControl executes instructions and generates an OnDragDrop event. The method is called when a user drags and drops an item (Source) onto the custom action control at coordinates (X,Y).

See Also

DragDrop (see page 5754)

4.1.20.4.13 TCustomActionControl.DragOver Method

OnDragOver event dispatcher.

Pascal

```
procedure DragOver(Source: TObject; X: Integer; Y: Integer; State: TDragState; var Accept:
Boolean); override;
```

C++

```
virtual __fastcall DragOver(TObject * Source, int X, int Y, TDragState State, Boolean Accept);
```

Description

Override DragOver to add additional code that executes before the OnDragOver event handler is called.

DragOver sets the Accept parameter to true to indicate that the user can drop the dragged object on the control. It sets Accept to false to indicate that the user cannot drop the dragged object on the control.

The Source parameter is the object being dragged. The State parameter indicates how the dragged object is moving in relation to the control. X and Y indicate the current position of the mouse.

See Also

DragDrop (see page 5754)

OnDragOver (see page 5857)

4.1.20.4.14 TCustomActionControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); virtual;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph (see page 522)

DrawText (see page 523)

4.1.20.4.15 TCustomActionControl.DrawDesignFocus Method

Pascal

```
procedure DrawDesignFocus(var PaintRect: TRect); virtual;
```

C++

```
virtual __fastcall DrawDesignFocus(TRect PaintRect);
```

Description

This is DrawDesignFocus, a member of class TCustomActionControl.

4.1.20.4.16 TCustomActionControl.DrawDragDropPoint Method

Pascal

```
procedure DrawDragDropPoint;
```

C++

```
__fastcall DrawDragDropPoint();
```

Description

This is DrawDragDropPoint, a member of class TCustomActionControl.

4.1.20.4.17 TCustomActionControl.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); virtual;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground (see page 521)

DrawText (see page 523)

4.1.20.4.18 TCustomActionControl.DrawLargeGlyph Method

Pascal

```
procedure DrawLargeGlyph(Location: TPoint); virtual;
```

C++

```
virtual __fastcall DrawLargeGlyph(TPoint Location);
```

Description

This is DrawLargeGlyph, a member of class TCustomActionControl.

4.1.20.4.19 TCustomActionControl.DrawSeparator Method

Pascal

```
procedure DrawSeparator(const Offset: Integer); virtual;
```

C++

```
virtual __fastcall DrawSeparator(const int Offset);
```

Description

This is DrawSeparator, a member of class TCustomActionControl.

4.1.20.4.20 TCustomActionControl.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); virtual;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, AnsiString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TCustomActionControl.

4.1.20.4.21 TCustomActionControl.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); virtual;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, AnsiString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

DrawBackground (see page 521)

DrawGlyph (see page 522)

4.1.20.4.22 TCustomActionControl.GetAction Method

Pascal

```
function GetAction: TBasicAction; override;
```

C++

```
virtual __fastcall TBasicAction GetAction();
```

Description

This is GetAction, a member of class TCustomActionControl.

4.1.20.4.23 TCustomActionControl.GetImageSize Method

Pascal

```
function GetImageSize: TPoint; virtual;
```

C++

```
virtual __fastcall TPoint GetImageSize();
```

Description

This is GetImageSize, a member of class TCustomActionControl.

4.1.20.4.24 TCustomActionControl.GetSeparator Method

Pascal

```
function GetSeparator: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetSeparator();
```

Description

This is GetSeparator, a member of class TCustomActionControl.

4.1.20.4.25 TCustomActionControl.GetShowCaption Method

Pascal

```
function GetShowCaption: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetShowCaption();
```

Description

This is GetShowCaption, a member of class TCustomActionControl.

4.1.20.4.26 TCustomActionControl.GetShowShortCut Method

Pascal

```
function GetShowShortCut: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetShowShortCut();
```

Description

This is GetShowShortCut, a member of class TCustomActionControl.

4.1.20.4.27 TCustomActionControl.HasGlyph Method

Pascal

```
function HasGlyph: Boolean;
```

C++

```
__fastcall Boolean HasGlyph();
```

Description

This is HasGlyph, a member of class TCustomActionControl.

4.1.20.4.28 TCustomActionControl.InitiateAction Method

Calls the action client's Update method if the control is associated with an action client.

Pascal

```
procedure InitiateAction; override;
```

C++

```
virtual __fastcall InitiateAction();
```

Description

This method performs the same function as TControl's InitiateAction method. See the documentation for that method for more details.

See Also

InitiateAction (see page 5769)

4.1.20.4.29 TCustomActionControl.IsChecked Method

Pascal

```
function IsChecked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsChecked();
```

Description

This is IsChecked, a member of class TCustomActionControl.

4.1.20.4.30 TCustomActionControl.IsGrouped Method

Pascal

```
function IsGrouped: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsGrouped();
```

Description

This is IsGrouped, a member of class TCustomActionControl.

4.1.20.4.31 TCustomActionControl.Keyed Method

Executes the control's function in response to a keyboard action.

Pascal

```
procedure Keyed; virtual;
```

C++

```
virtual __fastcall Keyed();
```

Description

Use Keyed to execute the control's function in response to a user request from the keyboard, as opposed to a mouse click. Usage data, which is used to determine whether a control is used frequently enough to be shown by default, is updated as well.

See Also

Click (see page 518)

UsageCount (see page 388)

4.1.20.4.32 TCustomActionControl.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas (see page 6053)

4.1.20.4.33 TCustomActionControl.PositionChanged Method

Pascal

```
procedure PositionChanged; virtual;
```

C++

```
virtual __fastcall PositionChanged();
```

Description

This is PositionChanged, a member of class TCustomActionControl.

4.1.20.4.34 TCustomActionControl.ResetUsageData Method

Pascal

```
procedure ResetUsageData;
```

C++

```
__fastcall ResetUsageData();
```

Description

This is ResetUsageData, a member of class TCustomActionControl.

4.1.20.4.35 TCustomActionControl.SetActionClient Method

Pascal

```
procedure SetActionClient(Value: TActionClientItem); virtual;
```

C++

```
virtual __fastcall SetActionClient(TActionClientItem Value);
```

Description

This is SetActionClient, a member of class TCustomActionControl.

4.1.20.4.36 TCustomActionControl.SetDropPoint Method

Pascal

```
procedure SetDropPoint(Value: Boolean);
```

C++

```
__fastcall SetDropPoint(Boolean Value);
```

Description

This is SetDropPoint, a member of class TCustomActionControl.

4.1.20.4.37 TCustomActionControl.SetGlyphLayout Method

Pascal

```
procedure SetGlyphLayout(const Value: TButtonLayout); virtual;
```

C++

```
virtual __fastcall SetGlyphLayout(const TButtonLayout Value);
```

Description

This is SetGlyphLayout, a member of class TCustomActionControl.

4.1.20.4.38 TCustomActionControl.SetSelected Method

Pascal

```
procedure SetSelected(Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetSelected(Boolean Value);
```

Description

This is SetSelected, a member of class TCustomActionControl.

4.1.20.4.39 TCustomActionControl.UpdateSelection Method

Pascal

```
procedure UpdateSelection;
```

C++

```
__fastcall UpdateSelection();
```

Description

This is UpdateSelection, a member of class TCustomActionControl.

4.1.20.4.40 TCustomActionControl.UpdateTextBounds Method

Pascal

```
procedure UpdateTextBounds;
```

C++

```
__fastcall UpdateTextBounds();
```

Description

This is UpdateTextBounds, a member of class TCustomActionControl.

4.1.20.4.41 TCustomActionControl.WMSetText Method

Pascal

```
procedure WMSetText(var Message: TWMSetText); message WM_SETTEXT;
```

C++

```
__fastcall WMSetText(TWMSetText Message);
```

Description

This is WMSetText, a member of class TCustomActionControl.

4.1.20.5 TCustomActionControl Properties

The properties of the TCustomActionControl class are listed here.

Protected Properties

	Name	Description
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.

Public Properties

	Name	Description
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
	Selected (see page 533)	Indicates whether the control is currently selected.
R	Separator (see page 533)	Indicates whether the control is a separator.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	TextBounds (see page 534)	A bounding rectangle for the control caption.
	Transparent (see page 534)	Shows whether the control is transparent or not.

4.1.20.5.1 TCustomActionControl.ActionBar Property

The ActionBand object which contains the custom action control

Pascal

```
property ActionBar: TCustomActionBar;
```

C++

```
__property TCustomActionBar ActionBar;
```

Description

Custom action controls are objects on an ActionBand user interface object, such as a TActionMainMenuBar. Use ActionBar to

refer to that object.

See Also

TCustomActionBar (see page 447)

4.1.20.5.2 TCustomActionControl.ActionClient Property

Refers to the control's action client

Pascal

```
property ActionClient: TActionClientItem;
```

C++

```
__property TActionClientItem ActionClient;
```

Description

Use ActionClient to obtain a reference to a TCustomActionControl (see page 507)'s action client item. The action client item serves as an intermediary between the visible control and the action initiated by that control. See the documentation for the TActionClientItem (see page 374) object (referenced above) for more information.

See Also

TActionClientItem (see page 374)

4.1.20.5.3 TCustomActionControl.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
```

```
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
```

```
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
```

```
end;
```

4.1.20.5.4 TCustomActionControl.DropPoint Property

Pascal

```
property DropPoint: Boolean;
```

C++

```
__property Boolean DropPoint;
```

Description

This is DropPoint, a member of class TCustomActionControl.

4.1.20.5.5 TCustomActionControl.GlyphLayout Property

Describes where the image should be on the control

Pascal

```
property GlyphLayout: TButtonLayout;
```

C++

```
__property TButtonLayout GlyphLayout;
```

Description

GlyphLayout describes where the image should be placed on the control. The description is in terms of a TButtonLayout value; see the documentation for that type (referenced above) for more information.

See Also

TButtonLayout (see page 2393)

4.1.20.5.6 TCustomActionControl.GlyphPos Property

Pascal

```
property GlyphPos: TPoint;
```

C++

```
__property TPoint GlyphPos;
```

Description

This is GlyphPos, a member of class TCustomActionControl.

4.1.20.5.7 TCustomActionControl.Margins Property

Describes the boundaries of the control for drawing purposes.

Pascal

```
property Margins: TRect;
```

C++

```
__property TRect Margins;
```

Description

Margins is a TRect which describes the area of the control which can contain writing and/or drawings. The units of the TRect are

pixels.

4.1.20.5.8 TCustomActionControl.Selected Property

Indicates whether the control is currently selected.

Pascal

```
property Selected: Boolean;
```

C++

```
__property Boolean Selected;
```

Description

If a control is selected (by mouse click, keyboard or other action) Selected is true; otherwise it is false. One example of a situation where Selected is useful is when the control is to be redrawn, because generally the control should be drawn differently if it is selected.

4.1.20.5.9 TCustomActionControl.Separator Property

Indicates whether the control is a separator.

Pascal

```
property Separator: Boolean;
```

C++

```
__property Boolean Separator;
```

Description

Menus (see page 16053) and toolbars may include separators, which often appear as vertical or horizonal bars. Separators are also instances of TCustomActionControl (see page 507) or one of its descendants. Use Separator to see if the current control is a separator.

4.1.20.5.10 TCustomActionControl.ShowCaption Property

Indicates whether the control's caption should be shown.

Pascal

```
property ShowCaption: Boolean;
```

C++

```
__property Boolean ShowCaption;
```

Description

Read ShowCaption to determine whether or not the custom action control's caption, a text description of the control's function, should be shown.

4.1.20.5.11 TCustomActionControl.ShowShortCut Property

Indicates whether the control's short cut should be shown.

Pascal

```
property ShowShortCut: Boolean;
```

C++

```
__property Boolean ShowShortCut;
```

Description

Read ShowShortCut to determine whether or not the custom action control's short cut keystrokes should be shown.

4.1.20.5.12 TCustomActionControl.SmallIcon Property

Indicates whether the control's small icon should be shown.

Pascal

```
property SmallIcon: Boolean;
```

C++

```
__property Boolean SmallIcon;
```

Description

Set SmallIcon to true if you want the small icon associated with the control to be shown. Otherwise, set it to false.

4.1.20.5.13 TCustomActionControl.Spacing Property

Controls (see page 5711) the separation between the control's icon and caption.

Pascal

```
property Spacing: Integer;
```

C++

```
__property int Spacing;
```

Description

The value stored in Spacing is the number of pixels between the control's icon and caption. If either is absent from the control, the value of Spacing becomes irrelevant. When the control is drawn, the value used in calculations will be zero.

4.1.20.5.14 TCustomActionControl.TextBounds Property

A bounding rectangle for the control caption.

Pascal

```
property TextBounds: TRect;
```

C++

```
__property TRect TextBounds;
```

Description

TextBounds is a bounding rectangle for the control's caption.

4.1.20.5.15 TCustomActionControl.Transparent Property

Shows whether the control is transparent or not.

Pascal

```
property Transparent: Boolean;
```

C++

```
__property Boolean Transparent;
```

Description

If the action client has a background image to display, the control becomes transparent so that the background will display properly. Use Transparent to see if the control is transparent and, therefore, if its action client has a custom background.

See Also

Background (see page 370)

4.1.20.6 TCustomActionControl Events

The events of the TCustomActionControl class are listed here.

Public Events

	Name	Description
	OnClick (see page 535)	Occurs when the user clicks the control.

4.1.20.6.1 TCustomActionControl.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
```

```
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
```

```
end;
```

4.1.21 TCustomActionManager Class

TCustomActionManager is the base class for the TActionManager (see page 432) component.

Class Hierarchy

Pascal

```
TCustomActionManager = class(TCustomActionList);
```

C++

```
class TCustomActionManager : public TCustomActionList;
```

File

ActnMan

Description

TActionManager (see page 432) is a component that allows you to manage actions and categories of actions as UI elements at design-time and runtime. The action manager editor is the user interface for working with actions and categories of actions. You can visually add, delete, and regroup these UI elements on the action band components by dragging and dropping them from the action manager editor or by moving them around after they have been dropped on an action band.

See Also

TActionManager (see page 432)

TActionToolBar (see page 38)

TActionMainMenuBar (see page 585)

4.1.21.1 TCustomActionManager Members

The following tables list the members exposed by TCustomActionManager.

Protected Events

	Name	Description
	OnChange (see page 326)	Occurs when a change occurs in the action list.
	OnExecute (see page 327)	Occurs when a client object triggers an action in the list.
	OnGetBarItemClass (see page 557)	Occurs before TActionManager (see page 432) creates TActionBars (see page 352) items.
	OnGetBarsClass (see page 558)	Occurs before TActionManager (see page 432) creates its ActionBars (see page 553) collection.
	OnGetClientItemClass (see page 558)	Occurs before TActionManager (see page 432) creates any ActionClientItems.
	OnGetClientsClass (see page 558)	Occurs when attempting to add items to an ActionClient.
	OnUpdate (see page 327)	Occurs when the application is idle so that the action list can update a specific action in the list.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 545)	Generates an OnChange event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CreateActionBars (see page 545)	This is CreateActionBars, a member of class TCustomActionManager.
V	DefineProperties (see page 545)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	FindActionBar (see page 547)	This is FindActionBar, a member of class TCustomActionManager.
	FindActionClient (see page 547)	This is FindActionClient, a member of class TCustomActionManager.
	FindClient (see page 547)	This is FindClient, a member of class TCustomActionManager.
	GetActionBarItemClass (see page 548)	This is GetActionBarItemClass, a member of class TCustomActionManager.
	GetActionBarsClass (see page 548)	This is GetActionBarsClass, a member of class TCustomActionManager.
	GetActionClientItemClass (see page 548)	This is GetActionClientItemClass, a member of class TCustomActionManager.
	GetActionClientsClass (see page 549)	This is GetActionClientsClass, a member of class TCustomActionManager.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
V	GetChildren (see page 321)	Calls a specified method for each child action of the action list.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	GetUsage (see page 549)	This is GetUsage, a member of class TCustomActionManager.
	HasLinkedActionLists (see page 549)	This is HasLinkedActionLists, a member of class TCustomActionManager.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 549)	Initializes the component after the form file has been read into memory.
	LoadMenu (see page 551)	This is LoadMenu, a member of class TCustomActionManager.
V	Notification (see page 551)	Responds to notifications when objects are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.

	RemoveAction (see page 323)	Removes an action from the list.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetChildOrder (see page 323)	Sets the order that actions are passed to a callback by the GetChildren (see page 321) method.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetImages (see page 552)	Sets the value of the Images property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetState (see page 553)	This is SetState, a member of class TCustomActionManager.
	SetupActionBars (see page 553)	This is SetupActionBars, a member of class TCustomActionManager.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Loading (see page 555)	This is Loading, a member of class TCustomActionManager.

Public Events

	Name	Description
	OnStateChange (see page 327)	Occurs after an OnChange (see page 326) event.
	OnStyleChanged (see page 558)	This is OnStyleChanged, a member of class TCustomActionManager.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddAction (see page 543)	Inserts a new action into an existing actionband.
	AddCategory (see page 543)	Adds all of the actions from a category to an action band.
	AddSeparator (see page 544)	Adds a separator to an action band.
V	AfterConstruction (see page 544)	Loads the layout information needed to reconstruct the action bands by the action manager from a file.
V	Assign (see page 544)	Provides a custom Assign procedure for TCustomActionManager (see page 537) objects.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 541)	Instantiates and initializes a TCustomActionManager (see page 537) object.

	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DeleteActionItems (see page 546)	Removes items from an ActionBars (see page 553) collection.
	DeleteItem (see page 546)	Deletes an action band item.
	Destroy (see page 542)	Disposes of the instance of an action manager object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 321)	Generates an OnExecute (see page 327) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindItemByAction (see page 547)	Returns the first item linked to an action.
	FindItemByCaption (see page 548)	Returns the first item with a matching caption.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 321)	Returns a TComponent enumerator.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsShortCut (see page 322)	Evaluates an input key combination to determine whether it is a shortcut for one of the actions in the list.
	LoadFromFile (see page 550)	Loads the layout information needed to reconstruct the action bands by the action manager from a file.
	LoadFromStream (see page 550)	Loads the layout information needed to reconstruct the action bands by the action manager from a stream.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	ResetActionBar (see page 551)	Resets the action bands to their default state.
	ResetUsageData (see page 551)	Resets the usage data of the action bands.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.

V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 552)	Saves layout information needed to reconstruct the action bands by the action manager to a file.
	SaveToStream (see page 552)	Saves layout information needed to reconstruct the action bands by the action manager to a stream.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	UpdateAction (see page 324)	Generates an OnUpdate (see page 327) event.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	ActionBars (see page 553)	Contains a collection of all the action bands in the application.
R	ActionCount (see page 324)	Indicates the number of actions in the action list.
	Actions (see page 325)	Lists the actions maintained by the action list.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	DefaultActionBars (see page 554)	Contains a collection of the application default action bands.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	FileName (see page 554)	Specifies the name of the file that the action manager component uses to read and write layout information.
	Images (see page 554)	Lists the images available for actions in the action list.
	LinkedActionLists (see page 555)	Contains a collection of action lists available from action bands and menus.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	PrioritySchedule (see page 555)	Specifies a schedule that indicates how long it takes to mark an item as unused.
	State (see page 326)	Indicates whether the actions in the action list respond when the user triggers a client object.
	Style (see page 556)	Identifies the style object that gives the application its default look and feel.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

4.1.21.2 TCustomActionManager.Create Constructor

Instantiates and initializes a TCustomActionManager (see page 537) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomActionManager(TComponent * AOwner);
```

Description

When using the form designer, action manager instances are created automatically when you drop an action manager component on your form. The AOwner parameter is the owner of the action manager, typically this is the form.

You should never attempt to instantiate a TCustomActionManager (see page 537) object in an application. Instead, instantiate

and use the descendant class, TActionManager (see page 432).

See Also

Destroy (see page 542)

4.1.21.3 TCustomActionManager.Destroy Destructor

Disposes of the instance of an action manager object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomActionManager();
```

Description

You do not need to call the destructor for an action manager if it has an owner. The action manager is destroyed automatically by its owner that was passed to its constructor when it was created. In situations where the custom action manager object needs to be manually destroyed, do so by calling its Free method, not this destructor.

See Also

Create (see page 541)

4.1.21.4 TCustomActionManager Methods

The methods of the TCustomActionManager class are listed here.

Protected Methods

	Name	Description
	Change (see page 545)	Generates an OnChange event.
	CreateActionBars (see page 545)	This is CreateActionBars, a member of class TCustomActionManager.
	DefineProperties (see page 545)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	FindActionBar (see page 547)	This is FindActionBar, a member of class TCustomActionManager.
	FindActionClient (see page 547)	This is FindActionClient, a member of class TCustomActionManager.
	FindClient (see page 547)	This is FindClient, a member of class TCustomActionManager.
	GetActionBarItemClass (see page 548)	This is GetActionBarItemClass, a member of class TCustomActionManager.
	GetActionBarsClass (see page 548)	This is GetActionBarsClass, a member of class TCustomActionManager.
	GetActionClientItemClass (see page 548)	This is GetActionClientItemClass, a member of class TCustomActionManager.
	GetActionClientsClass (see page 549)	This is GetActionClientsClass, a member of class TCustomActionManager.
	GetUsage (see page 549)	This is GetUsage, a member of class TCustomActionManager.
	HasLinkedActionLists (see page 549)	This is HasLinkedActionLists, a member of class TCustomActionManager.
	Loaded (see page 549)	Initializes the component after the form file has been read into memory.
	LoadMenu (see page 551)	This is LoadMenu, a member of class TCustomActionManager.
	Notification (see page 551)	Responds to notifications when objects are created or destroyed.
	SetImages (see page 552)	Sets the value of the Images property.
	SetState (see page 553)	This is SetState, a member of class TCustomActionManager.
	SetupActionBars (see page 553)	This is SetupActionBars, a member of class TCustomActionManager.

Public Methods

	Name	Description
	AddAction (see page 543)	Inserts a new action into an existing actionband.

	AddCategory (see page 543)	Adds all of the actions from a category to an action band.
	AddSeparator (see page 544)	Adds a separator to an action band.
V	AfterConstruction (see page 544)	Loads the layout information needed to reconstruct the action bands by the action manager from a file.
V	Assign (see page 544)	Provides a custom Assign procedure for TCustomActionManager (see page 537) objects.
	DeleteActionItems (see page 546)	Removes items from an ActionBars (see page 553) collection.
	DeleteItem (see page 546)	Deletes an action band item.
	FindItemByAction (see page 547)	Returns the first item linked to an action.
	FindItemByCaption (see page 548)	Returns the first item with a matching caption.
	LoadFromFile (see page 550)	Loads the layout information needed to reconstruct the action bands by the action manager from a file.
	LoadFromStream (see page 550)	Loads the layout information needed to reconstruct the action bands by the action manager from a stream.
	ResetActionBar (see page 551)	Resets the action bands to their default state.
	ResetUsageData (see page 551)	Resets the usage data of the action bands.
	SaveToFile (see page 552)	Saves layout information needed to reconstruct the action bands by the action manager to a file.
	SaveToStream (see page 552)	Saves layout information needed to reconstruct the action bands by the action manager to a stream.

4.1.21.4.1 TCustomActionManager.AddAction Method

Inserts a new action into an existing actionband.

Pascal

```
function AddAction(AnAction: TCustomAction; AClient: TActionClient; After: Boolean = True):
TActionClientItem;
```

C++

```
__fastcall TActionClientItem AddAction(TCustomAction AnAction, TActionClient AClient, Boolean
After = True);
```

Description

AddAction adds an action to an action band. Use this method to insert a new action into an existing actionband. Use FindItemByCaption (see page 548) and FindItemByAction (see page 547) methods to locate the position at which you want to insert the new item.

See Also

LoadFromStream (see page 550)

FileName (see page 554)

4.1.21.4.2 TCustomActionManager.AddCategory Method

Adds all of the actions from a category to an action band.

Pascal

```
function AddCategory(ACategory: string; AClient: TActionClient; After: Boolean = True):
TActionClientItem;
```

C++

```
__fastcall TActionClientItem AddCategory(AnsiString ACategory, TActionClient AClient, Boolean
After = True);
```

Description

AddCategory adds all of the actions from a category to an action band.

See Also

LoadFromStream (see page 550)

FileName (see page 554)

4.1.21.4.3 TCustomActionManager.AddSeparator Method

Adds a separator to an action band.

Pascal

```
function AddSeparator(AnItem: TActionClientItem; After: Boolean = True): TActionClientItem;
```

C++

```
__fastcall TActionClientItem AddSeparator(TActionClientItem AnItem, Boolean After = True);
```

Description

AddSeparator adds a separator to an action band. Use FindItemByCaption (see page 548) and FindItemByAction (see page 547) to locate the separator insertion point, either before or after the found item.

See Also

LoadFromStream (see page 550)

FileName (see page 554)

4.1.21.4.4 TCustomActionManager.AfterConstruction Method

Loads the layout information needed to reconstruct the action bands by the action manager from a file.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

AfterConstruction reads the file specified in the FileName (see page 554) property of the action manager component and loads the layout information needed to reconstruct the action bands connected to the action manager.

See Also

LoadFromStream (see page 550)

FileName (see page 554)

4.1.21.4.5 TCustomActionManager.Assign Method

Provides a custom Assign procedure for TCustomActionManager (see page 537) objects.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Use this override of the inherited TPersistent procedure to assign the properties of one TCustomActionManager (see page 537) object to another. The ActionBars (see page 553), Images (see page 554), PrioritySchedule (see page 555), and LinkedActionLists (see page 555) items of the current TCustomActionManager (see page 537) all refer to the same objects as in the Source. In the case of the FileName (see page 554) property, it becomes a copy of the Source property of the same name. If Source is not an action manager, the inherited procedure is called.

See Also

Assign (see page 2930)

4.1.21.4.6 TCustomActionManager.Change Method

Generates an OnChange event.

Pascal

```
procedure Change; override;
```

C++

```
virtual __fastcall Change();
```

Description

Change is called when a change, such as a modification to the categories of the actions in the list, occurs in the action list.

Change:

1. Invokes an OnChange handler, if one has been assigned.
2. Informs all actions in the list that something has changed so that they can update themselves.

See Also

OnChange (see page 326)

4.1.21.4.7 TCustomActionManager.CreateActionBars Method

Pascal

```
function CreateActionBars: TActionBars;
```

C++

```
__fastcall TActionBars CreateActionBars();
```

Description

This is CreateActionBars, a member of class TCustomActionManager.

4.1.21.4.8 TCustomActionManager.DefineProperties Method

Designates methods for storing an object's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TComponent overrides the DefineProperties method defined in TPersistent to define "fake" Top and Left properties. These are defined so that components that are not controls can be manipulated at design-time. However, the Top and Left properties are hidden, that is, they are not published, because only controls appear at run-time.

DefineProperties is virtual; descendant classes can override it. When overriding DefineProperties, be aware that the Ancestor property of Filer might be set, and that this property can determine whether or not it is appropriate to write properties.

DefineProperties is called automatically as part of the component streaming system; do not call it directly.

See Also

Ancestor (see page 2839)

DefineBinaryProperty (see page 2837)

DefineProperties (see page 2931)

DefineProperty (see page 2838)

4.1.21.4.9 TCustomActionManager.DeleteActionItems Method

Removes items from an ActionBars (see page 553) collection.

Pascal

```
procedure DeleteActionItems(Actions: array of TCustomAction);
```

C++

```
__fastcall DeleteActionItems(array of TCustomAction Actions);
```

Description

DeleteActionItems removes items from the ActionBars (see page 553) collection which are linked to the Actions specified.

See Also

LoadFromStream (see page 550)

FileName (see page 554)

4.1.21.4.10 TCustomActionManager.DeleteItem Method

Deletes an action band item.

Pascal

```
procedure DeleteItem(Caption: string);
```

C++

```
__fastcall DeleteItem(AnsiString Caption);
```

Description

DeleteItem deletes an action band item after locating it based on its caption.

See Also

LoadFromStream (see page 550)

FileName (see page 554)

4.1.21.4.11 TCustomActionManager.FindActionBar Method

Pascal

```
function FindActionBar(ActionBar: TCustomActionBar; Clients: TActionClientsCollection = nil):
TActionClient;
```

C++

```
__fastcall TActionClient FindActionBar(TCustomActionBar ActionBar, TActionClientsCollection
Clients = nil);
```

Description

This is FindActionBar, a member of class TCustomActionManager.

4.1.21.4.12 TCustomActionManager.FindActionClient Method

Pascal

```
function FindActionClient(AnAction: TContainedAction; Clients: TActionClientsCollection =
nil): TActionClientItem;
```

C++

```
__fastcall TActionClientItem FindActionClient(TContainedAction AnAction,
TActionClientsCollection Clients = nil);
```

Description

This is FindActionClient, a member of class TCustomActionManager.

4.1.21.4.13 TCustomActionManager.FindClient Method

Pascal

```
procedure FindClient(AClient: TActionClient);
```

C++

```
__fastcall FindClient(TActionClient AClient);
```

Description

This is FindClient, a member of class TCustomActionManager.

4.1.21.4.14 TCustomActionManager.FindItemByAction Method

Returns the first item linked to an action.

Pascal

```
function FindItemByAction(Action: TCustomAction): TActionClientItem;
```

C++

```
__fastcall TActionClientItem FindItemByAction(TCustomAction Action);
```

Description

FindItemByAction takes an action and returns the first item that is linked to that action.

See Also

LoadFromStream (see page 550)

FileName (see page 554)

Creating Most Recently Used Lists

4.1.21.4.15 TCustomActionManager.FindItemByCaption Method

Returns the first item with a matching caption.

Pascal

```
function FindItemByCaption(ACaption: string): TActionClientItem;
```

C++

```
__fastcall TActionClientItem FindItemByCaption(AnsiString ACaption);
```

Description

FindItemByCaption takes a caption and returns the first item with a matching caption.

See Also

LoadFromStream (see page 550)

FileName (see page 554)

Creating Most Recently Used Lists

4.1.21.4.16 TCustomActionManager.GetActionBarItemClass Method

Pascal

```
function GetActionBarItemClass: TActionBarItemClass; dynamic;
```

C++

```
__fastcall TActionBarItemClass GetActionBarItemClass();
```

Description

This is GetActionBarItemClass, a member of class TCustomActionManager.

4.1.21.4.17 TCustomActionManager.GetActionBarsClass Method

Pascal

```
function GetActionBarsClass: TActionBarsClass; dynamic;
```

C++

```
__fastcall TActionBarsClass GetActionBarsClass();
```

Description

This is GetActionBarsClass, a member of class TCustomActionManager.

4.1.21.4.18 TCustomActionManager.GetActionClientItemClass Method

Pascal

```
function GetActionClientItemClass: TActionClientItemClass; dynamic;
```

C++

```
__fastcall TActionClientItemClass GetActionClientItemClass();
```

Description

This is GetActionClientItemClass, a member of class TCustomActionManager.

4.1.21.4.19 TCustomActionManager.GetActionClientsClass Method

Pascal

```
function GetActionClientsClass: TActionClientsClass; dynamic;
```

C++

```
__fastcall TActionClientsClass GetActionClientsClass();
```

Description

This is GetActionClientsClass, a member of class TCustomActionManager.

4.1.21.4.20 TCustomActionManager.GetUsage Method

Pascal

```
function GetUsage(AnItem: TActionClientItem): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetUsage(TActionClientItem AnItem);
```

Description

This is GetUsage, a member of class TCustomActionManager.

4.1.21.4.21 TCustomActionManager.HasLinkedActionLists Method

Pascal

```
function HasLinkedActionLists: Boolean;
```

C++

```
__fastcall Boolean HasLinkedActionLists();
```

Description

This is HasLinkedActionLists, a member of class TCustomActionManager.

4.1.21.4.22 TCustomActionManager.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the

streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

See Also

ComponentState (see page 2804)

Create (see page 2766)

TReader (see page 2933)

4.1.21.4.23 TCustomActionManager.LoadFromFile Method

Loads the layout information needed to reconstruct the action bands by the action manager from a file.

Pascal

```
procedure LoadFromFile(const Filename: string);
```

C++

```
__fastcall LoadFromFile(const AnsiString Filename);
```

Description

LoadFromFile reads the file specified in the FileName (see page 554) property of the action manager component and loads the layout information needed to reconstruct the action bands connected to the action manager.

See Also

LoadFromStream (see page 550)

FileName (see page 554)

4.1.21.4.24 TCustomActionManager.LoadFromStream Method

Loads the layout information needed to reconstruct the action bands by the action manager from a stream.

Pascal

```
procedure LoadFromStream(S: TStream);
```

C++

```
__fastcall LoadFromStream(TStream S);
```

Description

LoadFromStream reads the stream specified in the Stream parameter and loads the layout information needed to reconstruct the action bands connected to the action manager contained in the stream.

See Also

LoadFromFile (see page 550)

TStream (see page 2973)

4.1.21.4.25 TCustomActionManager.LoadMenu Method

Pascal

```
procedure LoadMenu(Clients: TActionClients; AMenu: TMenuItem);
```

C++

```
__fastcall LoadMenu(TActionClients Clients, TMenuItem AMenu);
```

Description

This is LoadMenu, a member of class TCustomActionManager.

4.1.21.4.26 TCustomActionManager.Notification Method

Responds to notifications when objects are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification notifies the action list that the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

TCustomActionList overrides Notification to update the Images property when images from the list are destroyed and the Actions property when actions in the list are destroyed.

See Also

Images (see page 325)

4.1.21.4.27 TCustomActionManager.ResetActionBar Method

Resets the action bands to their default state.

Pascal

```
procedure ResetActionBar(Index: Integer);
```

C++

```
__fastcall ResetActionBar(int Index);
```

Description

Use ResetActionBar to return the action bands to their default state, which is stored in the property DefaultActionBars (see page 554).

See Also

DefaultActionBars (see page 554)

4.1.21.4.28 TCustomActionManager.ResetUsageData Method

Resets the usage data of the action bands.

Pascal

```
procedure ResetUsageData;
```

C++

```
__fastcall ResetUsageData();
```

Description

TCustomActionManager (see page 537) keeps a file of usage data whose name is FileName (see page 554). Usage data determines which items on the ActionBars (see page 553) are displayed at any given time. Call ResetUsageData to delete that file. The user interface will appear in the same state it was in when the program was run for the first time.

4.1.21.4.29 TCustomActionManager.SaveToFile Method

Saves layout information needed to reconstruct the action bands by the action manager to a file.

Pascal

```
procedure SaveToFile(const Filename: string);
```

C++

```
__fastcall SaveToFile(const AnsiString Filename);
```

Description

SaveToFile saves the layout information to a file specified in the FileName (see page 554) property. The action manager uses the layout information in the file to reconstruct the action bands.

4.1.21.4.30 TCustomActionManager.SaveToStream Method

Saves layout information needed to reconstruct the action bands by the action manager to a stream.

Pascal

```
procedure SaveToStream(S: TStream);
```

C++

```
__fastcall SaveToStream(TStream S);
```

Description

SaveToStream saves layout information to a stream specified in the Stream parameter. The action manager uses the layout information in the stream to reconstruct the action bands.

4.1.21.4.31 TCustomActionManager.SetImages Method

Sets the value of the Images property.

Pascal

```
procedure SetImages(Value: TCustomImageList); override;
```

C++

```
virtual __fastcall SetImages(TCustomImageList Value);
```

Description

SetImages is the protected write implementation of the Images property. It registers the action list with the image list specified by Value so that it will be informed of any changes to the image list.

See Also

Images (see page 325)

4.1.21.4.32 TCustomActionManager.SetState Method

Pascal

```
procedure SetState(const Value: TActionListState); override;
```

C++

```
virtual __fastcall SetState(const TActionListState Value);
```

Description

This is SetState, a member of class TCustomActionManager.

4.1.21.4.33 TCustomActionManager.SetupActionBars Method

Pascal

```
procedure SetupActionBars(ActionBars: TActionClientsCollection);
```

C++

```
__fastcall SetupActionBars(TActionClientsCollection ActionBars);
```

Description

This is SetupActionBars, a member of class TCustomActionManager.

4.1.21.5 TCustomActionManager Properties

The properties of the TCustomActionManager class are listed here.

Protected Properties

	Name	Description
R	Loading (see page 555)	This is Loading, a member of class TCustomActionManager.

Public Properties

	Name	Description
	ActionBars (see page 553)	Contains a collection of all the action bands in the application.
R	DefaultActionBars (see page 554)	Contains a collection of the application default action bands.
	FileName (see page 554)	Specifies the name of the file that the action manager component uses to read and write layout information.
	Images (see page 554)	Lists the images available for actions in the action list.
	LinkedActionLists (see page 555)	Contains a collection of action lists available from action bands and menus.
	PrioritySchedule (see page 555)	Specifies a schedule that indicates how long it takes to mark an item as unused.
	Style (see page 556)	Identifies the style object that gives the application its default look and feel.

4.1.21.5.1 TCustomActionManager.ActionBars Property

Contains a collection of all the action bands in the application.

Pascal

```
property ActionBars: TActionBars;
```

C++

```
__property TActionBars ActionBars;
```

Description

ActionBars is used internally by the action manager component to maintain a collection of all the action bands connected to the action manager in the application. An action band is automatically added to the collection when an action or category of actions is dropped on an action band or the ActionManager property in an action band component is set in the Object Inspector.

See Also

DefaultActionBars (see page 554)

4.1.21.5.2 TCustomActionManager.DefaultActionBars Property

Contains a collection of the application default action bands.

Pascal

```
property DefaultActionBars: TActionBars;
```

C++

```
__property TActionBars DefaultActionBars;
```

Description

DefaultActionBars is a collection of action bands similar to ActionBars (see page 553). These bands are the default action bands, and are not user interface elements in the application. Instead, they are used by the method ResetActionBar (see page 551) to restore the user's action bands to their default values.

See Also

ActionBars (see page 553)

ResetActionBar (see page 551)

4.1.21.5.3 TCustomActionManager.FileName Property

Specifies the name of the file that the action manager component uses to read and write layout information.

Pascal

```
property FileName: TFileName;
```

C++

```
__property TFileName FileName;
```

Description

Use FileName to specify the name of the file that the action manager will use to read and write layout information for the action bands that are connected to the action manager. The action manager uses this file to store the current state of the action bands that are connected to the action manager when the application is closed. When an application is started, the action manager uses the layout information contained in this file to reconstruct the action bands back to the state when the application last closed. All customizations made to the action bands are saved in this file.

4.1.21.5.4 TCustomActionManager.Images Property

Lists the images available for actions in the action list.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Images is a list of bitmaps that can be displayed to the left of any action in the action list. An action is associated with an image from this image list by its ImageIndex property. This image can then appear on client controls such as menu items, tool buttons, and so on.

See Also

Actions (see page 325)

ImageIndex (see page 313)

4.1.21.5.5 TCustomActionManager.LinkedActionLists Property

Contains a collection of action lists available from action bands and menus.

Pascal

```
property LinkedActionLists: TActionListCollection;
```

C++

```
__property TActionListCollection LinkedActionLists;
```

Description

LinkedActionLists is a linked list of TActionListCollection (see page 425) objects. LinkedActionLists are simple data structures with two fields. One field is a TCustomActionList object, which is a list of possible actions. The other field is a caption, which defines the action list's description appearing on the action band or menu.

Use LinkedActionLists to merge in action lists from other sources outside the action manager. Those action lists will become accessible from action bands and menus. Application users can exploit this feature, for example, to reorganize items from a traditional main menu bar.

See Also

TActionListCollection (see page 425)

4.1.21.5.6 TCustomActionManager.Loading Property

Pascal

```
property Loading: Boolean;
```

C++

```
__property Boolean Loading;
```

Description

This is Loading, a member of class TCustomActionManager.

4.1.21.5.7 TCustomActionManager.PrioritySchedule Property

Specifies a schedule that indicates how long it takes to mark an item as unused.

Pascal

```
property PrioritySchedule: TStringList;
```

C++

```
__property TStringList PrioritySchedule;
```

Description

Based on usage statistics and layout space, the action manager uses PrioritySchedule to determine when a UI element representing a TActionClientItem (see page 374) is hidden or displayed on an action band. (This is not the same as the TActionClientItem (see page 374)'s visibility, as set by the TActionClientItem (see page 374)'s Visible property.)

To determine when to display or hide a UI element that is rendered by the action band for a specific TActionClientItem (see page 374), the action manager maintains a total count for each item of the total number of sessions, the session number it was used in, and the current session number. The number of sessions is defined as the number of times the application has been launched.

To determine if an item should be displayed, the program looks up the value of UsageCount in the left hand column in PrioritySchedule. If UsageCount is greater than the maximum tabulated value, that maximum is used for calculation purposes. The corresponding value in the right hand column is the number of sessions an item can be unused before it becomes hidden.

An action band will always show as many controls as it has space to show; the action band will wrap rows or columns, if necessary. TActionClientItems with their UsageCount property set to -1, will always be shown. You can use the UsageCount property to ensure that specific action band controls are always shown.

The default PrioritySchedule is as follows:

Number of sessions in which the action band item was used	Number of sessions the item will remain unhidden after its last use
0, 1	3
2	6
3	9
4, 5	12
6 – 8	17
9 – 13	23
14 – 24	29
25 or more	31

See Also

SessionCount (see page 358)

LastSession (see page 385)

UsageCount (see page 388)

4.1.21.5.8 TCustomActionManager.Style Property

Identifies the style object that gives the application its default look and feel.

Pascal

```
property Style: TActionBarStyle;
```

C++

```
__property TActionBarStyle Style;
```

Description

Use Style to access the application's Style object. This object manages which type of controls are used on the action bands to present a particular thematic look. To change the overall appearance of action bands in your application, change the style property accordingly. Delphi includes two styles by default: Standard and XP style. You can further augment these styles by using colormap components to control the colors that render the different style of controls.

To register new styles create a descendant of TActionBarStyleEx and register it using RegisterActnBarStyle.

See Also

TActionBarStyleEx (see page 583)

TStandardColorMap (see page 2)

TXPColorMap (see page 23)

RegisterActnBarStyle (see page 837)

4.1.21.6 TCustomActionManager Events

The events of the TCustomActionManager class are listed here.

Protected Events

	Name	Description
	OnGetBarItemClass (see page 557)	Occurs before TActionManager (see page 432) creates TActionBars (see page 352) items.
	OnGetBarsClass (see page 558)	Occurs before TActionManager (see page 432) creates its ActionBars (see page 553) collection.
	OnGetClientItemClass (see page 558)	Occurs before TActionManager (see page 432) creates any ActionClientItems.
	OnGetClientsClass (see page 558)	Occurs when attempting to add items to an ActionClient.

Public Events

	Name	Description
	OnStyleChanged (see page 558)	This is OnStyleChanged, a member of class TCustomActionManager.

4.1.21.6.1 TCustomActionManager.OnGetBarItemClass Event

Occurs before TActionManager (see page 432) creates TActionBars (see page 352) items.

Pascal

```
property OnGetBarItemClass: TGetBarItemClassEvent;
```

C++

```
__property TGetBarItemClassEvent OnGetBarItemClass;
```

Description

Write an OnGetBarItemClass event handler to change the type of the class used for the ActionBarItem. The OnGetBarItemClass event occurs after a find action fetches the item's class, but before the class is sent to the action client. OnGetBarItemClass provides an opportunity to change the class used for the items within the TActionBars (see page 352) collection.

4.1.21.6.2 TCustomActionManager.OnGetBarsClass Event

Occurs before TActionManager (see page 432) creates its ActionBars (see page 553) collection.

Pascal

```
property OnGetBarsClass: TGetBarsClassEvent;
```

C++

```
__property TGetBarsClassEvent OnGetBarsClass;
```

Description

Write an OnGetBarsClass event handler to change the type of the TActionBars (see page 352) collection to a descedant of TActionBars (see page 352). OnGetBarsClass provides an opportunity to change the class used for the TActionBars (see page 352) collection. By implementing this event and returning a descendant of TActionBars (see page 352), the developer can add new properties and new functionality to the collection for use within action bands.

4.1.21.6.3 TCustomActionManager.OnGetClientItemClass Event

Occurs before TActionManager (see page 432) creates any ActionClientItems.

Pascal

```
property OnGetClientItemClass: TGetClientItemClassEvent;
```

C++

```
__property TGetClientItemClassEvent OnGetClientItemClass;
```

Description

Write an OnGetClientItemClass event handler to change the type of the TactionClientItem class that is created and used by the ActionManager. OnGetClientItemClass provides an opportunity to return a descendant of TactionClientItem, which has new properties, events and methods for use within action bands.

4.1.21.6.4 TCustomActionManager.OnGetClientsClass Event

Occurs when attempting to add items to an ActionClient.

Pascal

```
property OnGetClientsClass: TGetClientsClassEvent;
```

C++

```
__property TGetClientsClassEvent OnGetClientsClass;
```

Description

Write an OnGetClientsClass event handler to change the type of the TactionClients class that is created and used by the ActionManager. OnGetClientsClass provides an opportunity to return a descendant of TActionClients (see page 400) which implements new properties, events and methods for use within action bands.

4.1.21.6.5 TCustomActionManager.OnStyleChanged Event

Pascal

```
property OnStyleChanged: TStyleChanged;
```

C++

```
__property TStyleChanged OnStyleChanged;
```

Description

This is OnStyleChanged, a member of class TCustomActionManager.

4.1.22 TXToolDockForm Class

Class Hierarchy

Pascal

```
TXToolDockForm = class(TToolDockForm);
```

C++

```
class TXToolDockForm : public TToolDockForm;
```

File

ActnMan

Description

This is class ActnMan.TXToolDockForm.

4.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IActionBarDesigner (see page 560)	This is class ActnMan.IActionBarDesigner.

4.2.1 IActionBarDesigner Interface

Class Hierarchy

ActnMan.IActionBarDesigner

Pascal

```
IActionBarDesigner = interface;
```

C++

```
__interface IActionBarDesigner;
```

File

ActnMan

Description

This is class ActnMan.IActionBarDesigner.

4.2.1.1 IActionBarDesigner Members

The following tables list the members exposed by IActionBarDesigner.

Public Methods

	Name	Description
	CreateAction (see page 561)	This is CreateAction, a member of class IActionBarDesigner.
	EditAction (see page 561)	This is EditAction, a member of class IActionBarDesigner.
	Modified (see page 561)	This is Modified, a member of class IActionBarDesigner.
	SetActiveMenu (see page 561)	This is SetActiveMenu, a member of class IActionBarDesigner.
	SetItemSelection (see page 562)	This is SetItemSelection, a member of class IActionBarDesigner.
	SetSelection (see page 562)	This is SetSelection, a member of class IActionBarDesigner.

4.2.1.2 IActionBarDesigner Methods

The methods of the IActionBarDesigner class are listed here.

Public Methods

	Name	Description
	CreateAction (see page 561)	This is CreateAction, a member of class IActionBarDesigner.

	EditAction (see page 561)	This is EditAction, a member of class IActionBarDesigner.
	Modified (see page 561)	This is Modified, a member of class IActionBarDesigner.
	SetActiveMenu (see page 561)	This is SetActiveMenu, a member of class IActionBarDesigner.
	SetItemSelection (see page 562)	This is SetItemSelection, a member of class IActionBarDesigner.
	SetSelection (see page 562)	This is SetSelection, a member of class IActionBarDesigner.

4.2.1.2.1 IActionBarDesigner.CreateAction Method

Pascal

```
function CreateAction(AnActionClass: TContainedActionClass): TContainedAction;
```

C++

```
__fastcall TContainedAction CreateAction(TContainedActionClass AnActionClass);
```

Description

This is CreateAction, a member of class IActionBarDesigner.

4.2.1.2.2 IActionBarDesigner.EditAction Method

Pascal

```
procedure EditAction(Action: TContainedAction);
```

C++

```
__fastcall EditAction(TContainedAction Action);
```

Description

This is EditAction, a member of class IActionBarDesigner.

4.2.1.2.3 IActionBarDesigner.Modified Method

Pascal

```
procedure Modified(ActionBar: TCustomActionBar);
```

C++

```
__fastcall Modified(TCustomActionBar ActionBar);
```

Description

This is Modified, a member of class IActionBarDesigner.

4.2.1.2.4 IActionBarDesigner.SetActiveMenu Method

Pascal

```
procedure SetActiveMenu(Menu: TCustomActionBar);
```

C++

```
__fastcall SetActiveMenu(TCustomActionBar Menu);
```

Description

This is SetActiveMenu, a member of class IActionBarDesigner.

4.2.1.2.5 IActionBarDesigner.SetItemSelection Method

Pascal

```
procedure SetItemSelection(const Items: array of TActionClient);
```

C++

```
__fastcall SetItemSelection(const array of TActionClient Items);
```

Description

This is SetItemSelection, a member of class IActionBarDesigner.

4.2.1.2.6 IActionBarDesigner.SetSelection Method

Pascal

```
procedure SetSelection(APersistent: TPersistent);
```

C++

```
__fastcall SetSelection(TPersistent * APersistent);
```

Description

This is SetSelection, a member of class IActionBarDesigner.

4.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	NotifyDesigner (see page 563)	This is function ActnMan.NotifyDesigner.

4.3.1 ActnMan.NotifyDesigner Function

Pascal

```
procedure NotifyDesigner(ActionBar: TCustomActionBar);
```

C++

```
NotifyDesigner(TCustomActionBar ActionBar);
```

File

ActnMan

Description

This is function ActnMan.NotifyDesigner.

4.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TBackgroundLayout (see page 564)	This is record ActnMan.TBackgroundLayout.
	TBarEdge (see page 564)	This is record ActnMan.TBarEdge.
	TBarOrientation (see page 565)	This is record ActnMan.TBarOrientation.
	TCaptionOptions (see page 565)	This is record ActnMan.TCaptionOptions.
	TChangesAllowed (see page 566)	This is record ActnMan.TChangesAllowed.

Records

	Name	Description
	TCMItemMsg (see page 566)	This is record ActnMan.TCMItemMsg.

4.4.1 ActnMan.TBackgroundLayout Enumeration

Pascal

```
TBackgroundLayout = (
  blNormal,
  blStretch,
  blTile,
  blLeftBanner,
  blRightBanner
);
```

C++

```
enum TBackgroundLayout {
  blNormal,
  blStretch,
  blTile,
  blLeftBanner,
  blRightBanner
};
```

File

ActnMan

Description

This is record ActnMan.TBackgroundLayout.

4.4.2 ActnMan.TBarEdge Enumeration

Pascal

```
TBarEdge = (
  beLeft,
```

```
    beRight,
    beEither
  );
```

C++

```
  enum TBarEdge {
    beLeft,
    beRight,
    beEither
  };
```

File

ActnMan

Description

This is record ActnMan.TBarEdge.

4.4.3 ActnMan.TBarOrientation Enumeration

Pascal

```
  TBarOrientation = (
    boLeftToRight,
    boRightToLeft,
    boTopToBottom,
    boBottomToTop
  );
```

C++

```
  enum TBarOrientation {
    boLeftToRight,
    boRightToLeft,
    boTopToBottom,
    boBottomToTop
  };
```

File

ActnMan

Description

This is record ActnMan.TBarOrientation.

4.4.4 ActnMan.TCaptionOptions Enumeration

Pascal

```
  TCaptionOptions = (
    coNone,
    coSelective,
    coAll
  );
```

C++

```
  enum TCaptionOptions {
    coNone,
```

```
    coSelective,
    coAll
  };
```

File

ActnMan

Description

This is record ActnMan.TCaptionOptions.

4.4.5 ActnMan.TChangesAllowed Enumeration

Pascal

```
  TChangesAllowed = (
    caModify,
    caMove,
    caDelete
  );
```

C++

```
  enum TChangesAllowed {
    caModify,
    caMove,
    caDelete
  };
```

File

ActnMan

Description

This is record ActnMan.TChangesAllowed.

4.4.6 ActnMan.TCMItemMsg Record

Pascal

```
  TCMItemMsg = record
    Msg: Cardinal;
    Unused: Integer;
    Sender: TCustomActionControl;
    Result: Longint;
  end;
```

C++

```
  struct TCMItemMsg {
    unsigned Msg;
    int Unused;
    TCustomActionControl Sender;
    Longint Result;
  };
```

File

ActnMan

Description

This is record ActnMan.TCMItemMsg.

4.5 Types

The following table lists types in this documentation.

Types

Name	Description
TActionBarItemClass (see page 568)	This is type ActnMan.TActionBarItemClass.
TActionBarsClass (see page 568)	This is type ActnMan.TActionBarsClass.
TActionClientClass (see page 569)	This is type ActnMan.TActionClientClass.
TActionClientItemClass (see page 569)	This is type ActnMan.TActionClientItemClass.
TActionClientLinkClass (see page 569)	This is type ActnMan.TActionClientLinkClass.
TActionClientsClass (see page 570)	This is type ActnMan.TActionClientsClass.
TActionProc (see page 570)	This is type ActnMan.TActionProc.
TChangesAllowedSet (see page 570)	This is type ActnMan.TChangesAllowedSet.
TColorMapUpdateProc (see page 571)	This is type ActnMan.TColorMapUpdateProc.
TControlCreatedEvent (see page 571)	This is type ActnMan.TControlCreatedEvent.
TCustomActionBarClass (see page 571)	This is type ActnMan.TCustomActionBarClass.
TCustomActionControlClass (see page 572)	This is type ActnMan.TCustomActionControlClass.
TCustomColorMapClass (see page 572)	This is type ActnMan.TCustomColorMapClass.
TGetBarItemClassEvent (see page 572)	This is type ActnMan.TGetBarItemClassEvent.
TGetBarsClassEvent (see page 573)	This is type ActnMan.TGetBarsClassEvent.
TGetClientItemClassEvent (see page 573)	This is type ActnMan.TGetClientItemClassEvent.
TGetClientsClassEvent (see page 573)	This is type ActnMan.TGetClientsClassEvent.
TGetControlClassEvent (see page 574)	This is type ActnMan.TGetControlClassEvent.
TMergeRange (see page 574)	This is type ActnMan.TMergeRange.
TStyleChanged (see page 574)	This is type ActnMan.TStyleChanged.

4.5.1 ActnMan.TActionBarItemClass Type

Pascal

```
TActionBarItemClass = class of TActionBarItem;
```

C++

```
TActionBarItem TActionBarItemClass;
```

File

ActnMan

Description

This is type ActnMan.TActionBarItemClass.

4.5.2 ActnMan.TActionBarsClass Type

Pascal

```
TActionBarsClass = class of TActionBars;
```

C++

```
TActionBars TActionBarsClass;
```

File

ActnMan

Description

This is type ActnMan.TActionBarsClass.

4.5.3 ActnMan.TActionClientClass Type

Pascal

```
TActionClientClass = class of TActionClient;
```

C++

```
TActionClient TActionClientClass;
```

File

ActnMan

Description

This is type ActnMan.TActionClientClass.

4.5.4 ActnMan.TActionClientItemClass Type

Pascal

```
TActionClientItemClass = class of TActionClientItem;
```

C++

```
TActionClientItem TActionClientItemClass;
```

File

ActnMan

Description

This is type ActnMan.TActionClientItemClass.

4.5.5 ActnMan.TActionClientLinkClass Type

Pascal

```
TActionClientLinkClass = class of TActionClientLink;
```

C++

```
TActionClientLink TActionClientLinkClass;
```

File

ActnMan

Description

This is type ActnMan.TActionClientLinkClass.

4.5.6 ActnMan.TActionClientsClass Type

Pascal

```
TActionClientsClass = class of TActionClients;
```

C++

```
TActionClients TActionClientsClass;
```

File

ActnMan

Description

This is type ActnMan.TActionClientsClass.

4.5.7 ActnMan.TActionProc Type

Pascal

```
TActionProc = procedure (AClient: TActionClient) of object;
```

C++

```
(AClient: TActionClient) ( TActionProc)();
```

File

ActnMan

Description

This is type ActnMan.TActionProc.

4.5.8 ActnMan.TChangesAllowedSet Type

Pascal

```
TChangesAllowedSet = set of TChangesAllowed;
```

C++

```
TChangesAllowed TChangesAllowedSet;
```

File

ActnMan

Description

This is type ActnMan.TChangesAllowedSet.

4.5.9 ActnMan.TColorMapUpdateProc Type

Pascal

```
TColorMapUpdateProc = procedure (ActionBar: TCustomActionBar; Colors:
TCustomActionBarColorMap);
```

C++

```
(ActionBar: TCustomActionBar; Colors: TCustomActionBarColorMap) ( TColorMapUpdateProc)();
```

File

ActnMan

Description

This is type ActnMan.TColorMapUpdateProc.

4.5.10 ActnMan.TControlCreatedEvent Type

Pascal

```
TControlCreatedEvent = procedure (Sender: TObject; var Control: TCustomActionControl) of
object;
```

C++

```
(Sender: TObject; var Control: TCustomActionControl) ( TControlCreatedEvent)();
```

File

ActnMan

Description

This is type ActnMan.TControlCreatedEvent.

4.5.11 ActnMan.TCustomActionBarClass Type

Pascal

```
TCustomActionBarClass = class of TCustomActionBar;
```

C++

```
TCustomActionBar TCustomActionBarClass;
```

File

ActnMan

Description

This is type ActnMan.TCustomActionBarClass.

4.5.12 ActnMan.TCustomActionControlClass Type

Pascal

```
TCustomActionControlClass = class of TCustomActionControl;
```

C++

```
TCustomActionControl TCustomActionControlClass;
```

File

ActnMan

Description

This is type ActnMan.TCustomActionControlClass.

4.5.13 ActnMan.TCustomColorMapClass Type

Pascal

```
TCustomColorMapClass = class of TCustomActionBarColorMap;
```

C++

```
TCustomActionBarColorMap TCustomColorMapClass;
```

File

ActnMan

Description

This is type ActnMan.TCustomColorMapClass.

4.5.14 ActnMan.TGetBarItemClassEvent Type

Pascal

```
TGetBarItemClassEvent = procedure (Sender: TCustomActionManager; var BarItemClass:
TActionBarItemClass) of object;
```

C++

```
(Sender: TCustomActionManager; var BarItemClass: TActionBarItemClass) (
TGetBarItemClassEvent)();
```

File

ActnMan

Description

This is type ActnMan.TGetBarItemClassEvent.

4.5.15 ActnMan.TGetBarsClassEvent Type

Pascal

```
TGetBarsClassEvent = procedure (Sender: TCustomActionManager; BarsClass: TActionBarsClass) of
object;
```

C++

```
(Sender: TCustomActionManager; BarsClass: TActionBarsClass) ( TGetBarsClassEvent)();
```

File

ActnMan

Description

This is type ActnMan.TGetBarsClassEvent.

4.5.16 ActnMan.TGetClientItemClassEvent Type

Pascal

```
TGetClientItemClassEvent = procedure (Sender: TCustomActionManager; var ClientItemClass:
TActionClientItemClass) of object;
```

C++

```
(Sender: TCustomActionManager; var ClientItemClass: TActionClientItemClass) (
TGetClientItemClassEvent)();
```

File

ActnMan

Description

This is type ActnMan.TGetClientItemClassEvent.

4.5.17 ActnMan.TGetClientsClassEvent Type

Pascal

```
TGetClientsClassEvent = procedure (Sender: TCustomActionManager; var ClientsClass:
TActionClientsClass) of object;
```

C++

```
(Sender: TCustomActionManager; var ClientsClass: TActionClientsClass) (
TGetClientsClassEvent)();
```

File

ActnMan

Description

This is type ActnMan.TGetClientsClassEvent.

4.5.18 ActnMan.TGetControlClassEvent Type

Pascal

```
TGetControlClassEvent = procedure (Sender: TCustomActionBar; AnItem: TActionClient; var
ControlClass: TCustomActionControlClass) of object;
```

C++

```
(Sender: TCustomActionBar; AnItem: TActionClient; var ControlClass: TCustomActionControlClass)
( TGetControlClassEvent)();
```

File

ActnMan

Description

This is type ActnMan.TGetControlClassEvent.

4.5.19 ActnMan.TMergeRange Type

Pascal

```
TMergeRange = 0..High(Integer);
```

C++

```
0..High(Integer) TMergeRange;
```

File

ActnMan

Description

This is type ActnMan.TMergeRange.

4.5.20 ActnMan.TStyleChanged Type

Pascal

```
TStyleChanged = procedure (Sender: TCustomActionManager) of object;
```

C++

```
(Sender: TCustomActionManager) ( TStyleChanged)();
```

File

ActnMan

Description

This is type ActnMan.TStyleChanged.

4.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
ActionBarDesigner (see page 575)	This is variable ActnMan.ActionBarDesigner.
ActionBarStyles (see page 575)	This is variable ActnMan.ActionBarStyles.
DefaultActnBarStyle (see page 575)	This is variable ActnMan.DefaultActnBarStyle.

4.6.1 ActnMan.ActionBarDesigner Variable

Pascal

```
ActionBarDesigner: IActionBarDesigner = nil;
```

C++

```
IActionBarDesigner ActionBarDesigner = nil;
```

File

ActnMan

Description

This is variable ActnMan.ActionBarDesigner.

4.6.2 ActnMan.ActionBarStyles Variable

Pascal

```
ActionBarStyles: TActionBarStyleList;
```

C++

```
TActionBarStyleList ActionBarStyles;
```

File

ActnMan

Description

This is variable ActnMan.ActionBarStyles.

4.6.3 ActnMan.DefaultActnBarStyle Variable

Pascal

```
DefaultActnBarStyle: string;
```

C++

```
AnsiString DefaultActnBarStyle;
```

File

ActnMan

Description

This is variable ActnMan.DefaultActnBarStyle.

4.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
caAllChanges (see page 577)	This is constant ActnMan.caAllChanges.
cDefaultSchedule (see page 577)	This is constant ActnMan.cDefaultSchedule.
CM_ENTERMENULOOP (see page 578)	This is constant ActnMan.CM_ENTERMENULOOP.
CM_ITEMCLICKED (see page 578)	This is constant ActnMan.CM_ITEMCLICKED.
CM_ITEMDROPPOINT (see page 578)	This is constant ActnMan.CM_ITEMDROPPOINT.
CM_ITEMKEYED (see page 579)	This is constant ActnMan.CM_ITEMKEYED.
CM_ITEMSELECTED (see page 579)	This is constant ActnMan.CM_ITEMSELECTED.
CM_RESETBAR (see page 579)	This is constant ActnMan.CM_RESETBAR.
CM_SCROLLCLICKED (see page 580)	This is constant ActnMan.CM_SCROLLCLICKED.
ControlDragMode (see page 580)	This is constant ActnMan.ControlDragMode.

4.7.1 ActnMan.caAllChanges Constant

Pascal

```
caAllChanges = [caModify, caMove, caDelete];
```

C++

```
caAllChanges = [caModify, caMove, caDelete];
```

File

ActnMan

Description

This is constant ActnMan.caAllChanges.

4.7.2 ActnMan.cDefaultSchedule Constant

Pascal

```
cDefaultSchedule: string = '0=3'#13#10'1=3'#13#10'2=6'#13#10'3=9'#13#10 +
'4=12'#13#10'5=12'#13#10'6=17'#13#10'7=17'#13#10 +
'8=17'#13#10'9=23'#13#10'10=23'#13#10'11=23'#13#10 +
'12=23'#13#10'13=23'#13#10'14=31'#13#10'15=31'#13#10 +
'16=31'#13#10'17=31'#13#10'18=31'#13#10'19=31'#13#10 +
'20=31'#13#10'21=31'#13#10'22=31'#13#10'23=31'#13#10 + '24=31'#13#10'25=31'#13#10;
```

C++

```
AnsiString cDefaultSchedule = '0=3'#13#10'1=3'#13#10'2=6'#13#10'3=9'#13#10 +
'4=12'#13#10'5=12'#13#10'6=17'#13#10'7=17'#13#10 +
'8=17'#13#10'9=23'#13#10'10=23'#13#10'11=23'#13#10 +
'12=23'#13#10'13=23'#13#10'14=31'#13#10'15=31'#13#10 +
'16=31'#13#10'17=31'#13#10'18=31'#13#10'19=31'#13#10 +
```

```
'20=31'#13#10'21=31'#13#10'22=31'#13#10'23=31'#13#10 + '24=31'#13#10'25=31'#13#10;
```

File

ActnMan

Description

This is constant ActnMan.cDefaultSchedule.

4.7.3 ActnMan.CM_ENTERMENULOOP Constant

Pascal

```
CM_ENTERMENULOOP = CM_BASE + $0410;
```

C++

```
CM_ENTERMENULOOP = CM_BASE + $0410;
```

File

ActnMan

Description

This is constant ActnMan.CM_ENTERMENULOOP.

4.7.4 ActnMan.CM_ITEMCLICKED Constant

Pascal

```
CM_ITEMCLICKED = CM_BASE + $0403;
```

C++

```
CM_ITEMCLICKED = CM_BASE + $0403;
```

File

ActnMan

Description

This is constant ActnMan.CM_ITEMCLICKED.

4.7.5 ActnMan.CM_ITEMDROPPOINT Constant

Pascal

```
CM_ITEMDROPPOINT = CM_BASE + $0411;
```

C++

```
CM_ITEMDROPPOINT = CM_BASE + $0411;
```

File

ActnMan

Description

This is constant ActnMan.CM_ITEMDROPPOINT.

4.7.6 ActnMan.CM_ITEMKEYED Constant

Pascal

```
CM_ITEMKEYED = CM_BASE + $0404;
```

C++

```
CM_ITEMKEYED = CM_BASE + $0404;
```

File

ActnMan

Description

This is constant ActnMan.CM_ITEMKEYED.

4.7.7 ActnMan.CM_ITEMSELECTED Constant

Pascal

```
CM_ITEMSELECTED = CM_BASE + $0402;
```

C++

```
CM_ITEMSELECTED = CM_BASE + $0402;
```

File

ActnMan

Description

This is constant ActnMan.CM_ITEMSELECTED.

4.7.8 ActnMan.CM_RESETBAR Constant

Pascal

```
CM_RESETBAR = CM_BASE + $0409;
```

C++

```
CM_RESETBAR = CM_BASE + $0409;
```

File

ActnMan

Description

This is constant ActnMan.CM_RESETBAR.

4.7.9 ActnMan.CM_SCROLLCLICKED Constant

Pascal

```
CM_SCROLLCLICKED = CM_BASE + $0406;
```

C++

```
CM_SCROLLCLICKED = CM_BASE + $0406;
```

File

ActnMan

Description

This is constant ActnMan.CM_SCROLLCLICKED.

4.7.10 ActnMan.ControlDragMode Constant

Pascal

```
ControlDragMode: array[Boolean] of TDragMode = (dmManual, dmAutomatic);
```

C++

```
array[Boolean] of TDragMode ControlDragMode = (dmManual, dmAutomatic);
```

File

ActnMan

Description

This is constant ActnMan.ControlDragMode.

5 ActnMenus Namespace

This is namespace ActnMenus.

Topics

Name	Description
Classes (see page 583)	The following table lists classes in this documentation.
Functions (see page 837)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 839)	The following table lists structs, records, enums in this documentation.
Types (see page 841)	The following table lists types in this documentation.
Variables (see page 846)	The following table lists variables in this documentation.

Classes

	Name	Description
	TActionBarStyleEx (see page 583)	TActionBarStyleEx is the implementation class for styles in Action Manager.
	TActionMainMenuBar (see page 585)	TActionMainMenuBar is a rendering engine that renders action client items as menu items.
	TCustomActionMainMenuBar (see page 661)	TCustomActionMainMenuBar is the ancestor for the TActionMainMenuBar (see page 585) component.
	TCustomActionMenuBar (see page 685)	TCustomActionMenuBar is the ancestor for action bands that render actions as menu item UI elements.
	TCustomActionPopupMenu (see page 721)	TCustomActionPopupMenu is the ancestor for popup action bands that render actions as popup menu item UI elements.
	TCustomAddRemoveItem (see page 745)	TCustomAddRemoveItem is the base class for the ActionBand menus for customizing action bands.
	TCustomizeActionClientItem (see page 756)	This is class ActnMenus.TCustomizeActionClientItem.
	TCustomizeActionLink (see page 759)	This is class ActnMenus.TCustomizeActionLink.
	TCustomizeActionToolBar (see page 762)	This is class ActnMenus.TCustomizeActionToolBar.
	TCustomMDIMenuButton (see page 781)	This is class ActnMenus.TCustomMDIMenuButton.
	TCustomMenuButton (see page 790)	TCustomMenuButton is the base class for ActionBand button controls.
	TCustomMenuExpandBtn (see page 805)	This is class ActnMenus.TCustomMenuExpandBtn.
	TCustomMenuItem (see page 816)	TCustomMenuItem is the base class for the ActionBand custom control TStandardMenuItem.
	TMenuStack (see page 833)	This is class ActnMenus.TMenuStack.

Functions

	Name	Description
	RegisterActnBarStyle (see page 837)	Registers an action band style so that it is available for use from TActionManager's Style property within the IDE.

	UnRegisterActnBarStyle (see page 837)	Unregisters an action band style from the IDE.

Structs, Records, Enums

	Name	Description
	TAnimationStyle (see page 839)	This is record ActnMenus.TAnimationStyle.
	TMDIButtonStyle (see page 839)	This is record ActnMenus.TMDIButtonStyle.

Types

Name	Description
TAddRemoveItemClass (see page 841)	This is type ActnMenus.TAddRemoveItemClass.
TCustomAddRemoveItemClass (see page 841)	This is type ActnMenus.TCustomAddRemoveItemClass.
TCustomizeActionToolBarClass (see page 842)	This is type ActnMenus.TCustomizeActionToolBarClass.
TCustomMenuExpandBtnClass (see page 842)	This is type ActnMenus.TCustomMenuExpandBtnClass.
TCustomPopupClass (see page 842)	This is type ActnMenus.TCustomPopupClass.
TExitMenuEvent (see page 843)	This is type ActnMenus.TExitMenuEvent.
TGetPopupClassEvent (see page 843)	This is type ActnMenus.TGetPopupClassEvent.
TMenuButtonControlClass (see page 843)	This is type ActnMenus.TMenuButtonControlClass.
TMenuEdges (see page 844)	This is type ActnMenus.TMenuEdges.
TMenuItemControlClass (see page 844)	This is type ActnMenus.TMenuItemControlClass.
TMenuPopupEvent (see page 844)	This is type ActnMenus.TMenuPopupEvent.
TUpdateActnMenusProc (see page 845)	This is type ActnMenus.TUpdateActnMenusProc.

Variables

Name	Description
MenuAddRemoveItemClass (see page 846)	This is variable ActnMenus.MenuAddRemoveItemClass.
MenuButtonControlClass (see page 846)	This is variable ActnMenus.MenuButtonControlClass.
MenuCustomizePopupClass (see page 847)	This is variable ActnMenus.MenuCustomizePopupClass.
MenuItemControlClass (see page 847)	This is variable ActnMenus.MenuItemControlClass.
MenuPopupClass (see page 847)	This is variable ActnMenus.MenuPopupClass.
UpdateActnMenusProc (see page 848)	This is variable ActnMenus.UpdateActnMenusProc.

5.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TActionBarStyleEx (see page 583)	TActionBarStyleEx is the implementation class for styles in Action Manager.
	TActionMainMenuBar (see page 585)	TActionMainMenuBar is a rendering engine that renders action client items as menu items.
	TCustomActionMainMenuBar (see page 661)	TCustomActionMainMenuBar is the ancestor for the TActionMainMenuBar (see page 585) component.
	TCustomActionMenuBar (see page 685)	TCustomActionMenuBar is the ancestor for action bands that render actions as menu item UI elements.
	TCustomActionPopupMenu (see page 721)	TCustomActionPopupMenu is the ancestor for popup action bands that render actions as popup menu item UI elements.
	TCustomAddRemoveItem (see page 745)	TCustomAddRemoveItem is the base class for the ActionBand menus for customizing action bands.
	TCustomizeActionClientItem (see page 756)	This is class ActnMenus.TCustomizeActionClientItem.
	TCustomizeActionLink (see page 759)	This is class ActnMenus.TCustomizeActionLink.
	TCustomizeActionToolBar (see page 762)	This is class ActnMenus.TCustomizeActionToolBar.
	TCustomMDIMenuButton (see page 781)	This is class ActnMenus.TCustomMDIMenuButton.
	TCustomMenuButton (see page 790)	TCustomMenuButton is the base class for ActionBand button controls.
	TCustomMenuExpandBtn (see page 805)	This is class ActnMenus.TCustomMenuExpandBtn.
	TCustomMenuItem (see page 816)	TCustomMenuItem is the base class for the ActionBand custom control TStandardMenuItem.
	TMenuStack (see page 833)	This is class ActnMenus.TMenuStack.

5.1.1 TActionBarStyleEx Class

TActionBarStyleEx is the implementation class for styles in Action Manager.

Class Hierarchy

Pascal

```
TActionBarStyleEx = class(TActionBarStyle);
```

C++

```
class TActionBarStyleEx : public TActionBarStyle;
```

File

ActnMenus

Description

When you select alternate styles for action band components, Action Manager uses TActionBarStyleEx to implement the approprite controls.

Note: When switching between alternate styles in Action Manager (such as XP and standard), the appropriate controls will be added to the uses clause automatically (such as XPStyleActnCtrls or StdStyleActnCtrls). If you want to reduce the amount of code that will be linked into your application, remove the unused control statement from the uses clause.

See Also

TActionManager (see page 432)

5.1.1.1 TActionBarStyleEx Members

The following tables list the members exposed by TActionBarStyleEx.

Public Methods

	Name	Description
	GetAddRemoveItemClass (see page 584)	Returns the base class for ActionBand menus for customizing action bands.
	GetColorMapClass (see page 359)	Returns the class type of the colormap for an action bar.
	GetControlClass (see page 359)	Returns the control class type on an action bar item.
	GetPopupClass (see page 584)	Returns the popup class added to a menu action band.
	GetScrollBtnClass (see page 585)	This is GetScrollBtnClass, a member of class TActionBarStyleEx.
	GetStyleName (see page 360)	Returns the style associated with action manager.

5.1.1.2 TActionBarStyleEx Methods

The methods of the TActionBarStyleEx class are listed here.

Public Methods

	Name	Description
	GetAddRemoveItemClass (see page 584)	Returns the base class for ActionBand menus for customizing action bands.
	GetPopupClass (see page 584)	Returns the popup class added to a menu action band.
	GetScrollBtnClass (see page 585)	This is GetScrollBtnClass, a member of class TActionBarStyleEx.

5.1.1.2.1 TActionBarStyleEx.GetAddRemoveItemClass Method

Returns the base class for ActionBand menus for customizing action bands.

Pascal

```
function GetAddRemoveItemClass(ActionBar: TCustomActionBar): TCustomAddRemoveItemClass;
virtual; abstract;
```

C++

```
virtual __fastcall TCustomAddRemoveItemClass GetAddRemoveItemClass(TCustomActionBar ActionBar)
= 0;
```

Description

Call GetAddRemoveItemClass to customize action bands.

See Also

TCustomAddRemoveItem (see page 745)

5.1.1.2.2 TActionBarStyleEx.GetPopupClass Method

Returns the popup class added to a menu action band.

Pascal

```
function GetPopupClass(ActionBar: TCustomActionBar): TCustomPopupClass; virtual; abstract;
```

C++

```
virtual __fastcall TCustomPopupClass GetPopupClass(TCustomActionBar ActionBar) = 0;
```

Description

Call GetPopupClass to find the popup menu associated with a menu action band. Override GetPopupClass to change which popup class is associated with a menu action band depending on the state of the control.

See Also

TCustomActionPopupMenu (see page 721)

5.1.1.2.3 TActionBarStyleEx.GetScrollBtnClass Method

Pascal

```
function GetScrollBtnClass: TCustomToolScrollBtnClass; virtual; abstract;
```

C++

```
virtual __fastcall TCustomToolScrollBtnClass GetScrollBtnClass() = 0;
```

Description

This is GetScrollBtnClass, a member of class TActionBarStyleEx.

5.1.2 TActionMainMenuBar Class

TActionMainMenuBar is a rendering engine that renders action client items as menu items.

Class Hierarchy

Pascal

```
TActionMainMenuBar = class(TCustomActionMainMenuBar);
```

C++

```
class TActionMainMenuBar : public TCustomActionMainMenuBar;
```

File

ActnMenus

Description

TActionMainMenuBar is a specialized container (like TPanel) that renders a group of items on screen in the order specified in the Action Manager. All of the items are created dynamically when the TActionMainMenuBar component is connected to an item from the Action Manager.

The items themselves are internal components (similar to TMenuItem) created by the TActionMainMenuBar and appear consistent with the look and function of a main menu. The layout of the items on the TActionMainMenuBar is managed automatically and specified by the Action Manager.

5.1.2.1 TActionMainMenuBar Members

The following tables list the members exposed by TActionMainMenuBar.

Protected Events

	Name	Description
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FCachedMenu (see page 699)	This is FCachedMenu, a member of class TCustomActionMenuBar.
	FChildMenu (see page 699)	This is FChildMenu, a member of class TCustomActionMenuBar.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefaultColorMap (see page 460)	This is FDefaultColorMap, a member of class TCustomActionBar.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExpandTimer (see page 700)	This is FExpandTimer, a member of class TCustomActionMenuBar.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FPopupTimer (see page 700)	This is FPopupTimer, a member of class TCustomActionMenuBar.
	FSavedWrapState (see page 460)	This is FSavedWrapState, a member of class TCustomActionBar.
	FSelectedItem (see page 700)	This is FSelectedItem, a member of class TCustomActionMenuBar.
	FWindowMenuItem (see page 676)	This is FWindowMenuItem, a member of class TCustomActionMainMenuBar.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 462)	Aligns any controls for which the control is the parent within a specified area of the control.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.

	Animate (see page 701)	This is Animate, a member of class TCustomActionMenuBar.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
V	AutoSizingChanged (see page 462)	This is AutoSizingChanged, a member of class TCustomActionBar.
	BackgroundSize (see page 462)	This is BackgroundSize, a member of class TCustomActionBar.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CalcInsertPosition (see page 462)	This is CalcInsertPosition, a member of class TCustomActionBar.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	CleanupStack (see page 701)	This is CleanupStack, a member of class TCustomActionMenuBar.
V	Clear (see page 463)	This is Clear, a member of class TCustomActionBar.
	ClearSubMenus (see page 702)	This is ClearSubMenus, a member of class TCustomActionMenuBar.
	Click (see page 5743)	Respond to user click.
	CMBorderChanged (see page 23285)	This is CMBorderChanged, a member of class TToolWindow.
	CMCtl3DChanged (see page 23286)	This is CMCtl3DChanged, a member of class TToolWindow.
	CMWininichange (see page 678)	This is CMWininichange, a member of class TCustomActionMainMenuBar.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
V	CreateControl (see page 463)	This is CreateControl, a member of class TCustomActionBar.
V	CreateControl (see page 678)	This is CreateControl, a member of class TCustomActionMainMenuBar.
V	CreateControl (see page 702)	This is CreateControl, a member of class TCustomActionMenuBar.
V	CreateControls (see page 463)	This is CreateControls, a member of class TCustomActionBar.
V	CreateControls (see page 678)	This is CreateControls, a member of class TCustomActionMainMenuBar.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreatePopup (see page 702)	This is CreatePopup, a member of class TCustomActionMenuBar.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 463)	Returns placement order of custom-aligned child control.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 464)	Returns aligned position of custom-aligned child control.
V	CustomAlignPosition (see page 678)	Returns aligned position of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.

	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 465)	This is DesignWndProc, a member of class TCustomActionBar.
	DesignWndProc (see page 679)	This is DesignWndProc, a member of class TCustomActionMainMenuBar.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoControlCreated (see page 465)	This is DoControlCreated, a member of class TCustomActionBar.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoDropActions (see page 465)	This is DoDropActions, a member of class TCustomActionBar.
	DoDropCategory (see page 465)	This is DoDropCategory, a member of class TCustomActionBar.
	DoDropItem (see page 466)	This is DoDropItem, a member of class TCustomActionBar.
	DoEndDock (see page 146)	OnEndDock event dispatcher.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoGetControlClass (see page 466)	This is DoGetControlClass, a member of class TCustomActionBar.
	DoGetPopupClass (see page 703)	This is DoGetPopupClass, a member of class TCustomActionMenuBar.
	DoItemClicked (see page 703)	This is DoItemClicked, a member of class TCustomActionMenuBar.
	DoItemKeyed (see page 703)	This is DoItemKeyed, a member of class TCustomActionMenuBar.
	DoItemSelected (see page 703)	This is DoItemSelected, a member of class TCustomActionMenuBar.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMenuDelay (see page 703)	This is DoMenuDelay, a member of class TCustomActionMenuBar.
	DoMouseIdle (see page 704)	This is DoMouseIdle, a member of class TCustomActionMenuBar.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoneMenuLoop (see page 679)	This is DoneMenuLoop, a member of class TCustomActionMainMenuBar.
	DoneMenuLoop (see page 704)	This is DoneMenuLoop, a member of class TCustomActionMenuBar.
	DoPopup (see page 704)	This is DoPopup, a member of class TCustomActionMenuBar.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 147)	OnStartDock event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 466)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawBackground (see page 467)	This is DrawBackground, a member of class TCustomActionBar.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.

	ExecAction (see page 704)	This is ExecAction, a member of class TCustomActionMenuBar.
	Expand (see page 704)	Causes the menu bar to show all items, including the hidden ones.
	ExpandTimer (see page 705)	This is ExpandTimer, a member of class TCustomActionMenuBar.
	FindAccelItem (see page 467)	This is FindAccelItem, a member of class TCustomActionBar.
	FindItemAt (see page 468)	This is FindItemAt, a member of class TCustomActionBar.
	FindItemCaption (see page 468)	This is FindItemCaption, a member of class TCustomActionBar.
	FindLast (see page 468)	This is FindLast, a member of class TCustomActionBar.
	FindLeastUsedItem (see page 469)	This is FindLeastUsedItem, a member of class TCustomActionBar.
	FindNearestControl (see page 469)	This is FindNearestControl, a member of class TCustomActionBar.
	FindNext (see page 470)	This is FindNext, a member of class TCustomActionBar.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FindNextVisibleItem (see page 470)	This is FindNextVisibleItem, a member of class TCustomActionBar.
	FindPrevious (see page 470)	This is FindPrevious, a member of class TCustomActionBar.
	FindPreviousVisibleItem (see page 470)	This is FindPreviousVisibleItem, a member of class TCustomActionBar.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionControl (see page 471)	This is GetActionControl, a member of class TCustomActionBar.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetActiveMDIChild (see page 679)	This is GetActiveMDIChild, a member of class TCustomActionMainMenuBar.
	GetBannerWidth (see page 471)	This is GetBannerWidth, a member of class TCustomActionBar.
	GetBarHeight (see page 471)	This is GetBarHeight, a member of class TCustomActionBar.
	GetBarWidth (see page 471)	This is GetBarWidth, a member of class TCustomActionBar.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlClass (see page 471)	This is GetControlClass, a member of class TCustomActionBar.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDefaultColorMapClass (see page 472)	This is GetDefaultColorMapClass, a member of class TCustomActionBar.
	GetDefaultSounds (see page 705)	This is GetDefaultSounds, a member of class TCustomActionMenuBar.
	GetDesignMode (see page 472)	This is GetDesignMode, a member of class TCustomActionBar.
	GetDesignMode (see page 705)	This is GetDesignMode, a member of class TCustomActionMenuBar.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 147)	Returns the class used for the control when it is floating.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetMouseHoverItem (see page 705)	This is GetMouseHoverItem, a member of class TCustomActionMenuBar.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupClass (see page 706)	This is GetPopupClass, a member of class TCustomActionMenuBar.

	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetPopupMenuClass (see page 472)	This is GetPopupMenuClass, a member of class TCustomActionBar.
	GetSelected (see page 706)	This is GetSelected, a member of class TCustomActionMenuBar.
V	GetSiteInfo (see page 147)	Generates an OnGetSiteInfo event
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasItems (see page 472)	This is HasItems, a member of class TCustomActionBar.
	Idle (see page 706)	This is Idle, a member of class TCustomActionMenuBar.
V	InitMenuLoop (see page 706)	This is InitMenuLoop, a member of class TCustomActionMenuBar.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsDesignMsg (see page 707)	This is IsDesignMsg, a member of class TCustomActionMenuBar.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
V	ItemCount (see page 473)	This is ItemCount, a member of class TCustomActionBar.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 148)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 473)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 707)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndHook (see page 680)	This is MainWndHook, a member of class TCustomActionMainMenuBar.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MDIChildMaximized (see page 680)	This is MDIChildMaximized, a member of class TCustomActionMainMenuBar.
	MDIChildRestored (see page 680)	This is MDIChildRestored, a member of class TCustomActionMainMenuBar.
V	MouseActivate (see page 707)	This is MouseActivate, a member of class TCustomActionMenuBar.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	NCPaint (see page 473)	This is NCPaint, a member of class TCustomActionBar.
V	NCPaint (see page 23286)	This is NCPaint, a member of class TToolWindow.
V	NewPopup (see page 680)	This is NewPopup, a member of class TCustomActionMainMenuBar.
V	NewPopup (see page 707)	This is NewPopup, a member of class TCustomActionMenuBar.
V	Notification (see page 473)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 681)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 708)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 474)	This is Paint, a member of class TCustomActionBar.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 474)	Renders the image of a windowed control.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.

	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	ProcessMenuLoop (see page 708)	This is ProcessMenuLoop, a member of class TCustomActionMenuBar.
	ProcessMessage (see page 708)	This is ProcessMessage, a member of class TCustomActionMenuBar.
	ProcessMessages (see page 709)	This is ProcessMessages, a member of class TCustomActionMenuBar.
	ProcessMouseMsg (see page 681)	This is ProcessMouseMsg, a member of class TCustomActionMainMenuBar.
	ProcessMouseMsg (see page 709)	This is ProcessMouseMsg, a member of class TCustomActionMenuBar.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	RefreshMDIMenu (see page 681)	This is RefreshMDIMenu, a member of class TCustomActionMainMenuBar.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Reset (see page 475)	This is Reset, a member of class TCustomActionBar.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Select (see page 709)	This is Select, a member of class TCustomActionMenuBar.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectItem (see page 710)	This is SelectItem, a member of class TCustomActionMenuBar.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 475)	This is SetActionClient, a member of class TCustomActionBar.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetAutoSizing (see page 475)	This is SetAutoSizing, a member of class TCustomActionBar.
	SetBiDiMode (see page 475)	Sets the control's bi-directional mode.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetColorMap (see page 476)	This is SetColorMap, a member of class TCustomActionBar.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignMode (see page 476)	This is SetDesignMode, a member of class TCustomActionBar.
	SetDesignMode (see page 681)	Specifies whether the whether the action band is being customized or being used in the IDE.
	SetDesignMode (see page 710)	Specifies whether the whether the action band is being customized or being used in the IDE.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetOrientation (see page 477)	This is SetOrientation, a member of class TCustomActionBar.
V	SetParent (see page 710)	Sets the parent of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetPersistentHotKeys (see page 477)	This is SetPersistentHotKeys, a member of class TCustomActionBar.
V	SetPersistentHotKeys (see page 711)	This is SetPersistentHotKeys, a member of class TCustomActionMenuBar.
V	SetSpacing (see page 477)	This is SetSpacing, a member of class TCustomActionBar.
	SetupDefaultColorMap (see page 477)	This is SetupDefaultColorMap, a member of class TCustomActionBar.
	SetupWindowMenu (see page 682)	This is SetupWindowMenu, a member of class TCustomActionMainMenuBar.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	VisibleChanging (see page 478)	Provides the interface for a method that responds to changes in the control's visibility.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMKeyDown (see page 682)	This is WMKeyDown, a member of class TCustomActionMainMenuBar.
	WMNCCalcSize (see page 23286)	This is WMNCCalcSize, a member of class TToolWindow.
	WMNCHitTest (see page 682)	This is WMNCHitTest, a member of class TCustomActionMainMenuBar.
	WMNCPaint (see page 23286)	This is WMNCPaint, a member of class TToolWindow.
	WMSysCommand (see page 683)	This is WMSysCommand, a member of class TCustomActionMainMenuBar.
	WMSysKeyDown (see page 683)	This is WMSysKeyDown, a member of class TCustomActionMainMenuBar.
	WMSysKeyUp (see page 683)	This is WMSysKeyUp, a member of class TCustomActionMainMenuBar.
V	WndProc (see page 711)	Provides specific message responses for the control.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DelayItem (see page 717)	This is DelayItem, a member of class TCustomActionMenuBar.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	Expandable (see page 717)	This is Expandable, a member of class TCustomActionMenuBar.
	Expanded (see page 718)	This is Expanded, a member of class TCustomActionMenuBar.
R	HRowCount (see page 488)	Indicates the number of columns of items that the action band displays.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Items (see page 488)	Lists the action clients that correspond to the child controls of this action band.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	MouseControl (see page 718)	This is MouseControl, a member of class TCustomActionMenuBar.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentMenu (see page 719)	This is ParentMenu, a member of class TCustomActionMenuBar.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
R	PopupStack (see page 719)	This is PopupStack, a member of class TCustomActionMenuBar.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
R	Selected (see page 719)	This is Selected, a member of class TCustomActionMenuBar.
	Text (see page 5842)	Contains a text string associated with the control.
R	VRowCount (see page 490)	Indicates the number of rows of items that the action band displays.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
R	Widest (see page 491)	This is Widest, a member of class TCustomActionBar.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.

	CalcDockedWidth (see page 146)	This is CalcDockedWidth, a member of class TCustomActionDockBar.
	CanFocus (see page 677)	Indicates whether a TActionMainMenuBar (see page 585) component can receive focus.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	CloseMenu (see page 677)	Closes the menu currently being displayed.
	CloseMenu (see page 702)	Closes the menu currently being displayed.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 145)	Creates and initializes a TCustomActionDockBar (see page 133) instance.
	Create (see page 459)	Creates and initializes a TCustomActionBar (see page 447) instance.
	Create (see page 675)	Creates and initializes a TCustomActionMainMenuBar (see page 661) instance.
	Create (see page 698)	Creates and initializes a TCustomActionMenuBar (see page 685) instance.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 5731)	Creates an instance of TControl (see page 5724).
	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 23285)	Creates and initializes a TToolWindow (see page 23274) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
