	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 459)	Destroys an instance of TCustomActionBar (see page 447).
	Destroy (see page 676)	Destroys an instance of TCustomActionMainMenuBar (see page 661).
	Destroy (see page 698)	Destroys an instance of TCustomActionMenuBar (see page 685).
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 146)	Used internally to dock the action band.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 466)	Generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.

	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
V	FindFirst (see page 467)	Finds the first TActionClientItem (see page 374) in the Items (see page 488) list.
	FindFirstVisibleItem (see page 468)	Finds the first visible TActionClientItem (see page 374) in the Items (see page 488) list.
	FindLastVisibleItem (see page 469)	Finds the last visibleTActionClientItem in the Items (see page 488) list.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	RecreateControls (see page 475)	Destroys and recreates all of the action band's action client controls.
	RecreateControls (see page 709)	Destroys and recreates all of the action band's action client controls.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
	SetBounds (see page 476)	Sets the bounds based on whether the popup is expanded or not
	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetDesignVisible (see page 6178)	Makes a control visible at design time.
	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Style (see page 477)	Identifies the style object that gives the application its default look and feel.
	Style (see page 711)	Retrieves the style used by the ActionBand menu that started the menu loop so the submenus have a consistent appearance.
	TrackMenu (see page 682)	Executes the action associated with the menu item.
	TrackMenu (see page 711)	Executes the action associated with the menu item.
	Update (see page 5789)	Processes any pending paint messages immediately.
	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.

	ActionClient (see page 479)	Specifies the action client associated with this action band.
R	ActionControls (see page 479)	Lists the controls on the action band.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	AutoSizing (see page 480)	Specifies whether the action band adjusts its size automatically to fit around its child controls.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	Canvas (see page 607)	Represents the drawing surface of the action band.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	ContextBar (see page 485)	Indicates whether items shown in this action band represent the items in a popup menu.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Designable (see page 485)	Specifies whether the action band can be customized (used internally by the IDE).
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignMode (see page 486)	Specifies whether the action band is being customized or being used in the IDE.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HorzSeparator (see page 487)	Indicates whether a horizontal separator bar appears between item lines.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	Inactive (see page 683)	Specifies whether the action band is disabled or enabled.
	InMenuLoop (see page 718)	Indicates whether items in the menu can be selected.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	Orientation (see page 488)	Specifies how the action band lays out its child items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.

	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentControl (see page 718)	Refers to the parent object of the TCustomActionBarControl.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	RootMenu (see page 719)	Refers to the root menu of the ActionBand menu.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	VertSeparator (see page 490)	Indicates whether a vertical separator bar should appear between item lines.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 625)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 626)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 627)	Occurs when an attempt is made to resize the control.
	OnClick (see page 627)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 629)	Adjust resize constraints.
	OnContextPopup (see page 629)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnControlCreated (see page 630)	Occurs when a control is created on the action band.
	OnDblClick (see page 631)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 631)	Occurs when another control is docked to the control.
	OnDockOver (see page 633)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 635)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 637)	Occurs when the user drags an object over a control.
	OnEndDock (see page 640)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 640)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 641)	Occurs when a control receives the input focus.
	OnEnterMenuLoop (see page 643)	Occurs when an ActionBand menu loop has begun.
	OnExit (see page 644)	Occurs when the input focus shifts away from one control to another.
	OnExitMenuLoop (see page 645)	Occurs when an ActionBand menu loop has ended and the menu is closed.
	OnGetControlClass (see page 645)	Occurs when an item is to be placed on the action band.
	OnGetPopupClass (see page 646)	Occurs prior to an ActionBand popupmenu appearing on screen.
	OnGetSiteInfo (see page 646)	Returns the control's docking information.
	OnMouseActivate (see page 648)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 649)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 651)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 654)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 656)	Occurs when the action band is painted.
	OnPopup (see page 656)	Occurs just before the pop-up menu appears.
	OnResize (see page 657)	Occurs immediately after the control is resized.
	OnStartDock (see page 657)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 658)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

	OnUnDock (see page 658)	Occurs when the application tries to undock a control that is docked to the windowed control.

Published Properties

	Name	Description
	ActionManager (see page 601)	Specifies the action manager component that is associated with the action band.
	Align (see page 601)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	AllowHiding (see page 605)	Determines whether the action band can be hidden.
	Anchors (see page 605)	Specifies how the control is anchored to its parent.
	AnimateDuration (see page 605)	This is AnimateDuration, a member of class TActionMainMenuBar.
	AnimationStyle (see page 606)	Specifies the type of animation the menu bar will display as it opens.
	AutoFocus (see page 606)	This is AutoFocus, a member of class TActionMainMenuBar.
	BiDiMode (see page 606)	Specifies the bi-directional mode for the control.
	Caption (see page 607)	Specifies a text string that identifies the control to the user.
	Color (see page 610)	Specifies the background color of the control.
	ColorMap (see page 610)	Indicates the colormap for individual action band components.
	Constraints (see page 611)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 612)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 612)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 612)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EdgeBorders (see page 614)	Determines which sides of the control have visible borders.
	EdgeInner (see page 614)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 615)	Determines the border style for the control's outer edge.
	Enabled (see page 615)	Controls whether the control responds to mouse, keyboard, and timer events.
	ExpandDelay (see page 616)	Specifies, in milliseconds, the delay period that a menu action band uses before showing hidden or unused items.
	Font (see page 616)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	HorzMargin (see page 617)	Specifies the width of the horizontal margins in pixels.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBackground (see page 617)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 617)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 618)	Determines where a control looks for its color information.
	ParentFont (see page 618)	Determines where a control looks for its font information.
	ParentShowHint (see page 619)	Determines where a control looks to find out if its Help Hint should be shown.
	PersistentHotKeys (see page 619)	Specifies whether keyboard accelerator shortcuts are always displayed.
	Shadows (see page 620)	Refers to the TActionMainMenuBar component's shadow.
	ShowHint (see page 620)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Spacing (see page 622)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.

	UseSystemFont (see page 622)	Specifies whether the default system font for menu items is used.
	VertMargin (see page 622)	Specifies the width of the vertical margins in pixels.
	Visible (see page 623)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.
	WindowMenu (see page 624)	Specifies the caption of the window menu.

5.1.2.2 TActionMainMenuBar Properties

The properties of the TActionMainMenuBar class are listed here.

Public Properties

	Name	Description
	Canvas (see page 607)	Represents the drawing surface of the action band.

Published Properties

	Name	Description
	ActionManager (see page 601)	Specifies the action manager component that is associated with the action band.
	Align (see page 601)	Determines how the control aligns within its container (parent control).
	AllowHiding (see page 605)	Determines whether the action band can be hidden.
	Anchors (see page 605)	Specifies how the control is anchored to its parent.
	AnimateDuration (see page 605)	This is AnimateDuration, a member of class TActionMainMenuBar.
	AnimationStyle (see page 606)	Specifies the type of animation the menu bar will display as it opens.
	AutoFocus (see page 606)	This is AutoFocus, a member of class TActionMainMenuBar.
	BiDiMode (see page 606)	Specifies the bi-directional mode for the control.
	Caption (see page 607)	Specifies a text string that identifies the control to the user.
	Color (see page 610)	Specifies the background color of the control.
	ColorMap (see page 610)	Indicates the colormap for individual action band components.
	Constraints (see page 611)	Specifies the size constraints for the control.
	DragCursor (see page 612)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 612)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 612)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EdgeBorders (see page 614)	Determines which sides of the control have visible borders.
	EdgeInner (see page 614)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 615)	Determines the border style for the control's outer edge.
	Enabled (see page 615)	Controls whether the control responds to mouse, keyboard, and timer events.
	ExpandDelay (see page 616)	Specifies, in milliseconds, the delay period that a menu action band uses before showing hidden or unused items.
	Font (see page 616)	Controls the attributes of text written on or in the control.
	HorzMargin (see page 617)	Specifies the width of the horizontal margins in pixels.
	ParentBackground (see page 617)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 617)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 618)	Determines where a control looks for its color information.
	ParentFont (see page 618)	Determines where a control looks for its font information.
	ParentShowHint (see page 619)	Determines where a control looks to find out if its Help Hint should be shown.
	PersistentHotKeys (see page 619)	Specifies whether keyboard accelerator shortcuts are always displayed.
	Shadows (see page 620)	Refers to the TActionMainMenuBar component's shadow.
	ShowHint (see page 620)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Spacing (see page 622)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	UseSystemFont (see page 622)	Specifies whether the default system font for menu items is used.
	VertMargin (see page 622)	Specifies the width of the vertical margins in pixels.
	Visible (see page 623)	Determines whether the component appears onscreen.
	WindowMenu (see page 624)	Specifies the caption of the window menu.

5.1.2.2.1 TActionMainMenuBar.ActionManager Property

Specifies the action manager component that is associated with the action band.

Pascal

```
property ActionManager: TCustomActionManager;
```

C++

```
__property TCustomActionManager ActionManager;
```

Description

Use ActionManager to access the action manager that uses this action band to render UI elements it manages. Typically, this association is created when you drag actions from the action manager and drop them on the action bar. When an action is dropped on an action band and the ActionManager property is not assigned, the ActionManager property is automatically assigned to the action manager that manages the action that was dropped on the action band.

At runtime, you can perform the equivalent operation to dragging an action onto the action band by setting the ActionBar property of one of the action clients that the action manager's ActionBars property lists so that it specifies this component.

See Also

ActionBars (see page 553)

ActionClient (see page 479)

ActionBar (see page 370)

5.1.2.2.2 TActionMainMenuBar.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
```

```
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
```

```
}

var
  I: Integer;

    clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia, clTeal,
    clNavy, clMaroon, clLime, clOlive, clPurple);
var
  i: Integer;
begin
  PageControl1 := TPageControl.Create(Self);
  PageControl1.Parent := Self;
  PageControl1.Align := alClient;
  for i := Low(TabTitles) to High(TabTitles) do
  begin
    pts[i]:= TTabSheet.Create(PageControl1);
    with pts[i] do
    begin
      PageControl := PageControl1;
      Name := 'ts' + TabTitles[i];
      Caption := TabTitles[i];
      Brush.Color := colorPalette[i];
   end;
  end;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  i: Integer;
begin
  for i := Low(TabTitles) to High(TabTitles) do
  begin
    pts[i].Free;
  end;
  PageControl1.Free;
end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

5.1.2.2.3 TActionMainMenuBar.AllowHiding Property

Determines whether the action band can be hidden.

Pascal

```
property AllowHiding: Boolean;
```

C++

```
__property Boolean AllowHiding;
```

Description

Use AllowHiding to specify whether the action band can be hidden at runtime, if the application allows runtime customization by the end user. Setting AllowHiding to true allows the action band to be hidden at runtime. If AllowHiding is set to false, the action cannot be hidden. Certain action bands, such as the main menu action band, should set this AllowHiding to false.

5.1.2.2.4 TActionMainMenuBar.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

5.1.2.2.5 TActionMainMenuBar.AnimateDuration Property

Pascal

```
property AnimateDuration: Integer;
```

C++

```
__property int AnimateDuration;
```

Description

This is AnimateDuration, a member of class TActionMainMenuBar.

5.1.2.2.6 TActionMainMenuBar.AnimationStyle Property

Specifies the type of animation the menu bar will display as it opens.

Pascal

```
property AnimationStyle: TAnimationStyle;
```

C++

```
__property TAnimationStyle AnimationStyle;
```

Description

Use AnimationStyle to change the style of animation used by the items in the menu bar as they open. The options are:.

Value	Animation Description
asNone	No animation is used; the menu appears fully formed.
asDefault	The operating system default animation style is used.
asUnfold	The menu unfolds diagonally down from the upper left corner.
asSlide	The menu slides from the top down.
asFade	The menu fades in from invisible to visible.

5.1.2.2.7 TActionMainMenuBar.AutoFocus Property

Pascal

```
property AutoFocus: Boolean;
```

C++

```
__property Boolean AutoFocus;
```

Description

This is AutoFocus, a member of class TActionMainMenuBar.

5.1.2.2.8 TActionMainMenuBar.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data

aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

Including Bi-directional Functionality in Applications

5.1.2.2.9 TActionMainMenuBar.Canvas Property

Represents the drawing surface of the action band.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

TCustomActionBar uses Canvas internally to render the background on which its child controls appear.

5.1.2.2.10 TActionMainMenuBar.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
```

```
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
```

```
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
```

```
end;
```

5.1.2.2.11 TActionMainMenuBar.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

5.1.2.2.12 TActionMainMenuBar.ColorMap Property

Indicates the colormap for individual action band components.

Pascal

```
property ColorMap: TCustomActionBarColorMap;
```

C++

```
__property TCustomActionBarColorMap ColorMap;
```

Description

Use the ColorMap property to change the default colormap for individual action band components. By default, the ColorMap property is set according to the first registered TActionBarStyleEx class. Otherwise, if the action band is linked to an action manager, the property defaults to the ColorMap as specified by the Style property of the action manager.

Note: To centrally set or change the default look and feel of all action band components, use ActionManager's Style property. To centrally control the colors used by all action bands within an application, connect the action bands to a single colormap component.

See Also

TActionManager (see page 432)

TStandardColorMap (see page 2)

TTwilightColorMap (see page 13)

Style (see page 556)

5.1.2.2.13 TActionMainMenuBar.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

5.1.2.2.14 TActionMainMenuBar.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

5.1.2.2.15 TActionMainMenuBar.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

5.1.2.2.16 TActionMainMenuBar.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

Arranging the Order of Persistent Columns

5.1.2.2.17 TActionMainMenuBar.EdgeBorders Property

Determines which sides of the control have visible borders.

Pascal

```
property EdgeBorders: TEdgeBorders;
```

C++

```
__property TEdgeBorders EdgeBorders;
```

Description

Use the EdgeBorders property to add or remove borders. The appearance of the borders can be set with the EdgeInner and EdgeOuter properties.

See Also

EdgeInner (see page 23287)

EdgeOuter (see page 23288)

5.1.2.2.18 TActionMainMenuBar.EdgeInner Property

Determines the border style for the control's inner edge.

Pascal

```
property EdgeInner: TEdgeStyle;
```

C++

```
__property TEdgeStyle EdgeInner;
```

Description

Use EdgeInner to provide the tool window with a three-dimensional beveled look. A tool window has two borders on each side, an outer border drawn next to the outer edge, and an inner border drawn inside the outer border. EdgeInner specifies the appearance of the inner border. It can be raised (esRaised), lowered (esLowered), or left off altogether (esNone).

Note: The EdgeInner property has an effect only on the sides specified by the EdgeBorders property.

Use EdgeInner with EdgeOuter to give the component a three-dimensional look.

See Also

EdgeBorders (see page 23287)

EdgeOuter (see page 23288)

5.1.2.2.19 TActionMainMenuBar.EdgeOuter Property

Determines the border style for the control's outer edge.

Pascal

```
property EdgeOuter: TEdgeStyle;
```

C++

```
__property TEdgeStyle EdgeOuter;
```

Description

Use EdgeOuter to provide the tool window with a three-dimensional beveled look. A tool window has two borders on each side, an outer border drawn next to the outer edge, and an inner border drawn inside the outer border. EdgeOuter specifies the appearance of the outer border. It can be raised (esRaised), lowered (esLowered), or left off altogether (esNone).

Note: The EdgeInner property has an effect only on the sides specified by the EdgeBorders property.

Use EdgeOuter with EdgeInner to give the component a three-dimensional look.

See Also

EdgeBorders (see page 23287)

EdgeInner (see page 23287)

5.1.2.2.20 TActionMainMenuBar.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

5.1.2.2.21 TActionMainMenuBar.ExpandDelay Property

Specifies, in milliseconds, the delay period that a menu action band uses before showing hidden or unused items.

Pascal

```
property ExpandDelay: Integer;
```

C++

```
__property int ExpandDelay;
```

Description

Use ExpandDelay to specify, in milliseconds, the delay period that a menu action band uses before showing hidden or unused items. The default is 4000 milliseconds.

5.1.2.2.22 TActionMainMenuBar.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
```

```
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

See Also

DesktopFont (see page 5818)

ParentFont (see page 5834)

Displaying and Editing Text in a Memo Control

5.1.2.2.23 TActionMainMenuBar.HorzMargin Property

Specifies the width of the horizontal margins in pixels.

Pascal

```
property HorzMargin: Integer;
```

C++

```
__property int HorzMargin;
```

Description

HorzMargin specifies the width of the action band's left and right horizontal margins in pixels.

See Also

VertMargin (see page 490)

VertSeparator (see page 490)

5.1.2.2.24 TActionMainMenuBar.ParentBackground Property

Determines whether control uses parent's theme background.

Pascal

```
property ParentBackground: Boolean;
```

C++

```
__property Boolean ParentBackground;
```

Description

If ParentBackground is true, the control uses the parent's theme background to draw its own background. ParentBackground has no effect unless XP themes are enabled.

5.1.2.2.25 TActionMainMenuBar.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

5.1.2.2.26 TActionMainMenuBar.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

5.1.2.2.27 TActionMainMenuBar.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

5.1.2.2.28 TActionMainMenuBar.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

5.1.2.2.29 TActionMainMenuBar.PersistentHotKeys Property

Specifies whether keyboard accelerator shortcuts are always displayed.

Pascal

```
property PersistentHotKeys: Boolean;
```

C++

```
__property Boolean PersistentHotKeys;
```

Description

Use PersistentHotKeys to specify whether the action band always displays keyboard accelerator shortcuts. Setting PersistentHotKeys to true causes the underline for the keyboard shortcut key to always appear. If PersistentHotKeys is set to false, the underline for the keyboard shortcut key is only displayed if the user has used the keyboard to navigate through the action band's items. If the user is only using the mouse to navigate through the action band's items and PersistentHotKeys is set to false, the underline under the character denoted as the shortcut key is not drawn.

Note: Accelerator shortcuts are specified by preceding the appropriate character in the item's caption with an ampersand.

See Also

Caption (see page 384)

5.1.2.2.30 TActionMainMenuBar.Shadows Property

Refers to the TActionMainMenuBar component's shadow.

Pascal

```
property Shadows: Boolean;
```

C++

```
__property Boolean Shadows;
```

Description

Use Shadows to determine whether or not the menus should display with shadows. The user can disable shadows through the OS, in which case the Shadows setting is ignored.

5.1.2.2.31 TActionMainMenuBar.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

Hint (see page 5827)

ParentShowHint (see page 5835)

ShowHint (see page 13721)

Displaying Fly-over Help

5.1.2.2.32 TActionMainMenuBar.Spacing Property

Determines where the image and text appear on an action band's rendered control that represents the action client.

Pascal

```
property Spacing: Integer;
```

C++

```
__property int Spacing;
```

Description

Spacing is used internally to set the number of pixels that should appear between the image specified in an action client's ImageIndex and the text specified in its Caption property.

See Also

Caption (see page 384)

ImageIndex (see page 385)

5.1.2.2.33 TActionMainMenuBar.UseSystemFont Property

Specifies whether the default system font for menu items is used.

Pascal

```
property UseSystemFont: Boolean;
```

C++

```
__property Boolean UseSystemFont;
```

Description

Use UseSystemFont to specify whether the action band uses the default system menu font when it draws the captions for its items. By default, UseSystemFont is set to true. When the Font property is changed from the default values, UseSystemFont is automatically set to false. Setting UseSystemFont to true causes the font specified in the MenuFont property of the TScreen object to be used instead of the font specified in the action band's Font property.

See Also

TFont (see page 14497)

TextOut (see page 14475)

TextRect (see page 14480)

Assign

5.1.2.2.34 TActionMainMenuBar.VertMargin Property

Specifies the width of the vertical margins in pixels.

Pascal

```
property VertMargin: Integer;
```

C++

```
__property int VertMargin;
```

Description

VertMargin specifies the width of the action band's top and bottom vertical margins in pixels.

See Also

HorzMargin (see page 487)

HorzSeparator (see page 487)

5.1.2.2.35 TActionMainMenuBar.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
```

```
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

See Also

Enabled (see page 5821)

Hide (see page 5769)

Show (see page 5788)

VisibleChanging (see page 5791)

5.1.2.2.36 TActionMainMenuBar.WindowMenu Property

Specifies the caption of the window menu.

Pascal

```
property WindowMenu: string;
```

C++

```
__property AnsiString WindowMenu;
```

Description

Specifies the caption of the window menu for MDI window operations, such as Cascade windows. This is used only for MDI applications.

5.1.2.3 TActionMainMenuBar Events

The events of the TActionMainMenuBar class are listed here.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 625)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 626)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 627)	Occurs when an attempt is made to resize the control.
	OnClick (see page 627)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 629)	Adjust resize constraints.
	OnContextPopup (see page 629)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnControlCreated (see page 630)	Occurs when a control is created on the action band.
	OnDblClick (see page 631)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 631)	Occurs when another control is docked to the control.
	OnDockOver (see page 633)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 635)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 637)	Occurs when the user drags an object over a control.
	OnEndDock (see page 640)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 640)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 641)	Occurs when a control receives the input focus.
	OnEnterMenuLoop (see page 643)	Occurs when an ActionBand menu loop has begun.
	OnExit (see page 644)	Occurs when the input focus shifts away from one control to another.
	OnExitMenuLoop (see page 645)	Occurs when an ActionBand menu loop has ended and the menu is closed.
	OnGetControlClass (see page 645)	Occurs when an item is to be placed on the action band.
	OnGetPopupClass (see page 646)	Occurs prior to an ActionBand popupmenu appearing on screen.
	OnGetSiteInfo (see page 646)	Returns the control's docking information.
	OnMouseActivate (see page 648)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 649)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 651)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 654)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 656)	Occurs when the action band is painted.
	OnPopup (see page 656)	Occurs just before the pop-up menu appears.
	OnResize (see page 657)	Occurs immediately after the control is resized.
	OnStartDock (see page 657)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 658)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 658)	Occurs when the application tries to undock a control that is docked to the windowed control.

5.1.2.3.1 TActionMainMenuBar.OnAlignInsertBefore Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignInsertBefore: TAlignInsertBeforeEvent;
```

C++

```
__property TAlignInsertBeforeEvent OnAlignInsertBefore;
```

Description

OnAlignInsertBefore occurs for each pair of child controls with an Align property of **alCustom**.

It can determine the order in which custom-aligned child controls are placed. OnAlignInsertBefore returns true if **C2** should be presented before **C1**, and false otherwise. It holds a TAlignInsertBeforeEvent type.

CustomAlignInsertBefore triggers the OnAlignInsertBefore event. If this event is defined, CustomAlignInsertBefore returns the value returned by OnAlignInsertBefore. Defining this event allows users to define the order of control alignment without overriding CustomAlignInsertBefore.

See Also

CustomAlignInsertBefore (see page 6137)

Align (see page 5798)

TAlignInsertBeforeEvent (see page 6293)

5.1.2.3.2 TActionMainMenuBar.OnAlignPosition Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignPosition: TAlignPositionEvent;
```

C++

```
__property TAlignPositionEvent OnAlignPosition;
```

Description

OnAlignPosition occurs when child controls with an Align property of **alCustom** are aligned.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition. It holds a TAlignPositionEvent type.

These are the parameters:

Parameter	Meaning
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. OnAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. OnAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, OnAlignPosition does nothing.	

See Also

CustomAlignPosition (see page 6138)

Align (see page 5798)

Anchors (see page 5802)

TAlignInfo (see page 6269)

TAlignPositionEvent (see page 6293)

5.1.2.3.3 TActionMainMenuBar.OnCanResize Event

Occurs when an attempt is made to resize the control.

Pascal

```
property OnCanResize: TCanResizeEvent;
```

C++

```
__property TCanResizeEvent OnCanResize;
```

Description

Use OnCanResize to adjust the way a control is resized. If necessary, change the new width and height of the control in the OnCanResize event handler. The OnCanResize event handler also allows applications to indicate that the entire resize should be aborted.

If there is no OnCanResize event handler, or if the OnCanResize event handler indicates that the resize attempt can proceed, the OnCanResize event is followed immediately by an OnConstrainedResize event.

See Also

OnConstrainedResize (see page 5853)

SetBounds (see page 5783)

OnResize (see page 5870)

5.1.2.3.4 TActionMainMenuBar.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var

5.1.2.3.5 TActionMainMenuBar.OnConstrainedResize Event

Adjust resize constraints.

Pascal

```
property OnConstrainedResize: TConstrainedResizeEvent;
```

C++

```
__property TConstrainedResizeEvent OnConstrainedResize;
```

Description

Use OnConstrainedResize to adjust a control's constraints when an attempt is made to resize it. Upon entry to the OnConstrainedResize event handler, the parameters of the event handler are set to the corresponding properties of the control's Constraints object. The event handler can adjust those values before they are applied to the new height and width that is being applied to the control. (The CanAutoSize method or an OnCanResize event handler may already have adjusted this new height and width).

On exit from the OnConstrainedResize event handler, the constraints are applied to the attempted new height and width. Once the constraints are applied, the control's height and width are changed. After the control's height and width change, an OnResize event occurs to allow any final adjustments or responses.

Note: The OnConstrainedResize handler is called immediately after the OnCanResize handler.

5.1.2.3.6 TActionMainMenuBar.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

5.1.2.3.7 TActionMainMenuBar.OnControlCreated Event

Occurs when a control is created on the action band.

Pascal

```
property OnControlCreated: TControlCreatedEvent;
```

C++

```
__property TControlCreatedEvent OnControlCreated;
```

Description

Write an OnControlCreated event handler to enhance or replace the type of UI element that is rendered on the action band.

Sender is the action band component that just created a new control.

AnItem is the new child control that was just created. The OnControlCreated event handler can initialize the properties of this control or replace it with a custom control.

OnGetControlClass (see page 492)

5.1.2.3.8 TActionMainMenuBar.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

5.1.2.3.9 TActionMainMenuBar.OnDockDrop Event

Occurs when another control is docked to the control.

Pascal

```
property OnDockDrop: TDockDropEvent;
```

C++

```
__property TDockDropEvent OnDockDrop;
```

Description

Write code in the OnDockDrop event to perform actions when another control is docked on the control.

OnDockDrop can only occur if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
```

```
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
```

```
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

5.1.2.3.10 TActionMainMenuBar.OnDockOver Event

Occurs when another control is dragged over the control.

Pascal

```
property OnDockOver: TDockOverEvent;
```

C++

```
__property TDockOverEvent OnDockOver;
```

Description

Write code in the OnDockOver event to indicate whether a dockable control that is dragged over the windowed control can be accepted as a dock client. OnDockOver occurs after the TDragDockObject has been initialized by an OnGetSiteInfo event.

OnDockOver occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
```

```
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
```

```
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

5.1.2.3.11 TActionMainMenuBar.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
```

```
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:
```

```
procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

5.1.2.3.12 TActionMainMenuBar.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler

is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;
```

```
procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

5.1.2.3.13 TActionMainMenuBar.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

5.1.2.3.14 TActionMainMenuBar.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

5.1.2.3.15 TActionMainMenuBar.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
```

```
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------

5.1.2.3.16 TActionMainMenuBar.OnEnterMenuLoop Event

Occurs when an ActionBand menu loop has begun.

Pascal

```
property OnEnterMenuLoop: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnterMenuLoop;
```

Description

Write an OnEnterMenuLoop event handler to modify the menu as necessary prior to the menu appearing on screen.

5.1.2.3.17 TActionMainMenuBar.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
```

```
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

5.1.2.3.18 TActionMainMenuBar.OnExitMenuLoop Event

Occurs when an ActionBand menu loop has ended and the menu is closed.

Pascal

```
property OnExitMenuLoop: TExitMenuEvent;
```

C++

```
__property TExitMenuEvent OnExitMenuLoop;
```

Description

Write an OnExitMenuLoop event handler to do any additional processing once the menu has closed.

5.1.2.3.19 TActionMainMenuBar.OnGetControlClass Event

Occurs when an item is to be placed on the action band.

Pascal

```
property OnGetControlClass: TGetControlClassEvent;
```

C++

```
__property TGetControlClassEvent OnGetControlClass;
```

Description

Write an OnGetControlClass event handler to specify the class of item that the action band should create to represent a specified action client.

Sender is the action band that needs to generate a child control to represent an action client.

AnItem is the action client that the new control should represent.

ControlClass returns the class reference for the new control. This should be a descendant of TCustomActionControl.

5.1.2.3.20 TActionMainMenuBar.OnGetPopupClass Event

Occurs prior to an ActionBand popupmenu appearing on screen.

Pascal

```
property OnGetPopupClass: TGetPopupClassEvent;
```

C++

```
__property TGetPopupClassEvent OnGetPopupClass;
```

Description

Write an OnGetPopupClass event handler to control which popup menu class is used to display an ActionBand menu.

5.1.2.3.21 TActionMainMenuBar.OnGetSiteInfo Event

Returns the control's docking information.

Pascal

```
property OnGetSiteInfo: TGetSiteInfoEvent;
```

C++

```
__property TGetSiteInfoEvent OnGetSiteInfo;
```

Description

Write code in the OnGetSiteInfo event handler to initialize a TDragDockObject with information about where a dragged object can be docked, if at all. OnGetSiteInfo occurs before the OnDockOver event.

OnGetSiteInfo occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/
```

```
void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;
```

```
procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

5.1.2.3.22 TActionMainMenuBar.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

5.1.2.3.23 TActionMainMenuBar.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
```

```
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {

5.1.2.3.24 TActionMainMenuBar.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

5.1.2.3.25 TActionMainMenuBar.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}
```

```
// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
```

```
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
        end
      else
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

OnMouseMove (see page 5865)

Responding to a Mouse-up Action

5.1.2.3.26 TActionMainMenuBar.OnPaint Event

Occurs when the action band is painted.

Pascal

```
property OnPaint: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPaint;
```

Description

Write an OnPaint event handler to change the way the action band renders itself.

See Also

Canvas (see page 481)

5.1.2.3.27 TActionMainMenuBar.OnPopup Event

Occurs just before the pop-up menu appears.

Pascal

```
property OnPopup: TMenuPopupEvent;
```

C++

```
__property TMenuPopupEvent OnPopup;
```

Description

Write an OnPopup event handler to take specific action just before the pop-up menu appears.

5.1.2.3.28 TActionMainMenuBar.OnResize Event

Occurs immediately after the control is resized.

Pascal

```
property OnResize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnResize;
```

Description

Use OnResize to make any final adjustments after a control is resized.

To modify the way a control responds when an attempt is made to resize it, use OnCanResize or OnConstrainedResize.

Note: Some controls call this event handler when the control is first created.

Delphi Examples:

```
{
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
}
procedure TForm1.FormResize(Sender: TObject);
begin
  Button1.Left := Form1.ClientWidth-Button1.Width;
end;
```

See Also

OnCanResize (see page 5851)

SetBounds (see page 5783)

AutoSize (see page 5803)

OnConstrainedResize (see page 5853)

5.1.2.3.29 TActionMainMenuBar.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is

automatically created.

Note: This information applies to Win32 applications only.

5.1.2.3.30 TActionMainMenuBar.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

5.1.2.3.31 TActionMainMenuBar.OnUnDock Event

Occurs when the application tries to undock a control that is docked to the windowed control.

Pascal

```
property OnUnDock: TUnDockEvent;
```

C++

```
__property TUnDockEvent OnUnDock;
```

Description

Write an OnUnDock event handler to adjust the windowed control when a dock client is undocked. The OnUnDock event handler can make any necessary adjustments, or it can block the undock attempt by setting the Allow parameter to false.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
```

```
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
}
procedure TConjoinDockHost.FormUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if Client is TDockableForm then
    TDockableForm(Client).DockSite := True;
  if (DockClientCount = 2) and (NewTarget <> Self) then
    PostMessage(Self.Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
end;
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
```

```
    var Accept: Boolean);
  var
    ARect: TRect;
  begin
    Accept := Source.Control is TDockableForm;
    if Accept then
    begin
      //Modify the DockRect to preview dock area.
      ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
      ARect.BottomRight := LeftDockPanel.ClientToScreen(
        Point(Self.ClientWidth div 3, LeftDockPanel.Height));
      Source.DockRect := ARect;
    end;
  end;

  procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
    NewTarget: TWinControl; var Allow: Boolean);
  begin
    //OnUnDock gets called BEFORE the client is undocked, in order to optionally
    //disallow the undock. DockClientCount is never 0 when called from this event.
    if (Sender as TPanel).DockClientCount = 1 then

5.1.3 TCustomActionMainMenuBar Class

TCustomActionMainMenuBar is the ancestor for the TActionMainMenuBar (see page 585) component.

Class Hierarchy

Pascal

```
TCustomActionMainMenuBar = class(TCustomActionMenuBar);
```

C++

```
class TCustomActionMainMenuBar : public TCustomActionMenuBar;
```

File

ActnMenus

Description

TCustomActionMainMenuBar is the ancestor for the TActionMainMenuBar (see page 585) component.

5.1.3.1 TCustomActionMainMenuBar Members

The following tables list the members exposed by TCustomActionMainMenuBar.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.

	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FCachedMenu (see page 699)	This is FCachedMenu, a member of class TCustomActionMenuBar.
	FChildMenu (see page 699)	This is FChildMenu, a member of class TCustomActionMenuBar.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefaultColorMap (see page 460)	This is FDefaultColorMap, a member of class TCustomActionBar.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExpandTimer (see page 700)	This is FExpandTimer, a member of class TCustomActionMenuBar.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FPopupTimer (see page 700)	This is FPopupTimer, a member of class TCustomActionMenuBar.
	FSavedWrapState (see page 460)	This is FSavedWrapState, a member of class TCustomActionBar.
	FSelectedItem (see page 700)	This is FSelectedItem, a member of class TCustomActionMenuBar.
	FWindowMenuItem (see page 676)	This is FWindowMenuItem, a member of class TCustomActionMainMenuBar.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 462)	Aligns any controls for which the control is the parent within a specified area of the control.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	Animate (see page 701)	This is Animate, a member of class TCustomActionMenuBar.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
V	AutoSizingChanged (see page 462)	This is AutoSizingChanged, a member of class TCustomActionBar.
	BackgroundSize (see page 462)	This is BackgroundSize, a member of class TCustomActionBar.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CalcInsertPosition (see page 462)	This is CalcInsertPosition, a member of class TCustomActionBar.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.

	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	CleanupStack (see page 701)	This is CleanupStack, a member of class TCustomActionMenuBar.
	Clear (see page 463)	This is Clear, a member of class TCustomActionBar.
	ClearSubMenus (see page 702)	This is ClearSubMenus, a member of class TCustomActionMenuBar.
	Click (see page 5743)	Respond to user click.
	CMBorderChanged (see page 23285)	This is CMBorderChanged, a member of class TToolWindow.
	CMCtl3DChanged (see page 23286)	This is CMCtl3DChanged, a member of class TToolWindow.
	CMWininichange (see page 678)	This is CMWininichange, a member of class TCustomActionMainMenuBar.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateControl (see page 678)	This is CreateControl, a member of class TCustomActionMainMenuBar.
	CreateControls (see page 678)	This is CreateControls, a member of class TCustomActionMainMenuBar.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreatePopup (see page 702)	This is CreatePopup, a member of class TCustomActionMenuBar.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 463)	Returns placement order of custom-aligned child control.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 678)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 679)	This is DesignWndProc, a member of class TCustomActionMainMenuBar.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoControlCreated (see page 465)	This is DoControlCreated, a member of class TCustomActionBar.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoDropActions (see page 465)	This is DoDropActions, a member of class TCustomActionBar.
	DoDropCategory (see page 465)	This is DoDropCategory, a member of class TCustomActionBar.
	DoDropItem (see page 466)	This is DoDropItem, a member of class TCustomActionBar.

	DoEndDock (see page 146)	OnEndDock event dispatcher.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoGetControlClass (see page 466)	This is DoGetControlClass, a member of class TCustomActionBar.
	DoGetPopupClass (see page 703)	This is DoGetPopupClass, a member of class TCustomActionMenuBar.
	DoItemClicked (see page 703)	This is DoItemClicked, a member of class TCustomActionMenuBar.
	DoItemKeyed (see page 703)	This is DoItemKeyed, a member of class TCustomActionMenuBar.
	DoItemSelected (see page 703)	This is DoItemSelected, a member of class TCustomActionMenuBar.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMenuDelay (see page 703)	This is DoMenuDelay, a member of class TCustomActionMenuBar.
	DoMouseIdle (see page 704)	This is DoMouseIdle, a member of class TCustomActionMenuBar.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoneMenuLoop (see page 679)	This is DoneMenuLoop, a member of class TCustomActionMainMenuBar.
	DoPopup (see page 704)	This is DoPopup, a member of class TCustomActionMenuBar.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 147)	OnStartDock event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 466)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawBackground (see page 467)	This is DrawBackground, a member of class TCustomActionBar.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	ExecAction (see page 704)	This is ExecAction, a member of class TCustomActionMenuBar.
	Expand (see page 704)	Causes the menu bar to show all items, including the hidden ones.
	ExpandTimer (see page 705)	This is ExpandTimer, a member of class TCustomActionMenuBar.
	FindAccelItem (see page 467)	This is FindAccelItem, a member of class TCustomActionBar.
	FindItemAt (see page 468)	This is FindItemAt, a member of class TCustomActionBar.
	FindItemCaption (see page 468)	This is FindItemCaption, a member of class TCustomActionBar.
	FindLast (see page 468)	This is FindLast, a member of class TCustomActionBar.
	FindLeastUsedItem (see page 469)	This is FindLeastUsedItem, a member of class TCustomActionBar.
	FindNearestControl (see page 469)	This is FindNearestControl, a member of class TCustomActionBar.
	FindNext (see page 470)	This is FindNext, a member of class TCustomActionBar.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FindNextVisibleItem (see page 470)	This is FindNextVisibleItem, a member of class TCustomActionBar.
	FindPrevious (see page 470)	This is FindPrevious, a member of class TCustomActionBar.
	FindPreviousVisibleItem (see page 470)	This is FindPreviousVisibleItem, a member of class TCustomActionBar.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionControl (see page 471)	This is GetActionControl, a member of class TCustomActionBar.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetActiveMDIChild (see page 679)	This is GetActiveMDIChild, a member of class TCustomActionMainMenuBar.

	GetBannerWidth (see page 471)	This is GetBannerWidth, a member of class TCustomActionBar.
	GetBarHeight (see page 471)	This is GetBarHeight, a member of class TCustomActionBar.
	GetBarWidth (see page 471)	This is GetBarWidth, a member of class TCustomActionBar.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlClass (see page 471)	This is GetControlClass, a member of class TCustomActionBar.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDefaultColorMapClass (see page 472)	This is GetDefaultColorMapClass, a member of class TCustomActionBar.
	GetDefaultSounds (see page 705)	This is GetDefaultSounds, a member of class TCustomActionMenuBar.
	GetDesignMode (see page 472)	This is GetDesignMode, a member of class TCustomActionBar.
	GetDesignMode (see page 705)	This is GetDesignMode, a member of class TCustomActionMenuBar.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 147)	Returns the class used for the control when it is floating.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetMouseHoverItem (see page 705)	This is GetMouseHoverItem, a member of class TCustomActionMenuBar.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupClass (see page 706)	This is GetPopupClass, a member of class TCustomActionMenuBar.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetPopupMenuClass (see page 472)	This is GetPopupMenuClass, a member of class TCustomActionBar.
	GetSelected (see page 706)	This is GetSelected, a member of class TCustomActionMenuBar.
	GetSiteInfo (see page 147)	Generates an OnGetSiteInfo event
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasItems (see page 472)	This is HasItems, a member of class TCustomActionBar.
	Idle (see page 706)	This is Idle, a member of class TCustomActionMenuBar.
	InitMenuLoop (see page 706)	This is InitMenuLoop, a member of class TCustomActionMenuBar.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsDesignMsg (see page 707)	This is IsDesignMsg, a member of class TCustomActionMenuBar.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.

	ItemCount (see page 473)	This is ItemCount, a member of class TCustomActionBar.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 148)	Initializes the control after it is loaded from a stream.
	Loaded (see page 473)	Initializes the control after it is loaded from a stream.
	Loaded (see page 707)	Initializes the control after it is loaded from a stream.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndHook (see page 680)	This is MainWndHook, a member of class TCustomActionMainMenuBar.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MDIChildMaximized (see page 680)	This is MDIChildMaximized, a member of class TCustomActionMainMenuBar.
	MDIChildRestored (see page 680)	This is MDIChildRestored, a member of class TCustomActionMainMenuBar.
	MouseActivate (see page 707)	This is MouseActivate, a member of class TCustomActionMenuBar.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	NCPaint (see page 473)	This is NCPaint, a member of class TCustomActionBar.
	NCPaint (see page 23286)	This is NCPaint, a member of class TToolWindow.
	NewPopup (see page 680)	This is NewPopup, a member of class TCustomActionMainMenuBar.
	Notification (see page 681)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 474)	This is Paint, a member of class TCustomActionBar.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 474)	Renders the image of a windowed control.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	ProcessMenuLoop (see page 708)	This is ProcessMenuLoop, a member of class TCustomActionMenuBar.
	ProcessMessage (see page 708)	This is ProcessMessage, a member of class TCustomActionMenuBar.
	ProcessMessages (see page 709)	This is ProcessMessages, a member of class TCustomActionMenuBar.
	ProcessMouseMsg (see page 681)	This is ProcessMouseMsg, a member of class TCustomActionMainMenuBar.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	RefreshMDIMenu (see page 681)	This is RefreshMDIMenu, a member of class TCustomActionMainMenuBar.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Reset (see page 475)	This is Reset, a member of class TCustomActionBar.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.

	Select (see page 709)	This is Select, a member of class TCustomActionMenuBar.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectItem (see page 710)	This is SelectItem, a member of class TCustomActionMenuBar.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
V	SetActionClient (see page 475)	This is SetActionClient, a member of class TCustomActionBar.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetAutoSizing (see page 475)	This is SetAutoSizing, a member of class TCustomActionBar.
V	SetBiDiMode (see page 475)	Sets the control's bi-directional mode.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
V	SetColorMap (see page 476)	This is SetColorMap, a member of class TCustomActionBar.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDesignMode (see page 681)	Specifies whether the whether the action band is being customized or being used in the IDE.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetOrientation (see page 477)	This is SetOrientation, a member of class TCustomActionBar.
V	SetParent (see page 710)	Sets the parent of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetPersistentHotKeys (see page 477)	This is SetPersistentHotKeys, a member of class TCustomActionBar.
V	SetPersistentHotKeys (see page 711)	This is SetPersistentHotKeys, a member of class TCustomActionMenuBar.
V	SetSpacing (see page 477)	This is SetSpacing, a member of class TCustomActionBar.
	SetupDefaultColorMap (see page 477)	This is SetupDefaultColorMap, a member of class TCustomActionBar.
	SetupWindowMenu (see page 682)	This is SetupWindowMenu, a member of class TCustomActionMainMenuBar.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.

V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	VisibleChanging (see page 478)	Provides the interface for a method that responds to changes in the control's visibility.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMKeyDown (see page 682)	This is WMKeyDown, a member of class TCustomActionMainMenuBar.
	WMNCCalcSize (see page 23286)	This is WMNCCalcSize, a member of class TToolWindow.
	WMNCHitTest (see page 682)	This is WMNCHitTest, a member of class TCustomActionMainMenuBar.
	WMNCPaint (see page 23286)	This is WMNCPaint, a member of class TToolWindow.
	WMSysCommand (see page 683)	This is WMSysCommand, a member of class TCustomActionMainMenuBar.
	WMSysKeyDown (see page 683)	This is WMSysKeyDown, a member of class TCustomActionMainMenuBar.
	WMSysKeyUp (see page 683)	This is WMSysKeyUp, a member of class TCustomActionMainMenuBar.
V	WndProc (see page 711)	Provides specific message responses for the control.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AnimateDuration (see page 716)	This is AnimateDuration, a member of class TCustomActionMenuBar.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DelayItem (see page 717)	This is DelayItem, a member of class TCustomActionMenuBar.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Expandable (see page 717)	This is Expandable, a member of class TCustomActionMenuBar.
	Expanded (see page 718)	This is Expanded, a member of class TCustomActionMenuBar.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
R	HRowCount (see page 488)	Indicates the number of columns of items that the action band displays.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.

R	Items (see page 488)	Lists the action clients that correspond to the child controls of this action band.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	MouseControl (see page 718)	This is MouseControl, a member of class TCustomActionMenuBar.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentMenu (see page 719)	This is ParentMenu, a member of class TCustomActionMenuBar.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
R	PopupStack (see page 719)	This is PopupStack, a member of class TCustomActionMenuBar.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
R	Selected (see page 719)	This is Selected, a member of class TCustomActionMenuBar.
	Text (see page 5842)	Contains a text string associated with the control.
R	VRowCount (see page 490)	Indicates the number of rows of items that the action band displays.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
R	Widest (see page 491)	This is Widest, a member of class TCustomActionBar.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnControlCreated (see page 491)	Occurs when a control is created on the action band.
	OnEnterMenuLoop (see page 720)	Occurs when an ActionBand menu loop has begun.
	OnExitMenuLoop (see page 721)	Occurs when an ActionBand menu loop has ended and the menu is closed.
	OnGetControlClass (see page 492)	Occurs when an item is to be placed on the action band.
	OnGetPopupClass (see page 721)	Occurs prior to an ActionBand popupmenu appearing on screen.
	OnPaint (see page 492)	Occurs when the action band is painted.
	OnPopup (see page 721)	Occurs just before the pop-up menu appears.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
V	CalcDockedWidth (see page 146)	This is CalcDockedWidth, a member of class TCustomActionDockBar.
V	CanFocus (see page 677)	Indicates whether a TActionMainMenuBar (see page 585) component can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	CloseMenu (see page 677)	Closes the menu currently being displayed.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 675)	Creates and initializes a TCustomActionMainMenuBar (see page 661) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 676)	Destroys an instance of TCustomActionMainMenuBar (see page 661).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Dock (see page 146)	Used internally to dock the action band.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
V	DragDrop (see page 466)	Generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
V	FindFirst (see page 467)	Finds the first TActionClientItem (see page 374) in the Items (see page 488) list.
	FindFirstVisibleItem (see page 468)	Finds the first visible TActionClientItem (see page 374) in the Items (see page 488) list.
	FindLastVisibleItem (see page 469)	Finds the last visibleTActionClientItem in the Items (see page 488) list.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.

	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
V	RecreateControls (see page 475)	Destroys and recreates all of the action band's action client controls.
V	RecreateControls (see page 709)	Destroys and recreates all of the action band's action client controls.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.

	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 476)	Sets the bounds based on whether the popup is expanded or not
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Style (see page 477)	Identifies the style object that gives the application its default look and feel.
V	Style (see page 711)	Retrieves the style used by the ActionBand menu that started the menu loop so the submenus have a consistent appearance.
V	TrackMenu (see page 682)	Executes the action associated with the menu item.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	ActionClient (see page 479)	Specifies the action client associated with this action band.
R	ActionControls (see page 479)	Lists the controls on the action band.
	ActionManager (see page 480)	Specifies the action manager component that is associated with the action band.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	AllowHiding (see page 480)	Determines whether the action band can be hidden.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AnimationStyle (see page 716)	Specifies the type of animation the menu bar will display as it opens.
	AutoFocus (see page 717)	This is AutoFocus, a member of class TCustomActionMenuBar.
	AutoSizing (see page 480)	Specifies whether the action band adjusts its size automatically to fit around its child controls.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 481)	Represents the drawing surface of the action band.
	Caption (see page 481)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	Color (see page 483)	Specifies the background color of the control.
	ColorMap (see page 484)	Indicates the colormap for individual action band components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ContextBar (see page 485)	Indicates whether items shown in this action band represent the items in a popup menu.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Designable (see page 485)	Specifies whether the action band can be customized (used internally by the IDE).
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignMode (see page 486)	Specifies whether the action band is being customized or being used in the IDE.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	EdgeBorders (see page 23287)	Determines which sides of the control have visible borders.
	EdgeInner (see page 23287)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 23288)	Determines the border style for the control's outer edge.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
	ExpandDelay (see page 717)	Specifies, in milliseconds, the delay period that a menu action band uses before showing hidden or unused items.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	Font (see page 486)	Controls the attributes of text written on or in the control.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HorzMargin (see page 487)	Specifies the width of the horizontal margins in pixels.
	HorzSeparator (see page 487)	Indicates whether a horizontal separator bar appears between item lines.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	Inactive (see page 683)	Specifies whether the action band is disabled or enabled.
	InMenuLoop (see page 718)	Indicates whether items in the menu can be selected.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	Orientation (see page 488)	Specifies how the action band lays out its child items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentControl (see page 718)	Refers to the parent object of the TCustomActionBarControl.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	PersistentHotKeys (see page 684)	Specifies whether keyboard accelerator shortcuts are always displayed.
	RootMenu (see page 719)	Refers to the root menu of the ActionBand menu.
	Shadows (see page 684)	Refers to the TActionMainMenuBar (see page 585) component's shadow.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.

R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	Spacing (see page 489)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	UseSystemFont (see page 720)	Specifies whether the default system font for menu items is used.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	VertMargin (see page 490)	Specifies the width of the vertical margins in pixels.
	VertSeparator (see page 490)	Indicates whether a vertical separator bar should appear between item lines.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.
	WindowMenu (see page 684)	Specifies the caption of the window menu.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

5.1.3.2 TCustomActionMainMenuBar.Create Constructor

Creates and initializes a TCustomActionMainMenuBar (see page 661) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomActionMainMenuBar(TComponent * AOwner);
```

Description

Create generates a TCustomActionMainMenuBar (see page 661) and initializes its properties.

```
__fastcall virtual TCustomActionMainMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMainMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

5.1.3.3 TCustomActionMainMenuBar.Destroy Destructor

Destroys an instance of TCustomActionMainMenuBar (see page 661).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomActionMainMenuBar();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TCustomActionMainMenuBar (see page 661) reference is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

Destroy (see page 5732)

5.1.3.4 TCustomActionMainMenuBar Fields

The fields of the TCustomActionMainMenuBar class are listed here.

Protected Fields

	Name	Description
	FWindowMenuItem (see page 676)	This is FWindowMenuItem, a member of class TCustomActionMainMenuBar.

5.1.3.4.1 TCustomActionMainMenuBar.FWindowMenuItem Field

Pascal

```
FWindowMenuItem: TActionClientItem;
```

C++

```
TActionClientItem FWindowMenuItem;
```

Description

This is FWindowMenuItem, a member of class TCustomActionMainMenuBar.

5.1.3.5 TCustomActionMainMenuBar Methods

The methods of the TCustomActionMainMenuBar class are listed here.

Protected Methods

	Name	Description
	CMWininichange (see page 678)	This is CMWininichange, a member of class TCustomActionMainMenuBar.
V	CreateControl (see page 678)	This is CreateControl, a member of class TCustomActionMainMenuBar.
V	CreateControls (see page 678)	This is CreateControls, a member of class TCustomActionMainMenuBar.
V	CustomAlignPosition (see page 678)	Returns aligned position of custom-aligned child control.
V	DesignWndProc (see page 679)	This is DesignWndProc, a member of class TCustomActionMainMenuBar.
V	DoneMenuLoop (see page 679)	This is DoneMenuLoop, a member of class TCustomActionMainMenuBar.

	GetActiveMDIChild (see page 679)	This is GetActiveMDIChild, a member of class TCustomActionMainMenuBar.
	MainWndHook (see page 680)	This is MainWndHook, a member of class TCustomActionMainMenuBar.
	MDIChildMaximized (see page 680)	This is MDIChildMaximized, a member of class TCustomActionMainMenuBar.
	MDIChildRestored (see page 680)	This is MDIChildRestored, a member of class TCustomActionMainMenuBar.
V	NewPopup (see page 680)	This is NewPopup, a member of class TCustomActionMainMenuBar.
V	Notification (see page 681)	Responds to notifications that components are being created or destroyed.
V	ProcessMouseMsg (see page 681)	This is ProcessMouseMsg, a member of class TCustomActionMainMenuBar.
	RefreshMDIMenu (see page 681)	This is RefreshMDIMenu, a member of class TCustomActionMainMenuBar.
V	SetDesignMode (see page 681)	Specifies whether the whether the action band is being customized or being used in the IDE.
	SetupWindowMenu (see page 682)	This is SetupWindowMenu, a member of class TCustomActionMainMenuBar.
	WMKeyDown (see page 682)	This is WMKeyDown, a member of class TCustomActionMainMenuBar.
	WMNCHitTest (see page 682)	This is WMNCHitTest, a member of class TCustomActionMainMenuBar.
	WMSysCommand (see page 683)	This is WMSysCommand, a member of class TCustomActionMainMenuBar.
	WMSysKeyDown (see page 683)	This is WMSysKeyDown, a member of class TCustomActionMainMenuBar.
	WMSysKeyUp (see page 683)	This is WMSysKeyUp, a member of class TCustomActionMainMenuBar.

Public Methods

	Name	Description
V	CanFocus (see page 677)	Indicates whether a TActionMainMenuBar (see page 585) component can receive focus.
V	CloseMenu (see page 677)	Closes the menu currently being displayed.
V	TrackMenu (see page 682)	Executes the action associated with the menu item.

5.1.3.5.1 TCustomActionMainMenuBar.CanFocus Method

Indicates whether a TActionMainMenuBar (see page 585) component can receive focus.

Pascal

```
function CanFocus: Boolean; override;
```

C++

```
virtual __fastcall Boolean CanFocus();
```

Description

By default, TActionMainMenuBar (see page 585) cannot receive input focus and should not participate in tab order. Therefore, CanFocus always returns false.

See Also

Enabled (see page 5821)

Parent (see page 5832)

Visible (see page 5847)

5.1.3.5.2 TCustomActionMainMenuBar.CloseMenu Method

Closes the menu currently being displayed.

Pascal

```
procedure CloseMenu; override;
```

C++

```
virtual __fastcall CloseMenu();
```

Description

CloseMenu is called to close the menu currently being displayed, including any submenus that may be open.

5.1.3.5.3 TCustomActionMainMenuBar.CMWininichange Method

Pascal

```
procedure CMWininichange(var Message: TWMWinIniChange); message CM_WININICHANGE;
```

C++

```
__fastcall CMWininichange(TWMWinIniChange Message);
```

Description

This is CMWininichange, a member of class TCustomActionMainMenuBar.

5.1.3.5.4 TCustomActionMainMenuBar.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TCustomActionMainMenuBar.

5.1.3.5.5 TCustomActionMainMenuBar.CreateControls Method

Pascal

```
procedure CreateControls; override;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TCustomActionMainMenuBar.

5.1.3.5.6 TCustomActionMainMenuBar.CustomAlignPosition Method

Returns aligned position of custom-aligned child control.

Pascal

```
procedure CustomAlignPosition(Control: TControl; var NewLeft: Integer; var NewTop: Integer;
var NewWidth: Integer; var NewHeight: Integer; var AlignRect: TRect; AlignInfo: TAlignInfo);
override;
```

C++

```
virtual __fastcall CustomAlignPosition(TControl * Control, int NewLeft, int NewTop, int
NewWidth, int NewHeight, TRect AlignRect, TAlignInfo AlignInfo);
```

Description

CustomAlignPosition determines the specific position of custom-aligned child controls. CustomAlignPosition is called once for each child control with an Align property of **alCustom**, in an order previously determined by calls to CustomAlignInsertBefore.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition.

These are the parameters:

Control	The child control being placed.
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. CustomAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. CustomAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, CustomAlignPosition does nothing.	

See Also

CustomAlignInsertBefore (see page 6137)

Align (see page 5798)

OnAlignPosition (see page 6214)

TAlignInfo (see page 6269)

5.1.3.5.7 TCustomActionMainMenuBar.DesignWndProc Method

Pascal

```
function DesignWndProc(var Message: TMessage): Boolean; override;
```

C++

```
virtual __fastcall Boolean DesignWndProc(TMessage Message);
```

Description

This is DesignWndProc, a member of class TCustomActionMainMenuBar.

5.1.3.5.8 TCustomActionMainMenuBar.DoneMenuLoop Method

Pascal

```
procedure DoneMenuLoop; override;
```

C++

```
virtual __fastcall DoneMenuLoop();
```

Description

This is DoneMenuLoop, a member of class TCustomActionMainMenuBar.

5.1.3.5.9 TCustomActionMainMenuBar.GetActiveMDIChild Method

Pascal

```
procedure GetActiveMDIChild;
```

C++

```
__fastcall GetActiveMDIChild();
```

Description

This is GetActiveMDIChild, a member of class TCustomActionMainMenuBar.

5.1.3.5.10 TCustomActionMainMenuBar.MainWndHook Method

Pascal

```
function MainWndHook(var Message: TMessage): Boolean;
```

C++

```
__fastcall Boolean MainWndHook(TMessage Message);
```

Description

This is MainWndHook, a member of class TCustomActionMainMenuBar.

5.1.3.5.11 TCustomActionMainMenuBar.MDIChildMaximized Method

Pascal

```
procedure MDIChildMaximized(ChildForm: TCustomForm);
```

C++

```
__fastcall MDIChildMaximized(TCustomForm ChildForm);
```

Description

This is MDIChildMaximized, a member of class TCustomActionMainMenuBar.

5.1.3.5.12 TCustomActionMainMenuBar.MDIChildRestored Method

Pascal

```
procedure MDIChildRestored;
```

C++

```
__fastcall MDIChildRestored();
```

Description

This is MDIChildRestored, a member of class TCustomActionMainMenuBar.

5.1.3.5.13 TCustomActionMainMenuBar.NewPopup Method

Pascal

```
function NewPopup: TCustomActionPopupMenu; override;
```

C++

```
virtual __fastcall TCustomActionPopupMenu NewPopup();
```

Description

This is NewPopup, a member of class TCustomActionMainMenuBar.

5.1.3.5.14 TCustomActionMainMenuBar.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu (see page 5835)

Notification (see page 2783)

5.1.3.5.15 TCustomActionMainMenuBar.ProcessMouseMsg Method

Pascal

```
procedure ProcessMouseMsg(var Msg: tagMSG); override;
```

C++

```
virtual __fastcall ProcessMouseMsg(tagMSG Msg);
```

Description

This is ProcessMouseMsg, a member of class TCustomActionMainMenuBar.

5.1.3.5.16 TCustomActionMainMenuBar.RefreshMDIMenu Method

Pascal

```
procedure RefreshMDIMenu;
```

C++

```
__fastcall RefreshMDIMenu();
```

Description

This is RefreshMDIMenu, a member of class TCustomActionMainMenuBar.

5.1.3.5.17 TCustomActionMainMenuBar.SetDesignMode Method

Specifies whether the whether the action band is being customized or being used in the IDE.

Pascal

```
procedure SetDesignMode(const Value: Boolean); override;
```

C++

```
virtual __fastcall SetDesignMode(const Boolean Value);
```

Description

SetDesignMode is used internally to determine whether the action band is being customized or being used within the IDE.

5.1.3.5.18 TCustomActionMainMenuBar.SetupWindowMenu Method

Pascal

```
procedure SetupWindowMenu;
```

C++

```
__fastcall SetupWindowMenu();
```

Description

This is SetupWindowMenu, a member of class TCustomActionMainMenuBar.

5.1.3.5.19 TCustomActionMainMenuBar.TrackMenu Method

Executes the action associated with the menu item.

Pascal

```
procedure TrackMenu; override;
```

C++

```
virtual __fastcall TrackMenu();
```

Description

TrackMenu is called internally to execute the action associated with the selected menu item..

5.1.3.5.20 TCustomActionMainMenuBar.WMKeyDown Method

Pascal

```
procedure WMKeyDown(var Message: TWMKeyDown); message WM_KEYDOWN;
```

C++

```
__fastcall WMKeyDown(TWMKeyDown Message);
```

Description

This is WMKeyDown, a member of class TCustomActionMainMenuBar.

5.1.3.5.21 TCustomActionMainMenuBar.WMNCHitTest Method

Pascal

```
procedure WMNCHitTest(var Message: TWMNCHitTest); message WM_NCHITTEST;
```

C++

```
__fastcall WMNCHitTest(TWMNCHitTest Message);
```

Description

This is WMNCHitTest, a member of class TCustomActionMainMenuBar.

5.1.3.5.22 TCustomActionMainMenuBar.WMSysCommand Method

Pascal

```
procedure WMSysCommand(var Message: TWMSysCommand); message WM_SYSCOMMAND;
```

C++

```
__fastcall WMSysCommand(TWMSysCommand Message);
```

Description

This is WMSysCommand, a member of class TCustomActionMainMenuBar.

5.1.3.5.23 TCustomActionMainMenuBar.WMSysKeyDown Method

Pascal

```
procedure WMSysKeyDown(var Message: TWMSysKeyDown); message WM_SYSKEYDOWN;
```

C++

```
__fastcall WMSysKeyDown(TWMSysKeyDown Message);
```

Description

This is WMSysKeyDown, a member of class TCustomActionMainMenuBar.

5.1.3.5.24 TCustomActionMainMenuBar.WMSysKeyUp Method

Pascal

```
procedure WMSysKeyUp(var Message: TWMSysKeyUp); message WM_SYSKEYUP;
```

C++

```
__fastcall WMSysKeyUp(TWMSysKeyUp Message);
```

Description

This is WMSysKeyUp, a member of class TCustomActionMainMenuBar.

5.1.3.6 TCustomActionMainMenuBar Properties

The properties of the TCustomActionMainMenuBar class are listed here.

Public Properties

	Name	Description
	Inactive (see page 683)	Specifies whether the action band is disabled or enabled.
	PersistentHotKeys (see page 684)	Specifies whether keyboard accelerator shortcuts are always displayed.
	Shadows (see page 684)	Refers to the TActionMainMenuBar (see page 585) component's shadow.
	WindowMenu (see page 684)	Specifies the caption of the window menu.

5.1.3.6.1 TCustomActionMainMenuBar.Inactive Property

Specifies whether the action band is disabled or enabled.

Pascal

```
property Inactive: Boolean;
```

C++

```
__property Boolean Inactive;
```

Description

Inactive is used internally to determine whether the action band is enabled or disabled. When the state changes, Inactive calls Invalidate to force a repaint of the action band.

5.1.3.6.2 TCustomActionMainMenuBar.PersistentHotKeys Property

Specifies whether keyboard accelerator shortcuts are always displayed.

Pascal

```
property PersistentHotKeys: Boolean;
```

C++

```
__property Boolean PersistentHotKeys;
```

Description

Use PersistentHotKeys to specify whether the action band always displays keyboard accelerator shortcuts. Setting PersistentHotKeys to true causes the underline for the keyboard shortcut key to always appear. If PersistentHotKeys is set to false, the underline for the keyboard shortcut key is only displayed if the user has used the keyboard to navigate through the action band's items. If the user is only using the mouse to navigate through the action band's items and PersistentHotKeys is set to false, the underline under the character denoted as the shortcut key is not drawn.

Note: Accelerator shortcuts are specified by preceding the appropriate character in the item's caption with an ampersand.

See Also

Caption (see page 384)

5.1.3.6.3 TCustomActionMainMenuBar.Shadows Property

Refers to the TActionMainMenuBar (see page 585) component's shadow.

Pascal

```
property Shadows: Boolean;
```

C++

```
__property Boolean Shadows;
```

Description

Use Shadows to determine whether or not the menus should display with shadows. The user can disable shadows through the OS, in which case the Shadows setting is ignored.

5.1.3.6.4 TCustomActionMainMenuBar.WindowMenu Property

Specifies the caption of the window menu.

Pascal

```
property WindowMenu: string;
```

C++

```
__property AnsiString WindowMenu;
```

Description

Specifies the caption of the window menu for MDI window operations, such as Cascade windows. This is used only for MDI applications.

5.1.4 TCustomActionMenuBar Class

TCustomActionMenuBar is the ancestor for action bands that render actions as menu item UI elements.

Class Hierarchy

Pascal

```
TCustomActionMenuBar = class(TCustomActionDockBar);
```

C++

```
class TCustomActionMenuBar : public TCustomActionDockBar;
```

File

ActnMenus

Description

TCustomActionMenuBar is the ancestor for all action bands that render actions as menu item UI elements.

See Also

TActionToolBar (see page 38)

TActionMainMenuBar (see page 585)

5.1.4.1 TCustomActionMenuBar Members

The following tables list the members exposed by TCustomActionMenuBar.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.

	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FCachedMenu (see page 699)	This is FCachedMenu, a member of class TCustomActionMenuBar.
	FChildMenu (see page 699)	This is FChildMenu, a member of class TCustomActionMenuBar.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefaultColorMap (see page 460)	This is FDefaultColorMap, a member of class TCustomActionBar.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExpandTimer (see page 700)	This is FExpandTimer, a member of class TCustomActionMenuBar.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FPopupTimer (see page 700)	This is FPopupTimer, a member of class TCustomActionMenuBar.
	FSavedWrapState (see page 460)	This is FSavedWrapState, a member of class TCustomActionBar.
	FSelectedItem (see page 700)	This is FSelectedItem, a member of class TCustomActionMenuBar.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 462)	Aligns any controls for which the control is the parent within a specified area of the control.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	Animate (see page 701)	This is Animate, a member of class TCustomActionMenuBar.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	AutoSizingChanged (see page 462)	This is AutoSizingChanged, a member of class TCustomActionBar.
	BackgroundSize (see page 462)	This is BackgroundSize, a member of class TCustomActionBar.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CalcInsertPosition (see page 462)	This is CalcInsertPosition, a member of class TCustomActionBar.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	CleanupStack (see page 701)	This is CleanupStack, a member of class TCustomActionMenuBar.
	Clear (see page 463)	This is Clear, a member of class TCustomActionBar.
	ClearSubMenus (see page 702)	This is ClearSubMenus, a member of class TCustomActionMenuBar.
	Click (see page 5743)	Respond to user click.
	CMBorderChanged (see page 23285)	This is CMBorderChanged, a member of class TToolWindow.
	CMCtl3DChanged (see page 23286)	This is CMCtl3DChanged, a member of class TToolWindow.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateControl (see page 702)	This is CreateControl, a member of class TCustomActionMenuBar.
	CreateControls (see page 463)	This is CreateControls, a member of class TCustomActionBar.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreatePopup (see page 702)	This is CreatePopup, a member of class TCustomActionMenuBar.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 463)	Returns placement order of custom-aligned child control.

	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 464)	Returns aligned position of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 465)	This is DesignWndProc, a member of class TCustomActionBar.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoControlCreated (see page 465)	This is DoControlCreated, a member of class TCustomActionBar.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoDropActions (see page 465)	This is DoDropActions, a member of class TCustomActionBar.
	DoDropCategory (see page 465)	This is DoDropCategory, a member of class TCustomActionBar.
	DoDropItem (see page 466)	This is DoDropItem, a member of class TCustomActionBar.
	DoEndDock (see page 146)	OnEndDock event dispatcher.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoGetControlClass (see page 466)	This is DoGetControlClass, a member of class TCustomActionBar.
	DoGetPopupClass (see page 703)	This is DoGetPopupClass, a member of class TCustomActionMenuBar.
	DoItemClicked (see page 703)	This is DoItemClicked, a member of class TCustomActionMenuBar.
	DoItemKeyed (see page 703)	This is DoItemKeyed, a member of class TCustomActionMenuBar.
	DoItemSelected (see page 703)	This is DoItemSelected, a member of class TCustomActionMenuBar.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMenuDelay (see page 703)	This is DoMenuDelay, a member of class TCustomActionMenuBar.
	DoMouseIdle (see page 704)	This is DoMouseIdle, a member of class TCustomActionMenuBar.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoneMenuLoop (see page 704)	This is DoneMenuLoop, a member of class TCustomActionMenuBar.
	DoPopup (see page 704)	This is DoPopup, a member of class TCustomActionMenuBar.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 147)	OnStartDock event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.

	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 466)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
V	DrawBackground (see page 467)	This is DrawBackground, a member of class TCustomActionBar.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
V	ExecAction (see page 704)	This is ExecAction, a member of class TCustomActionMenuBar.
V	Expand (see page 704)	Causes the menu bar to show all items, including the hidden ones.
	ExpandTimer (see page 705)	This is ExpandTimer, a member of class TCustomActionMenuBar.
	FindAccelItem (see page 467)	This is FindAccelItem, a member of class TCustomActionBar.
	FindItemAt (see page 468)	This is FindItemAt, a member of class TCustomActionBar.
	FindItemCaption (see page 468)	This is FindItemCaption, a member of class TCustomActionBar.
V	FindLast (see page 468)	This is FindLast, a member of class TCustomActionBar.
	FindLeastUsedItem (see page 469)	This is FindLeastUsedItem, a member of class TCustomActionBar.
	FindNearestControl (see page 469)	This is FindNearestControl, a member of class TCustomActionBar.
V	FindNext (see page 470)	This is FindNext, a member of class TCustomActionBar.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FindNextVisibleItem (see page 470)	This is FindNextVisibleItem, a member of class TCustomActionBar.
V	FindPrevious (see page 470)	This is FindPrevious, a member of class TCustomActionBar.
	FindPreviousVisibleItem (see page 470)	This is FindPreviousVisibleItem, a member of class TCustomActionBar.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
V	GetActionControl (see page 471)	This is GetActionControl, a member of class TCustomActionBar.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
V	GetBannerWidth (see page 471)	This is GetBannerWidth, a member of class TCustomActionBar.
V	GetBarHeight (see page 471)	This is GetBarHeight, a member of class TCustomActionBar.
V	GetBarWidth (see page 471)	This is GetBarWidth, a member of class TCustomActionBar.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlClass (see page 471)	This is GetControlClass, a member of class TCustomActionBar.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDefaultColorMapClass (see page 472)	This is GetDefaultColorMapClass, a member of class TCustomActionBar.
	GetDefaultSounds (see page 705)	This is GetDefaultSounds, a member of class TCustomActionMenuBar.
V	GetDesignMode (see page 705)	This is GetDesignMode, a member of class TCustomActionMenuBar.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 147)	Returns the class used for the control when it is floating.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).

	GetMouseHoverItem (see page 705)	This is GetMouseHoverItem, a member of class TCustomActionMenuBar.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupClass (see page 706)	This is GetPopupClass, a member of class TCustomActionMenuBar.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetPopupMenuClass (see page 472)	This is GetPopupMenuClass, a member of class TCustomActionBar.
	GetSelected (see page 706)	This is GetSelected, a member of class TCustomActionMenuBar.
	GetSiteInfo (see page 147)	Generates an OnGetSiteInfo event
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasItems (see page 472)	This is HasItems, a member of class TCustomActionBar.
	Idle (see page 706)	This is Idle, a member of class TCustomActionMenuBar.
	InitMenuLoop (see page 706)	This is InitMenuLoop, a member of class TCustomActionMenuBar.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsDesignMsg (see page 707)	This is IsDesignMsg, a member of class TCustomActionMenuBar.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	ItemCount (see page 473)	This is ItemCount, a member of class TCustomActionBar.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 707)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 707)	This is MouseActivate, a member of class TCustomActionMenuBar.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	NCPaint (see page 473)	This is NCPaint, a member of class TCustomActionBar.
	NCPaint (see page 23286)	This is NCPaint, a member of class TToolWindow.
	NewPopup (see page 707)	This is NewPopup, a member of class TCustomActionMenuBar.
	Notification (see page 708)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 474)	This is Paint, a member of class TCustomActionBar.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 474)	Renders the image of a windowed control.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	ProcessMenuLoop (see page 708)	This is ProcessMenuLoop, a member of class TCustomActionMenuBar.
	ProcessMessage (see page 708)	This is ProcessMessage, a member of class TCustomActionMenuBar.
	ProcessMessages (see page 709)	This is ProcessMessages, a member of class TCustomActionMenuBar.

	ProcessMouseMsg (see page 709)	This is ProcessMouseMsg, a member of class TCustomActionMenuBar.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Reset (see page 475)	This is Reset, a member of class TCustomActionBar.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Select (see page 709)	This is Select, a member of class TCustomActionMenuBar.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectItem (see page 710)	This is SelectItem, a member of class TCustomActionMenuBar.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 475)	This is SetActionClient, a member of class TCustomActionBar.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetAutoSizing (see page 475)	This is SetAutoSizing, a member of class TCustomActionBar.
	SetBiDiMode (see page 475)	Sets the control's bi-directional mode.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetColorMap (see page 476)	This is SetColorMap, a member of class TCustomActionBar.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignMode (see page 710)	Specifies whether the whether the action band is being customized or being used in the IDE.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetOrientation (see page 477)	This is SetOrientation, a member of class TCustomActionBar.
	SetParent (see page 710)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetPersistentHotKeys (see page 711)	This is SetPersistentHotKeys, a member of class TCustomActionMenuBar.
	SetSpacing (see page 477)	This is SetSpacing, a member of class TCustomActionBar.
	SetupDefaultColorMap (see page 477)	This is SetupDefaultColorMap, a member of class TCustomActionBar.

	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	VisibleChanging (see page 478)	Provides the interface for a method that responds to changes in the control's visibility.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMNCCalcSize (see page 23286)	This is WMNCCalcSize, a member of class TToolWindow.
	WMNCPaint (see page 23286)	This is WMNCPaint, a member of class TToolWindow.
V	WndProc (see page 711)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AnimateDuration (see page 716)	This is AnimateDuration, a member of class TCustomActionMenuBar.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DelayItem (see page 717)	This is DelayItem, a member of class TCustomActionMenuBar.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Expandable (see page 717)	This is Expandable, a member of class TCustomActionMenuBar.
	Expanded (see page 718)	This is Expanded, a member of class TCustomActionMenuBar.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.

R	HRowCount (see page 488)	Indicates the number of columns of items that the action band displays.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Items (see page 488)	Lists the action clients that correspond to the child controls of this action band.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	MouseControl (see page 718)	This is MouseControl, a member of class TCustomActionMenuBar.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentMenu (see page 719)	This is ParentMenu, a member of class TCustomActionMenuBar.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
R	PopupStack (see page 719)	This is PopupStack, a member of class TCustomActionMenuBar.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
R	Selected (see page 719)	This is Selected, a member of class TCustomActionMenuBar.
	Text (see page 5842)	Contains a text string associated with the control.
R	VRowCount (see page 490)	Indicates the number of rows of items that the action band displays.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
R	Widest (see page 491)	This is Widest, a member of class TCustomActionBar.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnControlCreated (see page 491)	Occurs when a control is created on the action band.
	OnEnterMenuLoop (see page 720)	Occurs when an ActionBand menu loop has begun.
	OnExitMenuLoop (see page 721)	Occurs when an ActionBand menu loop has ended and the menu is closed.
	OnGetControlClass (see page 492)	Occurs when an item is to be placed on the action band.
	OnGetPopupClass (see page 721)	Occurs prior to an ActionBand popupmenu appearing on screen.
	OnPaint (see page 492)	Occurs when the action band is painted.
	OnPopup (see page 721)	Occurs just before the pop-up menu appears.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
V	CalcDockedWidth (see page 146)	This is CalcDockedWidth, a member of class TCustomActionDockBar.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.

	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	CloseMenu (see page 702)	Closes the menu currently being displayed.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 698)	Creates and initializes a TCustomActionMenuBar (see page 685) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 698)	Destroys an instance of TCustomActionMenuBar (see page 685).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Dock (see page 146)	Used internally to dock the action band.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
V	DragDrop (see page 466)	Generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
V	FindFirst (see page 467)	Finds the first TActionClientItem (see page 374) in the Items (see page 488) list.
	FindFirstVisibleItem (see page 468)	Finds the first visible TActionClientItem (see page 374) in the Items (see page 488) list.
	FindLastVisibleItem (see page 469)	Finds the last visibleTActionClientItem in the Items (see page 488) list.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
V	RecreateControls (see page 709)	Destroys and recreates all of the action band's action client controls.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.

	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 476)	Sets the bounds based on whether the popup is expanded or not
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Style (see page 711)	Retrieves the style used by the ActionBand menu that started the menu loop so the submenus have a consistent appearance.
V	TrackMenu (see page 711)	Executes the action associated with the menu item.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	ActionClient (see page 479)	Specifies the action client associated with this action band.
R	ActionControls (see page 479)	Lists the controls on the action band.
	ActionManager (see page 480)	Specifies the action manager component that is associated with the action band.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	AllowHiding (see page 480)	Determines whether the action band can be hidden.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AnimationStyle (see page 716)	Specifies the type of animation the menu bar will display as it opens.
	AutoFocus (see page 717)	This is AutoFocus, a member of class TCustomActionMenuBar.
	AutoSizing (see page 480)	Specifies whether the action band adjusts its size automatically to fit around its child controls.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 481)	Represents the drawing surface of the action band.
	Caption (see page 481)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	Color (see page 483)	Specifies the background color of the control.
	ColorMap (see page 484)	Indicates the colormap for individual action band components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ContextBar (see page 485)	Indicates whether items shown in this action band represent the items in a popup menu.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Designable (see page 485)	Specifies whether the action band can be customized (used internally by the IDE).
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignMode (see page 486)	Specifies whether the action band is being customized or being used in the IDE.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	EdgeBorders (see page 23287)	Determines which sides of the control have visible borders.
	EdgeInner (see page 23287)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 23288)	Determines the border style for the control's outer edge.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
	ExpandDelay (see page 717)	Specifies, in milliseconds, the delay period that a menu action band uses before showing hidden or unused items.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	Font (see page 486)	Controls the attributes of text written on or in the control.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HorzMargin (see page 487)	Specifies the width of the horizontal margins in pixels.
	HorzSeparator (see page 487)	Indicates whether a horizontal separator bar appears between item lines.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	InMenuLoop (see page 718)	Indicates whether items in the menu can be selected.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	Orientation (see page 488)	Specifies how the action band lays out its child items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentControl (see page 718)	Refers to the parent object of the TCustomActionBarControl.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	PersistentHotKeys (see page 489)	Specifies whether keyboard accelerator shortcuts are always displayed.
	RootMenu (see page 719)	Refers to the root menu of the ActionBand menu.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.

	Spacing (see page 489)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	UseSystemFont (see page 720)	Specifies whether the default system font for menu items is used.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	VertMargin (see page 490)	Specifies the width of the vertical margins in pixels.
	VertSeparator (see page 490)	Indicates whether a vertical separator bar should appear between item lines.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

5.1.4.2 TCustomActionMenuBar.Create Constructor

Creates and initializes a TCustomActionMenuBar (see page 685) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomActionMenuBar(TComponent * AOwner);
```

Description

Create generates a TCustomActionMenuBar (see page 685) and initializes its properties.

```
__fastcall virtual TCustomActionMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

5.1.4.3 TCustomActionMenuBar.Destroy Destructor

Destroys an instance of TCustomActionMenuBar (see page 685).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomActionMenuBar();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TCustomActionMenuBar (see page 685) reference is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

Destroy (see page 5732)

5.1.4.4 TCustomActionMenuBar Fields

The fields of the TCustomActionMenuBar class are listed here.

Protected Fields

	Name	Description
	FCachedMenu (see page 699)	This is FCachedMenu, a member of class TCustomActionMenuBar.
	FChildMenu (see page 699)	This is FChildMenu, a member of class TCustomActionMenuBar.
	FExpandTimer (see page 700)	This is FExpandTimer, a member of class TCustomActionMenuBar.
	FPopupTimer (see page 700)	This is FPopupTimer, a member of class TCustomActionMenuBar.
	FSelectedItem (see page 700)	This is FSelectedItem, a member of class TCustomActionMenuBar.

5.1.4.4.1 TCustomActionMenuBar.FCachedMenu Field

Pascal

```
FCachedMenu: TCustomActionPopupMenu;
```

C++

```
TCustomActionPopupMenu FCachedMenu;
```

Description

This is FCachedMenu, a member of class TCustomActionMenuBar.

5.1.4.4.2 TCustomActionMenuBar.FChildMenu Field

Pascal

```
FChildMenu: TCustomActionMenuBar;
```

C++

```
TCustomActionMenuBar FChildMenu;
```

Description

This is FChildMenu, a member of class TCustomActionMenuBar.

5.1.4.4.3 TCustomActionMenuBar.FExpandTimer Field

Pascal

```
FExpandTimer: TTimer;
```

C++

```
TTimer FExpandTimer;
```

Description

This is FExpandTimer, a member of class TCustomActionMenuBar.

5.1.4.4.4 TCustomActionMenuBar.FPopupTimer Field

Pascal

```
FPopupTimer: TTimer;
```

C++

```
TTimer FPopupTimer;
```

Description

This is FPopupTimer, a member of class TCustomActionMenuBar.

5.1.4.4.5 TCustomActionMenuBar.FSelectedItem Field

Pascal

```
FSelectedItem: TActionClientItem;
```

C++

```
TActionClientItem FSelectedItem;
```

Description

This is FSelectedItem, a member of class TCustomActionMenuBar.

5.1.4.5 TCustomActionMenuBar Methods

The methods of the TCustomActionMenuBar class are listed here.

Protected Methods

	Name	Description
	Animate (see page 701)	This is Animate, a member of class TCustomActionMenuBar.
	CleanupStack (see page 701)	This is CleanupStack, a member of class TCustomActionMenuBar.
	ClearSubMenus (see page 702)	This is ClearSubMenus, a member of class TCustomActionMenuBar.
V	CreateControl (see page 702)	This is CreateControl, a member of class TCustomActionMenuBar.
V	CreatePopup (see page 702)	This is CreatePopup, a member of class TCustomActionMenuBar.
	DoGetPopupClass (see page 703)	This is DoGetPopupClass, a member of class TCustomActionMenuBar.
V	DoItemClicked (see page 703)	This is DoItemClicked, a member of class TCustomActionMenuBar.
V	DoItemKeyed (see page 703)	This is DoItemKeyed, a member of class TCustomActionMenuBar.
	DoItemSelected (see page 703)	This is DoItemSelected, a member of class TCustomActionMenuBar.
	DoMenuDelay (see page 703)	This is DoMenuDelay, a member of class TCustomActionMenuBar.
	DoMouseIdle (see page 704)	This is DoMouseIdle, a member of class TCustomActionMenuBar.
V	DoneMenuLoop (see page 704)	This is DoneMenuLoop, a member of class TCustomActionMenuBar.

	DoPopup (see page 704)	This is DoPopup, a member of class TCustomActionMenuBar.
	ExecAction (see page 704)	This is ExecAction, a member of class TCustomActionMenuBar.
	Expand (see page 704)	Causes the menu bar to show all items, including the hidden ones.
	ExpandTimer (see page 705)	This is ExpandTimer, a member of class TCustomActionMenuBar.
	GetDefaultSounds (see page 705)	This is GetDefaultSounds, a member of class TCustomActionMenuBar.
	GetDesignMode (see page 705)	This is GetDesignMode, a member of class TCustomActionMenuBar.
	GetMouseHoverItem (see page 705)	This is GetMouseHoverItem, a member of class TCustomActionMenuBar.
	GetPopupClass (see page 706)	This is GetPopupClass, a member of class TCustomActionMenuBar.
	GetSelected (see page 706)	This is GetSelected, a member of class TCustomActionMenuBar.
	Idle (see page 706)	This is Idle, a member of class TCustomActionMenuBar.
	InitMenuLoop (see page 706)	This is InitMenuLoop, a member of class TCustomActionMenuBar.
	IsDesignMsg (see page 707)	This is IsDesignMsg, a member of class TCustomActionMenuBar.
	Loaded (see page 707)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 707)	This is MouseActivate, a member of class TCustomActionMenuBar.
	NewPopup (see page 707)	This is NewPopup, a member of class TCustomActionMenuBar.
	Notification (see page 708)	Responds to notifications that components are being created or destroyed.
	ProcessMenuLoop (see page 708)	This is ProcessMenuLoop, a member of class TCustomActionMenuBar.
	ProcessMessage (see page 708)	This is ProcessMessage, a member of class TCustomActionMenuBar.
	ProcessMessages (see page 709)	This is ProcessMessages, a member of class TCustomActionMenuBar.
	ProcessMouseMsg (see page 709)	This is ProcessMouseMsg, a member of class TCustomActionMenuBar.
	Select (see page 709)	This is Select, a member of class TCustomActionMenuBar.
	SelectItem (see page 710)	This is SelectItem, a member of class TCustomActionMenuBar.
	SetDesignMode (see page 710)	Specifies whether the whether the action band is being customized or being used in the IDE.
	SetParent (see page 710)	Sets the parent of the control.
	SetPersistentHotKeys (see page 711)	This is SetPersistentHotKeys, a member of class TCustomActionMenuBar.
	WndProc (see page 711)	Provides specific message responses for the control.

Public Methods

	Name	Description
	CloseMenu (see page 702)	Closes the menu currently being displayed.
	RecreateControls (see page 709)	Destroys and recreates all of the action band's action client controls.
	Style (see page 711)	Retrieves the style used by the ActionBand menu that started the menu loop so the submenus have a consistent appearance.
	TrackMenu (see page 711)	Executes the action associated with the menu item.

5.1.4.5.1 TCustomActionMenuBar.Animate Method

Pascal

```
procedure Animate(Show: Boolean = True);
```

C++

```
__fastcall Animate(Boolean Show = True);
```

Description

This is Animate, a member of class TCustomActionMenuBar.

5.1.4.5.2 TCustomActionMenuBar.CleanupStack Method

Pascal

```
procedure CleanupStack;
```

C++

```
__fastcall CleanupStack();
```

Description

This is CleanupStack, a member of class TCustomActionMenuBar.

5.1.4.5.3 TCustomActionMenuBar.ClearSubMenus Method

Pascal

```
procedure ClearSubMenus;
```

C++

```
__fastcall ClearSubMenus();
```

Description

This is ClearSubMenus, a member of class TCustomActionMenuBar.

5.1.4.5.4 TCustomActionMenuBar.CloseMenu Method

Closes the menu currently being displayed.

Pascal

```
procedure CloseMenu; virtual;
```

C++

```
virtual __fastcall CloseMenu();
```

Description

CloseMenu is called to close the menu currently being displayed.

5.1.4.5.5 TCustomActionMenuBar.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TCustomActionMenuBar.

5.1.4.5.6 TCustomActionMenuBar.CreatePopup Method

Pascal

```
function CreatePopup(AOwner: TCustomActionMenuBar; Item: TCustomActionControl):
TCustomActionPopupMenu; virtual;
```

C++

```
virtual __fastcall TCustomActionPopupMenu CreatePopup(TCustomActionMenuBar AOwner,
TCustomActionControl Item);
```

Description

This is CreatePopup, a member of class TCustomActionMenuBar.

5.1.4.5.7 TCustomActionMenuBar.DoGetPopupClass Method

Pascal

```
function DoGetPopupClass: TCustomPopupClass; dynamic;
```

C++

```
__fastcall TCustomPopupClass DoGetPopupClass();
```

Description

This is DoGetPopupClass, a member of class TCustomActionMenuBar.

5.1.4.5.8 TCustomActionMenuBar.DoItemClicked Method

Pascal

```
function DoItemClicked(AnItem: TCustomActionControl): TActionClientItem; virtual;
```

C++

```
virtual __fastcall TActionClientItem DoItemClicked(TCustomActionControl AnItem);
```

Description

This is DoItemClicked, a member of class TCustomActionMenuBar.

5.1.4.5.9 TCustomActionMenuBar.DoItemKeyed Method

Pascal

```
function DoItemKeyed(AnItem: TCustomActionControl): TActionClientItem; virtual;
```

C++

```
virtual __fastcall TActionClientItem DoItemKeyed(TCustomActionControl AnItem);
```

Description

This is DoItemKeyed, a member of class TCustomActionMenuBar.

5.1.4.5.10 TCustomActionMenuBar.DoItemSelected Method

Pascal

```
procedure DoItemSelected(AnItem: TCustomActionControl);
```

C++

```
__fastcall DoItemSelected(TCustomActionControl AnItem);
```

Description

This is DoItemSelected, a member of class TCustomActionMenuBar.

5.1.4.5.11 TCustomActionMenuBar.DoMenuDelay Method

Pascal

```
procedure DoMenuDelay(Sender: TObject);
```

C++

```
__fastcall DoMenuDelay(TObject * Sender);
```

Description

This is DoMenuDelay, a member of class TCustomActionMenuBar.

5.1.4.5.12 TCustomActionMenuBar.DoMouseIdle Method

Pascal

```
function DoMouseIdle: TControl; deprecated;
```

C++

```
__fastcall TControl * DoMouseIdle();
```

Description

This is DoMouseIdle, a member of class TCustomActionMenuBar.

5.1.4.5.13 TCustomActionMenuBar.DoneMenuLoop Method

Pascal

```
procedure DoneMenuLoop; virtual;
```

C++

```
virtual __fastcall DoneMenuLoop();
```

Description

This is DoneMenuLoop, a member of class TCustomActionMenuBar.

5.1.4.5.14 TCustomActionMenuBar.DoPopup Method

Pascal

```
procedure DoPopup(Item: TCustomActionControl); virtual;
```

C++

```
virtual __fastcall DoPopup(TCustomActionControl Item);
```

Description

This is DoPopup, a member of class TCustomActionMenuBar.

5.1.4.5.15 TCustomActionMenuBar.ExecAction Method

Pascal

```
procedure ExecAction(Action: TContainedAction); virtual;
```

C++

```
virtual __fastcall ExecAction(TContainedAction Action);
```

Description

This is ExecAction, a member of class TCustomActionMenuBar.

5.1.4.5.16 TCustomActionMenuBar.Expand Method

Causes the menu bar to show all items, including the hidden ones.

Pascal

```
procedure Expand(Full: Boolean); virtual;
```

C++

```
virtual __fastcall Expand(Boolean Full);
```

Description

Use Expand to show all of the items in a menu, even if they are marked as hidden. The Full parameter is used to indicate whether or not submenus should display all items as well.

5.1.4.5.17 TCustomActionMenuBar.ExpandTimer Method

Pascal

```
procedure ExpandTimer(Sender: TObject);
```

C++

```
__fastcall ExpandTimer(TObject * Sender);
```

Description

This is ExpandTimer, a member of class TCustomActionMenuBar.

5.1.4.5.18 TCustomActionMenuBar.GetDefaultSounds Method

Pascal

```
procedure GetDefaultSounds; deprecated;
```

C++

```
__fastcall GetDefaultSounds();
```

Description

This is GetDefaultSounds, a member of class TCustomActionMenuBar.

5.1.4.5.19 TCustomActionMenuBar.GetDesignMode Method

Pascal

```
function GetDesignMode: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetDesignMode();
```

Description

This is GetDesignMode, a member of class TCustomActionMenuBar.

5.1.4.5.20 TCustomActionMenuBar.GetMouseHoverItem Method

Pascal

```
function GetMouseHoverItem(Msg: TMsg): TCustomActionControl;
```

C++

```
__fastcall TCustomActionControl GetMouseHoverItem(TMsg Msg);
```

Description

This is GetMouseHoverItem, a member of class TCustomActionMenuBar.

5.1.4.5.21 TCustomActionMenuBar.GetPopupClass Method

Pascal

```
function GetPopupClass: TCustomPopupClass; virtual;
```

C++

```
virtual __fastcall TCustomPopupClass GetPopupClass();
```

Description

This is GetPopupClass, a member of class TCustomActionMenuBar.

5.1.4.5.22 TCustomActionMenuBar.GetSelected Method

Pascal

```
function GetSelected: TActionClientItem;
```

C++

```
__fastcall TActionClientItem GetSelected();
```

Description

This is GetSelected, a member of class TCustomActionMenuBar.

5.1.4.5.23 TCustomActionMenuBar.Idle Method

Pascal

```
procedure Idle(const Msg: TMsg);
```

C++

```
__fastcall Idle(const TMsg Msg);
```

Description

This is Idle, a member of class TCustomActionMenuBar.

5.1.4.5.24 TCustomActionMenuBar.InitMenuLoop Method

Pascal

```
procedure InitMenuLoop; virtual;
```

C++

```
virtual __fastcall InitMenuLoop();
```

Description

This is InitMenuLoop, a member of class TCustomActionMenuBar.

5.1.4.5.25 TCustomActionMenuBar.IsDesignMsg Method

Pascal

```
function IsDesignMsg(var Msg: TMsg): Boolean;
```

C++

```
__fastcall Boolean IsDesignMsg(TMsg Msg);
```

Description

This is IsDesignMsg, a member of class TCustomActionMenuBar.

5.1.4.5.26 TCustomActionMenuBar.Loaded Method

Initializes the control after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the control's form is loaded into memory so that the control can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method in order to initialize the control from its associated Action. To change the properties the control copies from its action, override the ActionChange method.

See Also

Loaded (see page 2782)

Action (see page 5797)

ActionChange (see page 5737)

5.1.4.5.27 TCustomActionMenuBar.MouseActivate Method

Pascal

```
function MouseActivate(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer;
HitTest: Integer): TMouseActivate; override;
```

C++

```
virtual __fastcall TMouseActivate MouseActivate(TMouseButton Button, TShiftState Shift, int X,
int Y, int HitTest);
```

Description

This is MouseActivate, a member of class TCustomActionMenuBar.

5.1.4.5.28 TCustomActionMenuBar.NewPopup Method

Pascal

```
function NewPopup: TCustomActionPopupMenu; virtual;
```

C++

```
virtual __fastcall TCustomActionPopupMenu NewPopup();
```

Description

This is NewPopup, a member of class TCustomActionMenuBar.

5.1.4.5.29 TCustomActionMenuBar.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu (see page 5835)

Notification (see page 2783)

5.1.4.5.30 TCustomActionMenuBar.ProcessMenuLoop Method

Pascal

```
function ProcessMenuLoop: TActionClientItem; virtual;
```

C++

```
virtual __fastcall TActionClientItem ProcessMenuLoop();
```

Description

This is ProcessMenuLoop, a member of class TCustomActionMenuBar.

5.1.4.5.31 TCustomActionMenuBar.ProcessMessage Method

Pascal

```
function ProcessMessage(var Msg: TMsg): Boolean;
```

C++

```
__fastcall Boolean ProcessMessage(TMsg Msg);
```

Description

This is ProcessMessage, a member of class TCustomActionMenuBar.

5.1.4.5.32 TCustomActionMenuBar.ProcessMessages Method

Pascal

```
procedure ProcessMessages;
```

C++

```
__fastcall ProcessMessages();
```

Description

This is ProcessMessages, a member of class TCustomActionMenuBar.

5.1.4.5.33 TCustomActionMenuBar.ProcessMouseMsg Method

Pascal

```
procedure ProcessMouseMsg(var Msg: TMsg); virtual;
```

C++

```
virtual __fastcall ProcessMouseMsg(TMsg Msg);
```

Description

This is ProcessMouseMsg, a member of class TCustomActionMenuBar.

5.1.4.5.34 TCustomActionMenuBar.RecreateControls Method

Destroys and recreates all of the action band's action client controls.

Pascal

```
procedure RecreateControls; override;
```

C++

```
virtual __fastcall RecreateControls();
```

Description

Call RecreateControls to recreate all of the action client child controls contained by the action band from scratch. RecreateControls destroys the action client controls and creates a new component according to the current property settings.

5.1.4.5.35 TCustomActionMenuBar.Select Method

Pascal

```
procedure Select(const Forward: Boolean);
```

C++

```
__fastcall Select(const Boolean Forward);
```

Description

This is Select, a member of class TCustomActionMenuBar.

5.1.4.5.36 TCustomActionMenuBar.SelectItem Method

Pascal

```
procedure SelectItem(AnItem: TCustomActionControl);
```

C++

```
__fastcall SelectItem(TCustomActionControl AnItem);
```

Description

This is SelectItem, a member of class TCustomActionMenuBar.

5.1.4.5.37 TCustomActionMenuBar.SetDesignMode Method

Specifies whether the whether the action band is being customized or being used in the IDE.

Pascal

```
procedure SetDesignMode(const Value: Boolean); override;
```

C++

```
virtual __fastcall SetDesignMode(const Boolean Value);
```

Description

SetDesignMode is used internally to determine whether the action band is being customized or being used within the IDE.

5.1.4.5.38 TCustomActionMenuBar.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

See Also

Destroy (see page 5732)

InsertControl (see page 6160)

Parent (see page 5832)

RemoveControl (see page 6172)

5.1.4.5.39 TCustomActionMenuBar.SetPersistentHotKeys Method

Pascal

```
procedure SetPersistentHotKeys(const Value: Boolean); override;
```

C++

```
virtual __fastcall SetPersistentHotKeys(const Boolean Value);
```

Description

This is SetPersistentHotKeys, a member of class TCustomActionMenuBar.

5.1.4.5.40 TCustomActionMenuBar.Style Method

Retrieves the style used by the ActionBand menu that started the menu loop so the submenus have a consistent appearance.

Pascal

```
function Style: TActionBarStyle; override;
```

C++

```
virtual __fastcall TActionBarStyle Style();
```

Description

Use Style to access the Style of the menu which started the menu loop and therefore determines the appearance of submenus.

5.1.4.5.41 TCustomActionMenuBar.TrackMenu Method

Executes the action associated with the menu item.

Pascal

```
procedure TrackMenu; virtual;
```

C++

```
virtual __fastcall TrackMenu();
```

Description

TrackMenu is called internally to execute the action associated with the selected menu item..

5.1.4.5.42 TCustomActionMenuBar.WndProc Method

Provides specific message responses for the control.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

Override WndProc to change the initial Windows message handler for the control. The WindowProc property is initialized to point to the WndProc method.

WndProc for TWinControl overrides the inherited method to define responses for focus, mouse, and keyboard messages. It sends all others to its inherited WndProc.

When overriding WndProc to provide specialized responses to messages, call the inherited WndProc at the end to dispatch any unhandled messages.

C++ Examples:

```
/*
This example shows how to use the WndProc method and the
WindowProc property to subclass a custom control's window
procedure.  This example subclasses the window procedure of
a TListBox descendant to respond to a user-defined message
called WM_STYLEMESSAGE. The subclassed window procedure can
be turned on or off by pressing a radio button.
*/
class TMyListBoxDescendant : public TListBox
{
__published:    // IDE-managed Components
    void __fastcall SubClassWndProc(Messages::TMessage &Message);
    void __fastcall ToggleSubClass(bool On);
    void __fastcall OnDrawItemProc(
      TWinControl *Control, int Index, const TRect &Rect,
      TOwnerDrawState State);
private:    // User declarations
public:     // User declarations
    __fastcall TMyListBoxDescendant(TComponent* Owner);
};

TForm1 *Form1;
TMyListBoxDescendant *MyListBoxDescendant1;
Graphics::TBitmap *bitmap0;

const WM_STYLEMESSAGE = WM_USER + 2000;

__fastcall TForm1::TForm1(TComponent* Owner)
    : TForm(Owner)
{
}

__fastcall TMyListBoxDescendant::TMyListBoxDescendant(TComponent* Owner)
    : TListBox(Owner)
{
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PostMessage(
    MyListBoxDescendant1->Handle,
    WM_STYLEMESSAGE,
    Integer(lbOwnerDrawFixed),
    0);
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  PostMessage(
    MyListBoxDescendant1->Handle,
    WM_STYLEMESSAGE,

        BrushCopy(
          Bounds(Rect.Left + Offset, Rect.Top, Bitmap.Width, Bitmap.Height),
          Bitmap,
          Bounds(0, 0, Bitmap.Width, Bitmap.Height),
          clRed);  {render bitmap}
        Offset := Bitmap.width + 6;    { add four pixels between bitmap and text}
      end;
      TextOut(Rect.Left + Offset, Rect.Top, (Control as TListBox).Items[Index])  { display the
  text }
    end;
  end;
```

5.1.4.6 TCustomActionMenuBar Properties

The properties of the TCustomActionMenuBar class are listed here.

Protected Properties

	Name	Description
	AnimateDuration (see page 716)	This is AnimateDuration, a member of class TCustomActionMenuBar.
	DelayItem (see page 717)	This is DelayItem, a member of class TCustomActionMenuBar.
	Expandable (see page 717)	This is Expandable, a member of class TCustomActionMenuBar.
	Expanded (see page 718)	This is Expanded, a member of class TCustomActionMenuBar.
	MouseControl (see page 718)	This is MouseControl, a member of class TCustomActionMenuBar.
	ParentMenu (see page 719)	This is ParentMenu, a member of class TCustomActionMenuBar.
R	PopupStack (see page 719)	This is PopupStack, a member of class TCustomActionMenuBar.
R	Selected (see page 719)	This is Selected, a member of class TCustomActionMenuBar.

Public Properties

	Name	Description
	AnimationStyle (see page 716)	Specifies the type of animation the menu bar will display as it opens.
	AutoFocus (see page 717)	This is AutoFocus, a member of class TCustomActionMenuBar.
	ExpandDelay (see page 717)	Specifies, in milliseconds, the delay period that a menu action band uses before showing hidden or unused items.
	InMenuLoop (see page 718)	Indicates whether items in the menu can be selected.
	ParentControl (see page 718)	Refers to the parent object of the TCustomActionBarControl.
	RootMenu (see page 719)	Refers to the root menu of the ActionBand menu.
	UseSystemFont (see page 720)	Specifies whether the default system font for menu items is used.

5.1.4.6.1 TCustomActionMenuBar.AnimateDuration Property

Pascal

```
property AnimateDuration: Integer;
```

C++

```
__property int AnimateDuration;
```

Description

This is AnimateDuration, a member of class TCustomActionMenuBar.

5.1.4.6.2 TCustomActionMenuBar.AnimationStyle Property

Specifies the type of animation the menu bar will display as it opens.

Pascal

```
property AnimationStyle: TAnimationStyle;
```

C++

```
__property TAnimationStyle AnimationStyle;
```

Description

Use AnimationStyle to change the style of animation used by the items in the menu bar as they open. The options are:.

Value	Animation Description
asNone	No animation is used; the menu appears fully formed.
asDefault	The operating system default animation style is used.
asUnfold	The menu unfolds diagonally down from the upper left corner.
asSlide	The menu slides from the top down.
asFade	The menu fades in from invisible to visible.

5.1.4.6.3 TCustomActionMenuBar.AutoFocus Property

Pascal

```
property AutoFocus: Boolean;
```

C++

```
__property Boolean AutoFocus;
```

Description

This is AutoFocus, a member of class TCustomActionMenuBar.

5.1.4.6.4 TCustomActionMenuBar.DelayItem Property

Pascal

```
property DelayItem: TCustomActionControl;
```

C++

```
__property TCustomActionControl DelayItem;
```

Description

This is DelayItem, a member of class TCustomActionMenuBar.

5.1.4.6.5 TCustomActionMenuBar.Expandable Property

Pascal

```
property Expandable: Boolean;
```

C++

```
__property Boolean Expandable;
```

Description

This is Expandable, a member of class TCustomActionMenuBar.

5.1.4.6.6 TCustomActionMenuBar.ExpandDelay Property

Specifies, in milliseconds, the delay period that a menu action band uses before showing hidden or unused items.

Pascal

```
property ExpandDelay: Integer;
```

C++

```
__property int ExpandDelay;
```

Description

Use ExpandDelay to specify, in milliseconds, the delay period that a menu action band uses before showing hidden or unused items. The default is 4000 milliseconds.

5.1.4.6.7 TCustomActionMenuBar.Expanded Property

Pascal

```
property Expanded: Boolean;
```

C++

```
__property Boolean Expanded;
```

Description

This is Expanded, a member of class TCustomActionMenuBar.

5.1.4.6.8 TCustomActionMenuBar.InMenuLoop Property

Indicates whether items in the menu can be selected.

Pascal

```
property InMenuLoop: Boolean;
```

C++

```
__property Boolean InMenuLoop;
```

Description

Use InMenuLoop to determine if the menu bar has focus or not, which would allow items on the menu bar to be selected.

5.1.4.6.9 TCustomActionMenuBar.MouseControl Property

Pascal

```
property MouseControl: TControl;
```

C++

```
__property TControl * MouseControl;
```

Description

This is MouseControl, a member of class TCustomActionMenuBar.

5.1.4.6.10 TCustomActionMenuBar.ParentControl Property

Refers to the parent object of the TCustomActionBarControl.

Pascal

```
property ParentControl: TCustomActionControl;
```

C++

```
__property TCustomActionControl ParentControl;
```

Description

Use ParentControl to obtain a reference to the parent object which created the TCustomActionMenuBar (see page 685) object. This property is used mostly for popup menus, where the content of the menu depends upon the object in which the menu is appearing (the parent object). ParentControl is simply a reference to that object.

5.1.4.6.11 TCustomActionMenuBar.ParentMenu Property

Pascal

```
property ParentMenu: TCustomActionMenuBar;
```

C++

```
__property TCustomActionMenuBar ParentMenu;
```

Description

This is ParentMenu, a member of class TCustomActionMenuBar.

5.1.4.6.12 TCustomActionMenuBar.PopupStack Property

Pascal

```
property PopupStack: TMenuStack;
```

C++

```
__property TMenuStack PopupStack;
```

Description

This is PopupStack, a member of class TCustomActionMenuBar.

5.1.4.6.13 TCustomActionMenuBar.RootMenu Property

Refers to the root menu of the ActionBand menu.

Pascal

```
property RootMenu: TCustomActionMenuBar;
```

C++

```
__property TCustomActionMenuBar RootMenu;
```

Description

Application menus frequently contain submenus. It is sometimes important to know what the root menu is of any given menu; for example, selecting an item on a submenu may require that some change be made to the root menu object. Use RootMenu to determine the root menu of any TCustomActionMenuBar (see page 685) object.

5.1.4.6.14 TCustomActionMenuBar.Selected Property

Pascal

```
property Selected: TActionClientItem;
```

C++

```
__property TActionClientItem Selected;
```

Description

This is Selected, a member of class TCustomActionMenuBar.

5.1.4.6.15 TCustomActionMenuBar.UseSystemFont Property

Specifies whether the default system font for menu items is used.

Pascal

```
property UseSystemFont: Boolean;
```

C++

```
__property Boolean UseSystemFont;
```

Description

Use UseSystemFont to specify whether the action band uses the default system menu font when it draws the captions for its items. By default, UseSystemFont is set to true. When the Font property is changed from the default values, UseSystemFont is automatically set to false. Setting UseSystemFont to true causes the font specified in the MenuFont property of the TScreen object to be used instead of the font specified in the action band's Font property.

5.1.4.7 TCustomActionMenuBar Events

The events of the TCustomActionMenuBar class are listed here.

Public Events

	Name	Description
	OnEnterMenuLoop (see page 720)	Occurs when an ActionBand menu loop has begun.
	OnExitMenuLoop (see page 721)	Occurs when an ActionBand menu loop has ended and the menu is closed.
	OnGetPopupClass (see page 721)	Occurs prior to an ActionBand popupmenu appearing on screen.
	OnPopup (see page 721)	Occurs just before the pop-up menu appears.

5.1.4.7.1 TCustomActionMenuBar.OnEnterMenuLoop Event

Occurs when an ActionBand menu loop has begun.

Pascal

```
property OnEnterMenuLoop: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnterMenuLoop;
```

Description

Write an OnEnterMenuLoop event handler to modify the menu as necessary prior to the menu appearing on screen.

5.1.4.7.2 TCustomActionMenuBar.OnExitMenuLoop Event

Occurs when an ActionBand menu loop has ended and the menu is closed.

Pascal

```
property OnExitMenuLoop: TExitMenuEvent;
```

C++

```
__property TExitMenuEvent OnExitMenuLoop;
```

Description

Write an OnExitMenuLoop event handler to do any additional processing once the menu has closed.

5.1.4.7.3 TCustomActionMenuBar.OnGetPopupClass Event

Occurs prior to an ActionBand popupmenu appearing on screen.

Pascal

```
property OnGetPopupClass: TGetPopupClassEvent;
```

C++

```
__property TGetPopupClassEvent OnGetPopupClass;
```

Description

Write an OnGetPopupClass event handler to control which popup menu class is used to display an ActionBand menu.

5.1.4.7.4 TCustomActionMenuBar.OnPopup Event

Occurs just before the pop-up menu appears.

Pascal

```
property OnPopup: TMenuPopupEvent;
```

C++

```
__property TMenuPopupEvent OnPopup;
```

Description

Write an OnPopup event handler to take specific action just before the pop-up menu appears.

5.1.5 TCustomActionPopupMenu Class

TCustomActionPopupMenu is the ancestor for popup action bands that render actions as popup menu item UI elements.

Class Hierarchy

Pascal

```
TCustomActionPopupMenu = class(TCustomActionMenuBar);
```

C++

```
class TCustomActionPopupMenu : public TCustomActionMenuBar;
```

File

ActnMenus

Description

TCustomActionPopupMenu is the ancestor for all popup action bands that render actions as popup menu item UI elements, including the standard form, TStandardMenuPopup. If you would like to replace TStandardMenuPopup with a style of your own, subclass TCustomActionPopupMenu to provide your own behaviors. To make the change for your application, set the value of MenuPopupClass (see page 847) (a global variable) to your own subclass of TCustomActionPopupMenu instead of TStandardMenuPopup.

See Also

TStandardMenuPopup (see page 20478)

5.1.5.1 TCustomActionPopupMenu Members

The following tables list the members exposed by TCustomActionPopupMenu.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FCachedMenu (see page 699)	This is FCachedMenu, a member of class TCustomActionMenuBar.
	FChildMenu (see page 699)	This is FChildMenu, a member of class TCustomActionMenuBar.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefaultColorMap (see page 460)	This is FDefaultColorMap, a member of class TCustomActionBar.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExpandTimer (see page 700)	This is FExpandTimer, a member of class TCustomActionMenuBar.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FPopupTimer (see page 700)	This is FPopupTimer, a member of class TCustomActionMenuBar.
	FSavedWrapState (see page 460)	This is FSavedWrapState, a member of class TCustomActionBar.
	FSelectedItem (see page 700)	This is FSelectedItem, a member of class TCustomActionMenuBar.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AddEdges (see page 737)	This is AddEdges, a member of class TCustomActionPopupMenu.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 462)	Aligns any controls for which the control is the parent within a specified area of the control.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	Animate (see page 701)	This is Animate, a member of class TCustomActionMenuBar.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
V	AutoSizingChanged (see page 462)	This is AutoSizingChanged, a member of class TCustomActionBar.

	BackgroundSize (see page 462)	This is BackgroundSize, a member of class TCustomActionBar.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CalcInsertPosition (see page 462)	This is CalcInsertPosition, a member of class TCustomActionBar.
V	CanAutoSize (see page 737)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	CleanupStack (see page 701)	This is CleanupStack, a member of class TCustomActionMenuBar.
V	Clear (see page 463)	This is Clear, a member of class TCustomActionBar.
	ClearSubMenus (see page 702)	This is ClearSubMenus, a member of class TCustomActionMenuBar.
	Click (see page 5743)	Respond to user click.
	CMBorderChanged (see page 23285)	This is CMBorderChanged, a member of class TToolWindow.
	CMCtl3DChanged (see page 23286)	This is CMCtl3DChanged, a member of class TToolWindow.
	CMMouseLeave (see page 738)	This is CMMouseLeave, a member of class TCustomActionPopupMenu.
	CMVisibleChanged (see page 738)	This is CMVisibleChanged, a member of class TCustomActionPopupMenu.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
V	CreateControl (see page 738)	This is CreateControl, a member of class TCustomActionPopupMenu.
V	CreateControls (see page 738)	This is CreateControls, a member of class TCustomActionPopupMenu.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 739)	Initializes a window-creation parameter data structure.
V	CreatePopup (see page 702)	This is CreatePopup, a member of class TCustomActionMenuBar.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 463)	Returns placement order of custom-aligned child control.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 464)	Returns aligned position of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
V	DesignWndProc (see page 739)	This is DesignWndProc, a member of class TCustomActionPopupMenu.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
V	DisplayShadow (see page 739)	This is DisplayShadow, a member of class TCustomActionPopupMenu.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.

	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
V	DoControlCreated (see page 465)	This is DoControlCreated, a member of class TCustomActionBar.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
V	DoDropActions (see page 465)	This is DoDropActions, a member of class TCustomActionBar.
V	DoDropCategory (see page 465)	This is DoDropCategory, a member of class TCustomActionBar.
V	DoDropItem (see page 466)	This is DoDropItem, a member of class TCustomActionBar.
V	DoEndDock (see page 146)	OnEndDock event dispatcher.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoGetControlClass (see page 466)	This is DoGetControlClass, a member of class TCustomActionBar.
	DoGetPopupClass (see page 703)	This is DoGetPopupClass, a member of class TCustomActionMenuBar.
V	DoItemClicked (see page 703)	This is DoItemClicked, a member of class TCustomActionMenuBar.
V	DoItemKeyed (see page 703)	This is DoItemKeyed, a member of class TCustomActionMenuBar.
	DoItemSelected (see page 703)	This is DoItemSelected, a member of class TCustomActionMenuBar.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMenuDelay (see page 703)	This is DoMenuDelay, a member of class TCustomActionMenuBar.
	DoMouseIdle (see page 704)	This is DoMouseIdle, a member of class TCustomActionMenuBar.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
V	DoneMenuLoop (see page 704)	This is DoneMenuLoop, a member of class TCustomActionMenuBar.
V	DoPopup (see page 704)	This is DoPopup, a member of class TCustomActionMenuBar.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
V	DoStartDock (see page 147)	OnStartDock event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 466)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
V	DrawBackground (see page 740)	This is DrawBackground, a member of class TCustomActionPopupMenu.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
V	ExecAction (see page 740)	This is ExecAction, a member of class TCustomActionPopupMenu.
	ExpandClick (see page 740)	This is ExpandClick, a member of class TCustomActionPopupMenu.
	ExpandTimer (see page 705)	This is ExpandTimer, a member of class TCustomActionMenuBar.
	FindAccelItem (see page 467)	This is FindAccelItem, a member of class TCustomActionBar.
	FindItemAt (see page 468)	This is FindItemAt, a member of class TCustomActionBar.
	FindItemCaption (see page 468)	This is FindItemCaption, a member of class TCustomActionBar.
V	FindLast (see page 468)	This is FindLast, a member of class TCustomActionBar.
	FindLeastUsedItem (see page 469)	This is FindLeastUsedItem, a member of class TCustomActionBar.
	FindNearestControl (see page 469)	This is FindNearestControl, a member of class TCustomActionBar.
V	FindNext (see page 470)	This is FindNext, a member of class TCustomActionBar.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FindNextVisibleItem (see page 470)	This is FindNextVisibleItem, a member of class TCustomActionBar.
V	FindPrevious (see page 470)	This is FindPrevious, a member of class TCustomActionBar.

	FindPreviousVisibleItem (see page 470)	This is FindPreviousVisibleItem, a member of class TCustomActionBar.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
V	GetActionControl (see page 471)	This is GetActionControl, a member of class TCustomActionBar.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
V	GetBannerWidth (see page 471)	This is GetBannerWidth, a member of class TCustomActionBar.
V	GetBarHeight (see page 471)	This is GetBarHeight, a member of class TCustomActionBar.
V	GetBarWidth (see page 471)	This is GetBarWidth, a member of class TCustomActionBar.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 741)	Returns the value of the ClientRect property.
V	GetControlClass (see page 471)	This is GetControlClass, a member of class TCustomActionBar.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDefaultColorMapClass (see page 472)	This is GetDefaultColorMapClass, a member of class TCustomActionBar.
	GetDefaultSounds (see page 705)	This is GetDefaultSounds, a member of class TCustomActionMenuBar.
V	GetDesignMode (see page 472)	This is GetDesignMode, a member of class TCustomActionBar.
V	GetDesignMode (see page 705)	This is GetDesignMode, a member of class TCustomActionMenuBar.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetExpandBtnClass (see page 741)	This is GetExpandBtnClass, a member of class TCustomActionPopupMenu.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 147)	Returns the class used for the control when it is floating.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetMouseHoverItem (see page 705)	This is GetMouseHoverItem, a member of class TCustomActionMenuBar.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
V	GetPopupClass (see page 706)	This is GetPopupClass, a member of class TCustomActionMenuBar.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetPopupMenuClass (see page 472)	This is GetPopupMenuClass, a member of class TCustomActionBar.
	GetSelected (see page 706)	This is GetSelected, a member of class TCustomActionMenuBar.
V	GetSiteInfo (see page 147)	Generates an OnGetSiteInfo event
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasItems (see page 472)	This is HasItems, a member of class TCustomActionBar.
V	HideShadow (see page 741)	This is HideShadow, a member of class TCustomActionPopupMenu.
	Idle (see page 706)	This is Idle, a member of class TCustomActionMenuBar.
V	InitMenuLoop (see page 706)	This is InitMenuLoop, a member of class TCustomActionMenuBar.

	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsDesignMsg (see page 707)	This is IsDesignMsg, a member of class TCustomActionMenuBar.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
V	ItemCount (see page 473)	This is ItemCount, a member of class TCustomActionBar.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 148)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 473)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 707)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
V	MouseActivate (see page 707)	This is MouseActivate, a member of class TCustomActionMenuBar.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	NCPaint (see page 473)	This is NCPaint, a member of class TCustomActionBar.
V	NCPaint (see page 23286)	This is NCPaint, a member of class TToolWindow.
V	NewPopup (see page 741)	This is NewPopup, a member of class TCustomActionPopupMenu.
V	Notification (see page 742)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 474)	This is Paint, a member of class TCustomActionBar.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 474)	Renders the image of a windowed control.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	PositionPopup (see page 742)	This is PositionPopup, a member of class TCustomActionPopupMenu.
V	ProcessMenuLoop (see page 708)	This is ProcessMenuLoop, a member of class TCustomActionMenuBar.
	ProcessMessage (see page 708)	This is ProcessMessage, a member of class TCustomActionMenuBar.
	ProcessMessages (see page 709)	This is ProcessMessages, a member of class TCustomActionMenuBar.
V	ProcessMouseMsg (see page 709)	This is ProcessMouseMsg, a member of class TCustomActionMenuBar.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
V	Reset (see page 475)	This is Reset, a member of class TCustomActionBar.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.

	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Select (see page 709)	This is Select, a member of class TCustomActionMenuBar.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectItem (see page 710)	This is SelectItem, a member of class TCustomActionMenuBar.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
V	SetActionClient (see page 475)	This is SetActionClient, a member of class TCustomActionBar.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetAutoSizing (see page 475)	This is SetAutoSizing, a member of class TCustomActionBar.
V	SetBiDiMode (see page 475)	Sets the control's bi-directional mode.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
V	SetColorMap (see page 743)	This is SetColorMap, a member of class TCustomActionPopupMenu.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDesignMode (see page 476)	This is SetDesignMode, a member of class TCustomActionBar.
V	SetDesignMode (see page 710)	Specifies whether the whether the action band is being customized or being used in the IDE.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetOrientation (see page 743)	This is SetOrientation, a member of class TCustomActionPopupMenu.
V	SetParent (see page 710)	Sets the parent of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetPersistentHotKeys (see page 477)	This is SetPersistentHotKeys, a member of class TCustomActionBar.
V	SetPersistentHotKeys (see page 711)	This is SetPersistentHotKeys, a member of class TCustomActionMenuBar.
V	SetSpacing (see page 477)	This is SetSpacing, a member of class TCustomActionBar.
	SetupDefaultColorMap (see page 477)	This is SetupDefaultColorMap, a member of class TCustomActionBar.
	SetupExpandBtn (see page 743)	This is SetupExpandBtn, a member of class TCustomActionPopupMenu.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.

	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	VisibleChanging (see page 743)	Provides the interface for a method that responds to changes in the control's visibility.
	WMKeyDown (see page 744)	This is WMKeyDown, a member of class TCustomActionPopupMenu.
	WMNCCalcSize (see page 23286)	This is WMNCCalcSize, a member of class TToolWindow.
	WMNCPaint (see page 23286)	This is WMNCPaint, a member of class TToolWindow.
	WMPrint (see page 744)	This is WMPrint, a member of class TCustomActionPopupMenu.
	WMPrintClient (see page 744)	This is WMPrintClient, a member of class TCustomActionPopupMenu.
V	WndProc (see page 711)	Provides specific message responses for the control.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AnimateDuration (see page 716)	This is AnimateDuration, a member of class TCustomActionMenuBar.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DelayItem (see page 717)	This is DelayItem, a member of class TCustomActionMenuBar.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Expandable (see page 717)	This is Expandable, a member of class TCustomActionMenuBar.
	Expanded (see page 718)	This is Expanded, a member of class TCustomActionMenuBar.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
R	HRowCount (see page 488)	Indicates the number of columns of items that the action band displays.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).

	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Items (see page 488)	Lists the action clients that correspond to the child controls of this action band.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	MouseControl (see page 718)	This is MouseControl, a member of class TCustomActionMenuBar.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentMenu (see page 719)	This is ParentMenu, a member of class TCustomActionMenuBar.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
R	PopupStack (see page 719)	This is PopupStack, a member of class TCustomActionMenuBar.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
R	Selected (see page 719)	This is Selected, a member of class TCustomActionMenuBar.
	Text (see page 5842)	Contains a text string associated with the control.
R	VRowCount (see page 490)	Indicates the number of rows of items that the action band displays.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
R	Widest (see page 491)	This is Widest, a member of class TCustomActionBar.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnControlCreated (see page 491)	Occurs when a control is created on the action band.
	OnEnterMenuLoop (see page 720)	Occurs when an ActionBand menu loop has begun.
	OnExitMenuLoop (see page 721)	Occurs when an ActionBand menu loop has ended and the menu is closed.
	OnGetControlClass (see page 492)	Occurs when an item is to be placed on the action band.
	OnGetPopupClass (see page 721)	Occurs prior to an ActionBand popupmenu appearing on screen.
	OnPaint (see page 492)	Occurs when the action band is painted.
	OnPopup (see page 721)	Occurs just before the pop-up menu appears.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
V	CalcDockedWidth (see page 146)	This is CalcDockedWidth, a member of class TCustomActionDockBar.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	CloseMenu (see page 737)	Closes the menu currently being displayed.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 735)	Creates and initializes a TCustomActionPopupMenu (see page 721) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 736)	Destroys an instance of TCustomActionMenuBar (see page 685).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Dock (see page 146)	Used internally to dock the action band.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
V	DragDrop (see page 466)	Generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	Expand (see page 740)	Performs the same kinds of functions as the inherited method.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
V	FindFirst (see page 467)	Finds the first TActionClientItem (see page 374) in the Items (see page 488) list.
	FindFirstVisibleItem (see page 468)	Finds the first visible TActionClientItem (see page 374) in the Items (see page 488) list.
	FindLastVisibleItem (see page 469)	Finds the last visibleTActionClientItem in the Items (see page 488) list.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	Popup (see page 742)	Causes the popup menu to appear.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
V	RecreateControls (see page 475)	Destroys and recreates all of the action band's action client controls.
V	RecreateControls (see page 709)	Destroys and recreates all of the action band's action client controls.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.

	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 476)	Sets the bounds based on whether the popup is expanded or not
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Style (see page 477)	Identifies the style object that gives the application its default look and feel.
V	Style (see page 711)	Retrieves the style used by the ActionBand menu that started the menu loop so the submenus have a consistent appearance.
V	TrackMenu (see page 711)	Executes the action associated with the menu item.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	ActionClient (see page 479)	Specifies the action client associated with this action band.
R	ActionControls (see page 479)	Lists the controls on the action band.
	ActionManager (see page 480)	Specifies the action manager component that is associated with the action band.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	AllowHiding (see page 480)	Determines whether the action band can be hidden.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AnimationStyle (see page 716)	Specifies the type of animation the menu bar will display as it opens.
	AutoFocus (see page 717)	This is AutoFocus, a member of class TCustomActionMenuBar.
	AutoSizing (see page 480)	Specifies whether the action band adjusts its size automatically to fit around its child controls.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 481)	Represents the drawing surface of the action band.
	Caption (see page 481)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	Color (see page 483)	Specifies the background color of the control.
	ColorMap (see page 484)	Indicates the colormap for individual action band components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ContextBar (see page 485)	Indicates whether items shown in this action band represent the items in a popup menu.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Designable (see page 485)	Specifies whether the action band can be customized (used internally by the IDE).
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignMode (see page 486)	Specifies whether the action band is being customized or being used in the IDE.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	EdgeBorders (see page 23287)	Determines which sides of the control have visible borders.
	EdgeInner (see page 23287)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 23288)	Determines the border style for the control's outer edge.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
	ExpandBtn (see page 744)	Refers to the popup menu's expand button.
	ExpandDelay (see page 717)	Specifies, in milliseconds, the delay period that a menu action band uses before showing hidden or unused items.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	Font (see page 486)	Controls the attributes of text written on or in the control.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HorzMargin (see page 487)	Specifies the width of the horizontal margins in pixels.
	HorzSeparator (see page 487)	Indicates whether a horizontal separator bar appears between item lines.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	InMenuLoop (see page 718)	Indicates whether items in the menu can be selected.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	Orientation (see page 488)	Specifies how the action band lays out its child items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentControl (see page 718)	Refers to the parent object of the TCustomActionBarControl.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	PersistentHotKeys (see page 489)	Specifies whether keyboard accelerator shortcuts are always displayed.
	RootMenu (see page 719)	Refers to the root menu of the ActionBand menu.

	Shadow (see page 745)	Refers to the popup menu's shadow.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	Spacing (see page 489)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	UseSystemFont (see page 720)	Specifies whether the default system font for menu items is used.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	VertMargin (see page 490)	Specifies the width of the vertical margins in pixels.
	VertSeparator (see page 490)	Indicates whether a vertical separator bar should appear between item lines.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

5.1.5.2 TCustomActionPopupMenu.Create Constructor

Creates and initializes a TCustomActionPopupMenu (see page 721) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomActionPopupMenu(TComponent * AOwner);
```

Description

Create generates a TCustomActionPopupMenu (see page 721) and initializes its properties.

```
__fastcall virtual TCustomActionMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

5.1.5.3 TCustomActionPopupMenu.Destroy Destructor

Destroys an instance of TCustomActionMenuBar (see page 685).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomActionPopupMenu();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TCustomActionMenuBar (see page 685) reference is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

Destroy (see page 5732)

5.1.5.4 TCustomActionPopupMenu Methods

The methods of the TCustomActionPopupMenu class are listed here.

Protected Methods

	Name	Description
V	AddEdges (see page 737)	This is AddEdges, a member of class TCustomActionPopupMenu.
V	CanAutoSize (see page 737)	Indicates how the control can be resized.
	CMMouseLeave (see page 738)	This is CMMouseLeave, a member of class TCustomActionPopupMenu.
	CMVisibleChanged (see page 738)	This is CMVisibleChanged, a member of class TCustomActionPopupMenu.
V	CreateControl (see page 738)	This is CreateControl, a member of class TCustomActionPopupMenu.
V	CreateControls (see page 738)	This is CreateControls, a member of class TCustomActionPopupMenu.
V	CreateParams (see page 739)	Initializes a window-creation parameter data structure.
V	DesignWndProc (see page 739)	This is DesignWndProc, a member of class TCustomActionPopupMenu.
V	DisplayShadow (see page 739)	This is DisplayShadow, a member of class TCustomActionPopupMenu.
V	DrawBackground (see page 740)	This is DrawBackground, a member of class TCustomActionPopupMenu.
V	ExecAction (see page 740)	This is ExecAction, a member of class TCustomActionPopupMenu.
	ExpandClick (see page 740)	This is ExpandClick, a member of class TCustomActionPopupMenu.
V	GetClientRect (see page 741)	Returns the value of the ClientRect property.
V	GetExpandBtnClass (see page 741)	This is GetExpandBtnClass, a member of class TCustomActionPopupMenu.
V	HideShadow (see page 741)	This is HideShadow, a member of class TCustomActionPopupMenu.
V	NewPopup (see page 741)	This is NewPopup, a member of class TCustomActionPopupMenu.
V	Notification (see page 742)	Responds to notifications that components are being created or destroyed.
V	PositionPopup (see page 742)	This is PositionPopup, a member of class TCustomActionPopupMenu.
V	SetColorMap (see page 743)	This is SetColorMap, a member of class TCustomActionPopupMenu.
V	SetOrientation (see page 743)	This is SetOrientation, a member of class TCustomActionPopupMenu.
	SetupExpandBtn (see page 743)	This is SetupExpandBtn, a member of class TCustomActionPopupMenu.
V	VisibleChanging (see page 743)	Provides the interface for a method that responds to changes in the control's visibility.
	WMKeyDown (see page 744)	This is WMKeyDown, a member of class TCustomActionPopupMenu.
	WMPrint (see page 744)	This is WMPrint, a member of class TCustomActionPopupMenu.
	WMPrintClient (see page 744)	This is WMPrintClient, a member of class TCustomActionPopupMenu.

Public Methods

	Name	Description
	CloseMenu (see page 737)	Closes the menu currently being displayed.
	Expand (see page 740)	Performs the same kinds of functions as the inherited method.
	Popup (see page 742)	Causes the popup menu to appear.

5.1.5.4.1 TCustomActionPopupMenu.AddEdges Method

Pascal

```
procedure AddEdges(AnItem: TCustomMenuItem); virtual;
```

C++

```
virtual __fastcall AddEdges(TCustomMenuItem AnItem);
```

Description

This is AddEdges, a member of class TCustomActionPopupMenu.

5.1.5.4.2 TCustomActionPopupMenu.CanAutoSize Method

Indicates how the control can be resized.

Pascal

```
function CanAutoSize(var NewWidth: Integer; var NewHeight: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanAutoSize(int NewWidth, int NewHeight);
```

Description

CanAutoSize is called automatically when the AutoSize property is true and an attempt is made to resize the control. It allows controls to implement the AutoSize property before the resize sequence that begins with the OnCanResize and OnConstrainedResize events and ends with the OnResize event.

When CanAutoSize is called, the NewWidth and NewHeight parameters indicate the proposed new dimensions of the control. CanAutoSize adjusts these values so that the control's size adjusts to its contents. If the adjustment results in values of NewWidth and NewHeight that differ from the control's current width and height, CanAutoSize returns true, indicating that the resize sequence should proceed. If, after adjustment, NewWidth and NewHeight equal Width and Height, CanAutoSize returns false, and the resize sequence is aborted.

As implemented in TWinControl, CanAutoSize returns true, adjusting NewWidth and NewHeight so that all the control's children fit.

See Also

Constraints (see page 5812)

ConstrainedResize (see page 6133)

AdjustSize (see page 6129)

5.1.5.4.3 TCustomActionPopupMenu.CloseMenu Method

Closes the menu currently being displayed.

Pascal

```
procedure CloseMenu; override;
```

C++

```
virtual __fastcall CloseMenu();
```

Description

CloseMenu is called to close the menu currently being displayed. The only difference between this routine and the inherited one is that the Visible property is set to false.

See Also

CloseMenu (see page 702)

Visible (see page 5847)

5.1.5.4.4 TCustomActionPopupMenu.CMMouseLeave Method

Pascal

```
procedure CMMouseLeave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseLeave(TMessage Message);
```

Description

This is CMMouseLeave, a member of class TCustomActionPopupMenu.

5.1.5.4.5 TCustomActionPopupMenu.CMVisibleChanged Method

Pascal

```
procedure CMVisibleChanged(var Message: TMessage); message CM_VISIBLECHANGED;
```

C++

```
__fastcall CMVisibleChanged(TMessage Message);
```

Description

This is CMVisibleChanged, a member of class TCustomActionPopupMenu.

5.1.5.4.6 TCustomActionPopupMenu.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TCustomActionPopupMenu.

5.1.5.4.7 TCustomActionPopupMenu.CreateControls Method

Pascal

```
procedure CreateControls; override;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TCustomActionPopupMenu.

5.1.5.4.8 TCustomActionPopupMenu.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

5.1.5.4.9 TCustomActionPopupMenu.DesignWndProc Method

Pascal

```
function DesignWndProc(var Message: TMessage): Boolean; override;
```

C++

```
virtual __fastcall Boolean DesignWndProc(TMessage Message);
```

Description

This is DesignWndProc, a member of class TCustomActionPopupMenu.

5.1.5.4.10 TCustomActionPopupMenu.DisplayShadow Method

Pascal

```
procedure DisplayShadow; virtual;
```

C++

```
virtual __fastcall DisplayShadow();
```

Description

This is DisplayShadow, a member of class TCustomActionPopupMenu.

5.1.5.4.11 TCustomActionPopupMenu.DrawBackground Method

Pascal

```
procedure DrawBackground; override;
```

C++

```
virtual __fastcall DrawBackground();
```

Description

This is DrawBackground, a member of class TCustomActionPopupMenu.

5.1.5.4.12 TCustomActionPopupMenu.ExecAction Method

Pascal

```
procedure ExecAction(Action: TContainedAction); override;
```

C++

```
virtual __fastcall ExecAction(TContainedAction Action);
```

Description

This is ExecAction, a member of class TCustomActionPopupMenu.

5.1.5.4.13 TCustomActionPopupMenu.Expand Method

Performs the same kinds of functions as the inherited method.

Pascal

```
procedure Expand(Full: Boolean); override;
```

C++

```
virtual __fastcall Expand(Boolean Full);
```

Description

This implementation of Expand serves the same purpose as the inherited method. It performs actions specific to popup menus. For more information, see the documentation for the inherited method.

See Also

Expand (see page 704)

5.1.5.4.14 TCustomActionPopupMenu.ExpandClick Method

Pascal

```
procedure ExpandClick(Sender: TObject);
```

C++

```
__fastcall ExpandClick(TObject * Sender);
```

Description

This is ExpandClick, a member of class TCustomActionPopupMenu.

5.1.5.4.15 TCustomActionPopupMenu.GetClientRect Method

Returns the value of the ClientRect property.

Pascal

```
function GetClientRect: TRect; override;
```

C++

```
virtual __fastcall TRect GetClientRect();
```

Description

GetClientRect is the protected implementation of the ClientRect property. GetClientRect returns a rectangle with the rectangle's Top and Left fields set to zero, and its Bottom and Right fields set to the control's ClientHeight and ClientWidth, respectively.

See Also

ClientHeight (see page 5808)

ClientWidth (see page 5811)

GetClientOrigin (see page 6153)

5.1.5.4.16 TCustomActionPopupMenu.GetExpandBtnClass Method

Pascal

```
function GetExpandBtnClass: TCustomMenuExpandBtnClass; virtual;
```

C++

```
virtual __fastcall TCustomMenuExpandBtnClass GetExpandBtnClass();
```

Description

This is GetExpandBtnClass, a member of class TCustomActionPopupMenu.

5.1.5.4.17 TCustomActionPopupMenu.HideShadow Method

Pascal

```
procedure HideShadow; virtual;
```

C++

```
virtual __fastcall HideShadow();
```

Description

This is HideShadow, a member of class TCustomActionPopupMenu.

5.1.5.4.18 TCustomActionPopupMenu.NewPopup Method

Pascal

```
function NewPopup: TCustomActionPopupMenu; override;
```

C++

```
virtual __fastcall TCustomActionPopupMenu NewPopup();
```

Description

This is NewPopup, a member of class TCustomActionPopupMenu.

5.1.5.4.19 TCustomActionPopupMenu.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu (see page 5835)

Notification (see page 2783)

5.1.5.4.20 TCustomActionPopupMenu.Popup Method

Causes the popup menu to appear.

Pascal

```
procedure Popup(X: Integer; Y: Integer);
```

C++

```
__fastcall Popup(int X, int Y);
```

Description

Call Popup to display the popup menu at the specified coordinates (in pixels) on screen. This method is meant to behave the same as the procedure of the same name in TPopupMenu.

See Also

Popup (see page 16174)

5.1.5.4.21 TCustomActionPopupMenu.PositionPopup Method

Pascal

```
procedure PositionPopup(AnOwner: TCustomActionBar; ParentItem: TCustomActionControl); virtual;
```

C++

```
virtual __fastcall PositionPopup(TCustomActionBar AnOwner, TCustomActionControl ParentItem);
```

Description

This is PositionPopup, a member of class TCustomActionPopupMenu.

5.1.5.4.22 TCustomActionPopupMenu.SetColorMap Method

Pascal

```
procedure SetColorMap(const Value: TCustomActionBarColorMap); override;
```

C++

```
virtual __fastcall SetColorMap(const TCustomActionBarColorMap Value);
```

Description

This is SetColorMap, a member of class TCustomActionPopupMenu.

5.1.5.4.23 TCustomActionPopupMenu.SetOrientation Method

Pascal

```
procedure SetOrientation(const Value: TBarOrientation); override;
```

C++

```
virtual __fastcall SetOrientation(const TBarOrientation Value);
```

Description

This is SetOrientation, a member of class TCustomActionPopupMenu.

5.1.5.4.24 TCustomActionPopupMenu.SetupExpandBtn Method

Pascal

```
procedure SetupExpandBtn;
```

C++

```
__fastcall SetupExpandBtn();
```

Description

This is SetupExpandBtn, a member of class TCustomActionPopupMenu.

5.1.5.4.25 TCustomActionPopupMenu.VisibleChanging Method

Provides the interface for a method that responds to changes in the control's visibility.

Pascal

```
procedure VisibleChanging; override;
```

C++

```
virtual __fastcall VisibleChanging();
```

Description

VisibleChanging is called before the value of a control's Visible property changes. As implemented in TControl, it does nothing. Override VisibleChanging to respond to changes in the control's visibility. For example, if a control should not change its visibility, override VisibleChanging to raise an exception when an attempt is made to alter the control's visibility.

See Also

Visible (see page 5847)

5.1.5.4.26 TCustomActionPopupMenu.WMKeyDown Method

Pascal

```
procedure WMKeyDown(var Message: TWMKeyDown); message WM_KEYDOWN;
```

C++

```
__fastcall WMKeyDown(TWMKeyDown Message);
```

Description

This is WMKeyDown, a member of class TCustomActionPopupMenu.

5.1.5.4.27 TCustomActionPopupMenu.WMPrint Method

Pascal

```
procedure WMPrint(var Message: TMessage); message WM_PRINT;
```

C++

```
__fastcall WMPrint(TMessage Message);
```

Description

This is WMPrint, a member of class TCustomActionPopupMenu.

5.1.5.4.28 TCustomActionPopupMenu.WMPrintClient Method

Pascal

```
procedure WMPrintClient(var Message: TWMPrintClient); message WM_PRINTCLIENT;
```

C++

```
__fastcall WMPrintClient(TWMPrintClient Message);
```

Description

This is WMPrintClient, a member of class TCustomActionPopupMenu.

5.1.5.5 TCustomActionPopupMenu Properties

The properties of the TCustomActionPopupMenu class are listed here.

Public Properties

	Name	Description
	ExpandBtn (see page 744)	Refers to the popup menu's expand button.
	Shadow (see page 745)	Refers to the popup menu's shadow.

5.1.5.5.1 TCustomActionPopupMenu.ExpandBtn Property

Refers to the popup menu's expand button.

Pascal

```
property ExpandBtn: TCustomMenuExpandBtn;
```

C++

```
__property TCustomMenuExpandBtn ExpandBtn;
```

Description

Use ExpandBtn to access the popup menu action band's expand button object. An action band may have hidden items. For example, items which are used infrequently may be hidden to make the menus appear less cluttered. Still, the user may wish to use hidden items from time to time. They become visible again when the user selects the expand bar.

5.1.5.5.2 TCustomActionPopupMenu.Shadow Property

Refers to the popup menu's shadow.

Pascal

```
property Shadow: Boolean;
```

C++

```
__property Boolean Shadow;
```

Description

Use Shadow to control whether or not the menu displays with or without a shadow.

5.1.6 TCustomAddRemoveItem Class

TCustomAddRemoveItem is the base class for the ActionBand menus for customizing action bands.

Class Hierarchy

Pascal

```
TCustomAddRemoveItem = class(TCustomMenuItem);
```

C++

```
class TCustomAddRemoveItem : public TCustomMenuItem;
```

File

ActnMenus

Description

TCustomAddRemoveItem is a base class for TStandardAddRemoveItem, the standard ActionBand menu for customizing action bands at runtime.

Do not create instances of TCustomAddRemoveItem. If you would like to replace the standard customization menu, use the class TCustomAddRemoveItem as a parent class for your replacement class. To make the change for your application, set the value of MenuAddRemoveItemClass (see page 846) (a global variable) to your own subclass of TCustomAddRemoveItem instead of TStandardAddRemoveItem.

See Also

TStandardAddRemoveItem (see page 20398)

5.1.6.1 TCustomAddRemoveItem Members

The following tables list the members exposed by TCustomAddRemoveItem.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FNoPrefix (see page 826)	This is FNoPrefix, a member of class TCustomMenuItem.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.

	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CalcLayout (see page 827)	This is CalcLayout, a member of class TCustomMenuItem.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
V	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
V	DoDragDrop (see page 828)	This is DoDragDrop, a member of class TCustomMenuItem.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 521)	OnDragOver event dispatcher.
V	DragOver (see page 828)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
V	DrawBackground (see page 521)	Draws a background image on the control.
V	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
V	DrawEdge (see page 829)	This is DrawEdge, a member of class TCustomMenuItem.
V	DrawGlyph (see page 522)	Draws a symbol on the control.

	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.
	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
	DrawShadowedText (see page 829)	This is DrawShadowedText, a member of class TCustomMenuItem.
	DrawSubMenuGlyph (see page 829)	This is DrawSubMenuGlyph, a member of class TCustomMenuItem.
	DrawText (see page 523)	Draws text on the control.
	DrawText (see page 829)	This is DrawText, a member of class TCustomMenuItem.
	DrawUnusedEdges (see page 830)	This is DrawUnusedEdges, a member of class TCustomMenuItem.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionVisible (see page 755)	Indicates whether the add/remove item is visible in the menu of the customize dialog.
	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 755)	Responds when the user releases the mouse button when the mouse cursor is on this menu item.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Paint (see page 526)	Render control surface.
	Paint (see page 831)	Render control surface.

	Paint (see page 6052)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	PositionChanged (see page 831)	This is PositionChanged, a member of class TCustomMenuItem.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
	SetEnabled (see page 756)	Sets the value of the Enabled property.
	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
	SetSelected (see page 831)	This is SetSelected, a member of class TCustomMenuItem.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.

	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Menu (see page 832)	This is Menu, a member of class TCustomMenuItem.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseSelected (see page 832)	This is MouseSelected, a member of class TCustomMenuItem.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	ShortCutBounds (see page 832)	This is ShortCutBounds, a member of class TCustomMenuItem.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
V	CalcBounds (see page 754)	Calculates the size of the add/remove menu item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 518)	Executes the control's function in response to a mouse click.
V	Click (see page 827)	Executes the control's function.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 515)	Creates an instance of TCustomActionControl (see page 507).
V	Create (see page 825)	Creates an instance of TCustomMenuItem (see page 816).
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6051)	Creates an instance of TGraphicControl (see page 6044).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 516)	Destroys an instance of TCustomActionControl (see page 507).
V	Destroy (see page 825)	Destroys an instance of TCustomMenuItem (see page 816).
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
V	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
V	DragDrop (see page 828)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.

	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
V	Keyed (see page 525)	Executes the control's function in response to a keyboard action.
V	Keyed (see page 830)	Executes the menu item's function in response to a user's keyboard command.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Edges (see page 832)	Dictates which edges are drawn when the menu item is drawn.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	Selected (see page 533)	Indicates whether the control is currently selected.
R	Separator (see page 533)	Indicates whether the control is a separator.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.

	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

5.1.6.2 TCustomAddRemoveItem Methods

The methods of the TCustomAddRemoveItem class are listed here.

Protected Methods

	Name	Description
	IsActionVisible (see page 755)	Indicates whether the add/remove item is visible in the menu of the customize dialog.
	MouseUp (see page 755)	Responds when the user releases the mouse button when the mouse cursor is on this menu item.
	SetEnabled (see page 756)	Sets the value of the Enabled property.

Public Methods

	Name	Description
	CalcBounds (see page 754)	Calculates the size of the add/remove menu item.

5.1.6.2.1 TCustomAddRemoveItem.CalcBounds Method

Calculates the size of the add/remove menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

CalcBounds updates the Height, Width, and TextBounds properties to reflect current conditions (such as the item's caption and the current font).

See Also

Height (see page 5825)

Width (see page 5849)

TextBounds (see page 534)

5.1.6.2.2 TCustomAddRemoveItem.IsActionVisible Method

Indicates whether the add/remove item is visible in the menu of the customize dialog.

Pascal

```
function IsActionVisible: Boolean;
```

C++

```
__fastcall Boolean IsActionVisible();
```

Description

IsActionVisible returns true if the Add/Remove item is currently visible in the menu of the customize dialog. The menu can automatically hide items that have not been used recently.

IsActionVisible locates the action client object that corresponds to this menu item, if any. If this menu item has a corresponding action client in the action manager, IsActionVisible returns the value of that object's Visible property. If this menu item does not have a corresponding action client, IsActionVisible returns false.

See Also

Visible (see page 374)

Action (see page 382)

ActionClient (see page 529)

5.1.6.2.3 TCustomAddRemoveItem.MouseUp Method

Responds when the user releases the mouse button when the mouse cursor is on this menu item.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

MouseUp is called automatically when the user releases the mouse button over this menu item. This method generates an OnMouseUp event, and forces a repaint of the menu item.

Button indicates which mouse button the user released (left, right, or middle).

Shift indicates the state of the Ctrl, Alt, and Shift keys when the mouse was released.

X and Y indicate the screen coordinates of the mouse cursor's hotspot.

See Also

OnMouseUp (see page 5867)

5.1.6.2.4 TCustomAddRemoveItem.SetEnabled Method

Sets the value of the Enabled property.

Pascal

```
procedure SetEnabled(Value: Boolean); override;
```

C++

```
virtual __fastcall SetEnabled(Boolean Value);
```

Description

SetEnabled is the protected write implementation of the Enabled property.

Value is the new value to set. If Value is true, the add/remove menu item is enabled so that users can click it. If Value is false, the add/remove item is disabled, so that it appears gray and has no effect when clicked.

See Also

Enabled (see page 5821)

5.1.7 TCustomizeActionClientItem Class

Class Hierarchy

System::TObject → Classes.TPersistent → Classes.TCollectionItem → ActnMan.TActionClient → ActnMan.TActionClientItem → ActnMenus.TCustomizeActionClientItem

Pascal

```
TCustomizeActionClientItem = class(TActionClientItem);
```

C++

```
class TCustomizeActionClientItem : public TActionClientItem;
```

File

ActnMenus

Description

This is class ActnMenus.TCustomizeActionClientItem.

5.1.7.1 TCustomizeActionClientItem Members

The following tables list the members exposed by TCustomizeActionClientItem.

Protected Methods

	Name	Description
	ActionChange (see page 378)	This is ActionChange, a member of class TActionClientItem.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	ClearActionBar (see page 367)	This is ClearActionBar, a member of class TActionClient.

	ColorChanged (see page 367)	This is ColorChanged, a member of class TActionClient.
	ColorChanged (see page 379)	This is ColorChanged, a member of class TActionClientItem.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FreeChildren (see page 368)	This is FreeChildren, a member of class TActionClient.
	GetActionLinkClass (see page 759)	This is GetActionLinkClass, a member of class TCustomizeActionClientItem.
	GetDisplayName (see page 379)	Returns the name of the collection item as it appears in the collection editor.
	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	HasVisibleItems (see page 368)	This is HasVisibleItems, a member of class TActionClient.
	IsChildItem (see page 368)	This is IsChildItem, a member of class TActionClient.
	ResetUsageData (see page 380)	This is ResetUsageData, a member of class TActionClientItem.
	SetChangesAllowed (see page 369)	This is SetChangesAllowed, a member of class TActionClient.
	SetChangesAllowed (see page 380)	This is SetChangesAllowed, a member of class TActionClientItem.
	SetCollection (see page 381)	Sets the value of the Collection property.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetColor (see page 369)	This is SetColor, a member of class TActionClient.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 381)	Moves the collection item to a specified position in the parent collection.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.
	SetVisible (see page 369)	This is SetVisible, a member of class TActionClient.
	SetVisible (see page 381)	This is SetVisible, a member of class TActionClientItem.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 367)	Copies the contents of another object to the current one.
	Assign (see page 378)	Copies the contents of another TActionClientItem (see page 374) to the object where the method is executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 366)	Creates and initializes an action client object.
	Create (see page 377)	Creates and initializes a TActionClientItem (see page 374) object.
	Create (see page 2757)	Creates and initializes a TCollectionItem (see page 2755) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 366)	Destroys the action client and frees its memory.
	Destroy (see page 377)	Destroys the action client and frees its memory.
	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	HasBackground (see page 368)	Indicates whether a background image exists.
	HasGlyph (see page 379)	Indicates whether or not there is a glyph (small icon) associated with an action on the action band.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 380)	Updates the action associated with the action client item.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Refresh (see page 369)	Causes the action client to be redrawn.
V	Refresh (see page 380)	Causes the size of the action client item's control (if any) to be recalculated.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Unused (see page 382)	Determines whether a TActionClientItem (see page 374) is unused and should be hidden on an action band.

Public Properties

	Name	Description
	Accessible (see page 370)	This is Accessible, a member of class TActionClient.
	ActionBar (see page 370)	Specifies the action band the action client is rendered on.
R	ActionClients (see page 383)	Returns the TActionClients (see page 400) object that contains the TActionClientItem (see page 374).
	ActionLink (see page 383)	Refers to the action client item's action link.
	CheckUnused (see page 384)	Indicates whether the TActionClientItem (see page 374) object should be checked to see if it is unused and, if so, hidden from view.
	ChildActionBar (see page 372)	Specifies the action band that is used to render the TActionClients (see page 400) object specified in the Items (see page 373) property.
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	Control (see page 384)	Specifies the action band control that is rendered on an action band for the TActionClientItem (see page 374) object.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	HasItems (see page 373)	Specifies whether the action client has sub-items associated with the action client.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
R	OwningCollection (see page 373)	This is OwningCollection, a member of class TActionClient.
R	ParentItem (see page 386)	Refers to the parent item of the action client item.
R	Separator (see page 386)	Returns whether the TActionClientItem (see page 374) is rendered as a separator control on an action band.
R	ShortCutText (see page 387)	Contains the text label (like "Ctrl+S") for the shortcut.

Published Properties

	Name	Description
	Action (see page 382)	Specifies the action category or action that the TActionClientItem (see page 374) represents.
	Background (see page 370)	Specifies the image that is drawn on the action client's action band for the action client.
	BackgroundLayout (see page 371)	Specifies how the image specified in the Background (see page 370) property is rendered on the action band used by the action client to render any sub-items that are contained by the action client.

	Caption (see page 384)	Specifies the caption the action manager uses when the TActionClientItem (see page 374) is rendered on an action band.
	ChangesAllowed (see page 371)	Indicates which kinds of changes to the action client are permissible.
	Color (see page 372)	Specifies the background color for TClientAction when it is rendered on a action band.
	ContextItems (see page 372)	Specifies the TActionClients (see page 400) object that is rendered as a popup menu when a item is right clicked.
	HelpContext (see page 385)	This is HelpContext, a member of class TActionClientItem.
	ImageIndex (see page 385)	Contains the ImageIndex property for the client action item.
	Items (see page 373)	Specifies the TActionClients (see page 400) object that contains the sub-items of the action client.
	LastSession (see page 385)	Specifies the date an action client was last used.
	MergeIndex (see page 386)	Used to help merge action lists.
	ShortCut (see page 387)	Contains the ShortCut property for the action client item.
	ShowCaption (see page 387)	Determines whether the caption for the TActionClientItem (see page 374) is drawn.
	ShowGlyph (see page 388)	Indicates whether an image should be shown for the action.
	ShowShortCut (see page 388)	Determines whether the underbar character underneath the shortcut character is displayed.
	Tag (see page 374)	This is Tag, a member of class TActionClient.
	UsageCount (see page 388)	Specifies the total number of times an item has been used.
	Visible (see page 374)	Determines whether the action client is visible.

5.1.7.2 TCustomizeActionClientItem Methods

The methods of the TCustomizeActionClientItem class are listed here.

Protected Methods

	Name	Description
	GetActionLinkClass (see page 759)	This is GetActionLinkClass, a member of class TCustomizeActionClientItem.

5.1.7.2.1 TCustomizeActionClientItem.GetActionLinkClass Method

Pascal

```
function GetActionLinkClass: TActionClientLinkClass; override;
```

C++

```
virtual __fastcall TActionClientLinkClass GetActionLinkClass();
```

Description

This is GetActionLinkClass, a member of class TCustomizeActionClientItem.

5.1.8 TCustomizeActionLink Class

Class Hierarchy

Pascal

```
TCustomizeActionLink = class(TActionClientLink);
```

C++

```
class TCustomizeActionLink : public TActionClientLink;
```

File

ActnMenus

Description

This is class ActnMenus.TCustomizeActionLink.

5.1.8.1 TCustomizeActionLink Members

The following tables list the members exposed by TCustomizeActionLink.

Protected Fields

	Name	Description
	FAction (see page 2722)	This is FAction, a member of class TBasicActionLink.
	FClient (see page 391)	This is FClient, a member of class TActionClientLink.

Protected Methods

	Name	Description
	AssignClient (see page 392)	This is AssignClient, a member of class TActionClientLink.
	AssignClient (see page 2723)	This is AssignClient, a member of class TBasicActionLink.
	Change (see page 2723)	This is Change, a member of class TBasicActionLink.
	DoShowHint (see page 392)	This is DoShowHint, a member of class TActionClientLink.
	IsCaptionLinked (see page 268)	Indicates whether the Caption properties for the action and client are linked.
	IsCaptionLinked (see page 392)	Indicates whether the Caption properties for the action and client are linked.
	IsCheckedLinked (see page 269)	Indicates whether the Checked properties for the action and client are linked.
	IsEnabledLinked (see page 269)	Indicates whether the Enabled properties for the action and client are linked.
	IsEnabledLinked (see page 393)	Indicates whether the Enabled properties for the action and client are linked.
	IsGroupIndexLinked (see page 270)	Indicates whether the GroupIndex property for the action controls client behavior.
	IsHelpContextLinked (see page 270)	Indicates whether the HelpContext properties for the action and client controls are linked.
	IsHelpContextLinked (see page 393)	Indicates whether the HelpContext properties for the action and client controls are linked.
	IsHelpLinked (see page 271)	Indicates whether the help properties for the action and client are linked.
	IsHintLinked (see page 271)	Indicates whether the Hint properties for the action and client are linked.
	IsHintLinked (see page 394)	Indicates whether the Hint properties for the action and client are linked.
	IsImageIndexLinked (see page 272)	Indicates whether the image index for the action and the client are linked.
	IsImageIndexLinked (see page 394)	Indicates whether the image index for the action and the client are linked.
	IsOnExecuteLinked (see page 395)	This is IsOnExecuteLinked, a member of class TActionClientLink.
	IsOnExecuteLinked (see page 2723)	This is IsOnExecuteLinked, a member of class TBasicActionLink.
	IsShortCutLinked (see page 272)	Indicates whether the ShortCut properties for the action and client are linked.
	IsShortCutLinked (see page 395)	Indicates whether the ShortCut properties for the action and client are linked.
	IsVisibleLinked (see page 273)	Indicates whether the Visible properties for the action and client are linked.
	IsVisibleLinked (see page 396)	Indicates whether the Visible properties for the action and client are linked.
	SetAction (see page 2724)	This is SetAction, a member of class TBasicActionLink.
	SetAutoCheck (see page 274)	Introduces an interface for setting the AutoCheck property of a client.
	SetCaption (see page 274)	Introduces an interface for setting the caption on a client.
	SetCaption (see page 396)	Introduces an interface for setting the caption on a client.
	SetChecked (see page 274)	Introduces an interface for setting the checked state of a client.
	SetChecked (see page 397)	Introduces an interface for setting the checked state of a client.
	SetEnabled (see page 762)	Introduces an interface for setting the enabled state of a client.
	SetGroupIndex (see page 275)	Introduces an interface for setting the GroupIndex property of a client.

	SetHelpContext (see page 276)	Introduces an interface for setting the help context of a client.
	SetHelpContext (see page 398)	Introduces an interface for setting the help context of a client.
	SetHelpKeyword (see page 276)	Introduces an interface for setting the help keyword of a client.
	SetHelpType (see page 277)	Introduces an interface for setting the HelpType property of a client.
	SetHint (see page 278)	Introduces an interface for setting the hint for a client.
	SetHint (see page 398)	Introduces an interface for setting the hint for a client.
	SetImageIndex (see page 278)	Introduces an interface for setting the image index for a client.
	SetImageIndex (see page 399)	Introduces an interface for setting the image index for a client.
	SetOnExecute (see page 399)	This is SetOnExecute, a member of class TActionClientLink.
	SetOnExecute (see page 2724)	This is SetOnExecute, a member of class TBasicActionLink.
	SetShortCut (see page 279)	Introduces an interface for setting the shortcut for a client.
	SetShortCut (see page 399)	Introduces an interface for setting the shortcut for a client.
	SetVisible (see page 279)	Introduces an interface for setting the visible state of a client.
	SetVisible (see page 400)	Introduces an interface for setting the visible state of a client.

Public Events

	Name	Description
	OnChange (see page 2725)	Occurs when an OnChange event is triggered on the action.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2721)	Instantiates and initializes a TBasicActionLink (see page 2720) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2722)	Destroys an instance of an action link object.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 2723)	Invokes the action's Execute method.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Update (see page 2724)	Invokes the action's Update method.

Public Properties

	Name	Description
	Action (see page 2725)	Indicates which action the link connects to its client.

5.1.8.2 TCustomizeActionLink Methods

The methods of the TCustomizeActionLink class are listed here.

Protected Methods

	Name	Description
	SetEnabled (see page 762)	Introduces an interface for setting the enabled state of a client.

5.1.8.2.1 TCustomizeActionLink.SetEnabled Method

Introduces an interface for setting the enabled state of a client.

Pascal

```
procedure SetEnabled(Value: Boolean); override;
```

C++

```
virtual __fastcall SetEnabled(Boolean Value);
```

Description

The associated action calls SetEnabled when its Enabled property changes so that the action link can propagate the new Enabled value to the client object.

Value specifies the new value of the Enabled property.

As implemented in TActionLink, SetEnabled does nothing. Descendant classes override SetEnabled to set the client property that corresponds to the action's Enabled property if the IsEnabledLinked method returns true.

See Also

Enabled (see page 310)

Enabled (see page 5821)

Action (see page 2725)

IsEnabledLinked (see page 269)

5.1.9 TCustomizeActionToolBar Class

Class Hierarchy

Pascal

```
TCustomizeActionToolBar = class(TCustomActionPopupMenu);
```

C++

```
class TCustomizeActionToolBar : public TCustomActionPopupMenu;
```

File

ActnMenus

Description

This is class ActnMenus.TCustomizeActionToolBar.

5.1.9.1 TCustomizeActionToolBar Members

The following tables list the members exposed by TCustomizeActionToolBar.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.

	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FCachedMenu (see page 699)	This is FCachedMenu, a member of class TCustomActionMenuBar.
	FChildMenu (see page 699)	This is FChildMenu, a member of class TCustomActionMenuBar.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefaultColorMap (see page 460)	This is FDefaultColorMap, a member of class TCustomActionBar.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExpandTimer (see page 700)	This is FExpandTimer, a member of class TCustomActionMenuBar.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FPopupTimer (see page 700)	This is FPopupTimer, a member of class TCustomActionMenuBar.
	FSavedWrapState (see page 460)	This is FSavedWrapState, a member of class TCustomActionBar.
	FSelectedItem (see page 700)	This is FSelectedItem, a member of class TCustomActionMenuBar.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AddEdges (see page 737)	This is AddEdges, a member of class TCustomActionPopupMenu.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 462)	Aligns any controls for which the control is the parent within a specified area of the control.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	Animate (see page 701)	This is Animate, a member of class TCustomActionMenuBar.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
V	AutoSizingChanged (see page 462)	This is AutoSizingChanged, a member of class TCustomActionBar.
	BackgroundSize (see page 462)	This is BackgroundSize, a member of class TCustomActionBar.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CalcInsertPosition (see page 462)	This is CalcInsertPosition, a member of class TCustomActionBar.
V	CanAutoSize (see page 778)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.

	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	CleanupStack (see page 701)	This is CleanupStack, a member of class TCustomActionMenuBar.
	Clear (see page 778)	This is Clear, a member of class TCustomizeActionToolBar.
	ClearSubMenus (see page 702)	This is ClearSubMenus, a member of class TCustomActionMenuBar.
	Click (see page 5743)	Respond to user click.
	CMBorderChanged (see page 23285)	This is CMBorderChanged, a member of class TToolWindow.
	CMCtl3DChanged (see page 23286)	This is CMCtl3DChanged, a member of class TToolWindow.
	CMMouseLeave (see page 738)	This is CMMouseLeave, a member of class TCustomActionPopupMenu.
	CMVisibleChanged (see page 738)	This is CMVisibleChanged, a member of class TCustomActionPopupMenu.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateControl (see page 463)	This is CreateControl, a member of class TCustomActionBar.
	CreateControl (see page 702)	This is CreateControl, a member of class TCustomActionMenuBar.
	CreateControl (see page 738)	This is CreateControl, a member of class TCustomActionPopupMenu.
	CreateControls (see page 463)	This is CreateControls, a member of class TCustomActionBar.
	CreateControls (see page 738)	This is CreateControls, a member of class TCustomActionPopupMenu.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 739)	Initializes a window-creation parameter data structure.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreatePopup (see page 702)	This is CreatePopup, a member of class TCustomActionMenuBar.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 463)	Returns placement order of custom-aligned child control.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 464)	Returns aligned position of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 465)	This is DesignWndProc, a member of class TCustomActionBar.
	DesignWndProc (see page 739)	This is DesignWndProc, a member of class TCustomActionPopupMenu.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DisplayShadow (see page 739)	This is DisplayShadow, a member of class TCustomActionPopupMenu.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.

	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
V	DoControlCreated (see page 465)	This is DoControlCreated, a member of class TCustomActionBar.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
V	DoDropActions (see page 465)	This is DoDropActions, a member of class TCustomActionBar.
V	DoDropCategory (see page 465)	This is DoDropCategory, a member of class TCustomActionBar.
V	DoDropItem (see page 466)	This is DoDropItem, a member of class TCustomActionBar.
V	DoEndDock (see page 146)	OnEndDock event dispatcher.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoGetControlClass (see page 466)	This is DoGetControlClass, a member of class TCustomActionBar.
	DoGetPopupClass (see page 703)	This is DoGetPopupClass, a member of class TCustomActionMenuBar.
V	DoItemClicked (see page 778)	This is DoItemClicked, a member of class TCustomizeActionToolBar.
V	DoItemKeyed (see page 703)	This is DoItemKeyed, a member of class TCustomActionMenuBar.
	DoItemSelected (see page 703)	This is DoItemSelected, a member of class TCustomActionMenuBar.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMenuDelay (see page 703)	This is DoMenuDelay, a member of class TCustomActionMenuBar.
	DoMouseIdle (see page 704)	This is DoMouseIdle, a member of class TCustomActionMenuBar.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
V	DoneMenuLoop (see page 704)	This is DoneMenuLoop, a member of class TCustomActionMenuBar.
V	DoPopup (see page 704)	This is DoPopup, a member of class TCustomActionMenuBar.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
V	DoStartDock (see page 147)	OnStartDock event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 466)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
V	DrawBackground (see page 467)	This is DrawBackground, a member of class TCustomActionBar.
V	DrawBackground (see page 740)	This is DrawBackground, a member of class TCustomActionPopupMenu.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
V	ExecAction (see page 704)	This is ExecAction, a member of class TCustomActionMenuBar.
V	ExecAction (see page 740)	This is ExecAction, a member of class TCustomActionPopupMenu.
V	Expand (see page 704)	Causes the menu bar to show all items, including the hidden ones.
	ExpandClick (see page 740)	This is ExpandClick, a member of class TCustomActionPopupMenu.
	ExpandTimer (see page 705)	This is ExpandTimer, a member of class TCustomActionMenuBar.
	FindAccelItem (see page 467)	This is FindAccelItem, a member of class TCustomActionBar.
	FindItemAt (see page 468)	This is FindItemAt, a member of class TCustomActionBar.
	FindItemCaption (see page 468)	This is FindItemCaption, a member of class TCustomActionBar.
V	FindLast (see page 468)	This is FindLast, a member of class TCustomActionBar.
	FindLeastUsedItem (see page 469)	This is FindLeastUsedItem, a member of class TCustomActionBar.
	FindNearestControl (see page 469)	This is FindNearestControl, a member of class TCustomActionBar.
V	FindNext (see page 470)	This is FindNext, a member of class TCustomActionBar.

	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FindNextVisibleItem (see page 470)	This is FindNextVisibleItem, a member of class TCustomActionBar.
	FindPrevious (see page 470)	This is FindPrevious, a member of class TCustomActionBar.
	FindPreviousVisibleItem (see page 470)	This is FindPreviousVisibleItem, a member of class TCustomActionBar.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionControl (see page 779)	This is GetActionControl, a member of class TCustomizeActionToolBar.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetAddRemoveItemClass (see page 779)	This is GetAddRemoveItemClass, a member of class TCustomizeActionToolBar.
	GetBannerWidth (see page 471)	This is GetBannerWidth, a member of class TCustomActionBar.
	GetBarHeight (see page 471)	This is GetBarHeight, a member of class TCustomActionBar.
	GetBarWidth (see page 471)	This is GetBarWidth, a member of class TCustomActionBar.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 741)	Returns the value of the ClientRect property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlClass (see page 471)	This is GetControlClass, a member of class TCustomActionBar.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDefaultColorMapClass (see page 472)	This is GetDefaultColorMapClass, a member of class TCustomActionBar.
	GetDefaultSounds (see page 705)	This is GetDefaultSounds, a member of class TCustomActionMenuBar.
	GetDesignMode (see page 472)	This is GetDesignMode, a member of class TCustomActionBar.
	GetDesignMode (see page 705)	This is GetDesignMode, a member of class TCustomActionMenuBar.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetExpandBtnClass (see page 741)	This is GetExpandBtnClass, a member of class TCustomActionPopupMenu.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 147)	Returns the class used for the control when it is floating.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetMouseHoverItem (see page 705)	This is GetMouseHoverItem, a member of class TCustomActionMenuBar.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupClass (see page 706)	This is GetPopupClass, a member of class TCustomActionMenuBar.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetPopupMenuClass (see page 472)	This is GetPopupMenuClass, a member of class TCustomActionBar.
	GetSelected (see page 706)	This is GetSelected, a member of class TCustomActionMenuBar.
	GetSiteInfo (see page 147)	Generates an OnGetSiteInfo event
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetSubMenuControlClass (see page 779)	This is GetSubMenuControlClass, a member of class TCustomizeActionToolBar.
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.

	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasItems (see page 472)	This is HasItems, a member of class TCustomActionBar.
V	HideShadow (see page 741)	This is HideShadow, a member of class TCustomActionPopupMenu.
	Idle (see page 706)	This is Idle, a member of class TCustomActionMenuBar.
V	InitMenuLoop (see page 706)	This is InitMenuLoop, a member of class TCustomActionMenuBar.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsDesignMsg (see page 707)	This is IsDesignMsg, a member of class TCustomActionMenuBar.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 148)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 473)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 707)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
V	MouseActivate (see page 707)	This is MouseActivate, a member of class TCustomActionMenuBar.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	NCPaint (see page 473)	This is NCPaint, a member of class TCustomActionBar.
V	NCPaint (see page 23286)	This is NCPaint, a member of class TToolWindow.
V	NewPopup (see page 780)	This is NewPopup, a member of class TCustomizeActionToolBar.
V	Notification (see page 473)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 708)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 742)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 474)	This is Paint, a member of class TCustomActionBar.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 474)	Renders the image of a windowed control.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	PositionPopup (see page 742)	This is PositionPopup, a member of class TCustomActionPopupMenu.
V	ProcessMenuLoop (see page 708)	This is ProcessMenuLoop, a member of class TCustomActionMenuBar.
	ProcessMessage (see page 708)	This is ProcessMessage, a member of class TCustomActionMenuBar.
	ProcessMessages (see page 709)	This is ProcessMessages, a member of class TCustomActionMenuBar.
V	ProcessMouseMsg (see page 709)	This is ProcessMouseMsg, a member of class TCustomActionMenuBar.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.

	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Reset (see page 475)	This is Reset, a member of class TCustomActionBar.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Select (see page 709)	This is Select, a member of class TCustomActionMenuBar.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectItem (see page 710)	This is SelectItem, a member of class TCustomActionMenuBar.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 780)	This is SetActionClient, a member of class TCustomizeActionToolBar.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetAutoSizing (see page 475)	This is SetAutoSizing, a member of class TCustomActionBar.
	SetBiDiMode (see page 475)	Sets the control's bi-directional mode.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetColorMap (see page 476)	This is SetColorMap, a member of class TCustomActionBar.
	SetColorMap (see page 743)	This is SetColorMap, a member of class TCustomActionPopupMenu.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignMode (see page 476)	This is SetDesignMode, a member of class TCustomActionBar.
	SetDesignMode (see page 710)	Specifies whether the whether the action band is being customized or being used in the IDE.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetOrientation (see page 477)	This is SetOrientation, a member of class TCustomActionBar.
	SetOrientation (see page 743)	This is SetOrientation, a member of class TCustomActionPopupMenu.
	SetParent (see page 710)	Sets the parent of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.

V	SetPersistentHotKeys (see page 477)	This is SetPersistentHotKeys, a member of class TCustomActionBar.
V	SetPersistentHotKeys (see page 711)	This is SetPersistentHotKeys, a member of class TCustomActionMenuBar.
V	SetSpacing (see page 477)	This is SetSpacing, a member of class TCustomActionBar.
	SetupDefaultColorMap (see page 477)	This is SetupDefaultColorMap, a member of class TCustomActionBar.
	SetupExpandBtn (see page 743)	This is SetupExpandBtn, a member of class TCustomActionPopupMenu.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	VisibleChanging (see page 478)	Provides the interface for a method that responds to changes in the control's visibility.
V	VisibleChanging (see page 743)	Provides the interface for a method that responds to changes in the control's visibility.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMKeyDown (see page 744)	This is WMKeyDown, a member of class TCustomActionPopupMenu.
	WMNCCalcSize (see page 23286)	This is WMNCCalcSize, a member of class TToolWindow.
	WMNCPaint (see page 23286)	This is WMNCPaint, a member of class TToolWindow.
	WMPrint (see page 744)	This is WMPrint, a member of class TCustomActionPopupMenu.
	WMPrintClient (see page 744)	This is WMPrintClient, a member of class TCustomActionPopupMenu.
V	WndProc (see page 711)	Provides specific message responses for the control.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
R	AddlItem (see page 780)	This is AddlItem, a member of class TCustomizeActionToolBar.
	AnimateDuration (see page 716)	This is AnimateDuration, a member of class TCustomActionMenuBar.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.

	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DelayItem (see page 717)	This is DelayItem, a member of class TCustomActionMenuBar.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Expandable (see page 717)	This is Expandable, a member of class TCustomActionMenuBar.
	Expanded (see page 718)	This is Expanded, a member of class TCustomActionMenuBar.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
R	HRowCount (see page 488)	Indicates the number of columns of items that the action band displays.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Items (see page 488)	Lists the action clients that correspond to the child controls of this action band.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	MouseControl (see page 718)	This is MouseControl, a member of class TCustomActionMenuBar.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentMenu (see page 719)	This is ParentMenu, a member of class TCustomActionMenuBar.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
R	PopupStack (see page 719)	This is PopupStack, a member of class TCustomActionMenuBar.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
R	Selected (see page 719)	This is Selected, a member of class TCustomActionMenuBar.
	Text (see page 5842)	Contains a text string associated with the control.
R	VRowCount (see page 490)	Indicates the number of rows of items that the action band displays.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
R	Widest (see page 491)	This is Widest, a member of class TCustomActionBar.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnControlCreated (see page 491)	Occurs when a control is created on the action band.
	OnEnterMenuLoop (see page 720)	Occurs when an ActionBand menu loop has begun.
	OnExitMenuLoop (see page 721)	Occurs when an ActionBand menu loop has ended and the menu is closed.
	OnGetControlClass (see page 492)	Occurs when an item is to be placed on the action band.
	OnGetPopupClass (see page 721)	Occurs prior to an ActionBand popupmenu appearing on screen.
	OnPaint (see page 492)	Occurs when the action band is painted.
	OnPopup (see page 721)	Occurs just before the pop-up menu appears.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.

	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
V	CalcDockedWidth (see page 146)	This is CalcDockedWidth, a member of class TCustomActionDockBar.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	CloseMenu (see page 702)	Closes the menu currently being displayed.
V	CloseMenu (see page 737)	Closes the menu currently being displayed.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 777)	Creates and initializes a TCustomActionPopupMenu instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 777)	Destroys an instance of TCustomActionMenuBar.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Dock (see page 146)	Used internally to dock the action band.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
V	DragDrop (see page 466)	Generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	Expand (see page 740)	Performs the same kinds of functions as the inherited method.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.

	FindFirst (see page 467)	Finds the first TActionClientItem (see page 374) in the Items (see page 488) list.
	FindFirstVisibleItem (see page 468)	Finds the first visible TActionClientItem (see page 374) in the Items (see page 488) list.
	FindLastVisibleItem (see page 469)	Finds the last visibleTActionClientItem in the Items (see page 488) list.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ItemCount (see page 779)	This is ItemCount, a member of class TCustomizeActionToolBar.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	Popup (see page 742)	Causes the popup menu to appear.

	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
V	RecreateControls (see page 475)	Destroys and recreates all of the action band's action client controls.
V	RecreateControls (see page 709)	Destroys and recreates all of the action band's action client controls.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 476)	Sets the bounds based on whether the popup is expanded or not
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Style (see page 477)	Identifies the style object that gives the application its default look and feel.
V	Style (see page 711)	Retrieves the style used by the ActionBand menu that started the menu loop so the submenus have a consistent appearance.
V	TrackMenu (see page 711)	Executes the action associated with the menu item.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	ActionClient (see page 479)	Specifies the action client associated with this action band.
R	ActionControls (see page 479)	Lists the controls on the action band.
	ActionManager (see page 480)	Specifies the action manager component that is associated with the action band.
R	AdditionalItem (see page 780)	This is AdditionalItem, a member of class TCustomizeActionToolBar.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	AllowHiding (see page 480)	Determines whether the action band can be hidden.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.

	AnimationStyle (see page 716)	Specifies the type of animation the menu bar will display as it opens.
	AutoFocus (see page 717)	This is AutoFocus, a member of class TCustomActionMenuBar.
	AutoSizing (see page 480)	Specifies whether the action band adjusts its size automatically to fit around its child controls.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 481)	Represents the drawing surface of the action band.
	Caption (see page 481)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	Color (see page 483)	Specifies the background color of the control.
	ColorMap (see page 484)	Indicates the colormap for individual action band components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ContextBar (see page 485)	Indicates whether items shown in this action band represent the items in a popup menu.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Designable (see page 485)	Specifies whether the action band can be customized (used internally by the IDE).
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignMode (see page 486)	Specifies whether the action band is being customized or being used in the IDE.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	EdgeBorders (see page 23287)	Determines which sides of the control have visible borders.
	EdgeInner (see page 23287)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 23288)	Determines the border style for the control's outer edge.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
	ExpandBtn (see page 744)	Refers to the popup menu's expand button.
	ExpandDelay (see page 717)	Specifies, in milliseconds, the delay period that a menu action band uses before showing hidden or unused items.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.

	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	Font (see page 486)	Controls the attributes of text written on or in the control.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HorzMargin (see page 487)	Specifies the width of the horizontal margins in pixels.
	HorzSeparator (see page 487)	Indicates whether a horizontal separator bar appears between item lines.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	InMenuLoop (see page 718)	Indicates whether items in the menu can be selected.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	Orientation (see page 488)	Specifies how the action band lays out its child items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentControl (see page 718)	Refers to the parent object of the TCustomActionBarControl.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	PersistentHotKeys (see page 489)	Specifies whether keyboard accelerator shortcuts are always displayed.
	RootMenu (see page 719)	Refers to the root menu of the ActionBand menu.
	Shadow (see page 745)	Refers to the popup menu's shadow.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	Spacing (see page 489)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	UseSystemFont (see page 720)	Specifies whether the default system font for menu items is used.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	VertMargin (see page 490)	Specifies the width of the vertical margins in pixels.
	VertSeparator (see page 490)	Indicates whether a vertical separator bar should appear between item lines.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.

	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

5.1.9.2 TCustomizeActionToolBar.Create Constructor

Creates and initializes a TCustomActionPopupMenu instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomizeActionToolBar(TComponent * AOwner);
```

Description

Create generates a TCustomActionPopupMenu and initializes its properties.

```
__fastcall virtual TCustomActionMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

5.1.9.3 TCustomizeActionToolBar.Destroy Destructor

Destroys an instance of TCustomActionMenuBar.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomizeActionToolBar();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TCustomActionMenuBar reference is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

Destroy (see page 5732)

5.1.9.4 TCustomizeActionToolBar Methods

The methods of the TCustomizeActionToolBar class are listed here.

Protected Methods

	Name	Description
	CanAutoSize (see page 778)	Indicates how the control can be resized.
	Clear (see page 778)	This is Clear, a member of class TCustomizeActionToolBar.
	DoItemClicked (see page 778)	This is DoItemClicked, a member of class TCustomizeActionToolBar.
	GetActionControl (see page 779)	This is GetActionControl, a member of class TCustomizeActionToolBar.
	GetAddRemoveItemClass (see page 779)	This is GetAddRemoveItemClass, a member of class TCustomizeActionToolBar.
	GetSubMenuControlClass (see page 779)	This is GetSubMenuControlClass, a member of class TCustomizeActionToolBar.
	NewPopup (see page 780)	This is NewPopup, a member of class TCustomizeActionToolBar.
	SetActionClient (see page 780)	This is SetActionClient, a member of class TCustomizeActionToolBar.

Public Methods

	Name	Description
	ItemCount (see page 779)	This is ItemCount, a member of class TCustomizeActionToolBar.

5.1.9.4.1 TCustomizeActionToolBar.CanAutoSize Method

Indicates how the control can be resized.

Pascal

```
function CanAutoSize(var NewWidth: Integer; var NewHeight: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanAutoSize(int NewWidth, int NewHeight);
```

Description

CanAutoSize is called automatically when the AutoSize property is true and an attempt is made to resize the control. It allows controls to implement the AutoSize property before the resize sequence that begins with the OnCanResize and OnConstrainedResize events and ends with the OnResize event.

When CanAutoSize is called, the NewWidth and NewHeight parameters indicate the proposed new dimensions of the control. CanAutoSize adjusts these values so that the control's size adjusts to its contents. If the adjustment results in values of NewWidth and NewHeight that differ from the control's current width and height, CanAutoSize returns true, indicating that the resize sequence should proceed. If, after adjustment, NewWidth and NewHeight equal Width and Height, CanAutoSize returns false, and the resize sequence is aborted.

As implemented in TWinControl, CanAutoSize returns true, adjusting NewWidth and NewHeight so that all the control's children fit.

See Also

Constraints (see page 5812)

ConstrainedResize (see page 6133)

AdjustSize (see page 6129)

5.1.9.4.2 TCustomizeActionToolBar.Clear Method

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

This is Clear, a member of class TCustomizeActionToolBar.

5.1.9.4.3 TCustomizeActionToolBar.DoItemClicked Method

Pascal

```
function DoItemClicked(AnItem: TCustomActionControl): TActionClientItem; override;
```

C++

```
virtual __fastcall TActionClientItem DoItemClicked(TCustomActionControl AnItem);
```

Description

This is DoItemClicked, a member of class TCustomizeActionToolBar.

5.1.9.4.4 TCustomizeActionToolBar.GetActionControl Method

Pascal

```
function GetActionControl(const Index: Integer): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl GetActionControl(const int Index);
```

Description

This is GetActionControl, a member of class TCustomizeActionToolBar.

5.1.9.4.5 TCustomizeActionToolBar.GetAddRemoveItemClass Method

Pascal

```
function GetAddRemoveItemClass: TCustomAddRemoveItemClass; virtual;
```

C++

```
virtual __fastcall TCustomAddRemoveItemClass GetAddRemoveItemClass();
```

Description

This is GetAddRemoveItemClass, a member of class TCustomizeActionToolBar.

5.1.9.4.6 TCustomizeActionToolBar.GetSubMenuControlClass Method

Pascal

```
procedure GetSubMenuControlClass(Sender: TCustomActionBar; AnItem: TActionClient; var
ControlClass: TCustomActionControlClass); virtual;
```

C++

```
virtual __fastcall GetSubMenuControlClass(TCustomActionBar Sender, TActionClient AnItem,
TCustomActionControlClass ControlClass);
```

Description

This is GetSubMenuControlClass, a member of class TCustomizeActionToolBar.

5.1.9.4.7 TCustomizeActionToolBar.ItemCount Method

Pascal

```
function ItemCount: Integer; override;
```

C++

```
virtual __fastcall int ItemCount();
```

Description

This is ItemCount, a member of class TCustomizeActionToolBar.

5.1.9.4.8 TCustomizeActionToolBar.NewPopup Method

Pascal

```
function NewPopup: TCustomActionPopupMenu; override;
```

C++

```
virtual __fastcall TCustomActionPopupMenu NewPopup();
```

Description

This is NewPopup, a member of class TCustomizeActionToolBar.

5.1.9.4.9 TCustomizeActionToolBar.SetActionClient Method

Pascal

```
procedure SetActionClient(const Value: TActionClient); override;
```

C++

```
virtual __fastcall SetActionClient(const TActionClient Value);
```

Description

This is SetActionClient, a member of class TCustomizeActionToolBar.

5.1.9.5 TCustomizeActionToolBar Properties

The properties of the TCustomizeActionToolBar class are listed here.

Protected Properties

	Name	Description
R	AddlItem (see page 780)	This is AddlItem, a member of class TCustomizeActionToolBar.

Public Properties

	Name	Description
R	AdditionalItem (see page 780)	This is AdditionalItem, a member of class TCustomizeActionToolBar.

5.1.9.5.1 TCustomizeActionToolBar.AdditionalItem Property

Pascal

```
property AdditionalItem: TActionClientItem;
```

C++

```
__property TActionClientItem AdditionalItem;
```

Description

This is AdditionalItem, a member of class TCustomizeActionToolBar.

5.1.9.5.2 TCustomizeActionToolBar.AddlItem Property

Pascal

```
property AddlItem: TActionClientItem;
```

C++

```
__property TActionClientItem AddlItem;
```

Description

This is AddlItem, a member of class TCustomizeActionToolBar.

5.1.10 TCustomMDIMenuButton Class

Class Hierarchy

Pascal

```
TCustomMDIMenuButton = class(TSpeedButton);
```

C++

```
class TCustomMDIMenuButton : public TSpeedButton;
```

File

ActnMenus

Description

This is class ActnMenus.TCustomMDIMenuButton.

5.1.10.1 TCustomMDIMenuButton Members

The following tables list the members exposed by TCustomMDIMenuButton.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.

	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FState (see page 2345)	This is FState, a member of class TSpeedButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActionChange (see page 2345)	Responds when the action associated with the control changes.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	CopyImage (see page 2346)	This is CopyImage, a member of class TSpeedButton.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.

	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
V	GetActionLinkClass (see page 2346)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetPalette (see page 2347)	Returns the handle to a palette for use by the control.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2347)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
V	MouseDown (see page 2348)	OnMouseDown event dispatcher.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
V	MouseMove (see page 2348)	Respond to mouse moving over control area..
	MouseMove (see page 5773)	Respond to mouse moving over control area..
V	MouseUp (see page 2349)	OnMouseUp event dispatcher.
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 789)	Render control surface.

	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.

	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseInControl (see page 2361)	This is MouseInControl, a member of class TSpeedButton.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 2346)	Generates an OnClick (see page 2372) event or triggers the associated action.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 2344)	Creates and initializes an instance of TSpeedButton (see page 2335).
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6051)	Creates an instance of TGraphicControl (see page 6044).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2344)	Destroys an instance of TSpeedButton (see page 2335).
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).

	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	ButtonStyle (see page 790)	This is ButtonStyle, a member of class TCustomMDIMenuButton.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.

	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Events

	Name	Description
	OnClick (see page 2372)	Occurs when the user clicks the control.
	OnDblClick (see page 2374)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnMouseActivate (see page 2374)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2375)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 2377)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2378)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 2378)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2380)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Published Properties

	Name	Description
	Action (see page 2350)	Designates the action associated with the control.
	Align (see page 2350)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	AllowAllUp (see page 2354)	Specifies whether all speed buttons in the group that contains this speed button can be unselected at the same time.
	Anchors (see page 2355)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 2355)	Specifies the bi-directional mode for the control.
	Caption (see page 2356)	Specifies the caption, or label, that appears on the speed button.
	Constraints (see page 2356)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Down (see page 2357)	Specifies whether the button is selected (down) or unselected (up).
	Enabled (see page 2357)	Controls whether the control responds to mouse, keyboard, and timer events.
	Flat (see page 2357)	Determines whether the button has a 3D border that provides a raised or lowered look.
	Font (see page 2358)	Controls the attributes of text written on or in the control.
	Glyph (see page 2359)	Specifies the bitmap that appears on the speed button.

	GroupIndex (see page 2360)	Allows speed buttons to work together as a group.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Layout (see page 2360)	Determines where the image or text appears on the speed button.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margin (see page 2361)	Specifies the number of pixels between the edge of the button and the image or caption drawn on its surface.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NumGlyphs (see page 2361)	Specifies the number of images included in the Glyph (see page 2359) property.
	ParentBiDiMode (see page 2362)	Specifies whether the control uses its parent's BiDiMode.
	ParentFont (see page 2362)	Determines where a control looks for its font information.
	ParentShowHint (see page 2363)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 2363)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 2368)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Spacing (see page 2369)	Determines where the image and text appear on a speed button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Transparent (see page 2370)	Specifies whether the background of the button is transparent.
	Visible (see page 2370)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

5.1.10.2 TCustomMDIMenuButton Methods

The methods of the TCustomMDIMenuButton class are listed here.

Protected Methods

	Name	Description
	Paint (see page 789)	Render control surface.

5.1.10.2.1 TCustomMDIMenuButton.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas (see page 6053)

5.1.10.3 TCustomMDIMenuButton Properties

The properties of the TCustomMDIMenuButton class are listed here.

Public Properties

	Name	Description
	ButtonStyle (see page 790)	This is ButtonStyle, a member of class TCustomMDIMenuButton.

5.1.10.3.1 TCustomMDIMenuButton.ButtonStyle Property

Pascal

```
property ButtonStyle: TMDIButtonStyle;
```

C++

```
__property TMDIButtonStyle ButtonStyle;
```

Description

This is ButtonStyle, a member of class TCustomMDIMenuButton.

5.1.11 TCustomMenuButton Class

TCustomMenuButton is the base class for ActionBand button controls.

Class Hierarchy

Pascal

```
TCustomMenuButton = class(TCustomButtonControl);
```

C++

```
class TCustomMenuButton : public TCustomButtonControl;
```

File

ActnMenus

Description

TCustomMenuButton is a base class for the standard menu button class TStandardMenuButton. Do not create instances of TCustomMenuButton. If you would like to replace the standard menu button behaviors, use the class TCustomMenuButton as a parent class for your replacement class. To make the change for your application, set the value of MenuButtonControlClass (see page 846) (a global variable) to your own subclass of TCustomMenuButton instead of TStandardMenuButton.

See Also

TCustomMenuItem (see page 816)

TStandardMenuButton (see page 20444)

TStandardMenuItem (see page 20465)

5.1.11.1 TCustomMenuButton Members

The following tables list the members exposed by TCustomMenuButton.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFlat (see page 178)	This is FFlat, a member of class TCustomButtonControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FState (see page 178)	This is FState, a member of class TCustomButtonControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 801)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMDialogChar (see page 180)	This is CMDialogChar, a member of class TCustomButtonControl.
	CMEnabledChanged (see page 180)	This is CMEnabledChanged, a member of class TCustomButtonControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
	CMMouseEnter (see page 801)	This is CMMouseEnter, a member of class TCustomMenuButton.
	CMMouseLeave (see page 180)	This is CMMouseLeave, a member of class TCustomButtonControl.
	CMTextChanged (see page 180)	This is CMTextChanged, a member of class TCustomButtonControl.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
V	DoDragDrop (see page 802)	This is DoDragDrop, a member of class TCustomMenuButton.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 802)	OnDragOver event dispatcher.
V	DrawBackground (see page 181)	Draws a background image on the control.
V	DrawBackground (see page 521)	Draws a background image on the control.

	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
	DrawFrame (see page 181)	This is DrawFrame, a member of class TCustomButtonControl.
	DrawGlyph (see page 522)	Draws a symbol on the control.
	DrawLargeGlyph (see page 181)	This is DrawLargeGlyph, a member of class TCustomButtonControl.
	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.
	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
	DrawText (see page 802)	Draws text on the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
	GetShowShortCut (see page 181)	This is GetShowShortCut, a member of class TCustomButtonControl.
	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
	Loaded (see page 182)	Initializes the control after it is loaded from a stream.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 803)	OnMouseDown event dispatcher.
	MouseMove (see page 183)	Respond to mouse moving over control area..
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 804)	OnMouseUp event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.

	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Paint (see page 804)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 184)	This is SetActionClient, a member of class TCustomButtonControl.
	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetGlyphLayout (see page 185)	This is SetGlyphLayout, a member of class TCustomButtonControl.
	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelected (see page 185)	This is SetSelected, a member of class TCustomButtonControl.
	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.

V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMLButtonDblClk (see page 185)	This is WMLButtonDblClk, a member of class TCustomButtonControl.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Menu (see page 805)	This is Menu, a member of class TCustomMenuButton.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseInControl (see page 189)	This is MouseInControl, a member of class TCustomButtonControl.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
V	CalcBounds (see page 179)	Calculates the size of the control.
V	CalcBounds (see page 518)	Calculates the size of the control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 801)	Executes the control's function.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 799)	Creates an instance of TCustomMenuButton (see page 790).
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 800)	Destroys an instance of TCustomMenuButton (see page 790).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
V	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.

V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
V	Keyed (see page 803)	Executes the button's function in response to a keyboard command.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 184)	Sets the Left, Top, Width, and Height properties all at once.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	AllowAllUp (see page 186)	Indicates whether all the buttons in a given group can be up at the same time.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.

	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 186)	Specifies a text string that identifies the control to the user.
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	Down (see page 189)	Tells whether the button is down (selected) or up (unselected).
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
	Flat (see page 189)	Dictates whether the button should have a 2D look instead of the usual 3D look.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	Selected (see page 533)	Indicates whether the control is currently selected.
R	Separator (see page 533)	Indicates whether the control is a separator.
	ShowCaption (see page 189)	Indicates whether the control's caption should be shown.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
	ShowShortCut (see page 190)	Indicates whether the control's short cut should be shown.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	State (see page 190)	Describes the current state of the button.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.

	TrackButton (see page 190)	Specifies which mouse button activates the button control.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

5.1.11.2 TCustomMenuButton.Create Constructor

Creates an instance of TCustomMenuButton (see page 790).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomMenuButton(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomMenuButton (see page 790). However, you should never attempt to instantiate a TCustomMenuButton (see page 790). This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the menu button instance. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner (see page 2807)

Create (see page 5731)

Destroy (see page 800)

5.1.11.3 TCustomMenuButton.Destroy Destructor

Destroys an instance of TCustomMenuButton (see page 790).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomMenuButton();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create (see page 799) method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

Create (see page 799)

Free (see page 22300)

5.1.11.4 TCustomMenuButton Methods

The methods of the TCustomMenuButton class are listed here.

Protected Methods

	Name	Description
	BeginAutoDrag (see page 801)	Begin Automatic Drag.
	CMMouseEnter (see page 801)	This is CMMouseEnter, a member of class TCustomMenuButton.
	DoDragDrop (see page 802)	This is DoDragDrop, a member of class TCustomMenuButton.
	DragOver (see page 802)	OnDragOver event dispatcher.
	DrawText (see page 802)	Draws text on the control.
	MouseDown (see page 803)	OnMouseDown event dispatcher.
	MouseUp (see page 804)	OnMouseUp event dispatcher.
	Paint (see page 804)	Render control surface.

Public Methods

	Name	Description
	Click (see page 801)	Executes the control's function.
	Keyed (see page 803)	Executes the button's function in response to a keyboard command.

5.1.11.4.1 TCustomMenuButton.BeginAutoDrag Method

Begin Automatic Drag.

Pascal

```
procedure BeginAutoDrag; override;
```

C++

```
virtual __fastcall BeginAutoDrag();
```

Description

BeginAutoDrag is called automatically when a user drags a control whose DragMode is dmAutomatic. Do not call BeginAutoDrag in application code.

As implemented in TControl, BeginAutoDrag calls BeginDrag, passing in the global Mouse variable's DragImmediate and DragThreshold properties.

See Also

DragKind (see page 5819)

DragMode (see page 5819)

EndDrag (see page 5757)

Mouse (see page 6321)

DragImmediate (see page 6100)

DragThreshold (see page 6101)

Mouse (see page 6321)

5.1.11.4.2 TCustomMenuButton.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomButtonControl is essentially identical to the inherited method, with the exception of a few internal calls.

See Also

Click (see page 518)

Click (see page 179)

5.1.11.4.3 TCustomMenuButton.CMMouseEnter Method

Pascal

```
procedure CMMouseEnter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseEnter(TMessage Message);
```

Description

This is CMMouseEnter, a member of class TCustomMenuButton.

5.1.11.4.4 TCustomMenuButton.DoDragDrop Method

Pascal

```
procedure DoDragDrop(DragObject: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DoDragDrop(TObject * DragObject, int X, int Y);
```

Description

This is DoDragDrop, a member of class TCustomMenuButton.

5.1.11.4.5 TCustomMenuButton.DragOver Method

OnDragOver event dispatcher.

Pascal

```
procedure DragOver(Source: TObject; X: Integer; Y: Integer; State: TDragState; var Accept:
Boolean); override;
```

C++

```
virtual __fastcall DragOver(TObject * Source, int X, int Y, TDragState State, Boolean Accept);
```

Description

Override DragOver to add additional code that executes before the OnDragOver event handler is called.

DragOver sets the Accept parameter to true to indicate that the user can drop the dragged object on the control. It sets Accept to false to indicate that the user cannot drop the dragged object on the control.

The Source parameter is the object being dragged. The State parameter indicates how the dragged object is moving in relation to the control. X and Y indicate the current position of the mouse.

See Also

DragDrop (see page 5754)

OnDragOver (see page 5857)

5.1.11.4.6 TCustomMenuButton.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, AnsiString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

DrawBackground (see page 521)

DrawGlyph (see page 522)

5.1.11.4.7 TCustomMenuButton.Keyed Method

Executes the button's function in response to a keyboard command.

Pascal

```
procedure Keyed; override;
```

C++

```
virtual __fastcall Keyed();
```

Description

This method is mostly the same as the inherited method. The only difference is that the button becomes selected.

See Also

Keyed (see page 525)

5.1.11.4.8 TCustomMenuButton.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

See Also

MouseMove (see page 5773)

MouseUp (see page 5774)

OnMouseDown (see page 5862)

5.1.11.4.9 TCustomMenuButton.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

See Also

MouseDown (see page 5773)

MouseMove (see page 5773)

OnMouseUp (see page 5867)

5.1.11.4.10 TCustomMenuButton.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas (see page 6053)

5.1.11.5 TCustomMenuButton Properties

The properties of the TCustomMenuButton class are listed here.

Protected Properties

	Name	Description
R	Menu (see page 805)	This is Menu, a member of class TCustomMenuButton.

5.1.11.5.1 TCustomMenuButton.Menu Property

Pascal

```
property Menu: TCustomActionMenuBar;
```

C++

```
__property TCustomActionMenuBar Menu;
```

Description

This is Menu, a member of class TCustomMenuButton.

5.1.12 TCustomMenuExpandBtn Class

Class Hierarchy

Pascal

```
TCustomMenuExpandBtn = class(TCustomUtilityButton);
```

C++

```
class TCustomMenuExpandBtn : public TCustomUtilityButton;
```

File

ActnMenus

Description

This is class ActnMenus.TCustomMenuExpandBtn.

5.1.12.1 TCustomMenuExpandBtn Members

The following tables list the members exposed by TCustomMenuExpandBtn.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFlat (see page 178)	This is FFlat, a member of class TCustomButtonControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FState (see page 178)	This is FState, a member of class TCustomButtonControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMDialogChar (see page 180)	This is CMDialogChar, a member of class TCustomButtonControl.

	CMEnabledChanged (see page 180)	This is CMEnabledChanged, a member of class TCustomButtonControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
	CMMouseEnter (see page 180)	This is CMMouseEnter, a member of class TCustomButtonControl.
	CMMouseEnter (see page 238)	This is CMMouseEnter, a member of class TCustomUtilityButton.
	CMMouseLeave (see page 180)	This is CMMouseLeave, a member of class TCustomButtonControl.
	CMMouseLeave (see page 239)	This is CMMouseLeave, a member of class TCustomUtilityButton.
	CMTextChanged (see page 180)	This is CMTextChanged, a member of class TCustomButtonControl.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
V	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 815)	OnDragOver event dispatcher.
V	DrawArrows (see page 239)	This is DrawArrows, a member of class TCustomUtilityButton.
V	DrawBackground (see page 815)	Draws a background image on the control.
V	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
V	DrawFrame (see page 816)	This is DrawFrame, a member of class TCustomMenuExpandBtn.
V	DrawGlyph (see page 522)	Draws a symbol on the control.
V	DrawLargeGlyph (see page 181)	This is DrawLargeGlyph, a member of class TCustomButtonControl.
V	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.
V	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
V	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
V	DrawText (see page 523)	Draws text on the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
V	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.

	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
	GetShowShortCut (see page 181)	This is GetShowShortCut, a member of class TCustomButtonControl.
	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
	Loaded (see page 182)	Initializes the control after it is loaded from a stream.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 182)	OnMouseDown event dispatcher.
	MouseDown (see page 239)	OnMouseDown event dispatcher.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 183)	Respond to mouse moving over control area..
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 183)	OnMouseUp event dispatcher.
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	OnDelay (see page 240)	This is OnDelay, a member of class TCustomUtilityButton.
	Paint (see page 184)	Render control surface.
	Paint (see page 240)	Render control surface.
	Paint (see page 526)	Render control surface.
	Paint (see page 6052)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.

	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
V	SetActionClient (see page 184)	This is SetActionClient, a member of class TCustomButtonControl.
V	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
V	SetGlyphLayout (see page 185)	This is SetGlyphLayout, a member of class TCustomButtonControl.
V	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetSelected (see page 185)	This is SetSelected, a member of class TCustomButtonControl.
V	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMLButtonDblClk (see page 185)	This is WMLButtonDblClk, a member of class TCustomButtonControl.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.

	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Menu (see page 816)	This is Menu, a member of class TCustomMenuExpandBtn.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseInControl (see page 189)	This is MouseInControl, a member of class TCustomButtonControl.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 243)	Occurs when the user clicks the control.
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
V	CalcBounds (see page 179)	Calculates the size of the control.
V	CalcBounds (see page 518)	Calculates the size of the control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 179)	Executes the control's function.
V	Click (see page 238)	Executes the control's function.
V	Click (see page 518)	Executes the control's function in response to a mouse click.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 814)	Creates an instance of TCustomButtonControl.

	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 237)	Destroys an instance of TCustomActionControl.
	Destroy (see page 516)	Destroys an instance of TCustomActionControl (see page 507).
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	Keyed (see page 525)	Executes the control's function in response to a keyboard action.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
	SetBounds (see page 184)	Sets the Left, Top, Width, and Height properties all at once.
	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	AllowAllUp (see page 186)	Indicates whether all the buttons in a given group can be up at the same time.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	ArrowSize (see page 240)	This is ArrowSize, a member of class TCustomUtilityButton.
	ArrowType (see page 241)	This is ArrowType, a member of class TCustomUtilityButton.
	AutoScroll (see page 241)	This is AutoScroll, a member of class TCustomUtilityButton.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 186)	Specifies a text string that identifies the control to the user.

	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	Color (see page 241)	Specifies the background color of the control.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Direction (see page 242)	This is Direction, a member of class TCustomUtilityButton.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	Down (see page 189)	Tells whether the button is down (selected) or up (unselected).
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
	Flat (see page 189)	Dictates whether the button should have a 2D look instead of the usual 3D look.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	RepeatRate (see page 242)	This is RepeatRate, a member of class TCustomUtilityButton.
	Selected (see page 533)	Indicates whether the control is currently selected.
R	Separator (see page 533)	Indicates whether the control is a separator.
	ShowCaption (see page 189)	Indicates whether the control's caption should be shown.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
	ShowShortCut (see page 190)	Indicates whether the control's short cut should be shown.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	State (see page 190)	Describes the current state of the button.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.

	TrackButton (see page 190)	Specifies which mouse button activates the button control.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

5.1.12.2 TCustomMenuExpandBtn.Create Constructor

Creates an instance of TCustomButtonControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomMenuExpandBtn(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomButtonControl. However, you should never attempt to instantiate a TCustomButtonControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the button control. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner (see page 2807)

Create (see page 5731)

Destroy

5.1.12.3 TCustomMenuExpandBtn Methods

The methods of the TCustomMenuExpandBtn class are listed here.

Protected Methods

	Name	Description
	DragOver (see page 815)	OnDragOver event dispatcher.
	DrawBackground (see page 815)	Draws a background image on the control.
	DrawFrame (see page 816)	This is DrawFrame, a member of class TCustomMenuExpandBtn.

5.1.12.3.1 TCustomMenuExpandBtn.DragOver Method

OnDragOver event dispatcher.

Pascal

```
procedure DragOver(Source: TObject; X: Integer; Y: Integer; State: TDragState; var Accept:
Boolean); override;
```

C++

```
virtual __fastcall DragOver(TObject * Source, int X, int Y, TDragState State, Boolean Accept);
```

Description

Override DragOver to add additional code that executes before the OnDragOver event handler is called.

DragOver sets the Accept parameter to true to indicate that the user can drop the dragged object on the control. It sets Accept to false to indicate that the user cannot drop the dragged object on the control.

The Source parameter is the object being dragged. The State parameter indicates how the dragged object is moving in relation to the control. X and Y indicate the current position of the mouse.

See Also

DragDrop (see page 5754)

OnDragOver (see page 5857)

5.1.12.3.2 TCustomMenuExpandBtn.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph (see page 522)

DrawText (see page 523)

5.1.12.3.3 TCustomMenuExpandBtn.DrawFrame Method

Pascal

```
procedure DrawFrame(ARect: TRect; Down: Boolean); override;
```

C++

```
virtual __fastcall DrawFrame(TRect ARect, Boolean Down);
```

Description

This is DrawFrame, a member of class TCustomMenuExpandBtn.

5.1.12.4 TCustomMenuExpandBtn Properties

The properties of the TCustomMenuExpandBtn class are listed here.

Protected Properties

	Name	Description
	Menu (see page 816)	This is Menu, a member of class TCustomMenuExpandBtn.

5.1.12.4.1 TCustomMenuExpandBtn.Menu Property

Pascal

```
property Menu: TCustomActionMenuBar;
```

C++

```
__property TCustomActionMenuBar Menu;
```

Description

This is Menu, a member of class TCustomMenuExpandBtn.

5.1.13 TCustomMenuItem Class

TCustomMenuItem is the base class for the ActionBand custom control TStandardMenuItem.

Class Hierarchy

Pascal

```
TCustomMenuItem = class(TCustomActionControl);
```

C++

```
class TCustomMenuItem : public TCustomActionControl;
```

File

ActnMenus

Description

TCustomMenuItem is a base class for TStandardMenuItem, the standard ActionBand menu item class.

Do not create instances of TCustomMenuItem. If you would like to replace the standard menu item, use the class TCustomMenuItem as a parent class for your replacement class. To make the change for your application, set the value of MenuItemControlClass (see page 847) (a global variable) to your own subclass of TCustomMenuItem instead of TStandardMenuItem.

See Also

TStandardMenuItem (see page 20465)

5.1.13.1 TCustomMenuItem Members

The following tables list the members exposed by TCustomMenuItem.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FNoPrefix (see page 826)	This is FNoPrefix, a member of class TCustomMenuItem.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 827)	This is CalcLayout, a member of class TCustomMenuItem.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
V	DoDragDrop (see page 828)	This is DoDragDrop, a member of class TCustomMenuItem.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 828)	OnDragOver event dispatcher.

	DrawBackground (see page 521)	Draws a background image on the control.
	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
	DrawEdge (see page 829)	This is DrawEdge, a member of class TCustomMenuItem.
	DrawGlyph (see page 522)	Draws a symbol on the control.
	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.
	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
	DrawShadowedText (see page 829)	This is DrawShadowedText, a member of class TCustomMenuItem.
	DrawSubMenuGlyph (see page 829)	This is DrawSubMenuGlyph, a member of class TCustomMenuItem.
	DrawText (see page 829)	This is DrawText, a member of class TCustomMenuItem.
	DrawUnusedEdges (see page 830)	This is DrawUnusedEdges, a member of class TCustomMenuItem.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 830)	OnMouseUp event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.

	Paint (see page 831)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionChanged (see page 831)	This is PositionChanged, a member of class TCustomMenuItem.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelected (see page 831)	This is SetSelected, a member of class TCustomMenuItem.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
	WndProc (see page 5791)	Provides specific message responses for the control.

V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Menu (see page 832)	This is Menu, a member of class TCustomMenuItem.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseSelected (see page 832)	This is MouseSelected, a member of class TCustomMenuItem.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	ShortCutBounds (see page 832)	This is ShortCutBounds, a member of class TCustomMenuItem.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
V	CalcBounds (see page 827)	Calculates the size of the menu item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 827)	Executes the control's function.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 825)	Creates an instance of TCustomMenuItem (see page 816).
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 825)	Destroys an instance of TCustomMenuItem (see page 816).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
V	DragDrop (see page 828)	Performs actions and generates an OnDragDrop event.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.

	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
V	Keyed (see page 830)	Executes the menu item's function in response to a user's keyboard command.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.

R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Edges (see page 832)	Dictates which edges are drawn when the menu item is drawn.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	Selected (see page 533)	Indicates whether the control is currently selected.
R	Separator (see page 533)	Indicates whether the control is a separator.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic

	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

5.1.13.2 TCustomMenuItem.Create Constructor

Creates an instance of TCustomMenuItem (see page 816).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomMenuItem(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomMenuItem (see page 816). However, you should never attempt to instantiate a TCustomMenuItem (see page 816). This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes the TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Create (see page 5731)

Destroy (see page 825)

5.1.13.3 TCustomMenuItem.Destroy Destructor

Destroys an instance of TCustomMenuItem (see page 816).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomMenuItem();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create (see page 825) method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

See Also

Create (see page 825)

Free (see page 22300)

5.1.13.4 TCustomMenuItem Fields

The fields of the TCustomMenuItem class are listed here.

Protected Fields

	Name	Description
	FNoPrefix (see page 826)	This is FNoPrefix, a member of class TCustomMenuItem.

5.1.13.4.1 TCustomMenuItem.FNoPrefix Field

Pascal

```
FNoPrefix: string;
```

C++

```
AnsiString FNoPrefix;
```

Description

This is FNoPrefix, a member of class TCustomMenuItem.

5.1.13.5 TCustomMenuItem Methods

The methods of the TCustomMenuItem class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 827)	This is CalcLayout, a member of class TCustomMenuItem.
	DoDragDrop (see page 828)	This is DoDragDrop, a member of class TCustomMenuItem.
	DragOver (see page 828)	OnDragOver event dispatcher.
	DrawEdge (see page 829)	This is DrawEdge, a member of class TCustomMenuItem.
	DrawShadowedText (see page 829)	This is DrawShadowedText, a member of class TCustomMenuItem.
	DrawSubMenuGlyph (see page 829)	This is DrawSubMenuGlyph, a member of class TCustomMenuItem.
	DrawText (see page 829)	This is DrawText, a member of class TCustomMenuItem.
	DrawUnusedEdges (see page 830)	This is DrawUnusedEdges, a member of class TCustomMenuItem.
	MouseUp (see page 830)	OnMouseUp event dispatcher.

	Paint (see page 831)	Render control surface.
	PositionChanged (see page 831)	This is PositionChanged, a member of class TCustomMenuItem.
	SetSelected (see page 831)	This is SetSelected, a member of class TCustomMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 827)	Calculates the size of the menu item.
	Click (see page 827)	Executes the control's function.
	DragDrop (see page 828)	Performs actions and generates an OnDragDrop event.
	Keyed (see page 830)	Executes the menu item's function in response to a user's keyboard command.

5.1.13.5.1 TCustomMenuItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds (see page 5783)

5.1.13.5.2 TCustomMenuItem.CalcLayout Method

Pascal

```
procedure CalcLayout; override;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TCustomMenuItem.

5.1.13.5.3 TCustomMenuItem.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl does little except bring the form containing the item into focus, and prevent the inherited method from being called. The reason for this lack of action is that at runtime, no action should be

taken until the primary mouse button is pressed and released, which makes the OnClick event handler responsible for taking action. Click takes place only when the mouse button is first pressed, prior to release.

See Also

OnClick (see page 5851)

5.1.13.5.4 TCustomMenuItem.DoDragDrop Method

Pascal

```
procedure DoDragDrop(DragObject: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DoDragDrop(TObject * DragObject, int X, int Y);
```

Description

This is DoDragDrop, a member of class TCustomMenuItem.

5.1.13.5.5 TCustomMenuItem.DragDrop Method

Performs actions and generates an OnDragDrop event.

Pascal

```
procedure DragDrop(Source: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DragDrop(TObject * Source, int X, int Y);
```

Description

This override of the method inherited from TCustomActionControl calls the inherited routine and performs other actions to ensure that the focus is correct.

See Also

DragDrop (see page 520)

DragDrop (see page 5754)

5.1.13.5.6 TCustomMenuItem.DragOver Method

OnDragOver event dispatcher.

Pascal

```
procedure DragOver(Source: TObject; X: Integer; Y: Integer; State: TDragState; var Accept:
Boolean); override;
```

C++

```
virtual __fastcall DragOver(TObject * Source, int X, int Y, TDragState State, Boolean Accept);
```

Description

Override DragOver to add additional code that executes before the OnDragOver event handler is called.

DragOver sets the Accept parameter to true to indicate that the user can drop the dragged object on the control. It sets Accept to false to indicate that the user cannot drop the dragged object on the control.

The Source parameter is the object being dragged. The State parameter indicates how the dragged object is moving in relation to the control. X and Y indicate the current position of the mouse.

See Also

DragDrop (see page 5754)

OnDragOver (see page 5857)

5.1.13.5.7 TCustomMenuItem.DrawEdge Method

Pascal

```
procedure DrawEdge(Edges: TMenuEdges); virtual;
```

C++

```
virtual __fastcall DrawEdge(TMenuEdges Edges);
```

Description

This is DrawEdge, a member of class TCustomMenuItem.

5.1.13.5.8 TCustomMenuItem.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, AnsiString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TCustomMenuItem.

5.1.13.5.9 TCustomMenuItem.DrawSubMenuGlyph Method

Pascal

```
procedure DrawSubMenuGlyph; virtual;
```

C++

```
virtual __fastcall DrawSubMenuGlyph();
```

Description

This is DrawSubMenuGlyph, a member of class TCustomMenuItem.

5.1.13.5.10 TCustomMenuItem.DrawText Method

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: String); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, AnsiString Text);
```

Description

This is DrawText, a member of class TCustomMenuItem.

5.1.13.5.11 TCustomMenuItem.DrawUnusedEdges Method

Pascal

```
procedure DrawUnusedEdges; virtual;
```

C++

```
virtual __fastcall DrawUnusedEdges();
```

Description

This is DrawUnusedEdges, a member of class TCustomMenuItem.

5.1.13.5.12 TCustomMenuItem.Keyed Method

Executes the menu item's function in response to a user's keyboard command.

Pascal

```
procedure Keyed; override;
```

C++

```
virtual __fastcall Keyed();
```

Description

This method is largely identical to the inherited method in TCustomActionControl. Additional actions are taken specifically for TCustomMenuItem (see page 816) objects.

See Also

Keyed (see page 525)

5.1.13.5.13 TCustomMenuItem.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

See Also

MouseDown (see page 5773)

MouseMove (see page 5773)

OnMouseUp (see page 5867)

5.1.13.5.14 TCustomMenuItem.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas (see page 6053)

5.1.13.5.15 TCustomMenuItem.PositionChanged Method

Pascal

```
procedure PositionChanged; override;
```

C++

```
virtual __fastcall PositionChanged();
```

Description

This is PositionChanged, a member of class TCustomMenuItem.

5.1.13.5.16 TCustomMenuItem.SetSelected Method

Pascal

```
procedure SetSelected(Value: Boolean); override;
```

C++

```
virtual __fastcall SetSelected(Boolean Value);
```

Description

This is SetSelected, a member of class TCustomMenuItem.

5.1.13.6 TCustomMenuItem Properties

The properties of the TCustomMenuItem class are listed here.

Protected Properties

	Name	Description
R	Menu (see page 832)	This is Menu, a member of class TCustomMenuItem.
R	MouseSelected (see page 832)	This is MouseSelected, a member of class TCustomMenuItem.
	ShortCutBounds (see page 832)	This is ShortCutBounds, a member of class TCustomMenuItem.

Public Properties

	Name	Description
	Edges (see page 832)	Dictates which edges are drawn when the menu item is drawn.

5.1.13.6.1 TCustomMenuItem.Edges Property

Dictates which edges are drawn when the menu item is drawn.

Pascal

```
property Edges: TMenuEdges;
```

C++

```
__property TMenuEdges Edges;
```

Description

Use Edges to dictate which edges of the menu item should be drawn when the menu item is drawn. The values ebLeft, ebTop, ebRight, and ebBottom indicate that the left, top, right, and bottom edges (respectively) should be drawn.

5.1.13.6.2 TCustomMenuItem.Menu Property

Pascal

```
property Menu: TCustomActionMenuBar;
```

C++

```
__property TCustomActionMenuBar Menu;
```

Description

This is Menu, a member of class TCustomMenuItem.

5.1.13.6.3 TCustomMenuItem.MouseSelected Property

Pascal

```
property MouseSelected: Boolean;
```

C++

```
__property Boolean MouseSelected;
```

Description

This is MouseSelected, a member of class TCustomMenuItem.

5.1.13.6.4 TCustomMenuItem.ShortCutBounds Property

Pascal

```
property ShortCutBounds: TRect;
```

C++

```
__property TRect ShortCutBounds;
```

Description

This is ShortCutBounds, a member of class TCustomMenuItem.

5.1.14 TMenuStack Class

Class Hierarchy

System::TObject → Contnrs.TOrderedList → Contnrs.TStack → ActnMenus.TMenuStack

Pascal

```
TMenuStack = class(TStack);
```

C++

```
class TMenuStack : public TStack;
```

File

ActnMenus

Description

This is class ActnMenus.TMenuStack.

5.1.14.1 TMenuStack Members

The following tables list the members exposed by TMenuStack.

Protected Methods

	Name	Description
V	PeekItem (see page 5697)	Returns a pointer to the next item in the list.
V	PopItem (see page 5697)	Removes and returns a pointer to the next item in the list.
A	PushItem (see page 5698)	Adds an item to the list.
V	PushItem (see page 5703)	Adds an item to the list.

Protected Properties

	Name	Description
R	Bars (see page 836)	This is Bars, a member of class TMenuStack.
R	List (see page 5699)	Identifies the internal list used to store and manage the items in the ordered list.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AtLeast (see page 5696)	Checks the size of the list.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Count (see page 5696)	Returns the size of the list.
	Create (see page 834)	This is Create, a member of class TMenuStack.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 5695)	Destroys the TOrderedList (see page 5693) instance.

	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Peek (see page 834)	Returns a pointer to the next item in the list.
	Pop (see page 835)	Removes and returns the next item in the list.
	Push (see page 835)	This is Push, a member of class TMenuStack.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

5.1.14.2 TMenuStack.Create Constructor

Pascal

```
constructor Create(AMenu: TCustomActionMenuBar);
```

C++

```
__fastcall TMenuStack(TCustomActionMenuBar AMenu);
```

Description

This is Create, a member of class TMenuStack.

5.1.14.3 TMenuStack Methods

The methods of the TMenuStack class are listed here.

Public Methods

	Name	Description
	Peek (see page 834)	Returns a pointer to the next item in the list.
	Pop (see page 835)	Removes and returns the next item in the list.
	Push (see page 835)	This is Push, a member of class TMenuStack.

5.1.14.3.1 TMenuStack.Peek Method

Returns a pointer to the next item in the list.

Pascal

```
function Peek: TCustomActionMenuBar;
```

C++

```
__fastcall TCustomActionMenuBar Peek();
```

Description

Call Peek to access the list without removing an item. Peek returns a pointer to the next item in the list.

Each TOrderedList descendant implements Peek to return a specific item from the list. For example, TQueue returns the item that was added first, while TStack returns the item that was added last.

To remove an item from the list, call Pop.

See Also

Push (see page 5698)

Pop (see page 5697)

5.1.14.3.2 TMenuStack.Pop Method

Removes and returns the next item in the list.

Pascal

```
function Pop: TCustomActionMenuBar;
```

C++

```
__fastcall TCustomActionMenuBar Pop();
```

Description

Call Pop to retrieve an item from the list. Pop removes the next item from the list, then returns a pointer to the deleted item.

Each TOrderedList descendant implements Pop to remove and return a specific item from the list. For example, TQueue returns the item that was added first, while TStack returns the item that was added last.

To access the list without removing an item, call Peek.

See Also

Push (see page 5698)

Peek (see page 5696)

5.1.14.3.3 TMenuStack.Push Method

Pascal

```
procedure Push(Container: TCustomActionMenuBar);
```

C++

```
__fastcall Push(TCustomActionMenuBar Container);
```

Description

This is Push, a member of class TMenuStack.

5.1.14.4 TMenuStack Properties

The properties of the TMenuStack class are listed here.

Protected Properties

	Name	Description
	Bars (see page 836)	This is Bars, a member of class TMenuStack.

5.1.14.4.1 TMenuStack.Bars Property

Pascal

```
property Bars [const Index: Integer]: TCustomActionMenuBar;
```

C++

```
__property TCustomActionMenuBar Bars[int const Index];
```

Description

This is Bars, a member of class TMenuStack.

5.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	RegisterActnBarStyle (see page 837)	Registers an action band style so that it is available for use from TActionManager's Style property within the IDE.
	UnRegisterActnBarStyle (see page 837)	Unregisters an action band style from the IDE.

5.2.1 ActnMenus.RegisterActnBarStyle Function

Registers an action band style so that it is available for use from TActionManager's Style property within the IDE.

Pascal

```
procedure RegisterActnBarStyle(AStyle: TActionBarStyleEx);
```

C++

```
RegisterActnBarStyle(TActionBarStyleEx AStyle);
```

File

ActnMenus

Description

RegisterActnBarStyle registers a style so that is is available at design-time through TActionManager's Style property in the object inspector. After creating a descendant of TActionBarStyleEx (see page 583), call RegisterActnBarStyle to use the style in the IDE.

See Also

UnRegisterActnBarStyle (see page 837)

RegisterActions

5.2.2 ActnMenus.UnRegisterActnBarStyle Function

Unregisters an action band style from the IDE.

Pascal

```
procedure UnRegisterActnBarStyle(AStyle: TActionBarStyleEx);
```

C++

```
UnRegisterActnBarStyle(TActionBarStyleEx AStyle);
```

File

ActnMenus

Description

UnRegisterActnBarStyle unregisters an action band style from the IDE thus removing it from the list displayed in the Object Inspector for TActionManager's Style property.

See Also

RegisterActnBarStyle (see page 837)

UnRegisterActions

5.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAnimationStyle (see page 839)	This is record ActnMenus.TAnimationStyle.
	TMDIButtonStyle (see page 839)	This is record ActnMenus.TMDIButtonStyle.

5.3.1 ActnMenus.TAnimationStyle Enumeration

Pascal

```
TAnimationStyle = (
  asNone,
  asDefault,
  asUnFold,
  asSlide,
  asFade
);
```

C++

```
enum TAnimationStyle {
  asNone,
  asDefault,
  asUnFold,
  asSlide,
  asFade
};
```

File

ActnMenus

Description

This is record ActnMenus.TAnimationStyle.

5.3.2 ActnMenus.TMDIButtonStyle Enumeration

Pascal

```
TMDIButtonStyle = (
  mbMinimize,
  mbRestore,
  mbClose
);
```

C++

```
enum TMDIButtonStyle {
  mbMinimize,
  mbRestore,
```

```
    mbClose
  };
```

File

ActnMenus

Description

This is record ActnMenus.TMDIButtonStyle.

5.4 Types

The following table lists types in this documentation.

Types

Name	Description
TAddRemoveItemClass (see page 841)	This is type ActnMenus.TAddRemoveItemClass.
TCustomAddRemoveItemClass (see page 841)	This is type ActnMenus.TCustomAddRemoveItemClass.
TCustomizeActionToolBarClass (see page 842)	This is type ActnMenus.TCustomizeActionToolBarClass.
TCustomMenuExpandBtnClass (see page 842)	This is type ActnMenus.TCustomMenuExpandBtnClass.
TCustomPopupClass (see page 842)	This is type ActnMenus.TCustomPopupClass.
TExitMenuEvent (see page 843)	This is type ActnMenus.TExitMenuEvent.
TGetPopupClassEvent (see page 843)	This is type ActnMenus.TGetPopupClassEvent.
TMenuButtonControlClass (see page 843)	This is type ActnMenus.TMenuButtonControlClass.
TMenuEdges (see page 844)	This is type ActnMenus.TMenuEdges.
TMenuItemControlClass (see page 844)	This is type ActnMenus.TMenuItemControlClass.
TMenuPopupEvent (see page 844)	This is type ActnMenus.TMenuPopupEvent.
TUpdateActnMenusProc (see page 845)	This is type ActnMenus.TUpdateActnMenusProc.

5.4.1 ActnMenus.TAddRemoveItemClass Type

Pascal

```
TAddRemoveItemClass = class of TCustomAddRemoveItem;
```

C++

```
TCustomAddRemoveItem TAddRemoveItemClass;
```

File

ActnMenus

Description

This is type ActnMenus.TAddRemoveItemClass.

5.4.2 ActnMenus.TCustomAddRemoveItemClass Type

Pascal

```
TCustomAddRemoveItemClass = class of TCustomAddRemoveItem;
```

C++

```
TCustomAddRemoveItem TCustomAddRemoveItemClass;
```

File

ActnMenus

Description

This is type ActnMenus.TCustomAddRemoveItemClass.

5.4.3 ActnMenus.TCustomizeActionToolBarClass Type

Pascal

```
TCustomizeActionToolBarClass = class of TCustomizeActionToolBar;
```

C++

```
TCustomizeActionToolBar TCustomizeActionToolBarClass;
```

File

ActnMenus

Description

This is type ActnMenus.TCustomizeActionToolBarClass.

5.4.4 ActnMenus.TCustomMenuExpandBtnClass Type

Pascal

```
TCustomMenuExpandBtnClass = class of TCustomMenuExpandBtn;
```

C++

```
TCustomMenuExpandBtn TCustomMenuExpandBtnClass;
```

File

ActnMenus

Description

This is type ActnMenus.TCustomMenuExpandBtnClass.

5.4.5 ActnMenus.TCustomPopupClass Type

Pascal

```
TCustomPopupClass = class of TCustomActionPopupMenu;
```

C++

```
TCustomActionPopupMenu TCustomPopupClass;
```

File

ActnMenus

Description

This is type ActnMenus.TCustomPopupClass.

5.4.6 ActnMenus.TExitMenuEvent Type

Pascal

```
TExitMenuEvent = procedure (Sender: TCustomActionMenuBar; Cancelled: Boolean) of object;
```

C++

```
(Sender: TCustomActionMenuBar; Cancelled: Boolean) ( TExitMenuEvent)();
```

File

ActnMenus

Description

This is type ActnMenus.TExitMenuEvent.

5.4.7 ActnMenus.TGetPopupClassEvent Type

Pascal

```
TGetPopupClassEvent = procedure (Sender: TObject; var PopupClass: TCustomPopupClass) of object;
```

C++

```
(Sender: TObject; var PopupClass: TCustomPopupClass) ( TGetPopupClassEvent)();
```

File

ActnMenus

Description

This is type ActnMenus.TGetPopupClassEvent.

5.4.8 ActnMenus.TMenuButtonControlClass Type

Pascal

```
TMenuButtonControlClass = class of TCustomMenuButton;
```

C++

```
TCustomMenuButton TMenuButtonControlClass;
```

File

ActnMenus

Description

This is type ActnMenus.TMenuButtonControlClass.

5.4.9 ActnMenus.TMenuEdges Type

Pascal

```
TMenuEdges = set of TEdgeBorder;
```

C++

```
TEdgeBorder TMenuEdges;
```

File

ActnMenus

Description

This is type ActnMenus.TMenuEdges.

5.4.10 ActnMenus.TMenuItemControlClass Type

Pascal

```
TMenuItemControlClass = class of TCustomMenuItem;
```

C++

```
TCustomMenuItem TMenuItemControlClass;
```

File

ActnMenus

Description

This is type ActnMenus.TMenuItemControlClass.

5.4.11 ActnMenus.TMenuPopupEvent Type

Pascal

```
TMenuPopupEvent = procedure (Sender: TObject; Item: TCustomActionControl) of object;
```

C++

```
(Sender: TObject; Item: TCustomActionControl) ( TMenuPopupEvent)();
```

File

ActnMenus

Description

This is type ActnMenus.TMenuPopupEvent.

5.4.12 ActnMenus.TUpdateActnMenusProc Type

Pascal

```
TUpdateActnMenusProc = procedure;
```

C++

```
( TUpdateActnMenusProc)();
```

File

ActnMenus

Description

This is type ActnMenus.TUpdateActnMenusProc.

5.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
MenuAddRemoveItemClass (see page 846)	This is variable ActnMenus.MenuAddRemoveItemClass.
MenuButtonControlClass (see page 846)	This is variable ActnMenus.MenuButtonControlClass.
MenuCustomizePopupClass (see page 847)	This is variable ActnMenus.MenuCustomizePopupClass.
MenuItemControlClass (see page 847)	This is variable ActnMenus.MenuItemControlClass.
MenuPopupClass (see page 847)	This is variable ActnMenus.MenuPopupClass.
UpdateActnMenusProc (see page 848)	This is variable ActnMenus.UpdateActnMenusProc.

5.5.1 ActnMenus.MenuAddRemoveItemClass Variable

Pascal

```
MenuAddRemoveItemClass: TAddRemoveItemClass deprecated;
```

C++

```
TAddRemoveItemClass deprecated MenuAddRemoveItemClass;
```

File

ActnMenus

Description

This is variable ActnMenus.MenuAddRemoveItemClass.

5.5.2 ActnMenus.MenuButtonControlClass Variable

Pascal

```
MenuButtonControlClass: TMenuButtonControlClass deprecated;
```

C++

```
TMenuButtonControlClass deprecated MenuButtonControlClass;
```

File

ActnMenus

Description

This is variable ActnMenus.MenuButtonControlClass.

5.5.3 ActnMenus.MenuCustomizePopupClass Variable

Pascal

```
MenuCustomizePopupClass: TCustomizeActionToolBarClass deprecated;
```

C++

```
TCustomizeActionToolBarClass deprecated MenuCustomizePopupClass;
```

File

ActnMenus

Description

This is variable ActnMenus.MenuCustomizePopupClass.

5.5.4 ActnMenus.MenuItemControlClass Variable

Pascal

```
MenuItemControlClass: TMenuItemControlClass deprecated;
```

C++

```
TMenuItemControlClass deprecated MenuItemControlClass;
```

File

ActnMenus

Description

This is variable ActnMenus.MenuItemControlClass.

5.5.5 ActnMenus.MenuPopupClass Variable

Pascal

```
MenuPopupClass: TCustomPopupClass deprecated;
```

C++

```
TCustomPopupClass deprecated MenuPopupClass;
```

File

ActnMenus

Description

This is variable ActnMenus.MenuPopupClass.

5.5.6 ActnMenus.UpdateActnMenusProc Variable

Pascal

```
UpdateActnMenusProc: TUpdateActnMenusProc;
```

C++

```
TUpdateActnMenusProc UpdateActnMenusProc;
```

File

ActnMenus

Description

This is variable ActnMenus.UpdateActnMenusProc.

6 ActnPopup Namespace

This is namespace ActnPopup.

Topics

Name	Description
Classes (see page 850)	The following table lists classes in this documentation.
Functions (see page 859)	The following table lists functions in this documentation.

Classes

	Name	Description
	TCustomActionPopupMenuEx (see page 850)	This is class ActnPopup.TCustomActionPopupMenuEx.
	TPopupActionBar (see page 852)	This is class ActnPopup.TPopupActionBar.

Functions

	Name	Description
	NewPopupMenu (see page 859)	Creates and initializes a popup menu.

6.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomActionPopupMenuEx (see page 850)	This is class ActnPopup.TCustomActionPopupMenuEx.
	TPopupActionBar (see page 852)	This is class ActnPopup.TPopupActionBar.

6.1.1 TCustomActionPopupMenuEx Class

Class Hierarchy

Pascal

```
TCustomActionPopupMenuEx = class(TXPStylePopupMenu);
```

C++

```
class TCustomActionPopupMenuEx : public TXPStylePopupMenu;
```

File

ActnPopup

Description

This is class ActnPopup.TCustomActionPopupMenuEx.

6.1.1.1 TCustomActionPopupMenuEx Members

The following tables list the members exposed by TCustomActionPopupMenuEx.

Protected Methods

	Name	Description
	DoPopup (see page 851)	This is DoPopup, a member of class TCustomActionPopupMenuEx.
	ExecAction (see page 851)	This is ExecAction, a member of class TCustomActionPopupMenuEx.
	GetPopupClass (see page 851)	This is GetPopupClass, a member of class TCustomActionPopupMenuEx.

Public Methods

	Name	Description
	LoadMenu (see page 851)	This is LoadMenu, a member of class TCustomActionPopupMenuEx.

6.1.1.2 TCustomActionPopupMenuEx Methods

The methods of the TCustomActionPopupMenuEx class are listed here.

Protected Methods

	Name	Description
	DoPopup (see page 851)	This is DoPopup, a member of class TCustomActionPopupMenuEx.
	ExecAction (see page 851)	This is ExecAction, a member of class TCustomActionPopupMenuEx.
	GetPopupClass (see page 851)	This is GetPopupClass, a member of class TCustomActionPopupMenuEx.

Public Methods

	Name	Description
	LoadMenu (see page 851)	This is LoadMenu, a member of class TCustomActionPopupMenuEx.

6.1.1.2.1 TCustomActionPopupMenuEx.DoPopup Method

Pascal

```
procedure DoPopup(Item: TCustomActionControl); override;
```

C++

```
virtual __fastcall DoPopup(TCustomActionControl Item);
```

Description

This is DoPopup, a member of class TCustomActionPopupMenuEx.

6.1.1.2.2 TCustomActionPopupMenuEx.ExecAction Method

Pascal

```
procedure ExecAction(Action: TContainedAction); override;
```

C++

```
virtual __fastcall ExecAction(TContainedAction Action);
```

Description

This is ExecAction, a member of class TCustomActionPopupMenuEx.

6.1.1.2.3 TCustomActionPopupMenuEx.GetPopupClass Method

Pascal

```
function GetPopupClass: TCustomPopupClass; override;
```

C++

```
virtual __fastcall TCustomPopupClass GetPopupClass();
```

Description

This is GetPopupClass, a member of class TCustomActionPopupMenuEx.

6.1.1.2.4 TCustomActionPopupMenuEx.LoadMenu Method

Pascal

```
procedure LoadMenu(Clients: TActionClients; AMenu: TMenuItem);
```

C++

```
__fastcall LoadMenu(TActionClients Clients, TMenuItem AMenu);
```

Description

This is LoadMenu, a member of class TCustomActionPopupMenuEx.

6.1.2 TPopupActionBar Class

Class Hierarchy

Pascal

```
TPopupActionBar = class(TPopupMenu);
```

C++

```
class TPopupActionBar : public TPopupMenu;
```

File

ActnPopup

Description

This is class ActnPopup.TPopupActionBar.

6.1.2.1 TPopupActionBar Members

The following tables list the members exposed by TPopupActionBar.

Protected Events

	Name	Description
	OnChange (see page 16090)	Occurs when the menu changes.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AdjustBiDiBehavior (see page 16073)	Applies the BiDiMode (see page 16083) property to the menu when the Windows control is created.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoBiDiModeChanged (see page 16074)	Updates the menu when the BiDiMode (see page 16083) property changes.
V	DoChange (see page 16075)	Generates an OnChange (see page 16090) event.
	DoGetMenuString (see page 16075)	Returns the caption for an item in the menu.

	DoPopup (see page 16174)	Generates an OnPopup (see page 16184) event.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 16076)	Executes a callback for child menu items.
	GetHandle (see page 16076)	Returns the value of the Handle (see page 16083) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsOwnerDraw (see page 16077)	Indicates whether menu items can contain more than simple captions.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 16078)	Calls the DoChange (see page 16075) method when the menu is first loaded into memory.
	MenuChanged (see page 16079)	Responds when the menu changes.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 16079)	Responds when components are added or deleted.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 16081)	Ensures that the menu item indexes reflect the order in which they are loaded and saved.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetPopupPoint (see page 16175)	This is SetPopupPoint, a member of class TPopupMenu.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateItems (see page 16081)	Causes all menu items to update themselves.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UseRightToLeftAlignment (see page 16175)	Specifies whether the control's alignment is in a right-to-left mode.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.

	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 856)	Creates an instance of TPopupMenu.
	CreateMenuItem (see page 16073)	This is CreateMenuItem, a member of class TMenu.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 16072)	Destroys the menu component.
	Destroy (see page 16173)	Destroys an instance of TPopupMenu (see page 16169).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DispatchCommand (see page 16074)	Calls the Click method of the menu item with the specified value as its Command property.
	DispatchPopup (see page 16074)	Dispatches a pop-up menu command.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindItem (see page 16076)	Locates and returns a menu item.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHelpContext (see page 16077)	Returns the help context ID associated with a menu item.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 16077)	Indicates whether menu items read from right to left.
	IsShortCut (see page 16078)	Dispatches a key message if it represents a shortcut key for an item in the menu.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentBiDiModeChanged (see page 16079)	This is the overview for the ParentBiDiModeChanged method overload.
V	Popup (see page 856)	Displays the pop-up menu onscreen.
	ProcessMenuChar (see page 16080)	Responds to keyboard input for the menu.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	AutoHotkeys (see page 16082)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 16082)	Determines whether redundant separator bars are automatically removed from the menu.
	BiDiMode (see page 16083)	Determines the layout of the menu in Middle East locales.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Handle (see page 16083)	Provides access to the Windows menu handle for the menu.
	Images (see page 16083)	Lists the images that can appear beside individual menu items.
R	MenuActive (see page 857)	This is MenuActive, a member of class TPopupActionBar.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	OwnerDraw (see page 16088)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 16089)	Indicates whether the BiDiMode (see page 16083) property is inherited from the control that uses the menu.
	PopupComponent (see page 16181)	Indicates the component that last displayed the popup menu in response to a right mouse click.
R	PopupPoint (see page 16183)	Indicates the location where the pop-up menu appears.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	WindowHandle (see page 16089)	Provides access to the handle of the window that uses the menu.

Published Events

	Name	Description
	OnChange (see page 16184)	Occurs when the menu changes.
	OnGetControlClass (see page 858)	This is OnGetControlClass, a member of class TPopupActionBar.
	OnPopup (see page 16184)	Occurs just before the pop-up menu appears.

Published Properties

	Name	Description
	Alignment (see page 16176)	Determines where the pop-up menu appears when the user clicks the right mouse button.

	AutoHotkeys (see page 16176)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 16177)	Determines whether redundant separator bars are automatically removed from the menu.
	AutoPopup (see page 16178)	Determines whether the pop-up menu appears automatically when the user clicks the right mouse button.
	BiDiMode (see page 16178)	Determines the layout of the menu in Middle East locales.
	HelpContext (see page 16179)	Specifies a context ID for the entire pop-up menu.
	Images (see page 16179)	Lists the images that can appear beside individual menu items.
R	Items (see page 16084)	Describes the elements of the menu.
	MenuAnimation (see page 16180)	Specifies how the menu appears when it is first displayed.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OwnerDraw (see page 16180)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 16180)	Indicates whether the BiDiMode property is inherited from the control that uses the menu.
	PopupMenu (see page 858)	This is PopupMenu, a member of class TPopupActionBar.
	Tag (see page 2808)	Stores an integer value as part of a component.
	TrackButton (see page 16183)	Specifies which mouse button activates the popup menu when it is associated with a toolbar button.

6.1.2.2 TPopupActionBar.Create Constructor

Creates an instance of TPopupMenu.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPopupActionBar(TComponent * AOwner);
```

Description

Call Create to create to create a pop-up menu at runtime. Pop-up menus placed in forms or data modules at design time are created automatically.

See Also

Create (see page 16072)

6.1.2.3 TPopupActionBar Methods

The methods of the TPopupActionBar class are listed here.

Public Methods

	Name	Description
V	Popup (see page 856)	Displays the pop-up menu onscreen.

6.1.2.3.1 TPopupActionBar.Popup Method

Displays the pop-up menu onscreen.

Pascal

```
procedure Popup(X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall Popup(int X, int Y);
```

Description

Call Popup to bring up the pop-up menu. The menu appears at the screen coordinates indicated by the values (in pixels) of X and Y.

Delphi Examples:

```
{
This example uses a pop-up menu. When the user presses the
mouse button, the pop-up menu appears where the user
clicked the mouse:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := False;
end;

procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X, Y: Integer);
begin
  PopupMenu1.Popup(Left + X, Top + Y);
end;
```

See Also

Alignment (see page 16176)

AutoPopup (see page 16178)

OnPopup (see page 16184)

6.1.2.4 TPopupActionBar Properties

The properties of the TPopupActionBar class are listed here.

Public Properties

	Name	Description
R	MenuActive (see page 857)	This is MenuActive, a member of class TPopupActionBar.

Published Properties

	Name	Description
	PopupMenu (see page 858)	This is PopupMenu, a member of class TPopupActionBar.

6.1.2.4.1 TPopupActionBar.MenuActive Property

Pascal

```
property MenuActive: Boolean;
```

C++

```
__property Boolean MenuActive;
```

Description

This is MenuActive, a member of class TPopupActionBar.

6.1.2.4.2 TPopupActionBar.PopupMenu Property

Pascal

```
property PopupMenu: TCustomActionPopupMenuEx;
```

C++

```
__property TCustomActionPopupMenuEx PopupMenu;
```

Description

This is PopupMenu, a member of class TPopupActionBar.

6.1.2.5 TPopupActionBar Events

The events of the TPopupActionBar class are listed here.

Published Events

	Name	Description
	OnGetControlClass (see page 858)	This is OnGetControlClass, a member of class TPopupActionBar.

6.1.2.5.1 TPopupActionBar.OnGetControlClass Event

Pascal

```
property OnGetControlClass: TGetControlClassEvent;
```

C++

```
__property TGetControlClassEvent OnGetControlClass;
```

Description

This is OnGetControlClass, a member of class TPopupActionBar.

6.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	NewPopupMenu (see page 859)	Creates and initializes a popup menu.

6.2.1 ActnPopup.NewPopupMenu Function

Creates and initializes a popup menu.

Pascal

```
function NewPopupMenu(Owner: TComponent; const AName: string; Alignment: TPopupAlignment;
AutoPopup: Boolean; const Items: array of TMenuItem): TPopupMenu;
```

C++

```
TPopupMenu NewPopupMenu(TComponent * Owner, const AnsiString AName, TPopupAlignment Alignment,
Boolean AutoPopup, const array of TMenuItem Items);
```

File

ActnPopup

Description

Call NewPopupMenu to create and initialize a popup menu programmatically. NewPopupMenu returns the TPopupMenu component that represents the popup menu, but does not associate that popup menu with any control.

The Owner parameter specifies the component that is responsible for freeing the menu.

The AName parameter specifies the name of the popup menu, which is used to refer to it in code.

The Alignment parameter determines where the menu appears relative to the mouse when the user right clicks on the control that uses the menu.

The AutoPopup parameter specifies whether the menu should appear automatically when the user right clicks the associated control.

The Items parameter is an array of menu items that make up the top level menu items. To create the menu items for the Items parameter, use the NewItem function.

Note: The Items_Size parameter specifies the index of the last menu item in Items (one less than the number of menu items).

See Also

NewMenu (see page 16190)

NewSubMenu (see page 16192)

NewItem (see page 16188)

7 AdaptReq Namespace

This is namespace AdaptReq.

Topics

Name	Description
Classes (see page 863)	The following table lists classes in this documentation.
Interfaces (see page 920)	The following table lists interfaces in this documentation.
Functions (see page 968)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 969)	The following table lists structs, records, enums in this documentation.
Types (see page 971)	The following table lists types in this documentation.
Constants (see page 972)	The following table lists constants in this documentation.

Classes

	Name	Description
	EAdapterRequestException (see page 863)	EAdapterRequestException is raised by WebSnap adapter objects when a request fails.
	TActionFieldValueImpl (see page 864)	This is class AdaptReq.TActionFieldValueImpl.
	TActionFieldValuesImpl (see page 868)	This is class AdaptReq.TActionFieldValuesImpl.
	TAdapterActionFieldValuesList (see page 873)	This is class AdaptReq.TAdapterActionFieldValuesList.
	TAdapterModes (see page 876)	This is class AdaptReq.TAdapterModes.
	TAdapterRequestParamsImpl (see page 880)	This is class AdaptReq.TAdapterRequestParamsImpl.
	TBasicActionRequestImpl (see page 884)	This is class AdaptReq.TBasicActionRequestImpl.
	TBasicActionResponseImpl (see page 890)	This is class AdaptReq.TBasicActionResponseImpl.
	TBasicImageRequestImpl (see page 898)	This is class AdaptReq.TBasicImageRequestImpl.
	TBasicImageResponseImpl (see page 902)	This is class AdaptReq.TBasicImageResponseImpl.
	TEnumActionFieldValueRecordsImpl (see page 904)	This is class AdaptReq.TEnumActionFieldValueRecordsImpl.
	TMultiRecordActionRequestImpl (see page 909)	This is class AdaptReq.TMultiRecordActionRequestImpl.
	TSingleRecordActionRequestImpl (see page 915)	This is class AdaptReq.TSingleRecordActionRequestImpl.

Constants

Name	Description
roRedirect (see page 972)	This is constant AdaptReq.roRedirect.
sActionRequest (see page 972)	This is constant AdaptReq.sActionRequest.
sDelimAdapterMode (see page 973)	This is constant AdaptReq.sDelimAdapterMode.
sDelimOrigFieldValue (see page 973)	This is constant AdaptReq.sDelimOrigFieldValue.
sDelimRecordKeys (see page 973)	This is constant AdaptReq.sDelimRecordKeys.

Functions

	Name	Description
	ExtractStringValue (see page 968)	This is function AdaptReq.ExtractStringValue.
	TestRedirectOptions (see page 968)	This is function AdaptReq.TestRedirectOptions.

Interfaces

	Name	Description
	IActionFieldValue (see page 920)	IActionFieldValue is the interface for obtaining the value of an adapter field.
	IActionFieldValues (see page 925)	IActionFieldValues is the interface for extracting field values from the current HTTP request.
	IActionFieldValuesOfAdapter (see page 933)	IActionFieldValuesOfAdapter is the interface for determining whether a request includes field values that pertain to a specific adapter.
	IActionHandleResponse (see page 934)	This is class AdaptReq.IActionHandleResponse.
	IActionRequest (see page 935)	IActionRequest is the interface for interacting with action requests.
	IActionRespondWith (see page 938)	This is class AdaptReq.IActionRespondWith.
	IActionResponse (see page 941)	IActionResponse is the interface for interacting with action responses.
	IAdapterModes (see page 944)	IAdapterModes is the interface for extracting the mode of an adapter from an HTTP request.
	IAdapterRecordKeys (see page 949)	IAdapterRecordKeys is the interface for extracting name/value pairs from an HTTP request that identify a record for an adapter.
	IAdapterRequestParams (see page 952)	IAdapterRequestParams is the interface for extracting name/value pairs from an HTTP request message.
	IEnumActionFieldValueRecords (see page 957)	IEnumActionFieldValueRecords is the interface for iterating over the data in an HTTP request for each of several adapter records.
	IGetAdapterActionRedirectOptions (see page 963)	This is class AdaptReq.IGetAdapterActionRedirectOptions.
	IImageRequest (see page 965)	IImageRequest is the interface for extracting the name of a requested image from an HTTP request message.
	IImageResponse (see page 967)	This is class AdaptReq.IImageResponse.

Structs, Records, Enums

	Name	Description
	TAdapterActionRedirectOption (see page 969)	This is record AdaptReq.TAdapterActionRedirectOption.
	TExecuteStatus (see page 969)	This is record AdaptReq.TExecuteStatus.
	TRespondWith (see page 970)	This is record AdaptReq.TRespondWith.

Types

Name	Description
TAdapterActionRedirectOptions (see page 971)	This is type AdaptReq.TAdapterActionRedirectOptions.

7.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EAdapterRequestException (see page 863)	EAdapterRequestException is raised by WebSnap adapter objects when a request fails.
	TActionFieldValueImpl (see page 864)	This is class AdaptReq.TActionFieldValueImpl.
	TActionFieldValuesImpl (see page 868)	This is class AdaptReq.TActionFieldValuesImpl.
	TAdapterActionFieldValuesList (see page 873)	This is class AdaptReq.TAdapterActionFieldValuesList.
	TAdapterModes (see page 876)	This is class AdaptReq.TAdapterModes.
	TAdapterRequestParamsImpl (see page 880)	This is class AdaptReq.TAdapterRequestParamsImpl.
	TBasicActionRequestImpl (see page 884)	This is class AdaptReq.TBasicActionRequestImpl.
	TBasicActionResponseImpl (see page 890)	This is class AdaptReq.TBasicActionResponseImpl.
	TBasicImageRequestImpl (see page 898)	This is class AdaptReq.TBasicImageRequestImpl.
	TBasicImageResponseImpl (see page 902)	This is class AdaptReq.TBasicImageResponseImpl.
	TEnumActionFieldValueRecordsImpl (see page 904)	This is class AdaptReq.TEnumActionFieldValueRecordsImpl.
	TMultiRecordActionRequestImpl (see page 909)	This is class AdaptReq.TMultiRecordActionRequestImpl.
	TSingleRecordActionRequestImpl (see page 915)	This is class AdaptReq.TSingleRecordActionRequestImpl.

7.1.1 EAdapterRequestException Class

EAdapterRequestException is raised by WebSnap adapter objects when a request fails.

Class Hierarchy

Pascal

```
EAdapterRequestException = class(EWebBrokerException);
```

C++

```
class EAdapterRequestException : public EWebBrokerException;
```

File

AdaptReq

Description

EAdapterRequestException is raised when a WebSnap adapter object encounters an error while processing a request.

7.1.2 TActionFieldValueImpl Class

Class Hierarchy

Pascal

```
TActionFieldValueImpl = class(TInterfacedObject, IActionFieldValue);
```

C++

```
class TActionFieldValueImpl : public TInterfacedObject, public IActionFieldValue;
```

File

AdaptReq

Description

This is class AdaptReq.TActionFieldValueImpl.

7.1.2.1 TActionFieldValueImpl Members

The following tables list the members exposed by TActionFieldValueImpl.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetFieldName (see page 866)	Returns the value of the FieldName property.
	GetFile (see page 867)	Returns the value of the Files property.
	GetFileCount (see page 867)	Returns the value of the FileCount property.
	GetValue (see page 867)	Returns the value of the Values property.
	GetValueCount (see page 868)	Returns the value of the ValueCount property.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 865)	This is Create, a member of class TActionFieldValueImpl.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 866)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	FieldName (see page 923)	Indicates the name of the adapter field whose value this interface represents.
R	FileCount (see page 924)	Indicates the number of file references that the Files (see page 924) property lists.
R	Files (see page 924)	Lists the file references that make up this adapter field's value.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	ValueCount (see page 925)	Indicates the number of values that the Values (see page 925) property lists.
R	Values (see page 925)	Lists the values that belong to the adapter field.

7.1.2.2 TActionFieldValueImpl.Create Constructor

Pascal

```
constructor Create(const AFieldName: string; AStrings: TStrings);
```

C++

```
__fastcall TActionFieldValueImpl(const AnsiString AFieldName, TStrings AStrings);
```

Description

This is Create, a member of class TActionFieldValueImpl.

7.1.2.3 TActionFieldValueImpl.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TActionFieldValueImpl();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

7.1.2.4 TActionFieldValueImpl Methods

The methods of the TActionFieldValueImpl class are listed here.

Protected Methods

	Name	Description
	GetFieldName (see page 866)	Returns the value of the FieldName property.
	GetFile (see page 867)	Returns the value of the Files property.
	GetFileCount (see page 867)	Returns the value of the FileCount property.
	GetValue (see page 867)	Returns the value of the Values property.
	GetValueCount (see page 868)	Returns the value of the ValueCount property.

7.1.2.4.1 TActionFieldValueImpl.GetFieldName Method

Returns the value of the FieldName property.

Pascal

```
function GetFieldName: string;
```

C++

```
__fastcall AnsiString GetFieldName();
```

Description

GetFieldName is the read implementation of the FieldName property.

See Also

FieldName (see page 923)

7.1.2.4.2 TActionFieldValueImpl.GetFile Method

Returns the value of the Files property.

Pascal

```
function GetFile(I: Integer): TAbstractWebRequestFile;
```

C++

```
__fastcall TAbstractWebRequestFile GetFile(int I);
```

Description

GetFile is the read implementation of the Files property.

I is the index of the file reference to read.

See Also

Files (see page 924)

7.1.2.4.3 TActionFieldValueImpl.GetFileCount Method

Returns the value of the FileCount property.

Pascal

```
function GetFileCount: Integer;
```

C++

```
__fastcall int GetFileCount();
```

Description

GetFileCount is the read implementation of the FileCount property.

See Also

FileCount (see page 924)

7.1.2.4.4 TActionFieldValueImpl.GetValue Method

Returns the value of the Values property.

Pascal

```
function GetValue(I: Integer): Variant;
```

C++

```
__fastcall Variant GetValue(int I);
```

Description

GetValue is the read implementation of the Values property.

I is the index of the field value to read.

See Also

Values (see page 925)

7.1.2.4.5 TActionFieldValueImpl.GetValueCount Method

Returns the value of the ValueCount property.

Pascal

```
function GetValueCount: Integer;
```

C++

```
__fastcall int GetValueCount();
```

Description

GetValueCount is the read implementation of the ValueCount property.

See Also

ValueCount (see page 925)

7.1.3 TActionFieldValuesImpl Class

Class Hierarchy

Pascal

```
TActionFieldValuesImpl = class(TObject);
```

C++

```
class TActionFieldValuesImpl : public TObject;
```

File

AdaptReq

Description

This is class AdaptReq.TActionFieldValuesImpl.

7.1.3.1 TActionFieldValuesImpl Members

The following tables list the members exposed by TActionFieldValuesImpl.

Protected Methods

	Name	Description
	AddValue (see page 870)	This is AddValue, a member of class TActionFieldValuesImpl.
	GetFieldName (see page 871)	This is GetFieldName, a member of class TActionFieldValuesImpl.
	GetRecordKeyCount (see page 871)	This is GetRecordKeyCount, a member of class TActionFieldValuesImpl.
	GetRecordKeyName (see page 871)	This is GetRecordKeyName, a member of class TActionFieldValuesImpl.
	GetRecordKeyValue (see page 871)	This is GetRecordKeyValue, a member of class TActionFieldValuesImpl.
	IndexOfField (see page 872)	This is IndexOfField, a member of class TActionFieldValuesImpl.
	OrigValueOfField (see page 872)	This is OrigValueOfField, a member of class TActionFieldValuesImpl.

	ValueOfField (see page 872)	This is ValueOfField, a member of class TActionFieldValuesImpl.

Protected Properties

	Name	Description
R	FieldCount (see page 872)	This is FieldCount, a member of class TActionFieldValuesImpl.
R	FieldNames (see page 873)	This is FieldNames, a member of class TActionFieldValuesImpl.
R	OrigValues (see page 873)	This is OrigValues, a member of class TActionFieldValuesImpl.
R	Values (see page 873)	This is Values, a member of class TActionFieldValuesImpl.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 869)	This is Create, a member of class TActionFieldValuesImpl.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 870)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

7.1.3.2 TActionFieldValuesImpl.Create Constructor

Pascal

```
constructor Create(AValues: TStrings);
```

C++

```
__fastcall TActionFieldValuesImpl(TStrings AValues);
```

Description

This is Create, a member of class TActionFieldValuesImpl.

7.1.3.3 TActionFieldValuesImpl.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TActionFieldValuesImpl();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

7.1.3.4 TActionFieldValuesImpl Methods

The methods of the TActionFieldValuesImpl class are listed here.

Protected Methods

	Name	Description
	AddValue (see page 870)	This is AddValue, a member of class TActionFieldValuesImpl.
	GetFieldName (see page 871)	This is GetFieldName, a member of class TActionFieldValuesImpl.
	GetRecordKeyCount (see page 871)	This is GetRecordKeyCount, a member of class TActionFieldValuesImpl.
	GetRecordKeyName (see page 871)	This is GetRecordKeyName, a member of class TActionFieldValuesImpl.
	GetRecordKeyValue (see page 871)	This is GetRecordKeyValue, a member of class TActionFieldValuesImpl.
	IndexOfField (see page 872)	This is IndexOfField, a member of class TActionFieldValuesImpl.
	OrigValueOfField (see page 872)	This is OrigValueOfField, a member of class TActionFieldValuesImpl.
	ValueOfField (see page 872)	This is ValueOfField, a member of class TActionFieldValuesImpl.

7.1.3.4.1 TActionFieldValuesImpl.AddValue Method

Pascal

```
function AddValue(const AName: string): IActionFieldValue;
```

C++

```
__fastcall IActionFieldValue AddValue(const AnsiString AName);
```

Description

This is AddValue, a member of class TActionFieldValuesImpl.

7.1.3.4.2 TActionFieldValuesImpl.GetFieldName Method

Pascal

```
function GetFieldName(I: Integer): string;
```

C++

```
__fastcall AnsiString GetFieldName(int I);
```

Description

This is GetFieldName, a member of class TActionFieldValuesImpl.

7.1.3.4.3 TActionFieldValuesImpl.GetRecordKeyCount Method

Pascal

```
function GetRecordKeyCount: Integer;
```

C++

```
__fastcall int GetRecordKeyCount();
```

Description

This is GetRecordKeyCount, a member of class TActionFieldValuesImpl.

7.1.3.4.4 TActionFieldValuesImpl.GetRecordKeyName Method

Pascal

```
function GetRecordKeyName(I: Integer): string;
```

C++

```
__fastcall AnsiString GetRecordKeyName(int I);
```

Description

This is GetRecordKeyName, a member of class TActionFieldValuesImpl.

7.1.3.4.5 TActionFieldValuesImpl.GetRecordKeyValue Method

Pascal

```
function GetRecordKeyValue(I: Integer): string;
```

C++

```
__fastcall AnsiString GetRecordKeyValue(int I);
```

Description

This is GetRecordKeyValue, a member of class TActionFieldValuesImpl.

7.1.3.4.6 TActionFieldValuesImpl.IndexOfField Method

Pascal

```
function IndexOfField(const AName: string): Integer;
```

C++

```
__fastcall int IndexOfField(const AnsiString AName);
```

Description

This is IndexOfField, a member of class TActionFieldValuesImpl.

7.1.3.4.7 TActionFieldValuesImpl.OrigValueOfField Method

Pascal

```
function OrigValueOfField(const AName: string): IActionFieldValue;
```

C++

```
__fastcall IActionFieldValue OrigValueOfField(const AnsiString AName);
```

Description

This is OrigValueOfField, a member of class TActionFieldValuesImpl.

7.1.3.4.8 TActionFieldValuesImpl.ValueOfField Method

Pascal

```
function ValueOfField(const AName: string): IActionFieldValue;
```

C++

```
__fastcall IActionFieldValue ValueOfField(const AnsiString AName);
```

Description

This is ValueOfField, a member of class TActionFieldValuesImpl.

7.1.3.5 TActionFieldValuesImpl Properties

The properties of the TActionFieldValuesImpl class are listed here.

Protected Properties

	Name	Description
R	FieldCount (see page 872)	This is FieldCount, a member of class TActionFieldValuesImpl.
R	FieldNames (see page 873)	This is FieldNames, a member of class TActionFieldValuesImpl.
R	OrigValues (see page 873)	This is OrigValues, a member of class TActionFieldValuesImpl.
R	Values (see page 873)	This is Values, a member of class TActionFieldValuesImpl.

7.1.3.5.1 TActionFieldValuesImpl.FieldCount Property

Pascal

```
property FieldCount: Integer;
```

C++

```
__property int FieldCount;
```

Description

This is FieldCount, a member of class TActionFieldValuesImpl.

7.1.3.5.2 TActionFieldValuesImpl.FieldNames Property

Pascal

```
property FieldNames [I: Integer]: string;
```

C++

```
__property AnsiString FieldNames[int I];
```

Description

This is FieldNames, a member of class TActionFieldValuesImpl.

7.1.3.5.3 TActionFieldValuesImpl.OrigValues Property

Pascal

```
property OrigValues [I: Integer]: IActionFieldValue;
```

C++

```
__property IActionFieldValue OrigValues[int I];
```

Description

This is OrigValues, a member of class TActionFieldValuesImpl.

7.1.3.5.4 TActionFieldValuesImpl.Values Property

Pascal

```
property Values [I: Integer]: IActionFieldValue;
```

C++

```
__property IActionFieldValue Values[int I];
```

Description

This is Values, a member of class TActionFieldValuesImpl.

7.1.4 TAdapterActionFieldValuesList Class

Class Hierarchy

Pascal

```
TAdapterActionFieldValuesList = class(TObject);
```

C++

```
class TAdapterActionFieldValuesList : public TObject;
```

File

AdaptReq

Description

This is class AdaptReq.TAdapterActionFieldValuesList.

7.1.4.1 TAdapterActionFieldValuesList Members

The following tables list the members exposed by TAdapterActionFieldValuesList.

Protected Methods

	Name	Description
	LocateActionFieldValuesOfAdapter (see page 876)	This is LocateActionFieldValuesOfAdapter, a member of class TAdapterActionFieldValuesList.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 875)	This is Create, a member of class TAdapterActionFieldValuesList.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 875)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	CurrentActionFieldValuesList (see page 876)	This is CurrentActionFieldValuesList, a member of class TAdapterActionFieldValuesList.

7.1.4.2 TAdapterActionFieldValuesList.Create Constructor

Pascal

```
constructor Create(ARequest: TWebRequest);
```

C++

```
__fastcall TAdapterActionFieldValuesList(TWebRequest ARequest);
```

Description

This is Create, a member of class TAdapterActionFieldValuesList.

7.1.4.3 TAdapterActionFieldValuesList.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterActionFieldValuesList();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

System::TObject::Free (see page 22300)

7.1.4.4 TAdapterActionFieldValuesList Methods

The methods of the TAdapterActionFieldValuesList class are listed here.

Protected Methods

	Name	Description
	LocateActionFieldValuesOfAdapter (see page 876)	This is LocateActionFieldValuesOfAdapter, a member of class TAdapterActionFieldValuesList.

7.1.4.4.1 TAdapterActionFieldValuesList.LocateActionFieldValuesOfAdapter Method

Pascal

```
function LocateActionFieldValuesOfAdapter(AAdapter: TComponent): Boolean;
```

C++

```
__fastcall Boolean LocateActionFieldValuesOfAdapter(TComponent * AAdapter);
```

Description

This is LocateActionFieldValuesOfAdapter, a member of class TAdapterActionFieldValuesList.

7.1.4.5 TAdapterActionFieldValuesList Properties

The properties of the TAdapterActionFieldValuesList class are listed here.

Public Properties

	Name	Description
R	CurrentActionFieldValuesList (see page 876)	This is CurrentActionFieldValuesList, a member of class TAdapterActionFieldValuesList.

7.1.4.5.1 TAdapterActionFieldValuesList.CurrentActionFieldValuesList Property

Pascal

```
property CurrentActionFieldValuesList: TEnumActionFieldValueRecordsImpl;
```

C++

```
__property TEnumActionFieldValueRecordsImpl CurrentActionFieldValuesList;
```

Description

This is CurrentActionFieldValuesList, a member of class TAdapterActionFieldValuesList.

7.1.5 TAdapterModes Class

Class Hierarchy

Pascal

```
TAdapterModes = class(TObject);
```

C++

```
class TAdapterModes : public TObject;
```

File

AdaptReq

Description

This is class AdaptReq.TAdapterModes.

7.1.5.1 TAdapterModes Members

The following tables list the members exposed by TAdapterModes.

Protected Methods

	Name	Description
	FindAdapterMode (see page 879)	This is FindAdapterMode, a member of class TAdapterModes.
	GetAdapterCount (see page 879)	This is GetAdapterCount, a member of class TAdapterModes.
	GetAdapterMode (see page 879)	This is GetAdapterMode, a member of class TAdapterModes.
	GetAdapterName (see page 879)	This is GetAdapterName, a member of class TAdapterModes.

Protected Properties

	Name	Description
R	AdapterCount (see page 880)	This is AdapterCount, a member of class TAdapterModes.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 878)	This is Create, a member of class TAdapterModes.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 878)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

7.1.5.2 TAdapterModes.Create Constructor

Pascal

```
constructor Create(ARequest: TWebRequest);
```

C++

```
__fastcall TAdapterModes(TWebRequest ARequest);
```

Description

This is Create, a member of class TAdapterModes.

7.1.5.3 TAdapterModes.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterModes();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

7.1.5.4 TAdapterModes Methods

The methods of the TAdapterModes class are listed here.

Protected Methods

	Name	Description
	FindAdapterMode (see page 879)	This is FindAdapterMode, a member of class TAdapterModes.
	GetAdapterCount (see page 879)	This is GetAdapterCount, a member of class TAdapterModes.

	GetAdapterMode (see page 879)	This is GetAdapterMode, a member of class TAdapterModes.
	GetAdapterName (see page 879)	This is GetAdapterName, a member of class TAdapterModes.

7.1.5.4.1 TAdapterModes.FindAdapterMode Method

Pascal

```
function FindAdapterMode(AAdapter: TObject; var AMode: string): Boolean;
```

C++

```
__fastcall Boolean FindAdapterMode(TObject * AAdapter, AnsiString AMode);
```

Description

This is FindAdapterMode, a member of class TAdapterModes.

7.1.5.4.2 TAdapterModes.GetAdapterCount Method

Pascal

```
function GetAdapterCount: Integer;
```

C++

```
__fastcall int GetAdapterCount();
```

Description

This is GetAdapterCount, a member of class TAdapterModes.

7.1.5.4.3 TAdapterModes.GetAdapterMode Method

Pascal

```
function GetAdapterMode(I: Integer): string;
```

C++

```
__fastcall AnsiString GetAdapterMode(int I);
```

Description

This is GetAdapterMode, a member of class TAdapterModes.

7.1.5.4.4 TAdapterModes.GetAdapterName Method

Pascal

```
function GetAdapterName(I: Integer): string;
```

C++

```
__fastcall AnsiString GetAdapterName(int I);
```

Description

This is GetAdapterName, a member of class TAdapterModes.

7.1.5.5 TAdapterModes Properties

The properties of the TAdapterModes class are listed here.

Protected Properties

	Name	Description
R	AdapterCount (see page 880)	This is AdapterCount, a member of class TAdapterModes.

7.1.5.5.1 TAdapterModes.AdapterCount Property

Pascal

```
property AdapterCount: Integer;
```

C++

```
__property int AdapterCount;
```

Description

This is AdapterCount, a member of class TAdapterModes.

7.1.6 TAdapterRequestParamsImpl Class

Class Hierarchy

Pascal

```
TAdapterRequestParamsImpl = class(TObject);
```

C++

```
class TAdapterRequestParamsImpl : public TObject;
```

File

AdaptReq

Description

This is class AdaptReq.TAdapterRequestParamsImpl.

7.1.6.1 TAdapterRequestParamsImpl Members

The following tables list the members exposed by TAdapterRequestParamsImpl.

Protected Methods

	Name	Description
	AssignTo (see page 882)	This is AssignTo, a member of class TAdapterRequestParamsImpl.
	GetParamCount (see page 882)	This is GetParamCount, a member of class TAdapterRequestParamsImpl.
	GetParamName (see page 882)	This is GetParamName, a member of class TAdapterRequestParamsImpl.
	GetParamValue (see page 882)	This is GetParamValue, a member of class TAdapterRequestParamsImpl.
	IndexOfParam (see page 883)	This is IndexOfParam, a member of class TAdapterRequestParamsImpl.
	ValueOfParam (see page 883)	This is ValueOfParam, a member of class TAdapterRequestParamsImpl.

Protected Properties

	Name	Description
R	ParamCount (see page 883)	This is ParamCount, a member of class TAdapterRequestParamsImpl.
R	ParamNames (see page 883)	This is ParamNames, a member of class TAdapterRequestParamsImpl.

R	ParamValues (see page 884)	This is ParamValues, a member of class TAdapterRequestParamsImpl.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 881)	This is Create, a member of class TAdapterRequestParamsImpl.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

7.1.6.2 TAdapterRequestParamsImpl.Create Constructor

Pascal

```
constructor Create(ADispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall TAdapterRequestParamsImpl(IAdapterDispatchParams ADispatchParams);
```

Description

This is Create, a member of class TAdapterRequestParamsImpl.

7.1.6.3 TAdapterRequestParamsImpl Methods

The methods of the TAdapterRequestParamsImpl class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 882)	This is AssignTo, a member of class TAdapterRequestParamsImpl.
	GetParamCount (see page 882)	This is GetParamCount, a member of class TAdapterRequestParamsImpl.
	GetParamName (see page 882)	This is GetParamName, a member of class TAdapterRequestParamsImpl.
	GetParamValue (see page 882)	This is GetParamValue, a member of class TAdapterRequestParamsImpl.
	IndexOfParam (see page 883)	This is IndexOfParam, a member of class TAdapterRequestParamsImpl.
	ValueOfParam (see page 883)	This is ValueOfParam, a member of class TAdapterRequestParamsImpl.

7.1.6.3.1 TAdapterRequestParamsImpl.AssignTo Method

Pascal

```
procedure AssignTo(AStrings: TStrings);
```

C++

```
__fastcall AssignTo(TStrings AStrings);
```

Description

This is AssignTo, a member of class TAdapterRequestParamsImpl.

7.1.6.3.2 TAdapterRequestParamsImpl.GetParamCount Method

Pascal

```
function GetParamCount: Integer;
```

C++

```
__fastcall int GetParamCount();
```

Description

This is GetParamCount, a member of class TAdapterRequestParamsImpl.

7.1.6.3.3 TAdapterRequestParamsImpl.GetParamName Method

Pascal

```
function GetParamName(I: Integer): string;
```

C++

```
__fastcall AnsiString GetParamName(int I);
```

Description

This is GetParamName, a member of class TAdapterRequestParamsImpl.

7.1.6.3.4 TAdapterRequestParamsImpl.GetParamValue Method

Pascal

```
function GetParamValue(I: Integer): string;
```

C++

```
__fastcall AnsiString GetParamValue(int I);
```

Description

This is GetParamValue, a member of class TAdapterRequestParamsImpl.

7.1.6.3.5 TAdapterRequestParamsImpl.IndexOfParam Method

Pascal

```
function IndexOfParam(const AName: string): Integer;
```

C++

```
__fastcall int IndexOfParam(const AnsiString AName);
```

Description

This is IndexOfParam, a member of class TAdapterRequestParamsImpl.

7.1.6.3.6 TAdapterRequestParamsImpl.ValueOfParam Method

Pascal

```
function ValueOfParam(const AName: string): string;
```

C++

```
__fastcall AnsiString ValueOfParam(const AnsiString AName);
```

Description

This is ValueOfParam, a member of class TAdapterRequestParamsImpl.

7.1.6.4 TAdapterRequestParamsImpl Properties

The properties of the TAdapterRequestParamsImpl class are listed here.

Protected Properties

	Name	Description
R	ParamCount (see page 883)	This is ParamCount, a member of class TAdapterRequestParamsImpl.
R	ParamNames (see page 883)	This is ParamNames, a member of class TAdapterRequestParamsImpl.
R	ParamValues (see page 884)	This is ParamValues, a member of class TAdapterRequestParamsImpl.

7.1.6.4.1 TAdapterRequestParamsImpl.ParamCount Property

Pascal

```
property ParamCount: Integer;
```

C++

```
__property int ParamCount;
```

Description

This is ParamCount, a member of class TAdapterRequestParamsImpl.

7.1.6.4.2 TAdapterRequestParamsImpl.ParamNames Property

Pascal

```
property ParamNames [I: Integer]: string;
```

C++

```
__property AnsiString ParamNames[int I];
```

Description

This is ParamNames, a member of class TAdapterRequestParamsImpl.

7.1.6.4.3 TAdapterRequestParamsImpl.ParamValues Property

Pascal

```
property ParamValues [I: Integer]: string;
```

C++

```
__property AnsiString ParamValues[int I];
```

Description

This is ParamValues, a member of class TAdapterRequestParamsImpl.

7.1.7 TBasicActionRequestImpl Class

Class Hierarchy

Pascal

```
TBasicActionRequestImpl = class(TAbstractAdapterRequest, IActionRequest,
IAdapterRequestParams, IGetAdapterRequestDefaultResponse);
```

C++

```
class TBasicActionRequestImpl : public TAbstractAdapterRequest, public IActionRequest, public
IAdapterRequestParams, public IGetAdapterRequestDefaultResponse;
```

File

AdaptReq

Description

This is class AdaptReq.TBasicActionRequestImpl.

7.1.7.1 TBasicActionRequestImpl Members

The following tables list the members exposed by TBasicActionRequestImpl.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetActionName (see page 887)	Returns the value of the ActionName property.
	GetFailurePage (see page 887)	This is GetFailurePage, a member of class TBasicActionRequestImpl.
	GetHandled (see page 888)	Returns the value of the Handled property.
	GetSuccessPage (see page 888)	This is GetSuccessPage, a member of class TBasicActionRequestImpl.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetHandled (see page 888)	Sets the value of the Handled property.

Protected Properties

	Name	Description
R	Request (see page 24642)	This is Request, a member of class TAbstractAdapterRequest.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AssignTo (see page 954)	Fills a string list to contain the name/value pairs from the HTTP request message.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 886)	This is Create, a member of class TBasicActionRequestImpl.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 886)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetParamCount (see page 954)	Returns the value of the ParamCount (see page 956) property.
	GetParamName (see page 954)	Returns the value of the ParamNames (see page 956) property.
	GetParamValue (see page 955)	Returns the value of the ParamValues (see page 957) property.
	IndexOfParam (see page 955)	Returns the index of a specified name/value pair given its name.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ValueOfParam (see page 955)	Returns the value associated with a specified name.

Public Properties

	Name	Description
R	ActionName (see page 889)	Identifies the action to server-side scripts.
R	ActionParams (see page 889)	This is ActionParams, a member of class TBasicActionRequestImpl.
R	DispatchParams (see page 889)	This is DispatchParams, a member of class TBasicActionRequestImpl.
R	FailurePage (see page 889)	This is FailurePage, a member of class TBasicActionRequestImpl.
	Handled (see page 938)	Indicates whether the request has been handled.
R	ParamCount (see page 956)	Indicates the number of name/value pairs that can be accessed using this interface.
R	ParamNames (see page 956)	Lists the names of the name/value pairs that can be accessed using this interface.
R	ParamValues (see page 957)	Lists the values of the name/value pairs that can be accessed using this interface.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	SuccessPage (see page 890)	This is SuccessPage, a member of class TBasicActionRequestImpl.

7.1.7.2 TBasicActionRequestImpl.Create Constructor

Pascal

```
constructor Create(ADispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall TBasicActionRequestImpl(IAdapterDispatchParams ADispatchParams);
```

Description

This is Create, a member of class TBasicActionRequestImpl.

7.1.7.3 TBasicActionRequestImpl.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBasicActionRequestImpl();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a

virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

7.1.7.4 TBasicActionRequestImpl Methods

The methods of the TBasicActionRequestImpl class are listed here.

Protected Methods

	Name	Description
	GetActionName (see page 887)	Returns the value of the ActionName property.
	GetFailurePage (see page 887)	This is GetFailurePage, a member of class TBasicActionRequestImpl.
	GetHandled (see page 888)	Returns the value of the Handled property.
	GetSuccessPage (see page 888)	This is GetSuccessPage, a member of class TBasicActionRequestImpl.
	SetHandled (see page 888)	Sets the value of the Handled property.

7.1.7.4.1 TBasicActionRequestImpl.GetActionName Method

Returns the value of the ActionName property.

Pascal

```
function GetActionName: string;
```

C++

```
__fastcall AnsiString GetActionName();
```

Description

GetActionName is the read implementation of the ActionName property.

See Also

ActionName (see page 938)

7.1.7.4.2 TBasicActionRequestImpl.GetFailurePage Method

Pascal

```
function GetFailurePage: string;
```

C++

```
__fastcall AnsiString GetFailurePage();
```

Description

This is GetFailurePage, a member of class TBasicActionRequestImpl.

7.1.7.4.3 TBasicActionRequestImpl.GetHandled Method

Returns the value of the Handled property.

Pascal

```
function GetHandled: Boolean;
```

C++

```
__fastcall Boolean GetHandled();
```

Description

GetHandled is the read implementation of the Handled property.

See Also

Handled (see page 938)

7.1.7.4.4 TBasicActionRequestImpl.GetSuccessPage Method

Pascal

```
function GetSuccessPage: string;
```

C++

```
__fastcall AnsiString GetSuccessPage();
```

Description

This is GetSuccessPage, a member of class TBasicActionRequestImpl.

7.1.7.4.5 TBasicActionRequestImpl.SetHandled Method

Sets the value of the Handled property.

Pascal

```
procedure SetHandled(AValue: Boolean);
```

C++

```
__fastcall SetHandled(Boolean AValue);
```

Description

SetHandled is the write implementation of the Handled property.

See Also

Handled (see page 938)

7.1.7.5 TBasicActionRequestImpl Properties

The properties of the TBasicActionRequestImpl class are listed here.

Public Properties

	Name	Description
R	ActionName (see page 889)	Identifies the action to server-side scripts.
R	ActionParams (see page 889)	This is ActionParams, a member of class TBasicActionRequestImpl.
R	DispatchParams (see page 889)	This is DispatchParams, a member of class TBasicActionRequestImpl.

R	FailurePage (see page 889)	This is FailurePage, a member of class TBasicActionRequestImpl.
R	SuccessPage (see page 890)	This is SuccessPage, a member of class TBasicActionRequestImpl.

7.1.7.5.1 TBasicActionRequestImpl.ActionName Property

Identifies the action to server-side scripts.

Pascal

```
property ActionName: string;
```

C++

```
__property AnsiString ActionName;
```

Description

The ActionName property defines the name used to access the adapter action from server-side scripts.

7.1.7.5.2 TBasicActionRequestImpl.ActionParams Property

Pascal

```
property ActionParams: TAdapterRequestParamsImpl;
```

C++

```
__property TAdapterRequestParamsImpl ActionParams;
```

Description

This is ActionParams, a member of class TBasicActionRequestImpl.

7.1.7.5.3 TBasicActionRequestImpl.DispatchParams Property

Pascal

```
property DispatchParams: IAdapterDispatchParams;
```

C++

```
__property IAdapterDispatchParams DispatchParams;
```

Description

This is DispatchParams, a member of class TBasicActionRequestImpl.

7.1.7.5.4 TBasicActionRequestImpl.FailurePage Property

Pascal

```
property FailurePage: string;
```

C++

```
__property AnsiString FailurePage;
```

Description

This is FailurePage, a member of class TBasicActionRequestImpl.

7.1.7.5.5 TBasicActionRequestImpl.SuccessPage Property

Pascal

```
property SuccessPage: string;
```

C++

```
__property AnsiString SuccessPage;
```

Description

This is SuccessPage, a member of class TBasicActionRequestImpl.

7.1.8 TBasicActionResponseImpl Class

Class Hierarchy

Pascal

```
TBasicActionResponseImpl = class(TAbstractAdapterResponse, IActionResponse,
IActionRespondWith, IActionHandleResponse);
```

C++

```
class TBasicActionResponseImpl : public TAbstractAdapterResponse, public IActionResponse,
public IActionRespondWith, public IActionHandleResponse;
```

File

AdaptReq

Description

This is class AdaptReq.TBasicActionResponseImpl.

7.1.8.1 TBasicActionResponseImpl Members

The following tables list the members exposed by TBasicActionResponseImpl.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetExecuteStatus (see page 892)	Returns the value of the ExecuteStatus property.

	GetHandled (see page 893)	Returns the value of the Handled property.
	GetRedirectOptions (see page 893)	This is GetRedirectOptions, a member of class TBasicActionResponseImpl.
	GetRespondWith (see page 893)	This is GetRespondWith, a member of class TBasicActionResponseImpl.
	HandleResponse (see page 894)	This is HandleResponse, a member of class TBasicActionResponseImpl.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RespondWithComponentPage (see page 894)	This is RespondWithComponentPage, a member of class TBasicActionResponseImpl.
	RespondWithFailurePage (see page 894)	This is RespondWithFailurePage, a member of class TBasicActionResponseImpl.
	RespondWithPage (see page 894)	This is RespondWithPage, a member of class TBasicActionResponseImpl.
	RespondWithSuccessPage (see page 894)	This is RespondWithSuccessPage, a member of class TBasicActionResponseImpl.
	RespondWithURL (see page 895)	This is RespondWithURL, a member of class TBasicActionResponseImpl.
	SetExecuteStatus (see page 895)	Sets the value of the ExecuteStatus property.
	SetHandled (see page 895)	Sets the value of the Handled property.
	SetRedirectOptions (see page 895)	This is SetRedirectOptions, a member of class TBasicActionResponseImpl.

Protected Properties

	Name	Description
R	Response (see page 24644)	This is Response, a member of class TAbstractAdapterResponse.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 892)	This is Create, a member of class TBasicActionResponseImpl.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	ExecuteStatus (see page 896)	Indicates the status of executing the action.
R	FailurePage (see page 896)	This is FailurePage, a member of class TBasicActionResponseImpl.
	Handled (see page 896)	Indicates whether the incoming request has been handled.
	RedirectOptions (see page 897)	This is RedirectOptions, a member of class TBasicActionResponseImpl.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	RespondWith (see page 897)	This is RespondWith, a member of class TBasicActionResponseImpl.
R	SuccessPage (see page 897)	This is SuccessPage, a member of class TBasicActionResponseImpl.

7.1.8.2 TBasicActionResponseImpl.Create Constructor

Pascal

```
constructor Create(AActionRequest: TBasicActionRequestImpl);
```

C++

```
__fastcall TBasicActionResponseImpl(TBasicActionRequestImpl AActionRequest);
```

Description

This is Create, a member of class TBasicActionResponseImpl.

7.1.8.3 TBasicActionResponseImpl Methods

The methods of the TBasicActionResponseImpl class are listed here.

Protected Methods

	Name	Description
	GetExecuteStatus (see page 892)	Returns the value of the ExecuteStatus property.
	GetHandled (see page 893)	Returns the value of the Handled property.
	GetRedirectOptions (see page 893)	This is GetRedirectOptions, a member of class TBasicActionResponseImpl.
	GetRespondWith (see page 893)	This is GetRespondWith, a member of class TBasicActionResponseImpl.
	HandleResponse (see page 894)	This is HandleResponse, a member of class TBasicActionResponseImpl.
	RespondWithComponentPage (see page 894)	This is RespondWithComponentPage, a member of class TBasicActionResponseImpl.
	RespondWithFailurePage (see page 894)	This is RespondWithFailurePage, a member of class TBasicActionResponseImpl.
	RespondWithPage (see page 894)	This is RespondWithPage, a member of class TBasicActionResponseImpl.
	RespondWithSuccessPage (see page 894)	This is RespondWithSuccessPage, a member of class TBasicActionResponseImpl.
	RespondWithURL (see page 895)	This is RespondWithURL, a member of class TBasicActionResponseImpl.
	SetExecuteStatus (see page 895)	Sets the value of the ExecuteStatus property.
	SetHandled (see page 895)	Sets the value of the Handled property.
	SetRedirectOptions (see page 895)	This is SetRedirectOptions, a member of class TBasicActionResponseImpl.

7.1.8.3.1 TBasicActionResponseImpl.GetExecuteStatus Method

Returns the value of the ExecuteStatus property.

Pascal

```
function GetExecuteStatus: TExecuteStatus;
```

C++

```
__fastcall TExecuteStatus GetExecuteStatus();
```

Description

GetExecuteStatus is the read implementation of the ExecuteStatus property.

See Also

ExecuteStatus (see page 944)

7.1.8.3.2 TBasicActionResponseImpl.GetHandled Method

Returns the value of the Handled property.

Pascal

```
function GetHandled: Boolean;
```

C++

```
__fastcall Boolean GetHandled();
```

Description

GetHandled is the read implementation of the Handled property.

See Also

Handled (see page 944)

7.1.8.3.3 TBasicActionResponseImpl.GetRedirectOptions Method

Pascal

```
function GetRedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__fastcall TAdapterActionRedirectOptions GetRedirectOptions();
```

Description

This is GetRedirectOptions, a member of class TBasicActionResponseImpl.

7.1.8.3.4 TBasicActionResponseImpl.GetRespondWith Method

Pascal

```
function GetRespondWith: TRespondWith;
```

C++

```
__fastcall TRespondWith GetRespondWith();
```

Description

This is GetRespondWith, a member of class TBasicActionResponseImpl.

7.1.8.3.5 TBasicActionResponseImpl.HandleResponse Method

Pascal

```
procedure HandleResponse;
```

C++

```
__fastcall HandleResponse();
```

Description

This is HandleResponse, a member of class TBasicActionResponseImpl.

7.1.8.3.6 TBasicActionResponseImpl.RespondWithComponentPage Method

Pascal

```
procedure RespondWithComponentPage(const AComponent: TComponent);
```

C++

```
__fastcall RespondWithComponentPage(const TComponent * AComponent);
```

Description

This is RespondWithComponentPage, a member of class TBasicActionResponseImpl.

7.1.8.3.7 TBasicActionResponseImpl.RespondWithFailurePage Method

Pascal

```
procedure RespondWithFailurePage;
```

C++

```
__fastcall RespondWithFailurePage();
```

Description

This is RespondWithFailurePage, a member of class TBasicActionResponseImpl.

7.1.8.3.8 TBasicActionResponseImpl.RespondWithPage Method

Pascal

```
procedure RespondWithPage(const APageName: string);
```

C++

```
__fastcall RespondWithPage(const AnsiString APageName);
```

Description

This is RespondWithPage, a member of class TBasicActionResponseImpl.

7.1.8.3.9 TBasicActionResponseImpl.RespondWithSuccessPage Method

Pascal

```
procedure RespondWithSuccessPage;
```

C++

```
__fastcall RespondWithSuccessPage();
```

Description

This is RespondWithSuccessPage, a member of class TBasicActionResponseImpl.

7.1.8.3.10 TBasicActionResponseImpl.RespondWithURL Method

Pascal

```
procedure RespondWithURL(const AURL: string);
```

C++

```
__fastcall RespondWithURL(const AnsiString AURL);
```

Description

This is RespondWithURL, a member of class TBasicActionResponseImpl.

7.1.8.3.11 TBasicActionResponseImpl.SetExecuteStatus Method

Sets the value of the ExecuteStatus property.

Pascal

```
procedure SetExecuteStatus(Value: TExecuteStatus);
```

C++

```
__fastcall SetExecuteStatus(TExecuteStatus Value);
```

Description

SetExecuteStatus is the write implementation of the ExecuteStatus property.

See Also

ExecuteStatus (see page 944)

7.1.8.3.12 TBasicActionResponseImpl.SetHandled Method

Sets the value of the Handled property.

Pascal

```
procedure SetHandled(Value: Boolean);
```

C++

```
__fastcall SetHandled(Boolean Value);
```

Description

SetHandled is the write implementation of the Handled property.

See Also

Handled (see page 944)

7.1.8.3.13 TBasicActionResponseImpl.SetRedirectOptions Method

Pascal

```
procedure SetRedirectOptions(AOptions: TAdapterActionRedirectOptions);
```

C++

```
__fastcall SetRedirectOptions(TAdapterActionRedirectOptions AOptions);
```

Description

This is SetRedirectOptions, a member of class TBasicActionResponseImpl.

7.1.8.4 TBasicActionResponseImpl Properties

The properties of the TBasicActionResponseImpl class are listed here.

Public Properties

	Name	Description
	ExecuteStatus (see page 896)	Indicates the status of executing the action.
R	FailurePage (see page 896)	This is FailurePage, a member of class TBasicActionResponseImpl.
	Handled (see page 896)	Indicates whether the incoming request has been handled.
	RedirectOptions (see page 897)	This is RedirectOptions, a member of class TBasicActionResponseImpl.
R	RespondWith (see page 897)	This is RespondWith, a member of class TBasicActionResponseImpl.
R	SuccessPage (see page 897)	This is SuccessPage, a member of class TBasicActionResponseImpl.

7.1.8.4.1 TBasicActionResponseImpl.ExecuteStatus Property

Indicates the status of executing the action.

Pascal

```
property ExecuteStatus: TExecuteStatus;
```

C++

```
__property TExecuteStatus ExecuteStatus;
```

Description

The ExecuteStatus property indicates whether the request was completely handled, and if so, whether the attempt to handle the request was successful.

See Also

Handled (see page 944)

7.1.8.4.2 TBasicActionResponseImpl.FailurePage Property

Pascal

```
property FailurePage: string;
```

C++

```
__property AnsiString FailurePage;
```

Description

This is FailurePage, a member of class TBasicActionResponseImpl.

7.1.8.4.3 TBasicActionResponseImpl.Handled Property

Indicates whether the incoming request has been handled.

Pascal

```
property Handled: Boolean;
```

C++

```
__property Boolean Handled;
```

Description

Note: WebSnap sets Handled to true when the response has been handled.

7.1.8.4.4 TBasicActionResponseImpl.RedirectOptions Property

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

This is RedirectOptions, a member of class TBasicActionResponseImpl.

7.1.8.4.5 TBasicActionResponseImpl.RespondWith Property

Pascal

```
property RespondWith: TRespondWith;
```

C++

```
__property TRespondWith RespondWith;
```

Description

This is RespondWith, a member of class TBasicActionResponseImpl.

7.1.8.4.6 TBasicActionResponseImpl.SuccessPage Property

Pascal

```
property SuccessPage: string;
```

C++

```
__property AnsiString SuccessPage;
```

Description

This is SuccessPage, a member of class TBasicActionResponseImpl.

7.1.9 TBasicImageRequestImpl Class

Class Hierarchy

Pascal

```
TBasicImageRequestImpl = class(TAbstractAdapterRequest, IImageRequest, IAdapterRequestParams);
```

C++

```

AdaptReq

Description

This is class AdaptReq.TBasicImageRequestImpl.

7.1.9.1 TBasicImageRequestImpl Members

The following tables list the members exposed by TBasicImageRequestImpl.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetImageName (see page 901)	Returns the value of the ImageName property.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Protected Properties

	Name	Description
R	ActionRequestParams (see page 901)	This is ActionRequestParams, a member of class TBasicImageRequestImpl.
R	ImageName (see page 902)	Indicates the name of the requested image.
R	Request (see page 24642)	This is Request, a member of class TAbstractAdapterRequest.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.

V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AssignTo (see page 954)	Fills a string list to contain the name/value pairs from the HTTP request message.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 900)	This is Create, a member of class TBasicImageRequestImpl.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 900)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetParamCount (see page 954)	Returns the value of the ParamCount (see page 956) property.
	GetParamName (see page 954)	Returns the value of the ParamNames (see page 956) property.
	GetParamValue (see page 955)	Returns the value of the ParamValues (see page 957) property.
	IndexOfParam (see page 955)	Returns the index of a specified name/value pair given its name.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ValueOfParam (see page 955)	Returns the value associated with a specified name.

Public Properties

	Name	Description
R	DispatchParams (see page 901)	This is DispatchParams, a member of class TBasicImageRequestImpl.
R	ParamCount (see page 956)	Indicates the number of name/value pairs that can be accessed using this interface.
R	ParamNames (see page 956)	Lists the names of the name/value pairs that can be accessed using this interface.
R	ParamValues (see page 957)	Lists the values of the name/value pairs that can be accessed using this interface.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

7.1.9.2 TBasicImageRequestImpl.Create Constructor

Pascal

```
constructor Create(ADispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall TBasicImageRequestImpl(IAdapterDispatchParams ADispatchParams);
```

Description

This is Create, a member of class TBasicImageRequestImpl.

7.1.9.3 TBasicImageRequestImpl.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBasicImageRequestImpl();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

7.1.9.4 TBasicImageRequestImpl Methods

The methods of the TBasicImageRequestImpl class are listed here.

Protected Methods

	Name	Description
	GetImageName (see page 901)	Returns the value of the ImageName property.

7.1.9.4.1 TBasicImageRequestImpl.GetImageName Method

Returns the value of the ImageName property.

Pascal

```
function GetImageName: string;
```

C++

```
__fastcall AnsiString GetImageName();
```

Description

GetImageName is the read implementation of the ImageName property.

See Also

ImageName (see page 967)

7.1.9.5 TBasicImageRequestImpl Properties

The properties of the TBasicImageRequestImpl class are listed here.

Protected Properties

	Name	Description
R	ActionRequestParams (see page 901)	This is ActionRequestParams, a member of class TBasicImageRequestImpl.
R	ImageName (see page 902)	Indicates the name of the requested image.

Public Properties

	Name	Description
R	DispatchParams (see page 901)	This is DispatchParams, a member of class TBasicImageRequestImpl.

7.1.9.5.1 TBasicImageRequestImpl.ActionRequestParams Property

Pascal

```
property ActionRequestParams: TAdapterRequestParamsImpl;
```

C++

```
__property TAdapterRequestParamsImpl ActionRequestParams;
```

Description

This is ActionRequestParams, a member of class TBasicImageRequestImpl.

7.1.9.5.2 TBasicImageRequestImpl.DispatchParams Property

Pascal

```
property DispatchParams: IAdapterDispatchParams;
```

C++

```
__property IAdapterDispatchParams DispatchParams;
```

Description

This is DispatchParams, a member of class TBasicImageRequestImpl.

7.1.9.5.3 TBasicImageRequestImpl.ImageName Property

Indicates the name of the requested image.

Pascal

```
property ImageName: string;
```

C++

```
__property AnsiString ImageName;
```

Description

Read ImageName to obtain the name of the image that the HTTP request message requests.

7.1.10 TBasicImageResponseImpl Class

Class Hierarchy

Pascal

```
TBasicImageResponseImpl = class(TAbstractAdapterResponse, IImageResponse);
```

C++

```
class TBasicImageResponseImpl : public TAbstractAdapterResponse, public IImageResponse;
```

File

AdaptReq

Description

This is class AdaptReq.TBasicImageResponseImpl.

7.1.10.1 TBasicImageResponseImpl Members

The following tables list the members exposed by TBasicImageResponseImpl.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Protected Properties

	Name	Description
R	Response (see page 24644)	This is Response, a member of class TAbstractAdapterResponse.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 903)	This is Create, a member of class TBasicImageResponseImpl.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

7.1.10.2 TBasicImageResponseImpl.Create Constructor

Pascal

```
constructor Create(AImageRequest: TBasicImageRequestImpl);
```

C++

```
__fastcall TBasicImageResponseImpl(TBasicImageRequestImpl AImageRequest);
```

Description

This is Create, a member of class TBasicImageResponseImpl.

7.1.11 TEnumActionFieldValueRecordsImpl Class

Class Hierarchy

Pascal

```
TEnumActionFieldValueRecordsImpl = class(TObject);
```

C++

```
class TEnumActionFieldValueRecordsImpl : public TObject;
```

File

AdaptReq

Description

This is class AdaptReq.TEnumActionFieldValueRecordsImpl.

7.1.11.1 TEnumActionFieldValueRecordsImpl Members

The following tables list the members exposed by TEnumActionFieldValueRecordsImpl.

Protected Methods

	Name	Description
	EndIterator (see page 906)	This is EndIterator, a member of class TEnumActionFieldValueRecordsImpl.
	FindPopulatedRecord (see page 907)	This is FindPopulatedRecord, a member of class TEnumActionFieldValueRecordsImpl.
	GetEOF (see page 907)	This is GetEOF, a member of class TEnumActionFieldValueRecordsImpl.
	GetFirstRecord (see page 907)	This is GetFirstRecord, a member of class TEnumActionFieldValueRecordsImpl.
	GetInIterator (see page 907)	This is GetInIterator, a member of class TEnumActionFieldValueRecordsImpl.
	GetNextRecord (see page 907)	This is GetNextRecord, a member of class TEnumActionFieldValueRecordsImpl.
	GetRecord (see page 908)	This is GetRecord, a member of class TEnumActionFieldValueRecordsImpl.
	GetRecordCount (see page 908)	This is GetRecordCount, a member of class TEnumActionFieldValueRecordsImpl.

Protected Properties

	Name	Description
R	Eof (see page 909)	This is Eof, a member of class TEnumActionFieldValueRecordsImpl.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 905)	This is Create, a member of class TEnumActionFieldValueRecordsImpl.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 905)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	AdapterName (see page 908)	This is AdapterName, a member of class TEnumActionFieldValueRecordsImpl.
R	CurrentFieldValues (see page 909)	This is CurrentFieldValues, a member of class TEnumActionFieldValueRecordsImpl.

7.1.11.2 TEnumActionFieldValueRecordsImpl.Create Constructor

Pascal

```
constructor Create(const AAdapterName: string; AFieldValues: TStrings);
```

C++

```
__fastcall TEnumActionFieldValueRecordsImpl(const AnsiString AAdapterName, TStrings
AFieldValues);
```

Description

This is Create, a member of class TEnumActionFieldValueRecordsImpl.

7.1.11.3 TEnumActionFieldValueRecordsImpl.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TEnumActionFieldValueRecordsImpl();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

7.1.11.4 TEnumActionFieldValueRecordsImpl Methods

The methods of the TEnumActionFieldValueRecordsImpl class are listed here.

Protected Methods

	Name	Description
	EndIterator (see page 906)	This is EndIterator, a member of class TEnumActionFieldValueRecordsImpl.
	FindPopulatedRecord (see page 907)	This is FindPopulatedRecord, a member of class TEnumActionFieldValueRecordsImpl.
	GetEOF (see page 907)	This is GetEOF, a member of class TEnumActionFieldValueRecordsImpl.
	GetFirstRecord (see page 907)	This is GetFirstRecord, a member of class TEnumActionFieldValueRecordsImpl.
	GetInIterator (see page 907)	This is GetInIterator, a member of class TEnumActionFieldValueRecordsImpl.
	GetNextRecord (see page 907)	This is GetNextRecord, a member of class TEnumActionFieldValueRecordsImpl.
	GetRecord (see page 908)	This is GetRecord, a member of class TEnumActionFieldValueRecordsImpl.
	GetRecordCount (see page 908)	This is GetRecordCount, a member of class TEnumActionFieldValueRecordsImpl.

7.1.11.4.1 TEnumActionFieldValueRecordsImpl.EndIterator Method

Pascal

```
procedure EndIterator;
```

C++

```
__fastcall EndIterator();
```

Description

This is EndIterator, a member of class TEnumActionFieldValueRecordsImpl.

7.1.11.4.2 TEnumActionFieldValueRecordsImpl.FindPopulatedRecord Method

Pascal

```
function FindPopulatedRecord: Boolean;
```

C++

```
__fastcall Boolean FindPopulatedRecord();
```

Description

This is FindPopulatedRecord, a member of class TEnumActionFieldValueRecordsImpl.

7.1.11.4.3 TEnumActionFieldValueRecordsImpl.GetEOF Method

Pascal

```
function GetEOF: Boolean;
```

C++

```
__fastcall Boolean GetEOF();
```

Description

This is GetEOF, a member of class TEnumActionFieldValueRecordsImpl.

7.1.11.4.4 TEnumActionFieldValueRecordsImpl.GetFirstRecord Method

Pascal

```
function GetFirstRecord: Boolean;
```

C++

```
__fastcall Boolean GetFirstRecord();
```

Description

This is GetFirstRecord, a member of class TEnumActionFieldValueRecordsImpl.

7.1.11.4.5 TEnumActionFieldValueRecordsImpl.GetInIterator Method

Pascal

```
function GetInIterator: Boolean;
```

C++

```
__fastcall Boolean GetInIterator();
```

Description

This is GetInIterator, a member of class TEnumActionFieldValueRecordsImpl.

7.1.11.4.6 TEnumActionFieldValueRecordsImpl.GetNextRecord Method

Pascal

```
function GetNextRecord: Boolean;
```

C++

```
__fastcall Boolean GetNextRecord();
```

Description

This is GetNextRecord, a member of class TEnumActionFieldValueRecordsImpl.

7.1.11.4.7 TEnumActionFieldValueRecordsImpl.GetRecord Method

Pascal

```
function GetRecord(AIndex: Integer): Boolean;
```

C++

```
__fastcall Boolean GetRecord(int AIndex);
```

Description

This is GetRecord, a member of class TEnumActionFieldValueRecordsImpl.

7.1.11.4.8 TEnumActionFieldValueRecordsImpl.GetRecordCount Method

Pascal

```
function GetRecordCount: Integer;
```

C++

```
__fastcall int GetRecordCount();
```

Description

This is GetRecordCount, a member of class TEnumActionFieldValueRecordsImpl.

7.1.11.5 TEnumActionFieldValueRecordsImpl Properties

The properties of the TEnumActionFieldValueRecordsImpl class are listed here.

Protected Properties

	Name	Description
R	Eof (see page 909)	This is Eof, a member of class TEnumActionFieldValueRecordsImpl.

Public Properties

	Name	Description
R	AdapterName (see page 908)	This is AdapterName, a member of class TEnumActionFieldValueRecordsImpl.
R	CurrentFieldValues (see page 909)	This is CurrentFieldValues, a member of class TEnumActionFieldValueRecordsImpl.

7.1.11.5.1 TEnumActionFieldValueRecordsImpl.AdapterName Property

Pascal

```
property AdapterName: string;
```

C++

```
__property AnsiString AdapterName;
```

Description

This is AdapterName, a member of class TEnumActionFieldValueRecordsImpl.

7.1.11.5.2 TEnumActionFieldValueRecordsImpl.CurrentFieldValues Property

Pascal

```
property CurrentFieldValues: TActionFieldValuesImpl;
```

C++

```
__property TActionFieldValuesImpl CurrentFieldValues;
```

Description

This is CurrentFieldValues, a member of class TEnumActionFieldValueRecordsImpl.

7.1.11.5.3 TEnumActionFieldValueRecordsImpl.Eof Property

Pascal

```
property Eof: Boolean;
```

C++

```
__property Boolean Eof;
```

Description

This is Eof, a member of class TEnumActionFieldValueRecordsImpl.

7.1.12 TMultiRecordActionRequestImpl Class

Class Hierarchy

Pascal

```
TMultiRecordActionRequestImpl = class(TBasicActionRequestImpl, IAdapterModes,
IActionFieldValues, IEnumActionFieldValueRecords, IAdapterRecordKeys,
IActionFieldValuesOfAdapter);
```

C++

```
class TMultiRecordActionRequestImpl : public TBasicActionRequestImpl, public IAdapterModes,
public IActionFieldValues, public IEnumActionFieldValueRecords, public IAdapterRecordKeys,
public IActionFieldValuesOfAdapter;
```

File

AdaptReq

Description

This is class AdaptReq.TMultiRecordActionRequestImpl.

7.1.12.1 TMultiRecordActionRequestImpl Members

The following tables list the members exposed by TMultiRecordActionRequestImpl.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetActionName (see page 887)	Returns the value of the ActionName property.
	GetFailurePage (see page 887)	This is GetFailurePage, a member of class TBasicActionRequestImpl.
	GetHandled (see page 888)	Returns the value of the Handled property.
	GetSuccessPage (see page 888)	This is GetSuccessPage, a member of class TBasicActionRequestImpl.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetHandled (see page 888)	Sets the value of the Handled property.

Protected Properties

	Name	Description
R	ActionFieldValues (see page 913)	This is ActionFieldValues, a member of class TMultiRecordActionRequestImpl.
R	ActionFieldValues2 (see page 914)	This is ActionFieldValues2, a member of class TMultiRecordActionRequestImpl.
R	ActionFieldValuesList (see page 914)	This is ActionFieldValuesList, a member of class TMultiRecordActionRequestImpl.
R	AdapterActionFieldValuesList (see page 914)	This is AdapterActionFieldValuesList, a member of class TMultiRecordActionRequestImpl.
R	AdapterModes (see page 914)	Lists the modes for the adapters that the AdapterNames property lists.
R	Request (see page 24642)	This is Request, a member of class TAbstractAdapterRequest.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddValue (see page 927)	Adds a new field to the list.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AssignTo (see page 954)	Fills a string list to contain the name/value pairs from the HTTP request message.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	Create (see page 912)	This is Create, a member of class TMultiRecordActionRequestImpl.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 912)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 959)	Cleans up after iterating over the records in the request.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAdapterMode (see page 946)	Retrieves the mode for a specified adapter.
	FindPopulatedRecord (see page 959)	Detects whether any of the records of the request contain data.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetActionName (see page 937)	Returns the value of the ActionName (see page 938) property.
	GetAdapterCount (see page 946)	Returns the value of the AdapterCount (see page 947) property.
	GetAdapterMode (see page 947)	Returns the value of the AdapterModes (see page 948) property.
	GetAdapterName (see page 947)	Returns the value of the AdapterNames (see page 948) property.
	GetEOF (see page 960)	Returns the value of the EOF property.
	GetFailurePage (see page 19693)	This is GetFailurePage, a member of class IGetAdapterRequestDefaultResponse.
	GetFieldCount (see page 927)	Returns the value of the FieldCount (see page 930) property.
	GetFieldName (see page 928)	Returns the value of the FieldNames (see page 931) property.
	GetFirstRecord (see page 960)	Positions the request on the first record.
	GetHandled (see page 937)	Returns the value of the Handled (see page 938) property.
	GetInIterator (see page 960)	Returns the value of the InIterator (see page 962) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNextRecord (see page 961)	Repositions the request on the next record.
	GetOrigValue (see page 928)	Returns the value of the OrigValues (see page 931) property.
	GetParamCount (see page 954)	Returns the value of the ParamCount (see page 956) property.
	GetParamName (see page 954)	Returns the value of the ParamNames (see page 956) property.
	GetParamValue (see page 955)	Returns the value of the ParamValues (see page 957) property.
	GetRecord (see page 961)	Positions the request on a specified record.
	GetRecordCount (see page 962)	Returns the value of the RecordCount (see page 963) property.
	GetRecordKeyCount (see page 950)	Returns the number of keys stored in the HTTP request.
	GetRecordKeyName (see page 950)	Returns the value of the RecordKeyNames (see page 951) property.
	GetRecordKeyValue (see page 951)	Returns the value of the RecordKeyValues (see page 952) property.
	GetSuccessPage (see page 19693)	This is GetSuccessPage, a member of class IGetAdapterRequestDefaultResponse.
	GetValue (see page 928)	Returns the value of the Values (see page 932) property.
	IndexOfField (see page 929)	Returns the index of a specified field.
	IndexOfParam (see page 955)	Returns the index of a specified name/value pair given its name.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	LocateActionFieldValuesOfAdapter (see page 934)	Indicates whether the request includes field values for a specified adapter.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	OrigValueOfField (see page 929)	Returns the original value of a specified field.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetHandled (see page 937)	Sets the value of the Handled (see page 938) property.

	ValueOfField (see page 930)	Returns the current value for a specified field.
	ValueOfParam (see page 955)	Returns the value associated with a specified name.

Public Properties

	Name	Description
R	ActionName (see page 938)	Identifies the action to server-side scripts.
R	ActionName (see page 889)	Identifies the action to server-side scripts.
R	ActionParams (see page 889)	This is ActionParams, a member of class TBasicActionRequestImpl.
R	AdapterCount (see page 947)	Indicates the number of adapters whose modes are stored in the current request.
R	AdapterNames (see page 948)	Lists the names of the adapters for which the HTTP request contains mode information.
R	DispatchParams (see page 889)	This is DispatchParams, a member of class TBasicActionRequestImpl.
R	Eof (see page 962)	This is Eof, a member of class IEnumActionFieldValueRecords.
R	FailurePage (see page 889)	This is FailurePage, a member of class TBasicActionRequestImpl.
R	FailurePage (see page 19694)	This is FailurePage, a member of class IGetAdapterRequestDefaultResponse.
R	FieldCount (see page 930)	Indicates the number of field values stored in the current request.
R	FieldNames (see page 931)	Lists the names of the fields whose values are stored in the current request.
	Handled (see page 938)	Indicates whether the request has been handled.
R	InIterator (see page 962)	Indicates whether the request is explicitly positioned on an adapter record.
R	OrigValues (see page 931)	Lists the values of the fields in this request as they were first presented to the end user.
R	ParamCount (see page 956)	Indicates the number of name/value pairs that can be accessed using this interface.
R	ParamNames (see page 956)	Lists the names of the name/value pairs that can be accessed using this interface.
R	ParamValues (see page 957)	Lists the values of the name/value pairs that can be accessed using this interface.
R	RecordCount (see page 963)	Indicates the number of records of information the request contains.
R	RecordKeyNames (see page 951)	Lists the names of the keys stored in the HTTP request.
R	RecordKeyValues (see page 952)	Lists the key values stored in the HTTP request.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	SuccessPage (see page 890)	This is SuccessPage, a member of class TBasicActionRequestImpl.
R	SuccessPage (see page 19694)	This is SuccessPage, a member of class IGetAdapterRequestDefaultResponse.
R	Values (see page 932)	Lists the values of the fields in this request as they appeared when the user sent the request.

7.1.12.2 TMultiRecordActionRequestImpl.Create Constructor

Pascal

```
constructor Create(ADispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall TMultiRecordActionRequestImpl(IAdapterDispatchParams ADispatchParams);
```

Description

This is Create, a member of class TMultiRecordActionRequestImpl.

7.1.12.3 TMultiRecordActionRequestImpl.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMultiRecordActionRequestImpl();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

7.1.12.4 TMultiRecordActionRequestImpl Properties

The properties of the TMultiRecordActionRequestImpl class are listed here.

Protected Properties

	Name	Description
R	ActionFieldValues (see page 913)	This is ActionFieldValues, a member of class TMultiRecordActionRequestImpl.
R	ActionFieldValues2 (see page 914)	This is ActionFieldValues2, a member of class TMultiRecordActionRequestImpl.
R	ActionFieldValuesList (see page 914)	This is ActionFieldValuesList, a member of class TMultiRecordActionRequestImpl.
R	AdapterActionFieldValuesList (see page 914)	This is AdapterActionFieldValuesList, a member of class TMultiRecordActionRequestImpl.
R	AdapterModes (see page 914)	Lists the modes for the adapters that the AdapterNames property lists.

7.1.12.4.1 TMultiRecordActionRequestImpl.ActionFieldValues Property

Pascal

```
property ActionFieldValues: TActionFieldValuesImpl;
```

C++

```
__property TActionFieldValuesImpl ActionFieldValues;
```

Description

This is ActionFieldValues, a member of class TMultiRecordActionRequestImpl.

7.1.12.4.2 TMultiRecordActionRequestImpl.ActionFieldValues2 Property

Pascal

```
property ActionFieldValues2: TActionFieldValuesImpl;
```

C++

```
__property TActionFieldValuesImpl ActionFieldValues2;
```

Description

This is ActionFieldValues2, a member of class TMultiRecordActionRequestImpl.

7.1.12.4.3 TMultiRecordActionRequestImpl.ActionFieldValuesList Property

Pascal

```
property ActionFieldValuesList: TEnumActionFieldValueRecordsImpl;
```

C++

```
__property TEnumActionFieldValueRecordsImpl ActionFieldValuesList;
```

Description

This is ActionFieldValuesList, a member of class TMultiRecordActionRequestImpl.

7.1.12.4.4 TMultiRecordActionRequestImpl.AdapterActionFieldValuesList Property

Pascal

```
property AdapterActionFieldValuesList: TAdapterActionFieldValuesList;
```

C++

```
__property TAdapterActionFieldValuesList AdapterActionFieldValuesList;
```

Description

This is AdapterActionFieldValuesList, a member of class TMultiRecordActionRequestImpl.

7.1.12.4.5 TMultiRecordActionRequestImpl.AdapterModes Property

Lists the modes for the adapters that the AdapterNames property lists.

Pascal

```
property AdapterModes: TAdapterModes;
```

C++

```
__property TAdapterModes AdapterModes;
```

Description

Read AdapterModes to extract an adapter mode from the HTTP request. The AdapterNames property gives the corresponding adapter to which the mode should be applied.

I is the index of the adapter, where 0 indicates the first adapter, 1 indicates the second adapter, and so on. The AdapterCount property provides an upper bound for this index.

Use AdapterModes when iterating over all the modes in the request. To obtain the mode for a specific adapter, use the

FindAdapterMode method instead.

See Also

AdapterCount (see page 947)

AdapterNames (see page 948)

FindAdapterMode (see page 946)

7.1.13 TSingleRecordActionRequestImpl Class

Class Hierarchy

Pascal

```
TSingleRecordActionRequestImpl = class(TBasicActionRequestImpl, IAdapterModes,
IActionFieldValues);
```

C++

```
class TSingleRecordActionRequestImpl : public TBasicActionRequestImpl, public IAdapterModes,
public IActionFieldValues;
```

File

AdaptReq

Description

This is class AdaptReq.TSingleRecordActionRequestImpl.

7.1.13.1 TSingleRecordActionRequestImpl Members

The following tables list the members exposed by TSingleRecordActionRequestImpl.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetActionName (see page 887)	Returns the value of the ActionName property.
	GetFailurePage (see page 887)	This is GetFailurePage, a member of class TBasicActionRequestImpl.

	GetHandled (see page 888)	Returns the value of the Handled property.
	GetSuccessPage (see page 888)	This is GetSuccessPage, a member of class TBasicActionRequestImpl.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetHandled (see page 888)	Sets the value of the Handled property.

Protected Properties

	Name	Description
R	ActionFieldValues (see page 918)	This is ActionFieldValues, a member of class TSingleRecordActionRequestImpl.
R	AdapterModes (see page 919)	Lists the modes for the adapters that the AdapterNames property lists.
R	Request (see page 24642)	This is Request, a member of class TAbstractAdapterRequest.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddValue (see page 927)	Adds a new field to the list.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AssignTo (see page 954)	Fills a string list to contain the name/value pairs from the HTTP request message.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 917)	This is Create, a member of class TSingleRecordActionRequestImpl.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 918)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAdapterMode (see page 946)	Retrieves the mode for a specified adapter.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetActionName (see page 937)	Returns the value of the ActionName (see page 938) property.
	GetAdapterCount (see page 946)	Returns the value of the AdapterCount (see page 947) property.
	GetAdapterMode (see page 947)	Returns the value of the AdapterModes (see page 948) property.
	GetAdapterName (see page 947)	Returns the value of the AdapterNames (see page 948) property.
	GetFailurePage (see page 19693)	This is GetFailurePage, a member of class IGetAdapterRequestDefaultResponse.
	GetFieldCount (see page 927)	Returns the value of the FieldCount (see page 930) property.
	GetFieldName (see page 928)	Returns the value of the FieldNames (see page 931) property.
	GetHandled (see page 937)	Returns the value of the Handled (see page 938) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetOrigValue (see page 928)	Returns the value of the OrigValues (see page 931) property.
	GetParamCount (see page 954)	Returns the value of the ParamCount (see page 956) property.
	GetParamName (see page 954)	Returns the value of the ParamNames (see page 956) property.
	GetParamValue (see page 955)	Returns the value of the ParamValues (see page 957) property.

	GetSuccessPage (see page 19693)	This is GetSuccessPage, a member of class IGetAdapterRequestDefaultResponse.
	GetValue (see page 928)	Returns the value of the Values (see page 932) property.
	IndexOfField (see page 929)	Returns the index of a specified field.
	IndexOfParam (see page 955)	Returns the index of a specified name/value pair given its name.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	OrigValueOfField (see page 929)	Returns the original value of a specified field.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetHandled (see page 937)	Sets the value of the Handled (see page 938) property.
	ValueOfField (see page 930)	Returns the current value for a specified field.
	ValueOfParam (see page 955)	Returns the value associated with a specified name.

Public Properties

	Name	Description
R	ActionName (see page 938)	Identifies the action to server-side scripts.
R	ActionName (see page 889)	Identifies the action to server-side scripts.
R	ActionParams (see page 889)	This is ActionParams, a member of class TBasicActionRequestImpl.
R	AdapterCount (see page 947)	Indicates the number of adapters whose modes are stored in the current request.
R	AdapterNames (see page 948)	Lists the names of the adapters for which the HTTP request contains mode information.
R	DispatchParams (see page 889)	This is DispatchParams, a member of class TBasicActionRequestImpl.
R	FailurePage (see page 889)	This is FailurePage, a member of class TBasicActionRequestImpl.
R	FailurePage (see page 19694)	This is FailurePage, a member of class IGetAdapterRequestDefaultResponse.
R	FieldCount (see page 930)	Indicates the number of field values stored in the current request.
R	FieldNames (see page 931)	Lists the names of the fields whose values are stored in the current request.
	Handled (see page 938)	Indicates whether the request has been handled.
R	OrigValues (see page 931)	Lists the values of the fields in this request as they were first presented to the end user.
R	ParamCount (see page 956)	Indicates the number of name/value pairs that can be accessed using this interface.
R	ParamNames (see page 956)	Lists the names of the name/value pairs that can be accessed using this interface.
R	ParamValues (see page 957)	Lists the values of the name/value pairs that can be accessed using this interface.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	SuccessPage (see page 890)	This is SuccessPage, a member of class TBasicActionRequestImpl.
R	SuccessPage (see page 19694)	This is SuccessPage, a member of class IGetAdapterRequestDefaultResponse.
R	Values (see page 932)	Lists the values of the fields in this request as they appeared when the user sent the request.

7.1.13.2 TSingleRecordActionRequestImpl.Create Constructor

Pascal

```
constructor Create(ADispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall TSingleRecordActionRequestImpl(IAdapterDispatchParams ADispatchParams);
```

Description

This is Create, a member of class TSingleRecordActionRequestImpl.

7.1.13.3 TSingleRecordActionRequestImpl.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSingleRecordActionRequestImpl();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

System::TObject::Free (see page 22300)

7.1.13.4 TSingleRecordActionRequestImpl Properties

The properties of the TSingleRecordActionRequestImpl class are listed here.

Protected Properties

	Name	Description
R	ActionFieldValues (see page 918)	This is ActionFieldValues, a member of class TSingleRecordActionRequestImpl.
R	AdapterModes (see page 919)	Lists the modes for the adapters that the AdapterNames property lists.

7.1.13.4.1 TSingleRecordActionRequestImpl.ActionFieldValues Property

Pascal

```
property ActionFieldValues: TActionFieldValuesImpl;
```

C++

```
__property TActionFieldValuesImpl ActionFieldValues;
```

Description

This is ActionFieldValues, a member of class TSingleRecordActionRequestImpl.

7.1.13.4.2 TSingleRecordActionRequestImpl.AdapterModes Property

Lists the modes for the adapters that the AdapterNames property lists.

Pascal

```
property AdapterModes: TAdapterModes;
```

C++

```
__property TAdapterModes AdapterModes;
```

Description

Read AdapterModes to extract an adapter mode from the HTTP request. The AdapterNames property gives the corresponding adapter to which the mode should be applied.

I is the index of the adapter, where 0 indicates the first adapter, 1 indicates the second adapter, and so on. The AdapterCount property provides an upper bound for this index.

Use AdapterModes when iterating over all the modes in the request. To obtain the mode for a specific adapter, use the FindAdapterMode method instead.

See Also

AdapterCount (see page 947)

AdapterNames (see page 948)

FindAdapterMode (see page 946)

7.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IActionFieldValue (see page 920)	IActionFieldValue is the interface for obtaining the value of an adapter field.
	IActionFieldValues (see page 925)	IActionFieldValues is the interface for extracting field values from the current HTTP request.
	IActionFieldValuesOfAdapter (see page 933)	IActionFieldValuesOfAdapter is the interface for determining whether a request includes field values that pertain to a specific adapter.
	IActionHandleResponse (see page 934)	This is class AdaptReq.IActionHandleResponse.
	IActionRequest (see page 935)	IActionRequest is the interface for interacting with action requests.
	IActionRespondWith (see page 938)	This is class AdaptReq.IActionRespondWith.
	IActionResponse (see page 941)	IActionResponse is the interface for interacting with action responses.
	IAdapterModes (see page 944)	IAdapterModes is the interface for extracting the mode of an adapter from an HTTP request.
	IAdapterRecordKeys (see page 949)	IAdapterRecordKeys is the interface for extracting name/value pairs from an HTTP request that identify a record for an adapter.
	IAdapterRequestParams (see page 952)	IAdapterRequestParams is the interface for extracting name/value pairs from an HTTP request message.
	IEnumActionFieldValueRecords (see page 957)	IEnumActionFieldValueRecords is the interface for iterating over the data in an HTTP request for each of several adapter records.
	IGetAdapterActionRedirectOptions (see page 963)	This is class AdaptReq.IGetAdapterActionRedirectOptions.
	IImageRequest (see page 965)	IImageRequest is the interface for extracting the name of a requested image from an HTTP request message.
	IImageResponse (see page 967)	This is class AdaptReq.IImageResponse.

7.2.1 IActionFieldValue Interface

IActionFieldValue is the interface for obtaining the value of an adapter field.

Class Hierarchy

AdaptReq.IActionFieldValue

Pascal

```
IActionFieldValue = interface;
```

C++

```
__interface IActionFieldValue;
```

File

AdaptReq

Description

Use IActionFieldValue to read the value of an adapter field. The properties on this interface provide information about the value or values of an adapter field. These include

The FieldName (see page 923) property, which gives the name of the adapter field whose value you can read.

The FileCount (see page 924) and Files (see page 924) properties, which let you read one or more file references when the

value of the field is a file reference (for example, on an image field).

The ValueCount (see page 925) and Values (see page 925) properties, which let you read one or more values when the value of the field can be expressed as a Variant.

IActionFieldValue can provide access to multiple values when the adapter field is associated with a list of values. For example, when a list box in an HTML form represents an adapter field, IActionFieldValue provides access to every choice in that list box. When IActionFieldValue properties list several values for a field, the first value (the one with index 0) is the selected value (the one assigned to the field).

Note: Method declarations that use IActionFieldValue use the _di_IActionFieldValue type instead. This type is a DelphiInterface wrapper around the IActionFieldValue interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IActionFieldValue >
_di_IActionFieldValue;
```

See Also

TAdapterNamedField (see page 23925)

TAdapterNamedField (see page 23925)

IActionFieldValues (see page 925)

7.2.1.1 IActionFieldValue Members

The following tables list the members exposed by IActionFieldValue.

Public Methods

	Name	Description
	GetFieldName (see page 922)	Returns the value of the FieldName (see page 923) property.
	GetFile (see page 922)	Returns the value of the Files (see page 924) property.
	GetFileCount (see page 922)	Returns the value of the FileCount (see page 924) property.
	GetValue (see page 923)	Returns the value of the Values (see page 925) property.
	GetValueCount (see page 923)	Returns the value of the ValueCount (see page 925) property.

Public Properties

	Name	Description
R	FieldName (see page 923)	Indicates the name of the adapter field whose value this interface represents.
R	FileCount (see page 924)	Indicates the number of file references that the Files (see page 924) property lists.
R	Files (see page 924)	Lists the file references that make up this adapter field's value.
R	ValueCount (see page 925)	Indicates the number of values that the Values (see page 925) property lists.
R	Values (see page 925)	Lists the values that belong to the adapter field.

7.2.1.2 IActionFieldValue Methods

The methods of the IActionFieldValue class are listed here.

Public Methods

	Name	Description
	GetFieldName (see page 922)	Returns the value of the FieldName (see page 923) property.
	GetFile (see page 922)	Returns the value of the Files (see page 924) property.
	GetFileCount (see page 922)	Returns the value of the FileCount (see page 924) property.

	GetValue (see page 923)	Returns the value of the Values (see page 925) property.
	GetValueCount (see page 923)	Returns the value of the ValueCount (see page 925) property.

7.2.1.2.1 IActionFieldValue.GetFieldName Method

Returns the value of the FieldName (see page 923) property.

Pascal

```
function GetFieldName: string;
```

C++

```
__fastcall AnsiString GetFieldName();
```

Description

GetFieldName is the read implementation of the FieldName (see page 923) property.

See Also

FieldName (see page 923)

7.2.1.2.2 IActionFieldValue.GetFile Method

Returns the value of the Files (see page 924) property.

Pascal

```
function GetFile(I: Integer): TAbstractWebRequestFile;
```

C++

```
__fastcall TAbstractWebRequestFile GetFile(int I);
```

Description

GetFile is the read implementation of the Files (see page 924) property.

I is the index of the file reference to read.

See Also

Files (see page 924)

7.2.1.2.3 IActionFieldValue.GetFileCount Method

Returns the value of the FileCount (see page 924) property.

Pascal

```
function GetFileCount: Integer;
```

C++

```
__fastcall int GetFileCount();
```

Description

GetFileCount is the read implementation of the FileCount (see page 924) property.

See Also

FileCount (see page 924)

7.2.1.2.4 IActionFieldValue.GetValue Method

Returns the value of the Values (see page 925) property.

Pascal

```
function GetValue(I: Integer): Variant;
```

C++

```
__fastcall Variant GetValue(int I);
```

Description

GetValue is the read implementation of the Values (see page 925) property.

I is the index of the field value to read.

See Also

Values (see page 925)

7.2.1.2.5 IActionFieldValue.GetValueCount Method

Returns the value of the ValueCount (see page 925) property.

Pascal

```
function GetValueCount: Integer;
```

C++

```
__fastcall int GetValueCount();
```

Description

GetValueCount is the read implementation of the ValueCount (see page 925) property.

See Also

ValueCount (see page 925)

7.2.1.3 IActionFieldValue Properties

The properties of the IActionFieldValue class are listed here.

Public Properties

	Name	Description
R	FieldName (see page 923)	Indicates the name of the adapter field whose value this interface represents.
R	FileCount (see page 924)	Indicates the number of file references that the Files (see page 924) property lists.
R	Files (see page 924)	Lists the file references that make up this adapter field's value.
R	ValueCount (see page 925)	Indicates the number of values that the Values (see page 925) property lists.
R	Values (see page 925)	Lists the values that belong to the adapter field.

7.2.1.3.1 IActionFieldValue.FieldName Property

Indicates the name of the adapter field whose value this interface represents.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;
```

Description

Read FieldName to determine the name of the adapter field. This corresponds to the FieldName property of the adapter field component.

See Also

FieldName (see page 23944)

7.2.1.3.2 IActionFieldValue.FileCount Property

Indicates the number of file references that the Files (see page 924) property lists.

Pascal

```
property FileCount: Integer;
```

C++

```
__property int FileCount;
```

Description

Read FileCount to determine how many file references are assigned to the adapter field. FileCount provides an upper bound to the index on the Files (see page 924) property.

When FileCount is zero, there is no file reference assigned to the adapter field. This can be because the field's value is not a file reference, or because the field's value is not assigned.

When FileCount is greater than 1, the adapter field is associated with multiple field references. In this case, the first reference (the one with index 0) is the selected value (the one assigned to the field).

See Also

Files (see page 924)

7.2.1.3.3 IActionFieldValue.Files Property

Lists the file references that make up this adapter field's value.

Pascal

```
property Files [I: Integer]: TAbstractWebRequestFile;
```

C++

```
__property TAbstractWebRequestFile Files[int I];
```

Description

Read Files to access the content of a file that is the value of the adapter field. Files is an array of TAbstractWebRequestFile objects, where each object describes the content of a file and provides a stream from which to read the file's value.

I is the index of a file, where 0 indicates the first file, 1 indicates the second file, and so on. The FileCount (see page 924) property provides an upper bound on the value of I.

Note: If Files lists more than one file, the first file is the selected value of the adapter field (the one assigned to the field). Additional files indicate the other possible field values.

See Also

FileCount (see page 924)

Values (see page 925)

7.2.1.3.4 IActionFieldValue.ValueCount Property

Indicates the number of values that the Values (see page 925) property lists.

Pascal

```
property ValueCount: Integer;
```

C++

```
__property int ValueCount;
```

Description

Read ValueCount to determine how many values are assigned to the adapter field. ValueCount provides an upper bound to the index on the Values (see page 925) property.

When ValueCount is zero, there is no value assigned to the adapter field. This can be because the field's value is a file reference, or because the field's value is not assigned.

When ValueCount is greater than 1, the adapter field is associated with multiple values. In this case, the first reference (the one with index 0) is the selected value (the one assigned to the field).

See Also

Values (see page 925)

7.2.1.3.5 IActionFieldValue.Values Property

Lists the values that belong to the adapter field.

Pascal

```
property Values [I: Integer]: Variant;
```

C++

```
__property Variant Values[int I];
```

Description

Read Values to access the value of the adapter field. Values is an array of Variants (see page 23567), where each Variant describes a field value.

I is the index of a value, where 0 indicates the first value, 1 indicates the second value, and so on. The ValueCount (see page 925) property provides an upper bound on the value of I.

Note: If Values lists more than one value, the first value is the selected value of the adapter field (the one assigned to the field). Additional values indicate the other possible field values.

See Also

ValueCount (see page 925)

Files (see page 924)

7.2.2 IActionFieldValues Interface

IActionFieldValues is the interface for extracting field values from the current HTTP request.

Class Hierarchy

AdaptReq.IActionFieldValues

Pascal

```
IActionFieldValues = interface;
```

C++

```
__interface IActionFieldValues;
```

File

AdaptReq

Description

Use IActionFieldValues to obtain information about adapter field values that are stored in an HTTP request. You can obtain an IActionFieldValues interface by casting (Delphi) or calling QueryInterface on (C++) the interface that is the AdapterRequest property of the global Web context.

IActionFieldValues lists the names of the fields that were represented in the HTML form from which the current request originated, along with their values. It also lists the original values those fields held when the form was first presented to the end user.

Note: Method declarations that use IActionFieldValues use the _di_IActionFieldValues type instead. This type is a DelphiInterface wrapper around the IActionFieldValues interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IActionFieldValues >
_di_IActionFieldValues;
```

See Also

IActionRequest (see page 935)

IActionFieldValuesOfAdapter (see page 933)

IAdapterModes (see page 944)

IAdapterRecordKeys (see page 949)

IAdapterRequestParams (see page 952)

IImageRequest (see page 965)

TAbstractWebContext (see page 24644)

WebContext

7.2.2.1 IActionFieldValues Members

The following tables list the members exposed by IActionFieldValues.

Public Methods

	Name	Description
	AddValue (see page 927)	Adds a new field to the list.
	GetFieldCount (see page 927)	Returns the value of the FieldCount (see page 930) property.
	GetFieldName (see page 928)	Returns the value of the FieldNames (see page 931) property.
	GetOrigValue (see page 928)	Returns the value of the OrigValues (see page 931) property.
	GetValue (see page 928)	Returns the value of the Values (see page 932) property.

	IndexOfField (see page 929)	Returns the index of a specified field.
	OrigValueOfField (see page 929)	Returns the original value of a specified field.
	ValueOfField (see page 930)	Returns the current value for a specified field.

Public Properties

	Name	Description
R	FieldCount (see page 930)	Indicates the number of field values stored in the current request.
R	FieldNames (see page 931)	Lists the names of the fields whose values are stored in the current request.
R	OrigValues (see page 931)	Lists the values of the fields in this request as they were first presented to the end user.
R	Values (see page 932)	Lists the values of the fields in this request as they appeared when the user sent the request.

7.2.2.2 IActionFieldValues Methods

The methods of the IActionFieldValues class are listed here.

Public Methods

	Name	Description
	AddValue (see page 927)	Adds a new field to the list.
	GetFieldCount (see page 927)	Returns the value of the FieldCount (see page 930) property.
	GetFieldName (see page 928)	Returns the value of the FieldNames (see page 931) property.
	GetOrigValue (see page 928)	Returns the value of the OrigValues (see page 931) property.
	GetValue (see page 928)	Returns the value of the Values (see page 932) property.
	IndexOfField (see page 929)	Returns the index of a specified field.
	OrigValueOfField (see page 929)	Returns the original value of a specified field.
	ValueOfField (see page 930)	Returns the current value for a specified field.

7.2.2.2.1 IActionFieldValues.AddValue Method

Adds a new field to the list.

Pascal

```
function AddValue(const AName: string): IActionFieldValue;
```

C++

```
__fastcall IActionFieldValue AddValue(const AnsiString AName);
```

Description

Typically, WebSnap applications do not need to call AddValue, because the IActionFieldValues (see page 925) interface is used for reading the values that are stored in a request message, not for adding to them. You can, however, use this method to add a new field to the list so that it appears as if it arrived with the current request message.

AName is the name of the new field. This must not match any of the names currently listed by the FieldNames (see page 931) property.

AddValue returns the interface for the value of the newly added field.

See Also

FieldNames (see page 931)

7.2.2.2.2 IActionFieldValues.GetFieldCount Method

Returns the value of the FieldCount (see page 930) property.

Pascal

```
function GetFieldCount: Integer;
```

C++

```
__fastcall int GetFieldCount();
```

Description

GetFieldCount is the read implementation of the FieldCount (see page 930) property.

See Also

FieldCount (see page 930)

7.2.2.2.3 IActionFieldValues.GetFieldName Method

Returns the value of the FieldNames (see page 931) property.

Pascal

```
function GetFieldName(I: Integer): string;
```

C++

```
__fastcall AnsiString GetFieldName(int I);
```

Description

GetFieldName is the read implementation of the FieldNames (see page 931) property.

I is the index of the field name to retrieve.

See Also

FieldNames (see page 931)

7.2.2.2.4 IActionFieldValues.GetOrigValue Method

Returns the value of the OrigValues (see page 931) property.

Pascal

```
function GetOrigValue(I: Integer): IActionFieldValue;
```

C++

```
__fastcall IActionFieldValue GetOrigValue(int I);
```

Description

GetOrigValue is the read implementation of the OrigValues (see page 931) property.

I is the index of the original field value to retrieve.

See Also

OrigValues (see page 931)

7.2.2.2.5 IActionFieldValues.GetValue Method

Returns the value of the Values (see page 932) property.

Pascal

```
function GetValue(I: Integer): IActionFieldValue;
```

C++

```
__fastcall IActionFieldValue GetValue(int I);
```

Description

GetValue is the read implementation of the Values (see page 932) property.

I is the index of the field value to retrieve.

See Also

Values (see page 932)

7.2.2.2.6 IActionFieldValues.IndexOfField Method

Returns the index of a specified field.

Pascal

```
function IndexOfField(const AName: string): Integer;
```

C++

```
__fastcall int IndexOfField(const AnsiString AName);
```

Description

IndexOfField returns the index of the field with the specified name. This method performs the reverse lookup from reading the FieldNames (see page 931) property.

AName is the name of the field to locate.

IndexOfField returns the index for the specified field. This index identifies the position of the field in the FieldNames (see page 931), Values (see page 932), and OrigValues (see page 931) property arrays. If the current HTTP request does not include a field with the specified name, IndexOfField returns –1.

See Also

FieldNames (see page 931)

OrigValueOfField (see page 929)

ValueOfField (see page 930)

Values (see page 932)

OrigValues (see page 931)

7.2.2.2.7 IActionFieldValues.OrigValueOfField Method

Returns the original value of a specified field.

Pascal

```
function OrigValueOfField(const AName: string): IActionFieldValue;
```

C++

```
__fastcall IActionFieldValue OrigValueOfField(const AnsiString AName);
```

Description

OrigValueOfField returns the value of a specified field as it was when the HTML form was first presented to the end user (before the user made any changes). Use OrigValueOfField to access a field value by name rather than by index.

AName is the name of the field whose original value you want.

OrigValueOfField returns an interface for reading the original value, as it was stored as a hidden field in the HTML form. If the current HTTP request does not include a field with the specified name, or if the HTML form did not store an original value for this field as a hidden field, OrigValueOfField returns nil (Delphi) or NULL (C++).

See Also

IndexOfField (see page 929)

ValueOfField (see page 930)

OrigValues (see page 931)

7.2.2.2.8 IActionFieldValues.ValueOfField Method

Returns the current value for a specified field.

Pascal

```
function ValueOfField(const AName: string): IActionFieldValue;
```

C++

```
__fastcall IActionFieldValue ValueOfField(const AnsiString AName);
```

Description

ValueOfField returns the value that the HTTP request provides for a specified field. Use ValueOfField to access a field value by name rather than by index.

AName is the name of the field whose value you want.

ValueOfField returns an interface for reading the value, as it was after any edits the user made to the HTML form. If the current HTTP request does not include a field with the specified name, ValueOfField returns nil (Delphi) or NULL (C++).

See Also

IndexOfField (see page 929)

OrigValueOfField (see page 929)

Values (see page 932)

7.2.2.3 IActionFieldValues Properties

The properties of the IActionFieldValues class are listed here.

Public Properties

	Name	Description
R	FieldCount (see page 930)	Indicates the number of field values stored in the current request.
R	FieldNames (see page 931)	Lists the names of the fields whose values are stored in the current request.
R	OrigValues (see page 931)	Lists the values of the fields in this request as they were first presented to the end user.
R	Values (see page 932)	Lists the values of the fields in this request as they appeared when the user sent the request.

7.2.2.3.1 IActionFieldValues.FieldCount Property

Indicates the number of field values stored in the current request.

Pascal

```
property FieldCount: Integer;
```

C++

```
__property int FieldCount;
```

Description

Read FieldCount to determine how many field values you can extract from the current HTTP request. FieldCount provides an upper bound to the index on the FieldNames (see page 931), Values (see page 932), and OrigValues (see page 931) property arrays.

See Also

FieldNames (see page 931)

OrigValues (see page 931)

Values (see page 932)

7.2.2.3.2 IActionFieldValues.FieldNames Property

Lists the names of the fields whose values are stored in the current request.

Pascal

```
property FieldNames [I: Integer]: string;
```

C++

```
__property AnsiString FieldNames[int I];
```

Description

Read FieldNames to obtain the names of the fields about which the current request provides information.

I is the index of the field whose name this property identifies, where 0 indicates the first field, 1 indicates the second field, and so on. The FieldCount (see page 930) property provides an upper bound for this index.

Use FieldNames when iterating over all the fields in the request. To obtain information about a specific field, use the ValueOfField (see page 930) or OrigValueOfField (see page 929) method.

See Also

FieldCount (see page 930)

Values (see page 932)

OrigValues (see page 931)

IndexOfField (see page 929)

ValueOfField (see page 930)

OrigValueOfField (see page 929)

7.2.2.3.3 IActionFieldValues.OrigValues Property

Lists the values of the fields in this request as they were first presented to the end user.

Pascal

```
property OrigValues [I: Integer]: IActionFieldValue;
```

C++

```
__property IActionFieldValue OrigValues[int I];
```

Description

Read OrigValues to access the original value of a field. This is the value of the field when the HTML form was first presented to the end user, before the user made any changes. If the HTML form did not store original field values as hidden fields, the value of OrigValues is nil (Delphi) or NULL (C++).

I is the index of the field whose original value this property identifies, where 0 indicates the first field, 1 indicates the second field, and so on. The FieldCount (see page 930) property provides an upper bound for this index.

Tip: Use the FieldNames (see page 931) property to determine the name of the field associated with a specified index.

Use OrigValues when iterating over all the fields in the request. To obtain the original value of a specific field, use the OrigValueOfField (see page 929) method instead.

See Also

FieldCount (see page 930)

Values (see page 932)

FieldNames (see page 931)

OrigValueOfField (see page 929)

7.2.2.3.4 IActionFieldValues.Values Property

Lists the values of the fields in this request as they appeared when the user sent the request.

Pascal

```
property Values [I: Integer]: IActionFieldValue;
```

C++

```
__property IActionFieldValue Values[int I];
```

Description

Read Values to access the current value for a field. This value includes any edits that the end user may have made using the HTML form.

I is the index of the field whose value this property identifies, where 0 indicates the first field, 1 indicates the second field, and so on. The FieldCount (see page 930) property provides an upper bound for this index.

Tip: Use the FieldNames (see page 931) property to determine the name of the field associated with a specified index.

Use Values when iterating over all the fields in the request. To obtain the value for a specific field, use the ValueOfField (see page 930) method instead.

See Also

FieldCount (see page 930)

OrigValues (see page 931)

FieldNames (see page 931)

ValueOfField (see page 930)

7.2.3 IActionFieldValuesOfAdapter Interface

IActionFieldValuesOfAdapter is the interface for determining whether a request includes field values that pertain to a specific adapter.

Class Hierarchy

AdaptReq.IActionFieldValuesOfAdapter

Pascal

```
IActionFieldValuesOfAdapter = interface;
```

C++

```
__interface IActionFieldValuesOfAdapter;
```

File

AdaptReq

Description

Use IActionFieldValuesOfAdapter to obtain determine whether an HTTP request lists field values for a specific adapter component. This interface is supported by adapter request objects that represent requests originating from an HTML form that represents information from multiple adapters.

You can obtain an IActionFieldValuesOfAdapter interface by casting (Delphi) or calling QueryInterface on (C++) the interface that is the AdapterRequest property of the global Web context.

IActionFieldValuesOfAdapter defines a single method, LocateActionFieldValuesOfAdapter (see page 934), which indicates whether the request includes field values for a specified adapter. If the request does include such a list, fetching the IActionFieldValues (see page 925) interface for the request yields the list of field values for the specified adapter.

See Also

IActionRequest (see page 935)

IActionFieldValues (see page 925)

TAbstractWebContext (see page 24644)

WebContext

7.2.3.1 IActionFieldValuesOfAdapter Members

The following tables list the members exposed by IActionFieldValuesOfAdapter.

Public Methods

	Name	Description
	LocateActionFieldValuesOfAdapter (see page 934)	Indicates whether the request includes field values for a specified adapter.

7.2.3.2 IActionFieldValuesOfAdapter Methods

The methods of the IActionFieldValuesOfAdapter class are listed here.

Public Methods

	Name	Description
	LocateActionFieldValuesOfAdapter (see page 934)	Indicates whether the request includes field values for a specified adapter.

7.2.3.2.1 IActionFieldValuesOfAdapter.LocateActionFieldValuesOfAdapter Method

Indicates whether the request includes field values for a specified adapter.

Pascal

```
function LocateActionFieldValuesOfAdapter(AAdapter: TComponent): Boolean;
```

C++

```
__fastcall Boolean LocateActionFieldValuesOfAdapter(TComponent * AAdapter);
```

Description

LocateActionFieldValuesOfAdapter returns true if the request includes field values for the specified adapter, false if there are no field values for the specified adapter.

AAdapter is the name of the adapter component whose fields you want to access.

If the request contains field information for the specified adapter, LocateActionFieldValuesOfAdapter positions the request on the set of field values for AAdapter before returning true. This means that if you next cast (Delphi) or call QueryInterface on (C++) this interface to obtain an IActionFieldValues (see page 925) interface, you obtain an interface for the fields associated with the specified adapter.

See Also

IActionFieldValues (see page 925)

7.2.4 IActionHandleResponse Interface

Class Hierarchy

AdaptReq.IActionHandleResponse

Pascal

```
IActionHandleResponse = interface;
```

C++

```
__interface IActionHandleResponse;
```

File

AdaptReq

Description

This is class AdaptReq.IActionHandleResponse.

7.2.4.1 IActionHandleResponse Members

The following tables list the members exposed by IActionHandleResponse.

Public Methods

	Name	Description
	HandleResponse (see page 935)	This is HandleResponse, a member of class IActionHandleResponse.

7.2.4.2 IActionHandleResponse Methods

The methods of the IActionHandleResponse class are listed here.

Public Methods

	Name	Description
	HandleResponse (see page 935)	This is HandleResponse, a member of class IActionHandleResponse.

7.2.4.2.1 IActionHandleResponse.HandleResponse Method

Pascal

```
procedure HandleResponse;
```

C++

```
__fastcall HandleResponse();
```

Description

This is HandleResponse, a member of class IActionHandleResponse.

7.2.5 IActionRequest Interface

IActionRequest is the interface for interacting with action requests.

Class Hierarchy

AdaptReq.IActionRequest

Pascal

```
IActionRequest = interface;
```

C++

```
__interface IActionRequest;
```

File

AdaptReq

Description

IActionRequest is used by a wide variety of routines and methods to interact with action requests. Use the Supports function to determine whether a request object implements IActionRequest and to obtain the interface.

You can often cast this interface to another interface (Delphi) or use the QueryInterface method to obtain another interface from this one (C++) that lets you extract specialized information from the request. The following interfaces are often supported by the request object that implements this interface:

IActionFieldValues (see page 925)

IActionFieldValuesOfAdapter (see page 933)

IAdapterRequestParams (see page 952)

IImageRequest (see page 965)

IAdapterRecordKeys (see page 949)

IAdapterModes (see page 944)

IEnumActionFieldValueRecords (see page 957)

See Also

IActionResponse (see page 941)

Supports

TAbstractWebContext (see page 24644)

IActionFieldValues (see page 925)

IAdapterModes (see page 944)

IActionFieldValuesOfAdapter (see page 933)

IAdapterRecordKeys (see page 949)

IAdapterRequestParams (see page 952)

IImageRequest (see page 965)

IEnumActionFieldValueRecords (see page 957)

7.2.5.1 IActionRequest Members

The following tables list the members exposed by IActionRequest.

Public Methods

	Name	Description
	GetActionName (see page 937)	Returns the value of the ActionName (see page 938) property.
	GetHandled (see page 937)	Returns the value of the Handled (see page 938) property.
	SetHandled (see page 937)	Sets the value of the Handled (see page 938) property.

Public Properties

	Name	Description
R	ActionName (see page 938)	Identifies the action to server-side scripts.
	Handled (see page 938)	Indicates whether the request has been handled.

7.2.5.2 IActionRequest Methods

The methods of the IActionRequest class are listed here.

Public Methods

	Name	Description
	GetActionName (see page 937)	Returns the value of the ActionName (see page 938) property.
	GetHandled (see page 937)	Returns the value of the Handled (see page 938) property.
	SetHandled (see page 937)	Sets the value of the Handled (see page 938) property.

7.2.5.2.1 IActionRequest.GetActionName Method

Returns the value of the ActionName (see page 938) property.

Pascal

```
function GetActionName: string;
```

C++

```
__fastcall AnsiString GetActionName();
```

Description

GetActionName is the read implementation of the ActionName (see page 938) property.

See Also

ActionName (see page 938)

7.2.5.2.2 IActionRequest.GetHandled Method

Returns the value of the Handled (see page 938) property.

Pascal

```
function GetHandled: Boolean;
```

C++

```
__fastcall Boolean GetHandled();
```

Description

GetHandled is the read implementation of the Handled (see page 938) property.

See Also

Handled (see page 938)

7.2.5.2.3 IActionRequest.SetHandled Method

Sets the value of the Handled (see page 938) property.

Pascal

```
procedure SetHandled(AValue: Boolean);
```

C++

```
__fastcall SetHandled(Boolean AValue);
```

Description

SetHandled is the write implementation of the Handled (see page 938) property.

See Also

Handled (see page 938)

7.2.5.3 IActionRequest Properties

The properties of the IActionRequest class are listed here.

Public Properties

	Name	Description
	ActionName (see page 938)	Identifies the action to server-side scripts.
	Handled (see page 938)	Indicates whether the request has been handled.

7.2.5.3.1 IActionRequest.ActionName Property

Identifies the action to server-side scripts.

Pascal

```
property ActionName: string;
```

C++

```
__property AnsiString ActionName;
```

Description

The ActionName property defines the name used to access the adapter action from server-side scripts.

7.2.5.3.2 IActionRequest.Handled Property

Indicates whether the request has been handled.

Pascal

```
property Handled: Boolean;
```

C++

```
__property Boolean Handled;
```

Description

Note: WebSnap sets Handled to true when the request has been handled.

7.2.6 IActionRespondWith Interface

Class Hierarchy

AdaptReq.IActionRespondWith

Pascal

```
IActionRespondWith = interface;
```

C++

```
__interface IActionRespondWith;
```

File

AdaptReq

Description

This is class AdaptReq.IActionRespondWith.

7.2.6.1 IActionRespondWith Members

The following tables list the members exposed by IActionRespondWith.

Public Methods

	Name	Description
	GetRedirectOptions (see page 939)	This is GetRedirectOptions, a member of class IActionRespondWith.
	GetRespondWith (see page 939)	This is GetRespondWith, a member of class IActionRespondWith.
	RespondWithComponentPage (see page 940)	This is RespondWithComponentPage, a member of class IActionRespondWith.
	RespondWithPage (see page 940)	This is RespondWithPage, a member of class IActionRespondWith.
	RespondWithURL (see page 940)	This is RespondWithURL, a member of class IActionRespondWith.
	SetExecuteStatus (see page 940)	This is SetExecuteStatus, a member of class IActionRespondWith.
	SetRedirectOptions (see page 941)	This is SetRedirectOptions, a member of class IActionRespondWith.

Public Properties

	Name	Description
	RedirectOptions (see page 941)	This is RedirectOptions, a member of class IActionRespondWith.
R	RespondWith (see page 941)	This is RespondWith, a member of class IActionRespondWith.

7.2.6.2 IActionRespondWith Methods

The methods of the IActionRespondWith class are listed here.

Public Methods

	Name	Description
	GetRedirectOptions (see page 939)	This is GetRedirectOptions, a member of class IActionRespondWith.
	GetRespondWith (see page 939)	This is GetRespondWith, a member of class IActionRespondWith.
	RespondWithComponentPage (see page 940)	This is RespondWithComponentPage, a member of class IActionRespondWith.
	RespondWithPage (see page 940)	This is RespondWithPage, a member of class IActionRespondWith.
	RespondWithURL (see page 940)	This is RespondWithURL, a member of class IActionRespondWith.
	SetExecuteStatus (see page 940)	This is SetExecuteStatus, a member of class IActionRespondWith.
	SetRedirectOptions (see page 941)	This is SetRedirectOptions, a member of class IActionRespondWith.

7.2.6.2.1 IActionRespondWith.GetRedirectOptions Method

Pascal

```
function GetRedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__fastcall TAdapterActionRedirectOptions GetRedirectOptions();
```

Description

This is GetRedirectOptions, a member of class IActionRespondWith.

7.2.6.2.2 IActionRespondWith.GetRespondWith Method

Pascal

```
function GetRespondWith: TRespondWith;
```

C++

```
__fastcall TRespondWith GetRespondWith();
```

Description

This is GetRespondWith, a member of class IActionRespondWith.

7.2.6.2.3 IActionRespondWith.RespondWithComponentPage Method

Pascal

```
procedure RespondWithComponentPage(const AComponent: TComponent);
```

C++

```
__fastcall RespondWithComponentPage(const TComponent * AComponent);
```

Description

This is RespondWithComponentPage, a member of class IActionRespondWith.

7.2.6.2.4 IActionRespondWith.RespondWithPage Method

Pascal

```
procedure RespondWithPage(const APageName: string);
```

C++

```
__fastcall RespondWithPage(const AnsiString APageName);
```

Description

This is RespondWithPage, a member of class IActionRespondWith.

7.2.6.2.5 IActionRespondWith.RespondWithURL Method

Pascal

```
procedure RespondWithURL(const AURL: string);
```

C++

```
__fastcall RespondWithURL(const AnsiString AURL);
```

Description

This is RespondWithURL, a member of class IActionRespondWith.

7.2.6.2.6 IActionRespondWith.SetExecuteStatus Method

Pascal

```
procedure SetExecuteStatus(Value: TExecuteStatus);
```

C++

```
__fastcall SetExecuteStatus(TExecuteStatus Value);
```

Description

This is SetExecuteStatus, a member of class IActionRespondWith.

7.2.6.2.7 IActionRespondWith.SetRedirectOptions Method

Pascal

```
procedure SetRedirectOptions(AOptions: TAdapterActionRedirectOptions);
```

C++

```
__fastcall SetRedirectOptions(TAdapterActionRedirectOptions AOptions);
```

Description

This is SetRedirectOptions, a member of class IActionRespondWith.

7.2.6.3 IActionRespondWith Properties

The properties of the IActionRespondWith class are listed here.

Public Properties

	Name	Description
	RedirectOptions (see page 941)	This is RedirectOptions, a member of class IActionRespondWith.
R	RespondWith (see page 941)	This is RespondWith, a member of class IActionRespondWith.

7.2.6.3.1 IActionRespondWith.RedirectOptions Property

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

This is RedirectOptions, a member of class IActionRespondWith.

7.2.6.3.2 IActionRespondWith.RespondWith Property

Pascal

```
property RespondWith: TRespondWith;
```

C++

```
__property TRespondWith RespondWith;
```

Description

This is RespondWith, a member of class IActionRespondWith.

7.2.7 IActionResponse Interface

IActionResponse is the interface for interacting with action responses.

Class Hierarchy

Pascal

```
IActionResponse = interface;
```

C++

```
__interface IActionResponse;
```

File

AdaptReq

Description

IActionResponse is used by a variety of routines and methods to interact with action response. Use the Supports function to determine whether a request object implements IActionResponse and to obtain the interface.

See Also

IActionRequest (see page 935)

Supports

7.2.7.1 IActionResponse Members

The following tables list the members exposed by IActionResponse.

Public Methods

	Name	Description
	GetExecuteStatus (see page 942)	Returns the value of the ExecuteStatus (see page 944) property.
	GetHandled (see page 943)	Returns the value of the Handled (see page 944) property.
	SetExecuteStatus (see page 943)	Sets the value of the ExecuteStatus (see page 944) property.
	SetHandled (see page 943)	Sets the value of the Handled (see page 944) property.

Public Properties

	Name	Description
	ExecuteStatus (see page 944)	Indicates the status of executing the action.
	Handled (see page 944)	Indicates whether the incoming request has been handled.

7.2.7.2 IActionResponse Methods

The methods of the IActionResponse class are listed here.

Public Methods

	Name	Description
	GetExecuteStatus (see page 942)	Returns the value of the ExecuteStatus (see page 944) property.
	GetHandled (see page 943)	Returns the value of the Handled (see page 944) property.
	SetExecuteStatus (see page 943)	Sets the value of the ExecuteStatus (see page 944) property.
	SetHandled (see page 943)	Sets the value of the Handled (see page 944) property.

7.2.7.2.1 IActionResponse.GetExecuteStatus Method

Returns the value of the ExecuteStatus (see page 944) property.

Pascal

```
function GetExecuteStatus: TExecuteStatus;
```

C++

```
__fastcall TExecuteStatus GetExecuteStatus();
```

Description

GetExecuteStatus is the read implementation of the ExecuteStatus (see page 944) property.

See Also

ExecuteStatus (see page 944)

7.2.7.2.2 IActionResponse.GetHandled Method

Returns the value of the Handled (see page 944) property.

Pascal

```
function GetHandled: Boolean;
```

C++

```
__fastcall Boolean GetHandled();
```

Description

GetHandled is the read implementation of the Handled (see page 944) property.

See Also

Handled (see page 944)

7.2.7.2.3 IActionResponse.SetExecuteStatus Method

Sets the value of the ExecuteStatus (see page 944) property.

Pascal

```
procedure SetExecuteStatus(Value: TExecuteStatus);
```

C++

```
__fastcall SetExecuteStatus(TExecuteStatus Value);
```

Description

SetExecuteStatus is the write implementation of the ExecuteStatus (see page 944) property.

See Also

ExecuteStatus (see page 944)

7.2.7.2.4 IActionResponse.SetHandled Method

Sets the value of the Handled (see page 944) property.

Pascal

```
procedure SetHandled(Value: Boolean);
```

C++

```
__fastcall SetHandled(Boolean Value);
```

Description

SetHandled is the write implementation of the Handled (see page 944) property.

See Also

Handled (see page 944)

7.2.7.3 IActionResponse Properties

The properties of the IActionResponse class are listed here.

Public Properties

	Name	Description
	ExecuteStatus (see page 944)	Indicates the status of executing the action.
	Handled (see page 944)	Indicates whether the incoming request has been handled.

7.2.7.3.1 IActionResponse.ExecuteStatus Property

Indicates the status of executing the action.

Pascal

```
property ExecuteStatus: TExecuteStatus;
```

C++

```
__property TExecuteStatus ExecuteStatus;
```

Description

The ExecuteStatus property indicates whether the request was completely handled, and if so, whether the attempt to handle the request was successful.

See Also

Handled (see page 944)

7.2.7.3.2 IActionResponse.Handled Property

Indicates whether the incoming request has been handled.

Pascal

```
property Handled: Boolean;
```

C++

```
__property Boolean Handled;
```

Description

Note: WebSnap sets Handled to true when the response has been handled.

7.2.8 IAdapterModes Interface

IAdapterModes is the interface for extracting the mode of an adapter from an HTTP request.

Class Hierarchy

AdaptReq.IAdapterModes

Pascal

```
IAdapterModes = interface;
```

C++

```
__interface IAdapterModes;
```

File

AdaptReq

Description

Use IAdapterModes to obtain mode information for a specified adapter from an HTTP request message. You can obtain an IAdapterModes interface by casting (Delphi) or calling QueryInterface on (C++) the interface that is the AdapterRequest property of the global Web context.

Not all adapters have modes. For adapters that do support modes, the mode indicates the types of tasks that adapter can perform. Adapters that support modes include the mode as a hidden field in HTML forms so that they can re-establish the correct mode when processing requests that originate from that form.

IAdapterModes lists the modes of any adapters that support modes and that contributed to the HTML form from which this request originated.

See Also

IActionRequest (see page 935)

IAdapterRequestParams (see page 952)

IAdapterRecordKeys (see page 949)

IImageRequest (see page 965)

TAbstractWebContext (see page 24644)

WebContext

TCustomDataSetAdapter (see page 7766)

7.2.8.1 IAdapterModes Members

The following tables list the members exposed by IAdapterModes.

Public Methods

	Name	Description
	FindAdapterMode (see page 946)	Retrieves the mode for a specified adapter.
	GetAdapterCount (see page 946)	Returns the value of the AdapterCount (see page 947) property.
	GetAdapterMode (see page 947)	Returns the value of the AdapterModes (see page 948) property.
	GetAdapterName (see page 947)	Returns the value of the AdapterNames (see page 948) property.

Public Properties

	Name	Description
R	AdapterCount (see page 947)	Indicates the number of adapters whose modes are stored in the current request.
R	AdapterModes (see page 948)	Lists the modes for the adapters that the AdapterNames (see page 948) property lists.
R	AdapterNames (see page 948)	Lists the names of the adapters for which the HTTP request contains mode information.

7.2.8.2 IAdapterModes Methods

The methods of the IAdapterModes class are listed here.

Public Methods

	Name	Description
	FindAdapterMode (see page 946)	Retrieves the mode for a specified adapter.
	GetAdapterCount (see page 946)	Returns the value of the AdapterCount (see page 947) property.
	GetAdapterMode (see page 947)	Returns the value of the AdapterModes (see page 948) property.
	GetAdapterName (see page 947)	Returns the value of the AdapterNames (see page 948) property.

7.2.8.2.1 IAdapterModes.FindAdapterMode Method

Retrieves the mode for a specified adapter.

Pascal

```
function FindAdapterMode(AAdapter: TObject; var AMode: string): Boolean;
```

C++

```
__fastcall Boolean FindAdapterMode(TObject * AAdapter, AnsiString AMode);
```

Description

FindAdapterMode extracts the mode for a specified adapter from the HTTP request.

AAdapter is the adapter object whose mode you want to extract. The variable name for the adapter is one of the strings that the AdapterNames (see page 948) property lists.

AMode returns the mode string, if any, that the request stores for the specified adapter.

FindAdapterMode returns true if the request has a mode stored for the specified adapter. When FindAdapterMode returns true , the AMode parameter returns the mode string. FindAdapterMode returns false if the request does not include a mode for the specified adapter. When FindAdapterMode returns false, the AMode parameter is unchanged.

See Also

AdapterNames (see page 948)

AdapterModes (see page 948)

7.2.8.2.2 IAdapterModes.GetAdapterCount Method

Returns the value of the AdapterCount (see page 947) property.

Pascal

```
function GetAdapterCount: Integer;
```

C++

```
__fastcall int GetAdapterCount();
```

Description

GetAdapterCount is the read implementation of the AdapterCount (see page 947) property.

See Also

AdapterCount (see page 947)

7.2.8.2.3 IAdapterModes.GetAdapterMode Method

Returns the value of the AdapterModes (see page 948) property.

Pascal

```
function GetAdapterMode(I: Integer): string;
```

C++

```
__fastcall AnsiString GetAdapterMode(int I);
```

Description

GetAdapterMode is the read implementation of the AdapterModes (see page 948) property.

I is the index of the adapter whose mode this method returns.

See Also

AdapterModes (see page 948)

7.2.8.2.4 IAdapterModes.GetAdapterName Method

Returns the value of the AdapterNames (see page 948) property.

Pascal

```
function GetAdapterName(I: Integer): string;
```

C++

```
__fastcall AnsiString GetAdapterName(int I);
```

Description

GetAdapterName is the read implementation of the AdapterNames (see page 948) property.

I is the index of the adapter whose name this method returns.

See Also

AdapterNames (see page 948)

7.2.8.3 IAdapterModes Properties

The properties of the IAdapterModes class are listed here.

Public Properties

	Name	Description
R	AdapterCount (see page 947)	Indicates the number of adapters whose modes are stored in the current request.
R	AdapterModes (see page 948)	Lists the modes for the adapters that the AdapterNames (see page 948) property lists.
R	AdapterNames (see page 948)	Lists the names of the adapters for which the HTTP request contains mode information.

7.2.8.3.1 IAdapterModes.AdapterCount Property

Indicates the number of adapters whose modes are stored in the current request.

Pascal

```
property AdapterCount: Integer;
```

C++

```
__property int AdapterCount;
```

Description

Read AdapterCount to determine how many adapter modes you can extract from the current HTTP request. AdapterCount provides an upper bound to the index on the AdapterNames (see page 948) and AdapterModes (see page 948) property arrays.

See Also

AdapterNames (see page 948)

AdapterModes (see page 948)

7.2.8.3.2 IAdapterModes.AdapterModes Property

Lists the modes for the adapters that the AdapterNames (see page 948) property lists.

Pascal

```
property AdapterModes [I: Integer]: string;
```

C++

```
__property AnsiString AdapterModes[int I];
```

Description

Read AdapterModes to extract an adapter mode from the HTTP request. The AdapterNames (see page 948) property gives the corresponding adapter to which the mode should be applied.

I is the index of the adapter, where 0 indicates the first adapter, 1 indicates the second adapter, and so on. The AdapterCount (see page 947) property provides an upper bound for this index.

Use AdapterModes when iterating over all the modes in the request. To obtain the mode for a specific adapter, use the FindAdapterMode (see page 946) method instead.

See Also

AdapterCount (see page 947)

AdapterNames (see page 948)

FindAdapterMode (see page 946)

7.2.8.3.3 IAdapterModes.AdapterNames Property

Lists the names of the adapters for which the HTTP request contains mode information.

Pascal

```
property AdapterNames [I: Integer]: string;
```

C++

```
__property AnsiString AdapterNames[int I];
```

Description

Read AdapterNames to obtain the names of the adapters that have mode information included in the HTTP request. Each

adapter name is the name of the variable that refers to the adapter in server-side script.

I is the index of the adapter, where 0 indicates the first adapter, 1 indicates the second adapter, and so on. The AdapterCount (see page 947) property provides an upper bound for this index.

Use AdapterNames when iterating over all the adapters in the request. To obtain the mode of a specified Adapter given its name, use the FindAdapterMode (see page 946) method.

See Also

AdapterCount (see page 947)

AdapterModes (see page 948)

FindAdapterMode (see page 946)

7.2.9 IAdapterRecordKeys Interface

IAdapterRecordKeys is the interface for extracting name/value pairs from an HTTP request that identify a record for an adapter.

Class Hierarchy

AdaptReq.IAdapterRecordKeys

Pascal

```
IAdapterRecordKeys = interface;
```

C++

```
__interface IAdapterRecordKeys;
```

File

AdaptReq

Description

Use IAdapterRecordKeys to obtain key values from an HTTP request message. You can obtain an IAdapterRecordKeys interface by casting (Delphi) or calling QueryInterface on (C++)the interface that is the AdapterRequest property of the global Web context.

Some adapters use key values to define the relationship between values in the HTTP request and adapter data values. For example, TDataSetAdapter identifies dataset records using key field values. The adapter adds these key values to HTML forms as hidden fields. Requests that originate from those forms include the key values so that the adapter can locate the record to which a request applies.

IAdapterRecordKeys lists the names and values of any keys an adapter has added to the HTML form.

See Also

IActionRequest (see page 935)

IAdapterRequestParams (see page 952)

IAdapterModes (see page 944)

IImageRequest (see page 965)

7.2.9.1 IAdapterRecordKeys Members

The following tables list the members exposed by IAdapterRecordKeys.

Public Methods

	Name	Description
	GetRecordKeyCount (see page 950)	Returns the number of keys stored in the HTTP request.
	GetRecordKeyName (see page 950)	Returns the value of the RecordKeyNames (see page 951) property.
	GetRecordKeyValue (see page 951)	Returns the value of the RecordKeyValues (see page 952) property.

Public Properties

	Name	Description
R	RecordKeyNames (see page 951)	Lists the names of the keys stored in the HTTP request.
R	RecordKeyValues (see page 952)	Lists the key values stored in the HTTP request.

7.2.9.2 IAdapterRecordKeys Methods

The methods of the IAdapterRecordKeys class are listed here.

Public Methods

	Name	Description
	GetRecordKeyCount (see page 950)	Returns the number of keys stored in the HTTP request.
	GetRecordKeyName (see page 950)	Returns the value of the RecordKeyNames (see page 951) property.
	GetRecordKeyValue (see page 951)	Returns the value of the RecordKeyValues (see page 952) property.

7.2.9.2.1 IAdapterRecordKeys.GetRecordKeyCount Method

Returns the number of keys stored in the HTTP request.

Pascal

```
function GetRecordKeyCount: Integer;
```

C++

```
__fastcall int GetRecordKeyCount();
```

Description

GetRecordKeyCount returns the number of keys this interface makes available. This value provides an upper bound to the index for the RecordKeyValues (see page 952) and RecordKeyNames (see page 951) property arrays.

See Also

RecordKeyValues (see page 952)

RecordKeyNames (see page 951)

7.2.9.2.2 IAdapterRecordKeys.GetRecordKeyName Method

Returns the value of the RecordKeyNames (see page 951) property.

Pascal

```
function GetRecordKeyName(I: Integer): string;
```

C++

```
__fastcall AnsiString GetRecordKeyName(int I);
```

Description

GetRecordKeyName is the read implementation of the RecordKeyNames (see page 951) property.

I is the index of the key whose name this method returns.

See Also

RecordKeyNames (see page 951)

7.2.9.2.3 IAdapterRecordKeys.GetRecordKeyValue Method

Returns the value of the RecordKeyValues (see page 952) property.

Pascal

```
function GetRecordKeyValue(I: Integer): string;
```

C++

```
__fastcall AnsiString GetRecordKeyValue(int I);
```

Description

GetRecordKeyValue is the read implementation of the RecordKeyValues (see page 952) property.

I is the index of the key whose value this method returns.

See Also

RecordKeyValues (see page 952)

7.2.9.3 IAdapterRecordKeys Properties

The properties of the IAdapterRecordKeys class are listed here.

Public Properties

	Name	Description
R	RecordKeyNames (see page 951)	Lists the names of the keys stored in the HTTP request.
R	RecordKeyValues (see page 952)	Lists the key values stored in the HTTP request.

7.2.9.3.1 IAdapterRecordKeys.RecordKeyNames Property

Lists the names of the keys stored in the HTTP request.

Pascal

```
property RecordKeyNames [I: Integer]: string;
```

C++

```
__property AnsiString RecordKeyNames[int I];
```

Description

Read RecordKeyNames to obtain the names of the keys that the adapter uses to locate the record associated with the HTTP

request. The RecordKeyValues (see page 952) property lists the values of those keys.

I is the index of the key, where 0 indicates the first key, 1 indicates the second key, and so on. The GetRecordKeyCount (see page 950) method returns an upper bound for this index.

See Also

GetRecordKeyCount (see page 950)

RecordKeyValues (see page 952)

7.2.9.3.2 IAdapterRecordKeys.RecordKeyValues Property

Lists the key values stored in the HTTP request.

Pascal

```
property RecordKeyValues [I: Integer]: string;
```

C++

```
__property AnsiString RecordKeyValues[int I];
```

Description

Read RecordKeyValues to extract the value of a key for the adapter to use when locating the record associated with the HTTP request. The RecordKeyNames (see page 951) property gives the name of the key.

I is the index of the key, where 0 indicates the first key, 1 indicates the second key, and so on. The GetRecordKeyCount (see page 950) method returns an upper bound for this index.

See Also

GetRecordKeyCount (see page 950)

RecordKeyNames (see page 951)

7.2.10 IAdapterRequestParams Interface

IAdapterRequestParams is the interface for extracting name/value pairs from an HTTP request message.

Class Hierarchy

Pascal

```
IAdapterRequestParams = interface;
```

C++

```
__interface IAdapterRequestParams;
```

File

AdaptReq

Description

Use IAdapterRequestParams to obtain the parameters needed to execute an adapter action from an HTTP request message. You can obtain an IAdapterRequestParams interface by casting (Delphi) or calling QueryInterface on (C++) the interface that is the AdapterRequest property of the global Web context.

The name/value pairs that IAdapterRequestParams makes available are added as hidden fields to an HTML form by the adapter's EncodeActionParams method. Use the IAdapterRequestParams interface of a request that originates from the form containing those hidden fields to retrieve their names and values.

See Also

IActionRequest (see page 935)

IActionFieldValues (see page 925)

IAdapterModes (see page 944)

IAdapterRecordKeys (see page 949)

TCustomAdapter

7.2.10.1 IAdapterRequestParams Members

The following tables list the members exposed by IAdapterRequestParams.

Public Methods

	Name	Description
	AssignTo (see page 954)	Fills a string list to contain the name/value pairs from the HTTP request message.
	GetParamCount (see page 954)	Returns the value of the ParamCount (see page 956) property.
	GetParamName (see page 954)	Returns the value of the ParamNames (see page 956) property.
	GetParamValue (see page 955)	Returns the value of the ParamValues (see page 957) property.
	IndexOfParam (see page 955)	Returns the index of a specified name/value pair given its name.
	ValueOfParam (see page 955)	Returns the value associated with a specified name.

Public Properties

	Name	Description
R	ParamCount (see page 956)	Indicates the number of name/value pairs that can be accessed using this interface.
R	ParamNames (see page 956)	Lists the names of the name/value pairs that can be accessed using this interface.
R	ParamValues (see page 957)	Lists the values of the name/value pairs that can be accessed using this interface.

7.2.10.2 IAdapterRequestParams Methods

The methods of the IAdapterRequestParams class are listed here.

Public Methods

	Name	Description
	AssignTo (see page 954)	Fills a string list to contain the name/value pairs from the HTTP request message.
	GetParamCount (see page 954)	Returns the value of the ParamCount (see page 956) property.
	GetParamName (see page 954)	Returns the value of the ParamNames (see page 956) property.
	GetParamValue (see page 955)	Returns the value of the ParamValues (see page 957) property.
	IndexOfParam (see page 955)	Returns the index of a specified name/value pair given its name.
	ValueOfParam (see page 955)	Returns the value associated with a specified name.

7.2.10.2.1 IAdapterRequestParams.AssignTo Method

Fills a string list to contain the name/value pairs from the HTTP request message.

Pascal

```
procedure AssignTo(AStrings: TStrings);
```

C++

```
__fastcall AssignTo(TStrings AStrings);
```

Description

AssignTo replaces the content of a string list with strings of the form 'Name=Value', where Name and Value represent the names and values of name/value pairs extracted from the HTTP request message. After a call to AssignTo, the string list contains the same information that this interface makes available.

AStrings is the string list to fill with the name/value pairs from the HTTP request.

See Also

ParamNames (see page 956)

ParamValues (see page 957)

7.2.10.2.2 IAdapterRequestParams.GetParamCount Method

Returns the value of the ParamCount (see page 956) property.

Pascal

```
function GetParamCount: Integer;
```

C++

```
__fastcall int GetParamCount();
```

Description

GetParamCount is the read implementation of the ParamCount (see page 956) property.

See Also

ParamCount (see page 956)

7.2.10.2.3 IAdapterRequestParams.GetParamName Method

Returns the value of the ParamNames (see page 956) property.

Pascal

```
function GetParamName(I: Integer): string;
```

C++

```
__fastcall AnsiString GetParamName(int I);
```

Description

GetParamName is the read implementation of the ParamNames (see page 956) property.

I is the index of the name to retrieve.

See Also

ParamNames (see page 956)

7.2.10.2.4 IAdapterRequestParams.GetParamValue Method

Returns the value of the ParamValues (see page 957) property.

Pascal

```
function GetParamValue(I: Integer): string;
```

C++

```
__fastcall AnsiString GetParamValue(int I);
```

Description

GetParamValue is the read implementation of the ParamValues (see page 957) property.

I is the index of the value to retrieve.

See Also

ParamValues (see page 957)

7.2.10.2.5 IAdapterRequestParams.IndexOfParam Method

Returns the index of a specified name/value pair given its name.

Pascal

```
function IndexOfParam(const AName: string): Integer;
```

C++

```
__fastcall int IndexOfParam(const AnsiString AName);
```

Description

IndexOfParam returns the index of the value associated with a specified name. This method performs the reverse lookup from reading the ParamNames (see page 956) property.

AName is the name of the name/value pair to locate.

IndexOfParam returns the index for the specified name/value pair. This index identifies the position of the pair in the ParamNames (see page 956) and ParamValues (see page 957) property arrays. If the current HTTP request does not include a name/value pair with the specified name, IndexOfParam returns –1.

See Also

ParamNames (see page 956)

ValueOfParam (see page 955)

ParamValues (see page 957)

7.2.10.2.6 IAdapterRequestParams.ValueOfParam Method

Returns the value associated with a specified name.

Pascal

```
function ValueOfParam(const AName: string): string;
```

C++

```
__fastcall AnsiString ValueOfParam(const AnsiString AName);
```

Description

ValueOfParam returns the value part of the name/value pair with the specified name. Use ValueOfParam to access a value by name rather than by index.

AName is the name part of the name/value pair.

ValueOfParam returns the associated value string. If the current HTTP request does not include a parameter with the specified name, ValueOfParam returns an empty string.

See Also

IndexOfParam (see page 955)

ParamValues (see page 957)

7.2.10.3 IAdapterRequestParams Properties

The properties of the IAdapterRequestParams class are listed here.

Public Properties

	Name	Description
R	ParamCount (see page 956)	Indicates the number of name/value pairs that can be accessed using this interface.
R	ParamNames (see page 956)	Lists the names of the name/value pairs that can be accessed using this interface.
R	ParamValues (see page 957)	Lists the values of the name/value pairs that can be accessed using this interface.

7.2.10.3.1 IAdapterRequestParams.ParamCount Property

Indicates the number of name/value pairs that can be accessed using this interface.

Pascal

```
property ParamCount: Integer;
```

C++

```
__property int ParamCount;
```

Description

Read ParamCount to determine how many name/value pairs you can extract from the current HTTP request. ParamCount provides an upper bound to the index on the ParamNames (see page 956) and ParamValues (see page 957) property arrays.

See Also

ParamNames (see page 956)

ParamValues (see page 957)

7.2.10.3.2 IAdapterRequestParams.ParamNames Property

Lists the names of the name/value pairs that can be accessed using this interface.

Pascal

```
property ParamNames [I: Integer]: string;
```

C++

```
__property AnsiString ParamNames[int I];
```

Description

Read ParamNames to obtain the name parts of the name/value pairs you can extract from the current HTTP request.

I is the index of the name/value pair, where 0 indicates the first pair, 1 indicates the second pair, and so on. The ParamCount (see page 956) property provides an upper bound for this index.

Use ParamNames when iterating over all the name/value pairs in the request. To obtain the value of a specified parameter given its name, use the ValueOfParam (see page 955) method.

See Also

ParamCount (see page 956)

ParamValues (see page 957)

IndexOfParam (see page 955)

ValueOfParam (see page 955)

7.2.10.3.3 IAdapterRequestParams.ParamValues Property

Lists the values of the name/value pairs that can be accessed using this interface.

Pascal

```
property ParamValues [I: Integer]: string;
```

C++

```
__property AnsiString ParamValues[int I];
```

Description

Read ParamValues to access the value of a name/value pair given its position.

I is the index of the name/value pair, where 0 indicates the first pair, 1 indicates the second pair, and so on. The ParamCount (see page 956) property provides an upper bound for this index.

Tip: Use the ParamNames (see page 956) property to determine the name associated with a specified index.

Use ParamValues when iterating over all the name/value pairs in the request. To obtain the value for a specific name, use the ValueOfParam (see page 955) method instead.

See Also

ParamCount (see page 956)

ParamNames (see page 956)

ValueOfParam (see page 955)

7.2.11 IEnumActionFieldValueRecords Interface

IEnumActionFieldValueRecords is the interface for iterating over the data in an HTTP request for each of several adapter records.

Class Hierarchy

AdaptReq.IEnumActionFieldValueRecords

Pascal

```
IEnumActionFieldValueRecords = interface;
```

C++

```
__interface IEnumActionFieldValueRecords;
```

File

AdaptReq

Description

Use IEnumActionFieldValueRecords when extracting information from an HTTP request message for an adapter that supports multiple records of information. Typically, this interface is used to process requests from HTML forms that use a grid to represent information from an adapter.

You can obtain an IEnumActionFieldValueRecords interface by casting (Delphi) or calling QueryInterface on (C++) the interface that is the AdapterRequest property of the global Web context.

IEnumActionFieldValueRecords includes methods to "position" the request on a particular record. Once the request is positioned on a record, the IActionFieldValues (see page 925) interfaces gives the values of adapter fields for that record only. After processing those values, use IEnumActionFieldValueRecords to position the request on the next record.

See Also

IActionRequest (see page 935)

IAdapterModes (see page 944)

IAdapterRecordKeys (see page 949)

IAdapterRequestParams (see page 952)

IImageRequest (see page 965)

TAbstractWebContext (see page 24644)

WebContext

IActionFieldValues (see page 925)

7.2.11.1 IEnumActionFieldValueRecords Members

The following tables list the members exposed by IEnumActionFieldValueRecords.

Public Methods

	Name	Description
	EndIterator (see page 959)	Cleans up after iterating over the records in the request.
	FindPopulatedRecord (see page 959)	Detects whether any of the records of the request contain data.
	GetEOF (see page 960)	Returns the value of the EOF property.
	GetFirstRecord (see page 960)	Positions the request on the first record.
	GetInIterator (see page 960)	Returns the value of the InIterator (see page 962) property.
	GetNextRecord (see page 961)	Repositions the request on the next record.
	GetRecord (see page 961)	Positions the request on a specified record.
	GetRecordCount (see page 962)	Returns the value of the RecordCount (see page 963) property.

Public Properties

	Name	Description
R	Eof (see page 962)	This is Eof, a member of class IEnumActionFieldValueRecords.
R	InIterator (see page 962)	Indicates whether the request is explicitly positioned on an adapter record.
R	RecordCount (see page 963)	Indicates the number of records of information the request contains.

7.2.11.2 IEnumActionFieldValueRecords Methods

The methods of the IEnumActionFieldValueRecords class are listed here.

Public Methods

	Name	Description
	EndIterator (see page 959)	Cleans up after iterating over the records in the request.
	FindPopulatedRecord (see page 959)	Detects whether any of the records of the request contain data.
	GetEOF (see page 960)	Returns the value of the EOF property.
	GetFirstRecord (see page 960)	Positions the request on the first record.
	GetInIterator (see page 960)	Returns the value of the InIterator (see page 962) property.
	GetNextRecord (see page 961)	Repositions the request on the next record.
	GetRecord (see page 961)	Positions the request on a specified record.
	GetRecordCount (see page 962)	Returns the value of the RecordCount (see page 963) property.

7.2.11.2.1 IEnumActionFieldValueRecords.EndIterator Method

Cleans up after iterating over the records in the request.

Pascal

```
procedure EndIterator;
```

C++

```
__fastcall EndIterator();
```

Description

Call EndIterator when you are finished iterating over the records in the HTTP request. EndIterator performs all necessary cleanup, and sets the InIterator (see page 962) property to false.

See Also

InIterator (see page 962)

7.2.11.2.2 IEnumActionFieldValueRecords.FindPopulatedRecord Method

Detects whether any of the records of the request contain data.

Pascal

```
function FindPopulatedRecord: Boolean;
```

C++

```
__fastcall Boolean FindPopulatedRecord();
```

Description

Call FindPopulatedRecord to determine whether any of the records on which you can position the request contain field values. FindPopulatedRecord returns true if there is at least one record on which you can position the request and then obtain a non-empty IActionFieldValues (see page 925) interface.

See Also

IActionFieldValues (see page 925)

7.2.11.2.3 IEnumActionFieldValueRecords.GetEOF Method

Returns the value of the EOF property.

Pascal

```
function GetEOF: Boolean;
```

C++

```
__fastcall Boolean GetEOF();
```

Description

GetEOF is the read implementation of the EOF property.

See Also

EOF (see page 962)

7.2.11.2.4 IEnumActionFieldValueRecords.GetFirstRecord Method

Positions the request on the first record.

Pascal

```
function GetFirstRecord: Boolean;
```

C++

```
__fastcall Boolean GetFirstRecord();
```

Description

Call GetFirstRecord to start iterating over the records in the HTTP request. GetFirstRecord positions the request on the first record. That is, after a call to GetFirstRecord, if you obtain an IActionFieldValues (see page 925) interface for the request, it will extract the field values for the first record.

GetFirstRecord returns true if it successfully positions the request on the first record and sets the InIterator (see page 962) property to true. GetFirstRecord returns false if it is unable to position the request on the first record. When GetFirstRecord returns false, the value of the InIterator (see page 962) property is false, and the value of the EOF property is true.

See Also

InIterator (see page 962)

GetNextRecord (see page 961)

GetRecord (see page 961)

IActionFieldValues (see page 925)

7.2.11.2.5 IEnumActionFieldValueRecords.GetInIterator Method

Returns the value of the InIterator (see page 962) property.

Pascal

```
function GetInIterator: Boolean;
```

C++

```
__fastcall Boolean GetInIterator();
```

Description

GetInIterator is the read implementation of the InIterator (see page 962) property.

See Also

InIterator (see page 962)

7.2.11.2.6 IEnumActionFieldValueRecords.GetNextRecord Method

Repositions the request on the next record.

Pascal

```
function GetNextRecord: Boolean;
```

C++

```
__fastcall Boolean GetNextRecord();
```

Description

Call GetNextRecord to move to the next record of the request. After a call to GetNextRecord, if you obtain an IActionFieldValues (see page 925) interface for the request, it will extract the field values for the next record.

GetNextRecord returns true if it successfully positions the request on the next record. GetNextRecord returns false if it is unable to position the request on the next record. When GetFirstRecord (see page 960) returns false, the value of the InIterator (see page 962) property is false, and the value of the EOF property is true.

See Also

GetFirstRecord (see page 960)

GetRecord (see page 961)

EOF (see page 962)

IActionFieldValues (see page 925)

7.2.11.2.7 IEnumActionFieldValueRecords.GetRecord Method

Positions the request on a specified record.

Pascal

```
function GetRecord(AIndex: Integer): Boolean;
```

C++

```
__fastcall Boolean GetRecord(int AIndex);
```

Description

Call GetRecord to move to a specified record of the request. After a call to GetRecord, if you obtain an IActionFieldValues (see page 925) interface for the request, it will extract the field values for the specified record.

AIndex is the index of the record to which you want to move, where 0 specifies the first record, 1 specifies the second record, and so on. AIndex should be less than the value of the RecordCount (see page 963) property.

GetRecord returns true if it successfully positions the request on the specified record. GetRecord returns false if it is unable to position the request on the specified record.

See Also

RecordCount (see page 963)

GetFirstRecord (see page 960)

GetNextRecord (see page 961)

IActionFieldValues (see page 925)

7.2.11.2.8 IEnumActionFieldValueRecords.GetRecordCount Method

Returns the value of the RecordCount (see page 963) property.

Pascal

```
function GetRecordCount: Integer;
```

C++

```
__fastcall int GetRecordCount();
```

Description

GetRecordCount is the read implementation of the RecordCount (see page 963) property.

See Also

RecordCount (see page 963)

7.2.11.3 IEnumActionFieldValueRecords Properties

The properties of the IEnumActionFieldValueRecords class are listed here.

Public Properties

	Name	Description
R	Eof (see page 962)	This is Eof, a member of class IEnumActionFieldValueRecords.
R	InIterator (see page 962)	Indicates whether the request is explicitly positioned on an adapter record.
R	RecordCount (see page 963)	Indicates the number of records of information the request contains.

7.2.11.3.1 IEnumActionFieldValueRecords.Eof Property

Pascal

```
property Eof: Boolean;
```

C++

```
__property Boolean Eof;
```

Description

This is Eof, a member of class IEnumActionFieldValueRecords.

7.2.11.3.2 IEnumActionFieldValueRecords.InIterator Property

Indicates whether the request is explicitly positioned on an adapter record.

Pascal

```
property InIterator: Boolean;
```

C++

```
__property Boolean InIterator;
```

Description

Read InIterator to determine whether the request is currently iterating over the records of information. InIterator is first set to true when you call the GetFirstRecord (see page 960) method to position the request on the first record. It remains true until you position the request on the last record (until the EOF property becomes true) or until you call the EndIterator (see page 959) method to stop iterating.

Note: In the degenerate case where RecordCount (see page 963) is 0, InIterator is always false, even after a call to GetFirstRecord (see page 960).

See Also

GetFirstRecord (see page 960)

EndIterator (see page 959)

EOF (see page 962)

RecordCount (see page 963)

7.2.11.3.3 IEnumActionFieldValueRecords.RecordCount Property

Indicates the number of records of information the request contains.

Pascal

```
property RecordCount: Integer;
```

C++

```
__property int RecordCount;
```

Description

Read RecordCount to determine the number of records on which you can position the request. After a call to the GetFirstRecord (see page 960) method, this is the number of times you can call GetNextRecord (see page 961) before the EOF property becomes true.

See Also

GetNextRecord (see page 961)

GetFirstRecord (see page 960)

EOF (see page 962)

7.2.12 IGetAdapterActionRedirectOptions Interface

Class Hierarchy

AdaptReq.IGetAdapterActionRedirectOptions

Pascal

```
IGetAdapterActionRedirectOptions = interface;
```

C++

```
__interface IGetAdapterActionRedirectOptions;
```

File

AdaptReq

Description

This is class AdaptReq.IGetAdapterActionRedirectOptions.

7.2.12.1 IGetAdapterActionRedirectOptions Members

The following tables list the members exposed by IGetAdapterActionRedirectOptions.

Public Methods

	Name	Description
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.

Public Properties

	Name	Description
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.

7.2.12.2 IGetAdapterActionRedirectOptions Methods

The methods of the IGetAdapterActionRedirectOptions class are listed here.

Public Methods

	Name	Description
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.

7.2.12.2.1 IGetAdapterActionRedirectOptions.GetFailureOptions Method

Pascal

```
function GetFailureOptions: TAdapterActionRedirectOptions;
```

C++

```
__fastcall TAdapterActionRedirectOptions GetFailureOptions();
```

Description

This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.

7.2.12.2.2 IGetAdapterActionRedirectOptions.GetSuccessOptions Method

Pascal

```
function GetSuccessOptions: TAdapterActionRedirectOptions;
```

C++

```
__fastcall TAdapterActionRedirectOptions GetSuccessOptions();
```

Description

This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.

7.2.12.3 IGetAdapterActionRedirectOptions Properties

The properties of the IGetAdapterActionRedirectOptions class are listed here.

Public Properties

	Name	Description
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.

7.2.12.3.1 IGetAdapterActionRedirectOptions.FailureOptions Property

Pascal

```
property FailureOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions FailureOptions;
```

Description

This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.

7.2.12.3.2 IGetAdapterActionRedirectOptions.SuccessOptions Property

Pascal

```
property SuccessOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions SuccessOptions;
```

Description

This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.

7.2.13 IImageRequest Interface

IImageRequest is the interface for extracting the name of a requested image from an HTTP request message.

Class Hierarchy

AdaptReq.IImageRequest

Pascal

```
IImageRequest = interface;
```

C++

```
__interface IImageRequest;
```

File

AdaptReq

Description

Use IImageRequest to obtain the name of the image that an HTTP request message requests. You can obtain an IImageRequest interface by casting (Delphi) or calling QueryInterface on (C++) the interface that is the AdapterRequest property of the global Web context.

See Also

IActionRequest (see page 935)

IAdapterRequestParams (see page 952)

IAdapterModes (see page 944)

IAdapterRecordKeys (see page 949)

TAbstractWebContext (see page 24644)

WebContext

IEnumActionFieldValueRecords (see page 957)

7.2.13.1 IImageRequest Members

The following tables list the members exposed by IImageRequest.

Public Methods

	Name	Description
	GetImageName (see page 966)	Returns the value of the ImageName (see page 967) property.

Public Properties

	Name	Description
R	ImageName (see page 967)	Indicates the name of the requested image.

7.2.13.2 IImageRequest Methods

The methods of the IImageRequest class are listed here.

Public Methods

	Name	Description
	GetImageName (see page 966)	Returns the value of the ImageName (see page 967) property.

7.2.13.2.1 IImageRequest.GetImageName Method

Returns the value of the ImageName (see page 967) property.

Pascal

```
function GetImageName: string;
```

C++

```
__fastcall AnsiString GetImageName();
```

Description

GetImageName is the read implementation of the ImageName (see page 967) property.

See Also

ImageName (see page 967)

7.2.13.3 IImageRequest Properties

The properties of the IImageRequest class are listed here.

Public Properties

	Name	Description
R	ImageName (see page 967)	Indicates the name of the requested image.

7.2.13.3.1 IImageRequest.ImageName Property

Indicates the name of the requested image.

Pascal

```
property ImageName: string;
```

C++

```
__property AnsiString ImageName;
```

Description

Read ImageName to obtain the name of the image that the HTTP request message requests.

7.2.14 IImageResponse Interface

Class Hierarchy

AdaptReq.IImageResponse

Pascal

```
IImageResponse = interface;
```

C++

```
__interface IImageResponse;
```

File

AdaptReq

Description

This is class AdaptReq.IImageResponse.

7.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	ExtractStringValue (see page 968)	This is function AdaptReq.ExtractStringValue.
	TestRedirectOptions (see page 968)	This is function AdaptReq.TestRedirectOptions.

7.3.1 AdaptReq.ExtractStringValue Function

Pascal

```
function ExtractStringValue(const S: string): string;
```

C++

```
AnsiString ExtractStringValue(const AnsiString S);
```

File

AdaptReq

Description

This is function AdaptReq.ExtractStringValue.

7.3.2 AdaptReq.TestRedirectOptions Function

Pascal

```
function TestRedirectOptions(AOptions: TAdapterActionRedirectOptions; AMethodType:
TMethodType): Boolean;
```

C++

```
Boolean TestRedirectOptions(TAdapterActionRedirectOptions AOptions, TMethodType AMethodType);
```

File

AdaptReq

Description

This is function AdaptReq.TestRedirectOptions.

7.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAdapterActionRedirectOption (see page 969)	This is record AdaptReq.TAdapterActionRedirectOption.
	TExecuteStatus (see page 969)	This is record AdaptReq.TExecuteStatus.
	TRespondWith (see page 970)	This is record AdaptReq.TRespondWith.

7.4.1 AdaptReq.TAdapterActionRedirectOption Enumeration

Pascal

```
TAdapterActionRedirectOption = (
  roRedirectHTTPPost,
  roRedirectHTTPGet
);
```

C++

```
enum TAdapterActionRedirectOption {
  roRedirectHTTPPost,
  roRedirectHTTPGet
};
```

File

AdaptReq

Description

This is record AdaptReq.TAdapterActionRedirectOption.

7.4.2 AdaptReq.TExecuteStatus Enumeration

Pascal

```
TExecuteStatus = (
  esSuccess,
  esFail,
  esUndefined,
  esOther
);
```

C++

```
enum TExecuteStatus {
  esSuccess,
  esFail,
  esUndefined,
  esOther
};
```

File

AdaptReq

Description

This is record AdaptReq.TExecuteStatus.

7.4.3 AdaptReq.TRespondWith Enumeration

Pascal

```
TRespondWith = (
  rwPage,
  rwURL,
  rwComponentPage,
  rwUndefined
);
```

C++

```
enum TRespondWith {
  rwPage,
  rwURL,
  rwComponentPage,
  rwUndefined
};
```

File

AdaptReq

Description

This is record AdaptReq.TRespondWith.

7.5 Types

The following table lists types in this documentation.

Types

Name	Description
TAdapterActionRedirectOptions (see page 971)	This is type AdaptReq.TAdapterActionRedirectOptions.

7.5.1 AdaptReq.TAdapterActionRedirectOptions Type

Pascal

```
TAdapterActionRedirectOptions = set of TAdapterActionRedirectOption;
```

C++

```
TAdapterActionRedirectOption TAdapterActionRedirectOptions;
```

File

AdaptReq

Description

This is type AdaptReq.TAdapterActionRedirectOptions.

7.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
roRedirect (see page 972)	This is constant AdaptReq.roRedirect.
sActionRequest (see page 972)	This is constant AdaptReq.sActionRequest.
sDelimAdapterMode (see page 973)	This is constant AdaptReq.sDelimAdapterMode.
sDelimOrigFieldValue (see page 973)	This is constant AdaptReq.sDelimOrigFieldValue.
sDelimRecordKeys (see page 973)	This is constant AdaptReq.sDelimRecordKeys.

7.6.1 AdaptReq.roRedirect Constant

Pascal

```
roRedirect = [roRedirectHTTPPost, roRedirectHTTPGet];
```

C++

```
roRedirect = [roRedirectHTTPPost, roRedirectHTTPGet];
```

File

AdaptReq

Description

This is constant AdaptReq.roRedirect.

7.6.2 AdaptReq.sActionRequest Constant

Pascal

```
sActionRequest = '__act';
```

C++

```
sActionRequest = '__act';
```

File

AdaptReq

Description

This is constant AdaptReq.sActionRequest.

7.6.3 AdaptReq.sDelimAdapterMode Constant

Pascal

```
sDelimAdapterMode = '__am.';
```

C++

```
sDelimAdapterMode = '__am.';
```

File

AdaptReq

Description

This is constant AdaptReq.sDelimAdapterMode.

7.6.4 AdaptReq.sDelimOrigFieldValue Constant

Pascal

```
sDelimOrigFieldValue = '__ov.';
```

C++

```
sDelimOrigFieldValue = '__ov.';
```

File

AdaptReq

Description

This is constant AdaptReq.sDelimOrigFieldValue.

7.6.5 AdaptReq.sDelimRecordKeys Constant

Pascal

```
sDelimRecordKeys = '__key.';
```

C++

```
sDelimRecordKeys = '__key.';
```

File

AdaptReq

Description

This is constant AdaptReq.sDelimRecordKeys.

8 ADODB Namespace

This is namespace ADODB.

Topics

Name	Description
Classes (see page 978)	The following table lists classes in this documentation.
Functions (see page 1286)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 1289)	The following table lists structs, records, enums in this documentation.
Types (see page 1310)	The following table lists types in this documentation.

Classes

	Name	Description
	EADOError (see page 978)	EADOError is the exception class for database errors generated by ADO databases.
	TADOBlobStream (see page 979)	TADOBlobStream is a stream object that reads from and writes to field objects that represent Binary large object (BLOB) fields.
	TADOCommand (see page 984)	TADOCommand represents an ADO command object.
	TADOConnection (see page 1001)	TADOConnection connects to an ADO data store.
	TADODataSet (see page 1041)	TADODataSet represents a dataset retrieved from an ADO data store.
	TADOQuery (see page 1084)	TADOQuery provides the means for issuing SQL (see page 1105) against an ADO data store.
	TADOStoredProc (see page 1106)	TADOStoredProc encapsulates a stored procedure in an ADO database.
	TADOTable (see page 1125)	TADOTable is a dataset component that encapsulates a table accessed through an ADO data store.
	TCustomADODataSet (see page 1145)	TCustomADODataSet is the virtualized base class for all ADO dataset components.
	TParameter (see page 1250)	TParameter represents a parameter.
	TParameters (see page 1261)	TParameters manages a collection of parameters.
	TRDSConnection (see page 1274)	TRDSConnection implements an RDS DataSpace object.

Functions

	Name	Description
	CreateUDLFile (see page 1286)	This is function ADODB.CreateUDLFile.
	DataLinkDir (see page 1286)	This is function ADODB.DataLinkDir.
	GetDataLinkFiles (see page 1287)	This is function ADODB.GetDataLinkFiles.
	GetDataLinkFiles (see page 1287)	This is function ADODB.GetDataLinkFiles.
	GetProviderNames (see page 1287)	This is function ADODB.GetProviderNames.

	GetProviderNames (see page 1288)	This is function ADODB.GetProviderNames.
	PromptDataLinkFile (see page 1288)	This is function ADODB.PromptDataLinkFile.
	PromptDataSource (see page 1288)	This is function ADODB.PromptDataSource.

Structs, Records, Enums

	Name	Description
	TADOLockType (see page 1289)	TADOLockType specifies the types of locks used.
	TAffectRecords (see page 1290)	This is record ADODB.TAffectRecords.
	TCommandType (see page 1291)	TCommandType values designate the type of a command.
	TConnectMode (see page 1292)	TConnectMode values indicate the persimissions available to a connection.
	TConnectOption (see page 1293)	TConnectOption indicates whether the connection to the ADO data store is synchronous or asynchronous.
	TCursorLocation (see page 1293)	TCursorLocation values specify whether to use client-side or server-side cursor library.
	TCursorOption (see page 1294)	TCursorOptions (see page 1314) values indicate the functionality a recordset provides.
	TCursorType (see page 1295)	TCursorType valies indicate the type of cursor to use for a recordset.
	TEventReason (see page 1296)	TEventReason values indicate the reason an event occurred.
	TEventStatus (see page 1298)	TEventStatus values indicate the success or failure of an operation.
	TExecuteOption (see page 1299)	This is record ADODB.TExecuteOption.
	TFilterGroup (see page 1299)	This is record ADODB.TFilterGroup.
	TIsolationLevel (see page 1300)	TIsolationLevel values specify the level of isolation for a connection.
	TMarshalOption (see page 1301)	This is record ADODB.TMarshalOption.
	TObjectState (see page 1302)	This is record ADODB.TObjectState.
	TParameterAttribute (see page 1302)	This is record ADODB.TParameterAttribute.
	TParameterDirection (see page 1303)	TParameterDirection specifies the direction of a parameter.
	TPersistFormat (see page 1303)	TPersistFormat values indicate the format for a saved recordset.
	TRecordStatus (see page 1304)	This is record ADODB.TRecordStatus.
	TSchemaInfo (see page 1305)	TSchemaInfo values indicate the type of schema information to retrieve.
	TSeekOption (see page 1308)	This is record ADODB.TSeekOption.
	TXactAttribute (see page 1308)	TXactAttribute values specify automated transaction behavior.

Types

Name	Description
_Command (see page 1310)	This is type ADODB._Command.
_Connection (see page 1311)	This is type ADODB._Connection.
_Parameter (see page 1311)	This is type ADODB._Parameter.
_Recordset (see page 1311)	This is type ADODB._Recordset.
Error (see page 1312)	This is type ADODB.Error.
Errors (see page 1312)	This is type ADODB.Errors.
Parameters (see page 1312)	This is type ADODB.Parameters.
Properties (see page 1313)	This is type ADODB.Properties.
Property_ (see page 1313)	This is type ADODB.Property_.
PVariantList (see page 1313)	This is type ADODB.PVariantList.
TBeginTransCompleteEvent (see page 1314)	This is type ADODB.TBeginTransCompleteEvent.
TConnectErrorEvent (see page 1314)	This is type ADODB.TConnectErrorEvent.
TCursorOptions (see page 1314)	This is type ADODB.TCursorOptions.
TDataType (see page 1315)	TDataType indicates the type of a parameter.
TDisconnectEvent (see page 1315)	This is type ADODB.TDisconnectEvent.
TEndOfRecordsetEvent (see page 1315)	This is type ADODB.TEndOfRecordsetEvent.
TExecuteCompleteEvent (see page 1316)	This is type ADODB.TExecuteCompleteEvent.
TExecuteOptions (see page 1316)	TExecuteOptions values specify the characteristics of an execution operation.
TFetchProgressEvent (see page 1317)	This is type ADODB.TFetchProgressEvent.
TFieldChangeCompleteEvent (see page 1317)	This is type ADODB.TFieldChangeCompleteEvent.
TInfoMessageEvent (see page 1317)	This is type ADODB.TInfoMessageEvent.

TObjectStates (see page 1318)	TObjectStates values indicate the current state of an ADO object.
TParameterAttributes (see page 1318)	TParameterAttributes values indicate the types of values a parameter can accept.
TPropList (see page 1319)	This is type ADODB.TPropList.
TRecordChangeCompleteEvent (see page 1319)	This is type ADODB.TRecordChangeCompleteEvent.
TRecordsetCreate (see page 1320)	This is type ADODB.TRecordsetCreate.
TRecordsetErrorEvent (see page 1320)	This is type ADODB.TRecordsetErrorEvent.
TRecordsetEvent (see page 1320)	This is type ADODB.TRecordsetEvent.
TRecordsetReasonEvent (see page 1321)	This is type ADODB.TRecordsetReasonEvent.
TRecordStatusSet (see page 1321)	TRecordStatusSet values indicate the status of the current record relative to batch updates or other bulk operations
TVariantList (see page 1322)	This is type ADODB.TVariantList.
TWillChangeFieldEvent (see page 1322)	This is type ADODB.TWillChangeFieldEvent.
TWillChangeRecordEvent (see page 1323)	This is type ADODB.TWillChangeRecordEvent.
TWillConnectEvent (see page 1323)	This is type ADODB.TWillConnectEvent.
TWillExecuteEvent (see page 1323)	This is type ADODB.TWillExecuteEvent.
TXactAttributes (see page 1324)	This is type ADODB.TXactAttributes.

8.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EADOError (see page 978)	EADOError is the exception class for database errors generated by ADO databases.
	TADOBlobStream (see page 979)	TADOBlobStream is a stream object that reads from and writes to field objects that represent Binary large object (BLOB) fields.
	TADOCommand (see page 984)	TADOCommand represents an ADO command object.
	TADOConnection (see page 1001)	TADOConnection connects to an ADO data store.
	TADODataSet (see page 1041)	TADODataSet represents a dataset retrieved from an ADO data store.
	TADOQuery (see page 1084)	TADOQuery provides the means for issuing SQL (see page 1105) against an ADO data store.
	TADOStoredProc (see page 1106)	TADOStoredProc encapsulates a stored procedure in an ADO database.
	TADOTable (see page 1125)	TADOTable is a dataset component that encapsulates a table accessed through an ADO data store.
	TCustomADODataSet (see page 1145)	TCustomADODataSet is the virtualized base class for all ADO dataset components.
	TParameter (see page 1250)	TParameter represents a parameter.
	TParameters (see page 1261)	TParameters manages a collection of parameters.
	TRDSConnection (see page 1274)	TRDSConnection implements an RDS DataSpace object.

8.1.1 EADOError Class

EADOError is the exception class for database errors generated by ADO databases.

Class Hierarchy

Pascal

```
EADOError = class(EDatabaseError);
```

C++

```
class EADOError : public EDatabaseError;
```

File

ADODB

Description

An EADOError exception is raised when a component detects a database error. Use EADOError in an exception handling block or to create a database exception.

See Also

TDataSet (see page 6894)

DatabaseError

EDatabaseError (see page 6731)

8.1.2 TADOBlobStream Class

TADOBlobStream is a stream object that reads from and writes to field objects that represent Binary large object (BLOB) fields.

Class Hierarchy

Pascal

```
TADOBlobStream = class(TMemoryStream);
```

C++

```
class TADOBlobStream : public TMemoryStream;
```

File

ADODB

Description

Use TADOBlobStream to access or modify the value of a BLOB or memo field in an ADO dataset. BLOB fields are represented by TBlobField objects and descendants of TBlobField such as TGraphicField and TMemoField.

TADOBlobStream allows objects that have no specialized knowledge of how data is stored in a BLOB field (raw binary data) to read or write such data by employing the uniform stream interface.

To use an ADO BLOB stream, create an instance of TADOBlobStream, use the methods of the stream to read or write the data, and then free the BLOB stream. Do not use the same instance of TADOBlobStream to access data from more than one record. Instead, create a new TADOBlobStream object every time you need to read or write BLOB data on a new record.

Use the Read method to copy the data from BLOB field object to a null-terminated string (or comparable) buffer. Use the Write (see page 983) method to copy from buffer to BLOB field object. When reading data from the BLOB field object, use the Size property to determine the volume of the field's contents and to allocate the correct amount of space in memory for the receiving buffer.

8.1.2.1 TADOBlobStream Members

The following tables list the members exposed by TADOBlobStream.

Protected Methods

	Name	Description
	GetSize (see page 2982)	This is GetSize, a member of class TStream.
	ReadBlobData (see page 982)	This is ReadBlobData, a member of class TADOBlobStream.

	Realloc (see page 982)	This is Realloc, a member of class TADOBlobStream.
	SetPointer (see page 2823)	Replaces the memory buffer associated with the memory stream.
	SetSize (see page 2989)	This is the overview for the SetSize method overload.

Protected Properties

	Name	Description
	Capacity (see page 2912)	This is Capacity, a member of class TMemoryStream.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2909)	Frees the memory buffer, discarding all data associated with the memory stream.
	CopyFrom (see page 2979)	Copies a specified number of bytes from one stream to another.
	Create (see page 981)	Creates a new TADOBlobStream (see page 979) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 981)	Destroys an instance of TADOBlobStream (see page 979).
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FixupResourceHeader (see page 2981)	Patches the resource header for a resource that has been written to the stream.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	LoadFromFile (see page 2909)	Loads the entire contents of a file into the memory buffer.
	LoadFromStream (see page 2909)	Loads the entire contents of a stream into the memory buffer.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Read (see page 2817)	Reads up to Count bytes from the memory stream into Buffer and advances the current position of the stream by the number of bytes read.
	Read (see page 2982)	Introduces an abstract or pure virtual method responsible for reading from the stream.
	ReadBuffer (see page 2983)	Reads bytes from the stream into Buffer.
	ReadComponent (see page 2983)	Initiates streaming of components and their properties.
	ReadComponentRes (see page 2987)	Reads components and their properties from a stream in a resource file format.
	ReadResHeader (see page 2987)	Reads a resource-file header from the stream.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 2818)	Writes the entire contents of the memory stream to the file with a given file name.

	SaveToStream (see page 2818)	Writes the entire contents of the memory stream to the stream object specified by Stream.
V	Seek (see page 2819)	Moves the current position of the stream by Offset bytes, relative to the origin specified by Origin.
V	Seek (see page 2988)	This is the overview for the Seek method overload.
V	SetSize (see page 2910)	Sets the Size (see page 2997) property of the memory stream.
	Truncate (see page 983)	Discards all data in the BLOB field from the current position on.
V	Write (see page 983)	Writes data from a memory buffer to a BLOB field object.
	WriteBuffer (see page 2990)	Writes Count bytes from Buffer onto the stream and advances the current position of the stream by Count bytes.
	WriteComponent (see page 2990)	Initiates the writing of components and their properties to a stream.
	WriteComponentRes (see page 2994)	Writes components and their properties to a stream from a resource file format.
	WriteDescendent (see page 2994)	Streams components and their properties in inherited forms.
	WriteDescendentRes (see page 2995)	Streams components and their properties in inherited forms.
	WriteResourceHeader (see page 2995)	Writes a resource-file header to the stream.

Public Properties

	Name	Description
R	Memory (see page 2823)	Provides direct access to the memory pool allocated for the memory stream.
	Position (see page 2996)	Indicates the current offset into the stream for reading and writing.
	Size (see page 2997)	Indicates the size in bytes of the stream.

8.1.2.2 TADOBlobStream.Create Constructor

Creates a new TADOBlobStream (see page 979) object.

Pascal

```
constructor Create(Field: TBlobField; Mode: TBlobStreamMode);
```

C++

```
__fastcall TADOBlobStream(TBlobField Field, TBlobStreamMode Mode);
```

Description

Call Create to obtain an instance of TADOBlobStream (see page 979) for reading from or writing to a specific BLOB field object.

Create links the TADOBlobStream (see page 979) to the field object specified by the Field parameter. Mode specifies whether the BLOB stream will be used to read data (bmRead), write data (bmWrite) or modify data (bmReadWrite).

See Also

Destroy_d

8.1.2.3 TADOBlobStream.Destroy Destructor

Destroys an instance of TADOBlobStream (see page 979).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TADOBlobStream();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the TADOBlobStream (see page 979)

reference is not nil before calling Destroy.

Destroy a TADOBlobStream (see page 979) object when it is no longer needed to store or write data. Destroy calls Clear to free the memory buffer before calling the inherited destructor.

Destroy performs the following tasks:

Sets the field's data.

Changes the field object's Modified property to true.

Triggers a field change event in the field's dataset object.

Calls the inherited destructor.

Create_d

Free (see page 22300)

Modified (see page 6820)

8.1.2.4 TADOBlobStream Methods

The methods of the TADOBlobStream class are listed here.

Protected Methods

	Name	Description
	ReadBlobData (see page 982)	This is ReadBlobData, a member of class TADOBlobStream.
V	Realloc (see page 982)	This is Realloc, a member of class TADOBlobStream.

Public Methods

	Name	Description
	Truncate (see page 983)	Discards all data in the BLOB field from the current position on.
V	Write (see page 983)	Writes data from a memory buffer to a BLOB field object.

8.1.2.4.1 TADOBlobStream.ReadBlobData Method

Pascal

```
procedure ReadBlobData;
```

C++

```
__fastcall ReadBlobData();
```

Description

This is ReadBlobData, a member of class TADOBlobStream.

8.1.2.4.2 TADOBlobStream.Realloc Method

Pascal

```
function Realloc(var NewCapacity: Longint): Pointer; override;
```

C++

```
virtual __fastcall void * Realloc(Longint NewCapacity);
```

Description

This is Realloc, a member of class TADOBlobStream.

8.1.2.4.3 TADOBlobStream.Truncate Method

Discards all data in the BLOB field from the current position on.

Pascal

```
procedure Truncate;
```

C++

```
__fastcall Truncate();
```

Description

Use Truncate to limit the size of the data in the BLOB field. Calling Truncate when the current position is 0 will clear the contents of the BLOB field. If Position is other than zero, data is cleared from the point to the end of the field's data for the current record.

Note: Do not call Truncate when the TADOBlobStream (see page 979) was created in bmRead mode.

See Also

Position (see page 2996)

8.1.2.4.4 TADOBlobStream.Write Method

Writes data from a memory buffer to a BLOB field object.

Pascal

```
function Write(const Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  Buffer, Longint Count);
```

Description

Use Write to copy data from a null-terminated string (or comparable) buffer in memory to the BLOB field object. Write copies data from the buffer to the current position in the BLOB field object (current position indicated by the Position property). Write copies the number of bytes specified in Count or the number of bytes remaining in the memory buffer (counting from the current position to the end), whichever is less. Write can be called multiple times during the lifetime of a TADOBlobStream (see page 979), each call copying less than the total number of bytes to be copied.

Count represents the maximum number of bytes to copy in a single call to Write. Count may be less than, the same as, or greater than the number of bytes actually contained in the memory buffer. If Count is greater than the actual number of bytes present or remaining in the memory buffer, copying stops at the last byte. No penalty is incurred on exceptions generated by specifying a number greater than the actual size of the contents.

Write updates the Size property to Position + Count, and sets the Position property to the new value of Size. Thus, any data that was stored in the memory stream in the Count bytes after the current position is lost when calling Write.

After successful execution, Write returns the number of bytes copied to the BLOB field object. If the return value is less than Count, the most likely reason is that the end of the buffer was reached prior to copying the specified number of bytes.

```
var
  P: PChar;
  S: Integer;
  BS:TADOBlobStream;
begin
```

```
if not (ADOTable1.State in [dsEdit, dsInsert]) then
    ADOTable1.Edit;
  BS := TADOBlobStream.Create(TMemoField(ADOTable1.Fields[1]), bmWrite);
try
    S := Memo1.GetTextLen;
    Inc(S);
    P := AllocMem(S);
    FillChar(P^, S, #0);
    Memo1.GetTextBuf(P, S);
    BS.Write(P^, S);
finally
    BS.Free;
    FreeMem(P, S);
end;
end;
int S;
ADOTable1->Edit();
TADOBlobStream *BS = new TADOBlobStream(ADOTable1->Fields->Fields[1], bmWrite);
try
{
  S = Memo1->GetTextLen() + 1;
char *P = new char[S];
  Memo1->GetTextBuf(P, S);
  BS->Write(P.c_str(), P.Length());
}
__finally
{
delete BS;
}
```

8.1.3 TADOCommand Class

TADOCommand represents an ADO command object.

Class Hierarchy

Pascal

```
TADOCommand = class(TComponent);
```

C++

```
class TADOCommand : public TComponent;
```

File

ADODB

Description

The TADOCommand represents the ADO Command object. Use TADOCommand for issuing commands against a data store accessed through an ADO (ActiveX Data Objects) provider.

The TADOCommand component executes the command specified in its CommandText (see page 995) property. One command may be executed at a time. Parameters (see page 999), if the command includes them, are specified in its Parameters (see page 999) property. The command is executed by a call to the Execute (see page 992) method.

TADOCommand can either use a TADOConnection (see page 1001) object to connect to a data store (through its Connection (see page 997) property) or connect directly to the data store if the connection information is specified in the ConnectionString (see page 998) property.

TADOCommand is most often used for executing data definition language (DDL) SQL commands or to execute a stored procedure that does not return a result set. For SQL statements that return a result set, TADODataSet (see page 1041), TADOQuery (see page 1084), or TADOStoredProc (see page 1106) is better suited. The Execute (see page 992) method of TADOCommand is, however, capable of returning a recordset. To use that recordset, however, you will need a separate ADO dataset component.

As a close representation of the ADO Command object, many of the TADOCommand properties and methods have the same name as those of the ADO Command object and serve the same purpose. For example, the CommandType (see page 997) property and Execute (see page 992) methods are the same in both the TADOCommand component and ADO Command object. Note that subsequent versions of ADO may introduce changes in the underlying ADO command object, which will change the behavior of TADOCommand. As a result, you may want to view the Microsoft Data Store SDK documentation for additional information about the behavior of TADOCommand.

Overview of ADO Components

Using Command Objects

8.1.3.1 TADOCommand Members

The following tables list the members exposed by TADOCommand.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.

	_Release (see page 2769)	Called when an application releases a component interface.
	AssignCommandText (see page 990)	This is AssignCommandText, a member of class TADOCommand.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckCommandText (see page 991)	This is CheckCommandText, a member of class TADOCommand.
	ClearActiveConnection (see page 991)	This is ClearActiveConnection, a member of class TADOCommand.
	ComponentLoading (see page 992)	This is ComponentLoading, a member of class TADOCommand.
	ConnectionStateChange (see page 992)	This is ConnectionStateChange, a member of class TADOCommand.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Initialize (see page 993)	This is Initialize, a member of class TADOCommand.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	OpenConnection (see page 993)	This is OpenConnection, a member of class TADOCommand.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetCommandText (see page 994)	This is SetCommandText, a member of class TADOCommand.
	SetConnectionFlag (see page 994)	This is SetConnectionFlag, a member of class TADOCommand.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveConnection (see page 995)	This is ActiveConnection, a member of class TADOCommand.
	CommandTextAlias (see page 996)	This is CommandTextAlias, a member of class TADOCommand.
	ComponentRef (see page 997)	This is ComponentRef, a member of class TADOCommand.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 990)	Makes one ADO command component a duplicate of another.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	Cancel (see page 991)	Halts execution of an ADO command.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 988)	Constructs an instance of an ADO command component.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 989)	Destroys the command component.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 992)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	CommandObject (see page 995)	Provides direct access to the ADO command object.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Properties (see page 1000)	This is Properties, a member of class TADOCommand.
R	States (see page 1001)	Indicates the current state of the ADO command component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	CommandText (see page 995)	Specifies command to execute.
	CommandTimeout (see page 996)	Specifies the amount of time to attempt execution of the command.
	CommandType (see page 997)	Specifies the type of command to execute.
	Connection (see page 997)	Specifies ADO connection component to use.
	ConnectionString (see page 998)	Specifies the connection information for the database.
	ExecuteOptions (see page 999)	Specifies the characteristics of a command execution.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParamCheck (see page 999)	Specifies whether the parameter list for an ADO command component is regenerated if the SQL changes at runtime.
	Parameters (see page 999)	Contains the parameters for an ADO command object's SQL statement.
	Prepared (see page 1000)	Specifies whether the command is prepared before execution.
	Tag (see page 2808)	Stores an integer value as part of a component.

8.1.3.2 TADOCommand.Create Constructor

Constructs an instance of an ADO command component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TADOCommand(TComponent * AOwner);
```

Description

Use Create to programmatically instantiate an ADO command component. Command components added in the form designer are created automatically.

Create

Calls its inherited Create method.

Initializes the CommandObject (see page 995) property.

Initializes the Parameters (see page 999) property.

Sets the ParamCheck (see page 999) property to true.

See Also

Create_d

Destroy_d

8.1.3.3 TADOCommand.Destroy Destructor

Destroys the command component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TADOCommand();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the command component is not nil, and only then calls Destroy.

Destroy performs the following tasks:

Destroys the command object in the CommandObject (see page 995) property.

Destroys the parameter collection in the Parameters (see page 999) property.

Calls the inherited destructor.

See Also

Free (see page 22300)

8.1.3.4 TADOCommand Methods

The methods of the TADOCommand class are listed here.

Protected Methods

	Name	Description
	AssignCommandText (see page 990)	This is AssignCommandText, a member of class TADOCommand.
	CheckCommandText (see page 991)	This is CheckCommandText, a member of class TADOCommand.
	ClearActiveConnection (see page 991)	This is ClearActiveConnection, a member of class TADOCommand.

	ComponentLoading (see page 992)	This is ComponentLoading, a member of class TADOCommand.
	ConnectionStateChange (see page 992)	This is ConnectionStateChange, a member of class TADOCommand.
V	Initialize (see page 993)	This is Initialize, a member of class TADOCommand.
V	OpenConnection (see page 993)	This is OpenConnection, a member of class TADOCommand.
V	SetCommandText (see page 994)	This is SetCommandText, a member of class TADOCommand.
V	SetConnectionFlag (see page 994)	This is SetConnectionFlag, a member of class TADOCommand.

Public Methods

	Name	Description
V	Assign (see page 990)	Makes one ADO command component a duplicate of another.
	Cancel (see page 991)	Halts execution of an ADO command.
	Execute (see page 992)	This is the overview for the Execute method overload.

8.1.3.4.1 TADOCommand.Assign Method

Makes one ADO command component a duplicate of another.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the property values from one ADO command object to the properties of the current ADO command object.

Source is the ADO command object from which property values are copied. Source must be another TADOCommand (see page 984) object or an instance of a descendant class.

```
ADOCommand1.Assign(ADOCommand2);
ADOCommand1->Assign(ADOCommand2);
```

Assign copies the values of the following properties specific to ADO command objects:

Connection (see page 997), if assigned; otherwise the ConnectionString (see page 998) property is copied.

CommandText (see page 995).

CommandTimeout (see page 996).

CommandType (see page 997).

Prepared (see page 1000).

Parameters (see page 999).

8.1.3.4.2 TADOCommand.AssignCommandText Method

Pascal

```
procedure AssignCommandText(const Value: WideString; Loading: Boolean = False);
```

C++

```
__fastcall AssignCommandText(const BSTR Value, Boolean Loading = False);
```

Description

This is AssignCommandText, a member of class TADOCommand.

8.1.3.4.3 TADOCommand.Cancel Method

Halts execution of an ADO command.

Pascal

```
procedure Cancel;
```

C++

```
__fastcall Cancel();
```

Description

Call Cancel abort the execution of a command executed by the command component. To use Cancel to abort a command, the command by have been executed asynchronously (the eoAsyncExecute TExecuteOption (see page 1299) must have been used). If the command is not asynchronous an exception is raised. Use the command component's ExecuteOptions (see page 999) to specify that a command is executed asynchronously.

Note: To successfully cancel a command, Cancel must be called before the number of seconds specified in CommandTimeout (see page 996) have expired.

See Also

Execute (see page 992)

ExecuteOptions (see page 999)

TExecuteOptions

CommandTimeout (see page 996)

Canceling Commands

8.1.3.4.4 TADOCommand.CheckCommandText Method

Pascal

```
procedure CheckCommandText;
```

C++

```
__fastcall CheckCommandText();
```

Description

This is CheckCommandText, a member of class TADOCommand.

8.1.3.4.5 TADOCommand.ClearActiveConnection Method

Pascal

```
procedure ClearActiveConnection;
```

C++

```
__fastcall ClearActiveConnection();
```

Description

This is ClearActiveConnection, a member of class TADOCommand.

8.1.3.4.6 TADOCommand.ComponentLoading Method

Pascal

```
function ComponentLoading: Boolean;
```

C++

```
__fastcall Boolean ComponentLoading();
```

Description

This is ComponentLoading, a member of class TADOCommand.

8.1.3.4.7 TADOCommand.ConnectionStateChange Method

Pascal

```
procedure ConnectionStateChange(Sender: TObject; Connecting: Boolean);
```

C++

```
__fastcall ConnectionStateChange(TObject * Sender, Boolean Connecting);
```

Description

This is ConnectionStateChange, a member of class TADOCommand.

8.1.3.4.8 Execute Method

This is the overview for the Execute method overload.

Overload List

	Name	Description
	TADOCommand.Execute () (see page 992)	Causes the ADO command object's command to be executed.
	TADOCommand.Execute (Integer, OleVariant) (see page 992)	Causes the ADO command object's command to be executed.
	TADOCommand.Execute (OleVariant) (see page 992)	Causes the ADO command object's command to be executed.

8.1.3.4.8.1 TADOCommand.Execute Method ()

Causes the ADO command object's command to be executed.

Pascal

```
function Execute: _Recordset; overload;
function Execute(const Parameters: OleVariant): _Recordset; overload;
function Execute(var RecordsAffected: Integer; const Parameters: OleVariant): _Recordset;
overload;
```

C++

```
__fastcall _Recordset Execute();
__fastcall _Recordset Execute(const OleVariant Parameters);
__fastcall _Recordset Execute(int RecordsAffected, const OleVariant Parameters);
```

Description

Call Execute to immediately execute the command specified in the CommandText (see page 995) property.

RecordsAffected indicates the number of records, if the command operates on data, that are affected by the command after execution.

Parameters (see page 999) is a collection of parameters for the command, unnecessary if the command does not use any parameters.

When a command is executed that creates a recordset, Execute returns the recordset and it must be accessed through an ADO dataset component. To do this, assign the return value of Execute directly to the recordset property of an ADO data set component. For example:

```
ADODataSet1.Recordset := ADOCommand1.Execute;
ADODataSet1->Recordset = ADOCommand1->Execute();
```

See Also

TParameters (see page 1261)

Handling Command Parameters

Retrieving Result Sets with Commands

Using the Execute Method

8.1.3.4.9 TADOCommand.Initialize Method

Pascal

```
procedure Initialize(DoAppend: Boolean = True); virtual;
```

C++

```
virtual __fastcall Initialize(Boolean DoAppend = True);
```

Description

This is Initialize, a member of class TADOCommand.

8.1.3.4.10 TADOCommand.OpenConnection Method

Pascal

```
procedure OpenConnection; virtual;
```

C++

```
virtual __fastcall OpenConnection();
```

Description

This is OpenConnection, a member of class TADOCommand.

8.1.3.4.11 TADOCommand.SetCommandText Method

Pascal

```
procedure SetCommandText(const Value: WideString); virtual;
```

C++

```
virtual __fastcall SetCommandText(const BSTR Value);
```

Description

This is SetCommandText, a member of class TADOCommand.

8.1.3.4.12 TADOCommand.SetConnectionFlag Method

Pascal

```
function SetConnectionFlag(Flag: Integer; Value: Boolean): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean SetConnectionFlag(int Flag, Boolean Value);
```

Description

This is SetConnectionFlag, a member of class TADOCommand.

8.1.3.5 TADOCommand Properties

The properties of the TADOCommand class are listed here.

Protected Properties

	Name	Description
R	ActiveConnection (see page 995)	This is ActiveConnection, a member of class TADOCommand.
	CommandTextAlias (see page 996)	This is CommandTextAlias, a member of class TADOCommand.
	ComponentRef (see page 997)	This is ComponentRef, a member of class TADOCommand.

Public Properties

	Name	Description
R	CommandObject (see page 995)	Provides direct access to the ADO command object.
R	Properties (see page 1000)	This is Properties, a member of class TADOCommand.
R	States (see page 1001)	Indicates the current state of the ADO command component.

Published Properties

	Name	Description
	CommandText (see page 995)	Specifies command to execute.
	CommandTimeout (see page 996)	Specifies the amount of time to attempt execution of the command.
	CommandType (see page 997)	Specifies the type of command to execute.
	Connection (see page 997)	Specifies ADO connection component to use.
	ConnectionString (see page 998)	Specifies the connection information for the database.
	ExecuteOptions (see page 999)	Specifies the characteristics of a command execution.
	ParamCheck (see page 999)	Specifies whether the parameter list for an ADO command component is regenerated if the SQL changes at runtime.
	Parameters (see page 999)	Contains the parameters for an ADO command object's SQL statement.
	Prepared (see page 1000)	Specifies whether the command is prepared before execution.

8.1.3.5.1 TADOCommand.ActiveConnection Property

Pascal

```
property ActiveConnection: _Connection;
```

C++

```
__property _Connection ActiveConnection;
```

Description

This is ActiveConnection, a member of class TADOCommand.

8.1.3.5.2 TADOCommand.CommandObject Property

Provides direct access to the ADO command object.

Pascal

```
property CommandObject: _Command;
```

C++

```
__property _Command CommandObject;
```

Description

Use CommandObject to get direct access to the ADO command object the command component represents. Accessing the underlying command object is especially useful for utilizing properties and methods not surfaced in TADOCommand (see page 984).

Note: Use of CommandObject to directly access the underlying ADO command object requires a good working knowledge of ADO objects in general and the ADO command object in specific. It is not recommended that you use the command object directly unless familiar with command object operations. Consult the Microsoft Data Store SDK help for specific information on using ADO command objects.

See Also

CommandText (see page 995)

CommandTimeout (see page 996)

CommandType (see page 997)

Execute (see page 992)

8.1.3.5.3 TADOCommand.CommandText Property

Specifies command to execute.

Pascal

```
property CommandText: WideString;
```

C++

```
__property BSTR CommandText;
```

Description

Use CommandText to specify the command to execute using the ADO command component. CommandText is a textual representation of the command such as an SQL statement, a table name, or the name of a stored procedure to execute.

```
ADOCommand1.CommandText := 'DROP TABLE Employee1986';
```

```
ADOCommand1->CommandText = "DROP TABLE Employee1986";
```

If the command includes parameters, as might be the case with an SQL statement or stored procedure, access the them through the Parameters (see page 999) property.

See Also

CommandObject (see page 995)

CommandTimeout (see page 996)

CommandType (see page 997)

Execute (see page 992)

Parameters (see page 999)

Specifying the Command

8.1.3.5.4 TADOCommand.CommandTextAlias Property

Pascal

```
property CommandTextAlias: string;
```

C++

```
__property AnsiString CommandTextAlias;
```

Description

This is CommandTextAlias, a member of class TADOCommand.

8.1.3.5.5 TADOCommand.CommandTimeout Property

Specifies the amount of time to attempt execution of the command.

Pascal

```
property CommandTimeout: Integer;
```

C++

```
__property int CommandTimeout;
```

Description

Use CommandTimeout to indicate the time, in seconds, that can elapse before an attempt to execute the command is considered unsuccessful. The default value for CommandTimeout is 30.

If a command is successfully executed prior to the expiration of the seconds specified, CommandTimeout has no effect.

See Also

CommandText (see page 995)

CommandObject (see page 995)

CommandType (see page 997)

Execute (see page 992)

Cancel (see page 991)

Canceling Commands

8.1.3.5.6 TADOCommand.CommandType Property

Specifies the type of command to execute.

Pascal

```
property CommandType: TCommandType;
```

C++

```
__property TCommandType CommandType;
```

Description

Set CommandType to indicate the type of command that is contained in the CommandText (see page 995) property. The value in CommandType should agree with that of CommandText (see page 995). For instance, if CommandText (see page 995) is the name of a table, CommandType should be cmdTable or cmdTableDirect.

The default value of CommandType is cmdUnknown. While CommandType may be left as cmdUnknown for all commands, setting CommandType to explicitly indicate the type of the command results in better performance. When CommandType is cmdUnknown, ADO must evaluate the command to determine its type, which slows the operation.

Note: The TCommandType (see page 1291) constants cmdTable, cmdTableDirect, and cmdOpenFile should not be used with commands executed from a TADOCommand (see page 984) component.

See Also

CommandText (see page 995)

CommandObject (see page 995)

CommandTimeout (see page 996)

Execute (see page 992)

CommandType

Specifying the Command

8.1.3.5.7 TADOCommand.ComponentRef Property

Pascal

```
property ComponentRef: TComponent;
```

C++

```
__property TComponent * ComponentRef;
```

Description

This is ComponentRef, a member of class TADOCommand.

8.1.3.5.8 TADOCommand.Connection Property

Specifies ADO connection component to use.

Pascal

```
property Connection: TADOConnection;
```

C++

```
__property TADOConnection Connection;
```

Description

Set Connection to specify the TADOConnection (see page 1001) the command component uses to connect to the data store.

```
ADOCommand1.Connection := ADOConnection1;
ADOCommand1->Connection = ADOConnection1;
```

Note: the connection of an ADO command component to a data store can either be through a TADOConnection (see page 1001) specified in the Connection property or directly through the connection string specified in ConnectionString (see page 998). These two properties are mutually exclusive.

See Also

ConnectionString (see page 998)

Connecting to a Data Store Using TADOConnection

8.1.3.5.9 TADOCommand.ConnectionString Property

Specifies the connection information for the database.

Pascal

```
property ConnectionString: WideString;
```

C++

```
__property BSTR ConnectionString;
```

Description

Set ConnectionString to specify the information needed to connect the command component to the data store. The value used for ConnectionString consists of one or more arguments ADO uses to establish the connection. Specify multiple arguments as a list with individual arguments separated by semicolons.

```
ADOCommand1.ConnectionString := 'Provider=YourProviderName;Remote Server=YourServerName';
ADOCommand1->ConnectionString = "Provider=YourProviderName;Remote Server=YourServerName";
```

At design-time, select from the list of available ADO database connections invoked from the Object Inspector.

A connection string may be saved to file for later use. Specify only the name of such a file in ConnectionString to reuse a saved connection string.

The connection string may also contain login information such as user ID and password, for automated logins.

ADO supports the following four arguments for connection strings. Any other arguments (such as a user ID and password) are not processed by ADO and simply passed on to the provider.

Argument	Meaning
Provider (see page 18419)	The name of the provider to use for the connection.
File name	The name of a file containing connection information.
Remote Provider (see page 18419)	The name of the provider to use for a client-side connection.
Remote Server	The path name of the server to use for a client-side connection.

Note: the connection of an ADO command component to a database can either be through a TADOConnection (see page 1001) specified in the Connection (see page 997) property or directly through the connection string specified in ConnectionString. These two means for connecting to a database are mutually exclusive.

Note: After opening a connection, the contents of ConnectionString may be changed by ADO. One example of this behavior is when ADO-defined arguments are mapped to their provider equivalents.

See Also

Connection (see page 997)

8.1.3.5.10 TADOCommand.ExecuteOptions Property

Specifies the characteristics of a command execution.

Pascal

```
property ExecuteOptions: TExecuteOptions;
```

C++

```
__property TExecuteOptions ExecuteOptions;
```

Description

Set ExecuteOptions to control the characteristics of a command executed from the ADO dataset component.

8.1.3.5.11 TADOCommand.ParamCheck Property

Specifies whether the parameter list for an ADO command component is regenerated if the SQL changes at runtime.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

Set ParamCheck to specify whether or not the Parameters (see page 999) property is initialized using ":Param" style parameters in an SQL statement specified in the CommandText (see page 995) property. If the SQL statement in CommandText (see page 995) only contains "?" style parameters, the Parameters (see page 999) property will only be initialized if the OLE DB (see page 6725) provider returns parameter information for an SQL command. Otherwise, the parameters must be explicitly created using the CreateParameter method (TParameters (see page 1261)).

When ParamCheck is true, a parameter is generated for each ":Param" style parameter in the SQL statement.

The default value of ParamCheck is true.

This property is useful for data definition language (DDL) statements that contain parameters as part of the DDL statement and that are not parameters for the ADO command component. For example, the DDL statement to create a stored procedure may contain parameter statements that are part of the stored procedure. Set ParamCheck to false to prevent these parameters from being mistaken for parameters of the ADO command component executing the DDL statement.

See Also

Parameters (see page 999)

CommandText (see page 995)

CreateParameter (see page 1266)

8.1.3.5.12 TADOCommand.Parameters Property

Contains the parameters for an ADO command object's SQL statement.

Pascal

```
property Parameters: TParameters;
```

C++

```
__property TParameters Parameters;
```

Description

Access Parameters at runtime to view and set parameter names, values, and data types dynamically (at design time use the collection editor for the Parameters property to set parameter information). Parameters is a zero-based array of TParameter (see page 1250) parameter records. Index specifies the array element to access.

Note: Parameters is only applicable when the ADO command object issues an SQL statement or executes a stored procedure (the CommandType (see page 997) is cmdText or cmdStoredProc) and parameters are actually used in the SQL statement or stored procedure.

See Also

Prepared (see page 1000)

Handling Command Parameters

8.1.3.5.13 TADOCommand.Prepared Property

Specifies whether the command is prepared before execution.

Pascal

```
property Prepared: WordBool;
```

C++

```
__property WordBool Prepared;
```

Description

Set Prepared before calling the Execute (see page 992) method to specify whether ADO prepares the command. If Prepared is set to true and the command component is connected to a data store, ADO prepares the command before executing it. If Prepared is set to false, ADO does not prepare the command.

The default value of Prepared is false.

See Also

Parameters (see page 999)

Execute (see page 992)

8.1.3.5.14 TADOCommand.Properties Property

Pascal

```
property Properties: Properties;
```

C++

```
__property Properties Properties;
```

Description

This is Properties, a member of class TADOCommand.

8.1.3.5.15 TADOCommand.States Property

Indicates the current state of the ADO command component.

Pascal

```
property States: TObjectStates;
```

C++

```
__property TObjectStates States;
```

Description

Read States at runtime to determine the activity being performed, if any, by the command component at a specific point in time. Activity status includes the command component connecting to a data store, executing a command, fetching rows for a recordset, sitting idle but open, and sitting idle and closed.

Connection (see page 997)

Execute (see page 992)

8.1.4 TADOConnection Class

TADOConnection connects to an ADO data store.

Class Hierarchy

Pascal

```
TADOConnection = class(TCustomConnection, IUnknown, ConnectionEventsVT);
```

C++

```
class TADOConnection : public TCustomConnection, public IUnknown, public ConnectionEventsVT;
```

File

ADODB

Description

TADOConnection encapsulates the ADO connection object. Use TADOConnection for connecting to ADO data stores. The connection provided by a single TADOConnection component can be shared by multiple ADO command and dataset components through their Connection properties.

TADOConnection allows you to control the attributes and conditions of a connection to a data store. Use the properties of TADOConnection to control such attributes as record locking scheme (optimistic versus pessimistic), cursor type, cursor location, isolation level, and connection time-out. Methods are also provided for implementing transactions and retrieving metadata about the database to which this component connects.

8.1.4.1 TADOConnection Members

The following tables list the members exposed by TADOConnection.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BeginTransComplete (see page 1008)	This is BeginTransComplete, a member of class TADOConnection.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckActive (see page 1009)	This is CheckActive, a member of class TADOConnection.
V	CheckDisconnect (see page 1009)	This is CheckDisconnect, a member of class TADOConnection.
	CheckInactive (see page 1010)	This is CheckInactive, a member of class TADOConnection.
	CommitTransComplete (see page 1010)	This is CommitTransComplete, a member of class TADOConnection.
	ConnectComplete (see page 1010)	This is ConnectComplete, a member of class TADOConnection.
	ConnectionPoint (see page 1011)	This is ConnectionPoint, a member of class TADOConnection.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	Disconnect (see page 1011)	This is Disconnect, a member of class TADOConnection.
V	DoConnect (see page 1011)	Provides the interface for a method that opens a connection.
V	DoDisconnect (see page 1011)	Provides the interface for a method that terminates the connection.
	ExecuteComplete (see page 1013)	This is ExecuteComplete, a member of class TADOConnection.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.

	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetConnected (see page 1013)	Returns the value of the Connected property.
	GetDataSet (see page 6865)	Returns a dataset, given its index in the DataSets (see page 6870) property array.
	GetDataSetCount (see page 6865)	Returns the value of the DataSetCount (see page 6869) property.
	GetErrors (see page 1013)	This is GetErrors, a member of class TADOConnection.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InfoMessage (see page 1016)	This is InfoMessage, a member of class TADOConnection.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 1016)	Initializes the connection component after all objects in the form or data module have been loaded.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RegisterClient (see page 1017)	Registers an object that uses the connection component.
	RollbackTransComplete (see page 1018)	This is RollbackTransComplete, a member of class TADOConnection.
	SendConnectEvent (see page 6867)	Informs all registered clients that use the connection component when a connection is opened or closed.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetConnected (see page 6867)	Changes the value of the Connected (see page 6868) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	UnRegisterClient (see page 1019)	Removes a registered client so that it is no longer associated with the connection component.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WaitForConnectComplete (see page 1019)	This is WaitForConnectComplete, a member of class TADOConnection.
	WillConnect (see page 1019)	This is WillConnect, a member of class TADOConnection.
	WillExecute (see page 1020)	This is WillExecute, a member of class TADOConnection.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	StreamedConnected (see page 6874)	Indicates whether the Connected (see page 6868) property was true when the connection component was loaded from a stream.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginTrans (see page 1008)	Initiates a new transaction in the associated database.
	Cancel (see page 1009)	Aborts an attempt to connect to a data store.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 6863)	Closes the connection.
	CommitTrans (see page 1010)	Commits an open transaction.
V	Create (see page 1006)	Constructs an instance of the button control and initializes its values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 1006)	Destroys the bitmap button object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 1012)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldNames (see page 1014)	This is the overview for the GetFieldNames method overload.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProcedureNames (see page 1014)	This is the overview for the GetProcedureNames method overload.
	GetTableNames (see page 1015)	This is the overview for the GetTableNames method overload.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 1016)	Initiates a connection to a database.
	OpenSchema (see page 1017)	Retrieves schema information from the connection's provider.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RollbackTrans (see page 1018)	Rolls back an active transaction.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	CommandCount (see page 1021)	Indicates the number of command components associated with the connection.
R	Commands (see page 1021)	Lists all active commands for the connection component.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	ConnectionObject (see page 1023)	Provides direct access to the ADO connection object.
R	DataSetCount (see page 6869)	Indicates the number of datasets associated with the connection component.
R	DataSets (see page 1027)	Provides an indexed array of all active datasets for a connection component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Errors (see page 1028)	Errors is the implementation of the Errors Collection.
R	InTransaction (see page 1028)	Indicates whether a transaction is in progress.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Properties (see page 1032)	This is Properties, a member of class TADOConnection.
R	State (see page 1032)	Indicates the current state of the ADO connection.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Version (see page 1033)	Indicates the version of ADO used.

Published Events

	Name	Description
	AfterConnect (see page 1034)	Occurs after a connection is established.
	AfterDisconnect (see page 1034)	Occurs after the connection closes.
	BeforeConnect (see page 1034)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 1035)	Occurs immediately before the connection closes.
	OnBeginTransComplete (see page 1035)	Occurs after beginning a transaction.
	OnCommitTransComplete (see page 1036)	Occurs after committing a transaction.
	OnConnectComplete (see page 1036)	Occurs after starting a connection.
	OnDisconnect (see page 1037)	Occurs after a connection is terminated.
	OnExecuteComplete (see page 1038)	Occurs after a command is executed.
	OnInfoMessage (see page 1038)	Occurs when information messages are received from the data store connection.

	OnRollbackTransComplete (see page 1039)	Occurs after rolling back a transaction.
	OnWillConnect (see page 1039)	Occurs after a request to start a connection.
	OnWillExecute (see page 1040)	Occurs after a database server signals acceptance of a command execution.

Published Properties

	Name	Description
	Attributes (see page 1020)	Specifies automated transaction behavior.
	CommandTimeout (see page 1022)	Specifies amount of time to attempt execution of a command.
	Connected (see page 1022)	Specifies whether the connection is active.
	ConnectionString (see page 1024)	Specifies the connection information for the data store.
	ConnectionTimeout (see page 1025)	Specifies amount of time to attempt a connection.
	ConnectOptions (see page 1026)	Specifies whether a connection is synchronous or asynchronous.
	CursorLocation (see page 1026)	Specifies whether cursors for the connection is client-side or server-side.
	DefaultDatabase (see page 1027)	Indicates the database the ADO connection uses by default.
	IsolationLevel (see page 1029)	Specifies the transaction isolation level for transactions.
	KeepConnection (see page 1029)	Specifies whether an application remains connected to a database even if no datasets are open.
	LoginPrompt (see page 1029)	Specifies whether a login dialog appears immediately before opening a new connection.
	Mode (see page 1031)	Indicate the persmissions available to a connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OnLogin (see page 1031)	Occurs when a communication channel opens to the server.
	Provider (see page 1032)	Specifies the provider for the ADO connection.
	Tag (see page 2808)	Stores an integer value as part of a component.

8.1.4.2 TADOConnection.Create Constructor

Constructs an instance of the button control and initializes its values.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TADOConnection(TComponent * AOwner);
```

Description

Use Create to programmatically instantiate an ADO connection. ADO connections added in the form designer are created automatically.

Create

Calls its inherited Create method.

Initializes its connection interface.

Initializes is list of associated datasets.

See Also

Destroy_d

8.1.4.3 TADOConnection.Destroy Destructor

Destroys the bitmap button object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TADOConnection();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the ADO connection is not nil, and only then calls Destroy.

Destroy performs the following tasks:

Closes the connection.

Destroys its list of associated datasets.

Checks for unprocessed connection events.

Destroys its connection interface.

Calls the inherited destructor.

See Also

Create_d

Free (see page 22300)

8.1.4.4 TADOConnection Methods

The methods of the TADOConnection class are listed here.

Protected Methods

	Name	Description
	BeginTransComplete (see page 1008)	This is BeginTransComplete, a member of class TADOConnection.
	CheckActive (see page 1009)	This is CheckActive, a member of class TADOConnection.
V	CheckDisconnect (see page 1009)	This is CheckDisconnect, a member of class TADOConnection.
	CheckInactive (see page 1010)	This is CheckInactive, a member of class TADOConnection.
	CommitTransComplete (see page 1010)	This is CommitTransComplete, a member of class TADOConnection.
	ConnectComplete (see page 1010)	This is ConnectComplete, a member of class TADOConnection.
	ConnectionPoint (see page 1011)	This is ConnectionPoint, a member of class TADOConnection.
	Disconnect (see page 1011)	This is Disconnect, a member of class TADOConnection.
V	DoConnect (see page 1011)	Provides the interface for a method that opens a connection.
V	DoDisconnect (see page 1011)	Provides the interface for a method that terminates the connection.
	ExecuteComplete (see page 1013)	This is ExecuteComplete, a member of class TADOConnection.
V	GetConnected (see page 1013)	Returns the value of the Connected property.
	GetErrors (see page 1013)	This is GetErrors, a member of class TADOConnection.
	InfoMessage (see page 1016)	This is InfoMessage, a member of class TADOConnection.
V	Loaded (see page 1016)	Initializes the connection component after all objects in the form or data module have been loaded.
V	RegisterClient (see page 1017)	Registers an object that uses the connection component.
	RollbackTransComplete (see page 1018)	This is RollbackTransComplete, a member of class TADOConnection.
V	UnRegisterClient (see page 1019)	Removes a registered client so that it is no longer associated with the connection component.
V	WaitForConnectComplete (see page 1019)	This is WaitForConnectComplete, a member of class TADOConnection.
	WillConnect (see page 1019)	This is WillConnect, a member of class TADOConnection.
	WillExecute (see page 1020)	This is WillExecute, a member of class TADOConnection.

Public Methods

	Name	Description
	BeginTrans (see page 1008)	Initiates a new transaction in the associated database.
	Cancel (see page 1009)	Aborts an attempt to connect to a data store.
	CommitTrans (see page 1010)	Commits an open transaction.
	Execute (see page 1012)	This is the overview for the Execute method overload.
	GetFieldNames (see page 1014)	This is the overview for the GetFieldNames method overload.
	GetProcedureNames (see page 1014)	This is the overview for the GetProcedureNames method overload.
	GetTableNames (see page 1015)	This is the overview for the GetTableNames method overload.
	Open (see page 1016)	Initiates a connection to a database.
	OpenSchema (see page 1017)	Retrieves schema information from the connection's provider.
	RollbackTrans (see page 1018)	Rolls back an active transaction.

8.1.4.4.1 TADOConnection.BeginTrans Method

Initiates a new transaction in the associated database.

Pascal

```
function BeginTrans: Integer;
```

C++

```
__fastcall int BeginTrans();
```

Description

Call BeginTrans to start a new transaction in the data store the ADO connection component is connected to.

BeginTrans returns a value of type integer, indicating the nesting level of the new transaction.

A successful execution of BeginTrans triggers an OnBeginTransComplete (see page 1035) event and sets the InTransaction (see page 1028) property to true.

Note: The ADO connection object must have an active connection before BeginTrans can be used.

See Also

CommitTrans (see page 1010)

RollbackTrans (see page 1018)

Connected (see page 1022)

Open (see page 1016)

OnBeginTransComplete (see page 1035)

InTransaction (see page 1028)

8.1.4.4.2 TADOConnection.BeginTransComplete Method

Pascal

```
procedure BeginTransComplete(TransactionLevel: Integer; const pError: Error; var adStatus:
EventStatusEnum; const pConnection: _Connection); safecall;
```

C++

```
__fastcall BeginTransComplete(int TransactionLevel, const Error pError, EventStatusEnum
adStatus, const _Connection pConnection);
```

Description

This is BeginTransComplete, a member of class TADOConnection.

8.1.4.4.3 TADOConnection.Cancel Method

Aborts an attempt to connect to a data store.

Pascal

```
procedure Cancel;
```

C++

```
__fastcall Cancel();
```

Description

Call Cancel to abort an attempt to connect to an ADO data store. To use cancel, the connection attempted must be asynchronous (the ConnectOptions (see page 1026) property must be set to coAsyncConnect).

Cancel must be used after an attempt to connect is initiated by calling the Open (see page 1016) method (or setting Connected (see page 1022) to true) and before the connection has been successfully made or has timed out.

See Also

Open (see page 1016)

Connected (see page 1022)

ConnectionTimeout (see page 1025)

ConnectOptions (see page 1026)

8.1.4.4.4 TADOConnection.CheckActive Method

Pascal

```
procedure CheckActive;
```

C++

```
__fastcall CheckActive();
```

Description

This is CheckActive, a member of class TADOConnection.

8.1.4.4.5 TADOConnection.CheckDisconnect Method

Pascal

```
procedure CheckDisconnect; virtual;
```

C++

```
virtual __fastcall CheckDisconnect();
```

Description

This is CheckDisconnect, a member of class TADOConnection.

8.1.4.4.6 TADOConnection.CheckInactive Method

Pascal

```
procedure CheckInactive;
```

C++

```
__fastcall CheckInactive();
```

Description

This is CheckInactive, a member of class TADOConnection.

8.1.4.4.7 TADOConnection.CommitTrans Method

Commits an open transaction.

Pascal

```
procedure CommitTrans;
```

C++

```
__fastcall CommitTrans();
```

Description

Call CommitTrans to save any changes made during the current transaction and to end the transaction.

A successful execution of CommitTrans triggers an OnCommitTransComplete (see page 1036) event and sets the InTransaction (see page 1028) property to false.

See Also

BeginTrans (see page 1008)

RollbackTrans (see page 1018)

OnCommitTransComplete (see page 1036)

InTransaction (see page 1028)

8.1.4.4.8 TADOConnection.CommitTransComplete Method

Pascal

```
procedure CommitTransComplete(const pError: Error; var adStatus: EventStatusEnum; const
pConnection: _Connection); safecall;
```

C++

```
__fastcall CommitTransComplete(const Error pError, EventStatusEnum adStatus, const _Connection
pConnection);
```

Description

This is CommitTransComplete, a member of class TADOConnection.

8.1.4.4.9 TADOConnection.ConnectComplete Method

Pascal

```
procedure ConnectComplete(const pError: Error; var adStatus: EventStatusEnum; const
pConnection: _Connection); safecall;
```

C++

```
__fastcall ConnectComplete(const Error pError, EventStatusEnum adStatus, const _Connection
pConnection);
```

Description

This is ConnectComplete, a member of class TADOConnection.

8.1.4.4.10 TADOConnection.ConnectionPoint Method

Pascal

```
function ConnectionPoint: IConnectionPoint;
```

C++

```
__fastcall IConnectionPoint ConnectionPoint();
```

Description

This is ConnectionPoint, a member of class TADOConnection.

8.1.4.4.11 TADOConnection.Disconnect Method

Pascal

```
procedure Disconnect(var adStatus: EventStatusEnum; const pConnection: _Connection); safecall;
```

C++

```
__fastcall Disconnect(EventStatusEnum adStatus, const _Connection pConnection);
```

Description

This is Disconnect, a member of class TADOConnection.

8.1.4.4.12 TADOConnection.DoConnect Method

Provides the interface for a method that opens a connection.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

The Connected property uses DoConnect to establish a connection. Descendant classes override the DoConnect method to establish their connection as appropriate. As implemented in TCustomConnection, DoConnect does nothing.

See Also

Connected (see page 6868)

DoDisconnect (see page 6864)

8.1.4.4.13 TADOConnection.DoDisconnect Method

Provides the interface for a method that terminates the connection.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

The Connected property uses DoDisconnect to close a connection. Descendant classes override the DoDisconnect method to drop a connection. As implemented in TCustomConnection, DoDisconnect does nothing.

See Also

Connected (see page 6868)

DoConnect (see page 6864)

8.1.4.4.14 Execute Method

This is the overview for the Execute method overload.

Overload List

	Name	Description
	TADOConnection.Execute (WideString, Integer, TExecuteOptions) (see page 1012)	Executes a command.
	TADOConnection.Execute (WideString, TCommandType, TExecuteOptions) (see page 1012)	Executes a command.

8.1.4.4.14.1 TADOConnection.Execute Method (WideString, Integer, TExecuteOptions)

Executes a command.

Pascal

```
procedure Execute(const CommandText: WideString; var RecordsAffected: Integer; const
ExecuteOptions: TExecuteOptions = [eoExecuteNoRecords]); overload;
function Execute(const CommandText: WideString; const CommandType: TCommandType = cmdText;
const ExecuteOptions: TExecuteOptions = []): _Recordset; overload;
```

C++

```
__fastcall Execute(const BSTR CommandText, int RecordsAffected, const TExecuteOptions
ExecuteOptions = [eoExecuteNoRecords]);
__fastcall _Recordset Execute(const BSTR CommandText, const TCommandType CommandType =
cmdText, const TExecuteOptions ExecuteOptions = []);
```

Description

Call Execute to execute a command using the ADO connection object.

CommandText is the command to execute.

ExecuteOptions is a TExecuteOptions (see page 1316) value that specifies the characteristics of the command execution.

Execute returns a recordset if the command executed is one that generates a recordset.

RecordsAffected indicates the number of records, if the command operates on data, that are affected by the command after execution.

See Also

GetTableNames (see page 1015)

OnWillExecute (see page 1040)

OnExecuteComplete (see page 1038)

8.1.4.4.15 TADOConnection.ExecuteComplete Method

Pascal

```
procedure ExecuteComplete(RecordsAffected: Integer; const pError: Error; var adStatus:
EventStatusEnum; const pCommand: _Command; const pRecordset: _Recordset; const pConnection:
_Connection); safecall;
```

C++

```
__fastcall ExecuteComplete(int RecordsAffected, const Error pError, EventStatusEnum adStatus,
const _Command pCommand, const _Recordset pRecordset, const _Connection pConnection);
```

Description

This is ExecuteComplete, a member of class TADOConnection.

8.1.4.4.16 TADOConnection.GetConnected Method

Returns the value of the Connected property.

Pascal

```
function GetConnected: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetConnected();
```

Description

GetConnected is the protected read implementation of the Connected property. Descendant classes override this method to return true if a connection is open and false otherwise. As defined in TCustomConnection, GetConnected always returns false.

See Also

Connected (see page 6868)

SetConnected (see page 6867)

8.1.4.4.17 TADOConnection.GetErrors Method

Pascal

```
function GetErrors: Errors;
```

C++

```
__fastcall Errors GetErrors();
```

Description

This is GetErrors, a member of class TADOConnection.

8.1.4.4.18 GetFieldNames Method

This is the overview for the GetFieldNames method overload.

Overload List

	Name	Description
	TADOConnection.GetFieldNames (string, TStrings) (see page 1014)	Populates a string list with the names of fields in a table.
	TADOConnection.GetFieldNames (WideString, TWideStrings) (see page 1014)	Populates a string list with the names of fields in a table.

8.1.4.4.18.1 TADOConnection.GetFieldNames Method (WideString, TWideStrings)

Populates a string list with the names of fields in a table.

Pascal

```
procedure GetFieldNames(const TableName: WideString; List: TWideStrings); overload;
procedure GetFieldNames(const TableName: string; List: TStrings); overload;
```

C++

```
__fastcall GetFieldNames(const BSTR TableName, TWideStrings List);
__fastcall GetFieldNames(const AnsiString TableName, TStrings List);
```

Description

Call GetFieldNames to retrieve a list of fields in a table. The names of the fields are put into the already-existing string list object specified in the List parameter. Specify the table for which to retrieve the names of fields in the TableName property.

```
ADOConnection1.GetFieldNames('Employee', ListBox1.Items);
ADOConnection1->GetFieldNames("Employee", ListBox1->Items);
```

See Also

TStrings (see page 3029)

GetProcedureNames (see page 1014)

GetTableNames (see page 1015)

8.1.4.4.19 GetProcedureNames Method

This is the overview for the GetProcedureNames method overload.

Overload List

	Name	Description
	TADOConnection.GetProcedureNames (TStrings) (see page 1014)	Populates a string list with the names of stored procedures in the database.
	TADOConnection.GetProcedureNames (TWideStrings) (see page 1014)	Populates a string list with the names of stored procedures in the database.

8.1.4.4.19.1 TADOConnection.GetProcedureNames Method (TStrings)

Populates a string list with the names of stored procedures in the database.

Pascal

```
procedure GetProcedureNames(List: TWideStrings); overload;
procedure GetProcedureNames(List: TStrings); overload;
```

C++

```
__fastcall GetProcedureNames(TWideStrings List);
__fastcall GetProcedureNames(TStrings List);
```

Description

Call GetProcedureNames to retrieve a list of stored procedures in the associated database. The names of the stored procedures are put into the already-existing string list object specified in the List parameter.

```
ADOConnection1.GetProcedureNames(ListBox1.Items);
ADOConnection1->GetProcedureNames(ListBox1->Items);
```

Note: Any contents already in the target string list object are eliminated and overwritten by the data produces by GetProcedureNames.

See Also

TStrings (see page 3029)

GetTableNames (see page 1015)

GetFieldNames (see page 1014)

8.1.4.4.20 GetTableNames Method

This is the overview for the GetTableNames method overload.

Overload List

	Name	Description
	TADOConnection.GetTableNames (TStrings, Boolean) (see page 1015)	Populates a string list with the names of tables in the database.
	TADOConnection.GetTableNames (TWideStrings, Boolean) (see page 1015)	Populates a string list with the names of tables in the database.

8.1.4.4.20.1 TADOConnection.GetTableNames Method (TStrings, Boolean)

Populates a string list with the names of tables in the database.

Pascal

```
procedure GetTableNames(List: TWideStrings; SystemTables: Boolean = False); overload;
procedure GetTableNames(List: TStrings; SystemTables: Boolean = False); overload;
```

C++

```
__fastcall GetTableNames(TWideStrings List, Boolean SystemTables = False);
__fastcall GetTableNames(TStrings List, Boolean SystemTables = False);
```

Description

Call GetTableNames to retrieve a list of tables in the associated database.

List is the already-existing string list object into which the tables names are put.

Set SystemTables to indicate whether the list of table names should include the database's system tables.

```
ADOConnection1.GetTableNames(ListBox2.Items, False);
ADOConnection1->GetTableNames(ListBox2->Items, false);
```

Note: Any contents already in the target string list object are eliminated and overwritten by the data produces by GetTableNames.

See Also

GetFieldNames (see page 1014)

8.1.4.4.21 TADOConnection.InfoMessage Method

Pascal

```
procedure InfoMessage(const pError: Error; var adStatus: EventStatusEnum; const pConnection:
_Connection); safecall;
```

C++

```
__fastcall InfoMessage(const Error pError, EventStatusEnum adStatus, const _Connection
pConnection);
```

Description

This is InfoMessage, a member of class TADOConnection.

8.1.4.4.22 TADOConnection.Loaded Method

Initializes the connection component after all objects in the form or data module have been loaded.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. It is called automatically after the form or data module that contains the connection component has loaded all its owned objects. TCustomConnection overrides the inherited method to establish a connection if the Connected property is true.

See Also

StreamedConnected (see page 6874)

Loaded (see page 2782)

8.1.4.4.23 TADOConnection.Open Method

Initiates a connection to a database.

Pascal

```
procedure Open(const UserID: WideString; const Password: WideString); overload;
```

C++

```
__fastcall Open(const BSTR UserID, const BSTR Password);
```

Description

Call Open to initiate a connection to the database specified in the ConnectionString (see page 1024) property.

UserID and Password parameters for Open can be optionally used to pass the user ID and login password to the database server at the same time the request is made to connect.

```
ADOConnection1.Open('Joe Sixpack', 'SecretWord');
ADOConnection1->Open("Joe Sixpack", "SecretWord");
```

Alternately, this login information may be passed in the value in ConnectionString (see page 1024).

When explicitly passing login information through either the Open method or the ConnectionString (see page 1024), the LoginPrompt (see page 1029) property should be set to false to prevent an unnecessary login dialog.

See Also

Connected (see page 1022)

ConnectionString (see page 1024)

ConnectionObject (see page 1023)

OnWillConnect (see page 1039)

OnConnectComplete (see page 1036)

8.1.4.4.24 TADOConnection.OpenSchema Method

Retrieves schema information from the connection's provider.

Pascal

```
procedure OpenSchema(const Schema: TSchemaInfo; const Restrictions: OleVariant; const
SchemaID: OleVariant; DataSet: TADODataSet);
```

C++

```
__fastcall OpenSchema(const TSchemaInfo Schema, const OleVariant Restrictions, const
OleVariant SchemaID, TADODataSet DataSet);
```

Description

Call OpenSchema to open a connection and retrieve schema information from the associated provider. OpenSchema retrieves the schema information in the form of a recordset that can then be accessed through an ADO dataset component.

The Schema parameter is the type of schema information to retrieve, or in ADO terms, the query type.

The Restrictions parameter is an array of query constraints for the specified type of schema information. This lists the type of information requested for the entity specified by Schema. In ADO terms, the elements of the array list the criteria for the query type.

SchemaID is the GUID for a provider-schema schema query not defined by the OLE DB (see page 6725) specification. This parameter is required if the Schema parameter is set to siProviderSpecific, otherwise it is not used.

DataSet is the ADO dataset component (such as a TADOTable (see page 1125)) into the Recordset property of which the schema information is retrieved and through which the information is subsequently accessed. After OpenSchema loads the ADO dataset component with the schema information, use the standard navigation methods like First and Next to traverse the rows of data. Use the Fields property or the FieldByName method of the dataset component to read the value of any one column. Alternately, the schema data may be displayed using visual data-aware controls and a TDataSource.

See Also

Open (see page 1016)

Close (see page 6863)

8.1.4.4.25 TADOConnection.RegisterClient Method

Registers an object that uses the connection component.

Pascal

```
procedure RegisterClient(Client: TObject; Event: TConnectChangeEvent = nil); override;
```

C++

```
virtual __fastcall RegisterClient(TObject * Client, TConnectChangeEvent Event = nil);
```

Description

RegisterClient is used internally to associate objects with the connection component. Registered components can supply an event handler that responds when the connection is created or terminated.

Client is the object to register. If Client is a dataset, it is added to the DataSets property.

Event is an event handler that is called after the connection is established or before it is terminated.

Datasets call this method when they start using the connection component. For BDE-enabled datasets, ADO datasets, and dbExpress datasets, this is when they are activated. For client datasets, this is when the RemoteServer property is assigned.

See Also

DataSets (see page 6870)

UnRegisterClient (see page 6868)

8.1.4.4.26 TADOConnection.RollbackTrans Method

Rolls back an active transaction.

Pascal

```
procedure RollbackTrans;
```

C++

```
__fastcall RollbackTrans();
```

Description

Call RollbackTrans to cancel any changes made during the current transaction and to end the transaction.

A successful execution of RollbackTrans triggers an OnRollbackTransComplete (see page 1039) event and sets the InTransaction (see page 1028) property to true.

See Also

BeginTrans (see page 1008)

CommitTrans (see page 1010)

OnRollbackTransComplete (see page 1039)

InTransaction (see page 1028)

8.1.4.4.27 TADOConnection.RollbackTransComplete Method

Pascal

```
procedure RollbackTransComplete(const pError: Error; var adStatus: EventStatusEnum; const
pConnection: _Connection); safecall;
```

C++

```
__fastcall RollbackTransComplete(const Error pError, EventStatusEnum adStatus, const
_Connection pConnection);
```

Description

This is RollbackTransComplete, a member of class TADOConnection.

8.1.4.4.28 TADOConnection.UnRegisterClient Method

Removes a registered client so that it is no longer associated with the connection component.

Pascal

```
procedure UnRegisterClient(Client: TObject); override;
```

C++

```
virtual __fastcall UnRegisterClient(TObject * Client);
```

Description

UnRegisterClient is used internally to remove objects from the internal list of objects that are informed when a connection is created or terminated.

Client is the object that is removed from the list. It should be an object that was previously registered by a call to RegisterClient. If Client is a dataset, it is removed from the DataSets property list.

Datasets call this method when they stop using the connection component. For BDE-enabled datasets, ADO datasets, and dbExpress datasets, this is when they are deactivated. For client datasets, this is when the RemoteServer property is changed.

See Also

DataSets (see page 6870)

RegisterClient (see page 6866)

8.1.4.4.29 TADOConnection.WaitForConnectComplete Method

Pascal

```
procedure WaitForConnectComplete; virtual;
```

C++

```
virtual __fastcall WaitForConnectComplete();
```

Description

This is WaitForConnectComplete, a member of class TADOConnection.

8.1.4.4.30 TADOConnection.WillConnect Method

Pascal

```
procedure WillConnect(var ConnectionString: WideString; var UserID: WideString; var Password:
WideString; var Options: Integer; var adStatus: EventStatusEnum; const pConnection:
_Connection); safecall;
```

C++

```
__fastcall WillConnect(BSTR ConnectionString, BSTR UserID, BSTR Password, int Options,
EventStatusEnum adStatus, const _Connection pConnection);
```

Description

This is WillConnect, a member of class TADOConnection.

8.1.4.4.31 TADOConnection.WillExecute Method

Pascal

```
procedure WillExecute(var Source: WideString; var CursorType: CursorTypeEnum; var LockType:
LockTypeEnum; var Options: Integer; var adStatus: EventStatusEnum; const pCommand: _Command;
const pRecordset: _Recordset; const pConnection: _Connection); safecall;
```

C++

```
__fastcall WillExecute(BSTR Source, CursorTypeEnum CursorType, LockTypeEnum LockType, int
Options, EventStatusEnum adStatus, const _Command pCommand, const _Recordset pRecordset, const
_Connection pConnection);
```

Description

This is WillExecute, a member of class TADOConnection.

8.1.4.5 TADOConnection Properties

The properties of the TADOConnection class are listed here.

Public Properties

	Name	Description
R	CommandCount (see page 1021)	Indicates the number of command components associated with the connection.
R	Commands (see page 1021)	Lists all active commands for the connection component.
	ConnectionObject (see page 1023)	Provides direct access to the ADO connection object.
R	DataSets (see page 1027)	Provides an indexed array of all active datasets for a connection component.
R	Errors (see page 1028)	Errors is the implementation of the Errors Collection.
R	InTransaction (see page 1028)	Indicates whether a transaction is in progress.
R	Properties (see page 1032)	This is Properties, a member of class TADOConnection.
R	State (see page 1032)	Indicates the current state of the ADO connection.
R	Version (see page 1033)	Indicates the version of ADO used.

Published Properties

	Name	Description
	Attributes (see page 1020)	Specifies automated transaction behavior.
	CommandTimeout (see page 1022)	Specifies amount of time to attempt execution of a command.
	Connected (see page 1022)	Specifies whether the connection is active.
	ConnectionString (see page 1024)	Specifies the connection information for the data store.
	ConnectionTimeout (see page 1025)	Specifies amount of time to attempt a connection.
	ConnectOptions (see page 1026)	Specifies whether a connection is synchronous or asynchronous.
	CursorLocation (see page 1026)	Specifies whether cursors for the connection is client-side or server-side.
	DefaultDatabase (see page 1027)	Indicates the database the ADO connection uses by default.
	IsolationLevel (see page 1029)	Specifies the transaction isolation level for transactions.
	KeepConnection (see page 1029)	Specifies whether an application remains connected to a database even if no datasets are open.
	LoginPrompt (see page 1029)	Specifies whether a login dialog appears immediately before opening a new connection.
	Mode (see page 1031)	Indicate the persmissions available to a connection.
	OnLogin (see page 1031)	Occurs when a communication channel opens to the server.
	Provider (see page 1032)	Specifies the provider for the ADO connection.

8.1.4.5.1 TADOConnection.Attributes Property

Specifies automated transaction behavior.

Pascal

```
property Attributes: TXactAttributes;
```

C++

```
__property TXactAttributes Attributes;
```

Description

Set Attributes to specify whether a connection object performs retaining commits or retaining aborts. The two behaviors are independent of each other.

Attributes can contain one of the two TXactAttribute (see page 1308) values (xaCommitRetaining and xaAbortRetaining), both values, or neither value.

```
ADOConnection1.Attributes := [xaCommitRetaining, xaAbortRetaining];
ADOConnection1->Attributes = TXactAttributes() << xaCommitRetaining << xaAbortRetaining;
```

See Also

Specifying Whether the Connection Automatically Initiates Transactions

8.1.4.5.2 TADOConnection.CommandCount Property

Indicates the number of command components associated with the connection.

Pascal

```
property CommandCount: Integer;
```

C++

```
__property int CommandCount;
```

Description

Read CommandCount to determine the number of command components associated with the connection component. A command component is associated with a connection component if its Connection property is set to the connection component.

CommandCount can be used as the basis for a loop to access each command component using the Commands (see page 1021) property. For example, to execute all of the TADOCommand (see page 984) components connected through the TADOConnection (see page 1001) component ADOConnection1:

```
var
  i: Integer;
begin
for i := 0 to (ADOConnection1.CommandCount – 1) do
    ADOConnection1.Commands[i].Execute;
end;
for (int i = 0; i < ADOConnection1->CommandCount; i++)
  ADOConnection1->Commands[i]->Execute();
```

See Also

DataSetCount

DataSets (see page 1027)

Commands (see page 1021)

Accessing the Connection's Datasets

8.1.4.5.3 TADOConnection.Commands Property

Lists all active commands for the connection component.

Pascal

```
property Commands [Index: Integer]: TADOCommand;
```

C++

```
__property TADOCommand Commands[int Index];
```

Description

Use Commands to access active command components associated with a connection component. An active command component is one that is currently open.

Commands connected through an ADO connection object can be accessed in sequence through the Commands property in a loop based on CommandCount (see page 1021). For example, to execute all of the TADOCommand (see page 984) components connected through the TADOConnection (see page 1001) component ADOConnection1:

```
var
  i: Integer;
begin
for i := 0 to (ADOConnection1.CommandCount – 1) do
    ADOConnection1.Commands[i].Execute;
end;
for (int i = 0; i < ADOConnection1->CommandCount; i++)
  ADOConnection1->Commands[i]->Execute();
```

See Also

DataSetCount

DataSets (see page 1027)

CommandCount (see page 1021)

Accessing the Connections Datasets

8.1.4.5.4 TADOConnection.CommandTimeout Property

Specifies amount of time to attempt execution of a command.

Pascal

```
property CommandTimeout: Integer;
```

C++

```
__property int CommandTimeout;
```

Description

Use CommandTimeout to specify the amount of time, in seconds, that that can expire before an attempt to execute a command is considered unsuccessful. The default value is 30 seconds.

If a command successfully executed prior to the expiration of the seconds specified in CommandTimeout, this property has no effect. If execution of a command has not been successfully completed before the time has elapsed, the command is canceled.

See Also

ConnectionTimeout (see page 1025)

Controlling Timeouts

8.1.4.5.5 TADOConnection.Connected Property

Specifies whether the connection is active.

Pascal

```
property Connected: Boolean;
```

C++

```
__property Boolean Connected;
```

Description

Set Connected to trueto establish a connection to an ADO data store without opening a dataset. Set Connected to false to close a connection. The default value for Connected is false.

An application can check Connected to determine the current status of a connection. If Connected is true, the connection is active; if false, and the KeepConnection (see page 1029) property is also false, then the connection is inactive.

Connected can also be used in a program to determine the success of a call to the Open (see page 1016) method (a true value in Connected) or the Close method (a false value).

```
with ADOConnection1 do begin
  Open;
if Connected then
    { connection successful }
else
    { connection unsuccessful };
end;
ADOConnection1->Open();
if (ADOConnection1->Connected)
  // connection successful
else
  // connection unsuccessful
```

See Also

Open (see page 1016)

Close (see page 6863)

ConnectionTimeout (see page 1025)

ConnectionString (see page 1024)

ConnectionObject (see page 1023)

ConnectOptions (see page 1026)

OnWillConnect (see page 1039)

OnConnectComplete (see page 1036)

8.1.4.5.6 TADOConnection.ConnectionObject Property

Provides direct access to the ADO connection object.

Pascal

```
property ConnectionObject: _Connection;
```

C++

```
__property _Connection ConnectionObject;
```

Description

Use ConnectionObject to get direct access to the ADO connection object the connection component represents. This direct access reference allows an application to use properties and methods of the underlying connection object. Accessing the underlying connection object is especially useful for utilizing properties and methods of the connection object not surfaced in

TADOConnection (see page 1001).

Note: Use of ConnectionObject to directly access the underlying ADO connection object requires a good working knowledge of ADO objects in general and the ADO connection object in specific. Using the connection object directly is not recommended unless you are familiar with connection object operations. Consult the Microsoft Data Store SDK help for specific information on using ADO connection objects.

See Also

Open (see page 1016)

Close (see page 6863)

Accessing the Connection Object

8.1.4.5.7 TADOConnection.ConnectionString Property

Specifies the connection information for the data store.

Pascal

```
property ConnectionString: WideString;
```

C++

```
__property BSTR ConnectionString;
```

Description

Set ConnectionString to specify the information needed to connect the ADO connection component to the data store. The value used for ConnectionString consists of one or more arguments ADO uses to establish the connection. Specify multiple arguments as a list with individual arguments separated by semicolons.

```
ADOConnection1.ConnectionString := 'Provider=ProviderRef;Remote Server=ServerRef';
ADOConnection1->ConnectionString = "Provider=ProviderRef;Remote Server=ServerRef";
```

At design-time, select from the list of available ADO database connections invoked from the Object Inspector.

A connection string may be saved to file for later use. Specify only the name of such a file in ConnectionString to reuse a saved connection string.

The connection string may also contain login information such as user ID and password, for automated logins.

When explicitly passing login information through either the Open (see page 1016) method or the ConnectionString, the LoginPrompt (see page 1029) property should be set to false to prevent an unnecessary login dialog.

ADO supports the following four arguments for connection strings. Any other arguments (such as a user ID and password) are not processed by ADO and simply passed on to the provider.

Argument	Meaning
Provider (see page 1032)	The name of the provider to use for the connection.
File name	The name of a file containing connection information.

Remote Provider (see page 1032)	The name of the provider to use for a client-side connection.
Remote Server	The path name of the server to use for a client-side connection.

Note: After opening a connection, the contents of ConnectionString may be changed by ADO. One example of this behavior is when ADO-defined arguments are mapped to their provider equivalents.

DefaultDatabase (see page 1027)

Connecting to a Data Store Using TADOConnection

8.1.4.5.8 TADOConnection.ConnectionTimeout Property

Specifies amount of time to attempt a connection.

Pascal

```
property ConnectionTimeout: Integer;
```

C++

```
__property int ConnectionTimeout;
```

Description

Use ConnectionTimeout to specify the amount of time, in seconds, that can expire before an attempt to make a connection is considered unsuccessful. The default value is 15 seconds.

If a connection is successfully made prior to the expiration of the seconds specified or the Cancel (see page 1009) method is called, ConnectionTimeout has no effect. If the specified time expires and a connection has not been successfully made, the attempt is terminated and an exception is raised.

Cancel (see page 1009)

Controlling Timeouts

8.1.4.5.9 TADOConnection.ConnectOptions Property

Specifies whether a connection is synchronous or asynchronous.

Pascal

```
property ConnectOptions: TConnectOption;
```

C++

```
__property TConnectOption ConnectOptions;
```

Description

Set ConnectOptions to specify whether the connection established by the TADOConnection (see page 1001) is synchronous or asynchronous. The default value for ConnectOptions is coConnectUnspecified.

An application will typically use the default of a synchronous connection (coConnectUnspecified). Typically an asynchronous is only really needed to compensate for a slow server.

See Also

Open (see page 1016)

Close (see page 6863)

Connected (see page 1022)

ConnectionString (see page 1024)

ConnectionObject (see page 1023)

Cancel (see page 1009)

ConnectionTimeout (see page 1025)

Forcing Asynchronous Connections

8.1.4.5.10 TADOConnection.CursorLocation Property

Specifies whether cursors for the connection is client-side or server-side.

Pascal

```
property CursorLocation: TCursorLocation;
```

C++

```
__property TCursorLocation CursorLocation;
```

Description

Use CursorLocation to indicate whether the cursors that use the connection object to connect to the ADO datastore use a client-side or server-side cursor library. CursorLocation only affects connections opened after the property is set. The default value for CursorLocation is clUseClient.

A client-side cursor offers more flexibility. All data is retrieved to the local machine and then operated on there, allowing operations not normally supported by servers like sorting and resorting the data and additional filtering. SQL statements are executed at the server, so for statements that restrict the result set with a WHERE clause, only the reduced result set is retrieved to a local cursor.

A server-side cursor offers less flexibility, but may be more advantageous (or necessary) for large result sets. Using a server-side cursor becomes necessary when the sheer size of a result set exceeds the available disk space that would be needed to create the client-side cursor. Also, many servers only support unidirectional cursors. This would preclude moving the

record pointer in the dataset backward (even one record) through the result set.

8.1.4.5.11 TADOConnection.DataSets Property

Provides an indexed array of all active datasets for a connection component.

Pascal

```
property DataSets [Index: Integer]: TCustomADODataSet;
```

C++

```
__property TCustomADODataSet DataSets[int Index];
```

Description

Use DataSets to access active datasets associated with a connection component. An active dataset is one that is currently open.

Datasets connected through an ADO connection object can be accessed in sequence through the DataSets property in a loop based on DataSetCount.

```
var
  i: Integer;
begin
for i := 0 to (ADOConnection1.DataSetCount – 1) do
    ListBox1.Items.Add(ADOConnection1.DataSets[i].Name)
end;
for (int i = 0; i < ADOConnection1->DataSetCount; i++)
  ListBox1->Items->Add(ADOConnection1->DataSets[i]->Name);
```

See Also

DataSetCount

CommandCount (see page 1021)

Commands (see page 1021)

8.1.4.5.12 TADOConnection.DefaultDatabase Property

Indicates the database the ADO connection uses by default.

Pascal

```
property DefaultDatabase: WideString;
```

C++

```
__property BSTR DefaultDatabase;
```

Description

Set DefaultDatabase to indicate the database the ADO connection objects uses if the connection to the database specified in ConnectionString (see page 1024) is unavailable, the connection cannot be made, or the database is not specified in the connection string.

Note: If a default database is specified in the ConnectionString (see page 1024) property, it has precedence over the value in DefaultDatabase. The DefaultDatabase value is automatically changed to the database specified in ConnectionString (see page 1024) when the connection component is opened.

See Also

ConnectionString (see page 1024)

Open (see page 1016)

ConnectionObject (see page 1023)

Connecting to a Data Store Using TADOConnection

8.1.4.5.13 TADOConnection.Errors Property

Errors is the implementation of the Errors Collection.

Pascal

```
property Errors: Errors;
```

C++

```
__property Errors Errors;
```

Description

Use Errors to get direct access to the ADO Errors Collection for the ADO Connection object the TADOConnection (see page 1001) component represents. This direct access reference allows an application to use properties and methods of the underlying Errors Collection object. Accessing the underlying connection object is especially useful for utilizing properties and methods of the Errors Collection not surfaced in TADOConnection (see page 1001).

The Errors Collection object of a Connection object contains the errors generated by the provider. For each provider error, one or more ADO Error (see page 1312) objects are placed in the Errors Collection. Error (see page 1312) objects represent individual errors from the provider and are not ADO-specific. On a subsequent error, the Errors Collection is cleared of any Error (see page 1312) objects and new Error (see page 1312) objects are inserted for the current error.

Note: Use of Errors to directly access the underlying ADO Errors Collection object requires a good working knowledge of ADO objects in general and ADO Errors Collection objects in specific. Using the Errors Collection object directly is not recommended unless you are familiar with connection object operations. Consult the Microsoft Data Store SDK help for specific information on using ADO Errors Collection objects.

8.1.4.5.14 TADOConnection.InTransaction Property

Indicates whether a transaction is in progress.

Pascal

```
property InTransaction: Boolean;
```

C++

```
__property Boolean InTransaction;
```

Description

Read InTransaction at runtime to determine whether a transaction is currently active for the ADO connection component. If the connection component is currently in a transaction, InTransaction contains a true value. If no transaction is currently active it contains false.

A transaction is will be active if the BeginTrans (see page 1008) method has been called to initiate a transaction but that transaction has not either been consummated by calling CommitTrans (see page 1010) or canceled by calling the RollbackTrans (see page 1018) method. Use the InTransaction property to prevent calling BeginTrans (see page 1008) when a transaction has already been initiated for the connection component.

See Also

BeginTrans (see page 1008)

CommitTrans (see page 1010)

RollbackTrans (see page 1018)

8.1.4.5.15 TADOConnection.IsolationLevel Property

Specifies the transaction isolation level for transactions.

Pascal

```
property IsolationLevel: TIsolationLevel;
```

C++

```
__property TIsolationLevel IsolationLevel;
```

Description

Use IsolationLevel to specify the transaction isolation level for a connection. The transaction isolation level determines how a transaction interacts with other simultaneous transactions when they work with the same tables, and how much a transaction sees of the work performed by other transactions. The default value for IsolationLevel is ilCursorStability.

Set IsolationLevel to a valid TIsolationLevel (see page 1300) value prior to starting a new transaction. Read IsolationLevel after the transaction has been activated to determine the actual transaction isolation level used. It is possible that a server will force an isolation level other than that requested if the level requested is not supported.

Below are four of the supported transaction levels and the transaction phenomena that may occur under each. For more information on all supported transaction levels, see the topic for the TIsolationLevel (see page 1300) type.

Isolation Level	Dirty Reads	Nonrepeatable Reads	Phantoms

Dirty reads occur when a transaction reads data that has not yet been committed. Nonrepeatable reads occur when a transaction reads the same row twice and the data is different each time. Phantoms are rows that match the criteria used to compose a result set, but that are not initially visible.

8.1.4.5.16 TADOConnection.KeepConnection Property

Specifies whether an application remains connected to a database even if no datasets are open.

Pascal

```
property KeepConnection: Boolean;
```

C++

```
__property Boolean KeepConnection;
```

Description

Use KeepConnection to specify whether an application remains connected to a database even if no associated dataset components are currently active. When KeepConnection is true (the default) the connection is maintained. For connections to remote database servers, or for applications that frequently open and close datasets, set KeepConnection to true to reduce network traffic, speed up applications, and avoid logging in to the server each time the connection is reestablished.

When KeepConnection is false a connection is dropped when there are no open datasets. Dropping a connection releases system resources allocated to the connection, but if a dataset is later opened that uses the database, the connection must be reestablished and initialized.

8.1.4.5.17 TADOConnection.LoginPrompt Property

Specifies whether a login dialog appears immediately before opening a new connection.

Pascal

```
property LoginPrompt: Boolean;
```

C++

```
__property Boolean LoginPrompt;
```

Description

Set LoginPrompt to true to provide login support when establishing a connection. LoginPrompt controls two things: the occurrence of the OnLogin event, and the appearance of a default login dialog that prompts users for a name and password when you include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). When the OnLogin event occurs and when the default login dialog appears depend on the type of connection component:

For TDatabase, TIBDatabase, and TSQLConnection, the dialog appears after the BeforeConnect event and before the AfterConnect event, unless you supply an OnLogin event handler. If there is an OnLogin event handler, that event occurs in place of the login dialog, and there is no need to include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For TADOConnection components, the dialog appears after the OnWillConnect event and before the BeforeConnect event. If there is an OnLogin event handler, that event occurs after the login dialog. If you do not include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi), the OnLogin event occurs but there is no default login dialog. If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For DataSnap SOAP connection components, the dialog appears after the OnGetUsername event and before the BeforeConnect, AfterConnect, and OnLogin events. If the user cancels from the login dialog, no attempt is made to open a connection.

When LoginPrompt is false, the application must supply user name and password values programmatically:

For TDatabase, the user name and password can be supplied as USER NAME and PASSWORD parameters in the Params property.

For TADOConnection, the user name and password can be supplied as the ConnectionString property.

For TSQLConnection, the user name, password, and database can be supplied as UserName, Password, and Database parameters in the Params property, or provided as connection parameters associated with the connection name.

For DataSnap SOAP connection components, there is no built-in use for the user name and password supplied by the login dialog. (The UserName and Password properties of TWebConnection are unrelated).

Warning: Storing hard-coded user name and password entries as property values or in code for an OnLogin event handler can compromise server security.

OnLogin (see page 9994)

Controlling Server Login

8.1.4.5.18 TADOConnection.Mode Property

Indicate the persmissions available to a connection.

Pascal

```
property Mode: TConnectMode;
```

C++

```
__property TConnectMode Mode;
```

Description

Read Mode to determine the permissions available to the connection after the connection has been activated. The permissions expressed in Mode govern the types of operations (such as reading and writing) can be performed through the connection. They also control how these operations are affected by and affect other concurrent users.

See Also

Indicating the Types of Operations the Connection Supports

8.1.4.5.19 TADOConnection.OnLogin Property

Occurs when a communication channel opens to the server.

Pascal

```
property OnLogin: TLoginEvent;
```

C++

```
__property TLoginEvent OnLogin;
```

Description

OnLogin occurs when connections are opened if the LoginPrompt property is true.

For DataSnap SOAP connection components, the following sequence of events occurs when opening a connection to an application server:

1. An OnGetUsername event occurs, where the application can supply an initial user name for the login dialog.
2. The login dialog appears, where the user can supply a user name and password.
3. A BeforeConnect event occurs, the connection is opened, and an AfterConnect event occurs.
4. The OnLogin event occurs, where you can write code to log in to the application server using the username and password that were provided in the remote login dialog.

   Note: Do not use the OnLogin event if the connection component provides a different scheme for logging in. For example, TWebConnection uses the Username and Password properties instead.

   For ADO connection components, the following sequence of events occurs when opening a connection to an application server:

1. A BeforeConnect event occurs.

2. An OnWillConnect event occurs, where the application can supply an initial user name and password for the login dialog, as well as the connection options and status.

3. The login dialog appears, where the user can supply a user name and password.

4. The OnLogin event occurs, where you can write code to respond to the user-supplied values. (For example, you could convert an application-specific user name and password to database user name and password).

5. The connection is opened, and an AfterConnect event occurs.

Note: Some

C connection components that do not connect to an application server in a multitiered database application replace the OnLogin event defined in TCustomConnection with a different event that occurs before a connection is established.

OnWillConnect (see page 1039)

8.1.4.5.20 TADOConnection.Properties Property

Pascal

```
property Properties: Properties;
```

C++

```
__property Properties Properties;
```

Description

This is Properties, a member of class TADOConnection.

8.1.4.5.21 TADOConnection.Provider Property

Specifies the provider for the ADO connection.

Pascal

```
property Provider: WideString;
```

C++

```
__property BSTR Provider;
```

Description

Set Provider to indicate the provider the ADO connection object uses.

The provider a connection is to use can also be specified in the string entered in ConnectionString (see page 1024). If Provider is left blank and the provider specified through ConnectionString (see page 1024), when the connection is activated the Provider property is automatically set indicating the provider used.

See Also

Connecting to a Data Store Using TADOConnection

8.1.4.5.22 TADOConnection.State Property

Indicates the current state of the ADO connection.

Pascal

```
property State: TObjectStates;
```

C++

```
__property TObjectStates State;
```

Description

Read State at runtime to determine the activity being performed, if any, by the connection at a specific point in time. Activity status includes the command component connecting to a data store, executing a connection, fetching rows for a recordset, sitting idle but open, and sitting idle and closed.

See Also

Open (see page 1016)

Connected (see page 1022)

Close (see page 6863)

8.1.4.5.23 TADOConnection.Version Property

Indicates the version of ADO used.

Pascal

```
property Version: WideString;
```

C++

```
__property BSTR Version;
```

Description

Read Version at runtime to determine the version of ADO used. Some versions of ADO do not support all possible features, so querying Version is important when using features only supported in later versions.

8.1.4.6 TADOConnection Events

The events of the TADOConnection class are listed here.

Published Events

	Name	Description
	AfterConnect (see page 1034)	Occurs after a connection is established.
	AfterDisconnect (see page 1034)	Occurs after the connection closes.
	BeforeConnect (see page 1034)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 1035)	Occurs immediately before the connection closes.
	OnBeginTransComplete (see page 1035)	Occurs after beginning a transaction.
	OnCommitTransComplete (see page 1036)	Occurs after committing a transaction.
	OnConnectComplete (see page 1036)	Occurs after starting a connection.
	OnDisconnect (see page 1037)	Occurs after a connection is terminated.
	OnExecuteComplete (see page 1038)	Occurs after a command is executed.
	OnInfoMessage (see page 1038)	Occurs when information messages are received from the data store connection.
	OnRollbackTransComplete (see page 1039)	Occurs after rolling back a transaction.
	OnWillConnect (see page 1039)	Occurs after a request to start a connection.
	OnWillExecute (see page 1040)	Occurs after a database server signals acceptance of a command execution.

8.1.4.6.1 TADOConnection.AfterConnect Event

Occurs after a connection is established.

Pascal

```
property AfterConnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterConnect;
```

Description

Write an AfterConnect event handler to take application-specific actions immediately after the connection component opens a connection to the remote source of database information.

See Also

BeforeConnect (see page 6875)

Connected (see page 6868)

Connecting to a Database Server

8.1.4.6.2 TADOConnection.AfterDisconnect Event

Occurs after the connection closes.

Pascal

```
property AfterDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDisconnect;
```

Description

Write an AfterDisconnect event handler to take application-specific actions after the connection component drops a connection.

See Also

BeforeDisconnect (see page 6875)

Connected (see page 6868)

Disconnecting from a Database Server

8.1.4.6.3 TADOConnection.BeforeConnect Event

Occurs immediately before establishing a connection.

Pascal

```
property BeforeConnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeConnect;
```

Description

Write a BeforeConnect event handler to take application-specific actions before the connection component opens a connection to the remote source of database information.

See Also

AfterConnect (see page 6874)

Connected (see page 6868)

Connecting to a Database Server

8.1.4.6.4 TADOConnection.BeforeDisconnect Event

Occurs immediately before the connection closes.

Pascal

```
property BeforeDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDisconnect;
```

Description

Write a BeforeDisconnect event handler to take application-specific actions before dropping a connection.

Delphi Examples:

```
{
This BeforeDisconnect event handler makes sure that the
client dataset has applied all its pending updates before
terminating the connection to the server.
}
procedure TForm1.RemoteServer1BeforeDisconnect(Sender: TObject);
begin
  if (ClientDataSet1.ChangeCount > 0) then
    ClientDataSet1.ApplyUpdates(-1);
end;
```

See Also

AfterDisconnect (see page 6875)

Connected (see page 6868)

Disconnecting from a Database Server

8.1.4.6.5 TADOConnection.OnBeginTransComplete Event

Occurs after beginning a transaction.

Pascal

```
property OnBeginTransComplete: TBeginTransCompleteEvent;
```

C++

```
__property TBeginTransCompleteEvent OnBeginTransComplete;
```

Description

Write an OnBeginTransComplete event handler to take specific action after an attempt to begin a transaction has successfully completed. The OnBeginTransComplete event fires after the corresponding operation (initiation of a transaction) has executed at the ADO Connection object. Calling the BeginTrans (see page 1008) method will lead to this event occurring.

TransactionLevel is the new transaction level from the call to the BeginTrans (see page 1008) method.

Error (see page 1312) is an ADO Error (see page 1312) object. See the Microsoft Data Access SDK for more information on

using ADO Error (see page 1312) objects. The Error (see page 1312) parameter is only set if an error occurred during execution of the operation that triggered the event. In this case, the EventStatus parameter will contain the indicating value esErrorsOccured.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event.

See Also

OnCommitTransComplete (see page 1036)

OnRollbackTransComplete (see page 1039)

BeginTrans (see page 1008)

BeginTrans (see page 1008)

ADO Connection Events

8.1.4.6.6 TADOConnection.OnCommitTransComplete Event

Occurs after committing a transaction.

Pascal

```
property OnCommitTransComplete: TConnectErrorEvent;
```

C++

```
__property TConnectErrorEvent OnCommitTransComplete;
```

Description

Write an OnCommitTransComplete event handler to take specific action after an attempt to commit a transaction has successfully completed. The OnCommitTransComplete event fires after the corresponding operation (committing a transaction) has executed at the ADO Connection object. Calling the CommitTrans (see page 1010) method will lead to this event occurring.

Error (see page 1312) is an ADO Error (see page 1312) object. See the Microsoft Data Access SDK for more information on using ADO Error (see page 1312) objects. The Error (see page 1312) parameter is only set if an error occurred during execution of the operation that triggered the event. In this case, the EventStatus parameter will contain the indicating value esErrorsOccured.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event.

See Also

OnBeginTransComplete (see page 1035)

OnRollbackTransComplete (see page 1039)

CommitTrans (see page 1010)

CommitTrans (see page 1010)

ADO Connection Events

8.1.4.6.7 TADOConnection.OnConnectComplete Event

Occurs after starting a connection.

Pascal

```
property OnConnectComplete: TConnectErrorEvent;
```

C++

```
__property TConnectErrorEvent OnConnectComplete;
```

Description

Write an OnConnectComplete event handler to take specific action after an attempt to connect to a database has successfully completed and the connection has started. The OnConnectComplete event fires after the corresponding operation (establishing a connection) has executed at the ADO Connection object. Calling the Open (see page 1016) method or setting the Connected (see page 1022) property to true will lead to this event occurring.

Error (see page 1312) is an ADO Error (see page 1312) object. See the Microsoft Data Access SDK for more information on using ADO Error (see page 1312) objects. The Error (see page 1312) parameter is only set if an error occurred during execution of the operation that triggered the event. In this case, the EventStatus parameter will contain the indicating value esErrorsOccured.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event.

See Also

Open (see page 1016)

Connected (see page 1022)

ADO Connection Events

8.1.4.6.8 TADOConnection.OnDisconnect Event

Occurs after a connection is terminated.

Pascal

```
property OnDisconnect: TDisconnectEvent;
```

C++

```
__property TDisconnectEvent OnDisconnect;
```

Description

Write an OnDisconnect event handler to take specific action after a connection to a database is terminated. The OnDisconnect event fires after the corresponding operation (ending a connection) has executed at the ADO Connection object. Calling the Close method or setting the Connected (see page 1022) property to false will lead to this event occurring.

Error (see page 1312) is an ADO Error (see page 1312) object. See the Microsoft Data Access SDK for more information on using ADO Error (see page 1312) objects. The Error (see page 1312) parameter is only set if an error occurred during execution of the operation that triggered the event. In this case, the EventStatus parameter will contain the indicating value esErrorsOccured.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event.

See Also

Close (see page 6863)

Connected (see page 1022)

ADO Connection Events

8.1.4.6.9 TADOConnection.OnExecuteComplete Event

Occurs after a command is executed.

Pascal

```
property OnExecuteComplete: TExecuteCompleteEvent;
```

C++

```
__property TExecuteCompleteEvent OnExecuteComplete;
```

Description

Write an OnExecuteComplete event handler to take specific action after the ADO connection object has successfully executed a command. The OnExecuteComplete event fires after the corresponding operation (executing an ADO command) has completed execution at the ADO Connection object. Calling the Execute (see page 1012) method will lead to this event occurring.

Connection indicates the TADOConnection (see page 1001) component executing the ADO command.

RecordsAffected indicated the number of rows in the table that were affected by the execution of the command. For instance, if the command deletes rows in a table, RowsAfftected indicates how many rows were deleted (possibly less than all rows if a WHERE clause is used in the command).

Error (see page 1312) is an ADO Error (see page 1312) object. See the Microsoft Data Access SDK for more information on using ADO Error (see page 1312) objects. The Error (see page 1312) parameter is only set if an error occurred during execution of the operation that triggered the event. In this case, the EventStatus parameter will contain the indicating value esErrorsOccured.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event.

Command is the ADO Command object executing the command. If no Command object was used, this parameter contains a nil (Delphi) or NULL (C++) value.

Recordset is an ADO Recordset object containing the result set for the command. Recordset only contains an ADO Recordset object if the command was a SELECT statement, otherwise it contains a nil (Delphi) or NULL (C++) value.

See Also

Execute (see page 1012)

ADO Connection Events

8.1.4.6.10 TADOConnection.OnInfoMessage Event

Occurs when information messages are received from the data store connection.

Pascal

```
property OnInfoMessage: TInfoMessageEvent;
```

C++

```
__property TInfoMessageEvent OnInfoMessage;
```

Description

Write an OnInfoMessage event handler to take specific action after an information message is received from a database connection. This event occurs when a connection event successfully completes and additional information is returned by the provider.

Error (see page 1312) is an ADO Error (see page 1312) object. See the Microsoft Data Access SDK for more information on

using ADO Error (see page 1312) objects. The Error (see page 1312) parameter is only set if an error occurred during execution of the operation that triggered the event. In this case, the EventStatus parameter will contain the indicating value esErrorsOccured.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event.

See Also

ADO Connection Events

8.1.4.6.11 TADOConnection.OnRollbackTransComplete Event

Occurs after rolling back a transaction.

Pascal

```
property OnRollbackTransComplete: TConnectErrorEvent;
```

C++

```
__property TConnectErrorEvent OnRollbackTransComplete;
```

Description

Write an OnRollbackTransComplete event handler to take specific action after an attempt to roll back a transaction has successfully completed. The OnRollbackTransComplete event fires after the corresponding operation (rolling back a transaction) has executed at the ADO Connection object. Calling the RollbackTrans (see page 1018) method will lead to this event occurring.

Error (see page 1312) is an ADO Error (see page 1312) object. See the Microsoft Data Access SDK for more information on using ADO Error (see page 1312) objects. The Error (see page 1312) parameter is only set if an error occurred during execution of the operation that triggered the event. In this case, the EventStatus parameter will contain the indicating value esErrorsOccured.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event.

8.1.4.6.12 TADOConnection.OnWillConnect Event

Occurs after a request to start a connection.

Pascal

```
property OnWillConnect: TWillConnectEvent;
```

C++

```
__property TWillConnectEvent OnWillConnect;
```

Description

Write an OnWillConnect event handler to take specific action before a connection starts and after the provider indicates the connection attempt can be made. The OnWillConnect event fires after the corresponding operation (requesting a connection attempt) has executed at the ADO Connection object. Calling the Open (see page 1016) method or setting the Connected (see page 1022) property to true will lead to this event occurring.

Connection indicates the TADOConnection (see page 1001) component attempting the connection.

ConnectionString (see page 1024) contains the connection information for the pending connection.

UserID contains the user identification for the pending connection.

Password contains the password for the pending connection.

ConnectionOptions contains the TConnectOption (see page 1293) value that describes how the provider is to evaluate the connection string for the pending connection.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event. In a handler for this event, set this parameter to esCancel to request cancellation of the pending connection operation.

ADO Connection Events

8.1.4.6.13 TADOConnection.OnWillExecute Event

Occurs after a database server signals acceptance of a command execution.

Pascal

```
property OnWillExecute: TWillExecuteEvent;
```

C++

```
__property TWillExecuteEvent OnWillExecute;
```

Description

Write an OnWillExecute event handler to take specific action before a command is executed. The OnWillExecute event fires after the corresponding operation (requesting a command execution) has executed at the ADO Connection object. Calling the Execute (see page 1012) method will lead to this event occurring.

Error (see page 1312) is an ADO Error (see page 1312) object. See the Microsoft Data Access SDK for more information on using ADO Error (see page 1312) objects. The Error (see page 1312) parameter is only set if an error occurred during execution of the operation that triggered the event. In this case, the EventStatus parameter will contain the indicating value esErrorsOccured.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event. In a handler for this event, set this parameter to esCancel to request cancellation of the pending command execution.

8.1.5 TADODataSet Class

TADODataSet represents a dataset retrieved from an ADO data store.

Class Hierarchy

Pascal

```
TADODataSet = class(TCustomADODataSet);
```

C++

```
class TADODataSet : public TCustomADODataSet;
```

File

ADODB

Description

TADODataSet is the most generic of the ADO dataset components. TADODataSet is capable of retrieving a result set from one or more tables in an ADO data store. The retrieval can be either directly from a table or from one or more tables through an SQL statement.

Connect a TADODataSet to a data store before using it to retrieve a dataset. Do this with a connection string in its ConnectionString (see page 1206) property or with a connection already established by a TADOConnection (see page 1001) component specified in the Connection (see page 1205) property.

Use the TADODataSet component's CommandText (see page 1057) property to retrieve the dataset, specifying either a table name or an SQL statement (SELECT only). TADODataSet is not capable of issuing Data Manipulation Language (DML) SQL statements that do not return result sets (like DELETE, INSERT, and UPDATE). For this use a component like TADOCommand (see page 984) or TADOQuery (see page 1084).

Building a VCL Forms ADO.NET Database Application

8.1.5.1 TADODataSet Members

The following tables list the members exposed by TADODataSet.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.
	ActivateTextFilter (see page 1160)	This is ActivateTextFilter, a member of class TCustomADODataSet.
V	AllocRecordBuffer (see page 1160)	This is AllocRecordBuffer, a member of class TCustomADODataSet.
V	AllocRecordBuffer (see page 6909)	This is AllocRecordBuffer, a member of class TDataSet.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
V	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
V	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CheckActive (see page 1162)	This is CheckActive, a member of class TCustomADODataSet.
V	CheckActive (see page 6917)	This is CheckActive, a member of class TDataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
V	CheckFieldCompatibility (see page 1162)	This is CheckFieldCompatibility, a member of class TCustomADODataSet.
V	CheckFieldCompatibility (see page 6919)	This is CheckFieldCompatibility, a member of class TDataSet.
V	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
V	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.
V	ClearCalcFields (see page 1162)	This is ClearCalcFields, a member of class TCustomADODataSet.
V	ClearCalcFields (see page 6919)	This is ClearCalcFields, a member of class TDataSet.
V	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
V	CloseCursor (see page 6921)	This is CloseCursor, a member of class TDataSet.
	ConnectionPoint (see page 1163)	This is ConnectionPoint, a member of class TCustomADODataSet.
V	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
V	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
V	DataConvert (see page 6924)	This is DataConvert, a member of class TDataSet.
V	DataEvent (see page 1055)	This is DataEvent, a member of class TADODataSet.
	DeactivateFilters (see page 1164)	This is DeactivateFilters, a member of class TCustomADODataSet.
V	DefChanged (see page 1165)	This is DefChanged, a member of class TCustomADODataSet.
V	DefChanged (see page 6924)	This is DefChanged, a member of class TDataSet.
V	DefineProperties (see page 1165)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
V	DestroyLookupCursor (see page 1166)	This is DestroyLookupCursor, a member of class TCustomADODataSet.
V	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.
V	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
V	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
V	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.

	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.
	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.
	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
	DoBeforeInsert (see page 6930)	This is DoBeforeInsert, a member of class TDataSet.
	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.
	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
	DoOnNewRecord (see page 1166)	This is DoOnNewRecord, a member of class TCustomADODataSet.
	DoOnNewRecord (see page 6931)	This is DoOnNewRecord, a member of class TDataSet.
	EnableEvents (see page 1166)	This is EnableEvents, a member of class TCustomADODataSet.
	EndOfRecordset (see page 1167)	This is EndOfRecordset, a member of class TCustomADODataSet.
	FetchComplete (see page 1167)	This is FetchComplete, a member of class TCustomADODataSet.
	FetchProgress (see page 1167)	This is FetchProgress, a member of class TCustomADODataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.
	FieldChangeComplete (see page 1167)	This is FieldChangeComplete, a member of class TCustomADODataSet.
	FindRecord (see page 1168)	This is FindRecord, a member of class TCustomADODataSet.
	FindRecord (see page 6942)	This is FindRecord, a member of class TDataSet.
	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
	FreeRecordBuffer (see page 1168)	This is FreeRecordBuffer, a member of class TCustomADODataSet.
	FreeRecordBuffer (see page 6947)	This is FreeRecordBuffer, a member of class TDataSet.
	GetActiveRecBuf (see page 1168)	This is GetActiveRecBuf, a member of class TCustomADODataSet.
	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.
	GetAggregateValue (see page 6947)	This is GetAggregateValue, a member of class TDataSet.
	GetBookmarkData (see page 1169)	This is GetBookmarkData, a member of class TCustomADODataSet.
	GetBookmarkData (see page 6949)	This is GetBookmarkData, a member of class TDataSet.
	GetBookmarkFlag (see page 1169)	This is GetBookmarkFlag, a member of class TCustomADODataSet.
	GetBookmarkFlag (see page 6949)	This is GetBookmarkFlag, a member of class TDataSet.
	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
	GetCanModify (see page 1169)	This is GetCanModify, a member of class TCustomADODataSet.
	GetCanModify (see page 6950)	This is GetCanModify, a member of class TDataSet.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.
	GetCommandText (see page 1170)	This is GetCommandText, a member of class TCustomADODataSet.
	GetDataSource (see page 1170)	This is GetDataSource, a member of class TCustomADODataSet.
	GetDataSource (see page 6951)	This is GetDataSource, a member of class TDataSet.
	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
	GetIsIndexField (see page 6954)	This is GetIsIndexField, a member of class TDataSet.
	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.

V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
V	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.
V	GetRecNo (see page 1171)	This is GetRecNo, a member of class TCustomADODataSet.
V	GetRecNo (see page 6956)	This is GetRecNo, a member of class TDataSet.
V	GetRecord (see page 1172)	This is GetRecord, a member of class TCustomADODataSet.
A	GetRecord (see page 6956)	This is GetRecord, a member of class TDataSet.
V	GetRecordCount (see page 1172)	This is GetRecordCount, a member of class TCustomADODataSet.
V	GetRecordCount (see page 6956)	This is GetRecordCount, a member of class TDataSet.
V	GetRecordSize (see page 1172)	This is GetRecordSize, a member of class TCustomADODataSet.
V	GetRecordSize (see page 6956)	This is GetRecordSize, a member of class TDataSet.
V	GetStateFieldValue (see page 1172)	This is GetStateFieldValue, a member of class TCustomADODataSet.
V	GetStateFieldValue (see page 6956)	This is GetStateFieldValue, a member of class TDataSet.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
	InitOleDBAccess (see page 1173)	This is InitOleDBAccess, a member of class TCustomADODataSet.
V	InitRecord (see page 6959)	This is InitRecord, a member of class TDataSet.
V	InternalAddRecord (see page 1173)	This is InternalAddRecord, a member of class TCustomADODataSet.
V	InternalAddRecord (see page 6963)	This is InternalAddRecord, a member of class TDataSet.
V	InternalCancel (see page 1173)	This is InternalCancel, a member of class TCustomADODataSet.
V	InternalCancel (see page 6963)	This is InternalCancel, a member of class TDataSet.
V	InternalClose (see page 1173)	This is InternalClose, a member of class TCustomADODataSet.
A	InternalClose (see page 6963)	This is InternalClose, a member of class TDataSet.
V	InternalDelete (see page 1173)	This is InternalDelete, a member of class TCustomADODataSet.
V	InternalDelete (see page 6964)	This is InternalDelete, a member of class TDataSet.
V	InternalEdit (see page 1174)	This is InternalEdit, a member of class TCustomADODataSet.
V	InternalEdit (see page 6964)	This is InternalEdit, a member of class TDataSet.
V	InternalFirst (see page 1174)	This is InternalFirst, a member of class TCustomADODataSet.
V	InternalFirst (see page 6964)	This is InternalFirst, a member of class TDataSet.
	InternalGetRecord (see page 1174)	This is InternalGetRecord, a member of class TCustomADODataSet.
V	InternalGotoBookmark (see page 1174)	This is InternalGotoBookmark, a member of class TCustomADODataSet.
V	InternalGotoBookmark (see page 6964)	This is InternalGotoBookmark, a member of class TDataSet.
V	InternalHandleException (see page 1175)	This is InternalHandleException, a member of class TCustomADODataSet.
A	InternalHandleException (see page 6964)	This is InternalHandleException, a member of class TDataSet.
V	InternalInitFieldDefs (see page 1175)	This is InternalInitFieldDefs, a member of class TCustomADODataSet.
A	InternalInitFieldDefs (see page 6965)	This is InternalInitFieldDefs, a member of class TDataSet.
V	InternalInitRecord (see page 1175)	This is InternalInitRecord, a member of class TCustomADODataSet.
V	InternalInitRecord (see page 6965)	This is InternalInitRecord, a member of class TDataSet.
V	InternalInsert (see page 1175)	This is InternalInsert, a member of class TCustomADODataSet.
V	InternalInsert (see page 6965)	This is InternalInsert, a member of class TDataSet.
V	InternalLast (see page 1175)	This is InternalLast, a member of class TCustomADODataSet.
V	InternalLast (see page 6965)	This is InternalLast, a member of class TDataSet.
V	InternalOpen (see page 1176)	This is InternalOpen, a member of class TCustomADODataSet.
A	InternalOpen (see page 6966)	This is InternalOpen, a member of class TDataSet.
V	InternalPost (see page 1176)	This is InternalPost, a member of class TCustomADODataSet.
V	InternalPost (see page 6966)	This is InternalPost, a member of class TDataSet.
V	InternalRefresh (see page 1176)	This is InternalRefresh, a member of class TCustomADODataSet.
V	InternalRefresh (see page 6966)	This is InternalRefresh, a member of class TDataSet.
	InternalRequery (see page 1176)	This is InternalRequery, a member of class TCustomADODataSet.
	InternalSetSort (see page 1177)	This is InternalSetSort, a member of class TCustomADODataSet.
V	InternalSetToRecord (see page 1177)	This is InternalSetToRecord, a member of class TCustomADODataSet.

	InternalSetToRecord (see page 6966)	This is InternalSetToRecord, a member of class TDataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsCursorOpen (see page 1177)	This is IsCursorOpen, a member of class TCustomADODataSet.
	IsCursorOpen (see page 6966)	This is IsCursorOpen, a member of class TDataSet.
	Loaded (see page 1177)	Initializes the component after the form file has been read into memory.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 6969)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 1179)	This is LocateRecord, a member of class TCustomADODataSet.
	MasterChanged (see page 1180)	This is MasterChanged, a member of class TCustomADODataSet.
	MasterDisabled (see page 1180)	This is MasterDisabled, a member of class TCustomADODataSet.
	MoveComplete (see page 1180)	This is MoveComplete, a member of class TCustomADODataSet.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	OpenCursor (see page 1056)	This is OpenCursor, a member of class TADODataSet.
	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PrepareCursor (see page 1181)	This is PrepareCursor, a member of class TCustomADODataSet.
	PSEndTransaction (see page 1181)	Ends a transaction that was started by a call to PSStartTransaction.
	PSEndTransaction (see page 6979)	Ends a transaction that was started by a call to PSStartTransaction.
	PSExecute (see page 1182)	Executes the SQL command associated with the dataset.
	PSExecute (see page 6980)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 1182)	Executes a specified SQL command.
	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
	PSGetAttributes (see page 1183)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 6981)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 1183)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 6982)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 7537)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandTextW (see page 6982)	This is PSGetCommandTextW, a member of class TDataSet.
	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
	PSGetCommandType (see page 1184)	Gets the command type to be executed by PSExecute.
	PSGetCommandType (see page 6982)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 1184)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 6983)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 1185)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 6983)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 6984)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFieldsW (see page 1185)	This is PSGetKeyFieldsW, a member of class TCustomADODataSet.
	PSGetKeyFieldsW (see page 6984)	This is PSGetKeyFieldsW, a member of class TDataSet.
	PSGetKeyFieldsW (see page 7538)	This is PSGetKeyFieldsW, a member of class TWideDataSet.
	PSGetParams (see page 1185)	Returns the current parameter values of the dataset.
	PSGetParams (see page 6984)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 6985)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteCharW (see page 1186)	This is PSGetQuoteCharW, a member of class TCustomADODataSet.
	PSGetQuoteCharW (see page 6985)	This is PSGetQuoteCharW, a member of class TDataSet.
	PSGetQuoteCharW (see page 7539)	This is PSGetQuoteCharW, a member of class TWideDataSet.

	PSGetTableName (see page 6985)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableNameW (see page 1186)	This is PSGetTableNameW, a member of class TCustomADODataSet.
	PSGetTableNameW (see page 6986)	This is PSGetTableNameW, a member of class TDataSet.
	PSGetTableNameW (see page 7539)	This is PSGetTableNameW, a member of class TWideDataSet.
	PSGetUpdateException (see page 1186)	Generates an EUpdateError object based on another exception object.
	PSGetUpdateException (see page 6986)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 1187)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 6987)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 1187)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 6987)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 1188)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 6987)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 1188)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 6988)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 1188)	Assigns a specified SQL command to be executed by PSExecute.
	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
	PSSetParams (see page 1189)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 6989)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 1189)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSStartTransaction (see page 6989)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 1190)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 6990)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RecordChangeComplete (see page 1190)	This is RecordChangeComplete, a member of class TCustomADODataSet.
	RecordsetChangeComplete (see page 1190)	This is RecordsetChangeComplete, a member of class TCustomADODataSet.
	RefreshInternalCalcFields (see page 6993)	This is RefreshInternalCalcFields, a member of class TDataSet.
	RefreshParams (see page 1191)	This is RefreshParams, a member of class TCustomADODataSet.
	ReleaseLock (see page 1191)	This is ReleaseLock, a member of class TCustomADODataSet.
	ResetAggField (see page 6993)	This is ResetAggField, a member of class TDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBlockReadSize (see page 1194)	This is SetBlockReadSize, a member of class TCustomADODataSet.
	SetBlockReadSize (see page 6994)	This is SetBlockReadSize, a member of class TDataSet.
	SetBookmarkData (see page 1194)	This is SetBookmarkData, a member of class TCustomADODataSet.
	SetBookmarkData (see page 6994)	This is SetBookmarkData, a member of class TDataSet.
	SetBookmarkFlag (see page 1194)	This is SetBookmarkFlag, a member of class TCustomADODataSet.
	SetBookmarkFlag (see page 6995)	This is SetBookmarkFlag, a member of class TDataSet.
	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
	SetBufListSize (see page 6995)	This is SetBufListSize, a member of class TDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.
	SetCommandText (see page 1194)	This is SetCommandText, a member of class TCustomADODataSet.
	SetConnection (see page 1056)	This is SetConnection, a member of class TADODataSet.
	SetConnectionFlag (see page 1195)	This is SetConnectionFlag, a member of class TCustomADODataSet.
	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
	SetDataSetField (see page 1056)	This is SetDataSetField, a member of class TADODataSet.
	SetDataSource (see page 1195)	This is SetDataSource, a member of class TCustomADODataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDetailFilter (see page 1195)	This is SetDetailFilter, a member of class TCustomADODataSet.
V	SetFieldData (see page 1195)	This is the overview for the SetFieldData method overload.
V	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.
V	SetFiltered (see page 1196)	This is SetFiltered, a member of class TCustomADODataSet.
V	SetFiltered (see page 6997)	This is SetFiltered, a member of class TDataSet.
V	SetFilterOptions (see page 1196)	This is SetFilterOptions, a member of class TCustomADODataSet.
V	SetFilterOptions (see page 6998)	This is SetFilterOptions, a member of class TDataSet.
V	SetFilterText (see page 1196)	This is SetFilterText, a member of class TCustomADODataSet.
V	SetFilterText (see page 6998)	This is SetFilterText, a member of class TDataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 6999)	Sets the value of the Name property.
	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
V	SetOnFilterRecord (see page 6999)	This is SetOnFilterRecord, a member of class TDataSet.
	SetParamsFromCursor (see page 1197)	This is SetParamsFromCursor, a member of class TCustomADODataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetRecNo (see page 1197)	This is SetRecNo, a member of class TCustomADODataSet.
V	SetRecNo (see page 6999)	This is SetRecNo, a member of class TDataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
V	SetStateFieldValue (see page 7000)	This is SetStateFieldValue, a member of class TDataSet.
	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.
	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateIndexDefs (see page 1198)	This is UpdateIndexDefs, a member of class TCustomADODataSet.
V	UpdateIndexDefs (see page 7002)	This is UpdateIndexDefs, a member of class TDataSet.
	UpdateRecordSetPosition (see page 1198)	This is UpdateRecordSetPosition, a member of class TCustomADODataSet.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WillChangeField (see page 1199)	This is WillChangeField, a member of class TCustomADODataSet.
	WillChangeRecord (see page 1199)	This is WillChangeRecord, a member of class TCustomADODataSet.
	WillChangeRecordset (see page 1200)	This is WillChangeRecordset, a member of class TCustomADODataSet.
	WillMove (see page 1200)	This is WillMove, a member of class TCustomADODataSet.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.
R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.

R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.
R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.
R	Command (see page 1204)	Provides access to the internal command object that executes commands for the dataset.
	Constraints (see page 7013)	Specifies record-level constraints that must be met when editing the data.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
R	MasterDataLink (see page 1218)	Manages the relationship between the ADO dataset and a master table.
	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.
	Reserved (see page 7035)	For internal use only.

Public Events

	Name	Description
	AfterRefresh (see page 7047)	Occurs after an application refreshes the data in the dataset.
	BeforeRefresh (see page 7052)	Occurs immediately before an application refreshes the data in the dataset.
	OnFilterRecord (see page 7055)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BookmarkValid (see page 1160)	Tests the validity of a specified bookmark.
V	BookmarkValid (see page 6916)	Indicates the validity of a specified bookmark.
V	Cancel (see page 6916)	Cancels modifications to the active record if those changes are not yet posted.
	CancelBatch (see page 1161)	Cancels a pending batch update.
	CancelUpdates (see page 1162)	Cancels pending cached updates.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
	Clone (see page 1163)	Duplicates another dataset in the calling component
	Close (see page 6920)	Closes a dataset.
V	CompareBookmarks (see page 1163)	Compares two bookmarks.
V	CompareBookmarks (see page 6921)	Implements a virtual function to compare two bookmarks.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.
V	Create (see page 1156)	Creates an instance of a TCustomADONETConnector component.

	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 6904)	Creates an instance of a TDataSet (see page 6894) component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateBlobStream (see page 1164)	Creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CreateBlobStream (see page 6922)	Provides the interface for a method that creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CreateDataSet (see page 1055)	Creates the recordset for an ADO dataset.
	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
	DeleteRecords (see page 1165)	Deletes one or more records in the dataset.
	Destroy (see page 1157)	Destroys the TCustomADONETConnector instance.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 6904)	Destroys the TDataSet (see page 6894) instance.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.
	FilterOnBookmarks (see page 1168)	Filters a data set to just rows with pre-defined bookmarks.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.
	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetBlobFieldData (see page 1169)	Retrieves the current value of a field into a buffer.
	GetBlobFieldData (see page 6947)	Reads BLOB data into a buffer.
	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentRecord (see page 6950)	Implements a virtual function to retrieve the current record in a buffer.
	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
	GetDetailLinkFields (see page 1170)	Lists the field components that link this dataset as a detail of a master dataset.
	GetDetailLinkFields (see page 6951)	Introduces a method to list the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldData (see page 1171)	This is the overview for the GetFieldData method overload.

	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetIndexNames (see page 1055)	Retrieves a list of available indexes for a table.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.
	IsSequenced (see page 1177)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	IsSequenced (see page 6967)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	Last (see page 6968)	Moves to the last record in the dataset.
	LoadFromFile (see page 1178)	Loads a recordset from a file.
	Locate (see page 1179)	Searches the dataset for a specified record and makes that record the current record.
	Locate (see page 6970)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
	Lookup (see page 1180)	Retrieves field values from a row that matches specified search values.
	Lookup (see page 6970)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 6973)	Moves to the next record in the dataset.
	NextRecordset (see page 1181)	Provides access to a secondary recordset.
	Open (see page 6976)	Opens the dataset.
	Post (see page 6977)	Implements a virtual method to write a modified record to the database or change log.
	Prior (see page 6979)	Moves to the previous record in the dataset.
	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7579)	Executes a specified SQL command.
	PSExecuteStatement (see page 7590)	Executes a specified SQL command.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.

	PSGetCommandText (see page 7579)	Gets the SQL command to be executed by PSExecute (see page 7578).
	PSGetCommandText (see page 7591)	Gets the SQL command to be executed by PSExecute (see page 7590).
	PSGetCommandType (see page 7580)	Gets the command type to be executed by PSExecute (see page 7578).
	PSGetCommandType (see page 7591)	Gets the command type to be executed by PSExecute (see page 7590).
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7581)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 7592)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.
	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7585)	Assigns a specified SQL command to be executed by PSExecute (see page 7578).
	PSSetCommandText (see page 7596)	Assigns a specified SQL command to be executed by PSExecute (see page 7590).
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).
	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Requery (see page 1191)	Refreshes the recordset.
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.

V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 1192)	Saves a recordset to a file.
	Seek (see page 1192)	Searches for a record using the current index.
	SetFields (see page 6997)	Sets the values for all fields in a record
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	Supports (see page 1197)	Indicates whether a dataset supports certain types of operations.
V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateBatch (see page 1197)	Writes pending batch updates to disk.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.
	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 1199)	Indicates the update status of the current record.
V	UpdateStatus (see page 7002)	Reports the update status for the active record.

Public Properties

	Name	Description
	Active (see page 7004)	Specifies whether or not a dataset is open.
R	AggFields (see page 7006)	Contains any aggregate fields.
	AutoCalcFields (see page 7006)	Determines when the OnCalcFields (see page 7053) event is triggered and when lookup field values are calculated.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.
	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.
	DesignerData (see page 1208)	Stores custom data.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.
R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset
	Filter (see page 7026)	Specifies the text of the current filter for a dataset.
	Filtered (see page 7027)	Specifies whether or not filtering is active for a dataset.
	FilterGroup (see page 1214)	Filters a recordset based on row update status.
	FilterOptions (see page 7027)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
	IndexDefs (see page 1062)	Contains the definitions of the indexes for the current table.
R	IndexFieldCount (see page 1216)	Indicates the number of fields that comprise the current key.
	IndexFields (see page 1217)	Retrieves or sets a field for an index.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
R	Modified (see page 7029)	Indicates whether the active record is modified.
	ObjectView (see page 7031)	Specifies whether fields are stored hierarchically or flattened out in the Fields (see page 7023) property.

R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Properties (see page 1221)	This is Properties, a member of class TCustomADODataSet.
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 7032)	Indicates the total number of records associated with the dataset.
	Recordset (see page 1221)	This is Recordset, a member of class TCustomADODataSet.
R	RecordsetState (see page 1222)	This is RecordsetState, a member of class TCustomADODataSet.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.
R	RecordStatus (see page 1222)	Indicates the status of the current row.
	Sort (see page 1222)	Specifies the sort order of the recordset.
	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterCancel (see page 1067)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 1069)	Occurs after an application closes a dataset.
	AfterDelete (see page 1071)	Occurs after an application deletes a record.
	AfterEdit (see page 1073)	Occurs after an application starts editing a record.
	AfterInsert (see page 1074)	Occurs after an application inserts a new record.
	AfterOpen (see page 1075)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 1076)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 1233)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 1076)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 1077)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 1077)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 1078)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 1078)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 1079)	Occurs before an application enters insert mode.
	BeforeOpen (see page 1080)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 1081)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 1239)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 1082)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 1082)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 1083)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 1083)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnEndOfRecordset (see page 1241)	Occurs when moving a recordset's row pointer past the last row.
	OnFetchComplete (see page 1242)	Occurs after records have been retrieved into the recordset.
	OnFetchProgress (see page 1242)	Occurs periodically during an asynchronous data retrieval operation.
	OnFieldChangeComplete (see page 1243)	Occurs after a field has changed.
	OnFilterRecord (see page 1244)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnMoveComplete (see page 1244)	Occurs after the row pointer in a recordset has moved.
	OnNewRecord (see page 1084)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 1084)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnRecordChangeComplete (see page 1246)	Occurs after one or more records in the recordset change.
	OnRecordsetChangeComplete (see page 1247)	Occurs after the recordset has changed.
	OnRecordsetCreate (see page 1247)	Occurs when the recordset has been initialized and is ready to use.

	OnWillChangeField (see page 1248)	Occurs before a field is changed.
	OnWillChangeRecord (see page 1248)	Occurs before a record in the recordset is changed.
	OnWillChangeRecordset (see page 1249)	Occurs before the recordset has changed.
	OnWillMove (see page 1250)	Occurs before the row pointer in a recordset is moved.

Published Properties

	Name	Description
	Active (see page 1201)	Specifies whether or not a dataset is open.
	AutoCalcFields (see page 1203)	Determines when the OnCalcFields event is triggered and when lookup field values are calculated.
	CacheSize (see page 1203)	Specifies the size of the cache for the dataset.
	CommandText (see page 1057)	This is CommandText, a member of class TADODataSet.
	CommandTimeout (see page 1057)	Specifies amount of time to attempt execution of a command.
	CommandType (see page 1057)	Specifies the type of command to execute.
	Connection (see page 1205)	Specifies the ADO connection component to use.
	ConnectionString (see page 1206)	Specifies the connection information for the data store.
	CursorLocation (see page 1207)	Specifies whether the cursor for the connection is client-side or server-side.
	CursorType (see page 1208)	Specifies type of cursor an ADO dataset uses.
	DataSetField (see page 1058)	Indicates the persistent TDataSetField object that owns a nested dataset.
	DataSource (see page 1059)	Represents the data source of another dataset that supplies values to the dataset.
	EnableBCD (see page 1059)	Specifies whether to treat numeric fields as floating-point or BCD.
	ExecuteOptions (see page 1209)	Specifies the characteristics of a command execution.
	FieldDefs (see page 1060)	Points to the list of field definitions for the dataset.
	Filter (see page 1212)	Specifies the text of the current filter for a recordset.
	Filtered (see page 1214)	Specifies whether or not filtering is active for a dataset.
	IndexFieldNames (see page 1063)	Lists the columns to use for a persistent sort of the recordset.
	IndexName (see page 1063)	Specifies the currently active index.
	LockType (see page 1218)	Specifies the lock type to use when opening a dataset.
	MarshalOptions (see page 1218)	Specifies which records are marshaled back to the server.
	MasterFields (see page 1064)	Specifies field or fields on which a Master-Detail link is based.
	MaxRecords (see page 1219)	Specifies how many rows to return in a result set.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParamCheck (see page 1065)	Specifies whether the parameter list for an ADO dataset component is regenerated if the SQL changes at runtime.
	Parameters (see page 1065)	Contains the collection of parameters for an SQL statement.
	Prepared (see page 1066)	Specifies whether the command is prepared before execution.
	RDSConnection (see page 1066)	Specifies the RDS connection component to use.
	StoreDefs (see page 1066)	Specifies whether field definitions are stored with the ADO dataset.
	Tag (see page 2808)	Stores an integer value as part of a component.

8.1.5.2 TADODataSet Methods

The methods of the TADODataSet class are listed here.

Protected Methods

	Name	Description
	DataEvent (see page 1055)	This is DataEvent, a member of class TADODataSet.
	OpenCursor (see page 1056)	This is OpenCursor, a member of class TADODataSet.
	SetConnection (see page 1056)	This is SetConnection, a member of class TADODataSet.
	SetDataSetField (see page 1056)	This is SetDataSetField, a member of class TADODataSet.

Public Methods

	Name	Description
	CreateDataSet (see page 1055)	Creates the recordset for an ADO dataset.
	GetIndexNames (see page 1055)	Retrieves a list of available indexes for a table.

8.1.5.2.1 TADODataSet.CreateDataSet Method

Creates the recordset for an ADO dataset.

Pascal

```
procedure CreateDataSet;
```

C++

```
__fastcall CreateDataSet();
```

Description

Applications should not need to call CreateDataSet themselves. CreateDataSet is called automatically by an ADO dataset to create its recordset.

8.1.5.2.2 TADODataSet.DataEvent Method

Pascal

```
procedure DataEvent(Event: TDataEvent; Info: Longint); override;
```

C++

```
virtual __fastcall DataEvent(TDataEvent Event, Longint Info);
```

Description

This is DataEvent, a member of class TADODataSet.

8.1.5.2.3 TADODataSet.GetIndexNames Method

Retrieves a list of available indexes for a table.

Pascal

```
procedure GetIndexNames(List: TStrings);
```

C++

```
__fastcall GetIndexNames(TStrings List);
```

Description

Call GetIndexNames to retrieve a list of all available indexes for a table. GetIndexNames fills a string list object (such as a TStringList) with the names of the index for the table represented by the TADODataSet (see page 1041) component (and only that table). Any previous contents in the string list object are completely overwritten by the new information.

List is the string list object, created and maintained by the application, into which the index names are retrieved. This string list object must be created prior to the call to GetIndexNames.

The command line below fills the Items property of a TListBox with the names of indexes for the table represented by ADODataSet1.

```
ADODataSet1.GetIndexNames(ListBox1.Items);
ADODataSet1->GetIndexNames(ListBox1->Items);
```

See Also

GetTableNames (see page 1015)

GetProcedureNames (see page 1014)

Obtaining Information About Indexes

8.1.5.2.4 TADODataSet.OpenCursor Method

Pascal

```
procedure OpenCursor(InfoQuery: Boolean); override;
```

C++

```
virtual __fastcall OpenCursor(Boolean InfoQuery);
```

Description

This is OpenCursor, a member of class TADODataSet.

8.1.5.2.5 TADODataSet.SetConnection Method

Pascal

```
procedure SetConnection(const Value: TADOConnection); override;
```

C++

```
virtual __fastcall SetConnection(const TADOConnection Value);
```

Description

This is SetConnection, a member of class TADODataSet.

8.1.5.2.6 TADODataSet.SetDataSetField Method

Pascal

```
procedure SetDataSetField(const Value: TDataSetField); override;
```

C++

```
virtual __fastcall SetDataSetField(const TDataSetField Value);
```

Description

This is SetDataSetField, a member of class TADODataSet.

8.1.5.3 TADODataSet Properties

The properties of the TADODataSet class are listed here.

Public Properties

	Name	Description
	IndexDefs (see page 1062)	Contains the definitions of the indexes for the current table.

Published Properties

	Name	Description
	CommandText (see page 1057)	This is CommandText, a member of class TADODataSet.

	CommandTimeout (see page 1057)	Specifies amount of time to attempt execution of a command.
	CommandType (see page 1057)	Specifies the type of command to execute.
	DataSetField (see page 1058)	Indicates the persistent TDataSetField object that owns a nested dataset.
	DataSource (see page 1059)	Represents the data source of another dataset that supplies values to the dataset.
	EnableBCD (see page 1059)	Specifies whether to treat numeric fields as floating-point or BCD.
	FieldDefs (see page 1060)	Points to the list of field definitions for the dataset.
	IndexFieldNames (see page 1063)	Lists the columns to use for a persistent sort of the recordset.
	IndexName (see page 1063)	Specifies the currently active index.
	MasterFields (see page 1064)	Specifies field or fields on which a Master-Detail link is based.
	ParamCheck (see page 1065)	Specifies whether the parameter list for an ADO dataset component is regenerated if the SQL changes at runtime.
	Parameters (see page 1065)	Contains the collection of parameters for an SQL statement.
	Prepared (see page 1066)	Specifies whether the command is prepared before execution.
	RDSConnection (see page 1066)	Specifies the RDS connection component to use.
	StoreDefs (see page 1066)	Specifies whether field definitions are stored with the ADO dataset.

8.1.5.3.1 TADODataSet.CommandText Property

Pascal

```
property CommandText: WideString;
```

C++

```
__property BSTR CommandText;
```

Description

This is CommandText, a member of class TADODataSet.

8.1.5.3.2 TADODataSet.CommandTimeout Property

Specifies amount of time to attempt execution of a command.

Pascal

```
property CommandTimeout: Integer;
```

C++

```
__property int CommandTimeout;
```

Description

Use CommandTimeout to specify the amount of time that expires before an attempt to execute a command is considered unsuccessful. Measured in seconds, the default value for CommandTimeout is 30.

If a command is successfully executed prior to the expiration of the seconds specified, CommandTimeout has no effect.

See Also

commandtext (see page 1204)

CommandType (see page 1205)

8.1.5.3.3 TADODataSet.CommandType Property

Specifies the type of command to execute.

Pascal

```
property CommandType: TCommandType;
```

C++

```
__property TCommandType CommandType;
```

Description

Set CommandType to indicate the type of command that is contained in the CommandText property. The value in CommandType should agree with that of CommandText. For instance, if CommandText is the name of a table, CommandType should be cmdTable or cmdTableDirect.

The default value of CommandType is cmdUnknown. While CommandType may be left as cmdUnknown for all commands, better performance will be realized if CommandType is used to explicitly indicate the type of the command. When the type cmdUnknown is used, ADO must evaluate the command to determine its type, which slows the operation.

```
with ADODataSet1 do begin
  CommandType := cmdText;
  CommandText := 'SELECT * FROM CustomerTable';
  Open;
end;
ADODataSet1->CommandType = cmdText;
ADODataSet1->CommandText = "SELECT * FROM CustomerTable";
ADODataSet1->Open();
```

See Also

commandtext (see page 1204)

Open (see page 6976)

CommandTimeout (see page 1204)

Using TADODataSet

8.1.5.3.4 TADODataSet.DataSetField Property

Indicates the persistent TDataSetField object that owns a nested dataset.

Pascal

```
property DataSetField: TDataSetField;
```

C++

```
__property TDataSetField DataSetField;
```

Description

Use DataSetField when the dataset is the nested detail set of another dataset, such as an Oracle8 nested dataset. Read DataSetField to access the data set field component in the master dataset that includes this dataset as a detail. Set DataSetField to a field component in the master dataset to assign this dataset as the value of that field.

Note: When setting the DataSetField property, the dataset must be of (or a descendant of) the class specified by the master dataset's NestedDataSetClass property. Otherwise, setting DataSetField raises an exception. Further, setting DataSetField to a TDataSetField that is contained in the same dataset raises an exception (A dataset can't be nested in itself).

TNestedTable (see page 10040)

NestedDataSet (see page 7070)

NestedDataSetClass (see page 7030)

Using Nested Detail Tables

Working with DataSet Fields

Working with Reference Fields

8.1.5.3.5 TADODataSet.DataSource Property

Represents the data source of another dataset that supplies values to the dataset.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;__property TDataSource DataSource;
```

Description

As implemented in TDataSet, the DataSource property is always nil (Delphi) or NULL (C++).

Descendant dataset classes that support specifying a data source redeclare and implement methods for getting and setting the DataSource property.

See Also

Active (see page 7004)

IsLinkedTo (see page 6967)

Establishing Master/detail Relationships Using Parameters

8.1.5.3.6 TADODataSet.EnableBCD Property

Specifies whether to treat numeric fields as floating-point or BCD.

Pascal

```
property EnableBCD: Boolean;
```

C++

```
__property Boolean EnableBCD;
```

Description

Use the EnableBCD property to specify how fields are mapped to field classes. If EnableBCD is true, (the default value) adDecimal and adNumeric fields are mapped to the TBCDField class when field objects are created. If EnableBCD is false, the fields are mapped to the TFloatField class.

EnableBCD determines whether numeric and decimal fields are translated as floating-point values or binary coded decimal (BCD) values. BCD values eliminate the rounding errors associated with floating point math (such as a 3 * (2/3) resulting in 2.00000000001).

If persistent field objects are used (such as those created using the Fields Editor), the field class associated with a given field can contradict the setting of EnableBCD. Three numeric fields in the same table could, for instance, each be represented by a TFloatField, a TBCDField, and a TVariantField – regardless of the value in EnableBCD. Select field classes on a field-by-field basis for greater flexibility.

Note: For numeric values with more than 4 digits to the right of the decimal place, use of TFloatField is generally better. This is because TBCDField uses the currency data type that has a fixed scale of 4 decimal places.

Note: For fields with very large numbers of more than 19 significant digits, you can use TVariantField type persistent field objects. The TFloatField and TBCDField classes lack sufficient capacity for fields of this size. TVariantField allows the getting and setting of the field data as strings, preventing without loss of data due to insufficient capacity. However, arithmetic operations cannot be performed on numbers accessed through a TVariantField object.

See Also

TBCDField (see page 6776)

TFloatField (see page 7229)

8.1.5.3.7 TADODataSet.FieldDefs Property

Points to the list of field definitions for the dataset.

Pascal

```
property FieldDefs: TFieldDefs;
```

C++

```
__property TFieldDefs FieldDefs;
```

Description

FieldDefs lists the field definitions for a dataset. While an application can examine FieldDefs to explore the field definitions for a dataset, it should not change these definitions unless creating a new table with CreateTable or CreateDataSet.

To access fields and field values in a dataset, use the Fields, AggFields, and FieldValues properties, and the FieldsByName method.

Note: If the dataset includes object field descendants, FieldDefs represents a hierarchical view of the data, meaning that the definitions include object field definitions. To determine the definitions in a flattened view, use FieldDefList instead.

C++ Examples:

```
/*
The following code creates and activates a client dataset in
the form's OnCreate event handler.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TFieldDefs *pDefs = CDS2->FieldDefs;
  TFieldDef *pDef = pDefs->AddFieldDef();
  pDef->DataType = ftInteger;
  pDef->Name = "Field1";

  pDef = pDefs->AddFieldDef();
  pDef->DataType = ftString;
  pDef->Size = 10;
  pDef->Name = "Field2";

  TIndexDef *pIDef = CDS2->IndexDefs->AddIndexDef();
  pIDef->Fields = "Field1";
  pIDef->Name = "IntIndex";

  CDS2->CreateDataSet();
}
```

Delphi Examples:

```
{
The following code creates and activates a client dataset in
the form's OnCreate event handler.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  with CDS2 do
  begin
```

```
      with FieldDefs.AddFieldDef do
      begin
        DataType := ftInteger;
        Name := 'Field1';
      end;
      with FieldDefs.AddFieldDef do
      begin
        DataType := ftString;
        Size := 10;
        Name := 'Field2';
      end;
      with IndexDefs.AddIndexDef do
      begin
        Fields := 'Field1';
        Name := 'IntIndex';
      end;
      CreateDataSet;
    end;
  end;
  { The following example shows how to create a table. }
  procedure TForm1.Button1Click(Sender: TObject);
  begin
    Table1.Close;
    Table1.DeleteTable;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  var
    i: Integer;
  begin
    Table1:= TTable.Create(Form1);
    with Table1 do
    begin
      DatabaseName := 'DBDEMOS';
      TableType := ttParadox;
      TableName := 'CustInfo';
      Table1.Active := False;
      { Don't overwrite an existing table }
      if Table1.Exists then
        MessageDlg('CustInfo table already exists.', mtWarning, [mbOK], 0)
      else
      begin
        { The Table component must not be active }
        { First, describe the type of table and give }
        { it a name }
        { Next, describe the fields in the table }
        with FieldDefs do
        begin
          Clear;
          with AddFieldDef do
          begin
            Name := 'Field1';
            DataType := ftInteger;
            Required := True;
          end;
          with AddFieldDef do
          begin
            Name := 'Field2';
            DataType := ftString;
            Size := 30;
          end;
        end;
        { Next, describe any indexes }
        with IndexDefs do
        begin
          Clear;
```

```
          { The 1st index has no name because it is
          { a Paradox primary key }
          with AddIndexDef do
          begin
            Name := '';
            Fields := 'Field1';
            Options := [ixPrimary];
          end;
          with AddIndexDef do
          begin
            Name := 'Fld2Indx';
            Fields := 'Field2';
            Options := [ixCaseInsensitive];
          end;
        end;
        { Call the CreateTable method to create the table }
        CreateTable;
        Table1.Active:= True;
        for i := 1 to 20 do
          Table1.AppendRecord([i*111, i*222]);
      end;
    end;
    DS2.DataSet:= Table1;
    DBGrid2.DataSource.DataSet:= Table1;
    Table1.Active:= True;
  end;
```

Creating and Deleting Tables

8.1.5.3.8 TADODataSet.IndexDefs Property

Contains the definitions of the indexes for the current table.

Pascal

```
property IndexDefs: TIndexDefs;
```

C++

```
__property TIndexDefs IndexDefs;
```

Description

IndexDefs contains definitions for each index the current table has. IndexDefs is a collection of TIndexDef objects. Each TIndexDef object contains the definition for one index.

Inspect IndexDefs at runtime to get information on a given index. Use an index with IndexDefs to address a specific TIndexDef object. Use properties of TIndexDef to evaluate various index attributes. The example below retrieves the fields list for the third index of the table accessed through the component ADOTable1.

```
ADOTable1.IndexDefs.Update;
StrVar := ADOTable1.IndexDefs[2].Fields;
ADOTable1->IndexDefs->Update();
StrVar = ADOTable1->IndexDefs[2] ->Fields;
```

Call the Update method (TIndexDefs) prior to inspecting the property to ensure it contains the most current index information for the table.

TIndexDefs (see page 7292)

Update (see page 7299)

8.1.5.3.9 TADODataSet.IndexFieldNames Property

Lists the columns to use for a persistent sort of the recordset.

Pascal

```
property IndexFieldNames: string;
```

C++

```
__property AnsiString IndexFieldNames;
```

Description

Use IndexFieldNames as an alternative method of specifying the sort order of a recordset. IndexFieldNames is a direct implementation of the Sort property of the ADO recordset object, with the field list from IndexFieldNames being used for the Sort property. The actual sorting of data occurs on the OLE DB side and use of indexes for the sort depend on the particular provider.

To use IndexFieldNames to establish a recordset's sort order, the recordset must have been opened using a client-side cursor (the dataset component's CursorLocation property must be clUseClient). An exception is raised on attempts to use IndexFieldNames with server-side cursors.

IndexFieldNames may be used to set the sort order for the detail table in a master-detail link, increasing the performance of the link. However, use of IndexFieldNames is not required for master-detail links.

See Also

IndexName (see page 1217)

Creating an Index with IndexFieldNames

8.1.5.3.10 TADODataSet.IndexName Property

Specifies the currently active index.

Pascal

```
property IndexName: WideString;
```

C++

```
__property BSTR IndexName;
```

Description

Use IndexName to activate an index and cause it to actively order the dataset's rows. At runtime, set IndexName to a string containing the name of the index. At design-time, select the desired index from the drop-down list in the Object Inspector.

```
ADOTable1.IndexName := 'LastName';
ADOTable1->IndexName = "LastName";
```

Set IndexName to an empty string to have no index actively ordering the dataset. The rows then appear in natural order. In some database systems, the primary index of a table does not have a name. In these cases, setting IndexName to an empty string activates the primary index.

An index must be active for certain index dependent operations to be used, such as the Seek method.

Note: Many providers do not support changing indexes while the dataset is active, raising an exception when an attempt is made to do this. Ensure that the dataset is closed before changing the index through the IndexName property and reopen the dataset after specifying a new index.

IndexFieldNames (see page 1216)

IndexFieldCount (see page 1216)

8.1.5.3.11 TADODataSet.MasterFields Property

Specifies field or fields on which a Master-Detail link is based.

Pascal

```
property MasterFields: WideString;
```

C++

```
__property BSTR MasterFields;
```

Description

Use MasterFields after setting the MasterSource or DataSource property to specify the names of one or more fields in another, master, dataset that are used to establish a Master-Detail relationship between this dataset and the master dataset. The master dataset is specified by assigning its data source to the MasterSource or DataSource property.

MasterFields is a string containing one or more field names in the master dataset. When the datasets are related based on two fields, separate field names with semicolons:

```
ADOTable2.MasterSource := DataSource1;
ADOTable2.MasterFields := 'CustID;SaleDate'
ADOTable2->MasterSource = DataSource1;
ADOTable2->MasterFields = "CustID;SaleDate"
```

Each time the current record in the master dataset changes, the new values in those fields are used to select corresponding records in this table for display.

Note: At design time, use the Field Link designer to establish the master-detail relationship between two tables.

MasterSource (see page 1144)

DataSource (see page 7014)

Making the Table a Detail of Another Dataset

8.1.5.3.12 TADODataSet.ParamCheck Property

Specifies whether the parameter list for an ADO dataset component is regenerated if the SQL changes at runtime.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

Set ParamCheck to specify whether or not the Parameters property is initialized using ":Param" style parameters in an SQL statement specified in the CommandText property. If the SQL statement in CommandText only contains "?" style parameters, the Parameters property will only be initialized if the OLE DB provider returns parameter information for an SQL command. Otherwise, the parameters must be explicitly created using the CreateParameter method (TParameter).

When ParamCheck is true, a parameter is generated for each ":Param" style parameter in the SQL statement.

The default value of ParamCheck is true.

This property is useful for data definition language (DDL) statements that contain parameters as part of the DDL statement and that are not parameters for the ADO dataset component. For example, the DDL statement to create a stored procedure may contain parameter statements that are part of the stored procedure. Set ParamCheck to false to prevent these parameters from being mistaken for parameters of the ADO dataset component executing the DDL statement.

TADOQuery (see page 1084)

TADOStoredProc (see page 1106)

Parameters (see page 1220)

Open (see page 6976)

commandtext (see page 1204)

8.1.5.3.13 TADODataSet.Parameters Property

Contains the collection of parameters for an SQL statement.

Pascal

```
property Parameters: TParameters;
```

C++

```
__property TParameters Parameters;
```

Description

At design-time, use Parameters to access the parameters for the SQL statement used by the ADO component. Use the properties and methods of Parameters to set and get individual parameter values or to set or inspect parameter attributes.

At runtime, use the Parameters property editor to access the collection of parameters.

See Also

SQL (see page 1105)

ExecSQL (see page 1100)

8.1.5.3.14 TADODataSet.Prepared Property

Specifies whether the command is prepared before execution.

Pascal

```
property Prepared: Boolean;
```

C++

```
__property Boolean Prepared;
```

Description

Set Prepared before calling the Open method to specify whether ADO prepares the command used to create the dataset's recordset. If Prepared is set to true and the dataset component is connected to a data store, ADO prepares the command before executing it. If Prepared is set to false, ADO does not prepare the command.

The default value of Prepared is false.

See Also

Parameters (see page 1220)

ExecSQL (see page 1100)

Open (see page 6976)

8.1.5.3.15 TADODataSet.RDSConnection Property

Specifies the RDS connection component to use.

Pascal

```
property RDSConnection: TRDSConnection;
```

C++

```
__property TRDSConnection RDSConnection;
```

Description

Use RDSConnection to specify the RDS connection component to use to obtain the recordset when the TADODataSet (see page 1041) is opened. This property is mutually exclusive of the Connection (see page 1205) property. If the TADODataSet (see page 1041) uses RDSConnection to connect to the default RDS DataFactory, then the ConnectionString (see page 1206) property should also be set with the connection information required by the DataFactory. The CommandText (see page 1057) property should either specify the name of a property on the associated business object or be an SQL query.

See Also

TRDSConnection (see page 1274)

Using TADODataSet

8.1.5.3.16 TADODataSet.StoreDefs Property

Specifies whether field definitions are stored with the ADO dataset.

Pascal

```
property StoreDefs: Boolean;
```

C++

```
__property Boolean StoreDefs;
```

Description

StoreDefs controls whether the FieldDefs property value is saved with the ADO dataset when it is saved to a form (.dfm) file. By default, StoreDefs is false unless you explicitly change any of the field definitions.

FieldDefs (see page 7019)

8.1.5.4 TADODataSet Events

The events of the TADODataSet class are listed here.

Published Events

	Name	Description
	AfterCancel (see page 1067)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 1069)	Occurs after an application closes a dataset.
	AfterDelete (see page 1071)	Occurs after an application deletes a record.
	AfterEdit (see page 1073)	Occurs after an application starts editing a record.
	AfterInsert (see page 1074)	Occurs after an application inserts a new record.
	AfterOpen (see page 1075)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 1076)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterScroll (see page 1076)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 1077)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 1077)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 1078)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 1078)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 1079)	Occurs before an application enters insert mode.
	BeforeOpen (see page 1080)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 1081)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeScroll (see page 1082)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 1082)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 1083)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 1083)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnNewRecord (see page 1084)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 1084)	Occurs when an application attempts to modify or insert a record and an exception is raised.

8.1.5.4.1 TADODataSet.AfterCancel Event

Occurs after an application completes a request to cancel modifications to the active record.

Pascal

```
property AfterCancel: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterCancel;
```

Description

Write an AfterCancel event handler to take specific action after an application cancels changes to the active record. AfterCancel is called by the Cancel method after it updates the current position, releases the lock on the active record if necessary, and sets the dataset state to dsBrowse. If an application requires additional processing before returning control to a user after a Cancel event, code it in the AfterCancel event.

Delphi Examples:

```
{
This example updates the form's status bar with a message
when an AfterCancel event occurs.  Set the StatusBar
SimplePanel property to True.
}
procedure TForm1.Table1AfterCancel(DataSet: TDataSet);
begin
  StatusBar1.SimpleText := 'Record changes cancelled for ' + DataSet.Name;
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  Table1.Cancel;
end;

procedure TForm1.Button3Click(Sender: TObject);
begin
  Table1.Post
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
    DatabaseName := 'DBDEMOS';
    TableType := ttParadox;
    TableName := 'CustInfo';
    Name := 'CustInfo';
    Table1.Active := False;
    { Don't overwrite an existing table }
    if Table1.Exists then
    begin
        Table1.Close;
        Table1.DeleteTable;
    end;
    begin
      { The Table component must not be active }
      { First, describe the type of table and give }
      { it a name }
      { Next, describe the fields in the table }
      with FieldDefs do
      begin
        Clear;
        with AddFieldDef do
        begin
          Name := 'Field1';
          DataType := ftInteger;
          Required := True;
        end;
        with AddFieldDef do
```

```
          begin
            Name := 'Field2';
            DataType := ftString;
            Size := 30;
          end;
        end;
        { Next, describe any indexes }
        with IndexDefs do
        begin
          Clear;
          { The 1st index has no name because it is
          { a Paradox primary key }
          with AddIndexDef do
          begin
            Name := '';
            Fields := 'Field1';
            Options := [ixPrimary];
          end;
          with AddIndexDef do
          begin
            Name := 'Fld2Indx';
            Fields := 'Field2';
            Options := [ixCaseInsensitive];
          end;
        end;
        { Call the CreateTable method to create the table }
        CreateTable;
        Table1.Active:= True;
        for i := 1 to 20 do
          Table1.AppendRecord([i*111, i*222]);
      end;
    end;
    DS2.DataSet:= Table1;
    DBGrid2.DataSource.DataSet:= Table1;
    Table1.AfterCancel:= Table1AfterCancel;
    Table1.Active:= True;
  end;
```

See Also

8.1.5.4.2 TADODataSet.AfterClose Event

Occurs after an application closes a dataset.

Pascal

```
property AfterClose: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterClose;
```

Description

Write an AfterClose event handler to take specific action immediately after an application closes a dataset. For example, as a security measure, an application might clear a PASSWORD entry from the Params property of a TSQLConnection component when the dataset is closed.

AfterClose is called after a dataset is closed and the dataset state is set to dsInactive.

Delphi Examples:

```
{
This example adds an entry to a memo with a message when an
AfterOpen event or an AfterClose event occurs.  Populate the
ClientDataSet events with CheckButtonActive.
}
procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  if (Button1.Enabled) then
    Memo2.Lines.Add('Now that the dataset is open, record information is available.')
  else
    Memo2.Lines.Add('Now that the dataset is closed, record information is not available.');
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
    RemoteServer1.Connected := True;
  ClientDataSet1.Close;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].EnableControls;
  end;
  ClientDataSet1.Open;
end;

procedure TForm1.Button3Click(Sender: TObject);
var
  I: Integer;
begin
  ClientDataSet1.Close;
  RemoteServer1.Connected := False;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].DisableControls;
  end;
end;

procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
```

Opening and Closing Datasets

8.1.5.4.3 TADODataSet.AfterDelete Event

Occurs after an application deletes a record.

Pascal

```
property AfterDelete: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterDelete;
```

Description

Write an AfterDelete event handler to take specific action immediately after an application deletes the active record in a dataset. AfterDelete is called by Delete after it deletes the record, sets the dataset state to dsBrowse, and repositions the current record.

C++ Examples:

```
/*
This example displays a message on the form's status bar
indicating the record count after a record is deleted.  Set
the StatusBar SimplePanel property to True.
*/
void __fastcall TForm1::Table1AfterDelete(TDataSet *DataSet)
{
  StatusBar1->SimpleText = Format(
    "There are now %d records in the table",
    ARRAYOFCONST(((int)DataSet->RecordCount)));
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Table1->Delete();
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Table1 = new TTable(Form1);
  Table1->Active = false; // The Table component must not be active
  Table1->DatabaseName = "DBDEMOS";
  Table1->TableType = ttParadox;
  Table1->TableName = "CustInfo";
  Table1->Active = False;
  if (!Table1->Exists) // Don't overwrite an existing table
  {
    Table1->Close();
    Table1->DeleteTable();
  }
  // The Table component must not be active
  // First, describe the type of table and give
  // it a name
  // Next, describe the fields in the table
  Table1->FieldDefs->Clear();
  TFieldDef *pNewDef = Table1->FieldDefs->AddFieldDef();
  pNewDef->Name = "Field1";
  pNewDef->DataType = ftInteger;
  pNewDef->Required = true;
  pNewDef = Table1->FieldDefs->AddFieldDef();
  pNewDef->Name = "Field2";
  pNewDef->DataType = ftString;
  pNewDef->Size = 30;
  // Next, describe any indexes
  Table1->IndexDefs->Clear();
```

```
  /* the 1st index has no name because it is a Paradox primary key */
  Table1->IndexDefs->Add("","Field1", TIndexOptions() <<ixPrimary << ixUnique);
  Table1->IndexDefs->Add("Fld2Index","Field2", TIndexOptions() << ixCaseInsensitive);
  // Now that we have specified what we want, create the table
  Table1->CreateTable();
  Table1->Active = True;
  for (int i = 1; i <= 20; i++)
    Table1->AppendRecord(ARRAYOFCONST((i*111, i*222)));
  DS2->DataSet = Table1;
  DBGrid2->DataSource->DataSet = Table1;
  Table1->AfterDelete = Table1AfterDelete;
  Table1->Active = True;
}
```

Delphi Examples:

```
{
This example displays a message on the form’s status bar
indicating the record count after a record is deleted.  Set
the StatusBar SimplePanel property to True.
}
procedure TForm1.Table1AfterDelete(DataSet: TDataSet);
begin
  StatusBar1.SimpleText := Format('There are now %d records in the table',
[DataSet.RecordCount]);
end;

procedure TForm1.Button1Click(Sender: TObject);
begin
  Table1.Delete;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
    DatabaseName := 'DBDEMOS';
    TableType := ttParadox;
    TableName := 'CustInfo';
    Name := 'CustInfo';
    Table1.Active := False;
    { Don't overwrite an existing table }
    if Table1.Exists then
    begin
        Table1.Close;
        Table1.DeleteTable;
    end;
    begin
      { The Table component must not be active }
      { First, describe the type of table and give }
      { it a name }
      { Next, describe the fields in the table }
      with FieldDefs do
      begin
        Clear;
        with AddFieldDef do
        begin
          Name := 'Field1';
          DataType := ftInteger;
          Required := True;
        end;
        with AddFieldDef do
        begin
          Name := 'Field2';
```

```
            DataType := ftString;
            Size := 30;
          end;
        end;
        { Next, describe any indexes }
        with IndexDefs do
        begin
          Clear;
          { The 1st index has no name because it is
          { a Paradox primary key }
          with AddIndexDef do
          begin
            Name := '';
            Fields := 'Field1';
            Options := [ixPrimary];
          end;
          with AddIndexDef do
          begin
            Name := 'Fld2Indx';
            Fields := 'Field2';
            Options := [ixCaseInsensitive];
          end;
        end;
        { Call the CreateTable method to create the table }
        CreateTable;
        Table1.Active:= True;
        for i := 1 to 20 do
          Table1.AppendRecord([i*111, i*222]);
      end;
    end;
    DS2.DataSet:= Table1;
    DBGrid2.DataSource.DataSet:= Table1;
    Table1.AfterDelete:= Table1AfterDelete;
    Table1.Active:= True;
  end;
```

8.1.5.4.4 TADODataSet.AfterEdit Event

Occurs after an application starts editing a record.

Pascal

```
property AfterEdit: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterEdit;
```

Description

Write an AfterEdit event handler to take specific action immediately after dataset enters edit mode. AfterEdit is called by Edit after it enables editing of a record, recalculates calculated fields, and calls the data event handler to process a record change.

Delphi Examples:

```
{
This example adds an entry to a memo with a message
when an AfterEdit event occurs and when a BeforeEdit event
occurs.  Click on Run SQL to populate the DBGrid.  Then
```

```
select a cell to edit and click the Edit current cell
button, or just start editing the cell to invoke the
BeforeEdit and AfterEdit events.
}
procedure TForm1.ClientDataSet1AfterEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.ClientDataSet1BeforeEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  ClientDataSet1.Edit;
end;
```

See Also

BeforeEdit (see page 7049)

Edit (see page 6932)

8.1.5.4.5 TADODataSet.AfterInsert Event

Occurs after an application inserts a new record.

Pascal

```
property AfterInsert: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterInsert;
```

Description

Write an AfterInsert event handler to take specific action immediately after an application inserts a record. The Insert and Append methods generate an AfterInsert event after inserting or appending a new record.

Delphi Examples:

```
{
This example updates a memo with a message when an
AfterInsert event or a BeforeInsert event occurs.
}
procedure TForm1.ClientDataSet1AfterInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After inserting a record');
end;

procedure TForm1.ClientDataSet1BeforeInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before inserting a record');
end;
```

See Also

BeforeInsert (see page 7050)

Append (see page 6910)

Insert (see page 6959)

8.1.5.4.6 TADODataSet.AfterOpen Event

Occurs after an application completes opening a dataset and before any data access occurs.

Pascal

```
property AfterOpen: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterOpen;
```

Description

Write an AfterOpen event handler to take specific action immediately after an application opens the dataset. AfterOpen is called after the dataset establishes access to its data and the dataset is put into dsBrowse state. For example, an AfterOpen event handler might check an ini file to determine the last record touched in the dataset the previous time the application ran, and position the dataset at that record.

Delphi Examples:

```
{
This example adds an entry to a memo with a message when an
AfterOpen event or an AfterClose event occurs.  Populate the
ClientDataSet events with CheckButtonActive.
}
procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  if (Button1.Enabled) then
    Memo2.Lines.Add('Now that the dataset is open, record information is available.')
  else
    Memo2.Lines.Add('Now that the dataset is closed, record information is not available.');
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
    RemoteServer1.Connected := True;
  ClientDataSet1.Close;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].EnableControls;
  end;
  ClientDataSet1.Open;
end;

procedure TForm1.Button3Click(Sender: TObject);
var
  I: Integer;
begin
  ClientDataSet1.Close;
  RemoteServer1.Connected := False;
  with RemoteServer1 do
  begin
```

```
    for I := 0 to DataSetCount - 1 do
      DataSets[I].DisableControls;
  end;
end;

procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
```

State (see page 7036)

BeforeOpen (see page 7051)

Open (see page 6976)

Opening and Closing Datasets

8.1.5.4.7 TADODataSet.AfterPost Event

Occurs after an application writes the active record to the database or change log and returns to browse state.

Pascal

```
property AfterPost: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterPost;
```

Description

Write an AfterPost event handler to take specific action immediately after an application posts a change to the active record. AfterPost is called after a modification or insertion is made to a record.

Delphi Examples:

```
{
This example updates the form's status bar with a message
when an AfterPost event occurs.
}
procedure TForm1.ClientDataSet1AfterPost(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before posting a record');
end;
```

See Also

BeforePost (see page 7052)

Post (see page 6977)

8.1.5.4.8 TADODataSet.AfterScroll Event

Occurs after an application scrolls from one record to another.

Pascal

```
property AfterScroll: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterScroll;
```

Description

Write an AfterScroll event handler to take specific action immediately after an application scrolls to another record as a result of a call to the First, Last, MoveBy, Next, Prior, FindKey, FindFirst, FindNext, FindLast, FindPrior, and Locate methods. AfterScroll is called after all other events triggered by these methods and any other methods that switch from record to record in the dataset.

See Also

BeforeScroll (see page 7053)

First (see page 6942)

Last (see page 6968)

MoveBy (see page 6971)

Next (see page 6973)

Prior (see page 6979)

Navigating Datasets

8.1.5.4.9 TADODataSet.BeforeCancel Event

Occurs before an application executes a request to cancel changes to the active record.

Pascal

```
property BeforeCancel: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeCancel;
```

Description

Write a BeforeCancel event to take specific action before an application carries out a request to cancel changes. BeforeCancel is called by the Cancel method before it cancels a dataset operation such as Edit, Insert, or Delete.

An application might use the BeforeCancel event to record a user's changes in an undo buffer.

See Also

AfterCancel (see page 7038)

Delete (see page 6924)

Edit (see page 6932)

Insert (see page 6959)

8.1.5.4.10 TADODataSet.BeforeClose Event

Occurs immediately before the dataset closes.

Pascal

```
property BeforeClose: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeClose;
```

Description

Write a BeforeClose event to take specific action before an application closes a dataset. Calling Close or setting the Active property to false results in a call to the BeforeClose event handler.

See Also

Active (see page 7004)

AfterClose (see page 7040)

Close (see page 6920)

Opening and Closing Datasets

Posting Data

8.1.5.4.11 TADODataSet.BeforeDelete Event

Occurs before an application attempts to delete the active record.

Pascal

```
property BeforeDelete: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeDelete;
```

Description

Write a BeforeDelete event handler to take specific action before an application deletes the active record. BeforeDelete is called by Delete before it actually deletes a record.

In Delphi, making use of this event an application might, for example, display a dialog box asking for confirmation before deleting the record. On denial of confirmation, the application could abort the deletion by calling the Abort procedure.

See Also

AfterDelete (see page 7041)

Delete (see page 6924)

Abort (see page 22786)

8.1.5.4.12 TADODataSet.BeforeEdit Event

Occurs before an application enters edit mode for the active record.

Pascal

```
property BeforeEdit: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeEdit;
```

Description

Write a BeforeEdit event handler to take specific action before an application enables editing of the active record. For example, an application that keeps a log of database edits could use the BeforeEdit event to record the edit request, time, and user before entering edit state.

Delphi Examples:

```
{
```

```
This example adds an entry to a memo with a message
when an AfterEdit event occurs and when a BeforeEdit event
occurs.  Click on Run SQL to populate the DBGrid.  Then
select a cell to edit and click the Edit current cell
button, or just start editing the cell to invoke the
BeforeEdit and AfterEdit events.
}
procedure TForm1.ClientDataSet1AfterEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.ClientDataSet1BeforeEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  ClientDataSet1.Edit;
end;
```

See Also

State (see page 7036)

AfterEdit (see page 7044)

Edit (see page 6932)

8.1.5.4.13 TADODataSet.BeforeInsert Event

Occurs before an application enters insert mode.

Pascal

```
property BeforeInsert: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeInsert;
```

Description

Write a BeforeInsert event handler to take specific action before an application inserts or appends a new record. The Insert or Append method generates a BeforeInsert method before it sets the dataset into dsInsert state.

Delphi Examples:

```
{
This example updates a memo with a message when an
AfterInsert event or a BeforeInsert event occurs.
}
procedure TForm1.ClientDataSet1AfterInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After inserting a record');
end;

procedure TForm1.ClientDataSet1BeforeInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before inserting a record');
end;
{
This example uses the BeforeInsert event to do data
validation. If the StrToInt function raises an exception,
the edit control's contents are set to a valid value so
that the assignment to the INTEGER field in the dataset
```

```
will succeed.  Continuing after the exception causes a
'0' to be placed in the PORTA field.
DataSet design:
This example requires a ClientDataSet, a DBGrid, a
DataSource and a DBNavigator.  Name the ClientDataSet CDS.
Set the DataSet property in the DataSource to CDS and name
that DataSource DS.  Set the DataSource in the DBNavigator
to DS the DataSource in the DBGrid to DS.  Right click on CDS
and select the Fields Editor, then right click on the Field
Editor form and create two fields by selecting "new field".
In the field configuration window, set the name to HOST, the
Component value will automatically be set to CDSHOST.  Set
the filed type to String.  In the field configuration window
for the second field, set the name to PORTA, the Component
value will automatically be set to CDSPORTA.  Set the field
type to Integer.  The file used to load CDS must have an
attribute name of HOST with an attribute type of string and
an attribute name of PORTA with an attribute type of integer.
Add DB, DBCtrls, Grids, DBGrids and DBClient to the uses clause.
}
{$IFNDEF UNICODE}
uses SwSystem;
{$ENDIF}

procedure TForm1.Button3Click(Sender: TObject);
begin
  CDS.Insert;
  CDS.FieldByName('PORTA').AsInteger := StrToInt(Edit1.Text);
  CDS.Post;
end;

procedure TForm1.CDSBeforeInsert(DataSet: TDataSet);
begin
  try
  { Make sure edit field can be converted to integer --
   this will raise an exception if it can't }
    StrToInt(Edit1.Text);
  except
    Edit1.Text := '0';
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
{$ELSE}
  CDS.LoadFromFile(gsAppPath + 'CDS.XML');
{$ENDIF}
end;
```

AfterInsert (see page 7044)

Append (see page 6910)

Insert (see page 6959)

8.1.5.4.14 TADODataSet.BeforeOpen Event

Occurs before an application executes a request to open a dataset.

Pascal

```
property BeforeOpen: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeOpen;
```

Description

Write a BeforeOpen event handler to take specific action before an application opens a dataset for viewing or editing. BeforeOpen is triggered when an application sets the Active property to true for a dataset or an application calls Open.

See Also

Active (see page 7004)

AfterOpen (see page 7045)

Open (see page 6976)

Opening and Closing Datasets

8.1.5.4.15 TADODataSet.BeforePost Event

Occurs before an application posts changes for the active record to the database or change log.

Pascal

```
property BeforePost: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforePost;
```

Description

Write a BeforePost event handler to take specific action before an application posts dataset changes. BeforePost is triggered when an application calls the Post method. Post checks to make sure all required fields are present, then calls BeforePost before posting the record.

An application might use BeforePost to perform validity checks on data changes before committing them. If it encountered a validity problem, it could call Abort to cancel the Post operation (Delphi) or throw an exception (C++).

Delphi Examples:

```
{
This example checks for a valid entry in a TDBEdit control
and calls the Abort procedure if the control is empty; Abort
cancels the post before it happens.
}
procedure TForm1.ClientDataSet1BeforePost(DataSet: TDataSet);
begin
  if DBEdit1.Text = '' then
    Abort;
  DataSet.Fields[2].AsString := DBEdit1.Text;
end;
```

See Also

AfterPost (see page 7046)

Post (see page 6977)

Abort (see page 22786)

Working with Field Component Methods at Runtime

8.1.5.4.16 TADODataSet.BeforeScroll Event

Occurs before an application scrolls from one record to another.

Pascal

```
property BeforeScroll: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeScroll;
```

Description

Write a BeforeScroll event handler to take specific action immediately before an application scrolls to another record as a result of a call to the First, Last, MoveBy, Next, Prior, FindKey, FindFirst, FindNext, FindLast, FindPrior, and Locate methods. BeforeScroll is called before all other events triggered by these methods and any other methods that switch from record to record in the dataset.

See Also

AfterScroll (see page 7047)

First (see page 6942)

Last (see page 6968)

MoveBy (see page 6971)

Next (see page 6973)

Prior (see page 6979)

Navigating Datasets

8.1.5.4.17 TADODataSet.OnCalcFields Event

Occurs when an application recalculates calculated fields.

Pascal

```
property OnCalcFields: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent OnCalcFields;
```

Description

Write an OnCalcFields event handler to take specific action when an application recalculates calculated fields. A calculated field is one that derives its value from the values in one or more fields in the dataset, sometimes with additional processing.

OnCalcFields is triggered when:

A dataset is opened.

A dataset is put into dsEdit state.

A record is retrieved from a database.

When the AutoCalcFields property is true, OnCalcFields is also triggered when:

Focus moves from one visual control to another, or from one column to another is a data-aware grid control and modifications were made to the record.

Note: When the AutoCalcFields property is true, an OnCalcFields event handler should not modify the dataset (or a linked

dataset if it is part of a master-detail relationship), because such modifications retrigger the OnCalcField event, leading to infinite recursion.

If an application permits users to change data, OnCalcFields is frequently triggered. To reduce the frequency with which OnCalcFields occurs, set AutoCalcFields to false.

Warning: When the dataset is the master table of a master-detail relationship, OnCalcFields occurs before detail sets have been synchronized with the master table.

Active (see page 7004)

AutoCalcFields (see page 7006)

Open (see page 6976)

Post (see page 6977)

Calculating Fields

Using Internally Calculated Fields in Client Datasets

Defining a Calculated Field

8.1.5.4.18 TADODataSet.OnDeleteError Event

Occurs when an application attempts to delete a record and an exception is raised.

Pascal

```
property OnDeleteError: TDataSetErrorEvent;
```

C++

```
__property TDataSetErrorEvent OnDeleteError;
```

Description

Write an OnDeleteError event handler to handle exceptions that occur when an attempt to delete a record fails.

See Also

OnEditError (see page 7054)

OnPostError (see page 7056)

Delete (see page 6924)

8.1.5.4.19 TADODataSet.OnEditError Event

Occurs when an application attempts to modify or insert a record and an exception is raised.

Pascal

```
property OnEditError: TDataSetErrorEvent;
```

C++

```
__property TDataSetErrorEvent OnEditError;
```

Description

Write an OnEditError event handler to handle exceptions that occur when an attempt to edit a record fails.

See Also

OnDeleteError (see page 7054)

OnPostError (see page 7056)

Edit (see page 6932)

Insert (see page 6959)

8.1.5.4.20 TADODataSet.OnNewRecord Event

Occurs when an application inserts or appends a new dataset record.

Pascal

```
property OnNewRecord: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent OnNewRecord;
```

Description

Write an OnNewRecord event handler to take specific actions as an application inserts or appends a new record. OnNewRecord is called as part of the insert or append process. An application might use the OnNewRecord event to set initial values for a record or as a way of implementing cascading insertions in related datasets.

See Also

AfterInsert (see page 7044)

BeforeInsert (see page 7050)

8.1.5.4.21 TADODataSet.OnPostError Event

Occurs when an application attempts to modify or insert a record and an exception is raised.

Pascal

```
property OnPostError: TDataSetErrorEvent;
```

C++

```
__property TDataSetErrorEvent OnPostError;
```

Description

Write an OnPostError event handler to handle exceptions that occur when an attempt to post a record fails.

See Also

OnDeleteError (see page 7054)

OnEditError (see page 7054)

Post (see page 6977)

8.1.6 TADOQuery Class

TADOQuery provides the means for issuing SQL (see page 1105) against an ADO data store.

Class Hierarchy

Pascal

```
TADOQuery = class(TCustomADODataSet);
```

C++

```
class TADOQuery : public TCustomADODataSet;
```

File

ADODB

Description

Use TADOQuery to access one or more tables in a data store using SQL (see page 1105) statements.

Retrieve data from tables in an ADO data store using SELECT statements. Perform actions on tables and other metadata objects in an ADO data store with statements like INSERT, DELETE, UPDATE, ALTER TABLE, and CREATE TABLE. Execute stored procedures.

See Also

TDataSet (see page 6894)

TADODataSet (see page 1041)

TADOConnection (see page 1001)

TADOTable (see page 1125)

TADOStoredProc (see page 1106)

Types of Datasets

Overview of ADO Components

8.1.6.1 TADOQuery Members

The following tables list the members exposed by TADOQuery.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.

	ActivateTextFilter (see page 1160)	This is ActivateTextFilter, a member of class TCustomADODataSet.
	AllocRecordBuffer (see page 1160)	This is AllocRecordBuffer, a member of class TCustomADODataSet.
	AllocRecordBuffer (see page 6909)	This is AllocRecordBuffer, a member of class TDataSet.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckActive (see page 1162)	This is CheckActive, a member of class TCustomADODataSet.
	CheckActive (see page 6917)	This is CheckActive, a member of class TDataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
	CheckFieldCompatibility (see page 1162)	This is CheckFieldCompatibility, a member of class TCustomADODataSet.
	CheckFieldCompatibility (see page 6919)	This is CheckFieldCompatibility, a member of class TDataSet.
	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.
	ClearCalcFields (see page 1162)	This is ClearCalcFields, a member of class TCustomADODataSet.
	ClearCalcFields (see page 6919)	This is ClearCalcFields, a member of class TDataSet.
	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
	CloseCursor (see page 6921)	This is CloseCursor, a member of class TDataSet.
	ConnectionPoint (see page 1163)	This is ConnectionPoint, a member of class TCustomADODataSet.
	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
	DataConvert (see page 6924)	This is DataConvert, a member of class TDataSet.
	DataEvent (see page 1164)	This is DataEvent, a member of class TCustomADODataSet.
	DataEvent (see page 6924)	This is DataEvent, a member of class TDataSet.
	DeactivateFilters (see page 1164)	This is DeactivateFilters, a member of class TCustomADODataSet.
	DefChanged (see page 1165)	This is DefChanged, a member of class TCustomADODataSet.
	DefChanged (see page 6924)	This is DefChanged, a member of class TDataSet.
	DefineProperties (see page 1165)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
	DestroyLookupCursor (see page 1166)	This is DestroyLookupCursor, a member of class TCustomADODataSet.
	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.
	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.
	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.
	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.
	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
	DoBeforeInsert (see page 6930)	This is DoBeforeInsert, a member of class TDataSet.
	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.

	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
	DoOnNewRecord (see page 1166)	This is DoOnNewRecord, a member of class TCustomADODataSet.
	DoOnNewRecord (see page 6931)	This is DoOnNewRecord, a member of class TDataSet.
	EnableEvents (see page 1166)	This is EnableEvents, a member of class TCustomADODataSet.
	EndOfRecordset (see page 1167)	This is EndOfRecordset, a member of class TCustomADODataSet.
	FetchComplete (see page 1167)	This is FetchComplete, a member of class TCustomADODataSet.
	FetchProgress (see page 1167)	This is FetchProgress, a member of class TCustomADODataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.
	FieldChangeComplete (see page 1167)	This is FieldChangeComplete, a member of class TCustomADODataSet.
	FindRecord (see page 1168)	This is FindRecord, a member of class TCustomADODataSet.
	FindRecord (see page 6942)	This is FindRecord, a member of class TDataSet.
	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
	FreeRecordBuffer (see page 1168)	This is FreeRecordBuffer, a member of class TCustomADODataSet.
	FreeRecordBuffer (see page 6947)	This is FreeRecordBuffer, a member of class TDataSet.
	GetActiveRecBuf (see page 1168)	This is GetActiveRecBuf, a member of class TCustomADODataSet.
	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.
	GetAggregateValue (see page 6947)	This is GetAggregateValue, a member of class TDataSet.
	GetBookmarkData (see page 1169)	This is GetBookmarkData, a member of class TCustomADODataSet.
	GetBookmarkData (see page 6949)	This is GetBookmarkData, a member of class TDataSet.
	GetBookmarkFlag (see page 1169)	This is GetBookmarkFlag, a member of class TCustomADODataSet.
	GetBookmarkFlag (see page 6949)	This is GetBookmarkFlag, a member of class TDataSet.
	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
	GetCanModify (see page 1169)	This is GetCanModify, a member of class TCustomADODataSet.
	GetCanModify (see page 6950)	This is GetCanModify, a member of class TDataSet.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.
	GetCommandText (see page 1170)	This is GetCommandText, a member of class TCustomADODataSet.
	GetDataSource (see page 1170)	This is GetDataSource, a member of class TCustomADODataSet.
	GetDataSource (see page 6951)	This is GetDataSource, a member of class TDataSet.
	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
	GetIsIndexField (see page 6954)	This is GetIsIndexField, a member of class TDataSet.
	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.
	GetRecNo (see page 1171)	This is GetRecNo, a member of class TCustomADODataSet.
	GetRecNo (see page 6956)	This is GetRecNo, a member of class TDataSet.
	GetRecord (see page 1172)	This is GetRecord, a member of class TCustomADODataSet.
	GetRecord (see page 6956)	This is GetRecord, a member of class TDataSet.
	GetRecordCount (see page 1172)	This is GetRecordCount, a member of class TCustomADODataSet.
	GetRecordCount (see page 6956)	This is GetRecordCount, a member of class TDataSet.
	GetRecordSize (see page 1172)	This is GetRecordSize, a member of class TCustomADODataSet.
	GetRecordSize (see page 6956)	This is GetRecordSize, a member of class TDataSet.
	GetStateFieldValue (see page 1172)	This is GetStateFieldValue, a member of class TCustomADODataSet.
	GetStateFieldValue (see page 6956)	This is GetStateFieldValue, a member of class TDataSet.

	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
	InitOleDBAccess (see page 1173)	This is InitOleDBAccess, a member of class TCustomADODataSet.
V	InitRecord (see page 6959)	This is InitRecord, a member of class TDataSet.
V	InternalAddRecord (see page 1173)	This is InternalAddRecord, a member of class TCustomADODataSet.
V	InternalAddRecord (see page 6963)	This is InternalAddRecord, a member of class TDataSet.
V	InternalCancel (see page 1173)	This is InternalCancel, a member of class TCustomADODataSet.
V	InternalCancel (see page 6963)	This is InternalCancel, a member of class TDataSet.
V	InternalClose (see page 1173)	This is InternalClose, a member of class TCustomADODataSet.
A	InternalClose (see page 6963)	This is InternalClose, a member of class TDataSet.
V	InternalDelete (see page 1173)	This is InternalDelete, a member of class TCustomADODataSet.
V	InternalDelete (see page 6964)	This is InternalDelete, a member of class TDataSet.
V	InternalEdit (see page 1174)	This is InternalEdit, a member of class TCustomADODataSet.
V	InternalEdit (see page 6964)	This is InternalEdit, a member of class TDataSet.
V	InternalFirst (see page 1174)	This is InternalFirst, a member of class TCustomADODataSet.
V	InternalFirst (see page 6964)	This is InternalFirst, a member of class TDataSet.
	InternalGetRecord (see page 1174)	This is InternalGetRecord, a member of class TCustomADODataSet.
V	InternalGotoBookmark (see page 1174)	This is InternalGotoBookmark, a member of class TCustomADODataSet.
V	InternalGotoBookmark (see page 6964)	This is InternalGotoBookmark, a member of class TDataSet.
V	InternalHandleException (see page 1175)	This is InternalHandleException, a member of class TCustomADODataSet.
A	InternalHandleException (see page 6964)	This is InternalHandleException, a member of class TDataSet.
V	InternalInitFieldDefs (see page 1175)	This is InternalInitFieldDefs, a member of class TCustomADODataSet.
A	InternalInitFieldDefs (see page 6965)	This is InternalInitFieldDefs, a member of class TDataSet.
V	InternalInitRecord (see page 1175)	This is InternalInitRecord, a member of class TCustomADODataSet.
V	InternalInitRecord (see page 6965)	This is InternalInitRecord, a member of class TDataSet.
V	InternalInsert (see page 1175)	This is InternalInsert, a member of class TCustomADODataSet.
V	InternalInsert (see page 6965)	This is InternalInsert, a member of class TDataSet.
V	InternalLast (see page 1175)	This is InternalLast, a member of class TCustomADODataSet.
V	InternalLast (see page 6965)	This is InternalLast, a member of class TDataSet.
V	InternalOpen (see page 1176)	This is InternalOpen, a member of class TCustomADODataSet.
A	InternalOpen (see page 6966)	This is InternalOpen, a member of class TDataSet.
V	InternalPost (see page 1176)	This is InternalPost, a member of class TCustomADODataSet.
V	InternalPost (see page 6966)	This is InternalPost, a member of class TDataSet.
V	InternalRefresh (see page 1176)	This is InternalRefresh, a member of class TCustomADODataSet.
V	InternalRefresh (see page 6966)	This is InternalRefresh, a member of class TDataSet.
	InternalRequery (see page 1176)	This is InternalRequery, a member of class TCustomADODataSet.
	InternalSetSort (see page 1177)	This is InternalSetSort, a member of class TCustomADODataSet.
V	InternalSetToRecord (see page 1177)	This is InternalSetToRecord, a member of class TCustomADODataSet.
V	InternalSetToRecord (see page 6966)	This is InternalSetToRecord, a member of class TDataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsCursorOpen (see page 1177)	This is IsCursorOpen, a member of class TCustomADODataSet.
A	IsCursorOpen (see page 6966)	This is IsCursorOpen, a member of class TDataSet.
V	Loaded (see page 1177)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 6969)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 1179)	This is LocateRecord, a member of class TCustomADODataSet.
V	MasterChanged (see page 1180)	This is MasterChanged, a member of class TCustomADODataSet.
V	MasterDisabled (see page 1180)	This is MasterDisabled, a member of class TCustomADODataSet.
	MoveComplete (see page 1180)	This is MoveComplete, a member of class TCustomADODataSet.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	OpenCursor (see page 1181)	This is OpenCursor, a member of class TCustomADODataSet.

	OpenCursor (see page 6976)	This is OpenCursor, a member of class TDataSet.
	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PrepareCursor (see page 1181)	This is PrepareCursor, a member of class TCustomADODataSet.
	PSEndTransaction (see page 1181)	Ends a transaction that was started by a call to PSStartTransaction.
	PSEndTransaction (see page 6979)	Ends a transaction that was started by a call to PSStartTransaction.
	PSExecute (see page 1182)	Executes the SQL command associated with the dataset.
	PSExecute (see page 6980)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 1182)	Executes a specified SQL command.
	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
	PSGetAttributes (see page 1183)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 6981)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 1183)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 6982)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 7537)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandTextW (see page 6982)	This is PSGetCommandTextW, a member of class TDataSet.
	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
	PSGetCommandType (see page 1184)	Gets the command type to be executed by PSExecute.
	PSGetCommandType (see page 6982)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 1184)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 6983)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 1185)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 6983)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 6984)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFieldsW (see page 1185)	This is PSGetKeyFieldsW, a member of class TCustomADODataSet.
	PSGetKeyFieldsW (see page 6984)	This is PSGetKeyFieldsW, a member of class TDataSet.
	PSGetKeyFieldsW (see page 7538)	This is PSGetKeyFieldsW, a member of class TWideDataSet.
	PSGetParams (see page 1185)	Returns the current parameter values of the dataset.
	PSGetParams (see page 6984)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 6985)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteCharW (see page 1186)	This is PSGetQuoteCharW, a member of class TCustomADODataSet.
	PSGetQuoteCharW (see page 6985)	This is PSGetQuoteCharW, a member of class TDataSet.
	PSGetQuoteCharW (see page 7539)	This is PSGetQuoteCharW, a member of class TWideDataSet.
	PSGetTableName (see page 6985)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableNameW (see page 1186)	This is PSGetTableNameW, a member of class TCustomADODataSet.
	PSGetTableNameW (see page 6986)	This is PSGetTableNameW, a member of class TDataSet.
	PSGetTableNameW (see page 7539)	This is PSGetTableNameW, a member of class TWideDataSet.
	PSGetUpdateException (see page 1186)	Generates an EUpdateError object based on another exception object.
	PSGetUpdateException (see page 6986)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 1187)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 6987)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 1187)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 6987)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 1188)	Indicates whether the dataset can execute SQL statements.

	PSIsSQLSupported (see page 6987)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 1188)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 6988)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 1188)	Assigns a specified SQL command to be executed by PSExecute.
	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
	PSSetParams (see page 1189)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 6989)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 1189)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSStartTransaction (see page 6989)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 1190)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 6990)	Applies a single update to the underlying database table or tables.
	QueryChanged (see page 1100)	This is QueryChanged, a member of class TADOQuery.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RecordChangeComplete (see page 1190)	This is RecordChangeComplete, a member of class TCustomADODataSet.
	RecordsetChangeComplete (see page 1190)	This is RecordsetChangeComplete, a member of class TCustomADODataSet.
	RefreshInternalCalcFields (see page 6993)	This is RefreshInternalCalcFields, a member of class TDataSet.
	RefreshParams (see page 1191)	This is RefreshParams, a member of class TCustomADODataSet.
	ReleaseLock (see page 1191)	This is ReleaseLock, a member of class TCustomADODataSet.
	ResetAggField (see page 6993)	This is ResetAggField, a member of class TDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBlockReadSize (see page 1194)	This is SetBlockReadSize, a member of class TCustomADODataSet.
	SetBlockReadSize (see page 6994)	This is SetBlockReadSize, a member of class TDataSet.
	SetBookmarkData (see page 1194)	This is SetBookmarkData, a member of class TCustomADODataSet.
	SetBookmarkData (see page 6994)	This is SetBookmarkData, a member of class TDataSet.
	SetBookmarkFlag (see page 1194)	This is SetBookmarkFlag, a member of class TCustomADODataSet.
	SetBookmarkFlag (see page 6995)	This is SetBookmarkFlag, a member of class TDataSet.
	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
	SetBufListSize (see page 6995)	This is SetBufListSize, a member of class TDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.
	SetCommandText (see page 1194)	This is SetCommandText, a member of class TCustomADODataSet.
	SetConnection (see page 1194)	This is SetConnection, a member of class TCustomADODataSet.
	SetConnectionFlag (see page 1195)	This is SetConnectionFlag, a member of class TCustomADODataSet.
	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
	SetDataSetField (see page 6996)	This is SetDataSetField, a member of class TDataSet.
	SetDataSource (see page 1195)	This is SetDataSource, a member of class TCustomADODataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDetailFilter (see page 1195)	This is SetDetailFilter, a member of class TCustomADODataSet.
	SetFieldData (see page 1195)	This is the overview for the SetFieldData method overload.
	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.
	SetFiltered (see page 1196)	This is SetFiltered, a member of class TCustomADODataSet.
	SetFiltered (see page 6997)	This is SetFiltered, a member of class TDataSet.
	SetFilterOptions (see page 1196)	This is SetFilterOptions, a member of class TCustomADODataSet.
	SetFilterOptions (see page 6998)	This is SetFilterOptions, a member of class TDataSet.
	SetFilterText (see page 1196)	This is SetFilterText, a member of class TCustomADODataSet.
	SetFilterText (see page 6998)	This is SetFilterText, a member of class TDataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property

	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 6999)	Sets the value of the Name property.
	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
V	SetOnFilterRecord (see page 6999)	This is SetOnFilterRecord, a member of class TDataSet.
	SetParamsFromCursor (see page 1197)	This is SetParamsFromCursor, a member of class TCustomADODataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetRecNo (see page 1197)	This is SetRecNo, a member of class TCustomADODataSet.
V	SetRecNo (see page 6999)	This is SetRecNo, a member of class TDataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
V	SetStateFieldValue (see page 7000)	This is SetStateFieldValue, a member of class TDataSet.
	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.
	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateIndexDefs (see page 1198)	This is UpdateIndexDefs, a member of class TCustomADODataSet.
V	UpdateIndexDefs (see page 7002)	This is UpdateIndexDefs, a member of class TDataSet.
	UpdateRecordSetPosition (see page 1198)	This is UpdateRecordSetPosition, a member of class TCustomADODataSet.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WillChangeField (see page 1199)	This is WillChangeField, a member of class TCustomADODataSet.
	WillChangeRecord (see page 1199)	This is WillChangeRecord, a member of class TCustomADODataSet.
	WillChangeRecordset (see page 1200)	This is WillChangeRecordset, a member of class TCustomADODataSet.
	WillMove (see page 1200)	This is WillMove, a member of class TCustomADODataSet.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.
R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.
R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.
R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.
R	Command (see page 1204)	Provides access to the internal command object that executes commands for the dataset.
	CommandText (see page 1204)	This is CommandText, a member of class TCustomADODataSet.
	CommandType (see page 1205)	Specifies the type of command to execute.
	Constraints (see page 7013)	Specifies record-level constraints that must be met when editing the data.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
	FieldDefs (see page 1210)	Points to the list of field definitions for the dataset.
	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
	IndexDefs (see page 1215)	Contains the definitions of the indexes for the current table.

	IndexFieldNames (see page 1216)	Lists the columns to use for a persistent sort of the recordset.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
R	MasterDataLink (see page 1218)	Manages the relationship between the ADO dataset and a master table.
	MasterFields (see page 1219)	Specifies field or fields on which a Master-Detail link is based.
	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.
	Reserved (see page 7035)	For internal use only.
	StoreDefs (see page 1223)	Specifies whether field definitions are stored with the ADO dataset.

Public Events

	Name	Description
	AfterCancel (see page 7038)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 7040)	Occurs after an application closes a dataset.
	AfterDelete (see page 7041)	Occurs after an application deletes a record.
	AfterEdit (see page 7044)	Occurs after an application starts editing a record.
	AfterInsert (see page 7044)	Occurs after an application inserts a new record.
	AfterOpen (see page 7045)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 7046)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 7047)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 7047)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 7048)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 7048)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 7049)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 7049)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 7050)	Occurs before an application enters insert mode.
	BeforeOpen (see page 7051)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 7052)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 7052)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 7053)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 7053)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 7054)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 7054)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 7055)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 7056)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 7056)	Occurs when an application attempts to modify or insert a record and an exception is raised.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BookmarkValid (see page 1160)	Tests the validity of a specified bookmark.

	BookmarkValid (see page 6916)	Indicates the validity of a specified bookmark.
	Cancel (see page 6916)	Cancels modifications to the active record if those changes are not yet posted.
	CancelBatch (see page 1161)	Cancels a pending batch update.
	CancelUpdates (see page 1162)	Cancels pending cached updates.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
	Clone (see page 1163)	Duplicates another dataset in the calling component
	Close (see page 6920)	Closes a dataset.
	CompareBookmarks (see page 1163)	Compares two bookmarks.
	CompareBookmarks (see page 6921)	Implements a virtual function to compare two bookmarks.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.
	Create (see page 1099)	Creates an instance of a TADOQuery (see page 1084) component.
	CreateBlobStream (see page 1164)	Creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CreateBlobStream (see page 6922)	Provides the interface for a method that creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
	DeleteRecords (see page 1165)	Deletes one or more records in the dataset.
	Destroy (see page 1099)	Destroys the TADOQuery (see page 1084) instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
	ExecSQL (see page 1100)	Executes the SQL (see page 1105) statement for the ADO query.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.
	FilterOnBookmarks (see page 1168)	Filters a data set to just rows with pre-defined bookmarks.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.
	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
V	GetBlobFieldData (see page 1169)	Retrieves the current value of a field into a buffer.
V	GetBlobFieldData (see page 6947)	Reads BLOB data into a buffer.
V	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
V	GetCurrentRecord (see page 6950)	Implements a virtual function to retrieve the current record in a buffer.
V	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
V	GetDetailLinkFields (see page 1170)	Lists the field components that link this dataset as a detail of a master dataset.
V	GetDetailLinkFields (see page 6951)	Introduces a method to list the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
V	GetFieldData (see page 1171)	This is the overview for the GetFieldData method overload.
V	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
V	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.
V	IsSequenced (see page 1177)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
V	IsSequenced (see page 6967)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	Last (see page 6968)	Moves to the last record in the dataset.
	LoadFromFile (see page 1178)	Loads a recordset from a file.
V	Locate (see page 1179)	Searches the dataset for a specified record and makes that record the current record.
V	Locate (see page 6970)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
V	Lookup (see page 1180)	Retrieves field values from a row that matches specified search values.
V	Lookup (see page 6970)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 6973)	Moves to the next record in the dataset.
	NextRecordset (see page 1181)	Provides access to a secondary recordset.

	Open (see page 6976)	Opens the dataset.
V	Post (see page 6977)	Implements a virtual method to write a modified record to the database or change log.
	Prior (see page 6979)	Moves to the previous record in the dataset.
	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7579)	Executes a specified SQL command.
	PSExecuteStatement (see page 7590)	Executes a specified SQL command.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 7579)	Gets the SQL command to be executed by PSExecute (see page 7578).
	PSGetCommandText (see page 7591)	Gets the SQL command to be executed by PSExecute (see page 7590).
	PSGetCommandType (see page 7580)	Gets the command type to be executed by PSExecute (see page 7578).
	PSGetCommandType (see page 7591)	Gets the command type to be executed by PSExecute (see page 7590).
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7581)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 7592)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.
	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7585)	Assigns a specified SQL command to be executed by PSExecute (see page 7578).
	PSSetCommandText (see page 7596)	Assigns a specified SQL command to be executed by PSExecute (see page 7590).
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).

	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Requery (see page 1191)	Refreshes the recordset.
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 1192)	Saves a recordset to a file.
	Seek (see page 1192)	Searches for a record using the current index.
	SetFields (see page 6997)	Sets the values for all fields in a record
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	Supports (see page 1197)	Indicates whether a dataset supports certain types of operations.
V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateBatch (see page 1197)	Writes pending batch updates to disk.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.
	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 1199)	Indicates the update status of the current record.
V	UpdateStatus (see page 7002)	Reports the update status for the active record.

Public Properties

	Name	Description
	Active (see page 7004)	Specifies whether or not a dataset is open.
R	AggFields (see page 7006)	Contains any aggregate fields.
	AutoCalcFields (see page 7006)	Determines when the OnCalcFields (see page 7053) event is triggered and when lookup field values are calculated.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.
	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DataSetField (see page 7013)	Indicates the persistent TDataSetField (see page 7060) object that owns a nested dataset.
R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.
	DesignerData (see page 1208)	Stores custom data.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.

R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
	FieldDefs (see page 7019)	Points to the list of field definitions for the dataset.
R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset
	Filter (see page 7026)	Specifies the text of the current filter for a dataset.
	Filtered (see page 7027)	Specifies whether or not filtering is active for a dataset.
	FilterGroup (see page 1214)	Filters a recordset based on row update status.
	FilterOptions (see page 7027)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
R	IndexFieldCount (see page 1216)	Indicates the number of fields that comprise the current key.
	IndexFields (see page 1217)	Retrieves or sets a field for an index.
	IndexName (see page 1217)	Specifies the currently active index.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
R	Modified (see page 7029)	Indicates whether the active record is modified.
	ObjectView (see page 7031)	Specifies whether fields are stored hierarchically or flattened out in the Fields (see page 7023) property.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Properties (see page 1221)	This is Properties, a member of class TCustomADODataSet.
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 7032)	Indicates the total number of records associated with the dataset.
	Recordset (see page 1221)	This is Recordset, a member of class TCustomADODataSet.
R	RecordsetState (see page 1222)	This is RecordsetState, a member of class TCustomADODataSet.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.
R	RecordStatus (see page 1222)	Indicates the status of the current row.
R	RowsAffected (see page 1105)	Returns the number of rows operated upon by the latest query execution.
	Sort (see page 1222)	Specifies the sort order of the recordset.
	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterCancel (see page 1224)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 1226)	Occurs after an application closes a dataset.
	AfterDelete (see page 1227)	Occurs after an application deletes a record.
	AfterEdit (see page 1230)	Occurs after an application starts editing a record.
	AfterInsert (see page 1231)	Occurs after an application inserts a new record.
	AfterOpen (see page 1231)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 1233)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 1233)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 1233)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 1234)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 1234)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 1235)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 1235)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 1236)	Occurs before an application enters insert mode.
	BeforeOpen (see page 1237)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 1238)	Occurs before an application posts changes for the active record to the database or change log.

	BeforeRefresh (see page 1239)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 1239)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 1239)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 1240)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 1241)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnEndOfRecordset (see page 1241)	Occurs when moving a recordset's row pointer past the last row.
	OnFetchComplete (see page 1242)	Occurs after records have been retrieved into the recordset.
	OnFetchProgress (see page 1242)	Occurs periodically during an asynchronous data retrieval operation.
	OnFieldChangeComplete (see page 1243)	Occurs after a field has changed.
	OnFilterRecord (see page 1244)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnMoveComplete (see page 1244)	Occurs after the row pointer in a recordset has moved.
	OnNewRecord (see page 1245)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 1245)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnRecordChangeComplete (see page 1246)	Occurs after one or more records in the recordset change.
	OnRecordsetChangeComplete (see page 1247)	Occurs after the recordset has changed.
	OnRecordsetCreate (see page 1247)	Occurs when the recordset has been initialized and is ready to use.
	OnWillChangeField (see page 1248)	Occurs before a field is changed.
	OnWillChangeRecord (see page 1248)	Occurs before a record in the recordset is changed.
	OnWillChangeRecordset (see page 1249)	Occurs before the recordset has changed.
	OnWillMove (see page 1250)	Occurs before the row pointer in a recordset is moved.

Published Properties

	Name	Description
	Active (see page 1201)	Specifies whether or not a dataset is open.
	AutoCalcFields (see page 1203)	Determines when the OnCalcFields event is triggered and when lookup field values are calculated.
	CacheSize (see page 1203)	Specifies the size of the cache for the dataset.
	CommandTimeout (see page 1101)	Specifies amount of time to attempt execution of a command.
	Connection (see page 1205)	Specifies the ADO connection component to use.
	ConnectionString (see page 1206)	Specifies the connection information for the data store.
	CursorLocation (see page 1207)	Specifies whether the cursor for the connection is client-side or server-side.
	CursorType (see page 1208)	Specifies type of cursor an ADO dataset uses.
	DataSource (see page 1101)	Specifies the data source component from which to extract current field values to use in same-name parameters in the ADO query's SQL (see page 1105) statement.
	EnableBCD (see page 1103)	Specifies whether to treat numeric fields as floating-point or BCD.
	ExecuteOptions (see page 1209)	Specifies the characteristics of a command execution.
	Filter (see page 1212)	Specifies the text of the current filter for a recordset.
	Filtered (see page 1214)	Specifies whether or not filtering is active for a dataset.
	LockType (see page 1218)	Specifies the lock type to use when opening a dataset.
	MarshalOptions (see page 1218)	Specifies which records are marshaled back to the server.
	MaxRecords (see page 1219)	Specifies how many rows to return in a result set.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParamCheck (see page 1103)	Specifies whether the parameter list for an ADO dataset component is regenerated if the SQL changes at runtime.
	Parameters (see page 1104)	Contains the collection of parameters for an SQL statement.
	Prepared (see page 1104)	Specifies whether the command is prepared before execution.
	SQL (see page 1105)	Contains the text of the SQL statement to execute for the ADO query.
	Tag (see page 2808)	Stores an integer value as part of a component.

8.1.6.2 TADOQuery.Create Constructor

Creates an instance of a TADOQuery (see page 1084) component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TADOQuery(TComponent * AOwner);
```

Description

Call Create to instantiate an ADO query component at runtime. Query components placed in forms or data modules at design time are created automatically.

See Also

TADOStoredProc (see page 1106)

TADOTable (see page 1125)

Destroy (see page 1099)

8.1.6.3 TADOQuery.Destroy Destructor

Destroys the TADOQuery (see page 1084) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TADOQuery();
```

Description

Do not call Destroy directly in an application. Usually destruction of ADO query components is handled automatically by Delphi. If an application creates its own instances of a query, and does not assign an Owner that is responsible for freeing the dataset, then the application should call Free, which checks that the query is not nil before calling Destroy.

FieldDefs (see page 7019)

Create_d

Free (see page 22300)

8.1.6.4 TADOQuery Methods

The methods of the TADOQuery class are listed here.

Protected Methods

	Name	Description
	QueryChanged (see page 1100)	This is QueryChanged, a member of class TADOQuery.

Public Methods

	Name	Description
	ExecSQL (see page 1100)	Executes the SQL (see page 1105) statement for the ADO query.

8.1.6.4.1 TADOQuery.ExecSQL Method

Executes the SQL (see page 1105) statement for the ADO query.

Pascal

```
function ExecSQL: Integer;
```

C++

```
__fastcall int ExecSQL();
```

Description

Call ExecSQL to execute the SQL (see page 1105) statement currently assigned to the SQL (see page 1105) property. Use ExecSQL to execute queries that do not return a cursor to data (such as INSERT, UPDATE, DELETE, and CREATE TABLE).

ExecSQL returns an integer value reflecting the number of rows affected by the executed SQL (see page 1105) statement.

Note: For SELECT statements, call Open instead of ExecSQL or set the Active (see page 1201) property to true.

To speed performance, an application should ordinarily prepare the query by setting the Prepared (see page 1104) property to true before calling ExecSQL for the first time.

See Also

SQL (see page 1105)

Parameters

SQL (see page 1105)

Active (see page 7004)

Open (see page 6976)

Prepared

ParamByName (see page 1269)

8.1.6.4.2 TADOQuery.QueryChanged Method

Pascal

```
procedure QueryChanged(Sender: TObject);
```

C++

```
__fastcall QueryChanged(TObject * Sender);
```

Description

This is QueryChanged, a member of class TADOQuery.

8.1.6.5 TADOQuery Properties

The properties of the TADOQuery class are listed here.

Public Properties

	Name	Description
R	RowsAffected (see page 1105)	Returns the number of rows operated upon by the latest query execution.

Published Properties

	Name	Description
	CommandTimeout (see page 1101)	Specifies amount of time to attempt execution of a command.
	DataSource (see page 1101)	Specifies the data source component from which to extract current field values to use in same-name parameters in the ADO query's SQL (see page 1105) statement.
	EnableBCD (see page 1103)	Specifies whether to treat numeric fields as floating-point or BCD.
	ParamCheck (see page 1103)	Specifies whether the parameter list for an ADO dataset component is regenerated if the SQL changes at runtime.
	Parameters (see page 1104)	Contains the collection of parameters for an SQL statement.
	Prepared (see page 1104)	Specifies whether the command is prepared before execution.
	SQL (see page 1105)	Contains the text of the SQL statement to execute for the ADO query.

8.1.6.5.1 TADOQuery.CommandTimeout Property

Specifies amount of time to attempt execution of a command.

Pascal

```
property CommandTimeout: Integer;
```

C++

```
__property int CommandTimeout;
```

Description

Use CommandTimeout to specify the amount of time that expires before an attempt to execute a command is considered unsuccessful. Measured in seconds, the default value for CommandTimeout is 30.

If a command is successfully executed prior to the expiration of the seconds specified, CommandTimeout has no effect.

See Also

commandtext (see page 1204)

CommandType (see page 1205)

8.1.6.5.2 TADOQuery.DataSource Property

Specifies the data source component from which to extract current field values to use in same-name parameters in the ADO query's SQL (see page 1105) statement.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;__property TDataSource DataSource;
```

Description

Set DataSource to automatically fill parameters in a query with fields values from another dataset. Parameters (see page 1104) that have the same name as fields in the other dataset are filled with the field values. Parameters (see page 1104) with names that are not the same as fields in the other dataset do not automatically get values, and must be programmatically set. For example, if the SQL (see page 1105) property of the TADOQuery (see page 1084) contains the SQL (see page 1105) statement below and the dataset referenced through DataSource has a CustNo field, the value from the current record in that

other dataset is used in the CustNo parameter:

```
SELECT *
FROM Orders O
WHERE (O.CustNo = :CustNo)
```

DataSource must point to a TDataSource component linked to another dataset component; it cannot point to this query component. The dataset specified in DataSource must be created, populated, and opened before attempting to bind parameters. Parameters (see page 1104) are bound by setting the ADO query's Prepared (see page 1104) property to true prior to executing the query. If the SQL (see page 1105) statement used by a query does not contain parameters, or all parameters are bound by the application using the Parameters (see page 1104) property or the ParamByName method, DataSource need not be assigned. The example below shows setting the DataSource property of ADOQuery2 to the data source for ADOQuery1, preparing ADOQuery2, and activating ADOQuery2:

```
with ADOQuery2 do begin
  DataSource := DataSource1;
  Prepared := True;
  Open;
end;
ADOQuery2->DataSource = DataSource1;
ADOQuery2->Prepared = true;
ADOQuery2->Open();
```

If the SQL (see page 1105) statement in the TADOQuery (see page 1084) is a SELECT query, the query is executed using the new field values each time the record pointer in the other dataset is changed. It is not necessary to call the Open method of the TADOQuery (see page 1084) each time. This makes using the DataSource property to dynamically filter a query result set useful for establishing Master-Detail relationships. Set the DataSource property in the Detail query to the TDataSource component for the Master dataset.

If the SQL (see page 1105) statement uses other than a SELECT query (such as INSERT or UPDATE), the parameters with the same name as fields in the other dataset still get values, but the query must be explicitly executed each time the other dataset's record pointer moves. For example, the SQL (see page 1105) statement below uses the INSERT statement and has the parameters CustNo and CompanyName:

INSERT INTO Customer

(CustNo, Company)

VALUES (:CustNo, :CompanyName)

Another dataset, ADOQuery1 and DataSource1, has a CustNo field but no CompanyName field. If this dataset is used through the DataSource property, the CompanyName parameter must be programmatically assigned a value. Because ADOQuery1 has a CustNo field and ADOQuery1 is referenced through the DataSource property, the CustNo parameter automatically receives a value.

```
with ADOQuery2 do begin
```

DataSource := DataSource1;

```
  ParamByName ('CompanyName').AsString := Edit1.Text;
```

Prepared (see page 1104) := True;

ExecSQL (see page 1100);

```
end;
ADOQuery2->DataSource = DataSource1;
ADOQuery2->ParamByName("CompanyName")->AsString = Edit1->Text;
ADOQuery2->Prepared = true;
ADOQuery2->ExecSQL();
```

If the SQL (see page 1105) statement contains parameters with the same name as fields in the other dataset, do not manually set values for these parameters. Any values programmatically set, such as by using the Parameters (see page 1104) property

or the ParamByName method, will be overridden with automatic values. Parameters (see page 1104) of other names must be programmatically given values. These parameters are unaffected by setting DataSource.

DataSource can be set at runtime or at design-time using the Object Inspector. At design-time, select the desired TDataSource from the drop-down list or type in the name.

Prepared

ExecSQL (see page 1100)

8.1.6.5.3 TADOQuery.EnableBCD Property

Specifies whether to treat numeric fields as floating-point or BCD.

Pascal

```
property EnableBCD: Boolean;
```

C++

```
__property Boolean EnableBCD;
```

Description

Use the EnableBCD property to specify how fields are mapped to field classes. If EnableBCD is true, (the default value) adDecimal and adNumeric fields are mapped to the TBCDField class when field objects are created. If EnableBCD is false, the fields are mapped to the TFloatField class.

EnableBCD determines whether numeric and decimal fields are translated as floating-point values or binary coded decimal (BCD) values. BCD values eliminate the rounding errors associated with floating point math (such as a 3 * (2/3) resulting in 2.00000000001).

If persistent field objects are used (such as those created using the Fields Editor), the field class associated with a given field can contradict the setting of EnableBCD. Three numeric fields in the same table could, for instance, each be represented by a TFloatField, a TBCDField, and a TVariantField – regardless of the value in EnableBCD. Select field classes on a field-by-field basis for greater flexibility.

Note: For numeric values with more than 4 digits to the right of the decimal place, use of TFloatField is generally better. This is because TBCDField uses the currency data type that has a fixed scale of 4 decimal places.

Note: For fields with very large numbers of more than 19 significant digits, you can use TVariantField type persistent field objects. The TFloatField and TBCDField classes lack sufficient capacity for fields of this size. TVariantField allows the getting and setting of the field data as strings, preventing without loss of data due to insufficient capacity. However, arithmetic operations cannot be performed on numbers accessed through a TVariantField object.

TBCDField (see page 6776)

TFloatField (see page 7229)

8.1.6.5.4 TADOQuery.ParamCheck Property

Specifies whether the parameter list for an ADO dataset component is regenerated if the SQL changes at runtime.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

Set ParamCheck to specify whether or not the Parameters property is initialized using ":Param" style parameters in an SQL statement specified in the CommandText property. If the SQL statement in CommandText only contains "?" style parameters, the Parameters property will only be initialized if the OLE DB provider returns parameter information for an SQL command. Otherwise, the parameters must be explicitly created using the CreateParameter method (TParameter).

When ParamCheck is true, a parameter is generated for each ":Param" style parameter in the SQL statement.

The default value of ParamCheck is true.

This property is useful for data definition language (DDL) statements that contain parameters as part of the DDL statement and that are not parameters for the ADO dataset component. For example, the DDL statement to create a stored procedure may contain parameter statements that are part of the stored procedure. Set ParamCheck to false to prevent these parameters from being mistaken for parameters of the ADO dataset component executing the DDL statement.

Parameters (see page 1220)

Open (see page 6976)

commandtext (see page 1204)

8.1.6.5.5 TADOQuery.Parameters Property

Contains the collection of parameters for an SQL statement.

Pascal

```
property Parameters: TParameters;
```

C++

```
__property TParameters Parameters;
```

Description

At design-time, use Parameters to access the parameters for the SQL statement used by the ADO component. Use the properties and methods of Parameters to set and get individual parameter values or to set or inspect parameter attributes.

At runtime, use the Parameters property editor to access the collection of parameters.

SQL (see page 1105)

ExecSQL (see page 1100)

8.1.6.5.6 TADOQuery.Prepared Property

Specifies whether the command is prepared before execution.

Pascal

```
property Prepared: Boolean;
```

C++

```
__property Boolean Prepared;
```

Description

Set Prepared before calling the Open method to specify whether ADO prepares the command used to create the dataset's recordset. If Prepared is set to true and the dataset component is connected to a data store, ADO prepares the command before executing it. If Prepared is set to false, ADO does not prepare the command.

The default value of Prepared is false.

Parameters (see page 1220)

ExecSQL (see page 1100)

Open (see page 6976)

8.1.6.5.7 TADOQuery.RowsAffected Property

Returns the number of rows operated upon by the latest query execution.

Pascal

```
property RowsAffected: Integer;
```

C++

```
__property int RowsAffected;
```

Description

Inspect RowsAffected to determine how many rows were updated or deleted by the last query operation. If no rows were updated or deleted, RowsAffected has a value of zero. RowsAffected will have a value of –1 if the execution of the SQL (see page 1105) statement could not be executed due to an error condition. This latter situation would typically follow the raising of an exception.

See Also

ExecSQL (see page 1100)

8.1.6.5.8 TADOQuery.SQL Property

Contains the text of the SQL statement to execute for the ADO query.

Pascal

```
property SQL: TWideStrings;
```

C++

```
__property TWideStrings SQL;
```

Description

Use SQL to provide the SQL statement that an ADO query component executes when its ExecSQL (see page 1100) or Open method is called.

The SQL statement provided to the SQL property may contain replaceable parameters, following standard ADO syntax conventions. Parameters (see page 1104) are created and stored in the Parameters (see page 1104) property.

At design-time, edit the SQL statement using the property editor invoked by clicking the ellipsis button of the property in the Object Inspector. At runtime, use properties and methods of string list objects to clear the current contents, add new contents, or

to modify existing contents.

```
with ADOQuery1 do begin
  with SQL do begin
    Clear;
    Add('SELECT EmpNo, LastName, FirstName, HireDate');
    Add('FROM Employee');
  end;
  Open;
end;
ADOQuery1->Close();
ADOQuery1->SQL->Clear();
ADOQuery1->SQL->Add("SELECT EmpNo, LastName, FirstName, HireDate");
ADOQuery1->SQL->Add("FROM Employee");
ADOQuery1->Open();
```

Note: The library does not evaluate the SQL sent to the database via a TADOQuery (see page 1084) component. The SQL used must be valid for the particular database type accessed via ADO. Any error messages passed back to the application will have originated at the ADO or database level, and so will have error codes and messages specific to those systems.

8.1.7 TADOStoredProc Class

TADOStoredProc encapsulates a stored procedure in an ADO database.

Class Hierarchy

Pascal

```
TADOStoredProc = class(TCustomADODataSet);
```

C++

```
class TADOStoredProc : public TCustomADODataSet;
```

File

ADODB

Description

Use a TADOStoredProc object when a client application must use a stored procedure in a database. A stored procedure is a grouped set of statements, stored as part of a database's metadata (just like tables, indexes, and domains), that performs a frequently repeated, database-related task on the server and passes results to the client.

Note: Not all database servers support stored procedures. See a specific server's documentation to determine if it supports stored procedures.

Many stored procedures require a series of input arguments, or parameters, that are used during processing. TADOStoredProc provides a Parameters (see page 1123) property that enables an application to set these parameters before executing the stored procedure.

TADOStoredProc reuses the Parameters (see page 1123) property to hold the results returned by a stored procedure. Parameters (see page 1123) is a collection of TParameter (see page 1250) objects, each representing an individual parameter for the stored procedure. Depending on server implementation, a stored procedure can return either a single set of values, or a result set similar to the result set returned by a query.

Types of Datasets

Overview of ADO Components

8.1.7.1 TADOStoredProc Members

The following tables list the members exposed by TADOStoredProc.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.
	ActivateTextFilter (see page 1160)	This is ActivateTextFilter, a member of class TCustomADODataSet.
V	AllocRecordBuffer (see page 1160)	This is AllocRecordBuffer, a member of class TCustomADODataSet.
V	AllocRecordBuffer (see page 6909)	This is AllocRecordBuffer, a member of class TDataSet.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
V	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
V	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CheckActive (see page 1162)	This is CheckActive, a member of class TCustomADODataSet.

	CheckActive (see page 6917)	This is CheckActive, a member of class TDataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
	CheckFieldCompatibility (see page 1162)	This is CheckFieldCompatibility, a member of class TCustomADODataSet.
	CheckFieldCompatibility (see page 6919)	This is CheckFieldCompatibility, a member of class TDataSet.
	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.
	ClearCalcFields (see page 1162)	This is ClearCalcFields, a member of class TCustomADODataSet.
	ClearCalcFields (see page 6919)	This is ClearCalcFields, a member of class TDataSet.
	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
	CloseCursor (see page 6921)	This is CloseCursor, a member of class TDataSet.
	ConnectionPoint (see page 1163)	This is ConnectionPoint, a member of class TCustomADODataSet.
	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
	DataConvert (see page 6924)	This is DataConvert, a member of class TDataSet.
	DataEvent (see page 1164)	This is DataEvent, a member of class TCustomADODataSet.
	DataEvent (see page 6924)	This is DataEvent, a member of class TDataSet.
	DeactivateFilters (see page 1164)	This is DeactivateFilters, a member of class TCustomADODataSet.
	DefChanged (see page 1165)	This is DefChanged, a member of class TCustomADODataSet.
	DefChanged (see page 6924)	This is DefChanged, a member of class TDataSet.
	DefineProperties (see page 1165)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
	DestroyLookupCursor (see page 1166)	This is DestroyLookupCursor, a member of class TCustomADODataSet.
	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.
	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.
	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.
	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.
	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
	DoBeforeInsert (see page 6930)	This is DoBeforeInsert, a member of class TDataSet.
	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.
	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
	DoOnNewRecord (see page 1166)	This is DoOnNewRecord, a member of class TCustomADODataSet.
	DoOnNewRecord (see page 6931)	This is DoOnNewRecord, a member of class TDataSet.
	EnableEvents (see page 1166)	This is EnableEvents, a member of class TCustomADODataSet.
	EndOfRecordset (see page 1167)	This is EndOfRecordset, a member of class TCustomADODataSet.
	FetchComplete (see page 1167)	This is FetchComplete, a member of class TCustomADODataSet.
	FetchProgress (see page 1167)	This is FetchProgress, a member of class TCustomADODataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.
	FieldChangeComplete (see page 1167)	This is FieldChangeComplete, a member of class TCustomADODataSet.
	FindRecord (see page 1168)	This is FindRecord, a member of class TCustomADODataSet.

	FindRecord (see page 6942)	This is FindRecord, a member of class TDataSet.
	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
	FreeRecordBuffer (see page 1168)	This is FreeRecordBuffer, a member of class TCustomADODataSet.
	FreeRecordBuffer (see page 6947)	This is FreeRecordBuffer, a member of class TDataSet.
	GetActiveRecBuf (see page 1168)	This is GetActiveRecBuf, a member of class TCustomADODataSet.
	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.
	GetAggregateValue (see page 6947)	This is GetAggregateValue, a member of class TDataSet.
	GetBookmarkData (see page 1169)	This is GetBookmarkData, a member of class TCustomADODataSet.
	GetBookmarkData (see page 6949)	This is GetBookmarkData, a member of class TDataSet.
	GetBookmarkFlag (see page 1169)	This is GetBookmarkFlag, a member of class TCustomADODataSet.
	GetBookmarkFlag (see page 6949)	This is GetBookmarkFlag, a member of class TDataSet.
	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
	GetCanModify (see page 1169)	This is GetCanModify, a member of class TCustomADODataSet.
	GetCanModify (see page 6950)	This is GetCanModify, a member of class TDataSet.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.
	GetCommandText (see page 1170)	This is GetCommandText, a member of class TCustomADODataSet.
	GetDataSource (see page 1170)	This is GetDataSource, a member of class TCustomADODataSet.
	GetDataSource (see page 6951)	This is GetDataSource, a member of class TDataSet.
	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
	GetIsIndexField (see page 6954)	This is GetIsIndexField, a member of class TDataSet.
	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.
	GetRecNo (see page 1171)	This is GetRecNo, a member of class TCustomADODataSet.
	GetRecNo (see page 6956)	This is GetRecNo, a member of class TDataSet.
	GetRecord (see page 1172)	This is GetRecord, a member of class TCustomADODataSet.
	GetRecord (see page 6956)	This is GetRecord, a member of class TDataSet.
	GetRecordCount (see page 1172)	This is GetRecordCount, a member of class TCustomADODataSet.
	GetRecordCount (see page 6956)	This is GetRecordCount, a member of class TDataSet.
	GetRecordSize (see page 1172)	This is GetRecordSize, a member of class TCustomADODataSet.
	GetRecordSize (see page 6956)	This is GetRecordSize, a member of class TDataSet.
	GetStateFieldValue (see page 1172)	This is GetStateFieldValue, a member of class TCustomADODataSet.
	GetStateFieldValue (see page 6956)	This is GetStateFieldValue, a member of class TDataSet.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
	InitOleDBAccess (see page 1173)	This is InitOleDBAccess, a member of class TCustomADODataSet.
	InitRecord (see page 6959)	This is InitRecord, a member of class TDataSet.
	InternalAddRecord (see page 1173)	This is InternalAddRecord, a member of class TCustomADODataSet.
	InternalAddRecord (see page 6963)	This is InternalAddRecord, a member of class TDataSet.
	InternalCancel (see page 1173)	This is InternalCancel, a member of class TCustomADODataSet.

	InternalCancel (see page 6963)	This is InternalCancel, a member of class TDataSet.
	InternalClose (see page 1173)	This is InternalClose, a member of class TCustomADODataSet.
	InternalClose (see page 6963)	This is InternalClose, a member of class TDataSet.
	InternalDelete (see page 1173)	This is InternalDelete, a member of class TCustomADODataSet.
	InternalDelete (see page 6964)	This is InternalDelete, a member of class TDataSet.
	InternalEdit (see page 1174)	This is InternalEdit, a member of class TCustomADODataSet.
	InternalEdit (see page 6964)	This is InternalEdit, a member of class TDataSet.
	InternalFirst (see page 1174)	This is InternalFirst, a member of class TCustomADODataSet.
	InternalFirst (see page 6964)	This is InternalFirst, a member of class TDataSet.
	InternalGetRecord (see page 1174)	This is InternalGetRecord, a member of class TCustomADODataSet.
	InternalGotoBookmark (see page 1174)	This is InternalGotoBookmark, a member of class TCustomADODataSet.
	InternalGotoBookmark (see page 6964)	This is InternalGotoBookmark, a member of class TDataSet.
	InternalHandleException (see page 1175)	This is InternalHandleException, a member of class TCustomADODataSet.
	InternalHandleException (see page 6964)	This is InternalHandleException, a member of class TDataSet.
	InternalInitFieldDefs (see page 1175)	This is InternalInitFieldDefs, a member of class TCustomADODataSet.
	InternalInitFieldDefs (see page 6965)	This is InternalInitFieldDefs, a member of class TDataSet.
	InternalInitRecord (see page 1175)	This is InternalInitRecord, a member of class TCustomADODataSet.
	InternalInitRecord (see page 6965)	This is InternalInitRecord, a member of class TDataSet.
	InternalInsert (see page 1175)	This is InternalInsert, a member of class TCustomADODataSet.
	InternalInsert (see page 6965)	This is InternalInsert, a member of class TDataSet.
	InternalLast (see page 1175)	This is InternalLast, a member of class TCustomADODataSet.
	InternalLast (see page 6965)	This is InternalLast, a member of class TDataSet.
	InternalOpen (see page 1176)	This is InternalOpen, a member of class TCustomADODataSet.
	InternalOpen (see page 6966)	This is InternalOpen, a member of class TDataSet.
	InternalPost (see page 1176)	This is InternalPost, a member of class TCustomADODataSet.
	InternalPost (see page 6966)	This is InternalPost, a member of class TDataSet.
	InternalRefresh (see page 1176)	This is InternalRefresh, a member of class TCustomADODataSet.
	InternalRefresh (see page 6966)	This is InternalRefresh, a member of class TDataSet.
	InternalRequery (see page 1176)	This is InternalRequery, a member of class TCustomADODataSet.
	InternalSetSort (see page 1177)	This is InternalSetSort, a member of class TCustomADODataSet.
	InternalSetToRecord (see page 1177)	This is InternalSetToRecord, a member of class TCustomADODataSet.
	InternalSetToRecord (see page 6966)	This is InternalSetToRecord, a member of class TDataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsCursorOpen (see page 1177)	This is IsCursorOpen, a member of class TCustomADODataSet.
	IsCursorOpen (see page 6966)	This is IsCursorOpen, a member of class TDataSet.
	Loaded (see page 1177)	Initializes the component after the form file has been read into memory.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 6969)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 1179)	This is LocateRecord, a member of class TCustomADODataSet.
	MasterChanged (see page 1180)	This is MasterChanged, a member of class TCustomADODataSet.
	MasterDisabled (see page 1180)	This is MasterDisabled, a member of class TCustomADODataSet.
	MoveComplete (see page 1180)	This is MoveComplete, a member of class TCustomADODataSet.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	OpenCursor (see page 1181)	This is OpenCursor, a member of class TCustomADODataSet.
	OpenCursor (see page 6976)	This is OpenCursor, a member of class TDataSet.
	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PrepareCursor (see page 1181)	This is PrepareCursor, a member of class TCustomADODataSet.
	PSEndTransaction (see page 1181)	Ends a transaction that was started by a call to PSStartTransaction.
	PSEndTransaction (see page 6979)	Ends a transaction that was started by a call to PSStartTransaction.
	PSExecute (see page 1182)	Executes the SQL command associated with the dataset.
	PSExecute (see page 6980)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 1182)	Executes a specified SQL command.

	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
	PSGetAttributes (see page 1183)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 6981)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 1183)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 6982)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 7537)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandTextW (see page 6982)	This is PSGetCommandTextW, a member of class TDataSet.
	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
	PSGetCommandType (see page 1184)	Gets the command type to be executed by PSExecute.
	PSGetCommandType (see page 6982)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 1184)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 6983)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 1185)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 6983)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 6984)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFieldsW (see page 1185)	This is PSGetKeyFieldsW, a member of class TCustomADODataSet.
	PSGetKeyFieldsW (see page 6984)	This is PSGetKeyFieldsW, a member of class TDataSet.
	PSGetKeyFieldsW (see page 7538)	This is PSGetKeyFieldsW, a member of class TWideDataSet.
	PSGetParams (see page 1185)	Returns the current parameter values of the dataset.
	PSGetParams (see page 6984)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 6985)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteCharW (see page 1186)	This is PSGetQuoteCharW, a member of class TCustomADODataSet.
	PSGetQuoteCharW (see page 6985)	This is PSGetQuoteCharW, a member of class TDataSet.
	PSGetQuoteCharW (see page 7539)	This is PSGetQuoteCharW, a member of class TWideDataSet.
	PSGetTableName (see page 6985)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableNameW (see page 1186)	This is PSGetTableNameW, a member of class TCustomADODataSet.
	PSGetTableNameW (see page 6986)	This is PSGetTableNameW, a member of class TDataSet.
	PSGetTableNameW (see page 7539)	This is PSGetTableNameW, a member of class TWideDataSet.
	PSGetUpdateException (see page 1186)	Generates an EUpdateError object based on another exception object.
	PSGetUpdateException (see page 6986)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 1187)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 6987)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 1187)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 6987)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 1188)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 6987)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 1188)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 6988)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 1188)	Assigns a specified SQL command to be executed by PSExecute.
	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
	PSSetParams (see page 1189)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 6989)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 1189)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSStartTransaction (see page 6989)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.

	PSUpdateRecord (see page 1190)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 6990)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RecordChangeComplete (see page 1190)	This is RecordChangeComplete, a member of class TCustomADODataSet.
	RecordsetChangeComplete (see page 1190)	This is RecordsetChangeComplete, a member of class TCustomADODataSet.
	RefreshInternalCalcFields (see page 6993)	This is RefreshInternalCalcFields, a member of class TDataSet.
	RefreshParams (see page 1191)	This is RefreshParams, a member of class TCustomADODataSet.
	ReleaseLock (see page 1191)	This is ReleaseLock, a member of class TCustomADODataSet.
	ResetAggField (see page 6993)	This is ResetAggField, a member of class TDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBlockReadSize (see page 1194)	This is SetBlockReadSize, a member of class TCustomADODataSet.
	SetBlockReadSize (see page 6994)	This is SetBlockReadSize, a member of class TDataSet.
	SetBookmarkData (see page 1194)	This is SetBookmarkData, a member of class TCustomADODataSet.
	SetBookmarkData (see page 6994)	This is SetBookmarkData, a member of class TDataSet.
	SetBookmarkFlag (see page 1194)	This is SetBookmarkFlag, a member of class TCustomADODataSet.
	SetBookmarkFlag (see page 6995)	This is SetBookmarkFlag, a member of class TDataSet.
	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
	SetBufListSize (see page 6995)	This is SetBufListSize, a member of class TDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.
	SetCommandText (see page 1194)	This is SetCommandText, a member of class TCustomADODataSet.
	SetConnection (see page 1194)	This is SetConnection, a member of class TCustomADODataSet.
	SetConnectionFlag (see page 1195)	This is SetConnectionFlag, a member of class TCustomADODataSet.
	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
	SetDataSetField (see page 6996)	This is SetDataSetField, a member of class TDataSet.
	SetDataSource (see page 1195)	This is SetDataSource, a member of class TCustomADODataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDetailFilter (see page 1195)	This is SetDetailFilter, a member of class TCustomADODataSet.
	SetFieldData (see page 1195)	This is the overview for the SetFieldData method overload.
	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.
	SetFiltered (see page 1196)	This is SetFiltered, a member of class TCustomADODataSet.
	SetFiltered (see page 6997)	This is SetFiltered, a member of class TDataSet.
	SetFilterOptions (see page 1196)	This is SetFilterOptions, a member of class TCustomADODataSet.
	SetFilterOptions (see page 6998)	This is SetFilterOptions, a member of class TDataSet.
	SetFilterText (see page 1196)	This is SetFilterText, a member of class TCustomADODataSet.
	SetFilterText (see page 6998)	This is SetFilterText, a member of class TDataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 6999)	Sets the value of the Name property.
	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
	SetOnFilterRecord (see page 6999)	This is SetOnFilterRecord, a member of class TDataSet.
	SetParamsFromCursor (see page 1197)	This is SetParamsFromCursor, a member of class TCustomADODataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetRecNo (see page 1197)	This is SetRecNo, a member of class TCustomADODataSet.
	SetRecNo (see page 6999)	This is SetRecNo, a member of class TDataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
	SetStateFieldValue (see page 7000)	This is SetStateFieldValue, a member of class TDataSet.

	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.
	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateIndexDefs (see page 1198)	This is UpdateIndexDefs, a member of class TCustomADODataSet.
V	UpdateIndexDefs (see page 7002)	This is UpdateIndexDefs, a member of class TDataSet.
	UpdateRecordSetPosition (see page 1198)	This is UpdateRecordSetPosition, a member of class TCustomADODataSet.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WillChangeField (see page 1199)	This is WillChangeField, a member of class TCustomADODataSet.
	WillChangeRecord (see page 1199)	This is WillChangeRecord, a member of class TCustomADODataSet.
	WillChangeRecordset (see page 1200)	This is WillChangeRecordset, a member of class TCustomADODataSet.
	WillMove (see page 1200)	This is WillMove, a member of class TCustomADODataSet.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.
R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.
R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.
R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.
R	Command (see page 1204)	Provides access to the internal command object that executes commands for the dataset.
	CommandText (see page 1204)	This is CommandText, a member of class TCustomADODataSet.
	CommandType (see page 1205)	Specifies the type of command to execute.
	Constraints (see page 7013)	Specifies record-level constraints that must be met when editing the data.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
	FieldDefs (see page 1210)	Points to the list of field definitions for the dataset.
	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
	IndexDefs (see page 1215)	Contains the definitions of the indexes for the current table.
	IndexFieldNames (see page 1216)	Lists the columns to use for a persistent sort of the recordset.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
R	MasterDataLink (see page 1218)	Manages the relationship between the ADO dataset and a master table.
	MasterFields (see page 1219)	Specifies field or fields on which a Master-Detail link is based.
	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.
	ParamCheck (see page 1220)	Specifies whether the parameter list for an ADO dataset component is regenerated if the SQL changes at runtime.
	Reserved (see page 7035)	For internal use only.
	StoreDefs (see page 1223)	Specifies whether field definitions are stored with the ADO dataset.

Public Events

	Name	Description
	AfterCancel (see page 7038)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 7040)	Occurs after an application closes a dataset.
	AfterDelete (see page 7041)	Occurs after an application deletes a record.
	AfterEdit (see page 7044)	Occurs after an application starts editing a record.
	AfterInsert (see page 7044)	Occurs after an application inserts a new record.
	AfterOpen (see page 7045)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 7046)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 7047)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 7047)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 7048)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 7048)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 7049)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 7049)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 7050)	Occurs before an application enters insert mode.
	BeforeOpen (see page 7051)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 7052)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 7052)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 7053)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 7053)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 7054)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 7054)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 7055)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 7056)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 7056)	Occurs when an application attempts to modify or insert a record and an exception is raised.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BookmarkValid (see page 1160)	Tests the validity of a specified bookmark.
V	BookmarkValid (see page 6916)	Indicates the validity of a specified bookmark.
V	Cancel (see page 6916)	Cancels modifications to the active record if those changes are not yet posted.
	CancelBatch (see page 1161)	Cancels a pending batch update.
	CancelUpdates (see page 1162)	Cancels pending cached updates.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.

	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
	Clone (see page 1163)	Duplicates another dataset in the calling component
	Close (see page 6920)	Closes a dataset.
V	CompareBookmarks (see page 1163)	Compares two bookmarks.
V	CompareBookmarks (see page 6921)	Implements a virtual function to compare two bookmarks.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.
V	Create (see page 1120)	Creates an instance of a TADOStoredProc (see page 1106) component.
V	CreateBlobStream (see page 1164)	Creates a blob stream for a Binary large object (BLOB) field in the dataset.
V	CreateBlobStream (see page 6922)	Provides the interface for a method that creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
	DeleteRecords (see page 1165)	Deletes one or more records in the dataset.
V	Destroy (see page 1157)	Destroys the TCustomADONETConnector instance.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 6904)	Destroys the TDataSet (see page 6894) instance.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
	ExecProc (see page 1121)	Executes the stored procedure on the server.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.
	FilterOnBookmarks (see page 1168)	Filters a data set to just rows with pre-defined bookmarks.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.
	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
V	GetBlobFieldData (see page 1169)	Retrieves the current value of a field into a buffer.
V	GetBlobFieldData (see page 6947)	Reads BLOB data into a buffer.

	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentRecord (see page 6950)	Implements a virtual function to retrieve the current record in a buffer.
	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
	GetDetailLinkFields (see page 1170)	Lists the field components that link this dataset as a detail of a master dataset.
	GetDetailLinkFields (see page 6951)	Introduces a method to list the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldData (see page 1171)	This is the overview for the GetFieldData method overload.
	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.
	IsSequenced (see page 1177)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	IsSequenced (see page 6967)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	Last (see page 6968)	Moves to the last record in the dataset.
	LoadFromFile (see page 1178)	Loads a recordset from a file.
	Locate (see page 1179)	Searches the dataset for a specified record and makes that record the current record.
	Locate (see page 6970)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
	Lookup (see page 1180)	Retrieves field values from a row that matches specified search values.
	Lookup (see page 6970)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 6973)	Moves to the next record in the dataset.
	NextRecordset (see page 1181)	Provides access to a secondary recordset.
	Open (see page 6976)	Opens the dataset.
	Post (see page 6977)	Implements a virtual method to write a modified record to the database or change log.
	Prior (see page 6979)	Moves to the previous record in the dataset.

	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7579)	Executes a specified SQL command.
	PSExecuteStatement (see page 7590)	Executes a specified SQL command.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 7579)	Gets the SQL command to be executed by PSExecute (see page 7578).
	PSGetCommandText (see page 7591)	Gets the SQL command to be executed by PSExecute (see page 7590).
	PSGetCommandType (see page 7580)	Gets the command type to be executed by PSExecute (see page 7578).
	PSGetCommandType (see page 7591)	Gets the command type to be executed by PSExecute (see page 7590).
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7581)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 7592)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.
	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7585)	Assigns a specified SQL command to be executed by PSExecute (see page 7578).
	PSSetCommandText (see page 7596)	Assigns a specified SQL command to be executed by PSExecute (see page 7590).
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).
	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Requery (see page 1191)	Refreshes the recordset.
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 1192)	Saves a recordset to a file.
	Seek (see page 1192)	Searches for a record using the current index.
	SetFields (see page 6997)	Sets the values for all fields in a record
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	Supports (see page 1197)	Indicates whether a dataset supports certain types of operations.
V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateBatch (see page 1197)	Writes pending batch updates to disk.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.
	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 1199)	Indicates the update status of the current record.
V	UpdateStatus (see page 7002)	Reports the update status for the active record.

Public Properties

	Name	Description
	Active (see page 7004)	Specifies whether or not a dataset is open.
R	AggFields (see page 7006)	Contains any aggregate fields.
	AutoCalcFields (see page 7006)	Determines when the OnCalcFields (see page 7053) event is triggered and when lookup field values are calculated.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.
	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DataSetField (see page 7013)	Indicates the persistent TDataSetField (see page 7060) object that owns a nested dataset.
R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.
	DesignerData (see page 1208)	Stores custom data.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.
R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
	FieldDefs (see page 7019)	Points to the list of field definitions for the dataset.
R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset

	Filter (see page 7026)	Specifies the text of the current filter for a dataset.
	Filtered (see page 7027)	Specifies whether or not filtering is active for a dataset.
	FilterGroup (see page 1214)	Filters a recordset based on row update status.
	FilterOptions (see page 7027)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
R	IndexFieldCount (see page 1216)	Indicates the number of fields that comprise the current key.
	IndexFields (see page 1217)	Retrieves or sets a field for an index.
	IndexName (see page 1217)	Specifies the currently active index.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
R	Modified (see page 7029)	Indicates whether the active record is modified.
	ObjectView (see page 7031)	Specifies whether fields are stored hierarchically or flattened out in the Fields (see page 7023) property.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Properties (see page 1221)	This is Properties, a member of class TCustomADODataSet.
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 7032)	Indicates the total number of records associated with the dataset.
	Recordset (see page 1221)	This is Recordset, a member of class TCustomADODataSet.
R	RecordsetState (see page 1222)	This is RecordsetState, a member of class TCustomADODataSet.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.
R	RecordStatus (see page 1222)	Indicates the status of the current row.
	Sort (see page 1222)	Specifies the sort order of the recordset.
	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterCancel (see page 1224)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 1226)	Occurs after an application closes a dataset.
	AfterDelete (see page 1227)	Occurs after an application deletes a record.
	AfterEdit (see page 1230)	Occurs after an application starts editing a record.
	AfterInsert (see page 1231)	Occurs after an application inserts a new record.
	AfterOpen (see page 1231)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 1233)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 1233)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 1233)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 1234)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 1234)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 1235)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 1235)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 1236)	Occurs before an application enters insert mode.
	BeforeOpen (see page 1237)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 1238)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 1239)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 1239)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 1239)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 1240)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 1241)	Occurs when an application attempts to modify or insert a record and an exception is raised.

	OnEndOfRecordset (see page 1241)	Occurs when moving a recordset's row pointer past the last row.
	OnFetchComplete (see page 1242)	Occurs after records have been retrieved into the recordset.
	OnFetchProgress (see page 1242)	Occurs periodically during an asynchronous data retrieval operation.
	OnFieldChangeComplete (see page 1243)	Occurs after a field has changed.
	OnFilterRecord (see page 1244)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnMoveComplete (see page 1244)	Occurs after the row pointer in a recordset has moved.
	OnNewRecord (see page 1245)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 1245)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnRecordChangeComplete (see page 1246)	Occurs after one or more records in the recordset change.
	OnRecordsetChangeComplete (see page 1247)	Occurs after the recordset has changed.
	OnRecordsetCreate (see page 1247)	Occurs when the recordset has been initialized and is ready to use.
	OnWillChangeField (see page 1248)	Occurs before a field is changed.
	OnWillChangeRecord (see page 1248)	Occurs before a record in the recordset is changed.
	OnWillChangeRecordset (see page 1249)	Occurs before the recordset has changed.
	OnWillMove (see page 1250)	Occurs before the row pointer in a recordset is moved.

Published Properties

	Name	Description
	Active (see page 1201)	Specifies whether or not a dataset is open.
	AutoCalcFields (see page 1203)	Determines when the OnCalcFields event is triggered and when lookup field values are calculated.
	CacheSize (see page 1203)	Specifies the size of the cache for the dataset.
	CommandTimeout (see page 1122)	Specifies amount of time to attempt execution of a command.
	Connection (see page 1205)	Specifies the ADO connection component to use.
	ConnectionString (see page 1206)	Specifies the connection information for the data store.
	CursorLocation (see page 1207)	Specifies whether the cursor for the connection is client-side or server-side.
	CursorType (see page 1208)	Specifies type of cursor an ADO dataset uses.
	DataSource (see page 1122)	Represents the data source of another dataset that supplies values to the dataset.
	EnableBCD (see page 1123)	Specifies whether to treat numeric fields as floating-point or BCD.
	ExecuteOptions (see page 1209)	Specifies the characteristics of a command execution.
	Filter (see page 1212)	Specifies the text of the current filter for a recordset.
	Filtered (see page 1214)	Specifies whether or not filtering is active for a dataset.
	LockType (see page 1218)	Specifies the lock type to use when opening a dataset.
	MarshalOptions (see page 1218)	Specifies which records are marshaled back to the server.
	MaxRecords (see page 1219)	Specifies how many rows to return in a result set.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Parameters (see page 1123)	Contains the collection of parameters for an SQL statement.
	Prepared (see page 1124)	Specifies whether the command is prepared before execution.
	ProcedureName (see page 1124)	Indicates the stored procedure used by the TADOStoredProc (see page 1106).
	Tag (see page 2808)	Stores an integer value as part of a component.

8.1.7.2 TADOStoredProc.Create Constructor

Creates an instance of a TADOStoredProc (see page 1106) component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TADOStoredProc(TComponent * AOwner);
```

Description

Call Create to instantiate an ADO stored procedure component at runtime. Stored procedure components placed in forms or data modules at design time are created automatically.

Create

Calls its inherited Create method.

Sets the CommandType (see page 1205) property to cmdStoredProc.

See Also

TADODataSet (see page 1041)

TADOQuery (see page 1084)

TADOTable (see page 1125)

8.1.7.3 TADOStoredProc Methods

The methods of the TADOStoredProc class are listed here.

Public Methods

	Name	Description
	ExecProc (see page 1121)	Executes the stored procedure on the server.

8.1.7.3.1 TADOStoredProc.ExecProc Method

Executes the stored procedure on the server.

Pascal

```
procedure ExecProc;
```

C++

```
__fastcall ExecProc();
```

Description

Call ExecProc to execute a stored procedure. Before calling ExecProc:

1. Provide any input parameters in the Parameters (see page 1123) property. At design-time, a developer can provide parameters using the Parameters (see page 1123) Editor. At runtime an application must access the Parameters (see page 1123) property directly.
2. Set the Prepared (see page 1124) property to true to bind the parameters.

If a stored procedure returns output parameters, they are stored in the Parameters (see page 1123) property when ExecProc returns control to the application. An application can access the output parameters using the Parameters (see page 1123) property and identifying the particular parameter by its number or by using the ParamByName method and identifying the parameter by its name.

Tip: If an application is only interested in the result set returned by a stored procedure, call Open method for the TADOStoredProc (see page 1106) component or set its Active (see page 1201) property to true.

See Also

Active (see page 7004)

Open (see page 6976)

Parameters

Prepared

Connection

8.1.7.4 TADOStoredProc Properties

The properties of the TADOStoredProc class are listed here.

Published Properties

	Name	Description
	CommandTimeout (see page 1122)	Specifies amount of time to attempt execution of a command.
	DataSource (see page 1122)	Represents the data source of another dataset that supplies values to the dataset.
	EnableBCD (see page 1123)	Specifies whether to treat numeric fields as floating-point or BCD.
	Parameters (see page 1123)	Contains the collection of parameters for an SQL statement.
	Prepared (see page 1124)	Specifies whether the command is prepared before execution.
	ProcedureName (see page 1124)	Indicates the stored procedure used by the TADOStoredProc (see page 1106).

8.1.7.4.1 TADOStoredProc.CommandTimeout Property

Specifies amount of time to attempt execution of a command.

Pascal

```
property CommandTimeout: Integer;
```

C++

```
__property int CommandTimeout;
```

Description

Use CommandTimeout to specify the amount of time that expires before an attempt to execute a command is considered unsuccessful. Measured in seconds, the default value for CommandTimeout is 30.

If a command is successfully executed prior to the expiration of the seconds specified, CommandTimeout has no effect.

See Also

commandtext (see page 1204)

CommandType (see page 1205)

8.1.7.4.2 TADOStoredProc.DataSource Property

Represents the data source of another dataset that supplies values to the dataset.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;__property TDataSource DataSource;
```

Description

As implemented in TDataSet, the DataSource property is always nil (Delphi) or NULL (C++).

Descendant dataset classes that support specifying a data source redeclare and implement methods for getting and setting the

DataSource property.

See Also

Active (see page 7004)

IsLinkedTo (see page 6967)

Establishing Master/detail Relationships Using Parameters

8.1.7.4.3 TADOStoredProc.EnableBCD Property

Specifies whether to treat numeric fields as floating-point or BCD.

Pascal

```
property EnableBCD: Boolean;
```

C++

```
__property Boolean EnableBCD;
```

Description

Use the EnableBCD property to specify how fields are mapped to field classes. If EnableBCD is true, (the default value) adDecimal and adNumeric fields are mapped to the TBCDField class when field objects are created. If EnableBCD is false, the fields are mapped to the TFloatField class.

EnableBCD determines whether numeric and decimal fields are translated as floating-point values or binary coded decimal (BCD) values. BCD values eliminate the rounding errors associated with floating point math (such as a 3 * (2/3) resulting in 2.00000000001).

If persistent field objects are used (such as those created using the Fields Editor), the field class associated with a given field can contradict the setting of EnableBCD. Three numeric fields in the same table could, for instance, each be represented by a TFloatField, a TBCDField, and a TVariantField – regardless of the value in EnableBCD. Select field classes on a field-by-field basis for greater flexibility.

Note: For numeric values with more than 4 digits to the right of the decimal place, use of TFloatField is generally better. This is because TBCDField uses the currency data type that has a fixed scale of 4 decimal places.

Note: For fields with very large numbers of more than 19 significant digits, you can use TVariantField type persistent field objects. The TFloatField and TBCDField classes lack sufficient capacity for fields of this size. TVariantField allows the getting and setting of the field data as strings, preventing without loss of data due to insufficient capacity. However, arithmetic operations cannot be performed on numbers accessed through a TVariantField object.

See Also

TBCDField (see page 6776)

TFloatField (see page 7229)

8.1.7.4.4 TADOStoredProc.Parameters Property

Contains the collection of parameters for an SQL statement.

Pascal

```
property Parameters: TParameters;
```

C++

```
__property TParameters Parameters;
```

Description

At design-time, use Parameters to access the parameters for the SQL statement used by the ADO component. Use the properties and methods of Parameters to set and get individual parameter values or to set or inspect parameter attributes.

At runtime, use the Parameters property editor to access the collection of parameters.

See Also

SQL (see page 1105)

ExecSQL (see page 1100)

8.1.7.4.5 TADOStoredProc.Prepared Property

Specifies whether the command is prepared before execution.

Pascal

```
property Prepared: Boolean;
```

C++

```
__property Boolean Prepared;
```

Description

Set Prepared before calling the Open method to specify whether ADO prepares the command used to create the dataset's recordset. If Prepared is set to true and the dataset component is connected to a data store, ADO prepares the command before executing it. If Prepared is set to false, ADO does not prepare the command.

The default value of Prepared is false.

See Also

Parameters (see page 1220)

ExecSQL (see page 1100)

Open (see page 6976)

8.1.7.4.6 TADOStoredProc.ProcedureName Property

Indicates the stored procedure used by the TADOStoredProc (see page 1106).

Pascal

```
property ProcedureName: WideString;
```

C++

```
__property BSTR ProcedureName;
```

Description

Set ProcedureName to specify the stored procedure in an ADO database with which the TADOStoredProc (see page 1106) is associated.

At design-time, the property editor displays a list of available stored procedures. This list is only possible when a valid connection can be established between the stored procedure component and a database.

At runtime, set the ProcedureName property using a WideString (or comparable) value. The value used must be a valid name for a stored procedure in the associated database.

See Also

GetProcedureNames (see page 1014)

Connection (see page 1205)

8.1.8 TADOTable Class

TADOTable is a dataset component that encapsulates a table accessed through an ADO data store.

Class Hierarchy

Pascal

```
TADOTable = class(TCustomADODataSet);
```

C++

```
class TADOTable : public TCustomADODataSet;
```

File

ADODB

Description

Use TADOTable to access data in a single database table using ADO. TADOTable provides direct access to every record and field in an underlying database table. An ADO table component can also work with a subset of records within a database table using ranges and filters.

See Also

TDataSet (see page 6894)

Types of Datasets

Overview of ADO Components

8.1.8.1 TADOTable Members

The following tables list the members exposed by TADOTable.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.
	ActivateTextFilter (see page 1160)	This is ActivateTextFilter, a member of class TCustomADODataSet.
V	AllocRecordBuffer (see page 1160)	This is AllocRecordBuffer, a member of class TCustomADODataSet.
V	AllocRecordBuffer (see page 6909)	This is AllocRecordBuffer, a member of class TDataSet.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
V	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
V	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CheckActive (see page 1162)	This is CheckActive, a member of class TCustomADODataSet.
V	CheckActive (see page 6917)	This is CheckActive, a member of class TDataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
V	CheckFieldCompatibility (see page 1162)	This is CheckFieldCompatibility, a member of class TCustomADODataSet.
V	CheckFieldCompatibility (see page 6919)	This is CheckFieldCompatibility, a member of class TDataSet.
V	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
V	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.
V	ClearCalcFields (see page 1162)	This is ClearCalcFields, a member of class TCustomADODataSet.
V	ClearCalcFields (see page 6919)	This is ClearCalcFields, a member of class TDataSet.
V	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
V	CloseCursor (see page 6921)	This is CloseCursor, a member of class TDataSet.
	ConnectionPoint (see page 1163)	This is ConnectionPoint, a member of class TCustomADODataSet.
V	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
V	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
V	DataConvert (see page 6924)	This is DataConvert, a member of class TDataSet.
V	DataEvent (see page 1164)	This is DataEvent, a member of class TCustomADODataSet.
V	DataEvent (see page 6924)	This is DataEvent, a member of class TDataSet.
	DeactivateFilters (see page 1164)	This is DeactivateFilters, a member of class TCustomADODataSet.
V	DefChanged (see page 1165)	This is DefChanged, a member of class TCustomADODataSet.
V	DefChanged (see page 6924)	This is DefChanged, a member of class TDataSet.
V	DefineProperties (see page 1165)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
V	DestroyLookupCursor (see page 1166)	This is DestroyLookupCursor, a member of class TCustomADODataSet.
V	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.
V	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
V	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
V	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.
V	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
V	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
V	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.
V	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.

	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
	DoBeforeInsert (see page 6930)	This is DoBeforeInsert, a member of class TDataSet.
	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.
	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
	DoOnNewRecord (see page 1166)	This is DoOnNewRecord, a member of class TCustomADODataSet.
	DoOnNewRecord (see page 6931)	This is DoOnNewRecord, a member of class TDataSet.
	EnableEvents (see page 1166)	This is EnableEvents, a member of class TCustomADODataSet.
	EndOfRecordset (see page 1167)	This is EndOfRecordset, a member of class TCustomADODataSet.
	FetchComplete (see page 1167)	This is FetchComplete, a member of class TCustomADODataSet.
	FetchProgress (see page 1167)	This is FetchProgress, a member of class TCustomADODataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.
	FieldChangeComplete (see page 1167)	This is FieldChangeComplete, a member of class TCustomADODataSet.
	FindRecord (see page 1168)	This is FindRecord, a member of class TCustomADODataSet.
	FindRecord (see page 6942)	This is FindRecord, a member of class TDataSet.
	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
	FreeRecordBuffer (see page 1168)	This is FreeRecordBuffer, a member of class TCustomADODataSet.
	FreeRecordBuffer (see page 6947)	This is FreeRecordBuffer, a member of class TDataSet.
	GetActiveRecBuf (see page 1168)	This is GetActiveRecBuf, a member of class TCustomADODataSet.
	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.
	GetAggregateValue (see page 6947)	This is GetAggregateValue, a member of class TDataSet.
	GetBookmarkData (see page 1169)	This is GetBookmarkData, a member of class TCustomADODataSet.
	GetBookmarkData (see page 6949)	This is GetBookmarkData, a member of class TDataSet.
	GetBookmarkFlag (see page 1169)	This is GetBookmarkFlag, a member of class TCustomADODataSet.
	GetBookmarkFlag (see page 6949)	This is GetBookmarkFlag, a member of class TDataSet.
	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
	GetCanModify (see page 1169)	This is GetCanModify, a member of class TCustomADODataSet.
	GetCanModify (see page 6950)	This is GetCanModify, a member of class TDataSet.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.
	GetCommandText (see page 1170)	This is GetCommandText, a member of class TCustomADODataSet.
	GetDataSource (see page 1170)	This is GetDataSource, a member of class TCustomADODataSet.
	GetDataSource (see page 6951)	This is GetDataSource, a member of class TDataSet.
	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
	GetIsIndexField (see page 6954)	This is GetIsIndexField, a member of class TDataSet.
	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.

	GetRecNo (see page 1171)	This is GetRecNo, a member of class TCustomADODataSet.
	GetRecNo (see page 6956)	This is GetRecNo, a member of class TDataSet.
	GetRecord (see page 1172)	This is GetRecord, a member of class TCustomADODataSet.
	GetRecord (see page 6956)	This is GetRecord, a member of class TDataSet.
	GetRecordCount (see page 1172)	This is GetRecordCount, a member of class TCustomADODataSet.
	GetRecordCount (see page 6956)	This is GetRecordCount, a member of class TDataSet.
	GetRecordSize (see page 1172)	This is GetRecordSize, a member of class TCustomADODataSet.
	GetRecordSize (see page 6956)	This is GetRecordSize, a member of class TDataSet.
	GetStateFieldValue (see page 1172)	This is GetStateFieldValue, a member of class TCustomADODataSet.
	GetStateFieldValue (see page 6956)	This is GetStateFieldValue, a member of class TDataSet.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
	InitOleDBAccess (see page 1173)	This is InitOleDBAccess, a member of class TCustomADODataSet.
	InitRecord (see page 6959)	This is InitRecord, a member of class TDataSet.
	InternalAddRecord (see page 1173)	This is InternalAddRecord, a member of class TCustomADODataSet.
	InternalAddRecord (see page 6963)	This is InternalAddRecord, a member of class TDataSet.
	InternalCancel (see page 1173)	This is InternalCancel, a member of class TCustomADODataSet.
	InternalCancel (see page 6963)	This is InternalCancel, a member of class TDataSet.
	InternalClose (see page 1173)	This is InternalClose, a member of class TCustomADODataSet.
	InternalClose (see page 6963)	This is InternalClose, a member of class TDataSet.
	InternalDelete (see page 1173)	This is InternalDelete, a member of class TCustomADODataSet.
	InternalDelete (see page 6964)	This is InternalDelete, a member of class TDataSet.
	InternalEdit (see page 1174)	This is InternalEdit, a member of class TCustomADODataSet.
	InternalEdit (see page 6964)	This is InternalEdit, a member of class TDataSet.
	InternalFirst (see page 1174)	This is InternalFirst, a member of class TCustomADODataSet.
	InternalFirst (see page 6964)	This is InternalFirst, a member of class TDataSet.
	InternalGetRecord (see page 1174)	This is InternalGetRecord, a member of class TCustomADODataSet.
	InternalGotoBookmark (see page 1174)	This is InternalGotoBookmark, a member of class TCustomADODataSet.
	InternalGotoBookmark (see page 6964)	This is InternalGotoBookmark, a member of class TDataSet.
	InternalHandleException (see page 1175)	This is InternalHandleException, a member of class TCustomADODataSet.
	InternalHandleException (see page 6964)	This is InternalHandleException, a member of class TDataSet.
	InternalInitFieldDefs (see page 1175)	This is InternalInitFieldDefs, a member of class TCustomADODataSet.
	InternalInitFieldDefs (see page 6965)	This is InternalInitFieldDefs, a member of class TDataSet.
	InternalInitRecord (see page 1175)	This is InternalInitRecord, a member of class TCustomADODataSet.
	InternalInitRecord (see page 6965)	This is InternalInitRecord, a member of class TDataSet.
	InternalInsert (see page 1175)	This is InternalInsert, a member of class TCustomADODataSet.
	InternalInsert (see page 6965)	This is InternalInsert, a member of class TDataSet.
	InternalLast (see page 1175)	This is InternalLast, a member of class TCustomADODataSet.
	InternalLast (see page 6965)	This is InternalLast, a member of class TDataSet.
	InternalOpen (see page 1176)	This is InternalOpen, a member of class TCustomADODataSet.
	InternalOpen (see page 6966)	This is InternalOpen, a member of class TDataSet.
	InternalPost (see page 1176)	This is InternalPost, a member of class TCustomADODataSet.
	InternalPost (see page 6966)	This is InternalPost, a member of class TDataSet.
	InternalRefresh (see page 1176)	This is InternalRefresh, a member of class TCustomADODataSet.
	InternalRefresh (see page 6966)	This is InternalRefresh, a member of class TDataSet.
	InternalRequery (see page 1176)	This is InternalRequery, a member of class TCustomADODataSet.
	InternalSetSort (see page 1177)	This is InternalSetSort, a member of class TCustomADODataSet.
	InternalSetToRecord (see page 1177)	This is InternalSetToRecord, a member of class TCustomADODataSet.
	InternalSetToRecord (see page 6966)	This is InternalSetToRecord, a member of class TDataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsCursorOpen (see page 1177)	This is IsCursorOpen, a member of class TCustomADODataSet.

	IsCursorOpen (see page 6966)	This is IsCursorOpen, a member of class TDataSet.
	Loaded (see page 1177)	Initializes the component after the form file has been read into memory.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 6969)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 1179)	This is LocateRecord, a member of class TCustomADODataSet.
	MasterChanged (see page 1180)	This is MasterChanged, a member of class TCustomADODataSet.
	MasterDisabled (see page 1180)	This is MasterDisabled, a member of class TCustomADODataSet.
	MoveComplete (see page 1180)	This is MoveComplete, a member of class TCustomADODataSet.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	OpenCursor (see page 1181)	This is OpenCursor, a member of class TCustomADODataSet.
	OpenCursor (see page 6976)	This is OpenCursor, a member of class TDataSet.
	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PrepareCursor (see page 1181)	This is PrepareCursor, a member of class TCustomADODataSet.
	PSEndTransaction (see page 1181)	Ends a transaction that was started by a call to PSStartTransaction.
	PSEndTransaction (see page 6979)	Ends a transaction that was started by a call to PSStartTransaction.
	PSExecute (see page 1182)	Executes the SQL command associated with the dataset.
	PSExecute (see page 6980)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 1182)	Executes a specified SQL command.
	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
	PSGetAttributes (see page 1183)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 6981)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 1183)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 6982)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 7537)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandTextW (see page 6982)	This is PSGetCommandTextW, a member of class TDataSet.
	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
	PSGetCommandType (see page 1184)	Gets the command type to be executed by PSExecute.
	PSGetCommandType (see page 6982)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 1184)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 6983)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 1185)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 6983)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 6984)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFieldsW (see page 1185)	This is PSGetKeyFieldsW, a member of class TCustomADODataSet.
	PSGetKeyFieldsW (see page 6984)	This is PSGetKeyFieldsW, a member of class TDataSet.
	PSGetKeyFieldsW (see page 7538)	This is PSGetKeyFieldsW, a member of class TWideDataSet.
	PSGetParams (see page 1185)	Returns the current parameter values of the dataset.
	PSGetParams (see page 6984)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 6985)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteCharW (see page 1186)	This is PSGetQuoteCharW, a member of class TCustomADODataSet.
	PSGetQuoteCharW (see page 6985)	This is PSGetQuoteCharW, a member of class TDataSet.
	PSGetQuoteCharW (see page 7539)	This is PSGetQuoteCharW, a member of class TWideDataSet.
	PSGetTableName (see page 6985)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableNameW (see page 1186)	This is PSGetTableNameW, a member of class TCustomADODataSet.

	PSGetTableNameW (see page 6986)	This is PSGetTableNameW, a member of class TDataSet.
	PSGetTableNameW (see page 7539)	This is PSGetTableNameW, a member of class TWideDataSet.
	PSGetUpdateException (see page 1186)	Generates an EUpdateError object based on another exception object.
	PSGetUpdateException (see page 6986)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 1187)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 6987)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 1187)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 6987)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 1188)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 6987)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 1188)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 6988)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 1188)	Assigns a specified SQL command to be executed by PSExecute.
	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
	PSSetParams (see page 1189)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 6989)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 1189)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSStartTransaction (see page 6989)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 1190)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 6990)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RecordChangeComplete (see page 1190)	This is RecordChangeComplete, a member of class TCustomADODataSet.
	RecordsetChangeComplete (see page 1190)	This is RecordsetChangeComplete, a member of class TCustomADODataSet.
	RefreshInternalCalcFields (see page 6993)	This is RefreshInternalCalcFields, a member of class TDataSet.
	RefreshParams (see page 1191)	This is RefreshParams, a member of class TCustomADODataSet.
	ReleaseLock (see page 1191)	This is ReleaseLock, a member of class TCustomADODataSet.
	ResetAggField (see page 6993)	This is ResetAggField, a member of class TDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBlockReadSize (see page 1194)	This is SetBlockReadSize, a member of class TCustomADODataSet.
	SetBlockReadSize (see page 6994)	This is SetBlockReadSize, a member of class TDataSet.
	SetBookmarkData (see page 1194)	This is SetBookmarkData, a member of class TCustomADODataSet.
	SetBookmarkData (see page 6994)	This is SetBookmarkData, a member of class TDataSet.
	SetBookmarkFlag (see page 1194)	This is SetBookmarkFlag, a member of class TCustomADODataSet.
	SetBookmarkFlag (see page 6995)	This is SetBookmarkFlag, a member of class TDataSet.
	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
	SetBufListSize (see page 6995)	This is SetBufListSize, a member of class TDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.
	SetCommandText (see page 1194)	This is SetCommandText, a member of class TCustomADODataSet.
	SetConnection (see page 1194)	This is SetConnection, a member of class TCustomADODataSet.
	SetConnectionFlag (see page 1195)	This is SetConnectionFlag, a member of class TCustomADODataSet.
	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
	SetDataSetField (see page 6996)	This is SetDataSetField, a member of class TDataSet.
	SetDataSource (see page 1195)	This is SetDataSource, a member of class TCustomADODataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDetailFilter (see page 1195)	This is SetDetailFilter, a member of class TCustomADODataSet.
	SetFieldData (see page 1195)	This is the overview for the SetFieldData method overload.

V	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.
V	SetFiltered (see page 1196)	This is SetFiltered, a member of class TCustomADODataSet.
V	SetFiltered (see page 6997)	This is SetFiltered, a member of class TDataSet.
V	SetFilterOptions (see page 1196)	This is SetFilterOptions, a member of class TCustomADODataSet.
V	SetFilterOptions (see page 6998)	This is SetFilterOptions, a member of class TDataSet.
V	SetFilterText (see page 1196)	This is SetFilterText, a member of class TCustomADODataSet.
V	SetFilterText (see page 6998)	This is SetFilterText, a member of class TDataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 6999)	Sets the value of the Name property.
	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
V	SetOnFilterRecord (see page 6999)	This is SetOnFilterRecord, a member of class TDataSet.
	SetParamsFromCursor (see page 1197)	This is SetParamsFromCursor, a member of class TCustomADODataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetRecNo (see page 1197)	This is SetRecNo, a member of class TCustomADODataSet.
V	SetRecNo (see page 6999)	This is SetRecNo, a member of class TDataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
V	SetStateFieldValue (see page 7000)	This is SetStateFieldValue, a member of class TDataSet.
	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.
	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateIndexDefs (see page 1198)	This is UpdateIndexDefs, a member of class TCustomADODataSet.
V	UpdateIndexDefs (see page 7002)	This is UpdateIndexDefs, a member of class TDataSet.
	UpdateRecordSetPosition (see page 1198)	This is UpdateRecordSetPosition, a member of class TCustomADODataSet.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WillChangeField (see page 1199)	This is WillChangeField, a member of class TCustomADODataSet.
	WillChangeRecord (see page 1199)	This is WillChangeRecord, a member of class TCustomADODataSet.
	WillChangeRecordset (see page 1200)	This is WillChangeRecordset, a member of class TCustomADODataSet.
	WillMove (see page 1200)	This is WillMove, a member of class TCustomADODataSet.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.
R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.
R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.
R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.

R	Command (see page 1204)	Provides access to the internal command object that executes commands for the dataset.
	CommandText (see page 1204)	This is CommandText, a member of class TCustomADODataSet.
	CommandType (see page 1205)	Specifies the type of command to execute.
	Constraints (see page 7013)	Specifies record-level constraints that must be met when editing the data.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
	DataSource (see page 1208)	Represents the data source of another dataset that supplies values to the dataset.
	FieldDefs (see page 1210)	Points to the list of field definitions for the dataset.
	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
R	MasterDataLink (see page 1218)	Manages the relationship between the ADO dataset and a master table.
	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.
	ParamCheck (see page 1220)	Specifies whether the parameter list for an ADO dataset component is regenerated if the SQL changes at runtime.
	Parameters (see page 1220)	Contains the collection of parameters for an SQL statement.
	Prepared (see page 1221)	Specifies whether the command is prepared before execution.
	Reserved (see page 7035)	For internal use only.
	StoreDefs (see page 1223)	Specifies whether field definitions are stored with the ADO dataset.

Public Events

	Name	Description
	AfterCancel (see page 7038)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 7040)	Occurs after an application closes a dataset.
	AfterDelete (see page 7041)	Occurs after an application deletes a record.
	AfterEdit (see page 7044)	Occurs after an application starts editing a record.
	AfterInsert (see page 7044)	Occurs after an application inserts a new record.
	AfterOpen (see page 7045)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 7046)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 7047)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 7047)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 7048)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 7048)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 7049)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 7049)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 7050)	Occurs before an application enters insert mode.
	BeforeOpen (see page 7051)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 7052)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 7052)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 7053)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 7053)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 7054)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 7054)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 7055)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 7056)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 7056)	Occurs when an application attempts to modify or insert a record and an exception is raised.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BookmarkValid (see page 1160)	Tests the validity of a specified bookmark.
V	BookmarkValid (see page 6916)	Indicates the validity of a specified bookmark.
V	Cancel (see page 6916)	Cancels modifications to the active record if those changes are not yet posted.
	CancelBatch (see page 1161)	Cancels a pending batch update.
	CancelUpdates (see page 1162)	Cancels pending cached updates.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
	Clone (see page 1163)	Duplicates another dataset in the calling component
	Close (see page 6920)	Closes a dataset.
V	CompareBookmarks (see page 1163)	Compares two bookmarks.
V	CompareBookmarks (see page 6921)	Implements a virtual function to compare two bookmarks.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.
V	Create (see page 1139)	Creates an instance of a TADOTable (see page 1125) component.
V	CreateBlobStream (see page 1164)	Creates a blob stream for a Binary large object (BLOB) field in the dataset.
V	CreateBlobStream (see page 6922)	Provides the interface for a method that creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
	DeleteRecords (see page 1165)	Deletes one or more records in the dataset.
V	Destroy (see page 1157)	Destroys the TCustomADONETConnector instance.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 6904)	Destroys the TDataSet (see page 6894) instance.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.

	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.
	FilterOnBookmarks (see page 1168)	Filters a data set to just rows with pre-defined bookmarks.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.
	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
V	GetBlobFieldData (see page 1169)	Retrieves the current value of a field into a buffer.
V	GetBlobFieldData (see page 6947)	Reads BLOB data into a buffer.
V	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
V	GetCurrentRecord (see page 6950)	Implements a virtual function to retrieve the current record in a buffer.
V	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
V	GetDetailLinkFields (see page 1170)	Lists the field components that link this dataset as a detail of a master dataset.
V	GetDetailLinkFields (see page 6951)	Introduces a method to list the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
V	GetFieldData (see page 1171)	This is the overview for the GetFieldData method overload.
V	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
V	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetIndexNames (see page 1140)	Retrieves a list of available indexes for a table.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.

	IsSequenced (see page 1177)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	IsSequenced (see page 6967)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	Last (see page 6968)	Moves to the last record in the dataset.
	LoadFromFile (see page 1178)	Loads a recordset from a file.
	Locate (see page 1179)	Searches the dataset for a specified record and makes that record the current record.
	Locate (see page 6970)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
	Lookup (see page 1180)	Retrieves field values from a row that matches specified search values.
	Lookup (see page 6970)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 6973)	Moves to the next record in the dataset.
	NextRecordset (see page 1181)	Provides access to a secondary recordset.
	Open (see page 6976)	Opens the dataset.
	Post (see page 6977)	Implements a virtual method to write a modified record to the database or change log.
	Prior (see page 6979)	Moves to the previous record in the dataset.
	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7579)	Executes a specified SQL command.
	PSExecuteStatement (see page 7590)	Executes a specified SQL command.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 7579)	Gets the SQL command to be executed by PSExecute (see page 7578).
	PSGetCommandText (see page 7591)	Gets the SQL command to be executed by PSExecute (see page 7590).
	PSGetCommandType (see page 7580)	Gets the command type to be executed by PSExecute (see page 7578).
	PSGetCommandType (see page 7591)	Gets the command type to be executed by PSExecute (see page 7590).
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7581)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 7592)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.
	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.

	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7585)	Assigns a specified SQL command to be executed by PSExecute (see page 7578).
	PSSetCommandText (see page 7596)	Assigns a specified SQL command to be executed by PSExecute (see page 7590).
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).
	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Requery (see page 1191)	Refreshes the recordset.
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 1192)	Saves a recordset to a file.
	Seek (see page 1192)	Searches for a record using the current index.
	SetFields (see page 6997)	Sets the values for all fields in a record
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	Supports (see page 1197)	Indicates whether a dataset supports certain types of operations.
V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateBatch (see page 1197)	Writes pending batch updates to disk.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.
	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 1199)	Indicates the update status of the current record.
V	UpdateStatus (see page 7002)	Reports the update status for the active record.

Public Properties

	Name	Description
	Active (see page 7004)	Specifies whether or not a dataset is open.
R	AggFields (see page 7006)	Contains any aggregate fields.
	AutoCalcFields (see page 7006)	Determines when the OnCalcFields (see page 7053) event is triggered and when lookup field values are calculated.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.

	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DataSetField (see page 7013)	Indicates the persistent TDataSetField (see page 7060) object that owns a nested dataset.
R	DataSource (see page 7014)	Represents the data source of another dataset that supplies values to the dataset.
R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.
	DesignerData (see page 1208)	Stores custom data.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.
R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
	FieldDefs (see page 7019)	Points to the list of field definitions for the dataset.
R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset
	Filter (see page 7026)	Specifies the text of the current filter for a dataset.
	Filtered (see page 7027)	Specifies whether or not filtering is active for a dataset.
	FilterGroup (see page 1214)	Filters a recordset based on row update status.
	FilterOptions (see page 7027)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
	IndexDefs (see page 1141)	Contains the definitions of the indexes for the current table.
R	IndexFieldCount (see page 1216)	Indicates the number of fields that comprise the current key.
	IndexFields (see page 1217)	Retrieves or sets a field for an index.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
R	Modified (see page 7029)	Indicates whether the active record is modified.
	ObjectView (see page 7031)	Specifies whether fields are stored hierarchically or flattened out in the Fields (see page 7023) property.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Properties (see page 1221)	This is Properties, a member of class TCustomADODataSet.
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 7032)	Indicates the total number of records associated with the dataset.
	Recordset (see page 1221)	This is Recordset, a member of class TCustomADODataSet.
R	RecordsetState (see page 1222)	This is RecordsetState, a member of class TCustomADODataSet.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.
R	RecordStatus (see page 1222)	Indicates the status of the current row.
	Sort (see page 1222)	Specifies the sort order of the recordset.
	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterCancel (see page 1224)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 1226)	Occurs after an application closes a dataset.
	AfterDelete (see page 1227)	Occurs after an application deletes a record.
	AfterEdit (see page 1230)	Occurs after an application starts editing a record.
	AfterInsert (see page 1231)	Occurs after an application inserts a new record.
	AfterOpen (see page 1231)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 1233)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 1233)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 1233)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 1234)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 1234)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 1235)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 1235)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 1236)	Occurs before an application enters insert mode.
	BeforeOpen (see page 1237)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 1238)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 1239)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 1239)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 1239)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 1240)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 1241)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnEndOfRecordset (see page 1241)	Occurs when moving a recordset's row pointer past the last row.
	OnFetchComplete (see page 1242)	Occurs after records have been retrieved into the recordset.
	OnFetchProgress (see page 1242)	Occurs periodically during an asynchronous data retrieval operation.
	OnFieldChangeComplete (see page 1243)	Occurs after a field has changed.
	OnFilterRecord (see page 1244)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnMoveComplete (see page 1244)	Occurs after the row pointer in a recordset has moved.
	OnNewRecord (see page 1245)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 1245)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnRecordChangeComplete (see page 1246)	Occurs after one or more records in the recordset change.
	OnRecordsetChangeComplete (see page 1247)	Occurs after the recordset has changed.
	OnRecordsetCreate (see page 1247)	Occurs when the recordset has been initialized and is ready to use.
	OnWillChangeField (see page 1248)	Occurs before a field is changed.
	OnWillChangeRecord (see page 1248)	Occurs before a record in the recordset is changed.
	OnWillChangeRecordset (see page 1249)	Occurs before the recordset has changed.
	OnWillMove (see page 1250)	Occurs before the row pointer in a recordset is moved.

Published Properties

	Name	Description
	Active (see page 1201)	Specifies whether or not a dataset is open.
	AutoCalcFields (see page 1203)	Determines when the OnCalcFields event is triggered and when lookup field values are calculated.
	CacheSize (see page 1203)	Specifies the size of the cache for the dataset.
	CommandTimeout (see page 1140)	Specifies amount of time to attempt execution of a command.
	Connection (see page 1205)	Specifies the ADO connection component to use.
	ConnectionString (see page 1206)	Specifies the connection information for the data store.

	CursorLocation (see page 1207)	Specifies whether the cursor for the connection is client-side or server-side.
	CursorType (see page 1208)	Specifies type of cursor an ADO dataset uses.
	EnableBCD (see page 1141)	Specifies whether to treat numeric fields as floating-point or BCD.
	ExecuteOptions (see page 1209)	Specifies the characteristics of a command execution.
	Filter (see page 1212)	Specifies the text of the current filter for a recordset.
	Filtered (see page 1214)	Specifies whether or not filtering is active for a dataset.
	IndexFieldNames (see page 1142)	Lists the columns to use for a persistent sort of the recordset.
	IndexName (see page 1143)	Specifies the currently active index.
	LockType (see page 1218)	Specifies the lock type to use when opening a dataset.
	MarshalOptions (see page 1218)	Specifies which records are marshaled back to the server.
	MasterFields (see page 1143)	Specifies field or fields on which a Master-Detail link is based.
	MasterSource (see page 1144)	Specifies the data source component used for a Master-Detail relationship.
	MaxRecords (see page 1219)	Specifies how many rows to return in a result set.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ReadOnly (see page 1144)	Specifies whether the data retrieved is read-only.
	TableDirect (see page 1145)	Specifies how the table is referenced.
	TableName (see page 1145)	Indicates the base table operated on.
	Tag (see page 2808)	Stores an integer value as part of a component.

8.1.8.2 TADOTable.Create Constructor

Creates an instance of a TADOTable (see page 1125) component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TADOTable(TComponent * AOwner);
```

Description

Call Create to instantiate an ADO table component at runtime. Table components placed in forms or data modules at design time are created automatically.

Create

Calls its inherited Create method.

Sets the CommandType (see page 1205) property to cmdTable.

See Also

TADOStoredProc (see page 1106)

TADOTable (see page 1125)

Destroy

8.1.8.3 TADOTable Methods

The methods of the TADOTable class are listed here.

Public Methods

	Name	Description
	GetIndexNames (see page 1140)	Retrieves a list of available indexes for a table.

8.1.8.3.1 TADOTable.GetIndexNames Method

Retrieves a list of available indexes for a table.

Pascal

```
procedure GetIndexNames(List: TStrings);
```

C++

```
__fastcall GetIndexNames(TStrings List);
```

Description

Call GetIndexNames to retrieve a list of all available indexes for a table. GetIndexNames fills a string list object (such as a TStringList) with the names of the index for the table represented by the TADOTable (see page 1125) component (and only that table). Any previous contents in the string list object are completely overwritten by the new information.

List is the string list object, created and maintained by the application, into which the index names are retrieved. This string list object must be created prior to the call to GetIndexNames.

The command line below fills the Items property of a TListBox with the names of indexes for the table represented by ADOTable1.

```
ADOTable1.GetIndexNames(ListBox1.Items);
ADOTable1->GetIndexNames(ListBox1->Items);
```

Obtaining Information About Indexes

8.1.8.4 TADOTable Properties

The properties of the TADOTable class are listed here.

Public Properties

	Name	Description
	IndexDefs (see page 1141)	Contains the definitions of the indexes for the current table.

Published Properties

	Name	Description
	CommandTimeout (see page 1140)	Specifies amount of time to attempt execution of a command.
	EnableBCD (see page 1141)	Specifies whether to treat numeric fields as floating-point or BCD.
	IndexFieldNames (see page 1142)	Lists the columns to use for a persistent sort of the recordset.
	IndexName (see page 1143)	Specifies the currently active index.
	MasterFields (see page 1143)	Specifies field or fields on which a Master-Detail link is based.
	MasterSource (see page 1144)	Specifies the data source component used for a Master-Detail relationship.
	ReadOnly (see page 1144)	Specifies whether the data retrieved is read-only.
	TableDirect (see page 1145)	Specifies how the table is referenced.
	TableName (see page 1145)	Indicates the base table operated on.

8.1.8.4.1 TADOTable.CommandTimeout Property

Specifies amount of time to attempt execution of a command.

Pascal

```
property CommandTimeout: Integer;
```

C++

```
__property int CommandTimeout;
```

Description

Use CommandTimeout to specify the amount of time that expires before an attempt to execute a command is considered unsuccessful. Measured in seconds, the default value for CommandTimeout is 30.

If a command is successfully executed prior to the expiration of the seconds specified, CommandTimeout has no effect.

See Also

commandtext (see page 1204)

CommandType (see page 1205)

8.1.8.4.2 TADOTable.EnableBCD Property

Specifies whether to treat numeric fields as floating-point or BCD.

Pascal

```
property EnableBCD: Boolean;
```

C++

```
__property Boolean EnableBCD;
```

Description

Use the EnableBCD property to specify how fields are mapped to field classes. If EnableBCD is true, (the default value) adDecimal and adNumeric fields are mapped to the TBCDField class when field objects are created. If EnableBCD is false, the fields are mapped to the TFloatField class.

EnableBCD determines whether numeric and decimal fields are translated as floating-point values or binary coded decimal (BCD) values. BCD values eliminate the rounding errors associated with floating point math (such as a 3 * (2/3) resulting in 2.00000000001).

If persistent field objects are used (such as those created using the Fields Editor), the field class associated with a given field can contradict the setting of EnableBCD. Three numeric fields in the same table could, for instance, each be represented by a TFloatField, a TBCDField, and a TVariantField – regardless of the value in EnableBCD. Select field classes on a field-by-field basis for greater flexibility.

Note: For numeric values with more than 4 digits to the right of the decimal place, use of TFloatField is generally better. This is because TBCDField uses the currency data type that has a fixed scale of 4 decimal places.

Note: For fields with very large numbers of more than 19 significant digits, you can use TVariantField type persistent field objects. The TFloatField and TBCDField classes lack sufficient capacity for fields of this size. TVariantField allows the getting and setting of the field data as strings, preventing without loss of data due to insufficient capacity. However, arithmetic operations cannot be performed on numbers accessed through a TVariantField object.

See Also

TBCDField (see page 6776)

TFloatField (see page 7229)

8.1.8.4.3 TADOTable.IndexDefs Property

Contains the definitions of the indexes for the current table.

Pascal

```
property IndexDefs: TIndexDefs;
```

C++

```
__property TIndexDefs IndexDefs;
```

Description

IndexDefs contains definitions for each index the current table has. IndexDefs is a collection of TIndexDef objects. Each TIndexDef object contains the definition for one index.

Inspect IndexDefs at runtime to get information on a given index. Use an index with IndexDefs to address a specific TIndexDef object. Use properties of TIndexDef to evaluate various index attributes. The example below retrieves the fields list for the third index of the table accessed through the component ADOTable1.

```
ADOTable1.IndexDefs.Update;
StrVar := ADOTable1.IndexDefs[2].Fields;
ADOTable1->IndexDefs->Update();
StrVar = ADOTable1->IndexDefs[2] ->Fields;
```

Call the Update method (TIndexDefs) prior to inspecting the property to ensure it contains the most current index information for the table.

See Also

TIndexDef (see page 7283)

TIndexDefs (see page 7292)

Update (see page 7299)

8.1.8.4.4 TADOTable.IndexFieldNames Property

Lists the columns to use for a persistent sort of the recordset.

Pascal

```
property IndexFieldNames: string;
```

C++

```
__property AnsiString IndexFieldNames;
```

Description

Use IndexFieldNames as an alternative method of specifying the sort order of a recordset. IndexFieldNames is a direct implementation of the Sort property of the ADO recordset object, with the field list from IndexFieldNames being used for the Sort property. The actual sorting of data occurs on the OLE DB side and use of indexes for the sort depend on the particular provider.

To use IndexFieldNames to establish a recordset's sort order, the recordset must have been opened using a client-side cursor (the dataset component's CursorLocation property must be clUseClient). An exception is raised on attempts to use IndexFieldNames with server-side cursors.

IndexFieldNames may be used to set the sort order for the detail table in a master-detail link, increasing the performance of the link. However, use of IndexFieldNames is not required for master-detail links.

See Also

IndexName (see page 1217)

Creating an Index with IndexFieldNames

8.1.8.4.5 TADOTable.IndexName Property

Specifies the currently active index.

Pascal

```
property IndexName: WideString;
```

C++

```
__property BSTR IndexName;
```

Description

Use IndexName to activate an index and cause it to actively order the dataset's rows. At runtime, set IndexName to a string containing the name of the index. At design-time, select the desired index from the drop-down list in the Object Inspector.

```
ADOTable1.IndexName := 'LastName';
ADOTable1->IndexName = "LastName";
```

Set IndexName to an empty string to have no index actively ordering the dataset. The rows then appear in natural order. In some database systems, the primary index of a table does not have a name. In these cases, setting IndexName to an empty string activates the primary index.

An index must be active for certain index dependent operations to be used, such as the Seek method.

Note: Many providers do not support changing indexes while the dataset is active, raising an exception when an attempt is made to do this. Ensure that the dataset is closed before changing the index through the IndexName property and reopen the dataset after specifying a new index.

See Also

Seek (see page 1192)

IndexDefs (see page 1215)

IndexFieldNames (see page 1216)

IndexFieldCount (see page 1216)

8.1.8.4.6 TADOTable.MasterFields Property

Specifies field or fields on which a Master-Detail link is based.

Pascal

```
property MasterFields: WideString;
```

C++

```
__property BSTR MasterFields;
```

Description

Use MasterFields after setting the MasterSource or DataSource property to specify the names of one or more fields in another, master, dataset that are used to establish a Master-Detail relationship between this dataset and the master dataset. The master dataset is specified by assigning its data source to the MasterSource or DataSource property.

MasterFields is a string containing one or more field names in the master dataset. When the datasets are related based on two fields, separate field names with semicolons:

```
ADOTable2.MasterSource := DataSource1;
ADOTable2.MasterFields := 'CustID;SaleDate'
ADOTable2->MasterSource = DataSource1;
ADOTable2->MasterFields = "CustID;SaleDate"
```

Each time the current record in the master dataset changes, the new values in those fields are used to select corresponding records in this table for display.

Note: At design time, use the Field Link designer to establish the master-detail relationship between two tables.

See Also

MasterSource (see page 1144)

DataSource (see page 7014)

Making the Table a Detail of Another Dataset

8.1.8.4.7 TADOTable.MasterSource Property

Specifies the data source component used for a Master-Detail relationship.

Pascal

```
property MasterSource: TDataSource;
```

C++

```
__property TDataSource MasterSource;
```

Description

Use MasterSource to specify the name of the data source component whose DataSet property identifies a dataset to use as a Master table in establishing a Master-Detail relationship between this table and another one.

After setting the MasterSource property, specify which fields to use in the master table by setting the MasterFields (see page 1143) property. At runtime each time the current record in the master table changes, the new values in those fields are used to select corresponding records in this table for display.

```
ADOTable2.MasterSource := DataSource1;
ADOTable2.MasterFields := 'CustID';
ADOTable2->MasterSource = DataSource1;
ADOTable2->MasterFields = "CustID";
```

Note: At design time choose an available data source from the MasterSource property's drop-down list in the Object Inspector.

See Also

TDataSource (see page 7070)

MasterFields

Making the Table a Detail of Another Dataset

8.1.8.4.8 TADOTable.ReadOnly Property

Specifies whether the data retrieved is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use the ReadOnly property to prevent users from updating, inserting, or deleting data through the TADOTable (see page 1125). By default, ReadOnly is False, meaning users can alter a table's data.

See Also

CanModify

8.1.8.4.9 TADOTable.TableDirect Property

Specifies how the table is referenced.

Pascal

```
property TableDirect: Boolean;
```

C++

```
__property Boolean TableDirect;
```

Description

Set TableDirect to specify whether the table is accessed simply via its name or whether a background SQL statement is used. Not all providers support accessing a table by its name and require that this access be done with a SELECT statement. If TableDirect is true the data retrieval request uses a background SQL statement and all columns are simply returned. If it is false, the TADOTable (see page 1125) component creates a SELECT statement to retrieve the table's data. The default value of TableDirect is false.

8.1.8.4.10 TADOTable.TableName Property

Indicates the base table operated on.

Pascal

```
property TableName: WideString;
```

C++

```
__property BSTR TableName;
```

Description

Use TableName to specify the base table in a database on which the ADO table component operates. Data is retrieved from and changes written to this base table.

Before setting or changing the value of TableName, you should deactivate the ADO table component by calling its Close method or setting its Active (see page 1201) property to false.

At design-time, if a valid connection to a database can be established, the Object Inspector provides a drop-down list of names of available tables.

8.1.9 TCustomADODataSet Class

TCustomADODataSet is the virtualized base class for all ADO dataset components.

Class Hierarchy

Pascal

```
TCustomADODataSet = class(TWideDataSet, IUnknown, RecordsetEventsVt);
```

C++

```
class TCustomADODataSet : public TWideDataSet, public IUnknown, public RecordsetEventsVt;
```

File

ADODB

Description

TCustomADODataSet encapsulates a set of properties, events, and methods for working with data accessed through an ADO (ActiveX Data Objects) provider. TCustomADODataSet is the base class from which all ADO dataset components descend. Applications should never instantiate TCustomADODataSet objects. Instead, instantiate an object from one of the descendant classes: TADODataSet (see page 1041), TADOTable (see page 1125), TADOQuery (see page 1084), or TADOStoredProc (see page 1106).

TCustomADODataSet cannot be instantiated. Developers must use or derive descendants of TCustomADODataSet that declare and implement methods with no implementation in TCustomADODataSet. Many of the other TCustomADODataSet methods are declared and implemented in TCustomADODataSet as virtual methods, but the implementations are merely stubs that are reimplemented in descendants such as TADODataSet (see page 1041), TADOQuery (see page 1084), TADOStoredProc (see page 1106), and TADOTable (see page 1125).

See Also

TDataSet (see page 6894)

TADODataSet (see page 1041)

TADOTable (see page 1125)

TADOQuery (see page 1084)

TADOStoredProc (see page 1106)

8.1.9.1 TCustomADODataSet Members

The following tables list the members exposed by TCustomADODataSet.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.
	ActivateTextFilter (see page 1160)	This is ActivateTextFilter, a member of class TCustomADODataSet.
V	AllocRecordBuffer (see page 1160)	This is AllocRecordBuffer, a member of class TCustomADODataSet.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
V	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
V	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CheckActive (see page 1162)	This is CheckActive, a member of class TCustomADODataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
V	CheckFieldCompatibility (see page 1162)	This is CheckFieldCompatibility, a member of class TCustomADODataSet.
V	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
V	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.
V	ClearCalcFields (see page 1162)	This is ClearCalcFields, a member of class TCustomADODataSet.
V	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
V	CloseCursor (see page 6921)	This is CloseCursor, a member of class TDataSet.
	ConnectionPoint (see page 1163)	This is ConnectionPoint, a member of class TCustomADODataSet.
V	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
V	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
V	DataConvert (see page 6924)	This is DataConvert, a member of class TDataSet.
V	DataEvent (see page 1164)	This is DataEvent, a member of class TCustomADODataSet.
	DeactivateFilters (see page 1164)	This is DeactivateFilters, a member of class TCustomADODataSet.
V	DefChanged (see page 1165)	This is DefChanged, a member of class TCustomADODataSet.
V	DefineProperties (see page 1165)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
V	DestroyLookupCursor (see page 1166)	This is DestroyLookupCursor, a member of class TCustomADODataSet.
V	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.
V	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
V	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
V	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.
V	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
V	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
V	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.
V	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.
V	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
V	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
V	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
V	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
V	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
V	DoBeforeInsert (see page 6930)	This is DoBeforeInsert, a member of class TDataSet.
V	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
V	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
V	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
V	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.
V	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
V	DoOnNewRecord (see page 1166)	This is DoOnNewRecord, a member of class TCustomADODataSet.
	EnableEvents (see page 1166)	This is EnableEvents, a member of class TCustomADODataSet.

	EndOfRecordset (see page 1167)	This is EndOfRecordset, a member of class TCustomADODataSet.
	FetchComplete (see page 1167)	This is FetchComplete, a member of class TCustomADODataSet.
	FetchProgress (see page 1167)	This is FetchProgress, a member of class TCustomADODataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.
	FieldChangeComplete (see page 1167)	This is FieldChangeComplete, a member of class TCustomADODataSet.
V	FindRecord (see page 1168)	This is FindRecord, a member of class TCustomADODataSet.
V	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
V	FreeRecordBuffer (see page 1168)	This is FreeRecordBuffer, a member of class TCustomADODataSet.
	GetActiveRecBuf (see page 1168)	This is GetActiveRecBuf, a member of class TCustomADODataSet.
V	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.
V	GetAggregateValue (see page 6947)	This is GetAggregateValue, a member of class TDataSet.
V	GetBookmarkData (see page 1169)	This is GetBookmarkData, a member of class TCustomADODataSet.
V	GetBookmarkFlag (see page 1169)	This is GetBookmarkFlag, a member of class TCustomADODataSet.
V	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
V	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
V	GetCanModify (see page 1169)	This is GetCanModify, a member of class TCustomADODataSet.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.
	GetCommandText (see page 1170)	This is GetCommandText, a member of class TCustomADODataSet.
V	GetDataSource (see page 1170)	This is GetDataSource, a member of class TCustomADODataSet.
V	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
V	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
V	GetIsIndexField (see page 6954)	This is GetIsIndexField, a member of class TDataSet.
V	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
V	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
V	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.
V	GetRecNo (see page 1171)	This is GetRecNo, a member of class TCustomADODataSet.
V	GetRecord (see page 1172)	This is GetRecord, a member of class TCustomADODataSet.
V	GetRecordCount (see page 1172)	This is GetRecordCount, a member of class TCustomADODataSet.
V	GetRecordSize (see page 1172)	This is GetRecordSize, a member of class TCustomADODataSet.
V	GetStateFieldValue (see page 1172)	This is GetStateFieldValue, a member of class TCustomADODataSet.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
	InitOleDBAccess (see page 1173)	This is InitOleDBAccess, a member of class TCustomADODataSet.
V	InitRecord (see page 6959)	This is InitRecord, a member of class TDataSet.
V	InternalAddRecord (see page 1173)	This is InternalAddRecord, a member of class TCustomADODataSet.
V	InternalCancel (see page 1173)	This is InternalCancel, a member of class TCustomADODataSet.
V	InternalClose (see page 1173)	This is InternalClose, a member of class TCustomADODataSet.
V	InternalDelete (see page 1173)	This is InternalDelete, a member of class TCustomADODataSet.
V	InternalEdit (see page 1174)	This is InternalEdit, a member of class TCustomADODataSet.
V	InternalFirst (see page 1174)	This is InternalFirst, a member of class TCustomADODataSet.
	InternalGetRecord (see page 1174)	This is InternalGetRecord, a member of class TCustomADODataSet.
V	InternalGotoBookmark (see page 1174)	This is InternalGotoBookmark, a member of class TCustomADODataSet.

	InternalHandleException (see page 1175)	This is InternalHandleException, a member of class TCustomADODataSet.
	InternalInitFieldDefs (see page 1175)	This is InternalInitFieldDefs, a member of class TCustomADODataSet.
	InternalInitRecord (see page 1175)	This is InternalInitRecord, a member of class TCustomADODataSet.
	InternalInsert (see page 1175)	This is InternalInsert, a member of class TCustomADODataSet.
	InternalLast (see page 1175)	This is InternalLast, a member of class TCustomADODataSet.
	InternalOpen (see page 1176)	This is InternalOpen, a member of class TCustomADODataSet.
	InternalPost (see page 1176)	This is InternalPost, a member of class TCustomADODataSet.
	InternalRefresh (see page 1176)	This is InternalRefresh, a member of class TCustomADODataSet.
	InternalRequery (see page 1176)	This is InternalRequery, a member of class TCustomADODataSet.
	InternalSetSort (see page 1177)	This is InternalSetSort, a member of class TCustomADODataSet.
	InternalSetToRecord (see page 1177)	This is InternalSetToRecord, a member of class TCustomADODataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsCursorOpen (see page 1177)	This is IsCursorOpen, a member of class TCustomADODataSet.
	Loaded (see page 1177)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 1179)	This is LocateRecord, a member of class TCustomADODataSet.
	MasterChanged (see page 1180)	This is MasterChanged, a member of class TCustomADODataSet.
	MasterDisabled (see page 1180)	This is MasterDisabled, a member of class TCustomADODataSet.
	MoveComplete (see page 1180)	This is MoveComplete, a member of class TCustomADODataSet.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	OpenCursor (see page 1181)	This is OpenCursor, a member of class TCustomADODataSet.
	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PrepareCursor (see page 1181)	This is PrepareCursor, a member of class TCustomADODataSet.
	PSEndTransaction (see page 1181)	Ends a transaction that was started by a call to PSStartTransaction.
	PSExecute (see page 1182)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 1182)	Executes a specified SQL command.
	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
	PSGetAttributes (see page 1183)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 1183)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandTextW (see page 6982)	This is PSGetCommandTextW, a member of class TDataSet.
	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
	PSGetCommandType (see page 1184)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 1184)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 1185)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 6984)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFieldsW (see page 1185)	This is PSGetKeyFieldsW, a member of class TCustomADODataSet.
	PSGetParams (see page 1185)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 6985)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteCharW (see page 1186)	This is PSGetQuoteCharW, a member of class TCustomADODataSet.
	PSGetTableName (see page 6985)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableNameW (see page 1186)	This is PSGetTableNameW, a member of class TCustomADODataSet.
	PSGetUpdateException (see page 1186)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 1187)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 1187)	Indicates whether the dataset includes native SQL support.

	PSIsSQLSupported (see page 1188)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 1188)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 1188)	Assigns a specified SQL command to be executed by PSExecute.
	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
	PSSetParams (see page 1189)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 1189)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 1190)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RecordChangeComplete (see page 1190)	This is RecordChangeComplete, a member of class TCustomADODataSet.
	RecordsetChangeComplete (see page 1190)	This is RecordsetChangeComplete, a member of class TCustomADODataSet.
	RefreshInternalCalcFields (see page 6993)	This is RefreshInternalCalcFields, a member of class TDataSet.
	RefreshParams (see page 1191)	This is RefreshParams, a member of class TCustomADODataSet.
	ReleaseLock (see page 1191)	This is ReleaseLock, a member of class TCustomADODataSet.
	ResetAggField (see page 6993)	This is ResetAggField, a member of class TDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBlockReadSize (see page 1194)	This is SetBlockReadSize, a member of class TCustomADODataSet.
	SetBookmarkData (see page 1194)	This is SetBookmarkData, a member of class TCustomADODataSet.
	SetBookmarkFlag (see page 1194)	This is SetBookmarkFlag, a member of class TCustomADODataSet.
	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
	SetBufListSize (see page 6995)	This is SetBufListSize, a member of class TDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.
	SetCommandText (see page 1194)	This is SetCommandText, a member of class TCustomADODataSet.
	SetConnection (see page 1194)	This is SetConnection, a member of class TCustomADODataSet.
	SetConnectionFlag (see page 1195)	This is SetConnectionFlag, a member of class TCustomADODataSet.
	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
	SetDataSetField (see page 6996)	This is SetDataSetField, a member of class TDataSet.
	SetDataSource (see page 1195)	This is SetDataSource, a member of class TCustomADODataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDetailFilter (see page 1195)	This is SetDetailFilter, a member of class TCustomADODataSet.
	SetFieldData (see page 1195)	This is the overview for the SetFieldData method overload.
	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.
	SetFiltered (see page 1196)	This is SetFiltered, a member of class TCustomADODataSet.
	SetFilterOptions (see page 1196)	This is SetFilterOptions, a member of class TCustomADODataSet.
	SetFilterText (see page 1196)	This is SetFilterText, a member of class TCustomADODataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 6999)	Sets the value of the Name property.
	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
	SetOnFilterRecord (see page 6999)	This is SetOnFilterRecord, a member of class TDataSet.
	SetParamsFromCursor (see page 1197)	This is SetParamsFromCursor, a member of class TCustomADODataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetRecNo (see page 1197)	This is SetRecNo, a member of class TCustomADODataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
	SetStateFieldValue (see page 7000)	This is SetStateFieldValue, a member of class TDataSet.
	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.

	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateIndexDefs (see page 1198)	This is UpdateIndexDefs, a member of class TCustomADODataSet.
	UpdateRecordSetPosition (see page 1198)	This is UpdateRecordSetPosition, a member of class TCustomADODataSet.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WillChangeField (see page 1199)	This is WillChangeField, a member of class TCustomADODataSet.
	WillChangeRecord (see page 1199)	This is WillChangeRecord, a member of class TCustomADODataSet.
	WillChangeRecordset (see page 1200)	This is WillChangeRecordset, a member of class TCustomADODataSet.
	WillMove (see page 1200)	This is WillMove, a member of class TCustomADODataSet.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.
R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.
R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.
R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.
R	Command (see page 1204)	Provides access to the internal command object that executes commands for the dataset.
	CommandText (see page 1204)	This is CommandText, a member of class TCustomADODataSet.
	CommandTimeout (see page 1204)	Specifies amount of time to attempt execution of a command.
	CommandType (see page 1205)	Specifies the type of command to execute.
	Constraints (see page 7013)	Specifies record-level constraints that must be met when editing the data.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
	DataSource (see page 1208)	Represents the data source of another dataset that supplies values to the dataset.
	FieldDefs (see page 1210)	Points to the list of field definitions for the dataset.
	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
	IndexDefs (see page 1215)	Contains the definitions of the indexes for the current table.
	IndexFieldNames (see page 1216)	Lists the columns to use for a persistent sort of the recordset.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
R	MasterDataLink (see page 1218)	Manages the relationship between the ADO dataset and a master table.
	MasterFields (see page 1219)	Specifies field or fields on which a Master-Detail link is based.
	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.
	ParamCheck (see page 1220)	Specifies whether the parameter list for an ADO dataset component is regenerated if the SQL changes at runtime.
	Parameters (see page 1220)	Contains the collection of parameters for an SQL statement.
	Prepared (see page 1221)	Specifies whether the command is prepared before execution.
	Reserved (see page 7035)	For internal use only.

	StoreDefs (see page 1223)	Specifies whether field definitions are stored with the ADO dataset.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BookmarkValid (see page 1160)	Tests the validity of a specified bookmark.
V	Cancel (see page 6916)	Cancels modifications to the active record if those changes are not yet posted.
	CancelBatch (see page 1161)	Cancels a pending batch update.
	CancelUpdates (see page 1162)	Cancels pending cached updates.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
	Clone (see page 1163)	Duplicates another dataset in the calling component
	Close (see page 6920)	Closes a dataset.
V	CompareBookmarks (see page 1163)	Compares two bookmarks.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.
V	Create (see page 1156)	Creates an instance of a TCustomADONETConnector component.
V	CreateBlobStream (see page 1164)	Creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
	DeleteRecords (see page 1165)	Deletes one or more records in the dataset.
V	Destroy (see page 1157)	Destroys the TCustomADONETConnector instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.
	FilterOnBookmarks (see page 1168)	Filters a data set to just rows with pre-defined bookmarks.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.

	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
V	GetBlobFieldData (see page 1169)	Retrieves the current value of a field into a buffer.
V	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
V	GetCurrentRecord (see page 6950)	Implements a virtual function to retrieve the current record in a buffer.
V	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
V	GetDetailLinkFields (see page 1170)	Lists the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
V	GetFieldData (see page 1171)	This is the overview for the GetFieldData method overload.
V	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
V	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.
V	IsSequenced (see page 1177)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	Last (see page 6968)	Moves to the last record in the dataset.
	LoadFromFile (see page 1178)	Loads a recordset from a file.
V	Locate (see page 1179)	Searches the dataset for a specified record and makes that record the current record.
V	Lookup (see page 1180)	Retrieves field values from a row that matches specified search values.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	Next (see page 6973)	Moves to the next record in the dataset.
	NextRecordset (see page 1181)	Provides access to a secondary recordset.
	Open (see page 6976)	Opens the dataset.
V	Post (see page 6977)	Implements a virtual method to write a modified record to the database or change log.
	Prior (see page 6979)	Moves to the previous record in the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Requery (see page 1191)	Refreshes the recordset.
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 1192)	Saves a recordset to a file.
	Seek (see page 1192)	Searches for a record using the current index.
	SetFields (see page 6997)	Sets the values for all fields in a record
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	Supports (see page 1197)	Indicates whether a dataset supports certain types of operations.
V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateBatch (see page 1197)	Writes pending batch updates to disk.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.
	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 1199)	Indicates the update status of the current record.

Public Properties

	Name	Description
R	AggFields (see page 7006)	Contains any aggregate fields.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.
	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DataSetField (see page 7013)	Indicates the persistent TDataSetField (see page 7060) object that owns a nested dataset.

R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.
	DesignerData (see page 1208)	Stores custom data.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EnableBCD (see page 1209)	Specifies whether to treat numeric fields as floating-point or BCD.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.
R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset
	FilterGroup (see page 1214)	Filters a recordset based on row update status.
	FilterOptions (see page 7027)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
R	IndexFieldCount (see page 1216)	Indicates the number of fields that comprise the current key.
	IndexFields (see page 1217)	Retrieves or sets a field for an index.
	IndexName (see page 1217)	Specifies the currently active index.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
R	Modified (see page 7029)	Indicates whether the active record is modified.
	ObjectView (see page 7031)	Specifies whether fields are stored hierarchically or flattened out in the Fields (see page 7023) property.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Properties (see page 1221)	This is Properties, a member of class TCustomADODataSet.
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 7032)	Indicates the total number of records associated with the dataset.
	Recordset (see page 1221)	This is Recordset, a member of class TCustomADODataSet.
R	RecordsetState (see page 1222)	This is RecordsetState, a member of class TCustomADODataSet.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.
R	RecordStatus (see page 1222)	Indicates the status of the current row.
	Sort (see page 1222)	Specifies the sort order of the recordset.
	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterCancel (see page 1224)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 1226)	Occurs after an application closes a dataset.
	AfterDelete (see page 1227)	Occurs after an application deletes a record.
	AfterEdit (see page 1230)	Occurs after an application starts editing a record.
	AfterInsert (see page 1231)	Occurs after an application inserts a new record.
	AfterOpen (see page 1231)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 1233)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 1233)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 1233)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 1234)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 1234)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 1235)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 1235)	Occurs before an application enters edit mode for the active record.

	BeforeInsert (see page 1236)	Occurs before an application enters insert mode.
	BeforeOpen (see page 1237)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 1238)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 1239)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 1239)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 1239)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 1240)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 1241)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnEndOfRecordset (see page 1241)	Occurs when moving a recordset's row pointer past the last row.
	OnFetchComplete (see page 1242)	Occurs after records have been retrieved into the recordset.
	OnFetchProgress (see page 1242)	Occurs periodically during an asynchronous data retrieval operation.
	OnFieldChangeComplete (see page 1243)	Occurs after a field has changed.
	OnFilterRecord (see page 1244)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnMoveComplete (see page 1244)	Occurs after the row pointer in a recordset has moved.
	OnNewRecord (see page 1245)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 1245)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnRecordChangeComplete (see page 1246)	Occurs after one or more records in the recordset change.
	OnRecordsetChangeComplete (see page 1247)	Occurs after the recordset has changed.
	OnRecordsetCreate (see page 1247)	Occurs when the recordset has been initialized and is ready to use.
	OnWillChangeField (see page 1248)	Occurs before a field is changed.
	OnWillChangeRecord (see page 1248)	Occurs before a record in the recordset is changed.
	OnWillChangeRecordset (see page 1249)	Occurs before the recordset has changed.
	OnWillMove (see page 1250)	Occurs before the row pointer in a recordset is moved.

Published Properties

	Name	Description
	Active (see page 1201)	Specifies whether or not a dataset is open.
	AutoCalcFields (see page 1203)	Determines when the OnCalcFields event is triggered and when lookup field values are calculated.
	CacheSize (see page 1203)	Specifies the size of the cache for the dataset.
	Connection (see page 1205)	Specifies the ADO connection component to use.
	ConnectionString (see page 1206)	Specifies the connection information for the data store.
	CursorLocation (see page 1207)	Specifies whether the cursor for the connection is client-side or server-side.
	CursorType (see page 1208)	Specifies type of cursor an ADO dataset uses.
	ExecuteOptions (see page 1209)	Specifies the characteristics of a command execution.
	Filter (see page 1212)	Specifies the text of the current filter for a recordset.
	Filtered (see page 1214)	Specifies whether or not filtering is active for a dataset.
	LockType (see page 1218)	Specifies the lock type to use when opening a dataset.
	MarshalOptions (see page 1218)	Specifies which records are marshaled back to the server.
	MaxRecords (see page 1219)	Specifies how many rows to return in a result set.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

8.1.9.2 TCustomADODataSet.Create Constructor

Creates an instance of a TCustomADONETConnector component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomADODataSet(TComponent * AOwner);
```

Description

Call Create to instantiate an ADO dataset component at runtime. TCustomADONETConnector contains abstract methods, and is not intended to be used in applications. Instead, applications instantiate dataset descendants such as TADODataSet (see page 1041), TADOTable (see page 1125), TADOQuery (see page 1084), or TADOStoredProc (see page 1106).

AOwner is the component that becomes the value of the Owner property. Typically, this is the form or data module that contains the dataset.

See Also

TADOStoredProc (see page 1106)

TADOTable (see page 1125)

Owner (see page 2807)

8.1.9.3 TCustomADODataSet.Destroy Destructor

Destroys the TCustomADONETConnector instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomADODataSet();
```

Description

Do not call Destroy directly in an application. Usually destruction of datasets is handled automatically by Delphi. If an application creates its own instances of a dataset, however, and does not assign an Owner that is responsible for freeing the dataset, then the application should call Free, which verifies that the dataset reference is not nil before calling Destroy.

Destroy performs the following tasks:

Closes the dataset.

Disconnects from the associated database.

Calls the inherited destructor.

FieldDefs (see page 7019)

ADONETDb.TCustomADONETConnector.Create

Free (see page 22300)

8.1.9.4 TCustomADODataSet Methods

The methods of the TCustomADODataSet class are listed here.

Protected Methods

	Name	Description
	ActivateTextFilter (see page 1160)	This is ActivateTextFilter, a member of class TCustomADODataSet.
V	AllocRecordBuffer (see page 1160)	This is AllocRecordBuffer, a member of class TCustomADODataSet.
V	CheckActive (see page 1162)	This is CheckActive, a member of class TCustomADODataSet.
V	CheckFieldCompatibility (see page 1162)	This is CheckFieldCompatibility, a member of class TCustomADODataSet.
V	ClearCalcFields (see page 1162)	This is ClearCalcFields, a member of class TCustomADODataSet.
	ConnectionPoint (see page 1163)	This is ConnectionPoint, a member of class TCustomADODataSet.
V	DataEvent (see page 1164)	This is DataEvent, a member of class TCustomADODataSet.
	DeactivateFilters (see page 1164)	This is DeactivateFilters, a member of class TCustomADODataSet.
V	DefChanged (see page 1165)	This is DefChanged, a member of class TCustomADODataSet.
V	DefineProperties (see page 1165)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DestroyLookupCursor (see page 1166)	This is DestroyLookupCursor, a member of class TCustomADODataSet.
V	DoOnNewRecord (see page 1166)	This is DoOnNewRecord, a member of class TCustomADODataSet.
	EnableEvents (see page 1166)	This is EnableEvents, a member of class TCustomADODataSet.
	EndOfRecordset (see page 1167)	This is EndOfRecordset, a member of class TCustomADODataSet.
	FetchComplete (see page 1167)	This is FetchComplete, a member of class TCustomADODataSet.
	FetchProgress (see page 1167)	This is FetchProgress, a member of class TCustomADODataSet.
	FieldChangeComplete (see page 1167)	This is FieldChangeComplete, a member of class TCustomADODataSet.
V	FindRecord (see page 1168)	This is FindRecord, a member of class TCustomADODataSet.
V	FreeRecordBuffer (see page 1168)	This is FreeRecordBuffer, a member of class TCustomADODataSet.
	GetActiveRecBuf (see page 1168)	This is GetActiveRecBuf, a member of class TCustomADODataSet.
V	GetBookmarkData (see page 1169)	This is GetBookmarkData, a member of class TCustomADODataSet.
V	GetBookmarkFlag (see page 1169)	This is GetBookmarkFlag, a member of class TCustomADODataSet.
V	GetCanModify (see page 1169)	This is GetCanModify, a member of class TCustomADODataSet.
	GetCommandText (see page 1170)	This is GetCommandText, a member of class TCustomADODataSet.
V	GetDataSource (see page 1170)	This is GetDataSource, a member of class TCustomADODataSet.
V	GetRecNo (see page 1171)	This is GetRecNo, a member of class TCustomADODataSet.
V	GetRecord (see page 1172)	This is GetRecord, a member of class TCustomADODataSet.
V	GetRecordCount (see page 1172)	This is GetRecordCount, a member of class TCustomADODataSet.
V	GetRecordSize (see page 1172)	This is GetRecordSize, a member of class TCustomADODataSet.
V	GetStateFieldValue (see page 1172)	This is GetStateFieldValue, a member of class TCustomADODataSet.
	InitOleDBAccess (see page 1173)	This is InitOleDBAccess, a member of class TCustomADODataSet.
V	InternalAddRecord (see page 1173)	This is InternalAddRecord, a member of class TCustomADODataSet.
V	InternalCancel (see page 1173)	This is InternalCancel, a member of class TCustomADODataSet.
V	InternalClose (see page 1173)	This is InternalClose, a member of class TCustomADODataSet.
V	InternalDelete (see page 1173)	This is InternalDelete, a member of class TCustomADODataSet.
V	InternalEdit (see page 1174)	This is InternalEdit, a member of class TCustomADODataSet.
V	InternalFirst (see page 1174)	This is InternalFirst, a member of class TCustomADODataSet.
	InternalGetRecord (see page 1174)	This is InternalGetRecord, a member of class TCustomADODataSet.
V	InternalGotoBookmark (see page 1174)	This is InternalGotoBookmark, a member of class TCustomADODataSet.
V	InternalHandleException (see page 1175)	This is InternalHandleException, a member of class TCustomADODataSet.
V	InternalInitFieldDefs (see page 1175)	This is InternalInitFieldDefs, a member of class TCustomADODataSet.
V	InternalInitRecord (see page 1175)	This is InternalInitRecord, a member of class TCustomADODataSet.
V	InternalInsert (see page 1175)	This is InternalInsert, a member of class TCustomADODataSet.
V	InternalLast (see page 1175)	This is InternalLast, a member of class TCustomADODataSet.
V	InternalOpen (see page 1176)	This is InternalOpen, a member of class TCustomADODataSet.
V	InternalPost (see page 1176)	This is InternalPost, a member of class TCustomADODataSet.
V	InternalRefresh (see page 1176)	This is InternalRefresh, a member of class TCustomADODataSet.
	InternalRequery (see page 1176)	This is InternalRequery, a member of class TCustomADODataSet.
	InternalSetSort (see page 1177)	This is InternalSetSort, a member of class TCustomADODataSet.
V	InternalSetToRecord (see page 1177)	This is InternalSetToRecord, a member of class TCustomADODataSet.
V	IsCursorOpen (see page 1177)	This is IsCursorOpen, a member of class TCustomADODataSet.

	Loaded (see page 1177)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 1179)	This is LocateRecord, a member of class TCustomADODataSet.
	MasterChanged (see page 1180)	This is MasterChanged, a member of class TCustomADODataSet.
	MasterDisabled (see page 1180)	This is MasterDisabled, a member of class TCustomADODataSet.
	MoveComplete (see page 1180)	This is MoveComplete, a member of class TCustomADODataSet.
	OpenCursor (see page 1181)	This is OpenCursor, a member of class TCustomADODataSet.
	PrepareCursor (see page 1181)	This is PrepareCursor, a member of class TCustomADODataSet.
	PSEndTransaction (see page 1181)	Ends a transaction that was started by a call to PSStartTransaction.
	PSExecute (see page 1182)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 1182)	Executes a specified SQL command.
	PSGetAttributes (see page 1183)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 1183)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandType (see page 1184)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 1184)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 1185)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFieldsW (see page 1185)	This is PSGetKeyFieldsW, a member of class TCustomADODataSet.
	PSGetParams (see page 1185)	Returns the current parameter values of the dataset.
	PSGetQuoteCharW (see page 1186)	This is PSGetQuoteCharW, a member of class TCustomADODataSet.
	PSGetTableNameW (see page 1186)	This is PSGetTableNameW, a member of class TCustomADODataSet.
	PSGetUpdateException (see page 1186)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 1187)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 1187)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 1188)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 1188)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 1188)	Assigns a specified SQL command to be executed by PSExecute.
	PSSetParams (see page 1189)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 1189)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 1190)	Applies a single update to the underlying database table or tables.
	RecordChangeComplete (see page 1190)	This is RecordChangeComplete, a member of class TCustomADODataSet.
	RecordsetChangeComplete (see page 1190)	This is RecordsetChangeComplete, a member of class TCustomADODataSet.
	RefreshParams (see page 1191)	This is RefreshParams, a member of class TCustomADODataSet.
	ReleaseLock (see page 1191)	This is ReleaseLock, a member of class TCustomADODataSet.
	SetBlockReadSize (see page 1194)	This is SetBlockReadSize, a member of class TCustomADODataSet.
	SetBookmarkData (see page 1194)	This is SetBookmarkData, a member of class TCustomADODataSet.
	SetBookmarkFlag (see page 1194)	This is SetBookmarkFlag, a member of class TCustomADODataSet.
	SetCommandText (see page 1194)	This is SetCommandText, a member of class TCustomADODataSet.
	SetConnection (see page 1194)	This is SetConnection, a member of class TCustomADODataSet.
	SetConnectionFlag (see page 1195)	This is SetConnectionFlag, a member of class TCustomADODataSet.
	SetDataSource (see page 1195)	This is SetDataSource, a member of class TCustomADODataSet.
	SetDetailFilter (see page 1195)	This is SetDetailFilter, a member of class TCustomADODataSet.
	SetFieldData (see page 1195)	This is the overview for the SetFieldData method overload.
	SetFiltered (see page 1196)	This is SetFiltered, a member of class TCustomADODataSet.
	SetFilterOptions (see page 1196)	This is SetFilterOptions, a member of class TCustomADODataSet.
	SetFilterText (see page 1196)	This is SetFilterText, a member of class TCustomADODataSet.
	SetParamsFromCursor (see page 1197)	This is SetParamsFromCursor, a member of class TCustomADODataSet.
	SetRecNo (see page 1197)	This is SetRecNo, a member of class TCustomADODataSet.
	UpdateIndexDefs (see page 1198)	This is UpdateIndexDefs, a member of class TCustomADODataSet.
	UpdateRecordSetPosition (see page 1198)	This is UpdateRecordSetPosition, a member of class TCustomADODataSet.
	WillChangeField (see page 1199)	This is WillChangeField, a member of class TCustomADODataSet.
	WillChangeRecord (see page 1199)	This is WillChangeRecord, a member of class TCustomADODataSet.
	WillChangeRecordset (see page 1200)	This is WillChangeRecordset, a member of class TCustomADODataSet.
	WillMove (see page 1200)	This is WillMove, a member of class TCustomADODataSet.

Public Methods

	Name	Description
	BookmarkValid (see page 1160)	Tests the validity of a specified bookmark.
	CancelBatch (see page 1161)	Cancels a pending batch update.
	CancelUpdates (see page 1162)	Cancels pending cached updates.
	Clone (see page 1163)	Duplicates another dataset in the calling component
	CompareBookmarks (see page 1163)	Compares two bookmarks.
	CreateBlobStream (see page 1164)	Creates a blob stream for a Binary large object (BLOB) field in the dataset.
	DeleteRecords (see page 1165)	Deletes one or more records in the dataset.
	FilterOnBookmarks (see page 1168)	Filters a data set to just rows with pre-defined bookmarks.
	GetBlobFieldData (see page 1169)	Retrieves the current value of a field into a buffer.
	GetDetailLinkFields (see page 1170)	Lists the field components that link this dataset as a detail of a master dataset.
	GetFieldData (see page 1171)	This is the overview for the GetFieldData method overload.
	IsSequenced (see page 1177)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	LoadFromFile (see page 1178)	Loads a recordset from a file.
	Locate (see page 1179)	Searches the dataset for a specified record and makes that record the current record.
	Lookup (see page 1180)	Retrieves field values from a row that matches specified search values.
	NextRecordset (see page 1181)	Provides access to a secondary recordset.
	Requery (see page 1191)	Refreshes the recordset.
	SaveToFile (see page 1192)	Saves a recordset to a file.
	Seek (see page 1192)	Searches for a record using the current index.
	Supports (see page 1197)	Indicates whether a dataset supports certain types of operations.
	UpdateBatch (see page 1197)	Writes pending batch updates to disk.
	UpdateStatus (see page 1199)	Indicates the update status of the current record.

8.1.9.4.1 TCustomADODataSet.ActivateTextFilter Method

Pascal

```
procedure ActivateTextFilter(const FilterText: string);
```

C++

```
__fastcall ActivateTextFilter(const AnsiString FilterText);
```

Description

This is ActivateTextFilter, a member of class TCustomADODataSet.

8.1.9.4.2 TCustomADODataSet.AllocRecordBuffer Method

Pascal

```
function AllocRecordBuffer: PChar; override;
```

C++

```
virtual __fastcall const char * AllocRecordBuffer();
```

Description

This is AllocRecordBuffer, a member of class TCustomADODataSet.

8.1.9.4.3 TCustomADODataSet.BookmarkValid Method

Tests the validity of a specified bookmark.

Pascal

```
function BookmarkValid(Bookmark: TBookmark): Boolean; override;
```

C++

```
virtual __fastcall Boolean BookmarkValid(TBookmark Bookmark);
```

Description

Call BookmarkValid to determine if a specified bookmark is currently assigned a value. BookmarkValid returns true if a bookmark is valid. Otherwise, it returns false.

Bookmark specifies the bookmark to test.

See Also

CompareBookmarks (see page 1163)

GetBookmark (see page 6948)

8.1.9.4.4 TCustomADODataSet.CancelBatch Method

Cancels a pending batch update.

Pascal

```
procedure CancelBatch(AffectRecords: TAffectRecords = arAll);
```

C++

```
__fastcall CancelBatch(TAffectRecords AffectRecords = arAll);
```

Description

Call CancelBatch to cancel any pending updates in a dataset that has been opened in batch update mode. CancelBatch may be called without error when there are no pending updates, but this has no effect.

CancelBatch is not applicable to datasets in immediate update mode. Calling CancelBatch for such datasets without the arCurrent constant raises an exception.

The default AffectsRecords parameter value is arAll.

The AffectRecords parameter may be any one of the following TAffectRecords (see page 1290) values:

Option	Meaning
arCurrent	Only the updates for the current row are applied.
arFiltered	Only updates for rows matching the current filter are applied.
arAll	Updates for all rows are applied.
arAllChapters	Update affects all chapters (ADO chapters)

Note: : To use batch updating, the CursorType (see page 1208) property of the dataset component must be either ctKeySet (the default) or ctStatic and the LockType (see page 1218) property must be ltBatchOptimistic.

See Also

LockType (see page 1218)

Filtered (see page 1214)

RecordStatus (see page 1222)

FilterGroup (see page 1214)

UpdateBatch (see page 1197)

CursorType (see page 1208),

8.1.9.4.5 TCustomADODataSet.CancelUpdates Method

Cancels pending cached updates.

Pascal

```
procedure CancelUpdates;
```

C++

```
__fastcall CancelUpdates();
```

Description

Call CancelUpdates to cancel any pending cached updates and revert field values to their original values (the values present since the last applied update, if any).

Note: CancelUpdates does the same thing as CancelBatch (see page 1161)(arAll).

See Also

CancelBatch (see page 1161)

8.1.9.4.6 TCustomADODataSet.CheckActive Method

Pascal

```
procedure CheckActive; override;
```

C++

```
virtual __fastcall CheckActive();
```

Description

This is CheckActive, a member of class TCustomADODataSet.

8.1.9.4.7 TCustomADODataSet.CheckFieldCompatibility Method

Pascal

```
procedure CheckFieldCompatibility(Field: TField; FieldDef: TFieldDef); override;
```

C++

```
virtual __fastcall CheckFieldCompatibility(TField Field, TFieldDef FieldDef);
```

Description

This is CheckFieldCompatibility, a member of class TCustomADODataSet.

8.1.9.4.8 TCustomADODataSet.ClearCalcFields Method

Pascal

```
procedure ClearCalcFields(Buffer: PChar); override;
```

C++

```
virtual __fastcall ClearCalcFields(const char * Buffer);
```

Description

This is ClearCalcFields, a member of class TCustomADODataSet.

8.1.9.4.9 TCustomADODataSet.Clone Method

Duplicates another dataset in the calling component

Pascal

```
procedure Clone(Source: TCustomADODataSet; LockType: TADOLockType = ltUnspecified);
```

C++

```
__fastcall Clone(TCustomADODataSet Source, TADOLockType LockType = ltUnspecified);
```

Description

Call Clone to make the recordset of the calling ADO dataset component a duplicate of the recordset active in another TCustomADONETConnector descendant component. If the attempt to clone a dataset is successful, the current ADO dataset component's recordset will be the same as that in the other dataset. If unsuccessful, the recordset is set to nil (Delphi) or NULL (C++) and an EADOError (see page 978) exception raised.

LockType (see page 1218) specifies the lock type to use when opening the clone recordset. By default, LockType (see page 1218) is ltUnspecified.

See Also

LockType

8.1.9.4.10 TCustomADODataSet.CompareBookmarks Method

Compares two bookmarks.

Pascal

```
function CompareBookmarks(Bookmark1: TBookmark; Bookmark2: TBookmark): Integer; override;
```

C++

```
virtual __fastcall int CompareBookmarks(TBookmark Bookmark1, TBookmark Bookmark2);
```

Description

Call CompareBookmarks to compare one bookmark to another. CompareBookmarks returns an integer value indicating the difference between the two bookmarks. CompareBookmarks returns a 0 (zero) if the two bookmarks are the same, a –1 (negative one) if bookmark one is less than bookmark two, or a 1 (positive one) if bookmark one is greater than bookmark two. CompareBookmarks also returns a zero if one of the two bookmarks is nil (Delphi) or NULL (C++).

Bookmark1 and Bookmark2 are the two TBookmark values to compare.

See Also

BookmarkValid (see page 1160)

GetBookmark (see page 6948)

8.1.9.4.11 TCustomADODataSet.ConnectionPoint Method

Pascal

```
function ConnectionPoint: IConnectionPoint;
```

C++

```
__fastcall IConnectionPoint ConnectionPoint();
```

Description

This is ConnectionPoint, a member of class TCustomADODataSet.

8.1.9.4.12 TCustomADODataSet.CreateBlobStream Method

Creates a blob stream for a Binary large object (BLOB) field in the dataset.

Pascal

```
function CreateBlobStream(Field: TField; Mode: TBlobStreamMode): TStream; override;
```

C++

```
virtual __fastcall TStream CreateBlobStream(TField Field, TBlobStreamMode Mode);
```

Description

Call CreateBlobStream to obtain a stream for reading and writing the value of the field specified by the Field parameter.

Field is a string containing the name of the BLOB (or comparable type) field in the dataset.

Mode indicates whether the stream will be used for reading the field's value (bmRead), writing the field's value (bmWrite), or both (bmReadWrite).

See Also

TBlobStream (see page 9958)

TBlobField (see page 6801)

TClientBlobStream (see page 8285)

8.1.9.4.13 TCustomADODataSet.DataEvent Method

Pascal

```
procedure DataEvent(Event: TDataEvent; Info: Longint); override;
```

C++

```
virtual __fastcall DataEvent(TDataEvent Event, Longint Info);
```

Description

This is DataEvent, a member of class TCustomADODataSet.

8.1.9.4.14 TCustomADODataSet.DeactivateFilters Method

Pascal

```
procedure DeactivateFilters;
```

C++

```
__fastcall DeactivateFilters();
```

Description

This is DeactivateFilters, a member of class TCustomADODataSet.

8.1.9.4.15 TCustomADODataSet.DefChanged Method

Pascal

```
procedure DefChanged(Sender: TObject); override;
```

C++

```
virtual __fastcall DefChanged(TObject * Sender);
```

Description

This is DefChanged, a member of class TCustomADODataSet.

8.1.9.4.16 TCustomADODataSet.DefineProperties Method

Designates methods for storing an object's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TComponent overrides the DefineProperties method defined in TPersistent to define "fake" Top and Left properties. These are defined so that components that are not controls can be manipulated at design-time. However, the Top and Left properties are hidden, that is, they are not published, because only controls appear at run-time.

DefineProperties is virtual; descendant classes can override it. When overriding DefineProperties, be aware that the Ancestor property of Filer might be set, and that this property can determine whether or not it is appropriate to write properties.

DefineProperties is called automatically as part of the component streaming system; do not call it directly.

See Also

Ancestor (see page 2839)

DefineBinaryProperty (see page 2837)

DefineProperties (see page 2931)

DefineProperty (see page 2838)

8.1.9.4.17 TCustomADODataSet.DeleteRecords Method

Deletes one or more records in the dataset.

Pascal

```
procedure DeleteRecords(AffectRecords: TAffectRecords = arAll);
```

C++

```
__fastcall DeleteRecords(TAffectRecords AffectRecords = arAll);
```

Description

Use DeleteRecords to delete one or more records from the recordset the ADO dataset component represents.

If the recordset does not support record deletions, an exception is raised. Use the Supports (see page 1197) method to determine whether the recordset supports deleting records.

If the dataset was opened in batch update mode, the records are only marked for deletion. Apply the batch deletions by calling the UpdateBatch (see page 1197) method. If the dataset is not in batch update mode, the records are immediately removed from the base table.

AffectRecords is a TAffectRecords (see page 1290) constant that determines which records are deleted by DeleteRecords. The default value for the AffectRecords parameter is arAll, which causes all records in the recordset to be deleted.

Option	Meaning
arCurrent	Only the deletes the current record.
arFiltered	Only deletes records accessible through the current filter.
arAll	Deletes all records in the recordset.
arAllChapters	Deletes records in all chapters (ADO chapters)

See Also

Supports (see page 1197)

UpdateBatch (see page 1197)

8.1.9.4.18 TCustomADODataSet.DestroyLookupCursor Method

Pascal

```
procedure DestroyLookupCursor; virtual;
```

C++

```
virtual __fastcall DestroyLookupCursor();
```

Description

This is DestroyLookupCursor, a member of class TCustomADODataSet.

8.1.9.4.19 TCustomADODataSet.DoOnNewRecord Method

Pascal

```
procedure DoOnNewRecord; override;
```

C++

```
virtual __fastcall DoOnNewRecord();
```

Description

This is DoOnNewRecord, a member of class TCustomADODataSet.

8.1.9.4.20 TCustomADODataSet.EnableEvents Method

Pascal

```
procedure EnableEvents;
```

C++

```
__fastcall EnableEvents();
```

Description

This is EnableEvents, a member of class TCustomADODataSet.

8.1.9.4.21 TCustomADODataSet.EndOfRecordset Method

Pascal

```
procedure EndOfRecordset(var fMoreData: WordBool; var adStatus: EventStatusEnum; const
pRecordset: _Recordset); safecall;
```

C++

```
__fastcall EndOfRecordset(WordBool fMoreData, EventStatusEnum adStatus, const _Recordset
pRecordset);
```

Description

This is EndOfRecordset, a member of class TCustomADODataSet.

8.1.9.4.22 TCustomADODataSet.FetchComplete Method

Pascal

```
procedure FetchComplete(const pError: Error; var adStatus: EventStatusEnum; const pRecordset:
_Recordset); safecall;
```

C++

```
__fastcall FetchComplete(const Error pError, EventStatusEnum adStatus, const _Recordset
pRecordset);
```

Description

This is FetchComplete, a member of class TCustomADODataSet.

8.1.9.4.23 TCustomADODataSet.FetchProgress Method

Pascal

```
procedure FetchProgress(Progress: Integer; MaxProgress: Integer; var adStatus:
EventStatusEnum; const pRecordset: _Recordset); safecall;
```

C++

```
__fastcall FetchProgress(int Progress, int MaxProgress, EventStatusEnum adStatus, const
_Recordset pRecordset);
```

Description

This is FetchProgress, a member of class TCustomADODataSet.

8.1.9.4.24 TCustomADODataSet.FieldChangeComplete Method

Pascal

```
procedure FieldChangeComplete(cFields: Integer; Fields: OleVariant; const pError: Error; var
adStatus: EventStatusEnum; const pRecordset: _Recordset); safecall;
```

C++

```
__fastcall FieldChangeComplete(int cFields, OleVariant Fields, const Error pError,
EventStatusEnum adStatus, const _Recordset pRecordset);
```

Description

This is FieldChangeComplete, a member of class TCustomADODataSet.

8.1.9.4.25 TCustomADODataSet.FilterOnBookmarks Method

Filters a data set to just rows with pre-defined bookmarks.

Pascal

```
procedure FilterOnBookmarks(Bookmarks: array of const);
```

C++

```
__fastcall FilterOnBookmarks(array of const Bookmarks);
```

Description

Use FilterOnBookmarks to filter an ADO dataset to display only those data rows for which a bookmark has been defined. To successfully use FilterOnBookmarks, you must have already defined at least one valid bookmark in the dataset.

When FilterOnBookmarks is called, the Filter (see page 1212) property is automatically cleared, the FilterGroup (see page 1214) property is set to fgUnassigned, and the Filtered (see page 1214) property is set to true.

See Also

Filter (see page 1212)

Filtered (see page 1214)

FilterGroup (see page 1214)

8.1.9.4.26 TCustomADODataSet.FindRecord Method

Pascal

```
function FindRecord(Restart: Boolean; GoForward: Boolean): Boolean; override;
```

C++

```
virtual __fastcall Boolean FindRecord(Boolean Restart, Boolean GoForward);
```

Description

This is FindRecord, a member of class TCustomADODataSet.

8.1.9.4.27 TCustomADODataSet.FreeRecordBuffer Method

Pascal

```
procedure FreeRecordBuffer(var Buffer: PChar); override;
```

C++

```
virtual __fastcall FreeRecordBuffer(const char * Buffer);
```

Description

This is FreeRecordBuffer, a member of class TCustomADODataSet.

8.1.9.4.28 TCustomADODataSet.GetActiveRecBuf Method

Pascal

```
function GetActiveRecBuf(var RecBuf: PChar): Boolean;
```

C++

```
__fastcall Boolean GetActiveRecBuf(const char * RecBuf);
```

Description

This is GetActiveRecBuf, a member of class TCustomADODataSet.

8.1.9.4.29 TCustomADODataSet.GetBlobFieldData Method

Retrieves the current value of a field into a buffer.

Pascal

```
function GetBlobFieldData(FieldNo: Integer; var Buffer: TBlobByteData): Integer; override;
```

C++

```
virtual __fastcall int GetBlobFieldData(int FieldNo, TBlobByteData Buffer);
```

Description

Most applications do not need to call GetBlobFieldData, this method being used internally by descendants of TCustomADODataSet (see page 1145). GetBlobFieldData reads blob data from the field specified by FieldNo into a Buffer. The buffer is a dynamic array of bytes, so that it can grow to accommodate the size of the BLOB data. GetBlobFieldData returns the size of the buffer.

See Also

GetFieldData (see page 6952)

GetFieldData (see page 1171)

GetData (see page 7131)

8.1.9.4.30 TCustomADODataSet.GetBookmarkData Method

Pascal

```
procedure GetBookmarkData(Buffer: PChar; Data: Pointer); override;
```

C++

```
virtual __fastcall GetBookmarkData(const char * Buffer, void * Data);
```

Description

This is GetBookmarkData, a member of class TCustomADODataSet.

8.1.9.4.31 TCustomADODataSet.GetBookmarkFlag Method

Pascal

```
function GetBookmarkFlag(Buffer: PChar): TBookmarkFlag; override;
```

C++

```
virtual __fastcall TBookmarkFlag GetBookmarkFlag(const char * Buffer);
```

Description

This is GetBookmarkFlag, a member of class TCustomADODataSet.

8.1.9.4.32 TCustomADODataSet.GetCanModify Method

Pascal

```
function GetCanModify: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetCanModify();
```

Description

This is GetCanModify, a member of class TCustomADODataSet.

8.1.9.4.33 TCustomADODataSet.GetCommandText Method

Pascal

```
function GetCommandText: WideString;
```

C++

```
__fastcall BSTR GetCommandText();
```

Description

This is GetCommandText, a member of class TCustomADODataSet.

8.1.9.4.34 TCustomADODataSet.GetDataSource Method

Pascal

```
function GetDataSource: TDataSource; override;
```

C++

```
virtual __fastcall TDataSource GetDataSource();
```

Description

This is GetDataSource, a member of class TCustomADODataSet.

8.1.9.4.35 TCustomADODataSet.GetDetailLinkFields Method

Lists the field components that link this dataset as a detail of a master dataset.

Pascal

```
procedure GetDetailLinkFields(MasterFields: TList; DetailFields: TList); override;
```

C++

```
virtual __fastcall GetDetailLinkFields(TList MasterFields, TList DetailFields);
```

Description

GetDetailLInkFIelds fills the two lists with field components that define a master-detail relationship between this dataset and another (master) dataset. The MasterFields (see page 1219) list is filled with fields from the master table whose values must equal the values of the fields in the DetailFields list. The DetailFields list is filled with fields from this dataset.

Applications seldom call GetDetailLinkFields. It is used internally by the Field Link designer when setting up master/detail relationships.

See Also

DataSource (see page 7014)

MasterSource (see page 1144)

MasterFields (see page 1219)

8.1.9.4.36 GetFieldData Method

This is the overview for the GetFieldData method overload.

Overload List

	Name	Description
	TCustomADODataSet.GetFieldData (Integer, Pointer) (see page 1171)	Retrieves the current value of a field into a buffer.
	TCustomADODataSet.GetFieldData (TField, Pointer) (see page 1171)	Retrieves the current value of a field into a buffer.
	TCustomADODataSet.GetFieldData (TField, Pointer, Boolean) (see page 1171)	Retrieves the current value of a field into a buffer.

8.1.9.4.36.1 TCustomADODataSet.GetFieldData Method (Integer, Pointer)

Retrieves the current value of a field into a buffer.

Pascal

```
function GetFieldData(Field: TField; Buffer: Pointer): Boolean; override;
function GetFieldData(Field: TField; Buffer: Pointer; NativeFormat: Boolean): Boolean;
override;
function GetFieldData(FieldNo: Integer; Buffer: Pointer): Boolean; override; overload;
```

C++

```
virtual __fastcall Boolean GetFieldData(TField Field, void * Buffer);
virtual __fastcall Boolean GetFieldData(TField Field, void * Buffer, Boolean NativeFormat);
virtual __fastcall Boolean GetFieldData(int FieldNo, void * Buffer);
```

Description

Most applications do not need to call GetFieldData. TField objects call this method to implement their GetData method.

The Field or FieldNo parameter indicates the field whose data should be fetched. Field specifies the component itself, while FieldNo indicates its field number.

Buffer is a memory buffer with sufficient space to accept the value of the field as it exists in the database (unformatted and untranslated). GetFieldData returns a value that indicates whether the data was successfully fetched.

GetFieldData returns a boolean value indicating whether the operation was successful.

See Also

GetBlobFieldData (see page 6947)

GetBlobFieldData (see page 1169)

GetData (see page 7131)

8.1.9.4.37 TCustomADODataSet.GetRecNo Method

Pascal

```
function GetRecNo: Integer; override;
```

C++

```
virtual __fastcall int GetRecNo();
```

Description

This is GetRecNo, a member of class TCustomADODataSet.

8.1.9.4.38 TCustomADODataSet.GetRecord Method

Pascal

```
function GetRecord(Buffer: PChar; GetMode: TGetMode; DoCheck: Boolean): TGetResult; override;
```

C++

```
virtual __fastcall TGetResult GetRecord(const char * Buffer, TGetMode GetMode, Boolean
DoCheck);
```

Description

This is GetRecord, a member of class TCustomADODataSet.

8.1.9.4.39 TCustomADODataSet.GetRecordCount Method

Pascal

```
function GetRecordCount: Integer; override;
```

C++

```
virtual __fastcall int GetRecordCount();
```

Description

This is GetRecordCount, a member of class TCustomADODataSet.

8.1.9.4.40 TCustomADODataSet.GetRecordSize Method

Pascal

```
function GetRecordSize: Word; override;
```

C++

```
virtual __fastcall Word GetRecordSize();
```

Description

This is GetRecordSize, a member of class TCustomADODataSet.

8.1.9.4.41 TCustomADODataSet.GetStateFieldValue Method

Pascal

```
function GetStateFieldValue(State: TDataSetState; Field: TField): Variant; override;
```

C++

```
virtual __fastcall Variant GetStateFieldValue(TDataSetState State, TField Field);
```

Description

This is GetStateFieldValue, a member of class TCustomADODataSet.

8.1.9.4.42 TCustomADODataSet.InitOleDBAccess Method

Pascal

```
procedure InitOleDBAccess(Initializing: Boolean);
```

C++

```
__fastcall InitOleDBAccess(Boolean Initializing);
```

Description

This is InitOleDBAccess, a member of class TCustomADODataSet.

8.1.9.4.43 TCustomADODataSet.InternalAddRecord Method

Pascal

```
procedure InternalAddRecord(Buffer: Pointer; Append: Boolean); override;
```

C++

```
virtual __fastcall InternalAddRecord(void * Buffer, Boolean Append);
```

Description

This is InternalAddRecord, a member of class TCustomADODataSet.

8.1.9.4.44 TCustomADODataSet.InternalCancel Method

Pascal

```
procedure InternalCancel; override;
```

C++

```
virtual __fastcall InternalCancel();
```

Description

This is InternalCancel, a member of class TCustomADODataSet.

8.1.9.4.45 TCustomADODataSet.InternalClose Method

Pascal

```
procedure InternalClose; override;
```

C++

```
virtual __fastcall InternalClose();
```

Description

This is InternalClose, a member of class TCustomADODataSet.

8.1.9.4.46 TCustomADODataSet.InternalDelete Method

Pascal

```
procedure InternalDelete; override;
```

C++

```
virtual __fastcall InternalDelete();
```

Description

This is InternalDelete, a member of class TCustomADODataSet.

8.1.9.4.47 TCustomADODataSet.InternalEdit Method

Pascal

```
procedure InternalEdit; override;
```

C++

```
virtual __fastcall InternalEdit();
```

Description

This is InternalEdit, a member of class TCustomADODataSet.

8.1.9.4.48 TCustomADODataSet.InternalFirst Method

Pascal

```
procedure InternalFirst; override;
```

C++

```
virtual __fastcall InternalFirst();
```

Description

This is InternalFirst, a member of class TCustomADODataSet.

8.1.9.4.49 TCustomADODataSet.InternalGetRecord Method

Pascal

```
function InternalGetRecord(Buffer: PChar; GetMode: TGetMode; DoCheck: Boolean): TGetResult;
```

C++

```
__fastcall TGetResult InternalGetRecord(const char * Buffer, TGetMode GetMode, Boolean
DoCheck);
```

Description

This is InternalGetRecord, a member of class TCustomADODataSet.

8.1.9.4.50 TCustomADODataSet.InternalGotoBookmark Method

Pascal

```
procedure InternalGotoBookmark(Bookmark: Pointer); override;
```

C++

```
virtual __fastcall InternalGotoBookmark(void * Bookmark);
```

Description

This is InternalGotoBookmark, a member of class TCustomADODataSet.

8.1.9.4.51 TCustomADODataSet.InternalHandleException Method

Pascal

```
procedure InternalHandleException; override;
```

C++

```
virtual __fastcall InternalHandleException();
```

Description

This is InternalHandleException, a member of class TCustomADODataSet.

8.1.9.4.52 TCustomADODataSet.InternalInitFieldDefs Method

Pascal

```
procedure InternalInitFieldDefs; override;
```

C++

```
virtual __fastcall InternalInitFieldDefs();
```

Description

This is InternalInitFieldDefs, a member of class TCustomADODataSet.

8.1.9.4.53 TCustomADODataSet.InternalInitRecord Method

Pascal

```
procedure InternalInitRecord(Buffer: PChar); override;
```

C++

```
virtual __fastcall InternalInitRecord(const char * Buffer);
```

Description

This is InternalInitRecord, a member of class TCustomADODataSet.

8.1.9.4.54 TCustomADODataSet.InternalInsert Method

Pascal

```
procedure InternalInsert; override;
```

C++

```
virtual __fastcall InternalInsert();
```

Description

This is InternalInsert, a member of class TCustomADODataSet.

8.1.9.4.55 TCustomADODataSet.InternalLast Method

Pascal

```
procedure InternalLast; override;
```

C++

```
virtual __fastcall InternalLast();
```

Description

This is InternalLast, a member of class TCustomADODataSet.

8.1.9.4.56 TCustomADODataSet.InternalOpen Method

Pascal

```
procedure InternalOpen; override;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

This is InternalOpen, a member of class TCustomADODataSet.

8.1.9.4.57 TCustomADODataSet.InternalPost Method

Pascal

```
procedure InternalPost; override;
```

C++

```
virtual __fastcall InternalPost();
```

Description

This is InternalPost, a member of class TCustomADODataSet.

8.1.9.4.58 TCustomADODataSet.InternalRefresh Method

Pascal

```
procedure InternalRefresh; override;
```

C++

```
virtual __fastcall InternalRefresh();
```

Description

This is InternalRefresh, a member of class TCustomADODataSet.

8.1.9.4.59 TCustomADODataSet.InternalRequery Method

Pascal

```
procedure InternalRequery(Options: TExecuteOptions = []);
```

C++

```
__fastcall InternalRequery(TExecuteOptions Options = []);
```

Description

This is InternalRequery, a member of class TCustomADODataSet.

8.1.9.4.60 TCustomADODataSet.InternalSetSort Method

Pascal

```
procedure InternalSetSort(Value: WideString);
```

C++

```
__fastcall InternalSetSort(BSTR Value);
```

Description

This is InternalSetSort, a member of class TCustomADODataSet.

8.1.9.4.61 TCustomADODataSet.InternalSetToRecord Method

Pascal

```
procedure InternalSetToRecord(Buffer: PChar); override;
```

C++

```
virtual __fastcall InternalSetToRecord(const char * Buffer);
```

Description

This is InternalSetToRecord, a member of class TCustomADODataSet.

8.1.9.4.62 TCustomADODataSet.IsCursorOpen Method

Pascal

```
function IsCursorOpen: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsCursorOpen();
```

Description

This is IsCursorOpen, a member of class TCustomADODataSet.

8.1.9.4.63 TCustomADODataSet.IsSequenced Method

Indicates whether the underlying database table uses record numbers to indicate the order of records.

Pascal

```
function IsSequenced: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsSequenced();
```

Description

Use IsSequenced to determine whether the underlying database table supports sequence numbers, or whether these are computed by the dataset component. When IsSequenced returns true, applications can safely use the RecNo property to navigate to records in the dataset.

8.1.9.4.64 TCustomADODataSet.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

See Also

ComponentState (see page 2804)

Create (see page 2766)

TReader (see page 2933)

8.1.9.4.65 TCustomADODataSet.LoadFromFile Method

Loads a recordset from a file.

Pascal

```
procedure LoadFromFile(const FileName: WideString);
```

C++

```
__fastcall LoadFromFile(const BSTR FileName);
```

Description

Call LoadFromFile to load the recordset for the calling ADO dataset component from a file. If the loading operation fails, the current recordset is neutralized (set to nil (Delphi) or NULL (C++)), the dataset component remains inactive, and an EOleException exception is raised. If the attempt to load data from a file is successful, the ADO dataset component is automatically activated and the data made available.

FileName is a string containing the name of the file.

LoadFromFile closes the dataset component before loading the recordset from the file specified in FileName.

See Also

EADOError (see page 978)

SaveToFile (see page 1192),

8.1.9.4.66 TCustomADODataSet.Locate Method

Searches the dataset for a specified record and makes that record the current record.

Pascal

```
function Locate(const KeyFields: string; const KeyValues: Variant; Options: TLocateOptions):
Boolean; override;
```

C++

```
virtual __fastcall Boolean Locate(const AnsiString KeyFields, const Variant KeyValues,
TLocateOptions Options);
```

Description

Call Locate to search a dataset for a specific row and make it the current row.

KeyFields is a string containing a semicolon-delimited list of field names on which to search.

KeyValues is a variant that specifies the values to match in the key fields. If KeyFields lists a single field, KeyValues specifies the value for that field on the desired row. To specify multiple search values, pass a variant array as KeyValues, or construct a variant array on the fly using the VarArrayOf routine. For example:

```
with ADOTable1 do
  Locate('Company;Contact;Phone', VarArrayOf(['Sight Diver', 'P', '408-431-1000']),
[loPartialKey]);
TLocateOptions Opts;
Opts.Clear();
Opts << loPartialKey;
Variant locvalues[2];
locvalues[0] = Variant("Sight Diver");
locvalues[1] = Variant("P");
CustTable->Locate("Company;Contact", VarArrayOf(locvalues, 1), Opts);
```

Options is a set that optionally specifies additional search latitude when searching on string fields. If Options contains the loCaseInsensitive setting, then Locate ignores case when matching fields. If Options contains the loPartialKey setting, then Locate allows partial-string matching on strings in KeyValues. If Options is an empty set, or if KeyFields does not include any string fields, Options is ignored.

Locate returns true if it finds a matching row, and makes that row the current one. Otherwise Locate returns false.

See Also

FindField (see page 6938)

ADONETDb.TCustomADONETConnector.Lookup

8.1.9.4.67 TCustomADODataSet.LocateRecord Method

Pascal

```
function LocateRecord(const KeyFields: string; const KeyValues: OleVariant; Options:
TLocateOptions; SyncCursor: Boolean): Boolean;
```

C++

```
__fastcall Boolean LocateRecord(const AnsiString KeyFields, const OleVariant KeyValues,
TLocateOptions Options, Boolean SyncCursor);
```

Description

This is LocateRecord, a member of class TCustomADODataSet.

8.1.9.4.68 TCustomADODataSet.Lookup Method

Retrieves field values from a row that matches specified search values.

Pascal

```
function Lookup(const KeyFields: string; const KeyValues: Variant; const ResultFields:
string): Variant; override;
```

C++

```
virtual __fastcall Variant Lookup(const AnsiString KeyFields, const Variant KeyValues, const
AnsiString ResultFields);
```

Description

Call Lookup to retrieve values for specified fields from a row that matches search criteria. KeyFields is a string containing a semicolon-delimited list of field names on which to search.

KeyValues is a variant array containing the values to match in the key fields. To specify multiple search values, pass KeyValues as a variant array as an argument, or construct a variant array on the fly using the VarArrayOf routine.

ResultFields is a string containing a semicolon-delimited list of field names whose values should be returned from the matching row.

Lookup returns a variant array containing the values from the fields specified in ResultFields.

ADONETDb.TCustomADONETConnector.Locate

8.1.9.4.69 TCustomADODataSet.MasterChanged Method

Pascal

```
procedure MasterChanged(Sender: TObject); virtual;
```

C++

```
virtual __fastcall MasterChanged(TObject * Sender);
```

Description

This is MasterChanged, a member of class TCustomADODataSet.

8.1.9.4.70 TCustomADODataSet.MasterDisabled Method

Pascal

```
procedure MasterDisabled(Sender: TObject); virtual;
```

C++

```
virtual __fastcall MasterDisabled(TObject * Sender);
```

Description

This is MasterDisabled, a member of class TCustomADODataSet.

8.1.9.4.71 TCustomADODataSet.MoveComplete Method

Pascal

```
procedure MoveComplete(adReason: EventReasonEnum; const pError: Error; var adStatus:
```

```
EventStatusEnum; const pRecordset: _Recordset); safecall;
```

C++

```
__fastcall MoveComplete(EventReasonEnum adReason, const Error pError, EventStatusEnum
adStatus, const _Recordset pRecordset);
```

Description

This is MoveComplete, a member of class TCustomADODataSet.

8.1.9.4.72 TCustomADODataSet.NextRecordset Method

Provides access to a secondary recordset.

Pascal

```
function NextRecordset(var RecordsAffected: Integer): _Recordset;
```

C++

```
__fastcall _Recordset NextRecordset(int RecordsAffected);
```

Description

Call NextRecordset in situations where multiple recordsets are returned to provide access to the second (and subsequent) recordsets. The ADO Recordset (see page 1221) object returned by NextRecordset must be assigned to the Recordset (see page 1221) property of an ADO dataset component, such as TADODataSet (see page 1041), to be accessible.

```
ADODataSet1.Recordset := ADOQuery1.NextRecordset
ADODataSet1->Recordset = ADOQuery1->NextRecordset;
```

RecordsAffected is the number of rows in the returned recordset.

8.1.9.4.73 TCustomADODataSet.OpenCursor Method

Pascal

```
procedure OpenCursor(InfoQuery: Boolean); override;
```

C++

```
virtual __fastcall OpenCursor(Boolean InfoQuery);
```

Description

This is OpenCursor, a member of class TCustomADODataSet.

8.1.9.4.74 TCustomADODataSet.PrepareCursor Method

Pascal

```
procedure PrepareCursor; virtual;
```

C++

```
virtual __fastcall PrepareCursor();
```

Description

This is PrepareCursor, a member of class TCustomADODataSet.

8.1.9.4.75 TCustomADODataSet.PSEndTransaction Method

Ends a transaction that was started by a call to PSStartTransaction.

Pascal

```
procedure PSEndTransaction(Commit: Boolean); override;
```

C++

```
virtual __fastcall PSEndTransaction(Boolean Commit);
```

Description

The provider component applies updates within a transaction, if possible. To do so, it uses PSEndTransaction in conjunction with the PSStartTransaction method.

The Commit parameter indicates whether the dataset should commit the current transaction (Commit is true), or roll it back (Commit is false).

Note: TDataSetProvider only starts a transaction (Using PSStartTransaction) if the PSInTransaction method indicates that there is no transaction already established. That is, it does not assume nested transaction support is available. Thus, there is no need to ensure that PSEndTransaction does not terminate a transaction that was not started by the provider.

See Also

PSStartTransaction (see page 7586)

PSInTransaction (see page 7583)

applyupdates (see page 18459)

8.1.9.4.76 TCustomADODataSet.PSExecute Method

Executes the SQL command associated with the dataset.

Pascal

```
procedure PSExecute; override;
```

C++

```
virtual __fastcall PSExecute();
```

Description

The provider component calls PSExecute to implement its Execute method. If the dataset represents a query or stored procedure that does not return a cursor, this method executes the query or stored procedure. If the provider Options includes poAllowCommandText and the dataset supports the PSSetCommandText method, the statement specified by PSSetCommandText may be executed instead.

If there is not statement to execute, PSExecute raises an EDatabaseError exception.

See Also

PSSetCommandText (see page 7585)

Execute (see page 18466)

Options (see page 18440)

8.1.9.4.77 TCustomADODataSet.PSExecuteStatement Method

Executes a specified SQL command.

Pascal

```
function PSExecuteStatement(const ASQL: WideString; AParams: TParams; ResultSet: Pointer =
nil): Integer; override;
```

C++

```
virtual __fastcall int PSExecuteStatement(const BSTR ASQL, TParams AParams, void * ResultSet =
nil);
```

Description

If the value of its ResolveToDataSet property is false, a provider component calls PSExecuteStatement (indirectly) to execute SQL statements that it generates for applying updates. Usually, the dataset passes these statements on to its database server for execution.

The ASQL parameter specifies the SQL command to execute.

AParams contains any parameter values that should be applied to ASQL before execution.

ResultSet allows PSExecuteStatement to return a dataset component that contains the results of a SELECT statement. If ResultSet is not nil (Delphi) or NULL (C++), PSExecuteStatement creates a new dataset component as the target of this pointer and fills it with the result set. The caller is responsible for freeing the dataset.

PSExecuteStatement returns the number of rows affected by executing ASQL.

See Also

PSUpdateRecord (see page 7598)

applyupdates (see page 18459)

ResolveToDataSet (see page 18531)

8.1.9.4.78 TCustomADODataSet.PSGetAttributes Method

Returns information that is stored in data packets as Name/Value pairs.

Pascal

```
procedure PSGetAttributes(List: TList); override;
```

C++

```
virtual __fastcall PSGetAttributes(TList List);
```

Description

The provider component calls PSGetAttributes to add information about the dataset to the metadata stored with generated data packets. This information is stored as Name/Value pairs that are added to the list specified by the List parameter.

See Also

DoGetProviderAttributes (see page 18521)

8.1.9.4.79 TCustomADODataSet.PSGetCommandText Method

Gets the SQL command to be executed by PSExecute.

Pascal

```
function PSGetCommandText: string; override;
```

C++

```
virtual __fastcall AnsiString PSGetCommandText();
```

Description

If the provider's Options property includes poAllowCommandText, clients can supply an SQL command along with a call to GetRecords or Execute. This command is passed to the dataset by a call to PSSetCommandText, and subsequently executed

by a call to PSExecute.

See Also

CommandText (see page 8465)

PSExecute (see page 7578)

PSSetCommandText (see page 7585)

GetRecords (see page 18468)

Execute (see page 18466)

Options (see page 18440)

8.1.9.4.80 TCustomADODataSet.PSGetCommandType Method

Gets the command type to be executed by PSExecute.

Pascal

```
function PSGetCommandType: TPSCommandType; override;
```

C++

```
virtual __fastcall TPSCommandType PSGetCommandType();
```

Description

PSGetCommandType gets the command type executed by PSExecute. The type may be a type of SQL command or other command types, such as stored procedures.

See Also

CommandText (see page 8465)

PSExecute (see page 7578)

PSGetCommandText (see page 7579)

Execute (see page 18466)

Options (see page 18440)

8.1.9.4.81 TCustomADODataSet.PSGetDefaultOrder Method

Returns the definition of an index that imposes the default order on the data included in data packets.

Pascal

```
function PSGetDefaultOrder: TIndexDef; override;
```

C++

```
virtual __fastcall TIndexDef PSGetDefaultOrder();
```

Description

The provider component calls PSGetDefaultOrder to generate a default index, called DEFAULT_ORDER, for the records that appear in data packets. This index defines the default sort order for records when they appear in the client dataset on the client.

PSGetDefaultOrder creates a TIndexDef object to describe the default index. The provider that calls PSGetDefaultOrder subsequently frees this TIndexDef object.

See Also

CreateDataPacket (see page 18518)

8.1.9.4.82 TCustomADODataSet.PSGetIndexDefs Method

Returns the definitions of all specified indexes defined for the dataset.

Pascal

```
function PSGetIndexDefs(IndexTypes: TIndexOptions = [ixPrimary..ixNonMaintained]): TIndexDefs;
override;
```

C++

```
virtual __fastcall TIndexDefs PSGetIndexDefs(TIndexOptions IndexTypes =
[ixPrimary..ixNonMaintained]);
```

Description

The provider component calls PSGetIndexDefs to locate an index that contains information it needs. For example, it uses PSGetIndexDefs to locate an index that contains the key fields returned by PSGetKeyFields. This information allows the provider to locate the records that need to change when it applies updates. The provider also calls this method to locate indexes that it adds to the metadata of data packets.

IndexTypes indicates the options required of the returned indexes. PSGetIndexDefs returns all indexes whose Options property includes the specified flags.

PSGetIndexDefs returns a TIndexDefs object that contains all the indexes of the dataset that match the IndexTypes parameter.

See Also

Options (see page 7291)

PSGetKeyFields (see page 7581)

PSGetDefaultOrder (see page 7580)

8.1.9.4.83 TCustomADODataSet.PSGetKeyFieldsW Method

Pascal

```
function PSGetKeyFieldsW: WideString; override;
```

C++

```
virtual __fastcall BSTR PSGetKeyFieldsW();
```

Description

This is PSGetKeyFieldsW, a member of class TCustomADODataSet.

8.1.9.4.84 TCustomADODataSet.PSGetParams Method

Returns the current parameter values of the dataset.

Pascal

```
function PSGetParams: TParams; override;
```

C++

```
virtual __fastcall TParams PSGetParams();
```

Description

The provider component calls PSGetParams to implement its GetParams method.

PSGetParams returns a TParams object that describes the current values of all parameters of the dataset. If the dataset does not have any parameters, PSGetParams returns nil (Delphi) or NULL (C++).

Note: The PSGetParams method should not create a new instance of TParams for the return value. The provider that calls PSGetParams does not free the returned value.

See Also

GetParams (see page 18467)

8.1.9.4.85 TCustomADODataSet.PSGetQuoteCharW Method

Pascal

```
function PSGetQuoteCharW: WideString; override;
```

C++

```
virtual __fastcall BSTR PSGetQuoteCharW();
```

Description

This is PSGetQuoteCharW, a member of class TCustomADODataSet.

8.1.9.4.86 TCustomADODataSet.PSGetTableNameW Method

Pascal

```
function PSGetTableNameW: WideString; override;
```

C++

```
virtual __fastcall BSTR PSGetTableNameW();
```

Description

This is PSGetTableNameW, a member of class TCustomADODataSet.

8.1.9.4.87 TCustomADODataSet.PSGetUpdateException Method

Generates an EUpdateError object based on another exception object.

Pascal

```
function PSGetUpdateException(E: Exception; Prev: EUpdateError): EUpdateError; override;
```

C++

```
virtual __fastcall EUpdateError PSGetUpdateException(Exception E, EUpdateError Prev);
```

Description

The provider component calls PSGetUpdateException when the exception E occurs while applying updates. This method allows the provider to create a single EUpdateError object that encapsulates all the exceptions that occur in an update operation.

PSGetUpdateError determines the error message, context string, and error code from the exception specified by E and creates a new EUpdateError exception that includes that information as well as the information about a previous error as specified by Prev. The context string and error code for E may be specific to the Exception class associated with the dataset. By default, TDataSet generates an EUpdateError with an error code of 1 and an empty context string.

See Also

Create (see page 6733)

8.1.9.4.88 TCustomADODataSet.PSInTransaction Method

Indicates whether actions against the dataset occur in the context of a transaction.

Pascal

```
function PSInTransaction: Boolean; override;
```

C++

```
virtual __fastcall Boolean PSInTransaction();
```

Description

The provider component applies updates within a transaction, if possible. To do so, it first checks whether a transaction is already underway, and if not, generates one using PSStartTransaction. To determine whether a transaction is already underway, the provider calls PSInTransaction.

PSInTransaction returns true if there is a transaction underway, and false otherwise.

See Also

PSStartTransaction (see page 7586)

PSEndTransaction (see page 7578)

8.1.9.4.89 TCustomADODataSet.PSIsSQLBased Method

Indicates whether the dataset includes native SQL support.

Pascal

```
function PSIsSQLBased: Boolean; override;
```

C++

```
virtual __fastcall Boolean PSIsSQLBased();
```

Description

The provider calls PSIsSQLBased to determine whether the dataset supports some form of native SQL. This information is used when generating SQL commands that are executed by PSExecuteStatement.

Even if the dataset is not SQL-based, it may still allow the provider to execute SQL statements for applying updates. For example, BDE-enabled local databases such as Paradox and DBASE provide SQL support via the BDE's local SQL engine, but are not SQL-based. However, table and field names are not specified in the same way for the local SQL engine as they are for native SQL. The provider uses PSIsSQLBased to determine how these names should appear in generated SQL.

Note: The PSIsSQLSupported method indicates whether the dataset can execute SQL commands at all, regardless of whether the dataset is SQL-based.

See Also

PSIsSQLSupported (see page 7584)

PSExecuteStatement (see page 7579)

8.1.9.4.90 TCustomADODataSet.PSIsSQLSupported Method

Indicates whether the dataset can execute SQL statements.

Pascal

```
function PSIsSQLSupported: Boolean; override;
```

C++

```
virtual __fastcall Boolean PSIsSQLSupported();
```

Description

PSIsSQLSupported indicates whether the provider can call PSExecuteStatement to execute an SQL statement. When PSIsSQLSupported returns false, calling PSExecuteStatement generates an exception. The provider can still work with a dataset that returns false from PSIsSQLSupported, but it must set the ResolveToDataSet property to true, or provide data on a read-only basis.

See Also

PSIsSQLBased (see page 7584)

PSExecuteStatement (see page 7579)

ResolveToDataSet (see page 18531)

8.1.9.4.91 TCustomADODataSet.PSReset Method

Resets the dataset so that it is positioned on the first record.

Pascal

```
procedure PSReset; override;
```

C++

```
virtual __fastcall PSReset();
```

Description

The provider calls PSReset to reposition the dataset on the first record before fetching records.

See Also

GetRecords (see page 18468)

AS_GetRecords (see page 16455)

8.1.9.4.92 TCustomADODataSet.PSSetCommandText Method

Assigns a specified SQL command to be executed by PSExecute.

Pascal

```
procedure PSSetCommandText(const CommandText: WideString); override;
```

C++

```
virtual __fastcall PSSetCommandText(const BSTR CommandText);
```

Description

If the provider's Options property includes poAllowCommandText, clients can supply an SQL command along with a call to GetRecords or Execute. This command is passed to the dataset by a call to PSSetCommandText, and subsequently executed

by a call to PSExecute.

The value of the CommandText parameter replaces the dataset's SQL statement (if it has one), or replaces the name of an underlying database table or stored procedure.

See Also

CommandText (see page 8465)

PSExecute (see page 7590)

GetRecords (see page 18468)

Execute (see page 18466)

Options (see page 18440)

8.1.9.4.93 TCustomADODataSet.PSSetParams Method

Assigns the specified parameter values to the dataset.

Pascal

```
procedure PSSetParams(AParams: TParams); override;
```

C++

```
virtual __fastcall PSSetParams(TParams AParams);
```

Description

PSSetParams assigns the parameter values specified by AParams to the parameters of the dataset.

See Also

Params (see page 8489)

PSGetParams (see page 7582)

8.1.9.4.94 TCustomADODataSet.PSStartTransaction Method

Starts a transaction that encapsulates all activity until a call to PSEndTransaction.

Pascal

```
procedure PSStartTransaction; override;
```

C++

```
virtual __fastcall PSStartTransaction();
```

Description

The provider component applies updates within a transaction, if possible. To do so, it calls PSStartTransaction to start a transaction before applying updates, and calls PSEndTransaction when all updates are applied or too many errors are encountered.

Note: TDataSetProvider only starts a transaction (Using PSStartTransaction) if the PSInTransaction method indicates that there is no transaction already established. That is, it does not assume nested transaction support is available.

See Also

PSEndTransaction (see page 7578)

PSInTransaction (see page 7583)

applyupdates (see page 18459)

8.1.9.4.95 TCustomADODataSet.PSUpdateRecord Method

Applies a single update to the underlying database table or tables.

Pascal

```
function PSUpdateRecord(UpdateKind: TUpdateKind; Delta: TDataSet): Boolean; override;
```

C++

```
virtual __fastcall Boolean PSUpdateRecord(TUpdateKind UpdateKind, TDataSet Delta);
```

Description

Before the provider generates SQL statements to apply an update, it calls PSUpdateRecord to let the dataset apply the update in some other fashion. For example, BDE-enabled datasets generate an OnUpdateRecord to allow the application to apply the update and, if the OnUpdateRecord event handler does not apply the update, uses any associated TUpdateSQL object to apply the update.

UpdateKind indicates whether the update is an insertion (ukInsert), deletion (ukDelete), or modification (ukModify).

Delta is the delta datapacket. The current record represents the record to be updated.

PSUpdateRecord returns true if it updates the record, false otherwise. If PSUpdateRecord returns false, the provider generates dynamic SQL to perform the update and calls PSExecuteStatement.

Note: PSUpdateRecord is only called if the provider's ResolveToDataSet property is false.

See Also

OnUpdateRecord (see page 9957)

TUpdateSQL (see page 10229)

applyupdates (see page 18459)

ResolveToDataSet (see page 18531)

PSExecuteStatement (see page 7579)

8.1.9.4.96 TCustomADODataSet.RecordChangeComplete Method

Pascal

```
procedure RecordChangeComplete(adReason: EventReasonEnum; cRecords: Integer; const pError:
Error; var adStatus: EventStatusEnum; const pRecordset: _Recordset); safecall;
```

C++

```
__fastcall RecordChangeComplete(EventReasonEnum adReason, int cRecords, const Error pError,
EventStatusEnum adStatus, const _Recordset pRecordset);
```

Description

This is RecordChangeComplete, a member of class TCustomADODataSet.

8.1.9.4.97 TCustomADODataSet.RecordsetChangeComplete Method

Pascal

```
procedure RecordsetChangeComplete(adReason: EventReasonEnum; const pError: Error; var
adStatus: EventStatusEnum; const pRecordset: _Recordset); safecall;
```

C++

```
__fastcall RecordsetChangeComplete(EventReasonEnum adReason, const Error pError,
EventStatusEnum adStatus, const _Recordset pRecordset);
```

Description

This is RecordsetChangeComplete, a member of class TCustomADODataSet.

8.1.9.4.98 TCustomADODataSet.RefreshParams Method

Pascal

```
procedure RefreshParams;
```

C++

```
__fastcall RefreshParams();
```

Description

This is RefreshParams, a member of class TCustomADODataSet.

8.1.9.4.99 TCustomADODataSet.ReleaseLock Method

Pascal

```
procedure ReleaseLock;
```

C++

```
__fastcall ReleaseLock();
```

Description

This is ReleaseLock, a member of class TCustomADODataSet.

8.1.9.4.100 TCustomADODataSet.Requery Method

Refreshes the recordset.

Pascal

```
procedure Requery(Options: TExecuteOptions = []);
```

C++

```
__fastcall Requery(TExecuteOptions Options = []);
```

Description

Call Requery to refresh the recordset. Requery updates the dataset by re-executing the original command or SQL statement that produced the recordset.

The effects of Requery are the same as calling the dataset's Close method and then its Open method. However, there are circumstances when one means of refreshing the recordset is better than the other. The values in properties like CursorLocation (see page 1207), CursorType (see page 1208), and LockType (see page 1218) cannot be changed while the dataset is open, so Requery can only refresh the recordset using the existing values in these properties. To refresh the recordset using different values for these properties, effect the refresh using the Close and Open methods.

Options is a TExecuteOptions (see page 1316) value that specifies the characteristics of the command execution affected by the requery that produces the recordset for the dataset.

ADONETDb.TCustomADONETConnector.LoadFromFile

Close (see page 6920)

Open (see page 6976)

CursorLocation

CursorType

LockType

8.1.9.4.101 TCustomADODataSet.SaveToFile Method

Saves a recordset to a file.

Pascal

```
procedure SaveToFile(const FileName: WideString = ''; Format: TPersistFormat = pfADTG);
```

C++

```
__fastcall SaveToFile(const BSTR FileName = '', TPersistFormat Format = pfADTG);
```

Description

Call SaveToFile to save the current recordset to a file. If the destination file already exists, it is overwritten.

FileName is a string containing the name of the destination file. This file remains open from the first call to SaveToFile until the dataset is closed. This file can be read by other applications while it is open, but they cannot write to the file.

Format specifies the file format for the saved recordset. By default, Format is pfADTG (Advanced Data TableGram format).

Note: Microsoft recommends using a client-side cursor (the dataset is opened with a CursorLocation (see page 1207) property value of clUseClient). This way, if the provider used does not support saving the recordset the client cursor will provide the necessary functionality.

See Also

LoadFromFile (see page 1178)

CursorLocation (see page 1207)

8.1.9.4.102 TCustomADODataSet.Seek Method

Searches for a record using the current index.

Pascal

```
function Seek(const KeyValues: Variant; SeekOption: TSeekOption = soFirstEQ): Boolean;
```

C++

```
__fastcall Boolean Seek(const Variant KeyValues, TSeekOption SeekOption = soFirstEQ);
```

Description

Call Seek to find a record with a specified value (or values) in the field (or fields) on which the current index is based. An index must be active to use Seek. The field used for the search is that of the currently active index. Seek moved the record pointer of the dataset based on the success of the search. If the search finds a record, the record pointer is moved to that record. If Seek does not find a record matching the value in KeyValues using the comparison method specified in SeekOption, the record pointer is positioned to the end of the dataset. Seek returns a boolean value reflecting the success of the search: true if a record

was found or false if no record was found.

```
SuccessVar := ADODataSet1.Seek('Jones', soFirstEQ);
SuccessVar = ADODataSet1->Seek("Jones", soFirstEQ);
```

If the current index is based on more than one field, search values supplied in the Seek method must be for all fields sequentially from left to right in the index expression. That is, if the index is based on three fields, the search can be on the first field, the first and second fields, or on the first and second and third fields. It cannot be based only on the third field or on a combination of the first and third fields. To search based on multiple fields, pass a variant array to the Seek method.

KeyValues is the value to search for or multiple values if the index is based on multiple fields.

```
ADODataSet1.Seek(VarArrayOf([90030, 90020]), soFirstEQ);
ADODataSet1->Seek(VarArrayOf(OPENARRAY(Variant, (90030, 90020))), soFirstEQ);
```

SeekOption specifies the type of comparison made in determining whether the search was successful. SeekOption can be one of the six constants:

Seek Option	Meaning
soFirstEQ	Record pointer positioned at the first matching record, if one is found, or at the end of the dataset if one is not found.
soLastEQ	Record pointer positioned at the last matching record, if one is found, or at the end of the dataset if one is not found.
soAfterEQ	Record pointer positioned at matching record, if found, or just after where that matching record would have been found.
soAfter	Record pointer positioned just after where a matching record would have been found.
soBeforeEQ	Record pointer positioned at matching record, if found, or just before where that matching record would have been found.
soBefore	Record pointer positioned just before where a matching record would have been found.

Using the Seek method depends on the settings of a few properties. IndexName (see page 1217) must be set to activate the index to use, CommandType (see page 1205) must be cmdTableDirect (for TADODataSet (see page 1041), set TableDirect to true for a TADOTable (see page 1125)), CursorLocation (see page 1207) must be clUseServer, and CursorType (see page 1208) must be ctKeySet.

Note: The VCL Seek method is a direct implementation of the Seek method for the ADO Recordset (see page 1221) object. At the time of this writing, this method is only supported for use with Microsoft Access2000 and the Jet 4 provider.

8.1.9.4.103 TCustomADODataSet.SetBlockReadSize Method

Pascal

```
procedure SetBlockReadSize(Value: Integer); override;
```

C++

```
virtual __fastcall SetBlockReadSize(int Value);
```

Description

This is SetBlockReadSize, a member of class TCustomADODataSet.

8.1.9.4.104 TCustomADODataSet.SetBookmarkData Method

Pascal

```
procedure SetBookmarkData(Buffer: PChar; Data: Pointer); override;
```

C++

```
virtual __fastcall SetBookmarkData(const char * Buffer, void * Data);
```

Description

This is SetBookmarkData, a member of class TCustomADODataSet.

8.1.9.4.105 TCustomADODataSet.SetBookmarkFlag Method

Pascal

```
procedure SetBookmarkFlag(Buffer: PChar; Value: TBookmarkFlag); override;
```

C++

```
virtual __fastcall SetBookmarkFlag(const char * Buffer, TBookmarkFlag Value);
```

Description

This is SetBookmarkFlag, a member of class TCustomADODataSet.

8.1.9.4.106 TCustomADODataSet.SetCommandText Method

Pascal

```
procedure SetCommandText(const Value: WideString);
```

C++

```
__fastcall SetCommandText(const BSTR Value);
```

Description

This is SetCommandText, a member of class TCustomADODataSet.

8.1.9.4.107 TCustomADODataSet.SetConnection Method

Pascal

```
procedure SetConnection(const Value: TADOConnection); virtual;
```

C++

```
virtual __fastcall SetConnection(const TADOConnection Value);
```

Description

This is SetConnection, a member of class TCustomADODataSet.

8.1.9.4.108 TCustomADODataSet.SetConnectionFlag Method

Pascal

```
function SetConnectionFlag(Flag: Integer; Value: Boolean): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean SetConnectionFlag(int Flag, Boolean Value);
```

Description

This is SetConnectionFlag, a member of class TCustomADODataSet.

8.1.9.4.109 TCustomADODataSet.SetDataSource Method

Pascal

```
procedure SetDataSource(const Value: TDataSource); virtual;
```

C++

```
virtual __fastcall SetDataSource(const TDataSource Value);
```

Description

This is SetDataSource, a member of class TCustomADODataSet.

8.1.9.4.110 TCustomADODataSet.SetDetailFilter Method

Pascal

```
function SetDetailFilter: Boolean;
```

C++

```
__fastcall Boolean SetDetailFilter();
```

Description

This is SetDetailFilter, a member of class TCustomADODataSet.

8.1.9.4.111 SetFieldData Method

This is the overview for the SetFieldData method overload.

Overload List

	Name	Description
	TCustomADODataSet.SetFieldData (TField, Pointer) (see page 1196)	This is SetFieldData, a member of class TCustomADODataSet.
	TCustomADODataSet.SetFieldData (TField, Pointer, Boolean) (see page 1196)	This is SetFieldData, a member of class TCustomADODataSet.

8.1.9.4.111.1 TCustomADODataSet.SetFieldData Method (TField, Pointer)

Pascal

```
procedure SetFieldData(Field: TField; Buffer: Pointer); override;
```

C++

```
virtual __fastcall SetFieldData(TField Field, void * Buffer);
```

Description

This is SetFieldData, a member of class TCustomADODataSet.

8.1.9.4.111.2 TCustomADODataSet.SetFieldData Method (TField, Pointer, Boolean)

Pascal

```
procedure SetFieldData(Field: TField; Buffer: Pointer; NativeFormat: Boolean); override;
```

C++

```
virtual __fastcall SetFieldData(TField Field, void * Buffer, Boolean NativeFormat);
```

Description

This is SetFieldData, a member of class TCustomADODataSet.

8.1.9.4.112 TCustomADODataSet.SetFiltered Method

Pascal

```
procedure SetFiltered(Value: Boolean); override;
```

C++

```
virtual __fastcall SetFiltered(Boolean Value);
```

Description

This is SetFiltered, a member of class TCustomADODataSet.

8.1.9.4.113 TCustomADODataSet.SetFilterOptions Method

Pascal

```
procedure SetFilterOptions(Value: TFilterOptions); override;
```

C++

```
virtual __fastcall SetFilterOptions(TFilterOptions Value);
```

Description

This is SetFilterOptions, a member of class TCustomADODataSet.

8.1.9.4.114 TCustomADODataSet.SetFilterText Method

Pascal

```
procedure SetFilterText(const Value: string); override;
```

C++

```
virtual __fastcall SetFilterText(const AnsiString Value);
```

Description

This is SetFilterText, a member of class TCustomADODataSet.

8.1.9.4.115 TCustomADODataSet.SetParamsFromCursor Method

Pascal

```
procedure SetParamsFromCursor;
```

C++

```
__fastcall SetParamsFromCursor();
```

Description

This is SetParamsFromCursor, a member of class TCustomADODataSet.

8.1.9.4.116 TCustomADODataSet.SetRecNo Method

Pascal

```
procedure SetRecNo(Value: Integer); override;
```

C++

```
virtual __fastcall SetRecNo(int Value);
```

Description

This is SetRecNo, a member of class TCustomADODataSet.

8.1.9.4.117 TCustomADODataSet.Supports Method

Indicates whether a dataset supports certain types of operations.

Pascal

```
function Supports(CursorOptions: TCursorOptions): Boolean;
```

C++

```
__fastcall Boolean Supports(TCursorOptions CursorOptions);
```

Description

Call Supports to determine whether the active recordset supports the cursor operations specified in CursorOptions. Supports will indicate the active recordset, as defined, will support such cursor functionality as adding new rows, using ADO bookmarks, deleting rows, and updating rows. Other cursor functionality can be specified.

CursorOptions specifies one or more TCursorOptions (see page 1314) cursor operations.

If the recordset is active Supports returns a boolean whether the specified cursor operations are supported by the recordset. If all specified cursor operations are supported, Supports returns true, otherwise Supports returns false (one or more of the specified cursor operations are not supported by the recordset).

8.1.9.4.118 TCustomADODataSet.UpdateBatch Method

Writes pending batch updates to disk.

Pascal

```
procedure UpdateBatch(AffectRecords: TAffectRecords = arAll);
```

C++

```
__fastcall UpdateBatch(TAffectRecords AffectRecords = arAll);
```

Description

Call UpdateBatch to write any pending updates to disk for a dataset that is in batch update mode to the associated database.

The AffectRecords parameter may be any one of the following TAffectRecords (see page 1290) values:

Option	Meaning
arCurrent	Only the updates for the current row are applied.
arFiltered	Only updates for rows matching the current filter are applied.
arAll	Updates for all rows are applied.
arAllChapters	Update affects all chapters (ADO chapters)

Note: : To use batch updating, the CursorType (see page 1208) property of the dataset component must be either ctKeySet (the default) or ctStatic and the LockType (see page 1218) property must be ltBatchOptimistic.

See Also

LockType (see page 1218)

Filtered (see page 1214)

RecordStatus (see page 1222)

FilterGroup (see page 1214)

CancelBatch (see page 1161)

CursorType (see page 1208),

8.1.9.4.119 TCustomADODataSet.UpdateIndexDefs Method

Pascal

```
procedure UpdateIndexDefs; override;
```

C++

```
virtual __fastcall UpdateIndexDefs();
```

Description

This is UpdateIndexDefs, a member of class TCustomADODataSet.

8.1.9.4.120 TCustomADODataSet.UpdateRecordSetPosition Method

Pascal

```
procedure UpdateRecordSetPosition(Buffer: PChar);
```

C++

```
__fastcall UpdateRecordSetPosition(const char * Buffer);
```

Description

This is UpdateRecordSetPosition, a member of class TCustomADODataSet.

8.1.9.4.121 TCustomADODataSet.UpdateStatus Method

Indicates the update status of the current record.

Pascal

```
function UpdateStatus: TUpdateStatus; override;
```

C++

```
virtual __fastcall TUpdateStatus UpdateStatus();
```

Description

Call UpdateStatus for datasets opened in batch update mode to determine the update status of the currently active record. UpdateStatus only provides useful information when the dataset has been opened in batch update mode. Otherwise there cannot be any unapplied updates.

Note: : To use batch updating, the CursorType (see page 1208) property of the dataset component must be either ctKeySet (the default) or ctStatic and the LockType (see page 1218) property must be ltBatchOptimistic.

See Also

LockType (see page 1218)

CancelBatch (see page 1161)

CursorType (see page 1208),

8.1.9.4.122 TCustomADODataSet.WillChangeField Method

Pascal

```
procedure WillChangeField(cFields: Integer; Fields: OleVariant; var adStatus: EventStatusEnum;
const pRecordset: _Recordset); safecall;
```

C++

```
__fastcall WillChangeField(int cFields, OleVariant Fields, EventStatusEnum adStatus, const
_Recordset pRecordset);
```

Description

This is WillChangeField, a member of class TCustomADODataSet.

8.1.9.4.123 TCustomADODataSet.WillChangeRecord Method

Pascal

```
procedure WillChangeRecord(adReason: EventReasonEnum; cRecords: Integer; var adStatus:
EventStatusEnum; const pRecordset: _Recordset); safecall;
```

C++

```
__fastcall WillChangeRecord(EventReasonEnum adReason, int cRecords, EventStatusEnum adStatus,
const _Recordset pRecordset);
```

Description

This is WillChangeRecord, a member of class TCustomADODataSet.

8.1.9.4.124 TCustomADODataSet.WillChangeRecordset Method

Pascal

```
procedure WillChangeRecordset(adReason: EventReasonEnum; var adStatus: EventStatusEnum; const
pRecordset: _Recordset); safecall;
```

C++

```
__fastcall WillChangeRecordset(EventReasonEnum adReason, EventStatusEnum adStatus, const
_Recordset pRecordset);
```

Description

This is WillChangeRecordset, a member of class TCustomADODataSet.

8.1.9.4.125 TCustomADODataSet.WillMove Method

Pascal

```
procedure WillMove(adReason: EventReasonEnum; var adStatus: EventStatusEnum; const pRecordset:
_Recordset); safecall;
```

C++

```
__fastcall WillMove(EventReasonEnum adReason, EventStatusEnum adStatus, const _Recordset
pRecordset);
```

Description

This is WillMove, a member of class TCustomADODataSet.

8.1.9.5 TCustomADODataSet Properties

The properties of the TCustomADODataSet class are listed here.

Protected Properties

	Name	Description
R	Command (see page 1204)	Provides access to the internal command object that executes commands for the dataset.
	CommandText (see page 1204)	This is CommandText, a member of class TCustomADODataSet.
	CommandTimeout (see page 1204)	Specifies amount of time to attempt execution of a command.
	CommandType (see page 1205)	Specifies the type of command to execute.
	DataSource (see page 1208)	Represents the data source of another dataset that supplies values to the dataset.
	FieldDefs (see page 1210)	Points to the list of field definitions for the dataset.
	IndexDefs (see page 1215)	Contains the definitions of the indexes for the current table.
	IndexFieldNames (see page 1216)	Lists the columns to use for a persistent sort of the recordset.
R	MasterDataLink (see page 1218)	Manages the relationship between the ADO dataset and a master table.
	MasterFields (see page 1219)	Specifies field or fields on which a Master-Detail link is based.
	ParamCheck (see page 1220)	Specifies whether the parameter list for an ADO dataset component is regenerated if the SQL changes at runtime.
	Parameters (see page 1220)	Contains the collection of parameters for an SQL statement.
	Prepared (see page 1221)	Specifies whether the command is prepared before execution.
	StoreDefs (see page 1223)	Specifies whether field definitions are stored with the ADO dataset.

Public Properties

	Name	Description
	DesignerData (see page 1208)	Stores custom data.

	EnableBCD (see page 1209)	Specifies whether to treat numeric fields as floating-point or BCD.
	FilterGroup (see page 1214)	Filters a recordset based on row update status.
R	IndexFieldCount (see page 1216)	Indicates the number of fields that comprise the current key.
	IndexFields (see page 1217)	Retrieves or sets a field for an index.
	IndexName (see page 1217)	Specifies the currently active index.
R	Properties (see page 1221)	This is Properties, a member of class TCustomADODataSet.
	Recordset (see page 1221)	This is Recordset, a member of class TCustomADODataSet.
R	RecordsetState (see page 1222)	This is RecordsetState, a member of class TCustomADODataSet.
R	RecordStatus (see page 1222)	Indicates the status of the current row.
	Sort (see page 1222)	Specifies the sort order of the recordset.

Published Properties

	Name	Description
	Active (see page 1201)	Specifies whether or not a dataset is open.
	AutoCalcFields (see page 1203)	Determines when the OnCalcFields event is triggered and when lookup field values are calculated.
	CacheSize (see page 1203)	Specifies the size of the cache for the dataset.
	Connection (see page 1205)	Specifies the ADO connection component to use.
	ConnectionString (see page 1206)	Specifies the connection information for the data store.
	CursorLocation (see page 1207)	Specifies whether the cursor for the connection is client-side or server-side.
	CursorType (see page 1208)	Specifies type of cursor an ADO dataset uses.
	ExecuteOptions (see page 1209)	Specifies the characteristics of a command execution.
	Filter (see page 1212)	Specifies the text of the current filter for a recordset.
	Filtered (see page 1214)	Specifies whether or not filtering is active for a dataset.
	LockType (see page 1218)	Specifies the lock type to use when opening a dataset.
	MarshalOptions (see page 1218)	Specifies which records are marshaled back to the server.
	MaxRecords (see page 1219)	Specifies how many rows to return in a result set.

8.1.9.5.1 TCustomADODataSet.Active Property

Specifies whether or not a dataset is open.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Use Active to determine or set whether a dataset is populated with data. When Active is false, the dataset is closed; the dataset cannot read or write data and data-aware controls can not use it to fetch data or post edits. When Active is true, the dataset can be populated with data. It can read data from a database or other source (such as a provider). Depending on the CanModify property, active datasets can post changes.

Setting Active to true:

1. Generates a BeforeOpen event.
2. Sets the dataset state to dsBrowse.
3. Establishes a way to fetch data (typically by opening a cursor).
4. Generates an AfterOpen event.

If an error occurs while opening the dataset, dataset state is set to dsInactive, and any cursor is closed.

Setting Active to false:

1. Triggers a BeforeClose event.

2. Sets the State property to dsInactive.
3. Closes the cursor.
4. Triggers an AfterClose event.

An application must set Active to false before changing other properties that affect the status of a database or the controls that display data in an application.

Note: Calling the Open method sets Active to true; calling the Close method sets Active to false.

Delphi Examples:

```
{
This example requires a database with the following name or
in the form of a *.DB file in the following path.  The table
should be closed when changing the database.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Customers.Active := False;
  try
  { First try to use an alias }
    Customers.DatabaseName := 'DBDEMOS';
    Customers.Active := True;
  except
    on EDatabaseError do
    begin
      { If that fails, try to use the drive and directory }
      Customers.TableName := 'Flights';
      Customers.DatabaseName :=
        'c:\Documents and Settings\All Users\Documents\RAD
Studio\5.0\Demos\IntraWeb\Win32\FlightInformation\Data';
      Customers.Active := True;
    end;
  end;
end;
```

Using Datasets with Decision Support Components

Making the Table a Detail of Another Dataset

Opening and Closing Datasets

Fetching the Data

8.1.9.5.2 TCustomADODataSet.AutoCalcFields Property

Determines when the OnCalcFields event is triggered and when lookup field values are calculated.

Pascal

```
property AutoCalcFields: Boolean;
```

C++

```
__property Boolean AutoCalcFields;
```

Description

Set AutoCalcFields to control when the OnCalcFields event is triggered to update calculated fields and when lookup fields are calculated.

A calculated field is one that derives its value from the values of one or more fields in the active record, sometimes with additional processing. Lookup fields are fields whose values come from a secondary dataset or lookup cache.

Note: Unidirectional datasets support calculated fields but not unidirectional fields. For unidirectional datasets, OnCalcFields only controls when calculated fields are updated.

When AutoCalcFields is true (the default), Lookup fields are recalculated and OnCalcFields is triggered when:

The dataset is opened.

The dataset is put into dsEdit state.

Focus moves from one visual control to another, or from one column to another in a data-aware grid and modifications have been made to the record.

When AutoCalcFields is false, Lookup fields are recalculated and the OnCalcFields event occurs only when

The dataset is opened.

The dataset is put into dsEdit state.

A record is retrieved from a database.

If an application permits users to change data, OnCalcFields is frequently triggered. In these cases an application may set AutoCalcFields to false to reduce the frequency with which the OnCalcFields event occurs and with which lookup values are fetched.

See Also

OnCalcFields (see page 7053)

Calculating Fields

8.1.9.5.3 TCustomADODataSet.CacheSize Property

Specifies the size of the cache for the dataset.

Pascal

```
property CacheSize: Integer;
```

C++

```
__property int CacheSize;
```

Description

Set CacheSize to control how many rows the ADO dataset's provider keeps cached in its buffer and how many to retrieve at one

time into local memory. Default value of CacheSize is 1 and the minimum allowed value is 1.

For example, if CacheSize is set to 20, when the dataset is first activated the associated provider retrieves the first 20 rows into local memory. As the row pointer is moved through this recordset, the provider retrieves the data from the local memory buffer. If the dataset's row pointer moves beyond the last of these 20 buffered rows, the provider retrieves the next 20.

CacheSize represents the maximum number of rows to retrieve at one time. If the number of rows remaining to be retrieved is less than CacheSize, the remaining rows are retrieved and no exception is raised. The number of rows that can be returned by the provider can be less than all of the rows if the ADO dataset component's MaxRecords (see page 1219) property is set to other than the default (all rows).

Note: The rows retrieved from the cache do not reflect any changes made by other concurrent users of the data.

See Also

BlockReadSize

MaxRecords (see page 1219)

8.1.9.5.4 TCustomADODataSet.Command Property

Provides access to the internal command object that executes commands for the dataset.

Pascal

```
property Command: TADOCommand;
```

C++

```
__property TADOCommand Command;
```

Description

Applications can't use the protected Command property. Command is an internal TADOCommand (see page 984) component that the dataset uses to execute commands against the data store. For example, when the dataset is opened, the ADO dataset uses Command to execute the command that returns the records in the dataset.

See Also

Open (see page 6976)

commandtext (see page 1204)

8.1.9.5.5 TCustomADODataSet.CommandText Property

Pascal

```
property CommandText: WideString;
```

C++

```
__property BSTR CommandText;
```

Description

This is CommandText, a member of class TCustomADODataSet.

8.1.9.5.6 TCustomADODataSet.CommandTimeout Property

Specifies amount of time to attempt execution of a command.

Pascal

```
property CommandTimeout: Integer;
```

C++

```
__property int CommandTimeout;
```

Description

Use CommandTimeout to specify the amount of time that expires before an attempt to execute a command is considered unsuccessful. Measured in seconds, the default value for CommandTimeout is 30.

If a command is successfully executed prior to the expiration of the seconds specified, CommandTimeout has no effect.

See Also

commandtext (see page 1204)

CommandType (see page 1205)

8.1.9.5.7 TCustomADODataSet.CommandType Property

Specifies the type of command to execute.

Pascal

```
property CommandType: TCommandType;
```

C++

```
__property TCommandType CommandType;
```

Description

Set CommandType to indicate the type of command that is contained in the CommandText (see page 1204) property. The value in CommandType should agree with that of CommandText (see page 1204). For instance, if CommandText (see page 1204) is the name of a table, CommandType should be cmdTable or cmdTableDirect.

The default value of CommandType is cmdUnknown. While CommandType may be left as cmdUnknown for all commands, better performance will be realized if CommandType is used to explicitly indicate the type of the command. When the type cmdUnknown is used, ADO must evaluate the command to determine its type, which slows the operation.

```
with ADODataSet1 do begin
  CommandType := cmdText;
  CommandText := 'SELECT * FROM CustomerTable';
  Open;
end;
ADODataSet1->CommandType = cmdText;
ADODataSet1->CommandText = "SELECT * FROM CustomerTable";
ADODataSet1->Open();
```

See Also

commandtext (see page 1204)

Open (see page 6976)

CommandTimeout (see page 1204)

Using TADODataSet

8.1.9.5.8 TCustomADODataSet.Connection Property

Specifies the ADO connection component to use.

Pascal

```
property Connection: TADOConnection;
```

C++

```
__property TADOConnection Connection;
```

Description

Use Connection to specify an ADO connection object to use to connect to an ADO data store.

At design-time, select from the list of available TADOConnection (see page 1001) objects (if any have been added to the application) invoked from the Object Inspector.

At runtime, set Connection to reference an existing TADOConnection (see page 1001) object.

ADOTable1.Connection := ADOConnection1;

ADOTable1->Connection = ADOConnection1;

Note: a connection to an ADO database can be established either using a separate TADOConnection (see page 1001) object (configured to connect to the database) or directly with a valid entry in the ConnectionString (see page 1206) property.

Connecting to a Data Store Using TADOConnection

Connecting an ADO Dataset to a Data Store

Using TADODataSet

Connecting Directly to a Database Server

8.1.9.5.9 TCustomADODataSet.ConnectionString Property

Specifies the connection information for the data store.

Pascal

```
property ConnectionString: WideString;
```

C++

```
__property BSTR ConnectionString;
```

Description

Set ConnectionString to specify the information needed to connect the ADO dataset component to the data store. The value used for ConnectionString consists of one or more arguments ADO uses to establish the connection. Specify multiple arguments as a list with individual arguments separated by semicolons.

```
ADOQuery1.ConnectionString := 'Provider=ProviderRef;Remote Server=ServerRef';
ADOQuery1->ConnectionString = "Provider=ProviderRef;Remote Server=ServerRef";
```

At design-time, select from the list of available ADO database connections invoked from the Object Inspector.

A connection string may be saved to file for later use. Specify only the name of such a file in ConnectionString to reuse a saved connection string.

The connection string may also contain login information such as user ID and password, for automated logins.

ADO supports the following four arguments for connection strings. Any other arguments (such as a user ID and password) are

not processed by ADO and simply passed on to the provider.

Argument	Meaning
Provider (see page 18419)	The name of the provider to use for the connection.
File name	The name of a file containing connection information.
Remote Provider (see page 18419)	The name of the provider to use for a client-side connection.
Remote Server	The path name of the server to use for a client-side connection.

Note: After opening a connection, the contents of ConnectionString may be changed by ADO. One example of this behavior is when ADO-defined arguments are mapped to their provider equivalents.

Connection (see page 1205)

ConnectionString (see page 1024)

Using Implicit Connections

Connecting an ADO Dataset to a Data Store

Using TADODataSet

Connecting Directly to a Database Server

8.1.9.5.10 TCustomADODataSet.CursorLocation Property

Specifies whether the cursor for the connection is client-side or server-side.

Pascal

```
property CursorLocation: TCursorLocation;
```

C++

```
__property TCursorLocation CursorLocation;
```

Description

Use CursorLocation to indicate whether the cursors that use the connection object to connect to the ADO datastore use a client-side or server-side cursor library. CursorLocation only affects connections opened after the property is set. The default value for CursorLocation is clUseClient.

A client-side cursor offers more flexibility. All data is retrieved to the local machine and then operated on there, allowing operations not normally supported by servers like sorting and resorting the data and additional filtering. SQL statements are executed at the server, so for statements that restrict the result set with a WHERE clause, only the reduced result set is retrieved to a local cursor.

A server-side cursor offers less flexibility, but may be more advantageous (or necessary) for large result sets. Using a server-side cursor becomes necessary when the sheer size of a result set exceeds the available disk space that would be needed to create the client-side cursor. Also, many servers only support unidirectional cursors. This would preclude moving the record pointer in the dataset backward (even one record) through the result set.

See Also

CursorType (see page 1208)

8.1.9.5.11 TCustomADODataSet.CursorType Property

Specifies type of cursor an ADO dataset uses.

Pascal

```
property CursorType: TCursorType;
```

C++

```
__property TCursorType CursorType;
```

Description

Set CursorType to indicate the type of cursor the ADO dataset uses for the recordset when it is opened. CursorType must be set prior to activating the dataset component. Among other cursor aspects, CursorType affects directional scrolling through a recordset and the visibility of changes made by other users.

The default value of CursorType is ctKeyset.

See Also

CursorLocation (see page 1207)

Opening the Dataset in Batch Update Mode

8.1.9.5.12 TCustomADODataSet.DataSource Property

Represents the data source of another dataset that supplies values to the dataset.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

As implemented in TDataSet, the DataSource property is always nil (Delphi) or NULL (C++).

Descendant dataset classes that support specifying a data source redeclare and implement methods for getting and setting the DataSource property.

Establishing Master/detail Relationships Using Parameters

8.1.9.5.13 TCustomADODataSet.DesignerData Property

Stores custom data.

Pascal

```
property DesignerData: string;
```

C++

```
__property AnsiString DesignerData;
```

Description

Component writers use this property for storing designer-specific information with the TCustomADODataSet (see page 1145) descendent component. The VCL system does not use this property or its value at all. Use must be implemented by the programmer.

8.1.9.5.14 TCustomADODataSet.EnableBCD Property

Specifies whether to treat numeric fields as floating-point or BCD.

Pascal

```
property EnableBCD: Boolean;
```

C++

```
__property Boolean EnableBCD;
```

Description

Use the EnableBCD property to specify how fields are mapped to field classes. If EnableBCD is true, (the default value) adDecimal and adNumeric fields are mapped to the TBCDField class when field objects are created. If EnableBCD is false, the fields are mapped to the TFloatField class.

EnableBCD determines whether numeric and decimal fields are translated as floating-point values or binary coded decimal (BCD) values. BCD values eliminate the rounding errors associated with floating point math (such as a 3 * (2/3) resulting in 2.00000000001).

If persistent field objects are used (such as those created using the Fields Editor), the field class associated with a given field can contradict the setting of EnableBCD. Three numeric fields in the same table could, for instance, each be represented by a TFloatField, a TBCDField, and a TVariantField – regardless of the value in EnableBCD. Select field classes on a field-by-field basis for greater flexibility.

Note: For numeric values with more than 4 digits to the right of the decimal place, use of TFloatField is generally better. This is because TBCDField uses the currency data type that has a fixed scale of 4 decimal places.

Note: For fields with very large numbers of more than 19 significant digits, you can use TVariantField type persistent field objects. The TFloatField and TBCDField classes lack sufficient capacity for fields of this size. TVariantField allows the getting and setting of the field data as strings, preventing without loss of data due to insufficient capacity. However, arithmetic operations cannot be performed on numbers accessed through a TVariantField object.

See Also

TBCDField (see page 6776)

TFloatField (see page 7229)

8.1.9.5.15 TCustomADODataSet.ExecuteOptions Property

Specifies the characteristics of a command execution.

Pascal

```
property ExecuteOptions: TExecuteOptions;
```

C++

```
__property TExecuteOptions ExecuteOptions;
```

Description

Set ExecuteOptions to control the characteristics of a command (a data retrieval operation) executed from the ADO dataset

component.

See Also

Fetching Records Asynchronously

8.1.9.5.16 TCustomADODataSet.FieldDefs Property

Points to the list of field definitions for the dataset.

Pascal

```
property FieldDefs: TFieldDefs;
```

C++

```
__property TFieldDefs FieldDefs;
```

Description

FieldDefs lists the field definitions for a dataset. While an application can examine FieldDefs to explore the field definitions for a dataset, it should not change these definitions unless creating a new table with CreateTable or CreateDataSet.

To access fields and field values in a dataset, use the Fields, AggFields, and FieldValues properties, and the FieldsByName method.

Note: If the dataset includes object field descendants, FieldDefs represents a hierarchical view of the data, meaning that the definitions include object field definitions. To determine the definitions in a flattened view, use FieldDefList instead.

C++ Examples:

```
/*
The following code creates and activates a client dataset in
the form's OnCreate event handler.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TFieldDefs *pDefs = CDS2->FieldDefs;
  TFieldDef *pDef = pDefs->AddFieldDef();
  pDef->DataType = ftInteger;
  pDef->Name = "Field1";

  pDef = pDefs->AddFieldDef();
  pDef->DataType = ftString;
  pDef->Size = 10;
  pDef->Name = "Field2";

  TIndexDef *pIDef = CDS2->IndexDefs->AddIndexDef();
  pIDef->Fields = "Field1";
  pIDef->Name = "IntIndex";

  CDS2->CreateDataSet();
}
```

Delphi Examples:

```
{
The following code creates and activates a client dataset in
the form's OnCreate event handler.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  with CDS2 do
  begin
```

```
      with FieldDefs.AddFieldDef do
      begin
        DataType := ftInteger;
        Name := 'Field1';
      end;
      with FieldDefs.AddFieldDef do
      begin
        DataType := ftString;
        Size := 10;
        Name := 'Field2';
      end;
      with IndexDefs.AddIndexDef do
      begin
        Fields := 'Field1';
        Name := 'IntIndex';
      end;
      CreateDataSet;
    end;
  end;
  { The following example shows how to create a table. }
  procedure TForm1.Button1Click(Sender: TObject);
  begin
    Table1.Close;
    Table1.DeleteTable;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  var
    i: Integer;
  begin
    Table1:= TTable.Create(Form1);
    with Table1 do
    begin
      DatabaseName := 'DBDEMOS';
      TableType := ttParadox;
      TableName := 'CustInfo';
      Table1.Active := False;
      { Don't overwrite an existing table }
      if Table1.Exists then
        MessageDlg('CustInfo table already exists.', mtWarning, [mbOK], 0)
      else
      begin
        { The Table component must not be active }
        { First, describe the type of table and give }
        { it a name }
        { Next, describe the fields in the table }
        with FieldDefs do
        begin
          Clear;
          with AddFieldDef do
          begin
            Name := 'Field1';
            DataType := ftInteger;
            Required := True;
          end;
          with AddFieldDef do
          begin
            Name := 'Field2';
            DataType := ftString;
            Size := 30;
          end;
        end;
        { Next, describe any indexes }
        with IndexDefs do
        begin
          Clear;
```

```
          { The 1st index has no name because it is
          { a Paradox primary key }
          with AddIndexDef do
          begin
            Name := '';
            Fields := 'Field1';
            Options := [ixPrimary];
          end;
          with AddIndexDef do
          begin
            Name := 'Fld2Indx';
            Fields := 'Field2';
            Options := [ixCaseInsensitive];
          end;
        end;
        { Call the CreateTable method to create the table }
        CreateTable;
        Table1.Active:= True;
        for i := 1 to 20 do
          Table1.AppendRecord([i*111, i*222]);
      end;
    end;
    DS2.DataSet:= Table1;
    DBGrid2.DataSource.DataSet:= Table1;
    Table1.Active:= True;
  end;
```

Creating and Deleting Tables

8.1.9.5.17 TCustomADODataSet.Filter Property

Specifies the text of the current filter for a recordset.

Pascal

```
property Filter: string;
```

C++

```
__property AnsiString Filter;
```

Description

Use Filter to specify a recordset filter. When filtering is applied to a recordset by setting the Filtered (see page 1214) property to true, only those records that meet a filter's conditions are available to the application. Filter contains the expression used to evaluate the rows in the recordset. At design-time, enter the filter expression into the editing cell for the Filter property within the Object Inspector. At runtime, assign a string containing the filter expression to the Filter property.

The filter expression below displays only those rows where the State field is "CA" or "MA":

```
State = 'CA' OR State = 'MA'
```

The following runtime example shows how to assign that filter expression to the Filter property and activate the filtering.

```
with ADODataSet1 do begin
  Filtered := False;
  Filter := 'State = ' + QuotedStr('CA') + ' OR ' +
    'State = ' + QuotedStr('CA');
  Filtered := True;
end;
ADODataSet1->Filtered = false;
ADODataSet1->Filter = "State = " + QuotedStr("CA") + " OR " + "State = " + QuotedStr("CA");
ADODataSet1->Filtered = true;
```

When a filter is set, Blank records do not appear unless explicitly included in the filter. To include rows based on blank, (or "NULL") values in table columns, compare the column to NULL in the expression. For example:

```
with ADODataSet1 do begin
  Filtered := False;
  Filter := 'State = ' + QuotedStr('CA') + ' OR ' +
    'State = NULL';
  Filtered := True;
end;
ADODataSet1->Filtered = false;
ADODataSet1->Filter = "State = " + QuotedStr("CA") + " OR " + "State = NULL";
ADODataSet1->Filtered = true;
```

When a field name contains spaces, you must enclose the field name in brackets. For example:

```
[Home State] = 'CA' or [Home State] = 'MA'
```

Filter expressions on remote SQL tables and on client datasets support field comparisons. For example:

```
Field1 > Field2
```

The FilterOptions property controls case sensitivity and filtering on partial comparisons.

Tip: Applications can set Filter at runtime to change the filtering condition for a dataset at (for example, in response to user input).

Note: : include a space between comparison values and comparison operators in filter expressions. For instance, ensure that there is a space after the field name and before the operator.

See Also

Filtered (see page 1214)

OnFilterRecord (see page 7055)

Locate (see page 1179)

Lookup (see page 1180)

8.1.9.5.18 TCustomADODataSet.Filtered Property

Specifies whether or not filtering is active for a dataset.

Pascal

```
property Filtered: Boolean;
```

C++

```
__property Boolean Filtered;
```

Description

Check Filtered to determine whether or not dataset filtering is in effect. If Filtered is true, then filtering is active.

To apply filter conditions specified in the Filter (see page 1212) property or the OnFilterRecord (see page 1244) event handler, set Filtered to true.

Note: When filtering is enabled, user edits to a record may mean that the record no longer meets a filter's test condition. The next time an attempt is made to the read the record from the dataset while the filter is in effect, the record is not visible. If that happens, the next record that passes the filter condition becomes the active record.

See Also

Filter (see page 1212)

FilterOptions (see page 7027)

OnFilterRecord (see page 7055)

Locate (see page 1179)

Lookup (see page 1180)

FilterGroup (see page 1214)

8.1.9.5.19 TCustomADODataSet.FilterGroup Property

Filters a recordset based on row update status.

Pascal

```
property FilterGroup: TFilterGroup;
```

C++

```
__property TFilterGroup FilterGroup;
```

Description

Use FilterGroup to filter the recordset displayed with an ADO dataset component. The filter requires the dataset be in update batch mode and the rows are filtered based on the update status of individual rows. Set FilterGroup to a TFilterGroup (see page 1299) constant to filter the dataset to show just the rows that match that batch update status. For instance, set FilterGroup to fgPendingRecords to show just the rows that have been modified since the last update application.

```
if (ADODataSet1.LockType = ltBatchOptimistic) then begin
  ADODataSet1.Filtered := True;
  ADODataSet1.FilterGroup := fgPendingRecords;
end;
if (ADODataSet1->LockType == ltBatchOptimistic)
{
  ADODataSet1->Filtered = true;
  ADODataSet1->FilterGroup = fgPendingRecords;
};
```

To use FilterGroup to filter based on the update status of rows, ensure that the LockType (see page 1218) property is set to ltBatchOptimistic (a prerequisite for batch updating) and the Filtered (see page 1214) property is set to true. In a filtered dataset, check the update status of individual rows using the RecordStatus (see page 1222) property.

The TFilterGroup (see page 1299) type consists of the following constants:

Filter (see page 1212) group type	Meaning
fgUnassigned	Specifies that no filtering is in effect. This constant is used internally by the ADO dataset component.
fgNone	Removes any current filtering and all rows are visible. Can also be done by setting the Filtered (see page 1214) property to false.
fgPendingRecords	Filters to show just the rows that have been changed and the changes have not been applied (UpdateBatch (see page 1197) method) or canceled (CancelBatch (see page 1161)).
fgAffectedRecords	Filters to show just the rows affected by the last update.
fgFetchedRecords	Filters to show just the rows in the current update cache. This is the results of the last call to retrieve rows from the database.
fgPredicate	Filters to show just deleted rows.
fgConflictingRecords	Filters to show just the rows that had changes made to them, but could not be applied due to errors on the apply attempt.

See Recordset.Filter (see page 1212) property

CancelBatch (see page 1161)

Filtering Multiple Rows Based On Update Status

8.1.9.5.20 TCustomADODataSet.IndexDefs Property

Contains the definitions of the indexes for the current table.

Pascal

```
property IndexDefs: TIndexDefs;
```

C++

```
__property TIndexDefs IndexDefs;
```

Description

IndexDefs contains definitions for each index the current table has. IndexDefs is a collection of TIndexDef objects. Each TIndexDef object contains the definition for one index.

Inspect IndexDefs at runtime to get information on a given index. Use an index with IndexDefs to address a specific TIndexDef object. Use properties of TIndexDef to evaluate various index attributes. The example below retrieves the fields list for the third index of the table accessed through the component ADOTable1.

```
ADOTable1.IndexDefs.Update;
```

```
StrVar := ADOTable1.IndexDefs[2].Fields;
ADOTable1->IndexDefs->Update();
StrVar = ADOTable1->IndexDefs[2] ->Fields;
```

Call the Update method (TIndexDefs) prior to inspecting the property to ensure it contains the most current index information for the table.

See Also

TIndexDef (see page 7283)

TIndexDefs (see page 7292)

Update (see page 7299)

8.1.9.5.21 TCustomADODataSet.IndexFieldCount Property

Indicates the number of fields that comprise the current key.

Pascal

```
property IndexFieldCount: Integer;
```

C++

```
__property int IndexFieldCount;
```

Description

Examine IndexFieldCount to determine the number of fields that comprise the current key. For indexes based on a single column, IndexFieldCount returns 1. For multi-column indexes, IndexFieldCount indicates the number of fields upon which the index is based.

See Also

IndexFields (see page 1217)

IndexName (see page 1217)

8.1.9.5.22 TCustomADODataSet.IndexFieldNames Property

Lists the columns to use for a persistent sort of the recordset.

Pascal

```
property IndexFieldNames: string;
```

C++

```
__property AnsiString IndexFieldNames;
```

Description

Use IndexFieldNames as an alternative method of specifying the sort order of a recordset. IndexFieldNames is a direct implementation of the Sort (see page 1222) property of the ADO recordset object, with the field list from IndexFieldNames being used for the Sort (see page 1222) property. The actual sorting of data occurs on the OLE DB (see page 6725) side and use of indexes for the sort depend on the particular provider.

To use IndexFieldNames to establish a recordset's sort order, the recordset must have been opened using a client-side cursor (the dataset component's CursorLocation (see page 1207) property must be clUseClient). An exception is raised on attempts to use IndexFieldNames with server-side cursors.

IndexFieldNames may be used to set the sort order for the detail table in a master-detail link, increasing the performance of the link. However, use of IndexFieldNames is not required for master-detail links.

See Also

IndexName (see page 1217)

Creating an Index with IndexFieldNames

8.1.9.5.23 TCustomADODataSet.IndexFields Property

Retrieves or sets a field for an index.

Pascal

```
property IndexFields [Index: Integer]: TField;
```

C++

```
__property TField IndexFields[int Index];
```

Description

IndexFields provides a zero-based array of field objects, each of which corresponds to a field in the current index. Index is an ordinal value indicating the position of a field in the index. The first field in the index is IndexFields[0], the second is IndexFields[1], and so on.

See Also

IndexFieldCount (see page 1216)

IndexName (see page 1217)

8.1.9.5.24 TCustomADODataSet.IndexName Property

Specifies the currently active index.

Pascal

```
property IndexName: WideString;
```

C++

```
__property BSTR IndexName;
```

Description

Use IndexName to activate an index and cause it to actively order the dataset's rows. At runtime, set IndexName to a string containing the name of the index. At design-time, select the desired index from the drop-down list in the Object Inspector.

```
ADOTable1.IndexName := 'LastName';
ADOTable1->IndexName = "LastName";
```

Set IndexName to an empty string to have no index actively ordering the dataset. The rows then appear in natural order. In some database systems, the primary index of a table does not have a name. In these cases, setting IndexName to an empty string activates the primary index.

An index must be active for certain index dependent operations to be used, such as the Seek (see page 1192) method.

Note: Many providers do not support changing indexes while the dataset is active, raising an exception when an attempt is made to do this. Ensure that the dataset is closed before changing the index through the IndexName property and reopen the dataset after specifying a new index.

See Also

Seek (see page 1192)

IndexDefs (see page 1215)

IndexFieldNames (see page 1216)

IndexFieldCount (see page 1216)

8.1.9.5.25 TCustomADODataSet.LockType Property

Specifies the lock type to use when opening a dataset.

Pascal

```
property LockType: TADOLockType;
```

C++

```
__property TADOLockType LockType;
```

Description

Use LockType to specify the lock type to use when opening a dataset. LockType determines whether the row locking scheme for a recordset will be pessimistic, optimistic, or read-only. To be effective, LockType must be set prior to activating the ADO dataset component.

The default value of LockType is ltOptimistic.

Use the LockType ltBatchOptimistic to open a dataset in batch update mode.

See Also

FilterGroup (see page 1214)

8.1.9.5.26 TCustomADODataSet.MarshalOptions Property

Specifies which records are marshaled back to the server.

Pascal

```
property MarshalOptions: TMarshalOption;
```

C++

```
__property TMarshalOption MarshalOptions;
```

Description

Use MarshalOptions when the dataset component uses a client-side cursor and data changes are to be sent back to the server. MarshalOptions specifies which records in the local recordset are sent to the middle tier or server. A value of moMarshalAll results in all records in the local recordset being packaged and sent back. A value of moMarshalModifiedOnly sends back only those records that have actually been changed in the local recordset The default value for MarshalOptions is moMarshalAll.

8.1.9.5.27 TCustomADODataSet.MasterDataLink Property

Manages the relationship between the ADO dataset and a master table.

Pascal

```
property MasterDataLink: TMasterDataLink;
```

C++

```
__property TMasterDataLink MasterDataLink;
```

Description

Applications can't use the protected MasterDataLink property. It is used internally to handle the coordination of this dataset with the dataset that is associated with the DataSource (see page 1208) property.

See Also

MasterSource (see page 1144)

DataSource (see page 7014)

MasterFields (see page 1219)

8.1.9.5.28 TCustomADODataSet.MasterFields Property

Specifies field or fields on which a Master-Detail link is based.

Pascal

```
property MasterFields: WideString;
```

C++

```
__property BSTR MasterFields;
```

Description

Use MasterFields after setting the MasterSource or DataSource (see page 1208) property to specify the names of one or more fields in another, master, dataset that are used to establish a Master-Detail relationship between this dataset and the master dataset. The master dataset is specified by assigning its data source to the MasterSource or DataSource (see page 1208) property.

MasterFields is a string containing one or more field names in the master dataset. When the datasets are related based on two fields, separate field names with semicolons:

```
ADOTable2.MasterSource := DataSource1;
ADOTable2.MasterFields := 'CustID;SaleDate'
ADOTable2->MasterSource = DataSource1;
ADOTable2->MasterFields = "CustID;SaleDate"
```

Each time the current record in the master dataset changes, the new values in those fields are used to select corresponding records in this table for display.

Note: At design time, use the Field Link designer to establish the master-detail relationship between two tables.

See Also

MasterSource (see page 1144)

DataSource (see page 7014)

Making the Table a Detail of Another Dataset

8.1.9.5.29 TCustomADODataSet.MaxRecords Property

Specifies how many rows to return in a result set.

Pascal

```
property MaxRecords: Integer;
```

C++

```
__property int MaxRecords;
```

Description

Use MaxRecords to control the number of rows the provider for the ADO dataset component returns from the data source. Set MaxRecords to indicate the maximum number of rows. The default value for MaxRecords is 0 (zero), which places no limits on the result set.

See Also

CacheSize (see page 1203)

8.1.9.5.30 TCustomADODataSet.ParamCheck Property

Specifies whether the parameter list for an ADO dataset component is regenerated if the SQL changes at runtime.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

Set ParamCheck to specify whether or not the Parameters (see page 1220) property is initialized using ":Param" style parameters in an SQL statement specified in the CommandText (see page 1204) property. If the SQL statement in CommandText (see page 1204) only contains "?" style parameters, the Parameters (see page 1220) property will only be initialized if the OLE DB (see page 6725) provider returns parameter information for an SQL command. Otherwise, the parameters must be explicitly created using the CreateParameter method (TParameter (see page 1250)).

When ParamCheck is true, a parameter is generated for each ":Param" style parameter in the SQL statement.

The default value of ParamCheck is true.

This property is useful for data definition language (DDL) statements that contain parameters as part of the DDL statement and that are not parameters for the ADO dataset component. For example, the DDL statement to create a stored procedure may contain parameter statements that are part of the stored procedure. Set ParamCheck to false to prevent these parameters from being mistaken for parameters of the ADO dataset component executing the DDL statement.

TADOQuery (see page 1084)

TADOStoredProc (see page 1106)

Parameters (see page 1220)

Open (see page 6976)

commandtext (see page 1204)

8.1.9.5.31 TCustomADODataSet.Parameters Property

Contains the collection of parameters for an SQL statement.

Pascal

```
property Parameters: TParameters;
```

C++

```
__property TParameters Parameters;
```

Description

At design-time, use Parameters to access the parameters for the SQL statement used by the ADO component. Use the properties and methods of Parameters to set and get individual parameter values or to set or inspect parameter attributes.

At runtime, use the Parameters property editor to access the collection of parameters.

See Also

SQL (see page 1105)

ExecSQL (see page 1100)

8.1.9.5.32 TCustomADODataSet.Prepared Property

Specifies whether the command is prepared before execution.

Pascal

```
property Prepared: Boolean;
```

C++

```
__property Boolean Prepared;
```

Description

Set Prepared before calling the Open method to specify whether ADO prepares the command used to create the dataset's recordset. If Prepared is set to true and the dataset component is connected to a data store, ADO prepares the command before executing it. If Prepared is set to false, ADO does not prepare the command.

The default value of Prepared is false.

Parameters (see page 1220)

ExecSQL (see page 1100)

Open (see page 6976)

8.1.9.5.33 TCustomADODataSet.Properties Property

Pascal

```
property Properties: Properties;
```

C++

```
__property Properties Properties;
```

Description

This is Properties, a member of class TCustomADODataSet.

8.1.9.5.34 TCustomADODataSet.Recordset Property

Pascal

```
property Recordset: _Recordset;
```

C++

```
__property _Recordset Recordset;
```

Description

This is Recordset, a member of class TCustomADODataSet.

8.1.9.5.35 TCustomADODataSet.RecordsetState Property

Pascal

```
property RecordsetState: TObjectStates;
```

C++

```
__property TObjectStates RecordsetState;
```

Description

This is RecordsetState, a member of class TCustomADODataSet.

8.1.9.5.36 TCustomADODataSet.RecordStatus Property

Indicates the status of the current row.

Pascal

```
property RecordStatus: TRecordStatusSet;
```

C++

```
__property TRecordStatusSet RecordStatus;
```

Description

Read RecordStatus to determine the status of the current row relative to batch updates or other bulk operations. Among other record state aspects, RecordStatus indicates whether the current record is new, modified, deleted, or unmodified. RecordStatus will also give an indication why a row is not saved when modifying, adding, or deleting data.

Note: RecordStatus only provides meaningful information if the dataset is opened in batch update mode.

Inspecting the Update Status of Individual Rows

8.1.9.5.37 TCustomADODataSet.Sort Property

Specifies the sort order of the recordset.

Pascal

```
property Sort: WideString;
```

C++

```
__property BSTR Sort;
```

Description

Set Sort to establish or change the list of fields on which the recordset is sorted. Set sort to the name of a single field or to a comma-separated list of fields. Each field may optionally be followed by the keyword ASCENDING or DESCENDING to specify a sort direction for the field. If one of these keywords is not used, the default sort direction for the field is ascending. Set Sort to an

empty string to reset the recordset to the sort order originally used when the recordset's data was first retrieved.

```
ADOQuery1.Sort := 'LastName ASC, DateDue DESC'
ADOQuery1->Sort = "LastName ASC, DateDue DESC"
```

Read Sort to determine the field (or fields) on which the recordset is sorted.

Note: If the cursor is client-side (the dataset component's CursorLocation (see page 1207) property or that of an associated TADOConnection (see page 1001) component is clUseClient) and no index already exists matching the requested field sort order, a temporary index is created. Resetting the sort order by setting Sort to an empty string automatically deletes the temporary index.

CursorLocation (see page 1026)

Using TADODataSet

8.1.9.5.38 TCustomADODataSet.StoreDefs Property

Specifies whether field definitions are stored with the ADO dataset.

Pascal

```
property StoreDefs: Boolean;
```

C++

```
__property Boolean StoreDefs;
```

Description

StoreDefs controls whether the FieldDefs (see page 1210) property value is saved with the ADO dataset when it is saved to a form (.dfm) file. By default, StoreDefs is false unless you explicitly change any of the field definitions.

See Also

FieldDefs (see page 7019)

8.1.9.6 TCustomADODataSet Events

The events of the TCustomADODataSet class are listed here.

Published Events

	Name	Description
	AfterCancel (see page 1224)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 1226)	Occurs after an application closes a dataset.
	AfterDelete (see page 1227)	Occurs after an application deletes a record.
	AfterEdit (see page 1230)	Occurs after an application starts editing a record.
	AfterInsert (see page 1231)	Occurs after an application inserts a new record.
	AfterOpen (see page 1231)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 1233)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 1233)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 1233)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 1234)	Occurs before an application executes a request to cancel changes to the active record.

	BeforeClose (see page 1234)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 1235)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 1235)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 1236)	Occurs before an application enters insert mode.
	BeforeOpen (see page 1237)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 1238)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 1239)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 1239)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 1239)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 1240)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 1241)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnEndOfRecordset (see page 1241)	Occurs when moving a recordset's row pointer past the last row.
	OnFetchComplete (see page 1242)	Occurs after records have been retrieved into the recordset.
	OnFetchProgress (see page 1242)	Occurs periodically during an asynchronous data retrieval operation.
	OnFieldChangeComplete (see page 1243)	Occurs after a field has changed.
	OnFilterRecord (see page 1244)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnMoveComplete (see page 1244)	Occurs after the row pointer in a recordset has moved.
	OnNewRecord (see page 1245)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 1245)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnRecordChangeComplete (see page 1246)	Occurs after one or more records in the recordset change.
	OnRecordsetChangeComplete (see page 1247)	Occurs after the recordset has changed.
	OnRecordsetCreate (see page 1247)	Occurs when the recordset has been initialized and is ready to use.
	OnWillChangeField (see page 1248)	Occurs before a field is changed.
	OnWillChangeRecord (see page 1248)	Occurs before a record in the recordset is changed.
	OnWillChangeRecordset (see page 1249)	Occurs before the recordset has changed.
	OnWillMove (see page 1250)	Occurs before the row pointer in a recordset is moved.

8.1.9.6.1 TCustomADODataSet.AfterCancel Event

Occurs after an application completes a request to cancel modifications to the active record.

Pascal

```
property AfterCancel: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterCancel;
```

Description

Write an AfterCancel event handler to take specific action after an application cancels changes to the active record. AfterCancel is called by the Cancel method after it updates the current position, releases the lock on the active record if necessary, and sets the dataset state to dsBrowse. If an application requires additional processing before returning control to a user after a Cancel event, code it in the AfterCancel event.

Delphi Examples:

```
{
This example updates the form's status bar with a message
when an AfterCancel event occurs.  Set the StatusBar
SimplePanel property to True.
}
procedure TForm1.Table1AfterCancel(DataSet: TDataSet);
begin
  StatusBar1.SimpleText := 'Record changes cancelled for ' + DataSet.Name;
```

```
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  Table1.Cancel;
end;

procedure TForm1.Button3Click(Sender: TObject);
begin
  Table1.Post
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
    DatabaseName := 'DBDEMOS';
    TableType := ttParadox;
    TableName := 'CustInfo';
    Name := 'CustInfo';
    Table1.Active := False;
    { Don't overwrite an existing table }
    if Table1.Exists then
    begin
        Table1.Close;
        Table1.DeleteTable;
    end;
    begin
      { The Table component must not be active }
      { First, describe the type of table and give }
      { it a name }
      { Next, describe the fields in the table }
      with FieldDefs do
      begin
        Clear;
        with AddFieldDef do
        begin
          Name := 'Field1';
          DataType := ftInteger;
          Required := True;
        end;
        with AddFieldDef do
        begin
          Name := 'Field2';
          DataType := ftString;
          Size := 30;
        end;
      end;
      { Next, describe any indexes }
      with IndexDefs do
      begin
        Clear;
        { The 1st index has no name because it is
        { a Paradox primary key }
        with AddIndexDef do
        begin
          Name := '';
          Fields := 'Field1';
          Options := [ixPrimary];
        end;
        with AddIndexDef do
        begin
          Name := 'Fld2Indx';
```

```
            Fields := 'Field2';
            Options := [ixCaseInsensitive];
          end;
        end;
        { Call the CreateTable method to create the table }
        CreateTable;
        Table1.Active:= True;
        for i := 1 to 20 do
          Table1.AppendRecord([i*111, i*222]);
      end;
    end;
    DS2.DataSet:= Table1;
    DBGrid2.DataSource.DataSet:= Table1;
    Table1.AfterCancel:= Table1AfterCancel;
    Table1.Active:= True;
  end;
```

See Also

BeforeCancel (see page 7048)

Cancel (see page 6916)

8.1.9.6.2 TCustomADODataSet.AfterClose Event

Occurs after an application closes a dataset.

Pascal

```
property AfterClose: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterClose;
```

Description

Write an AfterClose event handler to take specific action immediately after an application closes a dataset. For example, as a security measure, an application might clear a PASSWORD entry from the Params property of a TSQLConnection component when the dataset is closed.

AfterClose is called after a dataset is closed and the dataset state is set to dsInactive.

Delphi Examples:

```
{
This example adds an entry to a memo with a message when an
AfterOpen event or an AfterClose event occurs.  Populate the
ClientDataSet events with CheckButtonActive.
}
procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  if (Button1.Enabled) then
    Memo2.Lines.Add('Now that the dataset is open, record information is available.')
  else
    Memo2.Lines.Add('Now that the dataset is closed, record information is not available.');
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
```

```
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
    RemoteServer1.Connected := True;
  ClientDataSet1.Close;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].EnableControls;
  end;
  ClientDataSet1.Open;
end;

procedure TForm1.Button3Click(Sender: TObject);
var
  I: Integer;
begin
  ClientDataSet1.Close;
  RemoteServer1.Connected := False;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].DisableControls;
  end;
end;

procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
```

Opening and Closing Datasets

8.1.9.6.3 TCustomADODataSet.AfterDelete Event

Occurs after an application deletes a record.

Pascal

```
property AfterDelete: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterDelete;
```

Description

Write an AfterDelete event handler to take specific action immediately after an application deletes the active record in a dataset. AfterDelete is called by Delete after it deletes the record, sets the dataset state to dsBrowse, and repositions the current record.

C++ Examples:

```
/*
This example displays a message on the form's status bar
indicating the record count after a record is deleted.  Set
the StatusBar SimplePanel property to True.
*/
void __fastcall TForm1::Table1AfterDelete(TDataSet *DataSet)
{
  StatusBar1->SimpleText = Format(
    "There are now %d records in the table",
    ARRAYOFCONST(((int)DataSet->RecordCount)));
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Table1->Delete();
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Table1 = new TTable(Form1);
  Table1->Active = false; // The Table component must not be active
  Table1->DatabaseName = "DBDEMOS";
  Table1->TableType = ttParadox;
  Table1->TableName = "CustInfo";
  Table1->Active = False;
  if (!Table1->Exists) // Don't overwrite an existing table
  {
    Table1->Close();
    Table1->DeleteTable();
  }
  // The Table component must not be active
  // First, describe the type of table and give
  // it a name
  // Next, describe the fields in the table
  Table1->FieldDefs->Clear();
  TFieldDef *pNewDef = Table1->FieldDefs->AddFieldDef();
  pNewDef->Name = "Field1";
  pNewDef->DataType = ftInteger;
  pNewDef->Required = true;
  pNewDef = Table1->FieldDefs->AddFieldDef();
  pNewDef->Name = "Field2";
  pNewDef->DataType = ftString;
  pNewDef->Size = 30;
  // Next, describe any indexes
  Table1->IndexDefs->Clear();
  /* the 1st index has no name because it is a Paradox primary key */
  Table1->IndexDefs->Add("","Field1", TIndexOptions() <<ixPrimary << ixUnique);
  Table1->IndexDefs->Add("Fld2Index","Field2", TIndexOptions() << ixCaseInsensitive);
  // Now that we have specified what we want, create the table
  Table1->CreateTable();
  Table1->Active = True;
  for (int i = 1; i <= 20; i++)
    Table1->AppendRecord(ARRAYOFCONST((i*111, i*222)));
  DS2->DataSet = Table1;
  DBGrid2->DataSource->DataSet = Table1;
  Table1->AfterDelete = Table1AfterDelete;
  Table1->Active = True;
}
```

Delphi Examples:

```
{
This example displays a message on the form's status bar
indicating the record count after a record is deleted.  Set
the StatusBar SimplePanel property to True.
```

```
}
procedure TForm1.Table1AfterDelete(DataSet: TDataSet);
begin
  StatusBar1.SimpleText := Format('There are now %d records in the table',
[DataSet.RecordCount]);
end;

procedure TForm1.Button1Click(Sender: TObject);
begin
  Table1.Delete;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
    DatabaseName := 'DBDEMOS';
    TableType := ttParadox;
    TableName := 'CustInfo';
    Name := 'CustInfo';
    Table1.Active := False;
    { Don't overwrite an existing table }
    if Table1.Exists then
    begin
        Table1.Close;
        Table1.DeleteTable;
    end;
    begin
      { The Table component must not be active }
      { First, describe the type of table and give }
      { it a name }
      { Next, describe the fields in the table }
      with FieldDefs do
      begin
        Clear;
        with AddFieldDef do
        begin
          Name := 'Field1';
          DataType := ftInteger;
          Required := True;
        end;
        with AddFieldDef do
        begin
          Name := 'Field2';
          DataType := ftString;
          Size := 30;
        end;
      end;
      { Next, describe any indexes }
      with IndexDefs do
      begin
        Clear;
        { The 1st index has no name because it is
        { a Paradox primary key }
        with AddIndexDef do
        begin
          Name := '';
          Fields := 'Field1';
          Options := [ixPrimary];
        end;
        with AddIndexDef do
        begin
          Name := 'Fld2Indx';
```

```
            Fields := 'Field2';
            Options := [ixCaseInsensitive];
          end;
        end;
        { Call the CreateTable method to create the table }
        CreateTable;
        Table1.Active:= True;
        for i := 1 to 20 do
          Table1.AppendRecord([i*111, i*222]);
      end;
    end;
    DS2.DataSet:= Table1;
    DBGrid2.DataSource.DataSet:= Table1;
    Table1.AfterDelete:= Table1AfterDelete;
    Table1.Active:= True;
  end;
```

See Also

Delete (see page 6924)

8.1.9.6.4 TCustomADODataSet.AfterEdit Event

Occurs after an application starts editing a record.

Pascal

```
property AfterEdit: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterEdit;
```

Description

Write an AfterEdit event handler to take specific action immediately after dataset enters edit mode. AfterEdit is called by Edit after it enables editing of a record, recalculates calculated fields, and calls the data event handler to process a record change.

Delphi Examples:

```
{
This example adds an entry to a memo with a message
when an AfterEdit event occurs and when a BeforeEdit event
occurs.  Click on Run SQL to populate the DBGrid.  Then
select a cell to edit and click the Edit current cell
button, or just start editing the cell to invoke the
BeforeEdit and AfterEdit events.
}
procedure TForm1.ClientDataSet1AfterEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.ClientDataSet1BeforeEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  ClientDataSet1.Edit;
end;
```

See Also

BeforeEdit (see page 7049)

Edit (see page 6932)

8.1.9.6.5 TCustomADODataSet.AfterInsert Event

Occurs after an application inserts a new record.

Pascal

```
property AfterInsert: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterInsert;
```

Description

Write an AfterInsert event handler to take specific action immediately after an application inserts a record. The Insert and Append methods generate an AfterInsert event after inserting or appending a new record.

Delphi Examples:

```
{
This example updates a memo with a message when an
AfterInsert event or a BeforeInsert event occurs.
}
procedure TForm1.ClientDataSet1AfterInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After inserting a record');
end;

procedure TForm1.ClientDataSet1BeforeInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before inserting a record');
end;
```

See Also

BeforeInsert (see page 7050)

Append (see page 6910)

Insert (see page 6959)

8.1.9.6.6 TCustomADODataSet.AfterOpen Event

Occurs after an application completes opening a dataset and before any data access occurs.

Pascal

```
property AfterOpen: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterOpen;
```

Description

Write an AfterOpen event handler to take specific action immediately after an application opens the dataset. AfterOpen is called after the dataset establishes access to its data and the dataset is put into dsBrowse state. For example, an AfterOpen event handler might check an ini file to determine the last record touched in the dataset the previous time the application ran, and position the dataset at that record.

Delphi Examples:

```
{
This example adds an entry to a memo with a message when an
AfterOpen event or an AfterClose event occurs.  Populate the
ClientDataSet events with CheckButtonActive.
}
procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  if (Button1.Enabled) then
    Memo2.Lines.Add('Now that the dataset is open, record information is available.')
  else
    Memo2.Lines.Add('Now that the dataset is closed, record information is not available.');
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
    RemoteServer1.Connected := True;
  ClientDataSet1.Close;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].EnableControls;
  end;
  ClientDataSet1.Open;
end;

procedure TForm1.Button3Click(Sender: TObject);
var
  I: Integer;
begin
  ClientDataSet1.Close;
  RemoteServer1.Connected := False;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].DisableControls;
  end;
end;

procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
```

See Also

Active (see page 7004)

Open (see page 6976)

Opening and Closing Datasets

8.1.9.6.7 TCustomADODataSet.AfterPost Event

Occurs after an application writes the active record to the database or change log and returns to browse state.

Pascal

```
property AfterPost: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterPost;
```

Description

Write an AfterPost event handler to take specific action immediately after an application posts a change to the active record. AfterPost is called after a modification or insertion is made to a record.

Delphi Examples:

```
{
This example updates the form's status bar with a message
when an AfterPost event occurs.
}
procedure TForm1.ClientDataSet1AfterPost(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before posting a record');
end;
```

See Also

BeforePost (see page 7052)

Post (see page 6977)

8.1.9.6.8 TCustomADODataSet.AfterRefresh Event

Occurs after an application refreshes the data in the dataset.

Pascal

```
property AfterRefresh: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterRefresh;
```

Description

Write an AfterRefresh event handler to take specific action immediately after an application has updated the records in the dataset. AfterRefresh is generated by calls to the Refresh method.

See Also

BeforeRefresh (see page 7052)

Refresh (see page 6991)

8.1.9.6.9 TCustomADODataSet.AfterScroll Event

Occurs after an application scrolls from one record to another.

Pascal

```
property AfterScroll: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterScroll;
```

Description

Write an AfterScroll event handler to take specific action immediately after an application scrolls to another record as a result of a call to the First, Last, MoveBy, Next, Prior, FindKey, FindFirst, FindNext, FindLast, FindPrior, and Locate methods. AfterScroll is called after all other events triggered by these methods and any other methods that switch from record to record in the dataset.

See Also

BeforeScroll (see page 7053)

First (see page 6942)

Last (see page 6968)

MoveBy (see page 6971)

Next (see page 6973)

Prior (see page 6979)

Navigating Datasets

8.1.9.6.10 TCustomADODataSet.BeforeCancel Event

Occurs before an application executes a request to cancel changes to the active record.

Pascal

```
property BeforeCancel: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeCancel;
```

Description

Write a BeforeCancel event to take specific action before an application carries out a request to cancel changes. BeforeCancel is called by the Cancel method before it cancels a dataset operation such as Edit, Insert, or Delete.

An application might use the BeforeCancel event to record a user's changes in an undo buffer.

See Also

AfterCancel (see page 7038)

Delete (see page 6924)

Edit (see page 6932)

Insert (see page 6959)

8.1.9.6.11 TCustomADODataSet.BeforeClose Event

Occurs immediately before the dataset closes.

Pascal

```
property BeforeClose: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeClose;
```

Description

Write a BeforeClose event to take specific action before an application closes a dataset. Calling Close or setting the Active property to false results in a call to the BeforeClose event handler.

See Also

Active (see page 7004)

AfterClose (see page 7040)

Close (see page 6920)

Opening and Closing Datasets

Posting Data

8.1.9.6.12 TCustomADODataSet.BeforeDelete Event

Occurs before an application attempts to delete the active record.

Pascal

```
property BeforeDelete: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeDelete;
```

Description

Write a BeforeDelete event handler to take specific action before an application deletes the active record. BeforeDelete is called by Delete before it actually deletes a record.

In Delphi, making use of this event an application might, for example, display a dialog box asking for confirmation before deleting the record. On denial of confirmation, the application could abort the deletion by calling the Abort procedure.

See Also

AfterDelete (see page 7041)

Delete (see page 6924)

Abort (see page 22786)

8.1.9.6.13 TCustomADODataSet.BeforeEdit Event

Occurs before an application enters edit mode for the active record.

Pascal

```
property BeforeEdit: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeEdit;
```

Description

Write a BeforeEdit event handler to take specific action before an application enables editing of the active record. For example, an application that keeps a log of database edits could use the BeforeEdit event to record the edit request, time, and user before entering edit state.

Delphi Examples:

```
{
```

```
This example adds an entry to a memo with a message
when an AfterEdit event occurs and when a BeforeEdit event
occurs.  Click on Run SQL to populate the DBGrid.  Then
select a cell to edit and click the Edit current cell
button, or just start editing the cell to invoke the
BeforeEdit and AfterEdit events.
}
procedure TForm1.ClientDataSet1AfterEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.ClientDataSet1BeforeEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  ClientDataSet1.Edit;
end;
```

State (see page 7036)

AfterEdit (see page 7044)

Edit (see page 6932)

8.1.9.6.14 TCustomADODataSet.BeforeInsert Event

Occurs before an application enters insert mode.

Pascal

```
property BeforeInsert: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeInsert;
```

Description

Write a BeforeInsert event handler to take specific action before an application inserts or appends a new record. The Insert or Append method generates a BeforeInsert method before it sets the dataset into dsInsert state.

Delphi Examples:

```
{
This example updates a memo with a message when an
AfterInsert event or a BeforeInsert event occurs.
}
procedure TForm1.ClientDataSet1AfterInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After inserting a record');
end;

procedure TForm1.ClientDataSet1BeforeInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before inserting a record');
end;
{
This example uses the BeforeInsert event to do data
validation. If the StrToInt function raises an exception,
the edit control's contents are set to a valid value so
that the assignment to the INTEGER field in the dataset
```

```
will succeed.  Continuing after the exception causes a
'0' to be placed in the PORTA field.
DataSet design:
This example requires a ClientDataSet, a DBGrid, a
DataSource and a DBNavigator.  Name the ClientDataSet CDS.
Set the DataSet property in the DataSource to CDS and name
that DataSource DS.  Set the DataSource in the DBNavigator
to DS the DataSource in the DBGrid to DS.  Right click on CDS
and select the Fields Editor, then right click on the Field
Editor form and create two fields by selecting "new field".
In the field configuration window, set the name to HOST, the
Component value will automatically be set to CDSHOST.  Set
the filed type to String.  In the field configuration window
for the second field, set the name to PORTA, the Component
value will automatically be set to CDSPORTA.  Set the field
type to Integer.  The file used to load CDS must have an
attribute name of HOST with an attribute type of string and
an attribute name of PORTA with an attribute type of integer.
Add DB, DBCtrls, Grids, DBGrids and DBClient to the uses clause.
}
{$IFNDEF UNICODE}
uses SwSystem;
{$ENDIF}

procedure TForm1.Button3Click(Sender: TObject);
begin
  CDS.Insert;
  CDS.FieldByName('PORTA').AsInteger := StrToInt(Edit1.Text);
  CDS.Post;
end;

procedure TForm1.CDSBeforeInsert(DataSet: TDataSet);
begin
  try
  { Make sure edit field can be converted to integer --
   this will raise an exception if it can't }
    StrToInt(Edit1.Text);
  except
    Edit1.Text := '0';
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
{$ELSE}
  CDS.LoadFromFile(gsAppPath + 'CDS.XML');
{$ENDIF}
end;
```

8.1.9.6.15 TCustomADODataSet.BeforeOpen Event

Occurs before an application executes a request to open a dataset.

Pascal

```
property BeforeOpen: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeOpen;
```

Description

Write a BeforeOpen event handler to take specific action before an application opens a dataset for viewing or editing. BeforeOpen is triggered when an application sets the Active property to true for a dataset or an application calls Open.

See Also

Active (see page 7004)

AfterOpen (see page 7045)

Open (see page 6976)

Opening and Closing Datasets

8.1.9.6.16 TCustomADODataSet.BeforePost Event

Occurs before an application posts changes for the active record to the database or change log.

Pascal

```
property BeforePost: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforePost;
```

Description

Write a BeforePost event handler to take specific action before an application posts dataset changes. BeforePost is triggered when an application calls the Post method. Post checks to make sure all required fields are present, then calls BeforePost before posting the record.

An application might use BeforePost to perform validity checks on data changes before committing them. If it encountered a validity problem, it could call Abort to cancel the Post operation (Delphi) or throw an exception (C++).

Delphi Examples:

```
{
This example checks for a valid entry in a TDBEdit control
and calls the Abort procedure if the control is empty; Abort
cancels the post before it happens.
}
procedure TForm1.ClientDataSet1BeforePost(DataSet: TDataSet);
begin
  if DBEdit1.Text = '' then
    Abort;
  DataSet.Fields[2].AsString := DBEdit1.Text;
end;
```

AfterPost (see page 7046)

Post (see page 6977)

Abort (see page 22786)

Working with Field Component Methods at Runtime

8.1.9.6.17 TCustomADODataSet.BeforeRefresh Event

Occurs immediately before an application refreshes the data in the dataset.

Pascal

```
property BeforeRefresh: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeRefresh;
```

Description

Write a BeforeRefresh event handler to take specific action immediately before an application updates the records in the dataset. BeforeRefresh is generated by calls to the Refresh method.

See Also

AfterRefresh (see page 7047)

Refresh (see page 6991)

8.1.9.6.18 TCustomADODataSet.BeforeScroll Event

Occurs before an application scrolls from one record to another.

Pascal

```
property BeforeScroll: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeScroll;
```

Description

Write a BeforeScroll event handler to take specific action immediately before an application scrolls to another record as a result of a call to the First, Last, MoveBy, Next, Prior, FindKey, FindFirst, FindNext, FindLast, FindPrior, and Locate methods. BeforeScroll is called before all other events triggered by these methods and any other methods that switch from record to record in the dataset.

See Also

AfterScroll (see page 7047)

First (see page 6942)

Last (see page 6968)

MoveBy (see page 6971)

Next (see page 6973)

Prior (see page 6979)

Navigating Datasets

8.1.9.6.19 TCustomADODataSet.OnCalcFields Event

Occurs when an application recalculates calculated fields.

Pascal

```
property OnCalcFields: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent OnCalcFields;
```

Description

Write an OnCalcFields event handler to take specific action when an application recalculates calculated fields. A calculated field is one that derives its value from the values in one or more fields in the dataset, sometimes with additional processing.

OnCalcFields is triggered when:

A dataset is opened.

A dataset is put into dsEdit state.

A record is retrieved from a database.

When the AutoCalcFields property is true, OnCalcFields is also triggered when:

Focus moves from one visual control to another, or from one column to another is a data-aware grid control and modifications were made to the record.

Note: When the AutoCalcFields property is true, an OnCalcFields event handler should not modify the dataset (or a linked dataset if it is part of a master-detail relationship), because such modifications retrigger the OnCalcField event, leading to infinite recursion.

If an application permits users to change data, OnCalcFields is frequently triggered. To reduce the frequency with which OnCalcFields occurs, set AutoCalcFields to false.

Warning: When the dataset is the master table of a master-detail relationship, OnCalcFields occurs before detail sets have been synchronized with the master table.

Defining a Calculated Field

8.1.9.6.20 TCustomADODataSet.OnDeleteError Event

Occurs when an application attempts to delete a record and an exception is raised.

Pascal

```
property OnDeleteError: TDataSetErrorEvent;
```

C++

```
__property TDataSetErrorEvent OnDeleteError;
```

Description

Write an OnDeleteError event handler to handle exceptions that occur when an attempt to delete a record fails.

See Also

OnEditError (see page 7054)

OnPostError (see page 7056)

Delete (see page 6924)

8.1.9.6.21 TCustomADODataSet.OnEditError Event

Occurs when an application attempts to modify or insert a record and an exception is raised.

Pascal

```
property OnEditError: TDataSetErrorEvent;
```

C++

```
__property TDataSetErrorEvent OnEditError;
```

Description

Write an OnEditError event handler to handle exceptions that occur when an attempt to edit a record fails.

See Also

OnDeleteError (see page 7054)

OnPostError (see page 7056)

Edit (see page 6932)

Insert (see page 6959)

8.1.9.6.22 TCustomADODataSet.OnEndOfRecordset Event

Occurs when moving a recordset's row pointer past the last row.

Pascal

```
property OnEndOfRecordset: TEndOfRecordsetEvent;
```

C++

```
__property TEndOfRecordsetEvent OnEndOfRecordset;
```

Description

Write an OnEndOfRecordset event handler to take specific action after an attempt to move to a row past the end of the recordset. No row navigation methods should trigger this event due to the effects of the Eof property. This event should only be triggered by internal recordset navigation operations or by direct access to the Recordset (see page 1221) object (through the dataset component's Recordset (see page 1221) property).

DataSet is the ADO dataset component that triggered the OnEndOfRecordset event. This dataset component also contains the recordset in question.

MoreData is a boolean value indicating whether there are more unfetched rows beyond the last row fetched prior to the OnEndOfRecordset event.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event.

Note: : A Recordset (see page 1221) object's row pointer is distinct from the record pointer of its ADO dataset component. It is possible that the ADO Recordset (see page 1221) object will generate row movement events without the ADO dataset component generating a BeforeScroll (see page 1239) or AfterScroll (see page 1233) event. A couple reasons for this are background updating and resynchronizing of the records as data is changed. The OnEndOfRecordset event is purely a Recordset (see page 1221) object event and independent of any dataset component record navigation events.

8.1.9.6.23 TCustomADODataSet.OnFetchComplete Event

Occurs after records have been retrieved into the recordset.

Pascal

```
property OnFetchComplete: TRecordsetEvent;
```

C++

```
__property TRecordsetEvent OnFetchComplete;
```

Description

Write an OnFetchComplete event handler to take specific action after all of the rows from an asynchronous data retrieval operation have been returned to the recordset. Calling the dataset component's Open method or setting its Active (see page 1201) property to true will lead to this event occurring.

DataSet is the ADO dataset component that triggered the OnFetchComplete event. This dataset component also contains the recordset in question.

Error (see page 1312) is an ADO Error (see page 1312) object. See the Microsoft Data Access SDK for more information on using ADO Error (see page 1312) objects. The Error (see page 1312) parameter is only set if an error occurred during execution of the operation that triggered the event. In this case, the EventStatus parameter will contain the value esErrorsOccured.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event.

See Also

OnFetchProgress (see page 1242)

8.1.9.6.24 TCustomADODataSet.OnFetchProgress Event

Occurs periodically during an asynchronous data retrieval operation.

Pascal

```
property OnFetchProgress: TFetchProgressEvent;
```

C++

```
__property TFetchProgressEvent OnFetchProgress;
```

Description

Write an OnFetchProgress event handler to take specific action during an asynchronous data retrieval operation. The OnFetchProgress event fires periodically during the data retrieval to provide indications of its progress. Create (see page 1156) a handler for this event to react to this periodic notification, such as providing the user with a visual indication of the progress of the data retrieval.

DataSet is the ADO dataset component that triggered the OnFetchProgress event. This dataset component also contains the recordset in question.

Progress is the number of records that have been received since the data fetching operation began.

MaxProgress is the total number of records to be retrieved by the operation.

Progress and MaxProgress used together to get percent complete. For example, Progress divided by MaxProgress and multiplied by 100 yields the percent completion of the data fetching.

```
procedure TForm1.ADODataSet1FetchProgress(DataSet: TCustomADODataSet; Progress, MaxProgress:
```

```
Integer; var EventStatus: TEventStatus);
begin
  Caption := 'Percent complete: ' +
    IntToStr(Trunc(Progress / MaxProgress * 100)) + '%';
  Application.ProcessMessages;
end;
void __fastcall TForm1::ADODataSet1FetchProgress(TCustomADODataSet *DataSet, int Progress, int
MaxProgress, TEventStatus &EventStatus)
{
  Caption = "Percent complete: " +
    IntToStr(Trunc(Progress / MaxProgress * 100)) + "%";
  Application->ProcessMessages;
}
```

See Also

OnFetchComplete (see page 1242)

8.1.9.6.25 TCustomADODataSet.OnFieldChangeComplete Event

Occurs after a field has changed.

Pascal

```
property OnFieldChangeComplete: TFieldChangeCompleteEvent;
```

C++

```
__property TFieldChangeCompleteEvent OnFieldChangeComplete;
```

Description

Write an OnFieldChangeComplete event handler to take specific action before a pending operation changes the value of one or more ADO Field objects in the Recordset (see page 1221) object. (The term "Field object" as used here refers to the ADO Field object, not VCL persistent field objects that descend from TField.)

DataSet is the ADO dataset component that triggered the OnFieldChangeComplete event. This dataset component also contains the recordset in question.

FieldCount is the number of ADO Field objects in the Fields parameter.

Fields is an array of Variants (see page 23567) representing the ADO Field objects about to be changed by the operation. See the Microsoft Data Access SDK for more information on using ADO Field objects.

Error (see page 1312) is an ADO Error (see page 1312) object. See the Microsoft Data Access SDK for more information on using ADO Error (see page 1312) objects. The Error (see page 1312) parameter is only set if an error occurred during execution of the operation that triggered the event. In this case, the EventStatus parameter will contain the value esErrorsOccured.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event.

Note: A Recordset (see page 1221) object's Field objects are distinct from the VCL field objects of its ADO dataset component. The OnFieldChangeComplete event is purely a Recordset (see page 1221) object event and independent of any VCL field change events.

See Also

OnWillChangeField (see page 1248)

OnRecordChangeComplete (see page 1246)

OnRecordsetChangeComplete (see page 1247)

8.1.9.6.26 TCustomADODataSet.OnFilterRecord Event

Occurs each time a different record in the dataset becomes the active record and filtering is enabled.

Pascal

```
property OnFilterRecord: TFilterRecordEvent;
```

C++

```
__property TFilterRecordEvent OnFilterRecord;
```

Description

Write an OnFilterRecord event handler to specify for each record in a dataset whether it should be visible to the application. To indicate that a record passes the filter condition, the OnFilterRecord event handler must set the Accept parameter to true. To exclude a record, set the Accept parameter to false. Most TDataSet descendants (such as ADO datasets or BDE-based datasets) initialize Accept to true before calling the OnFilterRecord event handler.

Warning: Do not supply an OnFilterRecord event handler to a unidirectional dataset. Unidirectional datasets do not support filters, and assigning an OnFilterRecord event handler causes the dataset to raise an exception.

Filtering is enabled if the Filtered property is true. When an application is processing a filter, the State property for the dataset is dsFilter.

Use an OnFilterRecord event handler to filter records using a criterion that can't be implemented using the Filter property. For example, using the Filter property, field comparisons are not supported against local tables (Paradox, dBASE, Access, FoxPro), but an OnFilterRecord event handler can implement any criterion at all.

Tip: Be sure that any interactions between the Filter property and the OnFilterRecord event handler do not result in an empty filter set when they are used simultaneously in an application.

Writing an OnFilterRecord Event Handler

8.1.9.6.27 TCustomADODataSet.OnMoveComplete Event

Occurs after the row pointer in a recordset has moved.

Pascal

```
property OnMoveComplete: TRecordsetErrorEvent;
```

C++

```
__property TRecordsetErrorEvent OnMoveComplete;
```

Description

Write an OnMoveComplete event handler to take specific action after the row pointer has moved in the dataset component's

Recordset (see page 1221) object. Calls to the First, Last, Next, Prior, MoveBy, Insert, Delete, Post, Requery (see page 1191), and Resynch methods can lead to the firing of this event. Setting or getting a bookmark can also trigger the event.

DataSet is the ADO dataset component that triggered the OnMoveComplete event. This dataset component also contains the recordset in question.

Reason indicates the type of move that triggered the event. While the TEventReason (see page 1296) type contains more constants, the value of Reason for an OnMoveComplete event is limited to: erRequery, erMove, erMoveFirst, erMoveNext, erMovePrevious, and erMoveLast.

Error (see page 1312) is an ADO Error (see page 1312) object. See the Microsoft Data Access SDK for more information on using ADO Error (see page 1312) objects. The Error (see page 1312) parameter is only set if an error occurred during execution of the operation that triggered the event. In this case, the EventStatus parameter will contain the value esErrorsOccured.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event.

Note: : A Recordset (see page 1221) object's row pointer is distinct from the record pointer of its ADO dataset component. It is possible that the ADO Recordset (see page 1221) object will generate row movement events without the ADO dataset component generating a BeforeScroll (see page 1239) or AfterScroll (see page 1233) event. A couple reasons for this are background updating and resynchronizing of the records as data is changed. The OnMoveComplete event is purely a Recordset (see page 1221) object event and independent of any dataset component record navigation events.

See Also

OnWillMove (see page 1250)

8.1.9.6.28 TCustomADODataSet.OnNewRecord Event

Occurs when an application inserts or appends a new dataset record.

Pascal

```
property OnNewRecord: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent OnNewRecord;
```

Description

Write an OnNewRecord event handler to take specific actions as an application inserts or appends a new record. OnNewRecord is called as part of the insert or append process. An application might use the OnNewRecord event to set initial values for a record or as a way of implementing cascading insertions in related datasets.

See Also

AfterInsert (see page 7044)

BeforeInsert (see page 7050)

8.1.9.6.29 TCustomADODataSet.OnPostError Event

Occurs when an application attempts to modify or insert a record and an exception is raised.

Pascal

```
property OnPostError: TDataSetErrorEvent;
```

C++

```
__property TDataSetErrorEvent OnPostError;
```

Description

Write an OnPostError event handler to handle exceptions that occur when an attempt to post a record fails.

See Also

OnDeleteError (see page 7054)

OnEditError (see page 7054)

Post (see page 6977)

8.1.9.6.30 TCustomADODataSet.OnRecordChangeComplete Event

Occurs after one or more records in the recordset change.

Pascal

```
property OnRecordChangeComplete: TRecordChangeCompleteEvent;
```

C++

```
__property TRecordChangeCompleteEvent OnRecordChangeComplete;
```

Description

Write an OnRecordChangeComplete event handler to take specific action after one or more rows in the dataset component's Recordset (see page 1221) object have changed.

DataSet is the ADO dataset component that triggered the OnRecordChangeComplete event. This dataset component also contains the recordset in question.

Reason indicates the type of change that triggered the event. While the TEventReason (see page 1296) type contains more constants, the value of Reason for an OnRecordChangeComplete event is limited to: erAddNew, erDelete, erUpdate, erUndoUpdate, erUndoAddNew, erUndoDelete, and erFirstChange.

RecordCount is the number of records that were changed.

Error (see page 1312) is an ADO Error (see page 1312) object. See the Microsoft Data Access SDK for more information on using ADO Error (see page 1312) objects. The Error (see page 1312) parameter is only set if an error occurred during execution of the operation that triggered the event. In this case, the EventStatus parameter will contain the value esErrorsOccured.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event.

Note: : The OnRecordChangeComplete event is purely a Recordset (see page 1221) object event and independent of any VCL data change events.

See Also

OnWillChangeRecord (see page 1248)

OnFieldChangeComplete (see page 1243)

OnRecordsetChangeComplete (see page 1247)

8.1.9.6.31 TCustomADODataSet.OnRecordsetChangeComplete Event

Occurs after the recordset has changed.

Pascal

```
property OnRecordsetChangeComplete: TRecordsetErrorEvent;
```

C++

```
__property TRecordsetErrorEvent OnRecordsetChangeComplete;
```

Description

Write an OnRecordsetChangeComplete event handler to take specific action after the dataset component's Recordset (see page 1221) object has changed.

DataSet is the ADO dataset component that triggered the OnRecordsetChangeComplete event. This dataset component also contains the recordset in question.

Reason indicates the type of change that triggered the event. While the TEventReason (see page 1296) type contains more constants, the value of Reason for an OnRecordsetChangeComplete event is limited to: erAddNew, erDelete, erUpdate, erUndoUpdate, erUndoAddNew, erUndoDelete, and erFirstChange.

Error (see page 1312) is an ADO Error (see page 1312) object. See the Microsoft Data Access SDK for more information on using ADO Error (see page 1312) objects. The Error (see page 1312) parameter is only set if an error occurred during execution of the operation that triggered the event. In this case, the EventStatus parameter will contain the value esErrorsOccured.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event. EventStatus will be esOK if the operation that triggered the event executed without error, esErrorsOccured if error occurred during execution of that operation, or esCancel if the operation was canceled.

Note: : The OnRecordsetChangeComplete event is purely a Recordset (see page 1221) object event and independent of any VCL data change events.

OnWillChangeRecordset (see page 1249)

OnRecordChangeComplete (see page 1246)

OnFieldChangeComplete (see page 1243)

8.1.9.6.32 TCustomADODataSet.OnRecordsetCreate Event

Occurs when the recordset has been initialized and is ready to use.

Pascal

```
property OnRecordsetCreate: TRecordsetCreate;
```

C++

```
__property TRecordsetCreate OnRecordsetCreate;
```

Description

Write an OnRecordsetCreate event handler to take specific action when the Recordset (see page 1221) property is first available for use. When the ADO dataset is first opened, it initializes the Recordset (see page 1221) property to the interface that it uses for accessing with data. OnRecordsetCreate occurs when Recordset (see page 1221) is fully initialized, and can be used by an application.

DataSet is the ADO dataset component whose Recordset (see page 1221) property has just been initialized to the interface for an ADO recordset.

Recordset (see page 1221) is the interface to the ADO recordset. It is the value of the Recordset (see page 1221) property.

See Also

RecordSet (see page 1221)

Open (see page 6976)

8.1.9.6.33 TCustomADODataSet.OnWillChangeField Event

Occurs before a field is changed.

Pascal

```
property OnWillChangeField: TWillChangeFieldEvent;
```

C++

```
__property TWillChangeFieldEvent OnWillChangeField;
```

Description

Write an OnWillChangeField event handler to take specific action before a pending operation changes the value of one or more ADO Field objects in the Recordset (see page 1221) object. (The term "Field object" as used here refers to the ADO Field object, not VCL persistent field objects that descend from TField.)

DataSet is the ADO dataset component that triggered the OnWillChangeField event. This dataset component also contains the recordset in question.

FieldCount is the number of ADO Field objects in the Fields parameter.

Fields is an array of Variants (see page 23567) representing the ADO Field objects about to be changed by the operation. See the Microsoft Data Access SDK for more information on using ADO Field objects.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event.

Note: : A Recordset (see page 1221) object's Field objects are distinct from the VCL field objects of its ADO dataset component. The OnWillChangeField event is purely a Recordset (see page 1221) object event and independent of any VCL field change events.

OnWillChangeRecordset (see page 1249)

8.1.9.6.34 TCustomADODataSet.OnWillChangeRecord Event

Occurs before a record in the recordset is changed.

Pascal

```
property OnWillChangeRecord: TWillChangeRecordEvent;
```

C++

```
__property TWillChangeRecordEvent OnWillChangeRecord;
```

Description

Write an OnWillChangeRecord event handler to take specific action just before a pending operation changes a row in the dataset component's recordset object.

DataSet is the ADO dataset component that triggered the OnWillChangeRecord event. This dataset component also contains the recordset in question.

Reason indicates the type of change that triggered the event. While the TEventReason (see page 1296) type contains more constants, the value of Reason for an OnWillChangeRecord event is limited to: erAddNew, erDelete, erUpdate, erUndoUpdate, erUndoAddNew, erUndoDelete, and erFirstChange.

RecordCount is the number of records that were changed.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event.

Note: : The OnWillChangeRecord event is purely a Recordset (see page 1221) object event and independent of any VCL data change events.

OnWillChangeRecordset (see page 1249)

8.1.9.6.35 TCustomADODataSet.OnWillChangeRecordset Event

Occurs before the recordset has changed.

Pascal

```
property OnWillChangeRecordset: TRecordsetReasonEvent;
```

C++

```
__property TRecordsetReasonEvent OnWillChangeRecordset;
```

Description

Write an OnWillChangeRecordset event handler to take specific action before the dataset component's Recordset (see page 1221) object is changed.

DataSet is the ADO dataset component that triggered the OnWillChangeRecordset event. This dataset component also contains the recordset in question.

Reason indicates the type of change that triggered the event. While the TEventReason (see page 1296) type contains more constants, the value of Reason for an OnWillChangeRecordset event is limited to: erAddNew, erDelete, erUpdate, erUndoUpdate, erUndoAddNew, erUndoDelete, and erFirstChange.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event. EventStatus will be esOK if the operation that triggered the event executed without error, esErrorsOccured if error occurred during execution of that operation, or esCancel if the operation was canceled.

Note: : The OnWillChangeRecordset event is purely a Recordset (see page 1221) object event and independent of any VCL data change events.

See Also

RecordSet (see page 1221)

OnWillChangeRecord (see page 1248)

OnWillChangeField (see page 1248)

8.1.9.6.36 TCustomADODataSet.OnWillMove Event

Occurs before the row pointer in a recordset is moved.

Pascal

```
property OnWillMove: TRecordsetReasonEvent;
```

C++

```
__property TRecordsetReasonEvent OnWillMove;
```

Description

Write an OnWillMove event handler to take specific action before an attempt to move the row pointer in the dataset component's Recordset (see page 1221) object. Calls to the First, Last, Next, Prior, MoveBy, Insert, Delete, Post, Requery (see page 1191), and Resynch methods can lead to the firing of this event. Setting or getting a bookmark can also trigger the event.

DataSet is the ADO dataset component that triggered the OnWillMove event. This dataset component also contains the recordset in question.

Reason indicates the type of move that triggered the event. While the TEventReason (see page 1296) type contains more constants, the value of Reason for an OnWillMove event is limited to: erRequery, erMove, erMoveFirst, erMoveNext, erMovePrevious, and erMoveLast.

The EventStatus value (ADO EventStatusEnum) indicates the success or failure of the execution of the operation that triggered the event.

Note: : A Recordset (see page 1221) object's row pointer is distinct from the record pointer of its ADO dataset component. It is possible that the ADO Recordset (see page 1221) object will generate row movement events without the ADO dataset component generating a BeforeScroll (see page 1239) or AfterScroll (see page 1233) event. A couple reasons for this are background updating and resynchronizing of the records as data is changed. The OnWillMove event is purely a Recordset (see page 1221) object event, and independent of any dataset component record navigation events.

OnMoveComplete (see page 1244)

8.1.10 TParameter Class

TParameter represents a parameter.

Class Hierarchy

Pascal

```
TParameter = class(TCollectionItem);
```

C++

```
class TParameter : public TCollectionItem;
```

File

ADODB

Description

Use the properties and methods of a TParameter to set or get the value of a parameter used in an ADO query, stored procedure, dataset, or command component. Objects that use parameters create TParameter objects to represent those parameters and use a TParameters (see page 1261) collection to organize and operate on the TParameter objects. For example, TParameters (see page 1261) are used by TADOQuery (see page 1084) objects and TADOStoredProc (see page 1106) components (in their Parameters (see page 1259) properties).

See Also

TParameters (see page 1261)

TParameters (see page 1261)

TParameters (see page 1261)

Parameters

Using Parameters in Queries

8.1.10.1 TParameter Members

The following tables list the members exposed by TParameter.

Protected Methods

	Name	Description
	AssignTo (see page 1254)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 1255)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	IsEqual (see page 1255)	This is IsEqual, a member of class TParameter.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AppendChunk (see page 1253)	Adds data to a parameter.
	Assign (see page 1253)	Copies the properties and value of one TParameter (see page 1250) object to another.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2757)	Creates and initializes a TCollectionItem (see page 2755) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.

V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	LoadFromFile (see page 1255)	Loads the value of a parameter from a file.
	LoadFromStream (see page 1255)	Loads the value of a parameter from a memory stream.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
R	ParameterObject (see page 1259)	Provides direct access to the ADO Parameter object.
R	Parameters (see page 1259)	Provides a reference to the TParameters (see page 1261) container.
R	Properties (see page 1260)	This is Properties, a member of class TParameter.

Published Properties

	Name	Description
	Attributes (see page 1257)	Specifies the attributes of a parameter.
	DataType (see page 1257)	Indicates the type of value the parameter represents.
	Direction (see page 1257)	Indicates the type of parameter.
	Name (see page 1258)	Identifies the TParameter (see page 1250) object.
	NumericScale (see page 1258)	Specifies the number of decimal places for the parameter.
	Precision (see page 1259)	Specifies the number of digits allowed for a numeric parameter.
	Size (see page 1260)	Specifies the size of a string type parameter.
	Value (see page 1260)	Represents the value of the parameter as a Variant.

8.1.10.2 TParameter Methods

The methods of the TParameter class are listed here.

Protected Methods

	Name	Description
V	AssignTo (see page 1254)	Copies the properties of an object to a destination object.

	GetDisplayName (see page 1255)	Returns the name of the collection item as it appears in the collection editor.
	IsEqual (see page 1255)	This is IsEqual, a member of class TParameter.

Public Methods

	Name	Description
	AppendChunk (see page 1253)	Adds data to a parameter.
	Assign (see page 1253)	Copies the properties and value of one TParameter (see page 1250) object to another.
	LoadFromFile (see page 1255)	Loads the value of a parameter from a file.
	LoadFromStream (see page 1255)	Loads the value of a parameter from a memory stream.

8.1.10.2.1 TParameter.AppendChunk Method

Adds data to a parameter.

Pascal

```
procedure AppendChunk(Val: OleVariant);
```

C++

```
__fastcall AppendChunk(OleVariant Val);
```

Description

Call AppendChunk to put data into or add data to a parameter's value. Use AppendChunk to insert binary or text data into a parameter.

AppendChunk may be used to pass all of the data at one time or in pieces using multiple calls to the method. The first call to AppendChunk overwrites any existing data in the parameter. If the data is being passed in its entirety using one call to AppendChunk, no further action takes place. If data is passed in multiple calls, the data passed in Val in each subsequent call to AppendChunk is appended to data previously passed.

Val is the data to pass to the parameter.

Note: : The Attributes (see page 1257) property must contain paLong to use AppendChunk.

See Also

Attributes (see page 1257)

8.1.10.2.2 TParameter.Assign Method

Copies the properties and value of one TParameter (see page 1250) object to another.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to make one TParameter (see page 1250) an exact clone of another. Assign copies the values of the Attributes (see page 1257), DataType (see page 1257), Direction (see page 1257), Name (see page 1258), NumericScale (see page 1258), Precision (see page 1259), Size (see page 1260), and Value (see page 1260) properties from the parameter object specified in Source to the calling parameter object.

```
ADOStoredProc1.Parameters[0].Assign(ADOStoredProc2.Parameters.Items[0]);
ADOStoredProc1->Parameters[0]->Assign(ADOStoredProc2->Parameters.Items[0]);
```

Assign may be used with various types of sources: another TParameter (see page 1250), a field in a table, a string list object

(most often for a memo type parameter), or a TBitmap (for BLOB type fields), a TPicture (for BLOB type fields). In the example below, Assign is used to give a value for a memo type parameter from a string list object (the Lines property of a TMemo).

```
ADOStoredProc1.Parameters[1].Assign(Memo1.Lines);
ADOStoredProc1->Parameters[1]->Assign(Memo1->Lines);
```

See Also

Attributes (see page 1257)

Direction (see page 1257)

Name (see page 1258)

NumericScale (see page 1258)

Precision (see page 1259)

Size (see page 1260)

Value (see page 1260)

DataType (see page 1257)

8.1.10.2.3 TParameter.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign (see page 2930)

EConvertError (see page 22724)

8.1.10.2.4 TParameter.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName (see page 2761)

GetNamePath (see page 2759)

8.1.10.2.5 TParameter.IsEqual Method

Pascal

```
function IsEqual(Value: TParameter): Boolean;
```

C++

```
__fastcall Boolean IsEqual(TParameter Value);
```

Description

This is IsEqual, a member of class TParameter.

8.1.10.2.6 TParameter.LoadFromFile Method

Loads the value of a parameter from a file.

Pascal

```
procedure LoadFromFile(const FileName: string; DataType: TDataType);
```

C++

```
__fastcall LoadFromFile(const AnsiString FileName, TDataType DataType);
```

Description

Call LoadFromFile to copy the contents of a file into a parameter.

FileName contains the name of the file from which to copy data.

DataType (see page 1257) is the field data type the loaded data is to be treated as.

See Also

LoadFromStream (see page 1255)

8.1.10.2.7 TParameter.LoadFromStream Method

Loads the value of a parameter from a memory stream.

Pascal

```
procedure LoadFromStream(Stream: TStream; DataType: TDataType);
```

C++

```
__fastcall LoadFromStream(TStream Stream, TDataType DataType);
```

Description

Call LoadFromStream to copy the contents of a memory stream into a parameter.

Stream is a reference to the memory stream from which to copy data.

DataType (see page 1257) is the field data type the loaded data is to be treated as.

```
var
  MS: TMemoryStream;
begin
  MS := TMemoryStream.Create;
try
    ... fill memory stream with data ...
    ADOQuery1.Parameters[4].LoadFromStream(MS);
finally
if assigned(MS) then
    MS.Free;
end;
end;
TMemoryStream *MS = new(TMemoryStream);
try
{
  Memo1->Lines->SaveToStream(MS);
  MS->Seek(0, soFromBeginning);
  ADOQuery1->Parameters[4]->LoadFromStream(MS);
}
__finally
{
delete MS;
}
```

See Also

LoadFromFile (see page 1255)

8.1.10.3 TParameter Properties

The properties of the TParameter class are listed here.

Public Properties

	Name	Description
R	ParameterObject (see page 1259)	Provides direct access to the ADO Parameter object.
R	Parameters (see page 1259)	Provides a reference to the TParameters (see page 1261) container.
R	Properties (see page 1260)	This is Properties, a member of class TParameter.

Published Properties

	Name	Description
	Attributes (see page 1257)	Specifies the attributes of a parameter.
	DataType (see page 1257)	Indicates the type of value the parameter represents.
	Direction (see page 1257)	Indicates the type of parameter.
	Name (see page 1258)	Identifies the TParameter (see page 1250) object.
	NumericScale (see page 1258)	Specifies the number of decimal places for the parameter.
	Precision (see page 1259)	Specifies the number of digits allowed for a numeric parameter.

	Size (see page 1260)	Specifies the size of a string type parameter.
	Value (see page 1260)	Represents the value of the parameter as a Variant.

8.1.10.3.1 TParameter.Attributes Property

Specifies the attributes of a parameter.

Pascal

```
property Attributes: TParameterAttributes;
```

C++

```
__property TParameterAttributes Attributes;
```

Description

Set Attributes to specify the attributes of a parameter, thus controlling the type of values a parameter will accept. By default, Attributes is assigned no value at all. Attributes may be set to any one or a combination of the three value TParameter (see page 1250) Attributes constants: paSigned, paNullable, and paLong.

See Also

Working with Stored Procedure Parameters

Supplying Parameters at Design Time

8.1.10.3.2 TParameter.DataType Property

Indicates the type of value the parameter represents.

Pascal

```
property DataType: TDataType;
```

C++

```
__property TDataType DataType;
```

Description

Set DataType to reflect the data type of the value the parameter represents. The default value of DataType is ftUnknown.

Read DataType to discover the type of data that was assigned to the parameter. Each possible value of DataType corresponds to a type of table field.

```
ADOStoredProc1.Parameters.Items[0].DataType := ftString;
ADOStoredProc1->Parameters->Items[0]->DataType = ftString;
```

See Also

Working with Stored Procedure Parameters

Supplying Parameters at Design Time

8.1.10.3.3 TParameter.Direction Property

Indicates the type of parameter.

Pascal

```
property Direction: TParameterDirection;
```

C++

```
__property TParameterDirection Direction;
```

Description

Set Direction to indicate the type of parameter the TParameter (see page 1250) object represents. A parameter can be one of the types: input, output, input-output, or return value. Assign (see page 1253) a type of pdUnknown when the actual type of the parameter is not known at the time. The default value of Direction is pdInput.

See Also

Working with Stored Procedure Parameters

Supplying Parameters at Design Time

8.1.10.3.4 TParameter.Name Property

Identifies the TParameter (see page 1250) object.

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

Use Name to identify a particular parameter within a TParameters (see page 1261) object.

Note: Name is the name of the TParameter (see page 1250) object, not the name of the parameter it represents in a query or stored procedure.

See Also

Working with Stored Procedure Parameters

8.1.10.3.5 TParameter.NumericScale Property

Specifies the number of decimal places for the parameter.

Pascal

```
property NumericScale: Byte;
```

C++

```
__property Byte NumericScale;
```

Description

Set NumericScale to indicate the maximum number of characters that can appear to the right of the decimal place in the parameter's value (the scale). (The Precision (see page 1259) property controls the total number of digits allowed.) By default, NumericScale is zero.

See Also

Precision (see page 1259)

Size (see page 1260)

Working with Stored Procedure Parameters

Supplying Parameters at Design Time

8.1.10.3.6 TParameter.ParameterObject Property

Provides direct access to the ADO Parameter object.

Pascal

```
property ParameterObject: _Parameter;
```

C++

```
__property _Parameter ParameterObject;
```

Description

Use ParameterObject to gain direct access to the ADO Parameter object that corresponds to the TParameter (see page 1250) object. Using this reference, you can access properties and call methods of the ADO Parameter object.

Under ordinary circumstances it should not be necessary to use the ADO Parameter directly in an application. This property is provided for the instances where a property or method of the ADO Parameter is needed but not implemented in the TParameter (see page 1250) object. You should be familiar with ADO objects before attempting to use them directly. Consult the Microsoft Data Access SDK for more specific information on ADO objects and their properties and methods.

8.1.10.3.7 TParameter.Parameters Property

Provides a reference to the TParameters (see page 1261) container.

Pascal

```
property Parameters: TParameters;
```

C++

```
__property TParameters Parameters;
```

Description

Use Parameters to get a reference to the TParameters (see page 1261) object in which the TParameter (see page 1250) object is contained.

See Also

TParameters (see page 1261)

8.1.10.3.8 TParameter.Precision Property

Specifies the number of digits allowed for a numeric parameter.

Pascal

```
property Precision: Byte;
```

C++

```
__property Byte Precision;
```

Description

Set Precision to indicate the maximum number of digits allowed in the parameter, including both significant and fractional (the precision). (The NumericScale (see page 1258) property controls the total number of decimal digits allowed.) By default, Precision is zero.

See Also

NumericScale (see page 1258)

Working with Stored Procedure Parameters

Supplying Parameters at Design Time

8.1.10.3.9 TParameter.Properties Property

Pascal

```
property Properties: Properties;
```

C++

```
__property Properties Properties;
```

Description

This is Properties, a member of class TParameter.

8.1.10.3.10 TParameter.Size Property

Specifies the size of a string type parameter.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

Set Size to indicate the maximum number of characters the parameter may contain. By default, Size is zero.

Note: Size only pertains to string type parameters (like CHAR and VARCHAR). For numeric type parameters, use the NumericScale (see page 1258) and Precision (see page 1259) properties. For other column types, Size should remain set to zero.

See Also

Precision (see page 1259)

NumericScale (see page 1258)

Working with Stored Procedure Parameters

Supplying Parameters at Design Time

8.1.10.3.11 TParameter.Value Property

Represents the value of the parameter as a Variant.

Pascal

```
property Value: Variant;
```

C++

```
__property Variant Value;
```

Description

Use Value in generic code that manipulates the values of parameters without needing to know the field type the parameters represent.

See Also

Working with Stored Procedure Parameters

Supplying Parameters at Design Time

8.1.11 TParameters Class

TParameters manages a collection of parameters.

Class Hierarchy

Pascal

```
TParameters = class(TOwnedCollection);
```

C++

```
class TParameters : public TOwnedCollection;
```

File

ADODB

Description

Use TParameters to manage a collection of TParameter (see page 1250) objects for an object that uses field parameters. For example, TADOStoredProc (see page 1106) objects and TADOQuery (see page 1084) objects use TParameters objects (in properties named Parameters (see page 1312)) to create and access their parameters.

Use the properties and methods of TParameters to:

Access a specific parameter.

Add or delete field parameters from the list.

Get or set the values of individual parameters.

Compare collections of parameters.

Iterate through all parameters.

Copy a collection of parameters to another parameter collection.

See Also

Parameters

TParameter (see page 1250)

8.1.11.1 TParameters Members

The following tables list the members exposed by TParameters.

Protected Methods

	Name	Description
	Added (see page 2736)	Responds when items are added to the collection.
	AppendParameters (see page 1264)	This is AppendParameters, a member of class TParameters.

V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
	Create_Parameter (see page 1265)	This is Create_Parameter, a member of class TParameters.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
V	GetAttr (see page 1267)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.
V	GetAttrCount (see page 1267)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
V	GetItemAttr (see page 1268)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
	InternalRefresh (see page 1269)	This is InternalRefresh, a member of class TParameters.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 1271)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	Modified (see page 1272)	This is Modified, a member of class TParameters.
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 2736)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	AddParameter (see page 1264)	Adds a parameter to the collection.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
	AssignValues (see page 1265)	Assigns parameter values from another parameters collection.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 2734)	Creates and initializes a collection.
	Create (see page 2914)	Creates and initializes a TOwnedCollection (see page 2912) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParameter (see page 1266)	Adds a parameter to the collection.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.

V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	FindParam (see page 1266)	Locates the parameter with a given name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParamList (see page 1268)	Fills a TList object with names of available parameters.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEqual (see page 1269)	Indicates whether two TParameters (see page 1261) objects have identical contents.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
	ParamByName (see page 1269)	Locates the parameter with a given name.
	ParseSQL (see page 1270)	Parses an SQL statement for parameters and TParameter (see page 1250) objects.
	Refresh (see page 1271)	Refreshes a parameter collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Command (see page 1272)	Indicates the associated ADO command object.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 1272)	Contains the collection of parameters.
R	ParameterCollection (see page 1273)	Encapsulates the ADO Parameters (see page 1312) Collection object.
	ParamValues (see page 1273)	Retrieves the value of one or more parameters.

8.1.11.2 TParameters Methods

The methods of the TParameters class are listed here.

Protected Methods

	Name	Description
	AppendParameters (see page 1264)	This is AppendParameters, a member of class TParameters.
	Create_Parameter (see page 1265)	This is Create_Parameter, a member of class TParameters.
V	GetAttr (see page 1267)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.

	GetAttrCount (see page 1267)	Returns the number of custom attributes associated with items in the collection.
	GetItemAttr (see page 1268)	Returns the value of a custom attribute assigned to one of the collection's items.
	InternalRefresh (see page 1269)	This is InternalRefresh, a member of class TParameters.
	Update (see page 1271)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	AddParameter (see page 1264)	Adds a parameter to the collection.
	AssignValues (see page 1265)	Assigns parameter values from another parameters collection.
	CreateParameter (see page 1266)	Adds a parameter to the collection.
	FindParam (see page 1266)	Locates the parameter with a given name.
	GetParamList (see page 1268)	Fills a TList object with names of available parameters.
	IsEqual (see page 1269)	Indicates whether two TParameters (see page 1261) objects have identical contents.
	ParamByName (see page 1269)	Locates the parameter with a given name.
	ParseSQL (see page 1270)	Parses an SQL statement for parameters and TParameter (see page 1250) objects.
	Refresh (see page 1271)	Refreshes a parameter collection.

8.1.11.2.1 TParameters.AddParameter Method

Adds a parameter to the collection.

Pascal

```
function AddParameter: TParameter;
```

C++

```
__fastcall TParameter AddParameter();
```

Description

Call AddParameter to create a single empty TParameter (see page 1250) object and add it to the TParameters (see page 1261) collection. All properties of the newly added TParameter (see page 1250) object are either at their default value or are empty.

```
with ADOStoredProc1.AddParameter do begin
  DataType := ftString;
..Direction := pdInput;
  Value := 'malathion';
end;
int PCount;
ADOStoredProc1->AddParameter;
PCount = ADOStoredProc1->Parameters->Count - 1;
ADOStoredProc1->Parameters[PCount]->DataType = ftString;
ADOStoredProc1->Parameters[PCount]->Direction = pdInput;
ADOStoredProc1->Parameters[PCount]->Value = "malathion";
```

See Also

TParameter (see page 1250)

Parameters (see page 1259)

CreateParameter (see page 1266)

8.1.11.2.2 TParameters.AppendParameters Method

Pascal

```
procedure AppendParameters;
```

C++

```
__fastcall AppendParameters();
```

Description

This is AppendParameters, a member of class TParameters.

8.1.11.2.3 TParameters.AssignValues Method

Assigns parameter values from another parameters collection.

Pascal

```
procedure AssignValues(Value: TParameters);
```

C++

```
__fastcall AssignValues(TParameters Value);
```

Description

Call AssignValues to assign the values of parameters in the calling TParameters (see page 1261) object using the values in another TParameters (see page 1261).

```
ADOQuery1.Parameters.AssignValues(ADOQuery2.Parameters);
ADOQuery1->Parameters->AssignValues(ADOQuery2->Parameters);
```

Each parameter with the same name as a parameter in the source TParameters (see page 1261) specified in Value is assigned the value from the source parameter. Parameters (see page 1312) in the calling TParameters (see page 1261) object that do not exist in the source TParameters (see page 1261) object are unaffected. Parameters (see page 1312) that only exist in the source TParameters (see page 1261) are not subsequently created in the calling TParameters (see page 1261) object. For example if the calling TParameters (see page 1261) has parameters named Parm1 and Parm2 and the source TParameters (see page 1261) has Parm2 and Parm3:

Parm1 in the calling TParameters (see page 1261) is unaffected.

Parm2 gets the value of Parm2 in the source TParameters (see page 1261).

No Parm3 is created in the calling TParameters (see page 1261).

See Also

TParameter (see page 1250)

Value (see page 1260)

8.1.11.2.4 TParameters.Create_Parameter Method

Pascal

```
function Create_Parameter(const Name: WideString; DataType: TDataType; Direction:
TParameterDirection = pdInput; Size: Integer = 0): _Parameter;
```

C++

```
__fastcall _Parameter Create_Parameter(const BSTR Name, TDataType DataType,
TParameterDirection Direction = pdInput, int Size = 0);
```

Description

This is Create_Parameter, a member of class TParameters.

8.1.11.2.5 TParameters.CreateParameter Method

Adds a parameter to the collection.

Pascal

```
function CreateParameter(const Name: WideString; DataType: TDataType; Direction:
TParameterDirection; Size: Integer; Value: OleVariant): TParameter;
```

C++

```
__fastcall TParameter CreateParameter(const BSTR Name, TDataType DataType, TParameterDirection
Direction, int Size, OleVariant Value);
```

Description

Call CreateParameter to create a single TParameter (see page 1250) object and add it to the TParameters (see page 1261) collection. Property values for the newly added TParameter (see page 1250) object are supplied via CreateParameter parameters.

Name is a WideString value containing the name of the newly created TParameter (see page 1250) object.

DataType is a TDataType (see page 1315) value indicating the data type of the parameter the new TParameter (see page 1250) object represents.

Direction is a TParameterDirection (see page 1303) value indicating the parameter type. A parameter represented by a TParameter (see page 1250) may be any one of: input, output, input-output, return value. Designate a parameter as unknown if the parameter type is not know at the time the TParameter (see page 1250) is created.

Size indicates the maximum size of the parameter's value.

Value is an OleVariant containing the parameter's value. A value need not be passed for Value when the TParameter (see page 1250) is created. It can be assigned later. If no value is assigned at this time, pass a nil (Delphi) or NULL (C++) for Value.

```
ADOStoredProc1.CreateParameter('Parm1', ftString, pdInput, 10, nil);
```

See Also

TParameter (see page 1250)

Parameters (see page 1259)

AddParameter (see page 1264)

8.1.11.2.6 TParameters.FindParam Method

Locates the parameter with a given name.

Pascal

```
function FindParam(const Value: WideString): TParameter;
```

C++

```
__fastcall TParameter FindParam(const BSTR Value);
```

Description

Use FindParam method to find a parameter with the name specified in Value. If a match is found, FindParam returns a reference to the TParameter (see page 1250) object (assignment-compatible with TParam objects) for the parameter of the specified name. Otherwise, it returns nil (Delphi) or NULL (C++). Use this method rather than a direct reference to the Items (see page 1272) property to avoid depending on the order of the entries.

To locate more than one parameter at a time, by name, use the GetParamList (see page 1268) method instead. To get only

the value of a named parameter, use the ParamValues (see page 1273) property.

Note: FindParam operates with the name of a parameter as it appears in an SQL statement or stored procedure, not the Name property of a TParameter (see page 1250) object. The two ways of referring to a parameter should not be confused.

See Also

TParameter (see page 1250)

TParam (see page 7386)

Items (see page 1272)

Name (see page 1258)

ParamByName (see page 1269)

GetParamList (see page 1268)

ParamValues (see page 1273)

8.1.11.2.7 TParameters.GetAttr Method

Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.

Pascal

```
function GetAttr(Index: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString GetAttr(int Index);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. The GetAttr method returns the name of an attribute.

Index identifies the attribute whose name is requested. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

As implemented by TCollection, GetAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttrCount (see page 2744)

GetItemAttr (see page 2745)

8.1.11.2.8 TParameters.GetAttrCount Method

Returns the number of custom attributes associated with items in the collection.

Pascal

```
function GetAttrCount: Integer; override;
```

C++

```
virtual __fastcall int GetAttrCount();
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetAttrCount returns the number of distinct attributes assigned to each item in the collection.

As implemented in TCollection, GetAttrCount always returns 0, because TCollection defines no custom attributes.

See Also

GetAttr (see page 2743)

GetItemAttr (see page 2745)

8.1.11.2.9 TParameters.GetItemAttr Method

Returns the value of a custom attribute assigned to one of the collection's items.

Pascal

```
function GetItemAttr(Index: Integer; ItemIndex: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString GetItemAttr(int Index, int ItemIndex);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetItemAttr returns the value of one of these attributes for a specified item in the collection.

Index identifies which attribute's value is desired. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

ItemIndex identifies the item whose attribute value is desired. This is an index into the Items property array.

As implemented in TCollection, GetItemAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttr (see page 2743)

GetAttrCount (see page 2744)

8.1.11.2.10 TParameters.GetParamList Method

Fills a TList object with names of available parameters.

Pascal

```
procedure GetParamList(List: TList; const ParamNames: WideString);
```

C++

```
__fastcall GetParamList(TList List, const BSTR ParamNames);
```

Description

Use GetParamList to obtain a subset of the parameters in the TParameters (see page 1261) collection that have been identified by name.

ParamNames is a string giving the names of all field parameters of interest. Multiple parameter names are separated by semicolons (;).

List is the TList object into which the parameters names are placed. GetParamList adds the field parameters to List in the order they appear in ParamNames. If ParamNames includes a name that does not match any of the field parameters in Items (see page 1272), an exception is raised.

Note: GetParamList operates with the names of parameters as they appear in an SQL statement or stored procedure, not the Name property of TParameter (see page 1250) objects. The two ways of referring to a parameter should not be confused.

See Also

TParameter (see page 1250)

Name (see page 1258)

ParamByName (see page 1269)

FindParam (see page 1266)

ParamValues (see page 1273)

8.1.11.2.11 TParameters.InternalRefresh Method

Pascal

```
function InternalRefresh: Boolean;
```

C++

```
__fastcall Boolean InternalRefresh();
```

Description

This is InternalRefresh, a member of class TParameters.

8.1.11.2.12 TParameters.IsEqual Method

Indicates whether two TParameters (see page 1261) objects have identical contents.

Pascal

```
function IsEqual(Value: TParameters): Boolean;
```

C++

```
__fastcall Boolean IsEqual(TParameters Value);
```

Description

Use IsEqual to compare the contents of two TParameters (see page 1261) objects. IsEqual returns true if the parameter collection specified in Value exactly matches the calling parameter collection. To match, each parameter collection must have the same number of TParameter (see page 1250) objects, in the same order, which match on name, datatype, parameter type, and value.

```
if (ADOQuery1.Parameters.IsEqual(ADOQuery2.Parameters) then
  { do one thing }
else
  { do something else };
if (ADOQuery1->Parameters->IsEqual(ADOQuery2->Parameters)
  // do one thing
else
  // do something else
```

See Also

TParameter (see page 1250)

8.1.11.2.13 TParameters.ParamByName Method

Locates the parameter with a given name.

Pascal

```
function ParamByName(const Value: WideString): TParameter;
```

C++

```
__fastcall TParameter ParamByName(const BSTR Value);
```

Description

Use ParamByName method to find a parameter with the name specified in Value. If a match is found, ParamByName returns a reference to the corresponding TParameter (see page 1250) object. Otherwise, the TParameter (see page 1250) reference is nil (Delphi) or NULL (C++) and an exception is raised. Use this method rather than a direct reference to the Items (see page 1272) property to avoid depending on the order of the entries.

```
ADOQuery1.Parameters.ParamByName('Verb').Value := 'propitiate';
ADOQuery1.Open;
ADOQuery1->Parameters->ParamByName("Verb")->Value = "propitiate";
ADOQuery1->Open();
```

To locate a parameter by name without raising an exception if the parameter is not found, use the FindParam (see page 1266) method.

To locate more than one parameter at a time, by name, use the GetParamList (see page 1268) method instead. To get only the value of a named parameter, use the ParamValues (see page 1273) property.

Note: ParamByName operates with the name of a parameter as it appears in an SQL statement or stored procedure, not the Name property of a TParameter (see page 1250) object. The two ways of referring to a parameter should not be confused.

See Also

Items (see page 1272)

Name (see page 1258)

GetParamList (see page 1268)

FindParam (see page 1266)

ParamValues (see page 1273)

8.1.11.2.14 TParameters.ParseSQL Method

Parses an SQL statement for parameters and TParameter (see page 1250) objects.

Pascal

```
function ParseSQL(SQL: WideString; DoCreate: Boolean): WideString;
```

C++

```
__fastcall BSTR ParseSQL(BSTR SQL, Boolean DoCreate);
```

Description

Call ParseSQL to parse an SQL statement for parameters. For each parameter found in the SQL statement, a TParameter (see page 1250) object is added to the calling TParameters (see page 1261) object using the name of the parameter in the SQL statement.

SQL contains the SQL statement to parse.

DoCreate indicates whether to clear all existing parameter definitions before parsing the SQL statement.

ParseSQL returns a parsed version of the SQL statement specified in the SQL parameter.

```
ADOQuery1.Parameters.ParseSQL(ADOQuery1.Text, True);
ADOQuery1->Parameters->ParseSQL(ADOQuery1->Text, true);
```

8.1.11.2.15 TParameters.Refresh Method

Refreshes a parameter collection.

Pascal

```
function Refresh: Boolean;
```

C++

```
__fastcall Boolean Refresh();
```

Description

Call Refresh to ensure a parameter collection has the most up to date information on available parameters.

See Also

TParameter (see page 1250)

Parameters (see page 1259)

8.1.11.2.16 TParameters.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem Item);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

See Also

Changed (see page 2740)

Changed (see page 2758)

8.1.11.3 TParameters Properties

The properties of the TParameters class are listed here.

Protected Properties

	Name	Description
R	Modified (see page 1272)	This is Modified, a member of class TParameters.

Public Properties

	Name	Description
R	Command (see page 1272)	Indicates the associated ADO command object.

	Items (see page 1272)	Contains the collection of parameters.
R	ParameterCollection (see page 1273)	Encapsulates the ADO Parameters (see page 1312) Collection object.
	ParamValues (see page 1273)	Retrieves the value of one or more parameters.

8.1.11.3.1 TParameters.Command Property

Indicates the associated ADO command object.

Pascal

```
property Command: TADOCommand;
```

C++

```
__property TADOCommand Command;
```

Description

Read Command to get a reference to the ADO command object associated with the ADO dataset object that contains the TParameters (see page 1261) object.

8.1.11.3.2 TParameters.Items Property

Contains the collection of parameters.

Pascal

```
property Items [Index: Integer]: TParameter;
```

C++

```
__property TParameter Items[int Index];
```

Description

Items is a collection of TParameter (see page 1250) objects. Each TParameter (see page 1250) object in the collection represents an individual parameter. Use Items to access a particular parameter.

Index indicates the specific parameter to access. Index identifies the parameter's position in the collection of parameters, in the range 0 to Count - 1.

See Also

TParameter (see page 1250)

TADOQuery (see page 1084)

TADOStoredProc (see page 1106)

Count (see page 2749)

ExecSQL (see page 1100)

operator_[]

8.1.11.3.3 TParameters.Modified Property

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

This is Modified, a member of class TParameters.

8.1.11.3.4 TParameters.ParameterCollection Property

Encapsulates the ADO Parameters (see page 1312) Collection object.

Pascal

```
property ParameterCollection: Parameters;
```

C++

```
__property Parameters ParameterCollection;
```

Description

Use Properties (see page 1313) to get direct access to the ADO Parameters (see page 1312) Collection for the ADO Recordset object with which the TParameters (see page 1261) is associated. A Parameters (see page 1312) Collection object contains al of the ADO Parameters (see page 1312) objects for a command. A Parameters (see page 1312) Collection contains one or more ADO Parameter objects.

Note: Use of ParameterCollection to directly access the underlying ADO Parameters (see page 1312) Collection object requires a good working knowledge of ADO objects in general and ADO Parameters (see page 1312) Collection objects in specific. Consult the Microsoft Data Store SDK help for specific information on using ADO Parameters (see page 1312) Collection objects.

See Also

TParameter (see page 1250)

8.1.11.3.5 TParameters.ParamValues Property

Retrieves the value of one or more parameters.

Pascal

```
property ParamValues [const ParamName: WideString]: Variant;
```

C++

```
__property Variant ParamValues[BSTR const ParamName];
```

Description

Use ParamValues to get or set the individual values of parameters identified by name.

ParamName contains the names of the individual parameters of interest. If ParamValues is used to access more than one parameter, the names are separated by semicolons (;).

Setting ParamValues sets the Value property for each parameter listed in the ParamName string. Specify the values as Variants (see page 23567), in order, in a variant array.

Getting ParamValues retrieves a variant array of variants, each of which represents the value of one of the named parameters.

If ParamName includes a name that does not match any of the field parameters in Items (see page 1272), an exception is raised.

Note: ParamValues operates with the names of parameters as they appear in an SQL statement or stored procedure, not the Name property of TParameter (see page 1250) objects. The two should not be confused.

See Also

Items (see page 1272)

Name (see page 1258)

GetParamList (see page 1268)

FindParam (see page 1266)

ParamByName (see page 1269)

8.1.12 TRDSConnection Class

TRDSConnection implements an RDS DataSpace object.

Class Hierarchy

Pascal

```
TRDSConnection = class(TCustomConnection);
```

C++

```
class TRDSConnection : public TCustomConnection;
```

File

ADODB

Description

The TRDSConnection class exposes the functionality of the RDS DataSpace object. RDS DataSpace objects manage the marshaling of data when a Recordset object is passed from one process or machine to another. Use TRDSConnection when building multi-tier applications using ADO-based business objects (Application Servers).

Use TRDSConnection in the place of TADOConnection (see page 1001). Associate the TRDSComponent with a TADODataSet (see page 1041) component using the latter's RDSConnection property.

By default, an RDS connection component is configured to work with the RDS DataFactory object. The DataFactory object can be used when you do not require a specialized business object. When using a DataFactory object, the ConnectionString and CommandText properties of the TADODataSet (see page 1041) are passed to the Query method of the DataFactory object. When using a business object, the CommandText property should contain the name of a property of the business object which returns the desired Recordset for the TADODataSet (see page 1041). The A value for the ConnectionString property is not required when using a business object.

See Also

TADOConnection (see page 1001)

TADODataSet (see page 1041)

TADODataSet (see page 1041)

Using TADODataSet

Database Architecture

8.1.12.1 TRDSConnection Members

The following tables list the members exposed by TRDSConnection.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoConnect (see page 1279)	Provides the interface for a method that opens a connection.
V	DoDisconnect (see page 1279)	Provides the interface for a method that terminates the connection.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetConnected (see page 1280)	Returns the value of the Connected property.
V	GetDataSet (see page 6865)	Returns a dataset, given its index in the DataSets (see page 6870) property array.
V	GetDataSetCount (see page 6865)	Returns the value of the DataSetCount (see page 6869) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 6866)	Initializes the connection component after all objects in the form or data module have been loaded.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	RegisterClient (see page 6866)	Registers an object that uses the connection component.
	SendConnectEvent (see page 6867)	Informs all registered clients that use the connection component when a connection is opened or closed.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetConnected (see page 6867)	Changes the value of the Connected (see page 6868) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.

	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	UnRegisterClient (see page 6868)	Removes a registered client so that it is no longer associated with the connection component.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	StreamedConnected (see page 6874)	Indicates whether the Connected (see page 6868) property was true when the connection component was loaded from a stream.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 6863)	Closes the connection.
V	Create (see page 1278)	Creates an instance of TRDSConnection (see page 1274).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 1278)	Destroys the instance of a connection component.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetRecordset (see page 1280)	Retrieves a Recordset.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 6866)	Opens the connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AppServer (see page 1281)	Provides access to the application server communication interface.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	DataSetCount (see page 6869)	Indicates the number of datasets associated with the connection component.
R	DataSets (see page 6870)	Lists the datasets currently using this connection component.
R	DataSpaceObject (see page 1282)	Provides access to the interface for the RDS DataSpace object.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	LoginPrompt (see page 6872)	Specifies whether a login dialog appears immediately before opening a new connection.
	OnLogin (see page 6873)	Occurs when a communication channel opens to the server.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterConnect (see page 1284)	Occurs after a connection is established.
	AfterDisconnect (see page 1284)	Occurs after the connection closes.

	BeforeConnect (see page 1284)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 1285)	Occurs immediately before the connection closes.

Published Properties

	Name	Description
	ComputerName (see page 1281)	Specifies the source of a business object.
	Connected (see page 1282)	Determines whether a connection has been established to the remote source of data.
	InternetTimeout (see page 1283)	Specifies the amount of time before a request times out.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ServerName (see page 1283)	Specifies the business object.
	Tag (see page 2808)	Stores an integer value as part of a component.

8.1.12.2 TRDSConnection.Create Constructor

Creates an instance of TRDSConnection (see page 1274).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRDSConnection(TComponent * AOwner);
```

Description

Call Create to instantiate an RDS connection component at runtime. The Owner parameter specifies another component (usually a form or data module) that is responsible for freeing the RDS connection component.

Create

Calls its inherited Create method.

Associates the RDS connection component to the default DataFactory.

See Also

Owner (see page 2807)

8.1.12.3 TRDSConnection.Destroy Destructor

Destroys the instance of a connection component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRDSConnection();
```

Description

Do not call Destroy directly in an application. Instead, call Free, which verifies that the TRDSConnection (see page 1274) reference is not nil before calling Destroy

Destroy closes all active datasets and closes its connection before freeing all internal resources.

Destroyperforms the following tasks:

Clears references.

Frees its data space object.

Calls the inherited destructor.

See Also

Create (see page 1278)

Free (see page 22300)

8.1.12.4 TRDSConnection Methods

The methods of the TRDSConnection class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 1279)	Provides the interface for a method that opens a connection.
	DoDisconnect (see page 1279)	Provides the interface for a method that terminates the connection.
	GetConnected (see page 1280)	Returns the value of the Connected property.

Public Methods

	Name	Description
	GetRecordset (see page 1280)	Retrieves a Recordset.

8.1.12.4.1 TRDSConnection.DoConnect Method

Provides the interface for a method that opens a connection.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

The Connected property uses DoConnect to establish a connection. Descendant classes override the DoConnect method to establish their connection as appropriate. As implemented in TCustomConnection, DoConnect does nothing.

See Also

Connected (see page 6868)

DoDisconnect (see page 6864)

8.1.12.4.2 TRDSConnection.DoDisconnect Method

Provides the interface for a method that terminates the connection.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

The Connected property uses DoDisconnect to close a connection. Descendant classes override the DoDisconnect method to

drop a connection. As implemented in TCustomConnection, DoDisconnect does nothing.

See Also

Connected (see page 6868)

DoConnect (see page 6864)

8.1.12.4.3 TRDSConnection.GetConnected Method

Returns the value of the Connected property.

Pascal

```
function GetConnected: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetConnected();
```

Description

GetConnected is the protected read implementation of the Connected property. Descendant classes override this method to return true if a connection is open and false otherwise. As defined in TCustomConnection, GetConnected always returns false.

See Also

Connected (see page 6868)

SetConnected (see page 6867)

8.1.12.4.4 TRDSConnection.GetRecordset Method

Retrieves a Recordset.

Pascal

```
function GetRecordset(const CommandText: WideString; ConnectionString: WideString = ''):
_Recordset;
```

C++

```
__fastcall _Recordset GetRecordset(const BSTR CommandText, BSTR ConnectionString = '');
```

Description

Call GetRecordset to retrieve a Recordset object from a business object. GetRecordset is called automatically by the TADODataSet (see page 1041) associated with the RDS connection component.

When using a business object, only the CommandText parameter should be passed a value. This is the Name property of the business object that returns the Recordset object. When GetRecordset is called by the TADODataSet (see page 1041) component, the value used for the CommandText parameter is the value in the CommandText property of the ADO dataset component.

When using a DataFactory, the CommandText parameter is a query command (SQL statement) to execute and the ConnectionString specifies the information needed to establish the connection. When GetRecordset is called by the ADO dataset component, the value used for the ConnectionString parameter is the value in the ConnectionString property of the ADO dataset component.

```
ADODataSet1.CommandText := 'SELECT * FROM Employee';
ADODataSet1.RecordSet := RDSConnection1.GetRecordset(ADODataSet1.CommandText, '');
ADODataSet1->CommandText := "SELECT * FROM Employee";
ADODataSet1->Recordset := RDSConnection1->GetRecordset(ADODataSet1.CommandText, "");
```

8.1.12.5 TRDSConnection Properties

The properties of the TRDSConnection class are listed here.

Public Properties

	Name	Description
R	AppServer (see page 1281)	Provides access to the application server communication interface.
R	DataSpaceObject (see page 1282)	Provides access to the interface for the RDS DataSpace object.

Published Properties

	Name	Description
	ComputerName (see page 1281)	Specifies the source of a business object.
	Connected (see page 1282)	Determines whether a connection has been established to the remote source of data.
	InternetTimeout (see page 1283)	Specifies the amount of time before a request times out.
	ServerName (see page 1283)	Specifies the business object.

8.1.12.5.1 TRDSConnection.AppServer Property

Provides access to the application server communication interface.

Pascal

```
property AppServer: OleVariant;
```

C++

```
__property OleVariant AppServer;
```

Description

Use AppServer to get direct access to the interface the ADO dataset uses to communicate with the application server. Use this property if you need to access additional properties or methods of the business object not related to Recordsets.

8.1.12.5.2 TRDSConnection.ComputerName Property

Specifies the source of a business object.

Pascal

```
property ComputerName: WideString;
```

C++

```
__property BSTR ComputerName;
```

Description

Use ComputerName to specify the source of a business object to use through the TRDSConnection (see page 1274) component. If left blank, the business object is loaded from the local machine.

Several protocols are supported for creating the business object: HTTP, HTTPS, and DCOM. For business objects created with HTTP and HTTPS, ComputerName is a string containing a Universal Resource Identifier (URL) identifying the Internet Information Server (IIS) Web server where an instance of the server business object is created. For DCOM, ComputerName is the name of the machine.

8.1.12.5.3 TRDSConnection.Connected Property

Determines whether a connection has been established to the remote source of data.

Pascal

```
property Connected: Boolean;
```

C++

```
__property Boolean Connected;
```

Description

Set Connected to true to open the connection. Set Connected to false to terminate the connection.

Setting Connected to true generates a BeforeConnect event, calls the protected DoConnect method to establish the connection, and generates an AfterConnect event. In addition, when setting Connected to true, TCustomConnection may display a login dialog, depending on the value of LoginPrompt.

Setting Connected to false generates a BeforeDisconnect event, calls the protected DoConnect method to drop the connection, and generates an AfterDisconnect event.

When deriving custom connection components from TCustomConnection, override GetConnected to return true when a connection is established, and override DoConnect and DoDisconnect to create and drop the connection.

Disconnecting from a Database Server

Connecting to a Database Server

8.1.12.5.4 TRDSConnection.DataSpaceObject Property

Provides access to the interface for the RDS DataSpace object.

Pascal

```
property DataSpaceObject: DataSpace;
```

C++

```
__property DataSpace DataSpaceObject;
```

Description

Use DataSpaceObject to get direct access to the RDS DataSpace object the RDS connection component represents. This direct access reference allows an application to use properties and methods of the underlying DataSpace object. Accessing the underlying DataSpace object is especially useful for utilizing properties and methods of the DataSpace object not surfaced in TRDSConnection (see page 1274).

Note: Use of DataSpaceObject to directly access the underlying RDS DataSpace object requires a good working knowledge of ADO objects in general and the RDS DataSpace object in specific. It is not recommended that you use the DataSpace object directly unless familiar with DataSpace object operations. Consult the Microsoft Data Store SDK help for specific information on using RDS DataSpace objects.

8.1.12.5.5 TRDSConnection.InternetTimeout Property

Specifies the amount of time before a request times out.

Pascal

```
property InternetTimeout: Integer;
```

C++

```
__property int InternetTimeout;
```

Description

Use InternetTimeout to specify the amount of time (measured in milliseconds) after which a request times out. InternetTimeout only applies to requests sent with the HTTP and HTTPS protocols. The default value for InternetTimeout is zero.

In a multi-tier environment, requests for data may take several minutes to execute. InternetTimeout can be used to specify a longer time-out period for long running requests.

8.1.12.5.6 TRDSConnection.ServerName Property

Specifies the business object.

Pascal

```
property ServerName: WideString;
```

C++

```
__property BSTR ServerName;
```

Description

Use ServerName to specify the ProgID of the business object to instantiate. The default value is that in the RDSServer.DataFactory property. This is the ProgID of the RDS DataFactory object. The DataFactory allows for execution of queries against any datasource. See the Microsoft Data Store SDK help for more information on the DataFactory object.

Connecting to the Application Server using DataSnap Components

8.1.12.6 TRDSConnection Events

The events of the TRDSConnection class are listed here.

Published Events

	Name	Description
	AfterConnect (see page 1284)	Occurs after a connection is established.
	AfterDisconnect (see page 1284)	Occurs after the connection closes.
	BeforeConnect (see page 1284)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 1285)	Occurs immediately before the connection closes.

8.1.12.6.1 TRDSConnection.AfterConnect Event

Occurs after a connection is established.

Pascal

```
property AfterConnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterConnect;
```

Description

Write an AfterConnect event handler to take application-specific actions immediately after the connection component opens a connection to the remote source of database information.

See Also

BeforeConnect (see page 6875)

Connected (see page 6868)

Connecting to a Database Server

8.1.12.6.2 TRDSConnection.AfterDisconnect Event

Occurs after the connection closes.

Pascal

```
property AfterDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDisconnect;
```

Description

Write an AfterDisconnect event handler to take application-specific actions after the connection component drops a connection.

See Also

BeforeDisconnect (see page 6875)

Connected (see page 6868)

Disconnecting from a Database Server

8.1.12.6.3 TRDSConnection.BeforeConnect Event

Occurs immediately before establishing a connection.

Pascal

```
property BeforeConnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeConnect;
```

Description

Write a BeforeConnect event handler to take application-specific actions before the connection component opens a connection to the remote source of database information.

See Also

AfterConnect (see page 6874)

Connected (see page 6868)

Connecting to a Database Server

8.1.12.6.4 TRDSConnection.BeforeDisconnect Event

Occurs immediately before the connection closes.

Pascal

```
property BeforeDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDisconnect;
```

Description

Write a BeforeDisconnect event handler to take application-specific actions before dropping a connection.

Delphi Examples:

```
{
This BeforeDisconnect event handler makes sure that the
client dataset has applied all its pending updates before
terminating the connection to the server.
}
procedure TForm1.RemoteServer1BeforeDisconnect(Sender: TObject);
begin
  if (ClientDataSet1.ChangeCount > 0) then
    ClientDataSet1.ApplyUpdates(-1);
end;
```

8.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CreateUDLFile (see page 1286)	This is function ADODB.CreateUDLFile.
	DataLinkDir (see page 1286)	This is function ADODB.DataLinkDir.
	GetDataLinkFiles (see page 1287)	This is function ADODB.GetDataLinkFiles.
	GetDataLinkFiles (see page 1287)	This is function ADODB.GetDataLinkFiles.
	GetProviderNames (see page 1287)	This is function ADODB.GetProviderNames.
	GetProviderNames (see page 1288)	This is function ADODB.GetProviderNames.
	PromptDataLinkFile (see page 1288)	This is function ADODB.PromptDataLinkFile.
	PromptDataSource (see page 1288)	This is function ADODB.PromptDataSource.

8.2.1 ADODB.CreateUDLFile Function

Pascal

```
procedure CreateUDLFile(const FileName: WideString; const ProviderName: WideString; const
DataSourceName: WideString);
```

C++

```
CreateUDLFile(const BSTR FileName, const BSTR ProviderName, const BSTR DataSourceName);
```

File

ADODB

Description

This is function ADODB.CreateUDLFile.

8.2.2 ADODB.DataLinkDir Function

Pascal

```
function DataLinkDir: string;
```

C++

```
AnsiString DataLinkDir();
```

File

ADODB

Description

This is function ADODB.DataLinkDir.

8.2.3 ADODB.GetDataLinkFiles Function

Pascal

```
function GetDataLinkFiles(FileNames: TStrings; Directory: string = ''): Integer; overload;
```

C++

```
int GetDataLinkFiles(TStrings FileNames, AnsiString Directory = '');
```

File

ADODB

Description

This is function ADODB.GetDataLinkFiles.

8.2.4 ADODB.GetDataLinkFiles Function

Pascal

```
function GetDataLinkFiles(FileNames: TWideStrings; Directory: string = ''): Integer; overload;
```

C++

```
int GetDataLinkFiles(TWideStrings FileNames, AnsiString Directory = '');
```

File

ADODB

Description

This is function ADODB.GetDataLinkFiles.

8.2.5 ADODB.GetProviderNames Function

Pascal

```
procedure GetProviderNames(Names: TStrings); overload;
```

C++

```
GetProviderNames(TStrings Names);
```

File

ADODB

Description

This is function ADODB.GetProviderNames.

8.2.6 ADODB.GetProviderNames Function

Pascal

```
procedure GetProviderNames(Names: TWideStrings); overload;
```

C++

```
GetProviderNames(TWideStrings Names);
```

File

ADODB

Description

This is function ADODB.GetProviderNames.

8.2.7 ADODB.PromptDataLinkFile Function

Pascal

```
function PromptDataLinkFile(ParentHandle: THandle; InitialFile: WideString): WideString;
```

C++

```
BSTR PromptDataLinkFile(THandle ParentHandle, BSTR InitialFile);
```

File

ADODB

Description

This is function ADODB.PromptDataLinkFile.

8.2.8 ADODB.PromptDataSource Function

Pascal

```
function PromptDataSource(ParentHandle: THandle; InitialString: WideString): WideString;
```

C++

```
BSTR PromptDataSource(THandle ParentHandle, BSTR InitialString);
```

File

ADODB

Description

This is function ADODB.PromptDataSource.

8.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TADOLockType (see page 1289)	TADOLockType specifies the types of locks used.
	TAffectRecords (see page 1290)	This is record ADODB.TAffectRecords.
	TCommandType (see page 1291)	TCommandType values designate the type of a command.
	TConnectMode (see page 1292)	TConnectMode values indicate the persimissions available to a connection.
	TConnectOption (see page 1293)	TConnectOption indicates whether the connection to the ADO data store is synchronous or asynchronous.
	TCursorLocation (see page 1293)	TCursorLocation values specify whether to use client-side or server-side cursor library.
	TCursorOption (see page 1294)	TCursorOptions (see page 1314) values indicate the functionality a recordset provides.
	TCursorType (see page 1295)	TCursorType valies indicate the type of cursor to use for a recordset.
	TEventReason (see page 1296)	TEventReason values indicate the reason an event occurred.
	TEventStatus (see page 1298)	TEventStatus values indicate the success or failure of an operation.
	TExecuteOption (see page 1299)	This is record ADODB.TExecuteOption.
	TFilterGroup (see page 1299)	This is record ADODB.TFilterGroup.
	TIsolationLevel (see page 1300)	TIsolationLevel values specify the level of isolation for a connection.
	TMarshalOption (see page 1301)	This is record ADODB.TMarshalOption.
	TObjectState (see page 1302)	This is record ADODB.TObjectState.
	TParameterAttribute (see page 1302)	This is record ADODB.TParameterAttribute.
	TParameterDirection (see page 1303)	TParameterDirection specifies the direction of a parameter.
	TPersistFormat (see page 1303)	TPersistFormat values indicate the format for a saved recordset.
	TRecordStatus (see page 1304)	This is record ADODB.TRecordStatus.
	TSchemaInfo (see page 1305)	TSchemaInfo values indicate the type of schema information to retrieve.
	TSeekOption (see page 1308)	This is record ADODB.TSeekOption.
	TXactAttribute (see page 1308)	TXactAttribute values specify automated transaction behavior.

8.3.1 ADODB.TADOLockType Enumeration

TADOLockType specifies the types of locks used.

Pascal

```
TADOLockType = (
  ltUnspecified,
  ltReadOnly,
  ltPessimistic,
  ltOptimistic,
  ltBatchOptimistic
);
```

C++

```
enum TADOLockType {
  ltUnspecified,
  ltReadOnly,
  ltPessimistic,
  ltOptimistic,
```

```
  ltBatchOptimistic
};
```

File

ADODB

Description

Use TADOLockType with execution methods to specify the types of record locks used during editing. Lock type values allow you to specify whether the locking scheme used for a recordset is optimistic or pessimistic. To use a specific locking scheme, the provider and database type must support that locking scheme. Use ltUnspecified to have the provider use the default locking scheme. Use the LockType ltBatchOptimistic to open a recordset in batch update mode.

In addition to use as command execution method parameters, TADOLockType values are passed as var parameters to event handlers related to execution. This value indicates the lock type already in use when the execution was initiated. The LockType parameter of the TADOConnection (see page 1001). ::OnWillExecute event is an example of this.

The constants that make up the TADOLockType type correspond directly to the LockTypeEnum values with similar names. These values are discussed in the Microsoft Data Access SDK help, in the topic for the LockType property of the ADO Recordset object. See the SDK for additional information on the ADO constants and their effects.

TADOLockType consists of the five constants summarized in the following table:

Lock Type	Meaning
ltUnspecified	A specific lock type has not been specified or determined.
ltReadOnly	Read-only; the current execution cannot modify data.
ltPessimistic	Pessimistic locks; locks instantiated on a record-by-record basis when edit mode is applied to a record.
ltOptimistic	Optimistic locks; locked are initiated on a record-by-record basis, but only when updates are applied and a record is being updated.
ltBatchOptimistic	Optimistic batch updates; used for batch update mode rather than immediate update mode.

8.3.2 ADODB.TAffectRecords Enumeration

Pascal

```
TAffectRecords = (
  arCurrent,
  arFiltered,
  arAll,
  arAllChapters
);
```

C++

```
enum TAffectRecords {
  arCurrent,
  arFiltered,
  arAll,
  arAllChapters
};
```

File

ADODB

Description

This is record ADODB.TAffectRecords.

8.3.3 ADODB.TCommandType Enumeration

TCommandType values designate the type of a command.

Pascal

```
TCommandType = (
  cmdUnknown,
  cmdText,
  cmdTable,
  cmdStoredProc,
  cmdFile,
  cmdTableDirect
);
```

C++

```
enum TCommandType {
  cmdUnknown,
  cmdText,
  cmdTable,
  cmdStoredProc,
  cmdFile,
  cmdTableDirect
};
```

File

ADODB

Description

Use TCommandType values to specify the type for a command contained in the CommandText property of an ADO component capable of issuing commands.

The constants that make up the TCommandType type correspond directly to the ADO CommandTypeEnum constants. These constants are used in the CommandType property of ADO Command objects. For additional information on these ADO constants and their effects, see the Microsoft Data Access SDK help in the topic for the CommandType property of the ADO Command object.

TCommandType consists of the seven constants summarized in the following table:

Command type	Meaning
cmdUnknown	The type of command in the CommandText property is not known.
cmdText	CommandText is a textual definition of a command or stored procedure call; data returned by an internal SQL statement.
cmdTable	CommandText is the name of a table.
cmdStoredProc	CommandText is the name of a stored procedure.
cmdFile	CommandText is the name of a saved recordset file.
cmdTableDirect	CommandText is the name of a table; all columns are returned.

Note: The TCommandType constants cmdTable, cmdTableDirect, and cmdOpenFile are not for use with commands executed from a TADOCommand (see page 984) component.

TADOCommand

TCustomADONETConnector

8.3.4 ADODB.TConnectMode Enumeration

TConnectMode values indicate the persimissions available to a connection.

Pascal

```
TConnectMode = (
  cmUnknown,
  cmRead,
  cmWrite,
  cmReadWrite,
  cmShareDenyRead,
  cmShareDenyWrite,
  cmShareExclusive,
  cmShareDenyNone
);
```

C++

```
enum TConnectMode {
  cmUnknown,
  cmRead,
  cmWrite,
  cmReadWrite,
  cmShareDenyRead,
  cmShareDenyWrite,
  cmShareExclusive,
  cmShareDenyNone
};
```

File

ADODB

Description

Use TConnectMode values to determine the permissions available to a connection and thus what type of data operations can be performed through that connection.

TConnectMode constants correspond directly to the ConnectModeEnum values for the Mode property of the ADO Connection object. The TConnectMode constants have the same effect on a TADOConnection (see page 1001) component as the ConnectModeEnum values have on the Connection object. These values are discussed in the Microsoft Data Access SDK help.

TConnectMode consists of the eight constants summarized in the following table:

Connect Mode	Meaning
cmUnknown	The permissions have not yet been set for the connection or cannot be determined.
cmRead	Read-only permissions are available to the connection.
cmWrite	Write-only permissions are available to the connection.
cmReadWrite	Read/write permissions are available to the connection.

cmShareDenyRead	Prevents others from opening connections with read permissions.
cmShareDenyWrite	Prevents others from opening connection with write permissions.
cmShareExclusive	Prevents others from opening connection.
cmShareDenyNone	Prevents others from opening connection with any permissions.

TADOConnection

8.3.5 ADODB.TConnectOption Enumeration

TConnectOption indicates whether the connection to the ADO data store is synchronous or asynchronous.

Pascal

```
TConnectOption = (
  coConnectUnspecified,
  coAsyncConnect
);
```

C++

```
enum TConnectOption {
  coConnectUnspecified,
  coAsyncConnect
};
```

File

ADODB

Description

TConnectOption is the type of the TADOConnection (see page 1001) object's ConnectOptions property. It specifies whether the connection established by the TADOConnection (see page 1001) is synchronous or asynchronous. The following table lists the possible values:

Value	Meaning
coConnectUnspecified	The connection is formed synchronously.
coAsyncConnect	The connection is formed asynchronously. This is useful if the server is very slow, but the application must be aware that not all data values are necessarily available when the connection is first established.

See Also

TADOConnection

8.3.6 ADODB.TCursorLocation Enumeration

TCursorLocation values specify whether to use client-side or server-side cursor library.

Pascal

```
TCursorLocation = (
```

```
    clUseServer,
    clUseClient
  );
```

C++

```
  enum TCursorLocation {
    clUseServer,
    clUseClient
  };
```

File

ADODB

Description

Use TCursorLocation values when determining a cursor location to specify whether to use a client-side or server-side cursor library. The value clUseServer indicates a server-side cursor library is used and clUseClient that a client-side cursor is used.

The TCursorLocation constants correspond to the Long value in the CursorLocation property of ADO Connection and Recordset objects. The ADO constants are adUseNone, adUseClient, and adUseServer. The TCursorLocation values clUseServer and clUseClient have the same effect as the ADO values adUseClient and adUseServer. See the Microsoft Data Access SDK help for information on these values and their effects.

8.3.7 ADODB.TCursorOption Enumeration

TCursorOptions (see page 1314) values indicate the functionality a recordset provides.

Pascal

```
  TCursorOption = (
    coHoldRecords,
    coMovePrevious,
    coAddNew,
    coDelete,
    coUpdate,
    coBookmark,
    coApproxPosition,
    coUpdateBatch,
    coResync,
    coNotify,
    coFind,
    coSeek,
    coIndex
  );
```

C++

```
  enum TCursorOption {
    coHoldRecords,
    coMovePrevious,
    coAddNew,
    coDelete,
    coUpdate,
    coBookmark,
    coApproxPosition,
    coUpdateBatch,
```

```
  coResync,
  coNotify,
  coFind,
  coSeek,
  coIndex
};
```

File

ADODB

Description

TCursorOptions (see page 1314) values are individual options the Supports method checks for. Include one or more of these values as a set for the CursorOptions parameter of Supports.

The constants of the TCursorOptions (see page 1314) type correspond directly with the CursorOptions parameter of the Supports method of the ADO Recordset object. See the Microsoft Data Access SDK help for information on these values and their effects.

TCursorOptions (see page 1314) consists of the eleven constants summarized in the following table:

Cursor Option	Meaning
coHoldRecords	More records can be retrieved or the position of the next retrieve can be changed without committing pending changes.
coMovePrevious	The pointer in the ADO Recordset object can be moved backwards without using bookmarks.
coAddNew	The recordset supports adding new records.
coDelete	The recordset supports deleting existing records.
coUpdate	The recordset supports modifying existing records.
coBookmark	The Bookmark property of the Recordset object can be used to move to or access specific records.
coApproxPosition	The recordset supports use of the RecNo property of the ADO dataset component.
coUpdateBatch	Batch updating (using the UpdateBatch and CancelBatch methods) can be used to transmit changes to the provider in groups.
coResync	The data in the cursor can be updated with the Resync method.
coNotify	The recordset supports notifications and returns events.
coFind	The Locate method can be used with the ADO dataset component.
coSeek	The Seek method can be used to search for a row in a dataset.
coIndex	The IndexName property of the ADO dataset component can be used to specify an index.

TCustomADONETConnector

8.3.8 ADODB.TCursorType Enumeration

TCursorType valies indicate the type of cursor to use for a recordset.

Pascal

```
TCursorType = (
  ctUnspecified,
  ctOpenForwardOnly,
  ctKeyset,
```

```
    ctDynamic,
    ctStatic
  );
```

C++

```
  enum TCursorType {
    ctUnspecified,
    ctOpenForwardOnly,
    ctKeyset,
    ctDynamic,
    ctStatic
  };
```

File

ADODB

Description

Use TCursorType values to indicate the type of cursor to use when a recordset is opened.

The constants of TCursorType correspond with the CursorTypeEnum values for the CursorType property of the ADO recordset object. See the Microsoft Data Access SDK help for information on these values and their effects.

TCursorType consists of the five constants summarized in the following table:

Cursor Type	Meaning
ctUnspecified	A specific cursor type has not yet been specified.
ctOpenForwardOnly	Forward-only cursor in which you can only scroll forward; better performance because only requires single through recordset.
ctKeyset	Keyset cursor; records added by other users are not visible; records deleted by other users are inaccessible.
ctDynamic	Dynamic cursor; data modifications, deletions, and insertions by other users are visible; scrolling forward and back allowed.
ctStatic	Static cursor; static copy of records; data changes by other users not visible; used mostly for reporting.

Note: Only ctStatic is supported if the CursorLocation property of the ADO dataset component is set to clUseClient.

Note: If the requested cursor type is not supported by the provider, the provider may return another cursor type. This alternate cursor type is reflected in the CursorType property after the recordset is opened.

TCustomADONETConnector

8.3.9 ADODB.TEventReason Enumeration

TEventReason values indicate the reason an event occurred.

Pascal

```
  TEventReason = (
    erAddNew,
    erDelete,
    erUpdate,
    erUndoUpdate,
```

```
    erUndoAddNew,
    erUndoDelete,
    erRequery,
    erResynch,
    erClose,
    erMove,
    erFirstChange,
    erMoveFirst,
    erMoveNext,
    erMovePrevious,
    erMoveLast
  );
```

C++

```
  enum TEventReason {
    erAddNew,
    erDelete,
    erUpdate,
    erUndoUpdate,
    erUndoAddNew,
    erUndoDelete,
    erRequery,
    erResynch,
    erClose,
    erMove,
    erFirstChange,
    erMoveFirst,
    erMoveNext,
    erMovePrevious,
    erMoveLast
  };
```

File

ADODB

Description

Use TEventReason values to determine the reason an event has occurred.

TEventReason consists of the five constants summarized in the following table:

Execute Option	Meaning
erAddNew	A new row was added.
erDelete	An existing row was deleted.
erUpdate	An existing row was modified with new values.
erUndoUpdate	An update operation was canceled.
erUndoAddNew	A row insert operation was canceled.
erUndoDelete	A row delete operation was canceled.
erRequery	The recordset was refreshed with the Requery method.
erResynch	The recordset was resynchronized with the Resynch method.
erClose	The recordset was closed.
erMove	The recordset's row pointer moved.
erFirstChange	Equivalent to the ADO value ad.
erMoveFirst	The recordset's row pointer moved to the first row.
erMoveNext	The recordset's row pointer moved to the next row.
erMovePrevious	The recordset's row pointer moved to the previous row.

erMoveLast	The recordset's row pointer moved to the last row.

8.3.10 ADODB.TEventStatus Enumeration

TEventStatus values indicate the success or failure of an operation.

Pascal

```
TEventStatus = (
  esOK,
  esErrorsOccured,
  esCantDeny,
  esCancel,
  esUnwantedEvent
);
```

C++

```
enum TEventStatus {
  esOK,
  esErrorsOccured,
  esCantDeny,
  esCancel,
  esUnwantedEvent
};
```

File

ADODB

Description

Read TEventStatus values to determine the success or failure status of an operation that triggers an event. A TEventStatus value is passed to the handler for every event of the TADOConnection (see page 1001) and TCustomADONETConnector descendant. Each TEventStatus is directly equivalent to the ADO value with a similar name.

In some cases, the event handler status parameter may be assigned a value to alter the outcome of the occurrence that triggered the event. These cases are documented in the help topics for individual connection and dataset component events.

The EventStatus parameter of associated event handlers surfaces the ADO adStatus parameter of its events, which is of ADO type EventStatusEnum. If the operation executed without problem, the TEventStatus value returned is esOK. If the operation did not execute without problem, one of the other values is returned. For instance, esErrorsOccured is returned when the operation failed because of one or more error conditions.

TEventStatus consists of the five constants summarized in the following table:

Execute Option	Meaning
esOK	Operation executed without problem.
esErrorsOccured	An error occurred during execution of the operation.
esCantDeny	A pending connection operation cannot be canceled. (Connection events only.).
esCancel	A pending connection has been canceled before it became active. (Connection events only.)
esUnwantedEvent	Set by the ADO method, prevents subsequent notification of the event.

8.3.11 ADODB.TExecuteOption Enumeration

Pascal

```
TExecuteOption = (
  eoAsyncExecute,
  eoAsyncFetch,
  eoAsyncFetchNonBlocking,
  eoExecuteNoRecords
);
```

C++

```
enum TExecuteOption {
  eoAsyncExecute,
  eoAsyncFetch,
  eoAsyncFetchNonBlocking,
  eoExecuteNoRecords
};
```

File

ADODB

Description

This is record ADODB.TExecuteOption.

8.3.12 ADODB.TFilterGroup Enumeration

Pascal

```
TFilterGroup = (
  fgUnassigned,
  fgNone,
  fgPendingRecords,
  fgAffectedRecords,
  fgFetchedRecords,
  fgPredicate,
  fgConflictingRecords
);
```

C++

```
enum TFilterGroup {
  fgUnassigned,
  fgNone,
  fgPendingRecords,
  fgAffectedRecords,
  fgFetchedRecords,
  fgPredicate,
  fgConflictingRecords
};
```

File

ADODB

Description

This is record ADODB.TFilterGroup.

8.3.13 ADODB.TIsolationLevel Enumeration

TIsolationLevel values specify the level of isolation for a connection.

Pascal

```
TIsolationLevel = (
  ilUnspecified,
  ilChaos,
  ilReadUncommitted,
  ilBrowse,
  ilCursorStability,
  ilReadCommitted,
  ilRepeatableRead,
  ilSerializable,
  ilIsolated
);
```

C++

```
enum TIsolationLevel {
  ilUnspecified,
  ilChaos,
  ilReadUncommitted,
  ilBrowse,
  ilCursorStability,
  ilReadCommitted,
  ilRepeatableRead,
  ilSerializable,
  ilIsolated
};
```

File

ADODB

Description

Use TIsolationLevel values to specify the transaction isolation level for a connection.

Note: it is possible that a server will force an isolation level other than that requested.

The constants that make up the TIsolationLevel type correspond directly to the ADO IsolationLevelEnum values with the same names. These values are discussed in the Microsoft Data Access SDK help, in the topic for the IsolationLevel property of the

ADO Connection object. See the SDK for additional information on the ADO constants and their effects.

The constants that make up the TADOLockType (see page 1289) type correspond directly to the LockTypeEnum values with similar names and have the same effects. These values are discussed in the Microsoft Data Access SDK help, in the topic for the LockType property of the ADO Recordset object. See the SDK for additional information on the ADO constants and their effects.

TIsolationLevel consists of the nine constants summarized in the following table:

Isolation Level	Meaning
ilUnspecified	Server is using a an isolation level other than what was requested and the specific isolation level cannot be determined.
ilChaos	Changes from more highly isolated transactions cannot be overwritten by the current connection.
ilReadUncommitted	Uncommitted changes in other transactions are visible.
ilBrowse	Uncommitted changes in other transactions are visible.
ilCursorStability	Changes from other transactions only visible after being committed.
ilReadCommitted	Changes from other transactions only visible after being committed.
ilRepeatableRead	Changes made in other transactions not visible, but requerying can retrieve new recordsets.
ilSerializable	Transactions conducted in isolation from other transactions.
ilIsolated	Transactions conducted in isolation from other transactions.

Note: The constants ilSerializable and ilIsolated have the same effects. These two constants parallel the ADO constants adXactSerializable and adXactIsolated, which have the same effects.

8.3.14 ADODB.TMarshalOption Enumeration

Pascal

```
TMarshalOption = (
  moMarshalAll,
  moMarshalModifiedOnly
);
```

C++

```
enum TMarshalOption {
  moMarshalAll,
  moMarshalModifiedOnly
};
```

File

ADODB

Description

This is record ADODB.TMarshalOption.

8.3.15 ADODB.TObjectState Enumeration

Pascal

```
TObjectState = (
  stClosed,
  stOpen,
  stConnecting,
  stExecuting,
  stFetching
);
```

C++

```
enum TObjectState {
  stClosed,
  stOpen,
  stConnecting,
  stExecuting,
  stFetching
};
```

File

ADODB

Description

This is record ADODB.TObjectState.

8.3.16 ADODB.TParameterAttribute Enumeration

Pascal

```
TParameterAttribute = (
  paSigned,
  paNullable,
  paLong
);
```

C++

```
enum TParameterAttribute {
  paSigned,
  paNullable,
  paLong
};
```

File

ADODB

Description

This is record ADODB.TParameterAttribute.

8.3.17 ADODB.TParameterDirection Enumeration

TParameterDirection specifies the direction of a parameter.

Pascal

```
TParameterDirection = (
  pdUnknown,
  pdInput,
  pdOutput,
  pdInputOutput,
  pdReturnValue
);
```

C++

```
enum TParameterDirection {
  pdUnknown,
  pdInput,
  pdOutput,
  pdInputOutput,
  pdReturnValue
};
```

File

ADODB

Description

Use a TParameterDirection value to specify whether a parameter is an input parameter, an output parameter, both, or conveys a return value.

The constants that make up the TParameterDirection type correspond directly to the ADO ParameterDirectionEnum constants with similar names used for the Direction property of the ADO Parameter object. For instance, the constant pdInput corresponds to the ADO constant adParamInput. For additional information on these ADO constants and their effects, see the Microsoft Data Access SDK help in the topic for the Direction property of the ADO Parameter object.

TParameterDirection consists of the five constants summarized in the following table:

Parameter Direction	Meaning
pdUnknown	Parameter direction is unknown or cannot be determined.
pdInput	Parameter can only be used to convey data to a stored procedure or SQL statement.
pdOutput	Parameter can only be used to convey data from a stored procedure or SQL statement.
pdInputOutput	Parameter can be used to convey data to or from a stored procedure or SQL statement.
pdReturnValue	Parameter is used to convey a return value.

TParameter

8.3.18 ADODB.TPersistFormat Enumeration

TPersistFormat values indicate the format for a saved recordset.

Pascal

```
TPersistFormat = (
  pfADTG,
  pfXML
);
```

C++

```
enum TPersistFormat {
  pfADTG,
  pfXML
};
```

File

ADODB

Description

Use TPersistFormat values to specify the format in which recordsets are saved to file. The value pfADTG indicates the file is saved in ADTG (Advanced Data Tablegram) format. The value pfXML saves the recordset in XML format (requires ADO 2.1 and above).

The constants that make up the TPersistFormat type correspond directly to the ADO PersistFormatEnum constants adPersistADTG and adPersistXML. PersistFormatEnum constants are used in the PersistFormat parameter of the Save method of the ADO Recordset object. For additional information on these ADO constants and their effects, see the Microsoft Data Access SDK help in the topic for the Direction property of the ADO Parameter object.

    siForeignKeys,
    siPrimaryKeys,
    siProcedureColumns,
    siDBInfoKeywords,
    siDBInfoLiterals,
    siCubes,
    siDimensions,
    siHierarchies,
    siLevels,
    siMeasures,
    siProperties,
    siMembers,
    siProviderSpecific
  };
```

File

ADODB

Description

Use TSchemaInfo values to specify the type of schema information to retrieve from a provider.

The constants that make up the TSchemaInfo type correspond directly to the ADO constants used for the QueryType parameter

for the OpenSchema method of the ADO Connection object. For additional information on these ADO constants and their effects, see the Microsoft Data Access SDK help in the topic for the OpenSchema method of the ADO Connection object.

A TSchemaInfo value may be any of the constants below:

Schema Parameter Value	ADO Criteria Values
siProviderSpecific	The provider defines its own nonstandard schema queries outside those listed below.
siAsserts	CONSTRAINT_CATALOG
siCatalogs	CATALOG_NAME

8.3.21 ADODB.TSeekOption Enumeration

Pascal

```
TSeekOption = (
  soFirstEQ,
  soLastEQ,
  soAfterEQ,
  soAfter,
  soBeforeEQ,
  soBefore
);
```

C++

```
enum TSeekOption {
  soFirstEQ,
  soLastEQ,
  soAfterEQ,
  soAfter,
  soBeforeEQ,
  soBefore
};
```

File

ADODB

Description

This is record ADODB.TSeekOption.

8.3.22 ADODB.TXactAttribute Enumeration

TXactAttribute values specify automated transaction behavior.

Pascal

```
TXactAttribute = (
  xaCommitRetaining,
  xaAbortRetaining
);
```

C++

```
enum TXactAttribute {
  xaCommitRetaining,
  xaAbortRetaining
};
```

File

ADODB

Description

Use TXactAttribute to specify how the committing and aborting of a connection component's transactions is handled. A property of type TXactAttribute may contain one TXactAttribute constant, both, or none.

An xaCommitRetaining value specifies that the connection performs retaining commits. Committing a transaction automatically starts a new transaction.

An xaAbortRetaining value specifies that the connection performs retaining aborts. Rolling back a transaction automatically starts a new transaction.

The constants that make up the TXactAttributes (see page 1324) type correspond directly to the ADO XactAttributeEnum constants adXactCommitRetaining and adXactAbortRetaining. These ADO constants are in the Attributes property of the ADO Connection object. For additional information on these ADO constants and their effects, see the Microsoft Data Access SDK help in the topic for the Attributes property of the ADO Connection object.

8.4 Types

The following table lists types in this documentation.

Types

Name	Description
_Command (see page 1310)	This is type ADODB._Command.
_Connection (see page 1311)	This is type ADODB._Connection.
_Parameter (see page 1311)	This is type ADODB._Parameter.
_Recordset (see page 1311)	This is type ADODB._Recordset.
Error (see page 1312)	This is type ADODB.Error.
Errors (see page 1312)	This is type ADODB.Errors.
Parameters (see page 1312)	This is type ADODB.Parameters.
Properties (see page 1313)	This is type ADODB.Properties.
Property_ (see page 1313)	This is type ADODB.Property_.
PVariantList (see page 1313)	This is type ADODB.PVariantList.
TBeginTransCompleteEvent (see page 1314)	This is type ADODB.TBeginTransCompleteEvent.
TConnectErrorEvent (see page 1314)	This is type ADODB.TConnectErrorEvent.
TCursorOptions (see page 1314)	This is type ADODB.TCursorOptions.
TDataType (see page 1315)	TDataType indicates the type of a parameter.
TDisconnectEvent (see page 1315)	This is type ADODB.TDisconnectEvent.
TEndOfRecordsetEvent (see page 1315)	This is type ADODB.TEndOfRecordsetEvent.
TExecuteCompleteEvent (see page 1316)	This is type ADODB.TExecuteCompleteEvent.
TExecuteOptions (see page 1316)	TExecuteOptions values specify the characteristics of an execution operation.
TFetchProgressEvent (see page 1317)	This is type ADODB.TFetchProgressEvent.
TFieldChangeCompleteEvent (see page 1317)	This is type ADODB.TFieldChangeCompleteEvent.
TInfoMessageEvent (see page 1317)	This is type ADODB.TInfoMessageEvent.
TObjectStates (see page 1318)	TObjectStates values indicate the current state of an ADO object.
TParameterAttributes (see page 1318)	TParameterAttributes values indicate the types of values a parameter can accept.
TPropList (see page 1319)	This is type ADODB.TPropList.
TRecordChangeCompleteEvent (see page 1319)	This is type ADODB.TRecordChangeCompleteEvent.
TRecordsetCreate (see page 1320)	This is type ADODB.TRecordsetCreate.
TRecordsetErrorEvent (see page 1320)	This is type ADODB.TRecordsetErrorEvent.
TRecordsetEvent (see page 1320)	This is type ADODB.TRecordsetEvent.
TRecordsetReasonEvent (see page 1321)	This is type ADODB.TRecordsetReasonEvent.
TRecordStatusSet (see page 1321)	TRecordStatusSet values indicate the status of the current record relative to batch updates or other bulk operations
TVariantList (see page 1322)	This is type ADODB.TVariantList.
TWillChangeFieldEvent (see page 1322)	This is type ADODB.TWillChangeFieldEvent.
TWillChangeRecordEvent (see page 1323)	This is type ADODB.TWillChangeRecordEvent.
TWillConnectEvent (see page 1323)	This is type ADODB.TWillConnectEvent.
TWillExecuteEvent (see page 1323)	This is type ADODB.TWillExecuteEvent.
TXactAttributes (see page 1324)	This is type ADODB.TXactAttributes.

8.4.1 ADODB._Command Type

Pascal

```
_Command = ADOInt._Command;
```

C++

```
ADOInt._Command _Command;
```

File

ADODB

Description

This is type ADODB._Command.

8.4.2 ADODB._Connection Type

Pascal

```
_Connection = ADOInt._Connection;
```

C++

```
ADOInt._Connection _Connection;
```

File

ADODB

Description

This is type ADODB._Connection.

8.4.3 ADODB._Parameter Type

Pascal

```
_Parameter = ADOInt._Parameter;
```

C++

```
ADOInt._Parameter _Parameter;
```

File

ADODB

Description

This is type ADODB._Parameter.

8.4.4 ADODB._Recordset Type

Pascal

```
_Recordset = ADOInt.Recordset;
```

C++

```
ADOInt.Recordset _Recordset;
```

File

ADODB

Description

This is type ADODB._Recordset.

8.4.5 ADODB.Error Type

Pascal

```
Error = ADOInt.Error;
```

C++

```
ADOInt.Error Error;
```

File

ADODB

Description

This is type ADODB.Error.

8.4.6 ADODB.Errors Type

Pascal

```
Errors = ADOInt.Errors;
```

C++

```
ADOInt.Errors Errors;
```

File

ADODB

Description

This is type ADODB.Errors.

8.4.7 ADODB.Parameters Type

Pascal

```
Parameters = ADOInt.Parameters;
```

C++

```
ADOInt.Parameters Parameters;
```

File

ADODB

Description

This is type ADODB.Parameters.

8.4.8 ADODB.Properties Type

Pascal

```
Properties = ADOInt.Properties;
```

C++

```
ADOInt.Properties Properties;
```

File

ADODB

Description

This is type ADODB.Properties.

8.4.9 ADODB.Property_ Type

Pascal

```
Property_ = ADOInt.Property_;
```

C++

```
ADOInt.Property_ Property_;
```

File

ADODB

Description

This is type ADODB.Property_.

8.4.10 ADODB.PVariantList Type

Pascal

```
PVariantList = ^TVariantList;
```

C++

```
^TVariantList PVariantList;
```

File

ADODB

Description

This is type ADODB.PVariantList.

8.4.11 ADODB.TBeginTransCompleteEvent Type

Pascal

```
TBeginTransCompleteEvent = procedure (Connection: TADOConnection; TransactionLevel: Integer;
const Error: Error; var EventStatus: TEventStatus) of object;
```

C++

```
(Connection: TADOConnection; TransactionLevel: Integer; const Error: Error; var EventStatus:
TEventStatus) ( TBeginTransCompleteEvent)();
```

File

ADODB

Description

This is type ADODB.TBeginTransCompleteEvent.

8.4.12 ADODB.TConnectErrorEvent Type

Pascal

```
TConnectErrorEvent = procedure (Connection: TADOConnection; const Error: Error; var
EventStatus: TEventStatus) of object;
```

C++

```
(Connection: TADOConnection; const Error: Error; var EventStatus: TEventStatus) (
TConnectErrorEvent)();
```

File

ADODB

Description

This is type ADODB.TConnectErrorEvent.

8.4.13 ADODB.TCursorOptions Type

Pascal

```
TCursorOptions = set of TCursorOption;
```

C++

```
TCursorOption TCursorOptions;
```

File

ADODB

Description

This is type ADODB.TCursorOptions.

8.4.14 ADODB.TDataType Type

TDataType indicates the type of a parameter.

Pascal

```
TDataType = TFieldType;
```

C++

```
TFieldType TDataType;
```

File

ADODB

Description

TDataType represents a field type when it is applied to a parameter.

8.4.15 ADODB.TDisconnectEvent Type

Pascal

```
TDisconnectEvent = procedure (Connection: TADOConnection; var EventStatus: TEventStatus) of
object;
```

C++

```
(Connection: TADOConnection; var EventStatus: TEventStatus) ( TDisconnectEvent)();
```

File

ADODB

Description

This is type ADODB.TDisconnectEvent.

8.4.16 ADODB.TEndOfRecordsetEvent Type

Pascal

```
TEndOfRecordsetEvent = procedure (DataSet: TCustomADODataSet; var MoreData: WordBool; var
EventStatus: TEventStatus) of object;
```

C++

```
(DataSet: TCustomADODataSet; var MoreData: WordBool; var EventStatus: TEventStatus) (
TEndOfRecordsetEvent)();
```

File

ADODB

Description

This is type ADODB.TEndOfRecordsetEvent.

8.4.17 ADODB.TExecuteCompleteEvent Type

Pascal

```
TExecuteCompleteEvent = procedure (Connection: TADOConnection; RecordsAffected: Integer; const
Error: Error; var EventStatus: TEventStatus; const Command: _Command; const Recordset:
_Recordset) of object;
```

C++

```
(Connection: TADOConnection; RecordsAffected: Integer; const Error: Error; var EventStatus:
TEventStatus; const Command: _Command; const Recordset: _Recordset) ( TExecuteCompleteEvent)();
```

File

ADODB

Description

This is type ADODB.TExecuteCompleteEvent.

8.4.18 ADODB.TExecuteOptions Type

TExecuteOptions values specify the characteristics of an execution operation.

Pascal

```
TExecuteOptions = set of TExecuteOption;
```

C++

```
TExecuteOption TExecuteOptions;
```

File

ADODB

Description

When executing a command or connection using a method, use TExecuteOptions values to specify the characteristics of the execution operation. When reacting to a command or connection execution in an event handler, read the execute options parameter to determine the options already established for the connection triggering the event.

TExecuteOptions consists of the constants summarized in the following table:

Execute Option	Meaning
eoAsyncExecute	The command is executed asynchronously.
eoAsyncFetch	The command fetches remaining rows after the initial quantity specified in the Cache property asynchronously.
eoAsyncFetchNonBlocking	Execution is performed without blocking the thread.
eoExecuteNoRecords	A command or stored procedure that does not return. If any rows are retrieved, they are discarded and not returned.

TCustomADONETConnector

TADOCommand

8.4.19 ADODB.TFetchProgressEvent Type

Pascal

```
TFetchProgressEvent = procedure (DataSet: TCustomADODataSet; Progress, MaxProgress: Integer;
var EventStatus: TEventStatus) of object;
```

C++

```
(DataSet: TCustomADODataSet; Progress, MaxProgress: Integer; var EventStatus: TEventStatus) (
TFetchProgressEvent)();
```

File

ADODB

Description

This is type ADODB.TFetchProgressEvent.

8.4.20 ADODB.TFieldChangeCompleteEvent Type

Pascal

```
TFieldChangeCompleteEvent = procedure (DataSet: TCustomADODataSet; const FieldCount: Integer;
const Fields: OleVariant; const Error: Error; var EventStatus: TEventStatus) of object;
```

C++

```
(DataSet: TCustomADODataSet; const FieldCount: Integer; const Fields: OleVariant; const Error:
Error; var EventStatus: TEventStatus) ( TFieldChangeCompleteEvent)();
```

File

ADODB

Description

This is type ADODB.TFieldChangeCompleteEvent.

8.4.21 ADODB.TInfoMessageEvent Type

Pascal

```
TInfoMessageEvent = procedure (Connection: TADOConnection; const Error: Error; var
EventStatus: TEventStatus) of object;
```

C++

```
(Connection: TADOConnection; const Error: Error; var EventStatus: TEventStatus) (
TInfoMessageEvent)();
```

File

ADODB

Description

This is type ADODB.TInfoMessageEvent.

8.4.22 ADODB.TObjectStates Type

TObjectStates values indicate the current state of an ADO object.

Pascal

```
TObjectStates = set of TObjectState;
```

C++

```
TObjectState TObjectStates;
```

File

ADODB

Description

Use TObjectStates values to determine the current activity status of a connection or recordset.

The constants that make up the TObjectStates type correspond directly to the similarly named constants used for the State property of the ADO Connection, Command, and Recordset objects. For additional information on these ADO constants and their effects, see the Microsoft Data Access SDK help in the topic for the State property.

TObjectStates consists of the five constants summarized in the following table:

Object State	Meaning
stClosed	Connection object is inactive and not connected to a database.
stOpen	Connection object is inactive, but connected to a database.
stConnecting	Connection object is in the process of connecting to a database.
stExecuting	Connection object is currently executing.
stFetching	Connection object is retrieving data from the database.

TADOCommand

TADOConnection

TCustomADONETConnector

8.4.23 ADODB.TParameterAttributes Type

TParameterAttributes values indicate the types of values a parameter can accept.

Pascal

```
TParameterAttributes = set of TParameterAttribute;
```

C++

```
TParameterAttribute TParameterAttributes;
```

File

ADODB

Description

Use TParameterAttributes values to specify the characteristics of a parameter that control the types of values a parameter can accept.

The constants that make of the TParameterAttributes type correspond to the ADO ParameterAttributesEnum values of similar names. For instance, the TParameterAttributes type constant paSigned corresponds to the ADO constant adParamSigned. For additional information on these ADO constants and their effects, see the Microsoft Data Access SDK help in the topic for the Attributes property of the ADO Parameter object.

TParameterAttributes consists of the three constants summarized in the following table:

Parameter Attribute	Meaning
psSigned	The parameter accepts signed values.
psNullable	The parameter accepts NULL values.
psLong	The parameter accepts long binary data.

See Also

TParameter

8.4.24 ADODB.TPropList Type

Pascal

```
TPropList = array of PPropInfo;
```

C++

```
array of PPropInfo TPropList;
```

File

ADODB

Description

This is type ADODB.TPropList.

8.4.25 ADODB.TRecordChangeCompleteEvent Type

Pascal

```
TRecordChangeCompleteEvent = procedure (DataSet: TCustomADODataSet; const Reason:
TEventReason; const RecordCount: Integer; const Error: Error; var EventStatus: TEventStatus)
of object;
```

C++

```
(DataSet: TCustomADODataSet; const Reason: TEventReason; const RecordCount: Integer; const
Error: Error; var EventStatus: TEventStatus) ( TRecordChangeCompleteEvent)();
```

File

ADODB

Description

This is type ADODB.TRecordChangeCompleteEvent.

8.4.26 ADODB.TRecordsetCreate Type

Pascal

```
TRecordsetCreate = procedure (DataSet: TCustomADODataSet; const Recordset: _Recordset) of
object;
```

C++

```
(DataSet: TCustomADODataSet; const Recordset: _Recordset) ( TRecordsetCreate)();
```

File

ADODB

Description

This is type ADODB.TRecordsetCreate.

8.4.27 ADODB.TRecordsetErrorEvent Type

Pascal

```
TRecordsetErrorEvent = procedure (DataSet: TCustomADODataSet; const Reason: TEventReason;
const Error: Error; var EventStatus: TEventStatus) of object;
```

C++

```
(DataSet: TCustomADODataSet; const Reason: TEventReason; const Error: Error; var EventStatus:
TEventStatus) ( TRecordsetErrorEvent)();
```

File

ADODB

Description

This is type ADODB.TRecordsetErrorEvent.

8.4.28 ADODB.TRecordsetEvent Type

Pascal

```
TRecordsetEvent = procedure (DataSet: TCustomADODataSet; const Error: Error; var EventStatus:
TEventStatus) of object;
```

C++

```
(DataSet: TCustomADODataSet; const Error: Error; var EventStatus: TEventStatus) (
TRecordsetEvent)();
```

File

ADODB

Description

This is type ADODB.TRecordsetEvent.

8.4.29 ADODB.TRecordsetReasonEvent Type

Pascal

```
TRecordsetReasonEvent = procedure (DataSet: TCustomADODataSet; const Reason: TEventReason; var
EventStatus: TEventStatus) of object;
```

C++

```
(DataSet: TCustomADODataSet; const Reason: TEventReason; var EventStatus: TEventStatus) (
TRecordsetReasonEvent)();
```

File

ADODB

Description

This is type ADODB.TRecordsetReasonEvent.

8.4.30 ADODB.TRecordStatusSet Type

TRecordStatusSet values indicate the status of the current record relative to batch updates or other bulk operations

Pascal

```
TRecordStatusSet = set of TRecordStatus;
```

C++

```
TRecordStatus TRecordStatusSet;
```

File

ADODB

Description

Use TRecordStatusSet values to determine the status of the current row.

The constants that make up the TRecordStatus (see page 1304) type correspond directly to the ADO RecordStatusEnum values used for the Status property of the ADO Recordset object. For additional information on these ADO constants and their effects, see the Microsoft Data Access SDK help in the topic for the Status property of the ADO Recordset object.

A TRecordStatusSet value may contain any one or more of the following constants:

Record Status Set Constant	Meaning
rsOK	The row was successfully updated
rsNew	The row is a new insert.

rsModified	The row has been modified.
rsDeleted	The row has been deleted.
rsUnmodified	The row has not been modified since being retrieved.
rsInvalid	The row was not saved due because the bookmark was invalid.
rsMultipleChanges	The row was not saved because it would have affected multiple rows.
rsPendingChanges	The row was not saved because it refers to a pending insert.
rsCanceled	The row was not saved because the operation was canceled.
rsCantRelease	The new row was not saved because of existing row locks.
rsConcurrencyViolation	The row was not saved because optimistic concurrency was in use.
rsIntegrityViolation	The row was not saved because the user violated integrity constraints.
rsMaxChangesExceeded	The row was not saved because there were too many pending changes.
rsObjectOpen	The row was not saved because of a conflict with an open storage object.
rsOutOfMemory	The row was not saved because the computer has run out of memory.
rsPermissionDenied	The row was not saved because the user has insufficient permissions.
rsSchemaViolation	The row was not saved because it violates the structure of the underlying database.
rsDBDeleted	The row has already been deleted from the data source.

8.4.31 ADODB.TVariantList Type

Pascal

```
TVariantList = array[0..0] of OleVariant;
```

C++

```
array[0..0] of OleVariant TVariantList;
```

File

ADODB

Description

This is type ADODB.TVariantList.

8.4.32 ADODB.TWillChangeFieldEvent Type

Pascal

```
TWillChangeFieldEvent = procedure (DataSet: TCustomADODataSet; const FieldCount: Integer;
const Fields: OleVariant; var EventStatus: TEventStatus) of object;
```

C++

```
(DataSet: TCustomADODataSet; const FieldCount: Integer; const Fields: OleVariant; var
```

```
EventStatus: TEventStatus) ( TWillChangeFieldEvent)();
```

File

ADODB

Description

This is type ADODB.TWillChangeFieldEvent.

8.4.33 ADODB.TWillChangeRecordEvent Type

Pascal

```
TWillChangeRecordEvent = procedure (DataSet: TCustomADODataSet; const Reason: TEventReason;
const RecordCount: Integer; var EventStatus: TEventStatus) of object;
```

C++

```
(DataSet: TCustomADODataSet; const Reason: TEventReason; const RecordCount: Integer; var
EventStatus: TEventStatus) ( TWillChangeRecordEvent)();
```

File

ADODB

Description

This is type ADODB.TWillChangeRecordEvent.

8.4.34 ADODB.TWillConnectEvent Type

Pascal

```
TWillConnectEvent = procedure (Connection: TADOConnection; var ConnectionString, UserID,
Password: WideString; var ConnectOptions: TConnectOption; var EventStatus: TEventStatus) of
object;
```

C++

```
(Connection: TADOConnection; var ConnectionString, UserID, Password: WideString; var
ConnectOptions: TConnectOption; var EventStatus: TEventStatus) ( TWillConnectEvent)();
```

File

ADODB

Description

This is type ADODB.TWillConnectEvent.

8.4.35 ADODB.TWillExecuteEvent Type

Pascal

```
TWillExecuteEvent = procedure (Connection: TADOConnection; var CommandText: WideString; var
CursorType: TCursorType; var LockType: TADOLockType; var CommandType: TCommandType; var
ExecuteOptions: TExecuteOptions; var EventStatus: TEventStatus; const Command: _Command; const
Recordset: _Recordset) of object;
```

C++

```
(Connection: TADOConnection; var CommandText: WideString; var CursorType: TCursorType; var
LockType: TADOLockType; var CommandType: TCommandType; var ExecuteOptions: TExecuteOptions;
var EventStatus: TEventStatus; const Command: _Command; const Recordset: _Recordset) (
TWillExecuteEvent)();
```

File

ADODB

Description

This is type ADODB.TWillExecuteEvent.

8.4.36 ADODB.TXactAttributes Type

Pascal

```
TXactAttributes = set of TXactAttribute;
```

C++

```
TXactAttribute TXactAttributes;
```

File

ADODB

Description

This is type ADODB.TXactAttributes.

9 AppEvnts Namespace

This is namespace AppEvnts.

Topics

Name	Description
Classes (see page 1326)	The following table lists classes in this documentation.

Classes

	Name	Description
	TApplicationEvents (see page 1326)	TApplicationEvents intercepts application-level events.
	TCustomApplicationEvents (see page 1347)	TCustomApplicationEvents intercepts application-level events.

9.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TApplicationEvents (see page 1326)	TApplicationEvents intercepts application-level events.
	TCustomApplicationEvents (see page 1347)	TCustomApplicationEvents intercepts application-level events.

9.1.1 TApplicationEvents Class

TApplicationEvents intercepts application-level events.

Class Hierarchy

Pascal

```
TApplicationEvents = class(TCustomApplicationEvents);
```

C++

```
class TApplicationEvents : public TCustomApplicationEvents;
```

File

AppEvnts

Description

Use TApplicationEvents to intercept the events of the global Application object. When you add a TApplicationEvents object to a form, the Application object forwards all events to the TApplicationEvents object. Thus, each event of the TApplicationEvents object is the same as the event with the same name on the Application object.

Each form in an application can have its own TApplicationEvents object. Each application event occurs for all the TApplicationEvents objects in the project. To change the order in which the different TApplicationEvents objects receive events, use the Activate (see page 1351) method. To prevent other TApplicationEvents objects from receiving a specific event, use the CancelDispatch (see page 1351) method.

See Also

TApplication (see page 13660)

Application

9.1.1.1 TApplicationEvents Members

The following tables list the members exposed by TApplicationEvents.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.

	Activate (see page 1351)	Ensures that this is the first component to receive any application events.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CancelDispatch (see page 1351)	Prevents other TCustomApplicationEvents (see page 1347) objects from receiving the current event.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 1350)	Creates a new TCustomApplicationEvents (see page 1347) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnActionExecute (see page 1330)	Occurs when an action's Execute method is called and its action list has not already handled it.
	OnActionUpdate (see page 1331)	Occurs when an action's Update method is called and its action list has not already handled it.
	OnActivate (see page 1333)	Occurs when an application becomes active.
	OnDeactivate (see page 1334)	Occurs when an application becomes inactive.
	OnException (see page 1335)	Occurs when an unhandled exception occurs in the application.
	OnHelp (see page 1336)	Occurs when the application receives a request for help.
	OnHint (see page 1337)	Occurs when the mouse pointer moves over a control or menu item that can display a Help Hint.
	OnIdle (see page 1339)	Occurs when an application becomes idle.
	OnMessage (see page 1340)	Occurs when the application receives a Windows message.
	OnMinimize (see page 1341)	Occurs when an application is minimized.
	OnModalBegin (see page 1342)	This is OnModalBegin, a member of class TApplicationEvents.
	OnModalEnd (see page 1342)	This is OnModalEnd, a member of class TApplicationEvents.
	OnRestore (see page 1342)	Occurs when the previously minimized application is restored to its normal size.
	OnSettingChange (see page 1343)	Occurs when Windows notifies the application that a system-wide setting has changed.
	OnShortCut (see page 1344)	Occurs when the user presses a key (before the OnKeyDown event).
	OnShowHint (see page 1345)	Occurs when the application is about to display the hint window for a Help Hint.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

9.1.1.2 TApplicationEvents Events

The events of the TApplicationEvents class are listed here.

Published Events

	Name	Description
	OnActionExecute (see page 1330)	Occurs when an action's Execute method is called and its action list has not already handled it.
	OnActionUpdate (see page 1331)	Occurs when an action's Update method is called and its action list has not already handled it.
	OnActivate (see page 1333)	Occurs when an application becomes active.
	OnDeactivate (see page 1334)	Occurs when an application becomes inactive.
	OnException (see page 1335)	Occurs when an unhandled exception occurs in the application.
	OnHelp (see page 1336)	Occurs when the application receives a request for help.
	OnHint (see page 1337)	Occurs when the mouse pointer moves over a control or menu item that can display a Help Hint.
	OnIdle (see page 1339)	Occurs when an application becomes idle.
	OnMessage (see page 1340)	Occurs when the application receives a Windows message.
	OnMinimize (see page 1341)	Occurs when an application is minimized.
	OnModalBegin (see page 1342)	This is OnModalBegin, a member of class TApplicationEvents.
	OnModalEnd (see page 1342)	This is OnModalEnd, a member of class TApplicationEvents.
	OnRestore (see page 1342)	Occurs when the previously minimized application is restored to its normal size.
	OnSettingChange (see page 1343)	Occurs when Windows notifies the application that a system-wide setting has changed.
	OnShortCut (see page 1344)	Occurs when the user presses a key (before the OnKeyDown event).
	OnShowHint (see page 1345)	Occurs when the application is about to display the hint window for a Help Hint.

9.1.1.2.1 TApplicationEvents.OnActionExecute Event

Occurs when an action's Execute method is called and its action list has not already handled it.

Pascal

```
property OnActionExecute: TActionEvent;
```

C++

```
__property TActionEvent OnActionExecute;
```

Description

Use the OnExecute event handler to respond when a user invokes actions whose action lists do not have OnExecute event handlers.

If the action list that contains the action does not handle it in an OnExecute event handler, then the action is routed to the Application object's OnActionExecute event. The application events object hooks this event and responds with its own OnActionExecute event handler.

The Handled parameter of the event handler returns false by default. If the handler handles the event, it should change Handled to true, thereby preventing further attempts to handle the action. When the event handler exits with Handled set to false, the event first goes to any other application events objects, and then the action's OnExecute event occurs. If the action remains unhandled after that, the active control's ExecuteAction method is called to allow the action to execute with an identified target. Finally, the active form's ExecuteAction method is called if all other handlers do not handle the action.

Note: Call the CancelDispatch method from an OnActionExecute event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents, a TActionList
and a TListBox in the form.  Select the TApplicationEvents,
```

```
double click on the OnActionExecute event and add the
following code to the handler.  Create an TAction named
MyAction in a TActionList.  The TActionList must have no
OnExecute event handler, and the TAction has an OnExecute
event handler called MyActionExecute.  Then set an object's
(such as a button) Action to MyAction.  The Handled
parameter of the event handler returns false by default. If
the handler handles the event, it should change Handled to
true, thereby preventing further attempts to handle the
action.
*/
void __fastcall TAppEventForm::ApplicationEventsActionExecute(
      TBasicAction *Action, bool &Handled)
{
    lbOther->Items->Add("Event OnActionExecute");
}

void __fastcall TAppEventForm::ActionExecute(TObject *Sender)
{
    ShowMessage("Action executed");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents, a TActionList
and a TListBox in the form.  Select the TApplicationEvents,
double click on the OnActionExecute event and add the
following code to the handler.  Create an TAction named
MyAction in a TActionList.  The TActionList must have no
OnExecute event handler, and the TAction has an OnExecute
event handler called MyActionExecute.  Then set an object's
(such as a button) Action to MyAction.  The Handled
parameter of the event handler returns false by default. If
the handler handles the event, it should change Handled to
true, thereby preventing further attempts to handle the
action.
}
procedure TMainForm.ApplicationEventsActionExecute(Action: TBasicAction;
  var Handled: Boolean);
begin
  lbOther.Items.Add('Event OnActionExecute');
end;

procedure TMainForm.MyActionExecute(Sender: TObject);
begin
  ShowMessage('Action executed');
end;
```

See Also

OnActionUpdate (see page 1354)

OnExecute (see page 2716)

OnExecute (see page 327)

ExecuteAction

CancelDispatch (see page 1351)

9.1.1.2.2 TApplicationEvents.OnActionUpdate Event

Occurs when an action's Update method is called and its action list has not already handled it.

Pascal

```
property OnActionUpdate: TActionEvent;
```

C++

```
__property TActionEvent OnActionUpdate;
```

Description

Use the OnActionUpdate event handler to update the properties of an action when the application is idle if the action's action list does not handle it in an OnUpdate event handler. OnActionUpdate occurs after the OnIdle event.

If the action list that contains the action does not update it in an OnUpdate event handler, the action is routed to the Application object's OnActionUpdate event. The application events object hooks this event and responds with its own OnActionUpdate event handler.

The Handled parameter of the event handler returns false by default. If the handler updates the event, it should change Handled to true, thereby ending the processing of the action. When the event handler exits with Handled set to false, the event first goes to any other application events objects, and then the action's OnUpdate event occurs. If the action is not updated after that, the active control's UpdateAction method is called to allow the target to update the action. Finally, the active form's UpdateAction method is called if all other handlers do not handle the action.

Note: Call the CancelDispatch method from an OnActionUpdate event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnActionUpdate event and add the following code to
the handler.  Create other TApplicationEvents the same way.
When these events update this event is triggered.  The
Handled parameter of the event handler returns false by
default. If the handler handles the event, it should change
Handled to true, thereby preventing further attempts to
*/
void __fastcall TAppEventForm::ApplicationEventsActionUpdate(
      TBasicAction *Action, bool &Handled)
{
     lbActionUpdate->Items->Add("Event OnActionUpdate");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnActionUpdate event and add the following code to
the handler.  Create other TApplicationEvents the same way.
When these events update this event is triggered.  The
Handled parameter of the event handler returns false by
default. If the handler handles the event, it should change
Handled to true, thereby preventing further attempts to
handle the action.
}
procedure TMainForm.ApplicationEventsActionUpdate(Action: TBasicAction;
  var Handled: Boolean);
begin
  lbActionUpdate.Items.Add('Event OnActionUpdate');
end;
```

OnUpdate (see page 327)

UpdateAction

OnIdle (see page 1361)

CancelDispatch (see page 1351)

9.1.1.2.3 TApplicationEvents.OnActivate Event

Occurs when an application becomes active.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to perform special processing when the application becomes active.

An application becomes active when it is initially run or when focus moves from another Windows application back to any window of the application.

Note: Call the CancelDispatch method from an OnActivate event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnActivate event and add the following code
to the handler.  These events occur when the form gains
or loses focus.
*/
void __fastcall TAppEventForm::ApplicationEventsActivate(TObject *Sender)
{
     lbOther->Items->Add("Event OnActivate");
}

void __fastcall TAppEventForm::ApplicationEventsDeactivate(TObject *Sender)
{
    lbOther->Items->Add("Event OnDeactivate");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnActivate event and add the following code
to the handler.  These events occur when the form gains
or loses focus.
```

```
}
procedure TMainForm.ApplicationEventsActivate(Sender: TObject);
begin
  lbOther.Items.Add('Event OnActivate');
end;

procedure TMainForm.ApplicationEventsDeactivate(Sender: TObject);
begin
  lbOther.Items.Add('Event OnDeactivate');
end;
```

See Also

Active (see page 13704)

OnDeactivate (see page 1356)

CancelDispatch (see page 1351)

9.1.1.2.4 TApplicationEvents.OnDeactivate Event

Occurs when an application becomes inactive.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to perform any special processing that should occur immediately before the application is deactivated. The OnDeactivate event occurs when the user switches from the application to another Windows application.

Note: Call the CancelDispatch method from an OnDeactivate event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnActivate event and add the following code
to the handler.  These events occur when the form gains
or loses focus.
*/
void __fastcall TAppEventForm::ApplicationEventsActivate(TObject *Sender)
{
     lbOther->Items->Add("Event OnActivate");
}

void __fastcall TAppEventForm::ApplicationEventsDeactivate(TObject *Sender)
{
    lbOther->Items->Add("Event OnDeactivate");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnActivate event and add the following code
to the handler.  These events occur when the form gains
```

```
or loses focus.
}
procedure TMainForm.ApplicationEventsActivate(Sender: TObject);
begin
  lbOther.Items.Add('Event OnActivate');
end;

procedure TMainForm.ApplicationEventsDeactivate(Sender: TObject);
begin
  lbOther.Items.Add('Event OnDeactivate');
end;
```

See Also

Active (see page 13704)

OnActivate (see page 1355)

CancelDispatch (see page 1351)

9.1.1.2.5 TApplicationEvents.OnException Event

Occurs when an unhandled exception occurs in the application.

Pascal

```
property OnException: TExceptionEvent;
```

C++

```
__property TExceptionEvent OnException;
```

Description

Use OnException to change the default behavior that occurs when an exception is not handled by application code. The OnException event handler is called automatically in the application's HandleException method.

OnException only handles exceptions that occur during message processing. Exceptions that occur before or after the execution of the application's Run method do not generate OnException events.

If an exception passes through the try blocks in the application code, the application automatically calls the HandleException method. Unless the exception object is EAbort, HandleException calls the OnException handler, if one exists. Otherwise, it calls ShowException to display a message box indicating an error occurred.

Note: Call the CancelDispatch method from an OnException event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnException event and add the following code
to the handler.  Trigger this event by calling the
Exception Create constructor.
*/
void __fastcall TAppEventForm::ApplicationEventsException(TObject *Sender,
      Exception *E)
{
    lbOther->Items->Add("Event OnException: " + E->Message);
}

void __fastcall TAppEventForm::MenuExceptionClick(TObject *Sender)
{
```

```
    char *sExceptionRaised = "This is an exception";
    throw Exception(sExceptionRaised);
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnException event and add the following code
to the handler.  Trigger this event by calling the
Exception Create constructor.
}
procedure TMainForm.ApplicationEventsException(Sender: TObject;
  E: Exception);
begin
  lbOther.Items.Add('Event OnException: ' + E.Message);
end;

procedure TMainForm.MenuExceptionClick(Sender: TObject);
resourcestring
  sExceptionRaised = 'This is an exception';

begin
  raise Exception.Create(sExceptionRaised);
end;
```

See Also

HandleException (see page 13674)

ShowException (see page 13698)

CancelDispatch (see page 1351)

9.1.1.2.6 TApplicationEvents.OnHelp Event

Occurs when the application receives a request for help.

Pascal

```
property OnHelp: THelpEvent;
```

C++

```
__property THelpEvent OnHelp;
```

Description

Write an OnHelp event handler to perform special processing when the user requests help. The HelpContext and the HelpJump methods automatically trigger the OnHelp event.

Set CallHelp to true to have the application call WinHelp after the event. Set CallHelp to false to prevent the application from calling WinHelp. All application help methods go through OnHelp. The application calls WinHelp only if OnHelp's CallHelp parameter returns True, true or if no OnHelp event handler is assigned.

To find the possible values of the Command and Data parameters, search for WinHelp in the Win32 Developer's Reference Help (Win32.HLP) file, which explains the WinHelp API (application programming interface). The possible values for the Data parameter depend upon the value of the Command parameter.

The return value is true if the event handler succeeds, false if it fails.

Note: Call the CancelDispatch method from an OnHelp event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnHelp event and add the following code to the
handler.  Trigger this event by pressing the F1 key or
call the HelpContext method.  Set CallHelp to true if the
application should still invoke the help system after the
event.
*/
bool __fastcall TAppEventForm::ApplicationEventsHelp(WORD Command, int Data,
      bool &CallHelp)
{
    lbOther->Items->Add("Event OnHelp");
    return false;
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnHelp event and add the following code to the
handler.  Trigger this event by pressing the F1 key or
call the HelpContext method.  Set CallHelp to true if the
application should still invoke the help system after the
event.
}
function TMainForm.ApplicationEventsHelp(Command: Word; Data: Integer;
  var CallHelp: Boolean): Boolean;
begin
  lbOther.Items.Add('Event OnHelp');
  CallHelp := False;
end;
```

See Also

HelpCommand (see page 13678)

HelpContext (see page 13679)

HelpFile (see page 13711)

CancelDispatch (see page 1351)

HelpJump (see page 13679)

9.1.1.2.7 TApplicationEvents.OnHint Event

Occurs when the mouse pointer moves over a control or menu item that can display a Help Hint.

Pascal

```
property OnHint: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnHint;
```

Description

Write an OnHint event handler to perform special processing when the mouse pauses over a control or menu item whose Hint property is not an empty string (' "" ').

A common use of the OnHint event is to display the value of a control or menu item's Hint property as the text of a status bar (TStatusBar). The Hint property of a control can specify both a short Help Hint and a (usually) longer hint that appears elsewhere

because of code in an OnHint event handler.

Note: Call the CancelDispatch method from an OnHint event handler to prevent the application from forwarding the event to any other application events objects.

Tip: Component writers can respond to the automatically-fired THintAction action in a component's ExecuteAction method rather than relying on an OnHint event handler.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnHint event and the OnShowHint event and add the
following code to the handlers.  OnHint is triggered when
the mouse passes over the control. OnShowHint is triggered
when the mouse passes over the control and the application
is about to display the hint window for a Help Hint
*/
void __fastcall TAppEventForm::ApplicationEventsHint(TObject *Sender)
{
    lbOther->Items->Add("Event OnHint");
}

void __fastcall TAppEventForm::ApplicationEventsShowHint(AnsiString &HintStr,
      bool &CanShow, THintInfo &HintInfo)
{
    lbOther->Items->Add("Event OnShowHint");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnHint event and the OnShowHint event and add the
following code to the handlers.  OnHint is triggered when
the mouse passes over the control. OnShowHint is triggered
when the mouse passes over the control and the application
is about to display the hint window for a Help Hint
}
procedure TMainForm.ApplicationEventsHint(Sender: TObject);
begin
  lbOther.Items.Add('Event OnHint');
end;

procedure TMainForm.ApplicationEventsShowHint(var HintStr: String;
  var CanShow: Boolean; var HintInfo: THintInfo);
begin
  lbOther.Items.Add('Event OnShowHint');
end;
```

CancelDispatch (see page 1351)

Hint (see page 13712)

ActivateHint (see page 13668)

9.1.1.2.8 TApplicationEvents.OnIdle Event

Occurs when an application becomes idle.

Pascal

```
property OnIdle: TIdleEvent;
```

C++

```
__property TIdleEvent OnIdle;
```

Description

Write an OnIdle event handler to perform special processing when an application is idle. An application is idle when it is not processing code. For example, an application is idle when it is waiting for input from the user.

OnIdle is called only once, as the application transitions into an idle state. It is not called continuously unless Done is set to false. Applications that set Done to false consume an inordinate amount of CPU time, which affects overall system performance.

Note: Call the CancelDispatch method from an OnIdle event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnIdle event and add the following code to the
handler.  The OnIdle event handler is used to perform
special processing when an application is idle. An
application is idle when it is not processing code.
*/
void __fastcall TAppEventForm::ApplicationEventsIdle(TObject *Sender,
      bool &Done)
{
    lbIdle->Items->Add("Event OnIdle");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnIdle event and add the following code to the
handler.  The OnIdle event handler is used to perform
special processing when an application is idle. An
application is idle when it is not processing code.
}
procedure TMainForm.ApplicationEventsIdle(Sender: TObject;
  var Done: Boolean);
begin
  lbIdle.Items.Add('Event OnIdle');
end;
```

OnActionUpdate (see page 1354)

CancelDispatch (see page 1351)

9.1.1.2.9 TApplicationEvents.OnMessage Event

Occurs when the application receives a Windows message.

Pascal

```
property OnMessage: TMessageEvent;
```

C++

```
__property TMessageEvent OnMessage;
```

Description

Use OnMessage to trap any or all Windows messages posted to all windows in the application. OnMessage occurs when an application receives a Windows message. OnMessage only receives messages that are posted to the message queue, not those sent directly with the Windows API SendMessage function.

An OnMessage event handler allows an application to respond to messages other than those declared in the events for TApplication. If the application doesn't have a specific handler for an incoming message, the message is dispatched to the window for which it was intended, and Windows handles the message.

Warning: Caution:Thousands of messages per second flow though this event. Be careful when coding the handler, because it can affect the performance of the entire application.

Tip: Call the CancelDispatch method from an OnMessage event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnMessage event and add the following code to the
handler.  OnMessage is triggered when the application
receives a Windows message.
*/
void __fastcall TAppEventForm::ApplicationEventsMessage(tagMSG &Msg,
      bool &Handled)
{
    lbOnMessage->Items->Add("X:=" + IntToStr(Msg.pt.x) + "|Y:=" + IntToStr(Msg.pt.y));
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnMessage event and add the following code to the
handler.  OnMessage is triggered when the application
receives a Windows message.
}
procedure TMainForm.ApplicationEventsMessage(var Msg: tagMSG;
  var Handled: Boolean);
begin
  lbOnMessage.Items.Add('X:=' + IntToStr(Msg.pt.x) + '|Y:=' + IntToStr(Msg.pt.y));
end;
```

See Also

HandleMessage (see page 13674)

CancelDispatch (see page 1351)

ProcessMessages (see page 13691)

9.1.1.2.10 TApplicationEvents.OnMinimize Event

Occurs when an application is minimized.

Pascal

```
property OnMinimize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMinimize;
```

Description

Write an OnMinimize event handler to perform special processing when the application is minimized. The application is minimized, either because the user minimizes the main window, or because of a call to the Minimize method. The application's Icon property determines the icon that represents the minimized application.

Note: Call the CancelDispatch method from an OnMinimize event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnMinimize event and add the following code to the
handler.  OnMinimize is triggered when the form is
minimized.
*/
void __fastcall TAppEventForm::ApplicationEventsMinimize(TObject *Sender)
{
  lbOther->Items->Add("Event OnMinimize");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnMinimize event and add the following code to the
handler.  OnMinimize is triggered when the form is
minimized.
}
procedure TMainForm.ApplicationEventsMinimize(Sender: TObject);
begin
  lbOther.Items.Add('Event OnMinimize');
end;
```

See Also

Icon (see page 13717)

Minimize (see page 13688)

CancelDispatch (see page 1351)

OnRestore (see page 1364)

9.1.1.2.11 TApplicationEvents.OnModalBegin Event

Pascal

```
property OnModalBegin: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnModalBegin;
```

Description

This is OnModalBegin, a member of class TApplicationEvents.

9.1.1.2.12 TApplicationEvents.OnModalEnd Event

Pascal

```
property OnModalEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnModalEnd;
```

Description

This is OnModalEnd, a member of class TApplicationEvents.

9.1.1.2.13 TApplicationEvents.OnRestore Event

Occurs when the previously minimized application is restored to its normal size.

Pascal

```
property OnRestore: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnRestore;
```

Description

Write an OnRestore event handler to perform special processing when the application is restored from the minimized state in which it appears as an icon. An application is restored either because the user restores the application, or because the application calls the Restore method.

Note: Don't confuse restoring an application with restoring a form or window to its original size. To minimize, maximize, and restore a window or form, change the value of the WindowState property.

Note: Call the CancelDispatch method from an OnRestore event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnRestore event and add the following code to the
handler.  OnRestore is triggered when a minimized
application is restored.
*/
```

```
void __fastcall TAppEventForm::ApplicationEventsRestore(TObject *Sender)
{

  lbOther->Items->Add("Event OnRestore");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnRestore event and add the following code to the
handler.  OnRestore is triggered when a minimized
application is restored.
}
procedure TMainForm.ApplicationEventsRestore(Sender: TObject);
begin
  lbOther.Items.Add('Event OnRestore');
end;
```

CancelDispatch (see page 1351)

Minimize (see page 13688)

Restore (see page 13694)

9.1.1.2.14 TApplicationEvents.OnSettingChange Event

Occurs when Windows notifies the application that a system-wide setting has changed.

Pascal

```
property OnSettingChange: TSettingChangeEvent;
```

C++

```
__property TSettingChangeEvent OnSettingChange;
```

Description

Use OnSettingChange to respond when Windows informs the application that a system-wide setting or policy has changed.

C++ Examples:

```
/*
This example requires that a memo and a TApplicationEvent be
added to the form.  Change the Windows Locale by using the
Regional and Language Options in the Windows Control Panel.
*/
void __fastcall TForm1::ApplicationEvents1SettingChange(TObject *Sender, int Flag, const
AnsiString Section, int &Result)
{
  Memo1->Lines->BeginUpdate();
  try
  {
//    char buffer[64];
    AnsiString buffer;
    buffer.sprintf("Section = %s", Section.c_str());
    Memo1->Lines->Add(buffer);
    buffer.sprintf("Flag = %8x", Flag);
    Memo1->Lines->Add(buffer);
    if (strcmp(Section.c_str(), "intl") == 0)
    {
      buffer.sprintf("DefaultLCID = %8x", SysLocale.DefaultLCID);
      Memo1->Lines->Add(buffer);
      buffer.sprintf("PriLangID = %8x", SysLocale.PriLangID);
```

```
        Memo1->Lines->Add(buffer);
        buffer.sprintf("SubLangID = %8x", SysLocale.SubLangID);
        Memo1->Lines->Add(buffer);
        buffer.sprintf("FarEast = %s", BoolToStr(SysLocale.FarEast, true));
        Memo1->Lines->Add(buffer);
        buffer.sprintf("MiddleEast = %s", BoolToStr(SysLocale.MiddleEast, true));
        Memo1->Lines->Add(buffer);
        Memo1->Lines->Add("");
      }
    }
    __finally
    {
      Memo1->Lines->EndUpdate();
    }
  }
```

Delphi Examples:

```
{
This example requires that a memo and a TApplicationEvent be
added to the form.  Change the Windows Locale by using the
Regional and Language Options in the Windows Control Panel.
}
procedure TForm1.ApplicationEvents1SettingChange(Sender: TObject; Flag: Integer; const
Section: string; var Result: Integer);
begin
  Memo1.Lines.BeginUpdate;
  try
    Memo1.Lines.Add(Format('Section  = %s', [Section]));
    Memo1.Lines.Add(Format('Flags  = %.8x', [Flag]));
    if AnsiSameStr(Section, 'intl') then
    with SysLocale do
    begin
      Memo1.Lines.Add(Format('DefaultLCID  = %.8x', [DefaultLCID]));
      Memo1.Lines.Add(Format('PriLangID  = %.8x', [PriLangID]));
      Memo1.Lines.Add(Format('SubLangID  = %.8x', [SubLangID]));
      Memo1.Lines.Add(Format('FarEast  = %s', [BoolToStr(FarEast, True)]));
      Memo1.Lines.Add(Format('MiddleEast  = %s', [BoolToStr(MiddleEast, True)]));
    end;
    Memo1.Lines.Add('');
  finally
    Memo1.Lines.EndUpdate;
  end;
//  Result:= 0;
end;
```

variables

9.1.1.2.15 TApplicationEvents.OnShortCut Event

Occurs when the user presses a key (before the OnKeyDown event).

Pascal

```
property OnShortCut: TShortCutEvent;
```

C++

```
__property TShortCutEvent OnShortCut;
```

Description

Use OnShortCut to dispatch shortcut keystrokes before the form or its controls handle them. When the user presses a key, the

application can dispatch it as a shortcut key instead of allowing the standard keystroke processing (OnKeyDown, OnKeyPress, and OnKeyUp). Built-in shortcut processing is provided for menu shortcuts and actions associated with the form. OnShortCut lets the application implement additional shortcuts.

If the OnShortCut event handler responds to the keystroke, set its Handled parameter to true. This prevents the keystroke from being passed on to menus or actions associated with the application. It also prevents the standard keystroke processing in the same way that a menu or action shortcut does.

Note: Call the CancelDispatch method from an OnShortCut event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnShortCut event and add the following code to the
handler.  Trigger this event by pressing the CTRL key or
any function key.
*/
void __fastcall TAppEventForm::ApplicationEventsShortCut(TWMKey &Msg,
      bool &Handled)
{
  lbOther->Items->Add("Event OnShortCut");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnShortCut event and add the following code to the
handler.  Trigger this event by pressing the CTRL key or
any function key.
}
procedure TMainForm.ApplicationEventsShortCut(var Msg: TWMKey;
  var Handled: Boolean);
begin
  lbOther.Items.Add('Event OnShortCut');
end;
```

CancelDispatch (see page 1351)

9.1.1.2.16 TApplicationEvents.OnShowHint Event

Occurs when the application is about to display the hint window for a Help Hint.

Pascal

```
property OnShowHint: TShowHintEvent;
```

C++

```
__property TShowHintEvent OnShowHint;
```

Description

Write an OnShowHint event handler to change the appearance and behavior of Help Hints.

The HintStr parameter sets the text of the Help Hint. To obtain the text of a hint for a particular control, call the GetLongHint or GetShortHint function, assigning the result to HintStr. To change the text, change the value of this string.

Use the CanShow parameter to permit or prevent the Help Hint from displaying. If CanShow is true, the Help Hint displays. If it is false, the Help Hint does not appear.

Note: Call the CancelDispatch method from an OnShowHint event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnHint event and the OnShowHint event and add the
following code to the handlers.  OnHint is triggered when
the mouse passes over the control. OnShowHint is triggered
when the mouse passes over the control and the application
is about to display the hint window for a Help Hint
*/
void __fastcall TAppEventForm::ApplicationEventsHint(TObject *Sender)
{
    lbOther->Items->Add("Event OnHint");
}

void __fastcall TAppEventForm::ApplicationEventsShowHint(AnsiString &HintStr,
      bool &CanShow, THintInfo &HintInfo)
{
    lbOther->Items->Add("Event OnShowHint");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnHint event and the OnShowHint event and add the
following code to the handlers.  OnHint is triggered when
the mouse passes over the control. OnShowHint is triggered
when the mouse passes over the control and the application
is about to display the hint window for a Help Hint
}
procedure TMainForm.ApplicationEventsHint(Sender: TObject);
begin
  lbOther.Items.Add('Event OnHint');
end;

procedure TMainForm.ApplicationEventsShowHint(var HintStr: String;
  var CanShow: Boolean; var HintInfo: THintInfo);
begin
  lbOther.Items.Add('Event OnShowHint');
end;
```

9.1.2 TCustomApplicationEvents Class

TCustomApplicationEvents intercepts application-level events.

Class Hierarchy

Pascal

```
TCustomApplicationEvents = class(TComponent);
```

C++

```
class TCustomApplicationEvents : public TComponent;
```

File

AppEvnts

Description

Use TCustomApplicationEvents as a base class for objects that intercept the events of the global Application object. Each event of the TApplicationEvents (see page 1326) object is the same as the event with the same name on the Application object.

Do not create instances of TCustomApplicationEvents. Instead, use a descendant of TCustomApplicationEvents such a TApplicationEvents (see page 1326).

See Also

TApplication (see page 13660)

Application

TApplicationEvents (see page 1326)

9.1.2.1 TCustomApplicationEvents Members

The following tables list the members exposed by TCustomApplicationEvents.

Protected Events

	Name	Description
	OnActionExecute (see page 1352)	Occurs when an action's Execute method is called and its action list has not already handled it.
	OnActionUpdate (see page 1354)	Occurs when an action's Update method is called and its action list has not already handled it.
	OnActivate (see page 1355)	Occurs when an application becomes active.
	OnDeactivate (see page 1356)	Occurs when an application becomes inactive.
	OnException (see page 1357)	Occurs when an unhandled exception occurs in the application.
	OnHelp (see page 1358)	Occurs when the application receives a request for help.
	OnHint (see page 1359)	Occurs when the mouse pointer moves over a control or menu item that can display a Help Hint.
	OnIdle (see page 1361)	Occurs when an application becomes idle.
	OnMessage (see page 1362)	Occurs when the application receives a Windows message.
	OnMinimize (see page 1363)	Occurs when an application is minimized.

	OnModalBegin (see page 1364)	This is OnModalBegin, a member of class TCustomApplicationEvents.
	OnModalEnd (see page 1364)	This is OnModalEnd, a member of class TCustomApplicationEvents.
	OnRestore (see page 1364)	Occurs when the previously minimized application is restored to its normal size.
	OnSettingChange (see page 1365)	Occurs when Windows notifies the application that a system-wide setting has changed.
	OnShortCut (see page 1366)	Occurs when the user presses a key (before the OnKeyDown event).
	OnShowHint (see page 1367)	Occurs when the application is about to display the hint window for a Help Hint.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.

	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Activate (see page 1351)	Ensures that this is the first component to receive any application events.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CancelDispatch (see page 1351)	Prevents other TCustomApplicationEvents (see page 1347) objects from receiving the current event.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1350)	Creates a new TCustomApplicationEvents (see page 1347) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.

	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

9.1.2.2 TCustomApplicationEvents.Create Constructor

Creates a new TCustomApplicationEvents (see page 1347) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomApplicationEvents(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomApplicationEvents (see page 1347) at runtime. Components added to forms at design time are created automatically.

Create adds the component to the internal list of components that respond to the application's events. Once the component is created, it responds to any of the application events unless another TCustomApplicationEvents (see page 1347) component prevents it by calling CancelDispatch (see page 1351).

See Also

CancelDispatch (see page 1351)

9.1.2.3 TCustomApplicationEvents Methods

The methods of the TCustomApplicationEvents class are listed here.

Public Methods

	Name	Description
	Activate (see page 1351)	Ensures that this is the first component to receive any application events.
	CancelDispatch (see page 1351)	Prevents other TCustomApplicationEvents (see page 1347) objects from receiving the current event.

9.1.2.3.1 TCustomApplicationEvents.Activate Method

Ensures that this is the first component to receive any application events.

Pascal

```
procedure Activate;
```

C++

```
__fastcall Activate();
```

Description

Call Activate to move the TCustomApplicationEvents (see page 1347) descendant to the front of the internal list of components that respond to the application's events. There is no need to call Activate unless the project includes more than one TCustomApplicationEvents (see page 1347) descendant.

Typically, each form that contains a TCustomApplicationEvents (see page 1347) descendant calls that component's Activate method from its OnActivate (see page 1355) event handler. This has the effect of switching the first event handler to receive an event every time the user changes the active form.

Activate does not prevent other TCustomApplicationEvents (see page 1347) descendants from receiving events, it merely places them in the queue behind the active TCustomApplicationEvents (see page 1347) descendant. To prevent other components from receiving the events, use the CancelDispatch (see page 1351) method.

Warning: Do not call Activate from an event handler that is responding to an application-level event. Such a call will cause an exception to be raised.

See Also

OnActivate (see page 13943)

CancelDispatch (see page 1351)

9.1.2.3.2 TCustomApplicationEvents.CancelDispatch Method

Prevents other TCustomApplicationEvents (see page 1347) objects from receiving the current event.

Pascal

```
procedure CancelDispatch;
```

C++

```
__fastcall CancelDispatch();
```

Description

Call CancelDispatch from one of the TCustomApplicationEvents (see page 1347) descendant's event handlers when it handles an event. CancelDispatch prevents other TCustomApplicationEvents (see page 1347) descendant's from receiving

the event after the current event handler exits.

CancelDispatch has no effect unless it is called from one of the component's event handlers.

9.1.2.4 TCustomApplicationEvents Events

The events of the TCustomApplicationEvents class are listed here.

Protected Events

	Name	Description
	OnActionExecute (see page 1352)	Occurs when an action's Execute method is called and its action list has not already handled it.
	OnActionUpdate (see page 1354)	Occurs when an action's Update method is called and its action list has not already handled it.
	OnActivate (see page 1355)	Occurs when an application becomes active.
	OnDeactivate (see page 1356)	Occurs when an application becomes inactive.
	OnException (see page 1357)	Occurs when an unhandled exception occurs in the application.
	OnHelp (see page 1358)	Occurs when the application receives a request for help.
	OnHint (see page 1359)	Occurs when the mouse pointer moves over a control or menu item that can display a Help Hint.
	OnIdle (see page 1361)	Occurs when an application becomes idle.
	OnMessage (see page 1362)	Occurs when the application receives a Windows message.
	OnMinimize (see page 1363)	Occurs when an application is minimized.
	OnModalBegin (see page 1364)	This is OnModalBegin, a member of class TCustomApplicationEvents.
	OnModalEnd (see page 1364)	This is OnModalEnd, a member of class TCustomApplicationEvents.
	OnRestore (see page 1364)	Occurs when the previously minimized application is restored to its normal size.
	OnSettingChange (see page 1365)	Occurs when Windows notifies the application that a system-wide setting has changed.
	OnShortCut (see page 1366)	Occurs when the user presses a key (before the OnKeyDown event).
	OnShowHint (see page 1367)	Occurs when the application is about to display the hint window for a Help Hint.

9.1.2.4.1 TCustomApplicationEvents.OnActionExecute Event

Occurs when an action's Execute method is called and its action list has not already handled it.

Pascal

```
property OnActionExecute: TActionEvent;
```

C++

```
__property TActionEvent OnActionExecute;
```

Description

Use the OnExecute event handler to respond when a user invokes actions whose action lists do not have OnExecute event handlers.

If the action list that contains the action does not handle it in an OnExecute event handler, then the action is routed to the Application object's OnActionExecute event. The application events object hooks this event and responds with its own OnActionExecute event handler.

The Handled parameter of the event handler returns false by default. If the handler handles the event, it should change Handled to true, thereby preventing further attempts to handle the action. When the event handler exits with Handled set to false, the event first goes to any other application events objects, and then the action's OnExecute event occurs. If the action remains unhandled after that, the active control's ExecuteAction method is called to allow the action to execute with an identified target. Finally, the active form's ExecuteAction method is called if all other handlers do not handle the action.

Note: Call the CancelDispatch (see page 1351) method from an OnActionExecute event handler to prevent the application

from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents, a TActionList
and a TListBox in the form.  Select the TApplicationEvents,
double click on the OnActionExecute event and add the
following code to the handler.  Create an TAction named
MyAction in a TActionList.  The TActionList must have no
OnExecute event handler, and the TAction has an OnExecute
event handler called MyActionExecute.  Then set an object's
(such as a button) Action to MyAction.  The Handled
parameter of the event handler returns false by default. If
the handler handles the event, it should change Handled to
true, thereby preventing further attempts to handle the
action.
*/
void __fastcall TAppEventForm::ApplicationEventsActionExecute(
      TBasicAction *Action, bool &Handled)
{
    lbOther->Items->Add("Event OnActionExecute");
}

void __fastcall TAppEventForm::ActionExecute(TObject *Sender)
{
    ShowMessage("Action executed");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents, a TActionList
and a TListBox in the form.  Select the TApplicationEvents,
double click on the OnActionExecute event and add the
following code to the handler.  Create an TAction named
MyAction in a TActionList.  The TActionList must have no
OnExecute event handler, and the TAction has an OnExecute
event handler called MyActionExecute.  Then set an object's
(such as a button) Action to MyAction.  The Handled
parameter of the event handler returns false by default. If
the handler handles the event, it should change Handled to
true, thereby preventing further attempts to handle the
action.
}
procedure TMainForm.ApplicationEventsActionExecute(Action: TBasicAction;
  var Handled: Boolean);
begin
  lbOther.Items.Add('Event OnActionExecute');
end;

procedure TMainForm.MyActionExecute(Sender: TObject);
begin
  ShowMessage('Action executed');
end;
```

OnExecute (see page 2716)

OnExecute (see page 327)

ExecuteAction

CancelDispatch (see page 1351)

9.1.2.4.2 TCustomApplicationEvents.OnActionUpdate Event

Occurs when an action's Update method is called and its action list has not already handled it.

Pascal

```
property OnActionUpdate: TActionEvent;
```

C++

```
__property TActionEvent OnActionUpdate;
```

Description

Use the OnActionUpdate event handler to update the properties of an action when the application is idle if the action's action list does not handle it in an OnUpdate event handler. OnActionUpdate occurs after the OnIdle (see page 1361) event.

If the action list that contains the action does not update it in an OnUpdate event handler, the action is routed to the Application object's OnActionUpdate event. The application events object hooks this event and responds with its own OnActionUpdate event handler.

The Handled parameter of the event handler returns false by default. If the handler updates the event, it should change Handled to true, thereby ending the processing of the action. When the event handler exits with Handled set to false, the event first goes to any other application events objects, and then the action's OnUpdate event occurs. If the action is not updated after that, the active control's UpdateAction method is called to allow the target to update the action. Finally, the active form's UpdateAction method is called if all other handlers do not handle the action.

Note: Call the CancelDispatch (see page 1351) method from an OnActionUpdate event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnActionUpdate event and add the following code to
the handler.  Create other TApplicationEvents the same way.
When these events update this event is triggered.  The
Handled parameter of the event handler returns false by
default. If the handler handles the event, it should change
Handled to true, thereby preventing further attempts to
*/
void __fastcall TAppEventForm::ApplicationEventsActionUpdate(
      TBasicAction *Action, bool &Handled)
{
     lbActionUpdate->Items->Add("Event OnActionUpdate");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnActionUpdate event and add the following code to
the handler.  Create other TApplicationEvents the same way.
When these events update this event is triggered.  The
Handled parameter of the event handler returns false by
default. If the handler handles the event, it should change
Handled to true, thereby preventing further attempts to
```

```
  handle the action.
  }
  procedure TMainForm.ApplicationEventsActionUpdate(Action: TBasicAction;
    var Handled: Boolean);
  begin
    lbActionUpdate.Items.Add('Event OnActionUpdate');
  end;
```

UpdateAction

OnIdle (see page 1361)

CancelDispatch (see page 1351)

9.1.2.4.3 TCustomApplicationEvents.OnActivate Event

Occurs when an application becomes active.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to perform special processing when the application becomes active.

An application becomes active when it is initially run or when focus moves from another Windows application back to any window of the application.

Note: Call the CancelDispatch (see page 1351) method from an OnActivate event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnActivate event and add the following code
to the handler.  These events occur when the form gains
or loses focus.
*/
void __fastcall TAppEventForm::ApplicationEventsActivate(TObject *Sender)
{
     lbOther->Items->Add("Event OnActivate");
}

void __fastcall TAppEventForm::ApplicationEventsDeactivate(TObject *Sender)
{
    lbOther->Items->Add("Event OnDeactivate");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnActivate event and add the following code
to the handler.  These events occur when the form gains
or loses focus.
}
procedure TMainForm.ApplicationEventsActivate(Sender: TObject);
begin
  lbOther.Items.Add('Event OnActivate');
end;

procedure TMainForm.ApplicationEventsDeactivate(Sender: TObject);
begin
  lbOther.Items.Add('Event OnDeactivate');
end;
```

See Also

Active (see page 13704)

OnDeactivate (see page 1356)

CancelDispatch (see page 1351)

9.1.2.4.4 TCustomApplicationEvents.OnDeactivate Event

Occurs when an application becomes inactive.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to perform any special processing that should occur immediately before the application is deactivated. The OnDeactivate event occurs when the user switches from the application to another Windows application.

Note: Call the CancelDispatch (see page 1351) method from an OnDeactivate event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnActivate event and add the following code
to the handler.  These events occur when the form gains
or loses focus.
*/
void __fastcall TAppEventForm::ApplicationEventsActivate(TObject *Sender)
{
     lbOther->Items->Add("Event OnActivate");
}

void __fastcall TAppEventForm::ApplicationEventsDeactivate(TObject *Sender)
{
    lbOther->Items->Add("Event OnDeactivate");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnActivate event and add the following code
to the handler.  These events occur when the form gains
or loses focus.
}
procedure TMainForm.ApplicationEventsActivate(Sender: TObject);
begin
  lbOther.Items.Add('Event OnActivate');
end;

procedure TMainForm.ApplicationEventsDeactivate(Sender: TObject);
begin
  lbOther.Items.Add('Event OnDeactivate');
end;
```

See Also

Active (see page 13704)

OnActivate (see page 1355)

CancelDispatch (see page 1351)

9.1.2.4.5 TCustomApplicationEvents.OnException Event

Occurs when an unhandled exception occurs in the application.

Pascal

```
property OnException: TExceptionEvent;
```

C++

```
__property TExceptionEvent OnException;
```

Description

Use OnException to change the default behavior that occurs when an exception is not handled by application code. The OnException event handler is called automatically in the application's HandleException method.

OnException only handles exceptions that occur during message processing. Exceptions that occur before or after the execution of the application's Run method do not generate OnException events.

If an exception passes through the try blocks in the application code, the application automatically calls the HandleException method. Unless the exception object is EAbort, HandleException calls the OnException handler, if one exists. Otherwise, it calls ShowException to display a message box indicating an error occurred.

Note: Call the CancelDispatch (see page 1351) method from an OnException event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnException event and add the following code
to the handler.  Trigger this event by calling the
Exception Create constructor.
*/
void __fastcall TAppEventForm::ApplicationEventsException(TObject *Sender,
```

```
      Exception *E)
{
    lbOther->Items->Add("Event OnException: " + E->Message);
}

void __fastcall TAppEventForm::MenuExceptionClick(TObject *Sender)
{
    char *sExceptionRaised = "This is an exception";
    throw Exception(sExceptionRaised);
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnException event and add the following code
to the handler.  Trigger this event by calling the
Exception Create constructor.
}
procedure TMainForm.ApplicationEventsException(Sender: TObject;
  E: Exception);
begin
  lbOther.Items.Add('Event OnException: ' + E.Message);
end;

procedure TMainForm.MenuExceptionClick(Sender: TObject);
resourcestring
  sExceptionRaised = 'This is an exception';

begin
  raise Exception.Create(sExceptionRaised);
end;
```

See Also

HandleException (see page 13674)

ShowException (see page 13698)

CancelDispatch (see page 1351)

9.1.2.4.6 TCustomApplicationEvents.OnHelp Event

Occurs when the application receives a request for help.

Pascal

```
property OnHelp: THelpEvent;
```

C++

```
__property THelpEvent OnHelp;
```

Description

Write an OnHelp event handler to perform special processing when the user requests help. The HelpContext and the HelpJump methods automatically trigger the OnHelp event.

Set CallHelp to true to have the application call WinHelp after the event. Set CallHelp to false to prevent the application from calling WinHelp. All application help methods go through OnHelp. The application calls WinHelp only if OnHelp's CallHelp parameter returns True, true or if no OnHelp event handler is assigned.

To find the possible values of the Command and Data parameters, search for WinHelp in the Win32 Developer's Reference Help (Win32.HLP) file, which explains the WinHelp API (application programming interface). The possible values for the Data parameter depend upon the value of the Command parameter.

The return value is true if the event handler succeeds, false if it fails.

Note: Call the CancelDispatch (see page 1351) method from an OnHelp event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnHelp event and add the following code to the
handler.  Trigger this event by pressing the F1 key or
call the HelpContext method.  Set CallHelp to true if the
application should still invoke the help system after the
event.
*/
bool __fastcall TAppEventForm::ApplicationEventsHelp(WORD Command, int Data,
      bool &CallHelp)
{
    lbOther->Items->Add("Event OnHelp");
    return false;
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnHelp event and add the following code to the
handler.  Trigger this event by pressing the F1 key or
call the HelpContext method.  Set CallHelp to true if the
application should still invoke the help system after the
event.
}
function TMainForm.ApplicationEventsHelp(Command: Word; Data: Integer;
  var CallHelp: Boolean): Boolean;
begin
  lbOther.Items.Add('Event OnHelp');
  CallHelp := False;
end;
```

See Also

HelpCommand (see page 13678)

HelpContext (see page 13679)

HelpFile (see page 13711)

CancelDispatch (see page 1351)

HelpJump (see page 13679)

9.1.2.4.7 TCustomApplicationEvents.OnHint Event

Occurs when the mouse pointer moves over a control or menu item that can display a Help Hint.

Pascal

```
property OnHint: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnHint;
```

Description

Write an OnHint event handler to perform special processing when the mouse pauses over a control or menu item whose Hint property is not an empty string (' "" ').

A common use of the OnHint event is to display the value of a control or menu item's Hint property as the text of a status bar (TStatusBar). The Hint property of a control can specify both a short Help Hint and a (usually) longer hint that appears elsewhere because of code in an OnHint event handler.

Note: Call the CancelDispatch (see page 1351) method from an OnHint event handler to prevent the application from forwarding the event to any other application events objects.

Tip: Component writers can respond to the automatically-fired THintAction action in a component's ExecuteAction method rather than relying on an OnHint event handler.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnHint event and the OnShowHint event and add the
following code to the handlers.  OnHint is triggered when
the mouse passes over the control. OnShowHint is triggered
when the mouse passes over the control and the application
is about to display the hint window for a Help Hint
*/
void __fastcall TAppEventForm::ApplicationEventsHint(TObject *Sender)
{
    lbOther->Items->Add("Event OnHint");
}

void __fastcall TAppEventForm::ApplicationEventsShowHint(AnsiString &HintStr,
      bool &CanShow, THintInfo &HintInfo)
{
    lbOther->Items->Add("Event OnShowHint");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnHint event and the OnShowHint event and add the
following code to the handlers.  OnHint is triggered when
the mouse passes over the control. OnShowHint is triggered
when the mouse passes over the control and the application
is about to display the hint window for a Help Hint
}
procedure TMainForm.ApplicationEventsHint(Sender: TObject);
begin
  lbOther.Items.Add('Event OnHint');
end;

procedure TMainForm.ApplicationEventsShowHint(var HintStr: String;
  var CanShow: Boolean; var HintInfo: THintInfo);
begin
  lbOther.Items.Add('Event OnShowHint');
end;
```

GetShortHint (see page 6253)

CancelDispatch (see page 1351)

Hint (see page 13712)

ActivateHint (see page 13668)

9.1.2.4.8 TCustomApplicationEvents.OnIdle Event

Occurs when an application becomes idle.

Pascal

```
property OnIdle: TIdleEvent;
```

C++

```
__property TIdleEvent OnIdle;
```

Description

Write an OnIdle event handler to perform special processing when an application is idle. An application is idle when it is not processing code. For example, an application is idle when it is waiting for input from the user.

OnIdle is called only once, as the application transitions into an idle state. It is not called continuously unless Done is set to false. Applications that set Done to false consume an inordinate amount of CPU time, which affects overall system performance.

Note: Call the CancelDispatch (see page 1351) method from an OnIdle event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnIdle event and add the following code to the
handler.  The OnIdle event handler is used to perform
special processing when an application is idle. An
application is idle when it is not processing code.
*/
void __fastcall TAppEventForm::ApplicationEventsIdle(TObject *Sender,
      bool &Done)
{
    lbIdle->Items->Add("Event OnIdle");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnIdle event and add the following code to the
handler.  The OnIdle event handler is used to perform
special processing when an application is idle. An
application is idle when it is not processing code.
}
procedure TMainForm.ApplicationEventsIdle(Sender: TObject;
  var Done: Boolean);
begin
  lbIdle.Items.Add('Event OnIdle');
end;
```

See Also

OnActionUpdate (see page 1354)

CancelDispatch (see page 1351)

9.1.2.4.9 TCustomApplicationEvents.OnMessage Event

Occurs when the application receives a Windows message.

Pascal

```
property OnMessage: TMessageEvent;
```

C++

```
__property TMessageEvent OnMessage;
```

Description

Use OnMessage to trap any or all Windows messages posted to all windows in the application. OnMessage occurs when an application receives a Windows message. OnMessage only receives messages that are posted to the message queue, not those sent directly with the Windows API SendMessage function.

An OnMessage event handler allows an application to respond to messages other than those declared in the events for TApplication. If the application doesn't have a specific handler for an incoming message, the message is dispatched to the window for which it was intended, and Windows handles the message.

Warning: Caution:Thousands of messages per second flow though this event. Be careful when coding the handler, because it can affect the performance of the entire application.

Tip: Call the CancelDispatch (see page 1351) method from an OnMessage event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnMessage event and add the following code to the
handler.  OnMessage is triggered when the application
receives a Windows message.
*/
void __fastcall TAppEventForm::ApplicationEventsMessage(tagMSG &Msg,
      bool &Handled)
{
    lbOnMessage->Items->Add("X:=" + IntToStr(Msg.pt.x) + "|Y:=" + IntToStr(Msg.pt.y));
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnMessage event and add the following code to the
handler.  OnMessage is triggered when the application
receives a Windows message.
}
procedure TMainForm.ApplicationEventsMessage(var Msg: tagMSG;
  var Handled: Boolean);
begin
  lbOnMessage.Items.Add('X:=' + IntToStr(Msg.pt.x) + '|Y:=' + IntToStr(Msg.pt.y));
end;
```

HandleMessage (see page 13674)

CancelDispatch (see page 1351)

ProcessMessages (see page 13691)

9.1.2.4.10 TCustomApplicationEvents.OnMinimize Event

Occurs when an application is minimized.

Pascal

```
property OnMinimize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMinimize;
```

Description

Write an OnMinimize event handler to perform special processing when the application is minimized. The application is minimized, either because the user minimizes the main window, or because of a call to the Minimize method. The application's Icon property determines the icon that represents the minimized application.

Note: Call the CancelDispatch (see page 1351) method from an OnMinimize event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnMinimize event and add the following code to the
handler.  OnMinimize is triggered when the form is
minimized.
*/
void __fastcall TAppEventForm::ApplicationEventsMinimize(TObject *Sender)
{
  lbOther->Items->Add("Event OnMinimize");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnMinimize event and add the following code to the
handler.  OnMinimize is triggered when the form is
minimized.
}
procedure TMainForm.ApplicationEventsMinimize(Sender: TObject);
begin
  lbOther.Items.Add('Event OnMinimize');
end;
```

Icon (see page 13717)

Minimize (see page 13688)

CancelDispatch (see page 1351)

OnRestore (see page 1364)

9.1.2.4.11 TCustomApplicationEvents.OnModalBegin Event

Pascal

```
property OnModalBegin: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnModalBegin;
```

Description

This is OnModalBegin, a member of class TCustomApplicationEvents.

9.1.2.4.12 TCustomApplicationEvents.OnModalEnd Event

Pascal

```
property OnModalEnd: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnModalEnd;
```

Description

This is OnModalEnd, a member of class TCustomApplicationEvents.

9.1.2.4.13 TCustomApplicationEvents.OnRestore Event

Occurs when the previously minimized application is restored to its normal size.

Pascal

```
property OnRestore: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnRestore;
```

Description

Write an OnRestore event handler to perform special processing when the application is restored from the minimized state in which it appears as an icon. An application is restored either because the user restores the application, or because the application calls the Restore method.

Note: Don't confuse restoring an application with restoring a form or window to its original size. To minimize, maximize, and restore a window or form, change the value of the WindowState property.

Note: Call the CancelDispatch (see page 1351) method from an OnRestore event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnRestore event and add the following code to the
handler.  OnRestore is triggered when a minimized
```

```
application is restored.
*/
void __fastcall TAppEventForm::ApplicationEventsRestore(TObject *Sender)
{

  lbOther->Items->Add("Event OnRestore");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnRestore event and add the following code to the
handler.  OnRestore is triggered when a minimized
application is restored.
}
procedure TMainForm.ApplicationEventsRestore(Sender: TObject);
begin
  lbOther.Items.Add('Event OnRestore');
end;
```

See Also

CancelDispatch (see page 1351)

Minimize (see page 13688)

Restore (see page 13694)

9.1.2.4.14 TCustomApplicationEvents.OnSettingChange Event

Occurs when Windows notifies the application that a system-wide setting has changed.

Pascal

```
property OnSettingChange: TSettingChangeEvent;
```

C++

```
__property TSettingChangeEvent OnSettingChange;
```

Description

Use OnSettingChange to respond when Windows informs the application that a system-wide setting or policy has changed.

C++ Examples:

```
/*
This example requires that a memo and a TApplicationEvent be
added to the form.  Change the Windows Locale by using the
Regional and Language Options in the Windows Control Panel.
*/
void __fastcall TForm1::ApplicationEvents1SettingChange(TObject *Sender, int Flag, const
AnsiString Section, int &Result)
{
  Memo1->Lines->BeginUpdate();
  try
  {
//    char buffer[64];
    AnsiString buffer;
    buffer.sprintf("Section = %s", Section.c_str());
    Memo1->Lines->Add(buffer);
    buffer.sprintf("Flag = %8x", Flag);
    Memo1->Lines->Add(buffer);
    if (strcmp(Section.c_str(), "intl") == 0)
    {
      buffer.sprintf("DefaultLCID = %8x", SysLocale.DefaultLCID);
```

```
        Memo1->Lines->Add(buffer);
        buffer.sprintf("PriLangID = %8x", SysLocale.PriLangID);
        Memo1->Lines->Add(buffer);
        buffer.sprintf("SubLangID = %8x", SysLocale.SubLangID);
        Memo1->Lines->Add(buffer);
        buffer.sprintf("FarEast = %s", BoolToStr(SysLocale.FarEast, true));
        Memo1->Lines->Add(buffer);
        buffer.sprintf("MiddleEast = %s", BoolToStr(SysLocale.MiddleEast, true));
        Memo1->Lines->Add(buffer);
        Memo1->Lines->Add("");
      }
    }
    __finally
    {
      Memo1->Lines->EndUpdate();
    }
  }
```

Delphi Examples:

```
{
This example requires that a memo and a TApplicationEvent be
added to the form.  Change the Windows Locale by using the
Regional and Language Options in the Windows Control Panel.
}
procedure TForm1.ApplicationEvents1SettingChange(Sender: TObject; Flag: Integer; const
Section: string; var Result: Integer);
begin
  Memo1.Lines.BeginUpdate;
  try
    Memo1.Lines.Add(Format('Section  = %s', [Section]));
    Memo1.Lines.Add(Format('Flags  = %.8x', [Flag]));
    if AnsiSameStr(Section, 'intl') then
    with SysLocale do
    begin
      Memo1.Lines.Add(Format('DefaultLCID  = %.8x', [DefaultLCID]));
      Memo1.Lines.Add(Format('PriLangID  = %.8x', [PriLangID]));
      Memo1.Lines.Add(Format('SubLangID  = %.8x', [SubLangID]));
      Memo1.Lines.Add(Format('FarEast  = %s', [BoolToStr(FarEast, True)]));
      Memo1.Lines.Add(Format('MiddleEast  = %s', [BoolToStr(MiddleEast, True)]));
    end;
    Memo1.Lines.Add('');
  finally
    Memo1.Lines.EndUpdate;
  end;
//  Result:= 0;
end;
```

variables

9.1.2.4.15 TCustomApplicationEvents.OnShortCut Event

Occurs when the user presses a key (before the OnKeyDown event).

Pascal

```
property OnShortCut: TShortCutEvent;
```

C++

```
__property TShortCutEvent OnShortCut;
```

Description

Use OnShortCut to dispatch shortcut keystrokes before the form or its controls handle them. When the user presses a key, the application can dispatch it as a shortcut key instead of allowing the standard keystroke processing (OnKeyDown, OnKeyPress, and OnKeyUp). Built-in shortcut processing is provided for menu shortcuts and actions associated with the form. OnShortCut lets the application implement additional shortcuts.

If the OnShortCut event handler responds to the keystroke, set its Handled parameter to true. This prevents the keystroke from being passed on to menus or actions associated with the application. It also prevents the standard keystroke processing in the same way that a menu or action shortcut does.

Note: Call the CancelDispatch (see page 1351) method from an OnShortCut event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnShortCut event and add the following code to the
handler.  Trigger this event by pressing the CTRL key or
any function key.
*/
void __fastcall TAppEventForm::ApplicationEventsShortCut(TWMKey &Msg,
      bool &Handled)
{
  lbOther->Items->Add("Event OnShortCut");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnShortCut event and add the following code to the
handler.  Trigger this event by pressing the CTRL key or
any function key.
}
procedure TMainForm.ApplicationEventsShortCut(var Msg: TWMKey;
  var Handled: Boolean);
begin
  lbOther.Items.Add('Event OnShortCut');
end;
```

OnShortCut (see page 13977)

OnKeyDown (see page 6225)

CancelDispatch (see page 1351)

9.1.2.4.16 TCustomApplicationEvents.OnShowHint Event

Occurs when the application is about to display the hint window for a Help Hint.

Pascal

```
property OnShowHint: TShowHintEvent;
```

C++

```
__property TShowHintEvent OnShowHint;
```

Description

Write an OnShowHint event handler to change the appearance and behavior of Help Hints.

The HintStr parameter sets the text of the Help Hint. To obtain the text of a hint for a particular control, call the GetLongHint or GetShortHint function, assigning the result to HintStr. To change the text, change the value of this string.

Use the CanShow parameter to permit or prevent the Help Hint from displaying. If CanShow is true, the Help Hint displays. If it is false, the Help Hint does not appear.

Note: Call the CancelDispatch (see page 1351) method from an OnShowHint event handler to prevent the application from forwarding the event to any other application events objects.

C++ Examples:

```
/*
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnHint event and the OnShowHint event and add the
following code to the handlers.  OnHint is triggered when
the mouse passes over the control. OnShowHint is triggered
when the mouse passes over the control and the application
is about to display the hint window for a Help Hint
*/
void __fastcall TAppEventForm::ApplicationEventsHint(TObject *Sender)
{
    lbOther->Items->Add("Event OnHint");
}

void __fastcall TAppEventForm::ApplicationEventsShowHint(AnsiString &HintStr,
      bool &CanShow, THintInfo &HintInfo)
{
    lbOther->Items->Add("Event OnShowHint");
}
```

Delphi Examples:

```
{
This example requires a TApplicationEvents and a TListBox
in the form.  Select the TApplicationEvents, double click
on the OnHint event and the OnShowHint event and add the
following code to the handlers.  OnHint is triggered when
the mouse passes over the control. OnShowHint is triggered
when the mouse passes over the control and the application
is about to display the hint window for a Help Hint
}
procedure TMainForm.ApplicationEventsHint(Sender: TObject);
begin
  lbOther.Items.Add('Event OnHint');
end;

procedure TMainForm.ApplicationEventsShowHint(var HintStr: String;
  var CanShow: Boolean; var HintInfo: THintInfo);
begin
  lbOther.Items.Add('Event OnShowHint');
end;
```

	IApplicationStub (see page 1462)	This is class AutoAdap.IApplicationStub.
	IBaseAdapterStub (see page 1466)	This is class AutoAdap.IBaseAdapterStub.
	IBaseRecordsAdapterStub (see page 1468)	This is class AutoAdap.IBaseRecordsAdapterStub.
	IEndUserStub (see page 1470)	This is class AutoAdap.IEndUserStub.
	IImageProducerStub (see page 1473)	This is class AutoAdap.IImageProducerStub.

Types

Name	Description
TAdapterStubClass (see page 1475)	This is type AutoAdap.TAdapterStubClass.

10.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TActionLink (see page 1373)	This is class AutoAdap.TActionLink.
	TAdapterActionArrayStub (see page 1376)	This is class AutoAdap.TAdapterActionArrayStub.
	TAdapterActionStub (see page 1379)	This is class AutoAdap.TAdapterActionStub.
	TAdapterComponentsStub (see page 1383)	This is class AutoAdap.TAdapterComponentsStub.
	TAdapterErrorsStub (see page 1384)	This is class AutoAdap.TAdapterErrorsStub.
	TAdapterErrorStub (see page 1387)	This is class AutoAdap.TAdapterErrorStub.
	TAdapterFieldStub (see page 1390)	This is class AutoAdap.TAdapterFieldStub.
	TAdapterFieldValuesStub (see page 1398)	This is class AutoAdap.TAdapterFieldValuesStub.
	TAdapterHiddenFieldsStub (see page 1400)	This is class AutoAdap.TAdapterHiddenFieldsStub.
	TAdapterHiddenFieldStub (see page 1403)	This is class AutoAdap.TAdapterHiddenFieldStub.
	TAdapterImageStub (see page 1405)	This is class AutoAdap.TAdapterImageStub.
	TAdapterRecordsStub (see page 1407)	This is class AutoAdap.TAdapterRecordsStub.
	TAdapterRecordStub (see page 1409)	This is class AutoAdap.TAdapterRecordStub.
	TAdapterStub (see page 1412)	This is class AutoAdap.TAdapterStub.
	TAdapterSubComponentStub (see page 1416)	This is class AutoAdap.TAdapterSubComponentStub.
	TAdapterValuesListStub (see page 1419)	This is class AutoAdap.TAdapterValuesListStub.
	TBaseAdapterStub (see page 1422)	This is class AutoAdap.TBaseAdapterStub.
	TBaseRecordsAdapterStub (see page 1425)	This is class AutoAdap.TBaseRecordsAdapterStub.
	TWebApplicationStub (see page 1427)	This is class AutoAdap.TWebApplicationStub.
	TWebEndUserStub (see page 1430)	This is class AutoAdap.TWebEndUserStub.

10.1.1 TActionLink Class

Class Hierarchy

Pascal

```
TActionLink = class(TInterfacedObject, IGetAdapterItemRequestParams,
IGetAdapterRequestDefaultResponse, IInterfaceComponentReference);
```

C++

```
class TActionLink : public TInterfacedObject, public IGetAdapterItemRequestParams, public
IGetAdapterRequestDefaultResponse, public IInterfaceComponentReference;
```

File

AutoAdap

Description

This is class AutoAdap.TActionLink.

10.1.1.1 TActionLink Members

The following tables list the members exposed by TActionLink.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetAdapterItemRequestParams (see page 1375)	This is GetAdapterItemRequestParams, a member of class TActionLink.
	GetComponent (see page 1376)	Returns a reference to the component associated by the implementing class.
	GetFailurePage (see page 1376)	This is GetFailurePage, a member of class TActionLink.
	GetSuccessPage (see page 1376)	This is GetSuccessPage, a member of class TActionLink.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1375)	This is Create, a member of class TActionLink.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	FailurePage (see page 19694)	This is FailurePage, a member of class IGetAdapterRequestDefaultResponse.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	SuccessPage (see page 19694)	This is SuccessPage, a member of class IGetAdapterRequestDefaultResponse.

10.1.1.2 TActionLink.Create Constructor

Pascal

```
constructor Create(AAction: IInterface; const APage: string; const AErrorPage: string);
```

C++

```
__fastcall TActionLink(IInterface AAction, const AnsiString APage, const AnsiString
AErrorPage);
```

Description

This is Create, a member of class TActionLink.

10.1.1.3 TActionLink Methods

The methods of the TActionLink class are listed here.

Protected Methods

	Name	Description
	GetAdapterItemRequestParams (see page 1375)	This is GetAdapterItemRequestParams, a member of class TActionLink.
	GetComponent (see page 1376)	Returns a reference to the component associated by the implementing class.
	GetFailurePage (see page 1376)	This is GetFailurePage, a member of class TActionLink.
	GetSuccessPage (see page 1376)	This is GetSuccessPage, a member of class TActionLink.

10.1.1.3.1 TActionLink.GetAdapterItemRequestParams Method

Pascal

```
procedure GetAdapterItemRequestParams(var AIdentifier: string; AParams:
IAdapterItemRequestParams);
```

C++

```
__fastcall GetAdapterItemRequestParams(AnsiString AIdentifier, IAdapterItemRequestParams
AParams);
```

Description

This is GetAdapterItemRequestParams, a member of class TActionLink.

10.1.1.3.2 TActionLink.GetComponent Method

Returns a reference to the component associated by the implementing class.

Pascal

```
function GetComponent: TComponent;
```

C++

```
__fastcall TComponent * GetComponent();
```

Description

GetComponent returns a TComponent value that is associated with the implementing class. For example, the TComponent class itself implements the GetComponent to return a pointer to itself.

See Also

TComponent (see page 2762)

10.1.1.3.3 TActionLink.GetFailurePage Method

Pascal

```
function GetFailurePage: string;
```

C++

```
__fastcall AnsiString GetFailurePage();
```

Description

This is GetFailurePage, a member of class TActionLink.

10.1.1.3.4 TActionLink.GetSuccessPage Method

Pascal

```
function GetSuccessPage: string;
```

C++

```
__fastcall AnsiString GetSuccessPage();
```

Description

This is GetSuccessPage, a member of class TActionLink.

10.1.2 TAdapterActionArrayStub Class

Class Hierarchy

Pascal

```
TAdapterActionArrayStub = class(TScriptObject, IAdapterActionArrayStub);
```

C++

```
class TAdapterActionArrayStub : public TScriptObject, public IAdapterActionArrayStub;
```

File

AutoAdap

Description

This is class AutoAdap.TAdapterActionArrayStub.

10.1.2.1 TAdapterActionArrayStub Members

The following tables list the members exposed by TAdapterActionArrayStub.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1378)	This is Create, a member of class TAdapterActionArrayStub.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Action (see page 1378)	This is Action, a member of class TAdapterActionArrayStub.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

10.1.2.2 TAdapterActionArrayStub.Create Constructor

Pascal

```
constructor Create(AAction: IInterfaceComponentReference);
```

C++

```
__fastcall TAdapterActionArrayStub(IInterfaceComponentReference AAction);
```

Description

This is Create, a member of class TAdapterActionArrayStub.

10.1.2.3 TAdapterActionArrayStub Properties

The properties of the TAdapterActionArrayStub class are listed here.

Public Properties

	Name	Description
R	Action (see page 1378)	This is Action, a member of class TAdapterActionArrayStub.

10.1.2.3.1 TAdapterActionArrayStub.Action Property

Pascal

```
property Action: IInterfaceComponentReference;
```

C++

```
__property IInterfaceComponentReference Action;
```

Description

This is Action, a member of class TAdapterActionArrayStub.

10.1.3 TAdapterActionStub Class

Class Hierarchy

Pascal

```
TAdapterActionStub = class(TAdapterSubComponentStub, IAdapterActionStub);
```

C++

```
class TAdapterActionStub : public TAdapterSubComponentStub, public IAdapterActionStub;
```

File

AutoAdap

Description

This is class AutoAdap.TAdapterActionStub.

10.1.3.1 TAdapterActionStub Members

The following tables list the members exposed by TAdapterActionStub.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
A	CreateActionArrayStub (see page 1381)	This is CreateActionArrayStub, a member of class TAdapterActionStub.
A	CreateActionStub (see page 1381)	This is CreateActionStub, a member of class TAdapterActionStub.
	Get_Array_ (see page 1381)	This is Get_Array_, a member of class TAdapterActionStub.
	Get_AsFieldValue (see page 1382)	This is Get_AsFieldValue, a member of class TAdapterActionStub.
	Get_AsHREF (see page 1382)	This is Get_AsHREF, a member of class TAdapterActionStub.
	Get_CanExecute (see page 1382)	This is Get_CanExecute, a member of class TAdapterActionStub.
	Get_DisplayLabel (see page 1382)	This is Get_DisplayLabel, a member of class TAdapterActionStub.
	Get_DisplayStyle (see page 1382)	This is Get_DisplayStyle, a member of class TAdapterActionStub.
	Get_Enabled (see page 1383)	This is Get_Enabled, a member of class TAdapterActionStub.
	Get_Name (see page 1418)	This is Get_Name, a member of class TAdapterSubComponentStub.
	Get_Visible (see page 1383)	This is Get_Visible, a member of class TAdapterActionStub.
	GetComponent (see page 1418)	Returns a reference to the component associated by the implementing class.
	LinkToPage (see page 1383)	This is LinkToPage, a member of class TAdapterActionStub.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 1417)	This is the overview for the Create constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ObjectIntf (see page 1419)	This is ObjectIntf, a member of class TAdapterSubComponentStub.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

10.1.3.2 TAdapterActionStub Methods

The methods of the TAdapterActionStub class are listed here.

Protected Methods

	Name	Description
	CreateActionArrayStub (see page 1381)	This is CreateActionArrayStub, a member of class TAdapterActionStub.
	CreateActionStub (see page 1381)	This is CreateActionStub, a member of class TAdapterActionStub.
	Get_Array_ (see page 1381)	This is Get_Array_, a member of class TAdapterActionStub.
	Get_AsFieldValue (see page 1382)	This is Get_AsFieldValue, a member of class TAdapterActionStub.
	Get_AsHREF (see page 1382)	This is Get_AsHREF, a member of class TAdapterActionStub.
	Get_CanExecute (see page 1382)	This is Get_CanExecute, a member of class TAdapterActionStub.
	Get_DisplayLabel (see page 1382)	This is Get_DisplayLabel, a member of class TAdapterActionStub.
	Get_DisplayStyle (see page 1382)	This is Get_DisplayStyle, a member of class TAdapterActionStub.
	Get_Enabled (see page 1383)	This is Get_Enabled, a member of class TAdapterActionStub.
	Get_Visible (see page 1383)	This is Get_Visible, a member of class TAdapterActionStub.
	LinkToPage (see page 1383)	This is LinkToPage, a member of class TAdapterActionStub.

10.1.3.2.1 TAdapterActionStub.CreateActionArrayStub Method

Pascal

```
function CreateActionArrayStub(O: IInterfaceComponentReference): IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateActionArrayStub(IInterfaceComponentReference O) = 0;
```

Description

This is CreateActionArrayStub, a member of class TAdapterActionStub.

10.1.3.2.2 TAdapterActionStub.CreateActionStub Method

Pascal

```
function CreateActionStub(O: IInterfaceComponentReference): IInterface; virtual; abstract;
overload;
```

C++

```
virtual __fastcall IInterface CreateActionStub(IInterfaceComponentReference O) = 0;
```

Description

This is CreateActionStub, a member of class TAdapterActionStub.

10.1.3.2.3 TAdapterActionStub.Get_Array_ Method

Pascal

```
function Get_Array_: IInterface;
```

C++

```
__fastcall IInterface Get_Array_();
```

Description

This is Get_Array_, a member of class TAdapterActionStub.

10.1.3.2.4 TAdapterActionStub.Get_AsFieldValue Method

Pascal

```
function Get_AsFieldValue: string;
```

C++

```
__fastcall AnsiString Get_AsFieldValue();
```

Description

This is Get_AsFieldValue, a member of class TAdapterActionStub.

10.1.3.2.5 TAdapterActionStub.Get_AsHREF Method

Pascal

```
function Get_AsHREF: string;
```

C++

```
__fastcall AnsiString Get_AsHREF();
```

Description

This is Get_AsHREF, a member of class TAdapterActionStub.

10.1.3.2.6 TAdapterActionStub.Get_CanExecute Method

Pascal

```
function Get_CanExecute: Boolean;
```

C++

```
__fastcall Boolean Get_CanExecute();
```

Description

This is Get_CanExecute, a member of class TAdapterActionStub.

10.1.3.2.7 TAdapterActionStub.Get_DisplayLabel Method

Pascal

```
function Get_DisplayLabel: string;
```

C++

```
__fastcall AnsiString Get_DisplayLabel();
```

Description

This is Get_DisplayLabel, a member of class TAdapterActionStub.

10.1.3.2.8 TAdapterActionStub.Get_DisplayStyle Method

Pascal

```
function Get_DisplayStyle: string;
```

C++

```
__fastcall AnsiString Get_DisplayStyle();
```

Description

This is Get_DisplayStyle, a member of class TAdapterActionStub.

10.1.3.2.9 TAdapterActionStub.Get_Enabled Method

Pascal

```
function Get_Enabled: Boolean;
```

C++

```
__fastcall Boolean Get_Enabled();
```

Description

This is Get_Enabled, a member of class TAdapterActionStub.

10.1.3.2.10 TAdapterActionStub.Get_Visible Method

Pascal

```
function Get_Visible: Boolean;
```

C++

```
__fastcall Boolean Get_Visible();
```

Description

This is Get_Visible, a member of class TAdapterActionStub.

10.1.3.2.11 TAdapterActionStub.LinkToPage Method

Pascal

```
function LinkToPage(const PageSuccess: string; const PageFail: string): IInterface;
```

C++

```
__fastcall IInterface LinkToPage(const AnsiString PageSuccess, const AnsiString PageFail);
```

Description

This is LinkToPage, a member of class TAdapterActionStub.

10.1.4 TAdapterComponentsStub Class

Class Hierarchy

Pascal

```
TAdapterComponentsStub = class(TWebComponentsStub, IComponentsStub);
```

C++

```
class TAdapterComponentsStub : public TWebComponentsStub, public IComponentsStub;
```

File

AutoAdap

Description

This is class AutoAdap.TAdapterComponentsStub.

10.1.4.1 TAdapterComponentsStub Members

The following tables list the members exposed by TAdapterComponentsStub.

Protected Methods

	Name	Description
	FindObject (see page 1384)	This is FindObject, a member of class TAdapterComponentsStub.

10.1.4.2 TAdapterComponentsStub Methods

The methods of the TAdapterComponentsStub class are listed here.

Protected Methods

	Name	Description
	FindObject (see page 1384)	This is FindObject, a member of class TAdapterComponentsStub.

10.1.4.2.1 TAdapterComponentsStub.FindObject Method

Pascal

```
function FindObject(const AName: string): TObject; override;
```

C++

```
virtual __fastcall TObject * FindObject(const AnsiString AName);
```

Description

This is FindObject, a member of class TAdapterComponentsStub.

10.1.5 TAdapterErrorsStub Class

Class Hierarchy

Pascal

```
TAdapterErrorsStub = class(TScriptObject, IAdapterErrorsStub);
```

C++

```
class TAdapterErrorsStub : public TScriptObject, public IAdapterErrorsStub;
```

File

AutoAdap

Description

This is class AutoAdap.TAdapterErrorsStub.

10.1.5.1 TAdapterErrorsStub Members

The following tables list the members exposed by TAdapterErrorsStub.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
A	CreateErrorsStub (see page 1386)	This is CreateErrorsStub, a member of class TAdapterErrorsStub.
	DefineLabel (see page 1387)	This is DefineLabel, a member of class TAdapterErrorsStub.
	FieldErrors (see page 1387)	This is FieldErrors, a member of class TAdapterErrorsStub.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1386)	This is Create, a member of class TAdapterErrorsStub.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Errors (see page 1387)	This is Errors, a member of class TAdapterErrorsStub.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

10.1.5.2 TAdapterErrorsStub.Create Constructor

Pascal

```
constructor Create(AErrors: TObject);
```

C++

```
__fastcall TAdapterErrorsStub(TObject * AErrors);
```

Description

This is Create, a member of class TAdapterErrorsStub.

10.1.5.3 TAdapterErrorsStub Methods

The methods of the TAdapterErrorsStub class are listed here.

Protected Methods

	Name	Description
A	CreateErrorsStub (see page 1386)	This is CreateErrorsStub, a member of class TAdapterErrorsStub.
	DefineLabel (see page 1387)	This is DefineLabel, a member of class TAdapterErrorsStub.
	FieldErrors (see page 1387)	This is FieldErrors, a member of class TAdapterErrorsStub.

10.1.5.3.1 TAdapterErrorsStub.CreateErrorsStub Method

Pascal

```
function CreateErrorsStub(O: TObject): IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateErrorsStub(TObject * O) = 0;
```

Description

This is CreateErrorsStub, a member of class TAdapterErrorsStub.

10.1.5.3.2 TAdapterErrorsStub.DefineLabel Method

Pascal

```
procedure DefineLabel(const Object_: IUnknown; const Value: string);
```

C++

```
__fastcall DefineLabel(const IUnknown Object_, const AnsiString Value);
```

Description

This is DefineLabel, a member of class TAdapterErrorsStub.

10.1.5.3.3 TAdapterErrorsStub.FieldErrors Method

Pascal

```
function FieldErrors(const Object_: IUnknown): IInterface;
```

C++

```
__fastcall IInterface FieldErrors(const IUnknown Object_);
```

Description

This is FieldErrors, a member of class TAdapterErrorsStub.

10.1.5.4 TAdapterErrorsStub Properties

The properties of the TAdapterErrorsStub class are listed here.

Public Properties

	Name	Description
	Errors (see page 1387)	This is Errors, a member of class TAdapterErrorsStub.

10.1.5.4.1 TAdapterErrorsStub.Errors Property

Pascal

```
property Errors: TObject;
```

C++

```
__property TObject * Errors;
```

Description

This is Errors, a member of class TAdapterErrorsStub.

10.1.6 TAdapterErrorStub Class

Class Hierarchy

Pascal

```
TAdapterErrorStub = class(TScriptObject, IAdapterErrorStub);
```

C++

```
class TAdapterErrorStub : public TScriptObject, public IAdapterErrorStub;
```

File

AutoAdap

Description

This is class AutoAdap.TAdapterErrorStub.

10.1.6.1 TAdapterErrorStub Members

The following tables list the members exposed by TAdapterErrorStub.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	Get_Field (see page 1389)	This is Get_Field, a member of class TAdapterErrorStub.
	Get_ID (see page 1390)	This is Get_ID, a member of class TAdapterErrorStub.
	Get_Message (see page 1390)	This is Get_Message, a member of class TAdapterErrorStub.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1389)	This is Create, a member of class TAdapterErrorStub.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Field (see page 1437)	This is Field, a member of class IAdapterErrorStub.
R	ID (see page 1437)	This is ID, a member of class IAdapterErrorStub.
R	Message (see page 1437)	This is Message, a member of class IAdapterErrorStub.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

10.1.6.2 TAdapterErrorStub.Create Constructor

Pascal

```
constructor Create(const AError: IAdapterError);
```

C++

```
__fastcall TAdapterErrorStub(const IAdapterError AError);
```

Description

This is Create, a member of class TAdapterErrorStub.

10.1.6.3 TAdapterErrorStub Methods

The methods of the TAdapterErrorStub class are listed here.

Protected Methods

	Name	Description
	Get_Field (see page 1389)	This is Get_Field, a member of class TAdapterErrorStub.
	Get_ID (see page 1390)	This is Get_ID, a member of class TAdapterErrorStub.
	Get_Message (see page 1390)	This is Get_Message, a member of class TAdapterErrorStub.

10.1.6.3.1 TAdapterErrorStub.Get_Field Method

Pascal

```
function Get_Field: IInterface;
```

C++

```
__fastcall IInterface Get_Field();
```

Description

This is Get_Field, a member of class TAdapterErrorStub.

10.1.6.3.2 TAdapterErrorStub.Get_ID Method

Pascal

```
function Get_ID: Integer;
```

C++

```
__fastcall int Get_ID();
```

Description

This is Get_ID, a member of class TAdapterErrorStub.

10.1.6.3.3 TAdapterErrorStub.Get_Message Method

Pascal

```
function Get_Message: string;
```

C++

```
__fastcall AnsiString Get_Message();
```

Description

This is Get_Message, a member of class TAdapterErrorStub.

10.1.7 TAdapterFieldStub Class

Class Hierarchy

Pascal

```
TAdapterFieldStub = class(TAdapterSubComponentStub, IAdapterFieldStub);
```

C++

```
class TAdapterFieldStub : public TAdapterSubComponentStub, public IAdapterFieldStub;
```

File

AutoAdap

Description

This is class AutoAdap.TAdapterFieldStub.

10.1.7.1 TAdapterFieldStub Members

The following tables list the members exposed by TAdapterFieldStub.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
A	CreateFieldValuesStub (see page 1393)	This is CreateFieldValuesStub, a member of class TAdapterFieldStub.
A	CreateImageStub (see page 1393)	This is CreateImageStub, a member of class TAdapterFieldStub.
A	CreateValuesListStub (see page 1394)	This is CreateValuesListStub, a member of class TAdapterFieldStub.
	Get_CanModify (see page 1394)	This is Get_CanModify, a member of class TAdapterFieldStub.
	Get_CanView (see page 1394)	This is Get_CanView, a member of class TAdapterFieldStub.
	Get_DisplayLabel (see page 1394)	This is Get_DisplayLabel, a member of class TAdapterFieldStub.
	Get_DisplayStyle (see page 1394)	This is Get_DisplayStyle, a member of class TAdapterFieldStub.
	Get_DisplayText (see page 1395)	This is Get_DisplayText, a member of class TAdapterFieldStub.
	Get_DisplayWidth (see page 1395)	This is Get_DisplayWidth, a member of class TAdapterFieldStub.
	Get_EditText (see page 1395)	This is Get_EditText, a member of class TAdapterFieldStub.
	Get_Image (see page 1395)	This is Get_Image, a member of class TAdapterFieldStub.
	Get_InputName (see page 1396)	This is Get_InputName, a member of class TAdapterFieldStub.
	Get_InputStyle (see page 1396)	This is Get_InputStyle, a member of class TAdapterFieldStub.
	Get_MaxLength (see page 1396)	This is Get_MaxLength, a member of class TAdapterFieldStub.
	Get_Name (see page 1418)	This is Get_Name, a member of class TAdapterSubComponentStub.
	Get_Required (see page 1396)	This is Get_Required, a member of class TAdapterFieldStub.
	Get_Value (see page 1396)	This is Get_Value, a member of class TAdapterFieldStub.
	Get_Values (see page 1397)	This is Get_Values, a member of class TAdapterFieldStub.
	Get_ValuesList (see page 1397)	This is Get_ValuesList, a member of class TAdapterFieldStub.
	Get_ViewMode (see page 1397)	This is Get_ViewMode, a member of class TAdapterFieldStub.
	Get_Visible (see page 1397)	This is Get_Visible, a member of class TAdapterFieldStub.
	GetComponent (see page 1418)	Returns a reference to the component associated by the implementing class.
	IsEqual (see page 1398)	This is IsEqual, a member of class TAdapterFieldStub.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 1417)	This is the overview for the Create constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	Get_Name (see page 1442)	This is Get_Name, a member of class IAdapterFieldStub.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	CanModify (see page 1444)	This is CanModify, a member of class IAdapterFieldStub.
R	CanView (see page 1444)	This is CanView, a member of class IAdapterFieldStub.
R	DisplayLabel (see page 1445)	This is DisplayLabel, a member of class IAdapterFieldStub.
R	DisplayStyle (see page 1445)	This is DisplayStyle, a member of class IAdapterFieldStub.
R	DisplayText (see page 1445)	This is DisplayText, a member of class IAdapterFieldStub.
R	DisplayWidth (see page 1445)	This is DisplayWidth, a member of class IAdapterFieldStub.
R	EditText (see page 1445)	This is EditText, a member of class IAdapterFieldStub.
R	Image (see page 1446)	This is Image, a member of class IAdapterFieldStub.
R	InputName (see page 1446)	This is InputName, a member of class IAdapterFieldStub.
R	InputStyle (see page 1446)	This is InputStyle, a member of class IAdapterFieldStub.
R	MaxLength (see page 1446)	This is MaxLength, a member of class IAdapterFieldStub.
R	Name (see page 1447)	This is Name, a member of class IAdapterFieldStub.
R	ObjectIntf (see page 1419)	This is ObjectIntf, a member of class TAdapterSubComponentStub.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	Required (see page 1447)	This is Required, a member of class IAdapterFieldStub.
R	Value (see page 1447)	This is Value, a member of class IAdapterFieldStub.
R	Values (see page 1447)	This is Values, a member of class IAdapterFieldStub.
R	ValuesList (see page 1447)	This is ValuesList, a member of class IAdapterFieldStub.
R	ViewMode (see page 1448)	This is ViewMode, a member of class IAdapterFieldStub.
R	Visible (see page 1448)	This is Visible, a member of class IAdapterFieldStub.

10.1.7.2 TAdapterFieldStub Methods

The methods of the TAdapterFieldStub class are listed here.

Protected Methods

	Name	Description
	CreateFieldValuesStub (see page 1393)	This is CreateFieldValuesStub, a member of class TAdapterFieldStub.
	CreateImageStub (see page 1393)	This is CreateImageStub, a member of class TAdapterFieldStub.
	CreateValuesListStub (see page 1394)	This is CreateValuesListStub, a member of class TAdapterFieldStub.
	Get_CanModify (see page 1394)	This is Get_CanModify, a member of class TAdapterFieldStub.
	Get_CanView (see page 1394)	This is Get_CanView, a member of class TAdapterFieldStub.
	Get_DisplayLabel (see page 1394)	This is Get_DisplayLabel, a member of class TAdapterFieldStub.
	Get_DisplayStyle (see page 1394)	This is Get_DisplayStyle, a member of class TAdapterFieldStub.
	Get_DisplayText (see page 1395)	This is Get_DisplayText, a member of class TAdapterFieldStub.
	Get_DisplayWidth (see page 1395)	This is Get_DisplayWidth, a member of class TAdapterFieldStub.
	Get_EditText (see page 1395)	This is Get_EditText, a member of class TAdapterFieldStub.
	Get_Image (see page 1395)	This is Get_Image, a member of class TAdapterFieldStub.
	Get_InputName (see page 1396)	This is Get_InputName, a member of class TAdapterFieldStub.
	Get_InputStyle (see page 1396)	This is Get_InputStyle, a member of class TAdapterFieldStub.
	Get_MaxLength (see page 1396)	This is Get_MaxLength, a member of class TAdapterFieldStub.
	Get_Required (see page 1396)	This is Get_Required, a member of class TAdapterFieldStub.
	Get_Value (see page 1396)	This is Get_Value, a member of class TAdapterFieldStub.
	Get_Values (see page 1397)	This is Get_Values, a member of class TAdapterFieldStub.
	Get_ValuesList (see page 1397)	This is Get_ValuesList, a member of class TAdapterFieldStub.
	Get_ViewMode (see page 1397)	This is Get_ViewMode, a member of class TAdapterFieldStub.
	Get_Visible (see page 1397)	This is Get_Visible, a member of class TAdapterFieldStub.
	IsEqual (see page 1398)	This is IsEqual, a member of class TAdapterFieldStub.

10.1.7.2.1 TAdapterFieldStub.CreateFieldValuesStub Method

Pascal

```
function CreateFieldValuesStub(O: TComponent): IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateFieldValuesStub(TComponent * O) = 0;
```

Description

This is CreateFieldValuesStub, a member of class TAdapterFieldStub.

10.1.7.2.2 TAdapterFieldStub.CreateImageStub Method

Pascal

```
function CreateImageStub(AdapterImage: IInterface): IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateImageStub(IInterface AdapterImage) = 0;
```

Description

This is CreateImageStub, a member of class TAdapterFieldStub.

10.1.7.2.3 TAdapterFieldStub.CreateValuesListStub Method

Pascal

```
function CreateValuesListStub(O: TComponent): IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateValuesListStub(TComponent * O) = 0;
```

Description

This is CreateValuesListStub, a member of class TAdapterFieldStub.

10.1.7.2.4 TAdapterFieldStub.Get_CanModify Method

Pascal

```
function Get_CanModify: Boolean;
```

C++

```
__fastcall Boolean Get_CanModify();
```

Description

This is Get_CanModify, a member of class TAdapterFieldStub.

10.1.7.2.5 TAdapterFieldStub.Get_CanView Method

Pascal

```
function Get_CanView: Boolean;
```

C++

```
__fastcall Boolean Get_CanView();
```

Description

This is Get_CanView, a member of class TAdapterFieldStub.

10.1.7.2.6 TAdapterFieldStub.Get_DisplayLabel Method

Pascal

```
function Get_DisplayLabel: string;
```

C++

```
__fastcall AnsiString Get_DisplayLabel();
```

Description

This is Get_DisplayLabel, a member of class TAdapterFieldStub.

10.1.7.2.7 TAdapterFieldStub.Get_DisplayStyle Method

Pascal

```
function Get_DisplayStyle: string;
```

C++

```
__fastcall AnsiString Get_DisplayStyle();
```

Description

This is Get_DisplayStyle, a member of class TAdapterFieldStub.

10.1.7.2.8 TAdapterFieldStub.Get_DisplayText Method

Pascal

```
function Get_DisplayText: string;
```

C++

```
__fastcall AnsiString Get_DisplayText();
```

Description

This is Get_DisplayText, a member of class TAdapterFieldStub.

10.1.7.2.9 TAdapterFieldStub.Get_DisplayWidth Method

Pascal

```
function Get_DisplayWidth: Integer;
```

C++

```
__fastcall int Get_DisplayWidth();
```

Description

This is Get_DisplayWidth, a member of class TAdapterFieldStub.

10.1.7.2.10 TAdapterFieldStub.Get_EditText Method

Pascal

```
function Get_EditText: string;
```

C++

```
__fastcall AnsiString Get_EditText();
```

Description

This is Get_EditText, a member of class TAdapterFieldStub.

10.1.7.2.11 TAdapterFieldStub.Get_Image Method

Pascal

```
function Get_Image: IInterface;
```

C++

```
__fastcall IInterface Get_Image();
```

Description

This is Get_Image, a member of class TAdapterFieldStub.

10.1.7.2.12 TAdapterFieldStub.Get_InputName Method

Pascal

```
function Get_InputName: string;
```

C++

```
__fastcall AnsiString Get_InputName();
```

Description

This is Get_InputName, a member of class TAdapterFieldStub.

10.1.7.2.13 TAdapterFieldStub.Get_InputStyle Method

Pascal

```
function Get_InputStyle: string;
```

C++

```
__fastcall AnsiString Get_InputStyle();
```

Description

This is Get_InputStyle, a member of class TAdapterFieldStub.

10.1.7.2.14 TAdapterFieldStub.Get_MaxLength Method

Pascal

```
function Get_MaxLength: Integer;
```

C++

```
__fastcall int Get_MaxLength();
```

Description

This is Get_MaxLength, a member of class TAdapterFieldStub.

10.1.7.2.15 TAdapterFieldStub.Get_Required Method

Pascal

```
function Get_Required: Boolean;
```

C++

```
__fastcall Boolean Get_Required();
```

Description

This is Get_Required, a member of class TAdapterFieldStub.

10.1.7.2.16 TAdapterFieldStub.Get_Value Method

Pascal

```
function Get_Value: Variant;
```

C++

```
__fastcall Variant Get_Value();
```

Description

This is Get_Value, a member of class TAdapterFieldStub.

10.1.7.2.17 TAdapterFieldStub.Get_Values Method

Pascal

```
function Get_Values: IInterface;
```

C++

```
__fastcall IInterface Get_Values();
```

Description

This is Get_Values, a member of class TAdapterFieldStub.

10.1.7.2.18 TAdapterFieldStub.Get_ValuesList Method

Pascal

```
function Get_ValuesList: IInterface;
```

C++

```
__fastcall IInterface Get_ValuesList();
```

Description

This is Get_ValuesList, a member of class TAdapterFieldStub.

10.1.7.2.19 TAdapterFieldStub.Get_ViewMode Method

Pascal

```
function Get_ViewMode: string;
```

C++

```
__fastcall AnsiString Get_ViewMode();
```

Description

This is Get_ViewMode, a member of class TAdapterFieldStub.

10.1.7.2.20 TAdapterFieldStub.Get_Visible Method

Pascal

```
function Get_Visible: Boolean;
```

C++

```
__fastcall Boolean Get_Visible();
```

Description

This is Get_Visible, a member of class TAdapterFieldStub.

10.1.7.2.21 TAdapterFieldStub.IsEqual Method

Pascal

```
function IsEqual(Value: Variant): Boolean;
```

C++

```
__fastcall Boolean IsEqual(Variant Value);
```

Description

This is IsEqual, a member of class TAdapterFieldStub.

10.1.8 TAdapterFieldValuesStub Class

Class Hierarchy

Pascal

```
TAdapterFieldValuesStub = class(TBaseRecordsAdapterStub, IAdapterFieldValuesStub);
```

C++

```
class TAdapterFieldValuesStub : public TBaseRecordsAdapterStub, public IAdapterFieldValuesStub;
```

File

AutoAdap

Description

This is class AutoAdap.TAdapterFieldValuesStub.

10.1.8.1 TAdapterFieldValuesStub Members

The following tables list the members exposed by TAdapterFieldValuesStub.

Protected Fields

	Name	Description
	FActions (see page 1423)	This is FActions, a member of class TBaseAdapterStub.
	FFields (see page 1424)	This is FFields, a member of class TBaseAdapterStub.

Protected Methods

	Name	Description
	CreateComponentsStub (see page 1424)	This is CreateComponentsStub, a member of class TBaseAdapterStub.
	CreateRecordsStub (see page 1427)	This is CreateRecordsStub, a member of class TBaseRecordsAdapterStub.
	FindObject (see page 1399)	This is FindObject, a member of class TAdapterFieldValuesStub.
	Get_Actions (see page 1424)	This is Get_Actions, a member of class TBaseAdapterStub.
	Get_ClassName_ (see page 1425)	This is Get_ClassName_, a member of class TBaseAdapterStub.
	Get_Fields (see page 1425)	This is Get_Fields, a member of class TBaseAdapterStub.
	Get_Name_ (see page 1425)	This is Get_Name_, a member of class TBaseAdapterStub.

	Get_Records (see page 1399)	This is Get_Records, a member of class TAdapterFieldValuesStub.
	Get_Value (see page 1400)	This is Get_Value, a member of class TAdapterFieldValuesStub.
	HasValue (see page 1400)	This is HasValue, a member of class TAdapterFieldValuesStub.

Public Methods

	Name	Description
	Get_Actions (see page 1467)	This is Get_Actions, a member of class IBaseAdapterStub.
	Get_ClassName_ (see page 1467)	This is Get_ClassName_, a member of class IBaseAdapterStub.
	Get_Fields (see page 1467)	This is Get_Fields, a member of class IBaseAdapterStub.
	Get_Name_ (see page 1467)	This is Get_Name_, a member of class IBaseAdapterStub.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.
R	Records (see page 1469)	This is Records, a member of class IBaseRecordsAdapterStub.
R	Value (see page 1450)	This is Value, a member of class IAdapterFieldValuesStub.

10.1.8.2 TAdapterFieldValuesStub Methods

The methods of the TAdapterFieldValuesStub class are listed here.

Protected Methods

	Name	Description
V	FindObject (see page 1399)	This is FindObject, a member of class TAdapterFieldValuesStub.
	Get_Records (see page 1399)	This is Get_Records, a member of class TAdapterFieldValuesStub.
	Get_Value (see page 1400)	This is Get_Value, a member of class TAdapterFieldValuesStub.
	HasValue (see page 1400)	This is HasValue, a member of class TAdapterFieldValuesStub.

10.1.8.2.1 TAdapterFieldValuesStub.FindObject Method

Pascal

```
function FindObject(const AName: string): TObject; override;
```

C++

```
virtual __fastcall TObject * FindObject(const AnsiString AName);
```

Description

This is FindObject, a member of class TAdapterFieldValuesStub.

10.1.8.2.2 TAdapterFieldValuesStub.Get_Records Method

Pascal

```
function Get_Records: IInterface;
```

C++

```
__fastcall IInterface Get_Records();
```

Description

This is Get_Records, a member of class TAdapterFieldValuesStub.

10.1.8.2.3 TAdapterFieldValuesStub.Get_Value Method

Pascal

```
function Get_Value: Variant;
```

C++

```
__fastcall Variant Get_Value();
```

Description

This is Get_Value, a member of class TAdapterFieldValuesStub.

10.1.8.2.4 TAdapterFieldValuesStub.HasValue Method

Pascal

```
function HasValue(Value: Variant): Boolean;
```

C++

```
__fastcall Boolean HasValue(Variant Value);
```

Description

This is HasValue, a member of class TAdapterFieldValuesStub.

10.1.9 TAdapterHiddenFieldsStub Class

Class Hierarchy

Pascal

```
TAdapterHiddenFieldsStub = class(TScriptObject, IAdapterHiddenFieldsStub);
```

C++

```
class TAdapterHiddenFieldsStub : public TScriptObject, public IAdapterHiddenFieldsStub;
```

File

AutoAdap

Description

This is class AutoAdap.TAdapterHiddenFieldsStub.

10.1.9.1 TAdapterHiddenFieldsStub Members

The following tables list the members exposed by TAdapterHiddenFieldsStub.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	WriteFields (see page 1402)	This is WriteFields, a member of class TAdapterHiddenFieldsStub.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1402)	This is Create, a member of class TAdapterHiddenFieldsStub.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	HiddenFields (see page 1402)	This is HiddenFields, a member of class TAdapterHiddenFieldsStub.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

10.1.9.2 TAdapterHiddenFieldsStub.Create Constructor

Pascal

```
constructor Create(AHiddenFields: TObject);
```

C++

```
__fastcall TAdapterHiddenFieldsStub(TObject * AHiddenFields);
```

Description

This is Create, a member of class TAdapterHiddenFieldsStub.

10.1.9.3 TAdapterHiddenFieldsStub Methods

The methods of the TAdapterHiddenFieldsStub class are listed here.

Protected Methods

	Name	Description
	WriteFields (see page 1402)	This is WriteFields, a member of class TAdapterHiddenFieldsStub.

10.1.9.3.1 TAdapterHiddenFieldsStub.WriteFields Method

Pascal

```
procedure WriteFields(const Response: IInterface);
```

C++

```
__fastcall WriteFields(const IInterface Response);
```

Description

This is WriteFields, a member of class TAdapterHiddenFieldsStub.

10.1.9.4 TAdapterHiddenFieldsStub Properties

The properties of the TAdapterHiddenFieldsStub class are listed here.

Public Properties

	Name	Description
R	HiddenFields (see page 1402)	This is HiddenFields, a member of class TAdapterHiddenFieldsStub.

10.1.9.4.1 TAdapterHiddenFieldsStub.HiddenFields Property

Pascal

```
property HiddenFields: TObject;
```

C++

```
__property TObject * HiddenFields;
```

Description

This is HiddenFields, a member of class TAdapterHiddenFieldsStub.

10.1.10 TAdapterHiddenFieldStub Class

Class Hierarchy

Pascal

```
TAdapterHiddenFieldStub = class(TScriptObject, IAdapterHiddenFieldStub);
```

C++

```
class TAdapterHiddenFieldStub : public TScriptObject, public IAdapterHiddenFieldStub;
```

File

AutoAdap

Description

This is class AutoAdap.TAdapterHiddenFieldStub.

10.1.10.1 TAdapterHiddenFieldStub Members

The following tables list the members exposed by TAdapterHiddenFieldStub.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	Get_Name (see page 1405)	This is Get_Name, a member of class TAdapterHiddenFieldStub.
	Get_Value (see page 1405)	This is Get_Value, a member of class TAdapterHiddenFieldStub.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.

	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1404)	This is Create, a member of class TAdapterHiddenFieldStub.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Name (see page 1452)	This is Name, a member of class IAdapterHiddenFieldStub.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	Value (see page 1453)	This is Value, a member of class IAdapterHiddenFieldStub.

10.1.10.2 TAdapterHiddenFieldStub.Create Constructor

Pascal

```
constructor Create(const AParam: IAdapterHiddenField);
```

C++

```
__fastcall TAdapterHiddenFieldStub(const IAdapterHiddenField AParam);
```

Description

This is Create, a member of class TAdapterHiddenFieldStub.

10.1.10.3 TAdapterHiddenFieldStub Methods

The methods of the TAdapterHiddenFieldStub class are listed here.

Protected Methods

	Name	Description
	Get_Name (see page 1405)	This is Get_Name, a member of class TAdapterHiddenFieldStub.
	Get_Value (see page 1405)	This is Get_Value, a member of class TAdapterHiddenFieldStub.

10.1.10.3.1 TAdapterHiddenFieldStub.Get_Name Method

Pascal

```
function Get_Name: string;
```

C++

```
__fastcall AnsiString Get_Name();
```

Description

This is Get_Name, a member of class TAdapterHiddenFieldStub.

10.1.10.3.2 TAdapterHiddenFieldStub.Get_Value Method

Pascal

```
function Get_Value: string;
```

C++

```
__fastcall AnsiString Get_Value();
```

Description

This is Get_Value, a member of class TAdapterHiddenFieldStub.

10.1.11 TAdapterImageStub Class

Class Hierarchy

Pascal

```
TAdapterImageStub = class(TScriptObject, IAdapterImageStub);
```

C++

```
class TAdapterImageStub : public TScriptObject, public IAdapterImageStub;
```

File

AutoAdap

Description

This is class AutoAdap.TAdapterImageStub.

10.1.11.1 TAdapterImageStub Members

The following tables list the members exposed by TAdapterImageStub.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	Get_AsHREF (see page 1407)	This is Get_AsHREF, a member of class TAdapterImageStub.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1407)	This is Create, a member of class TAdapterImageStub.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	AsHREF (see page 1454)	This is AsHREF, a member of class IAdapterImageStub.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

10.1.11.2 TAdapterImageStub.Create Constructor

Pascal

```
constructor Create(AIntf: IInterface);
```

C++

```
__fastcall TAdapterImageStub(IInterface AIntf);
```

Description

This is Create, a member of class TAdapterImageStub.

10.1.11.3 TAdapterImageStub Methods

The methods of the TAdapterImageStub class are listed here.

Protected Methods

	Name	Description
	Get_AsHREF (see page 1407)	This is Get_AsHREF, a member of class TAdapterImageStub.

10.1.11.3.1 TAdapterImageStub.Get_AsHREF Method

Pascal

```
function Get_AsHREF: string;
```

C++

```
__fastcall AnsiString Get_AsHREF();
```

Description

This is Get_AsHREF, a member of class TAdapterImageStub.

10.1.12 TAdapterRecordsStub Class

Class Hierarchy

Pascal

```
TAdapterRecordsStub = class(TScriptObject);
```

C++

```
class TAdapterRecordsStub : public TScriptObject;
```

File

AutoAdap

Description

This is class AutoAdap.TAdapterRecordsStub.

10.1.12.1 TAdapterRecordsStub Members

The following tables list the members exposed by TAdapterRecordsStub.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1409)	This is Create, a member of class TAdapterRecordsStub.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Adapter (see page 1409)	This is Adapter, a member of class TAdapterRecordsStub.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

10.1.12.2 TAdapterRecordsStub.Create Constructor

Pascal

```
constructor Create(AAdapter: TComponent);
```

C++

```
__fastcall TAdapterRecordsStub(TComponent * AAdapter);
```

Description

This is Create, a member of class TAdapterRecordsStub.

10.1.12.3 TAdapterRecordsStub Properties

The properties of the TAdapterRecordsStub class are listed here.

Public Properties

	Name	Description
R	Adapter (see page 1409)	This is Adapter, a member of class TAdapterRecordsStub.

10.1.12.3.1 TAdapterRecordsStub.Adapter Property

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

This is Adapter, a member of class TAdapterRecordsStub.

10.1.13 TAdapterRecordStub Class

Class Hierarchy

Pascal

```
TAdapterRecordStub = class(TScriptObject, IAdapterRecordStub);
```

C++

```
class TAdapterRecordStub : public TScriptObject, public IAdapterRecordStub;
```

File

AutoAdap

Description

This is class AutoAdap.TAdapterRecordStub.

10.1.13.1 TAdapterRecordStub Members

The following tables list the members exposed by TAdapterRecordStub.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1411)	This is Create, a member of class TAdapterRecordStub.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	Get_Actions (see page 1467)	This is Get_Actions, a member of class IBaseAdapterStub.
	Get_ClassName_ (see page 1467)	This is Get_ClassName_, a member of class IBaseAdapterStub.
	Get_Fields (see page 1467)	This is Get_Fields, a member of class IBaseAdapterStub.

	Get_Name_ (see page 1467)	This is Get_Name_, a member of class IBaseAdapterStub.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.
R	Impl (see page 1411)	This is Impl, a member of class TAdapterRecordStub.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

10.1.13.2 TAdapterRecordStub.Create Constructor

Pascal

```
constructor Create(AAdapter: TComponent; AAdapterStubClass: TAdapterStubClass);
```

C++

```
__fastcall TAdapterRecordStub(TComponent * AAdapter, TAdapterStubClass AAdapterStubClass);
```

Description

This is Create, a member of class TAdapterRecordStub.

10.1.13.3 TAdapterRecordStub Properties

The properties of the TAdapterRecordStub class are listed here.

Public Properties

	Name	Description
R	Impl (see page 1411)	This is Impl, a member of class TAdapterRecordStub.

10.1.13.3.1 TAdapterRecordStub.Impl Property

Pascal

```
property Impl: TBaseAdapterStub;
```

C++

```
__property TBaseAdapterStub Impl;
```

Description

This is Impl, a member of class TAdapterRecordStub.

10.1.14 TAdapterStub Class

Class Hierarchy

Pascal

```
TAdapterStub = class(TBaseRecordsAdapterStub, IAdapterStub);
```

C++

```
class TAdapterStub : public TBaseRecordsAdapterStub, public IAdapterStub;
```

File

AutoAdap

Description

This is class AutoAdap.TAdapterStub.

10.1.14.1 TAdapterStub Members

The following tables list the members exposed by TAdapterStub.

Protected Fields

	Name	Description
	FActions (see page 1423)	This is FActions, a member of class TBaseAdapterStub.
	FFields (see page 1424)	This is FFields, a member of class TBaseAdapterStub.

Protected Methods

	Name	Description
A	CreateComponentsStub (see page 1424)	This is CreateComponentsStub, a member of class TBaseAdapterStub.
A	CreateErrorsStub (see page 1413)	This is CreateErrorsStub, a member of class TAdapterStub.
A	CreateHiddenFieldsStub (see page 1414)	This is CreateHiddenFieldsStub, a member of class TAdapterStub.
A	CreateRecordsStub (see page 1427)	This is CreateRecordsStub, a member of class TBaseRecordsAdapterStub.
V	FindObject (see page 1414)	This is FindObject, a member of class TAdapterStub.
	Get_Actions (see page 1424)	This is Get_Actions, a member of class TBaseAdapterStub.
	Get_CanModify (see page 1414)	This is Get_CanModify, a member of class TAdapterStub.
	Get_CanView (see page 1414)	This is Get_CanView, a member of class TAdapterStub.
	Get_ClassName_ (see page 1425)	This is Get_ClassName_, a member of class TBaseAdapterStub.
	Get_Errors (see page 1414)	This is Get_Errors, a member of class TAdapterStub.
	Get_Fields (see page 1425)	This is Get_Fields, a member of class TBaseAdapterStub.
	Get_HiddenFields (see page 1415)	This is Get_HiddenFields, a member of class TAdapterStub.
	Get_HiddenRecordFields (see page 1415)	This is Get_HiddenRecordFields, a member of class TAdapterStub.
	Get_Mode (see page 1415)	This is Get_Mode, a member of class TAdapterStub.
	Get_Name_ (see page 1425)	This is Get_Name_, a member of class TBaseAdapterStub.
	Get_Records (see page 1427)	This is Get_Records, a member of class TBaseRecordsAdapterStub.
	Set_Mode (see page 1415)	This is Set_Mode, a member of class TAdapterStub.

Public Methods

	Name	Description
	Get_Actions (see page 1467)	This is Get_Actions, a member of class IBaseAdapterStub.
	Get_ClassName_ (see page 1467)	This is Get_ClassName_, a member of class IBaseAdapterStub.
	Get_Fields (see page 1467)	This is Get_Fields, a member of class IBaseAdapterStub.
	Get_Name_ (see page 1467)	This is Get_Name_, a member of class IBaseAdapterStub.
	Get_Records (see page 1469)	This is Get_Records, a member of class IBaseRecordsAdapterStub.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	CanModify (see page 1458)	This is CanModify, a member of class IAdapterStub.
R	CanView (see page 1458)	This is CanView, a member of class IAdapterStub.
R	Errors (see page 1458)	This is Errors, a member of class IAdapterStub.
R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.
R	HiddenFields (see page 1458)	This is HiddenFields, a member of class IAdapterStub.
R	HiddenRecordFields (see page 1459)	This is HiddenRecordFields, a member of class IAdapterStub.
	Mode (see page 1459)	This is Mode, a member of class IAdapterStub.
R	Records (see page 1469)	This is Records, a member of class IBaseRecordsAdapterStub.

10.1.14.2 TAdapterStub Methods

The methods of the TAdapterStub class are listed here.

Protected Methods

	Name	Description
A	CreateErrorsStub (see page 1413)	This is CreateErrorsStub, a member of class TAdapterStub.
A	CreateHiddenFieldsStub (see page 1414)	This is CreateHiddenFieldsStub, a member of class TAdapterStub.
V	FindObject (see page 1414)	This is FindObject, a member of class TAdapterStub.
	Get_CanModify (see page 1414)	This is Get_CanModify, a member of class TAdapterStub.
	Get_CanView (see page 1414)	This is Get_CanView, a member of class TAdapterStub.
	Get_Errors (see page 1414)	This is Get_Errors, a member of class TAdapterStub.
	Get_HiddenFields (see page 1415)	This is Get_HiddenFields, a member of class TAdapterStub.
	Get_HiddenRecordFields (see page 1415)	This is Get_HiddenRecordFields, a member of class TAdapterStub.
	Get_Mode (see page 1415)	This is Get_Mode, a member of class TAdapterStub.
	Set_Mode (see page 1415)	This is Set_Mode, a member of class TAdapterStub.

10.1.14.2.1 TAdapterStub.CreateErrorsStub Method

Pascal

```
function CreateErrorsStub(O: TObject): IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateErrorsStub(TObject * O) = 0;
```

Description

This is CreateErrorsStub, a member of class TAdapterStub.

10.1.14.2.2 TAdapterStub.CreateHiddenFieldsStub Method

Pascal

```
function CreateHiddenFieldsStub(O: TObject): IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateHiddenFieldsStub(TObject * O) = 0;
```

Description

This is CreateHiddenFieldsStub, a member of class TAdapterStub.

10.1.14.2.3 TAdapterStub.FindObject Method

Pascal

```
function FindObject(const AName: string): TObject; override;
```

C++

```
virtual __fastcall TObject * FindObject(const AnsiString AName);
```

Description

This is FindObject, a member of class TAdapterStub.

10.1.14.2.4 TAdapterStub.Get_CanModify Method

Pascal

```
function Get_CanModify: Boolean;
```

C++

```
__fastcall Boolean Get_CanModify();
```

Description

This is Get_CanModify, a member of class TAdapterStub.

10.1.14.2.5 TAdapterStub.Get_CanView Method

Pascal

```
function Get_CanView: Boolean;
```

C++

```
__fastcall Boolean Get_CanView();
```

Description

This is Get_CanView, a member of class TAdapterStub.

10.1.14.2.6 TAdapterStub.Get_Errors Method

Pascal

```
function Get_Errors: IInterface;
```

C++

```
__fastcall IInterface Get_Errors();
```

Description

This is Get_Errors, a member of class TAdapterStub.

10.1.14.2.7 TAdapterStub.Get_HiddenFields Method

Pascal

```
function Get_HiddenFields: IInterface;
```

C++

```
__fastcall IInterface Get_HiddenFields();
```

Description

This is Get_HiddenFields, a member of class TAdapterStub.

10.1.14.2.8 TAdapterStub.Get_HiddenRecordFields Method

Pascal

```
function Get_HiddenRecordFields: IInterface;
```

C++

```
__fastcall IInterface Get_HiddenRecordFields();
```

Description

This is Get_HiddenRecordFields, a member of class TAdapterStub.

10.1.14.2.9 TAdapterStub.Get_Mode Method

Pascal

```
function Get_Mode: string;
```

C++

```
__fastcall AnsiString Get_Mode();
```

Description

This is Get_Mode, a member of class TAdapterStub.

10.1.14.2.10 TAdapterStub.Set_Mode Method

Pascal

```
procedure Set_Mode(const Value: string);
```

C++

```
__fastcall Set_Mode(const AnsiString Value);
```

Description

This is Set_Mode, a member of class TAdapterStub.

10.1.15 TAdapterSubComponentStub Class

Class Hierarchy

Pascal

```
TAdapterSubComponentStub = class(TScriptObject, IInterfaceComponentReference);
```

C++

```
class TAdapterSubComponentStub : public TScriptObject, public IInterfaceComponentReference;
```

File

AutoAdap

Description

This is class AutoAdap.TAdapterSubComponentStub.

10.1.15.1 TAdapterSubComponentStub Members

The following tables list the members exposed by TAdapterSubComponentStub.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	Get_Name (see page 1418)	This is Get_Name, a member of class TAdapterSubComponentStub.
	GetComponent (see page 1418)	Returns a reference to the component associated by the implementing class.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.

	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1417)	This is the overview for the Create constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ObjectIntf (see page 1419)	This is ObjectIntf, a member of class TAdapterSubComponentStub.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

10.1.15.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TAdapterSubComponentStub.Create (IInterfaceComponentReference) (see page 1417)	This is Create, a member of class TAdapterSubComponentStub.
	TAdapterSubComponentStub.Create (TComponent) (see page 1418)	This is Create, a member of class TAdapterSubComponentStub.

10.1.15.2.1 TAdapterSubComponentStub.Create Constructor (IInterfaceComponentReference)

Pascal

```
constructor Create(AObject: IInterfaceComponentReference); overload;
```

C++

```
__fastcall TAdapterSubComponentStub(IInterfaceComponentReference AObject);
```

Description

This is Create, a member of class TAdapterSubComponentStub.

10.1.15.2.2 TAdapterSubComponentStub.Create Constructor (TComponent)

Pascal

```
constructor Create(AObject: TComponent); overload;
```

C++

```
__fastcall TAdapterSubComponentStub(TComponent * AObject);
```

Description

This is Create, a member of class TAdapterSubComponentStub.

10.1.15.3 TAdapterSubComponentStub Methods

The methods of the TAdapterSubComponentStub class are listed here.

Protected Methods

	Name	Description
	Get_Name (see page 1418)	This is Get_Name, a member of class TAdapterSubComponentStub.
	GetComponent (see page 1418)	Returns a reference to the component associated by the implementing class.

10.1.15.3.1 TAdapterSubComponentStub.Get_Name Method

Pascal

```
function Get_Name: Variant;
```

C++

```
__fastcall Variant Get_Name();
```

Description

This is Get_Name, a member of class TAdapterSubComponentStub.

10.1.15.3.2 TAdapterSubComponentStub.GetComponent Method

Returns a reference to the component associated by the implementing class.

Pascal

```
function GetComponent: TComponent;
```

C++

```
__fastcall TComponent * GetComponent();
```

Description

GetComponent returns a TComponent value that is associated with the implementing class. For example, the TComponent class itself implements the GetComponent to return a pointer to itself.

See Also

TComponent (see page 2762)

10.1.15.4 TAdapterSubComponentStub Properties

The properties of the TAdapterSubComponentStub class are listed here.

Public Properties

	Name	Description
R	ObjectIntf (see page 1419)	This is ObjectIntf, a member of class TAdapterSubComponentStub.

10.1.15.4.1 TAdapterSubComponentStub.ObjectIntf Property

Pascal

```
property ObjectIntf: IInterfaceComponentReference;
```

C++

```
__property IInterfaceComponentReference ObjectIntf;
```

Description

This is ObjectIntf, a member of class TAdapterSubComponentStub.

10.1.16 TAdapterValuesListStub Class

Class Hierarchy

Pascal

```
TAdapterValuesListStub = class(TBaseRecordsAdapterStub, IAdapterValuesListStub);
```

C++

```
class TAdapterValuesListStub : public TBaseRecordsAdapterStub, public IAdapterValuesListStub;
```

File

AutoAdap

Description

This is class AutoAdap.TAdapterValuesListStub.

10.1.16.1 TAdapterValuesListStub Members

The following tables list the members exposed by TAdapterValuesListStub.

Protected Fields

	Name	Description
	FActions (see page 1423)	This is FActions, a member of class TBaseAdapterStub.
	FFields (see page 1424)	This is FFields, a member of class TBaseAdapterStub.

Protected Methods

	Name	Description
A	CreateComponentsStub (see page 1424)	This is CreateComponentsStub, a member of class TBaseAdapterStub.
A	CreateImageStub (see page 1421)	This is CreateImageStub, a member of class TAdapterValuesListStub.
A	CreateRecordsStub (see page 1427)	This is CreateRecordsStub, a member of class TBaseRecordsAdapterStub.
V	FindObject (see page 1421)	This is FindObject, a member of class TAdapterValuesListStub.
	Get_Actions (see page 1424)	This is Get_Actions, a member of class TBaseAdapterStub.
	Get_ClassName_ (see page 1425)	This is Get_ClassName_, a member of class TBaseAdapterStub.
	Get_Fields (see page 1425)	This is Get_Fields, a member of class TBaseAdapterStub.
	Get_Image (see page 1421)	This is Get_Image, a member of class TAdapterValuesListStub.
	Get_Name_ (see page 1425)	This is Get_Name_, a member of class TBaseAdapterStub.
	Get_Records (see page 1421)	This is Get_Records, a member of class TAdapterValuesListStub.
	Get_Value (see page 1421)	This is Get_Value, a member of class TAdapterValuesListStub.
	Get_ValueName (see page 1422)	This is Get_ValueName, a member of class TAdapterValuesListStub.
	ImageOfValue (see page 1422)	This is ImageOfValue, a member of class TAdapterValuesListStub.
	NameOfValue (see page 1422)	This is NameOfValue, a member of class TAdapterValuesListStub.

Public Methods

	Name	Description
	Get_Actions (see page 1467)	This is Get_Actions, a member of class IBaseAdapterStub.
	Get_ClassName_ (see page 1467)	This is Get_ClassName_, a member of class IBaseAdapterStub.
	Get_Fields (see page 1467)	This is Get_Fields, a member of class IBaseAdapterStub.
	Get_Name_ (see page 1467)	This is Get_Name_, a member of class IBaseAdapterStub.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.
R	Image (see page 1461)	This is Image, a member of class IAdapterValuesListStub.
R	Records (see page 1469)	This is Records, a member of class IBaseRecordsAdapterStub.
R	Value (see page 1462)	This is Value, a member of class IAdapterValuesListStub.
R	ValueName (see page 1462)	This is ValueName, a member of class IAdapterValuesListStub.

10.1.16.2 TAdapterValuesListStub Methods

The methods of the TAdapterValuesListStub class are listed here.

Protected Methods

	Name	Description
A	CreateImageStub (see page 1421)	This is CreateImageStub, a member of class TAdapterValuesListStub.
V	FindObject (see page 1421)	This is FindObject, a member of class TAdapterValuesListStub.
	Get_Image (see page 1421)	This is Get_Image, a member of class TAdapterValuesListStub.
	Get_Records (see page 1421)	This is Get_Records, a member of class TAdapterValuesListStub.
	Get_Value (see page 1421)	This is Get_Value, a member of class TAdapterValuesListStub.
	Get_ValueName (see page 1422)	This is Get_ValueName, a member of class TAdapterValuesListStub.
	ImageOfValue (see page 1422)	This is ImageOfValue, a member of class TAdapterValuesListStub.
	NameOfValue (see page 1422)	This is NameOfValue, a member of class TAdapterValuesListStub.

10.1.16.2.1 TAdapterValuesListStub.CreateImageStub Method

Pascal

```
function CreateImageStub(AdapterImage: IInterface): IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateImageStub(IInterface AdapterImage) = 0;
```

Description

This is CreateImageStub, a member of class TAdapterValuesListStub.

10.1.16.2.2 TAdapterValuesListStub.FindObject Method

Pascal

```
function FindObject(const AName: string): TObject; override;
```

C++

```
virtual __fastcall TObject * FindObject(const AnsiString AName);
```

Description

This is FindObject, a member of class TAdapterValuesListStub.

10.1.16.2.3 TAdapterValuesListStub.Get_Image Method

Pascal

```
function Get_Image: IInterface;
```

C++

```
__fastcall IInterface Get_Image();
```

Description

This is Get_Image, a member of class TAdapterValuesListStub.

10.1.16.2.4 TAdapterValuesListStub.Get_Records Method

Pascal

```
function Get_Records: IInterface;
```

C++

```
__fastcall IInterface Get_Records();
```

Description

This is Get_Records, a member of class TAdapterValuesListStub.

10.1.16.2.5 TAdapterValuesListStub.Get_Value Method

Pascal

```
function Get_Value: Variant;
```

C++

```
__fastcall Variant Get_Value();
```

Description

This is Get_Value, a member of class TAdapterValuesListStub.

10.1.16.2.6 TAdapterValuesListStub.Get_ValueName Method

Pascal

```
function Get_ValueName: string;
```

C++

```
__fastcall AnsiString Get_ValueName();
```

Description

This is Get_ValueName, a member of class TAdapterValuesListStub.

10.1.16.2.7 TAdapterValuesListStub.ImageOfValue Method

Pascal

```
function ImageOfValue(Value: Variant): IInterface;
```

C++

```
__fastcall IInterface ImageOfValue(Variant Value);
```

Description

This is ImageOfValue, a member of class TAdapterValuesListStub.

10.1.16.2.8 TAdapterValuesListStub.NameOfValue Method

Pascal

```
function NameOfValue(Value: Variant): string;
```

C++

```
__fastcall AnsiString NameOfValue(Variant Value);
```

Description

This is NameOfValue, a member of class TAdapterValuesListStub.

10.1.17 TBaseAdapterStub Class

Class Hierarchy

Pascal

```
TBaseAdapterStub = class(TWebComponentsStub, IComponentStub, IBaseAdapterStub);
```

C++

```
class TBaseAdapterStub : public TWebComponentsStub, public IComponentStub, public
```

```
IBaseAdapterStub;
```

File

AutoAdap

Description

This is class AutoAdap.TBaseAdapterStub.

10.1.17.1 TBaseAdapterStub Members

The following tables list the members exposed by TBaseAdapterStub.

Protected Fields

	Name	Description
	FActions (see page 1423)	This is FActions, a member of class TBaseAdapterStub.
	FFields (see page 1424)	This is FFields, a member of class TBaseAdapterStub.

Protected Methods

	Name	Description
A	CreateComponentsStub (see page 1424)	This is CreateComponentsStub, a member of class TBaseAdapterStub.
V	FindObject (see page 1424)	This is FindObject, a member of class TBaseAdapterStub.
	Get_Actions (see page 1424)	This is Get_Actions, a member of class TBaseAdapterStub.
	Get_ClassName_ (see page 1425)	This is Get_ClassName_, a member of class TBaseAdapterStub.
	Get_Fields (see page 1425)	This is Get_Fields, a member of class TBaseAdapterStub.
	Get_Name_ (see page 1425)	This is Get_Name_, a member of class TBaseAdapterStub.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.

10.1.17.2 TBaseAdapterStub Fields

The fields of the TBaseAdapterStub class are listed here.

Protected Fields

	Name	Description
	FActions (see page 1423)	This is FActions, a member of class TBaseAdapterStub.
	FFields (see page 1424)	This is FFields, a member of class TBaseAdapterStub.

10.1.17.2.1 TBaseAdapterStub.FActions Field

Pascal

```
FActions: IInterface;
```

C++

```
IInterface FActions;
```

Description

This is FActions, a member of class TBaseAdapterStub.

10.1.17.2.2 TBaseAdapterStub.FFields Field

Pascal

```
FFields: IInterface;
```

C++

```
IInterface FFields;
```

Description

This is FFields, a member of class TBaseAdapterStub.

10.1.17.3 TBaseAdapterStub Methods

The methods of the TBaseAdapterStub class are listed here.

Protected Methods

	Name	Description
	CreateComponentsStub (see page 1424)	This is CreateComponentsStub, a member of class TBaseAdapterStub.
	FindObject (see page 1424)	This is FindObject, a member of class TBaseAdapterStub.
	Get_Actions (see page 1424)	This is Get_Actions, a member of class TBaseAdapterStub.
	Get_ClassName_ (see page 1425)	This is Get_ClassName_, a member of class TBaseAdapterStub.
	Get_Fields (see page 1425)	This is Get_Fields, a member of class TBaseAdapterStub.
	Get_Name_ (see page 1425)	This is Get_Name_, a member of class TBaseAdapterStub.

10.1.17.3.1 TBaseAdapterStub.CreateComponentsStub Method

Pascal

```
function CreateComponentsStub(O: TComponent): IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateComponentsStub(TComponent * O) = 0;
```

Description

This is CreateComponentsStub, a member of class TBaseAdapterStub.

10.1.17.3.2 TBaseAdapterStub.FindObject Method

Pascal

```
function FindObject(const AName: string): TObject; override;
```

C++

```
virtual __fastcall TObject * FindObject(const AnsiString AName);
```

Description

This is FindObject, a member of class TBaseAdapterStub.

10.1.17.3.3 TBaseAdapterStub.Get_Actions Method

Pascal

```
function Get_Actions: IInterface;
```

C++

```
__fastcall IInterface Get_Actions();
```

Description

This is Get_Actions, a member of class TBaseAdapterStub.

10.1.17.3.4 TBaseAdapterStub.Get_ClassName_ Method

Pascal

```
function Get_ClassName_: string;
```

C++

```
__fastcall AnsiString Get_ClassName_();
```

Description

This is Get_ClassName_, a member of class TBaseAdapterStub.

10.1.17.3.5 TBaseAdapterStub.Get_Fields Method

Pascal

```
function Get_Fields: IInterface;
```

C++

```
__fastcall IInterface Get_Fields();
```

Description

This is Get_Fields, a member of class TBaseAdapterStub.

10.1.17.3.6 TBaseAdapterStub.Get_Name_ Method

Pascal

```
function Get_Name_: string;
```

C++

```
__fastcall AnsiString Get_Name_();
```

Description

This is Get_Name_, a member of class TBaseAdapterStub.

10.1.18 TBaseRecordsAdapterStub Class

Class Hierarchy

Pascal

```
TBaseRecordsAdapterStub = class(TBaseAdapterStub, IBaseRecordsAdapterStub);
```

C++

```
class TBaseRecordsAdapterStub : public TBaseAdapterStub, public IBaseRecordsAdapterStub;
```

File

AutoAdap

Description

This is class AutoAdap.TBaseRecordsAdapterStub.

10.1.18.1 TBaseRecordsAdapterStub Members

The following tables list the members exposed by TBaseRecordsAdapterStub.

Protected Fields

	Name	Description
	FActions (see page 1423)	This is FActions, a member of class TBaseAdapterStub.
	FFields (see page 1424)	This is FFields, a member of class TBaseAdapterStub.

Protected Methods

	Name	Description
A	CreateComponentsStub (see page 1424)	This is CreateComponentsStub, a member of class TBaseAdapterStub.
A	CreateRecordsStub (see page 1427)	This is CreateRecordsStub, a member of class TBaseRecordsAdapterStub.
V	FindObject (see page 1424)	This is FindObject, a member of class TBaseAdapterStub.
	Get_Actions (see page 1424)	This is Get_Actions, a member of class TBaseAdapterStub.
	Get_ClassName_ (see page 1425)	This is Get_ClassName_, a member of class TBaseAdapterStub.
	Get_Fields (see page 1425)	This is Get_Fields, a member of class TBaseAdapterStub.
	Get_Name_ (see page 1425)	This is Get_Name_, a member of class TBaseAdapterStub.
	Get_Records (see page 1427)	This is Get_Records, a member of class TBaseRecordsAdapterStub.

Public Methods

	Name	Description
	Get_Actions (see page 1467)	This is Get_Actions, a member of class IBaseAdapterStub.
	Get_ClassName_ (see page 1467)	This is Get_ClassName_, a member of class IBaseAdapterStub.
	Get_Fields (see page 1467)	This is Get_Fields, a member of class IBaseAdapterStub.
	Get_Name_ (see page 1467)	This is Get_Name_, a member of class IBaseAdapterStub.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.
R	Records (see page 1469)	This is Records, a member of class IBaseRecordsAdapterStub.

10.1.18.2 TBaseRecordsAdapterStub Methods

The methods of the TBaseRecordsAdapterStub class are listed here.

Protected Methods

	Name	Description
A	CreateRecordsStub (see page 1427)	This is CreateRecordsStub, a member of class TBaseRecordsAdapterStub.
	Get_Records (see page 1427)	This is Get_Records, a member of class TBaseRecordsAdapterStub.

10.1.18.2.1 TBaseRecordsAdapterStub.CreateRecordsStub Method

Pascal

```
function CreateRecordsStub(O: TComponent): IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateRecordsStub(TComponent * O) = 0;
```

Description

This is CreateRecordsStub, a member of class TBaseRecordsAdapterStub.

10.1.18.2.2 TBaseRecordsAdapterStub.Get_Records Method

Pascal

```
function Get_Records: IInterface;
```

C++

```
__fastcall IInterface Get_Records();
```

Description

This is Get_Records, a member of class TBaseRecordsAdapterStub.

10.1.19 TWebApplicationStub Class

Class Hierarchy

Pascal

```
TWebApplicationStub = class(TAdapterStub, IApplicationStub);
```

C++

```
class TWebApplicationStub : public TAdapterStub, public IApplicationStub;
```

File

AutoAdap

Description

This is class AutoAdap.TWebApplicationStub.

10.1.19.1 TWebApplicationStub Members

The following tables list the members exposed by TWebApplicationStub.

Protected Fields

	Name	Description
	FActions (see page 1423)	This is FActions, a member of class TBaseAdapterStub.
	FFields (see page 1424)	This is FFields, a member of class TBaseAdapterStub.

Protected Methods

	Name	Description
A	CreateComponentsStub (see page 1424)	This is CreateComponentsStub, a member of class TBaseAdapterStub.
A	CreateErrorsStub (see page 1413)	This is CreateErrorsStub, a member of class TAdapterStub.
A	CreateHiddenFieldsStub (see page 1414)	This is CreateHiddenFieldsStub, a member of class TAdapterStub.
A	CreateRecordsStub (see page 1427)	This is CreateRecordsStub, a member of class TBaseRecordsAdapterStub.
V	FindObject (see page 1414)	This is FindObject, a member of class TAdapterStub.
V	FindObject (see page 1424)	This is FindObject, a member of class TBaseAdapterStub.
	Get_Actions (see page 1424)	This is Get_Actions, a member of class TBaseAdapterStub.
	Get_CanModify (see page 1414)	This is Get_CanModify, a member of class TAdapterStub.
	Get_CanView (see page 1414)	This is Get_CanView, a member of class TAdapterStub.
	Get_ClassName_ (see page 1425)	This is Get_ClassName_, a member of class TBaseAdapterStub.
	Get_Designing (see page 1429)	This is Get_Designing, a member of class TWebApplicationStub.
	Get_Errors (see page 1414)	This is Get_Errors, a member of class TAdapterStub.
	Get_Fields (see page 1425)	This is Get_Fields, a member of class TBaseAdapterStub.
	Get_HiddenFields (see page 1415)	This is Get_HiddenFields, a member of class TAdapterStub.
	Get_HiddenRecordFields (see page 1415)	This is Get_HiddenRecordFields, a member of class TAdapterStub.
	Get_Mode (see page 1415)	This is Get_Mode, a member of class TAdapterStub.
	Get_ModuleFileName (see page 1429)	This is Get_ModuleFileName, a member of class TWebApplicationStub.
	Get_ModulePath (see page 1430)	This is Get_ModulePath, a member of class TWebApplicationStub.
	Get_Name_ (see page 1425)	This is Get_Name_, a member of class TBaseAdapterStub.
	Get_Records (see page 1427)	This is Get_Records, a member of class TBaseRecordsAdapterStub.
	Get_Title (see page 1430)	This is Get_Title, a member of class TWebApplicationStub.
	QualifyFileName (see page 1430)	This is QualifyFileName, a member of class TWebApplicationStub.
	Set_Mode (see page 1415)	This is Set_Mode, a member of class TAdapterStub.

Public Methods

	Name	Description
	Create (see page 1429)	This is Create, a member of class TWebApplicationStub.
	Get_Actions (see page 1467)	This is Get_Actions, a member of class IBaseAdapterStub.
	Get_CanModify (see page 1456)	This is Get_CanModify, a member of class IAdapterStub.
	Get_CanView (see page 1456)	This is Get_CanView, a member of class IAdapterStub.
	Get_ClassName_ (see page 1467)	This is Get_ClassName_, a member of class IBaseAdapterStub.
	Get_Errors (see page 1456)	This is Get_Errors, a member of class IAdapterStub.
	Get_Fields (see page 1467)	This is Get_Fields, a member of class IBaseAdapterStub.
	Get_HiddenFields (see page 1457)	This is Get_HiddenFields, a member of class IAdapterStub.
	Get_HiddenRecordFields (see page 1457)	This is Get_HiddenRecordFields, a member of class IAdapterStub.
	Get_Mode (see page 1457)	This is Get_Mode, a member of class IAdapterStub.
	Get_Name_ (see page 1467)	This is Get_Name_, a member of class IBaseAdapterStub.
	Get_Records (see page 1469)	This is Get_Records, a member of class IBaseRecordsAdapterStub.
	Set_Mode (see page 1457)	This is Set_Mode, a member of class IAdapterStub.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	CanModify (see page 1458)	This is CanModify, a member of class IAdapterStub.
R	CanView (see page 1458)	This is CanView, a member of class IAdapterStub.
R	Designing (see page 1465)	This is Designing, a member of class IApplicationStub.
R	Errors (see page 1458)	This is Errors, a member of class IAdapterStub.

R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.
R	HiddenFields (see page 1458)	This is HiddenFields, a member of class IAdapterStub.
R	HiddenRecordFields (see page 1459)	This is HiddenRecordFields, a member of class IAdapterStub.
	Mode (see page 1459)	This is Mode, a member of class IAdapterStub.
R	ModuleFileName (see page 1465)	This is ModuleFileName, a member of class IApplicationStub.
R	ModulePath (see page 1465)	This is ModulePath, a member of class IApplicationStub.
R	Records (see page 1469)	This is Records, a member of class IBaseRecordsAdapterStub.
R	Title (see page 1465)	This is Title, a member of class IApplicationStub.

10.1.19.2 TWebApplicationStub.Create Constructor

Pascal

```
constructor Create(AContext: IScriptContext); reintroduce;
```

C++

```
__fastcall TWebApplicationStub(IScriptContext AContext);
```

Description

This is Create, a member of class TWebApplicationStub.

10.1.19.3 TWebApplicationStub Methods

The methods of the TWebApplicationStub class are listed here.

Protected Methods

	Name	Description
	Get_Designing (see page 1429)	This is Get_Designing, a member of class TWebApplicationStub.
	Get_ModuleFileName (see page 1429)	This is Get_ModuleFileName, a member of class TWebApplicationStub.
	Get_ModulePath (see page 1430)	This is Get_ModulePath, a member of class TWebApplicationStub.
	Get_Title (see page 1430)	This is Get_Title, a member of class TWebApplicationStub.
