	QualifyFileName (see page 1430)	This is QualifyFileName, a member of class TWebApplicationStub.

10.1.19.3.1 TWebApplicationStub.Get_Designing Method

Pascal

```
function Get_Designing: Boolean;
```

C++

```
__fastcall Boolean Get_Designing();
```

Description

This is Get_Designing, a member of class TWebApplicationStub.

10.1.19.3.2 TWebApplicationStub.Get_ModuleFileName Method

Pascal

```
function Get_ModuleFileName: string;
```

C++

```
__fastcall AnsiString Get_ModuleFileName();
```

Description

This is Get_ModuleFileName, a member of class TWebApplicationStub.

10.1.19.3.3 TWebApplicationStub.Get_ModulePath Method

Pascal

```
function Get_ModulePath: string;
```

C++

```
__fastcall AnsiString Get_ModulePath();
```

Description

This is Get_ModulePath, a member of class TWebApplicationStub.

10.1.19.3.4 TWebApplicationStub.Get_Title Method

Pascal

```
function Get_Title: string;
```

C++

```
__fastcall AnsiString Get_Title();
```

Description

This is Get_Title, a member of class TWebApplicationStub.

10.1.19.3.5 TWebApplicationStub.QualifyFileName Method

Pascal

```
function QualifyFileName(const FileName: PChar): string;
```

C++

```
__fastcall AnsiString QualifyFileName(const const char * FileName);
```

Description

This is QualifyFileName, a member of class TWebApplicationStub.

10.1.20 TWebEndUserStub Class

Class Hierarchy

Pascal

```
TWebEndUserStub = class(TAdapterStub, IEndUserStub);
```

C++

```
class TWebEndUserStub : public TAdapterStub, public IEndUserStub;
```

File

AutoAdap

Description

This is class AutoAdap.TWebEndUserStub.

10.1.20.1 TWebEndUserStub Members

The following tables list the members exposed by TWebEndUserStub.

Protected Fields

	Name	Description
	FActions (see page 1423)	This is FActions, a member of class TBaseAdapterStub.
	FFields (see page 1424)	This is FFields, a member of class TBaseAdapterStub.

Protected Methods

	Name	Description
	CreateActionStub (see page 1432)	This is CreateActionStub, a member of class TWebEndUserStub.
	CreateComponentsStub (see page 1424)	This is CreateComponentsStub, a member of class TBaseAdapterStub.
	CreateErrorsStub (see page 1413)	This is CreateErrorsStub, a member of class TAdapterStub.
	CreateHiddenFieldsStub (see page 1414)	This is CreateHiddenFieldsStub, a member of class TAdapterStub.
	CreateRecordsStub (see page 1427)	This is CreateRecordsStub, a member of class TBaseRecordsAdapterStub.
	FindObject (see page 1414)	This is FindObject, a member of class TAdapterStub.
	FindObject (see page 1424)	This is FindObject, a member of class TBaseAdapterStub.
	Get_Actions (see page 1424)	This is Get_Actions, a member of class TBaseAdapterStub.
	Get_CanModify (see page 1414)	This is Get_CanModify, a member of class TAdapterStub.
	Get_CanView (see page 1414)	This is Get_CanView, a member of class TAdapterStub.
	Get_ClassName_ (see page 1425)	This is Get_ClassName_, a member of class TBaseAdapterStub.
	Get_DisplayName (see page 1433)	This is Get_DisplayName, a member of class TWebEndUserStub.
	Get_Errors (see page 1414)	This is Get_Errors, a member of class TAdapterStub.
	Get_Fields (see page 1425)	This is Get_Fields, a member of class TBaseAdapterStub.
	Get_HiddenFields (see page 1415)	This is Get_HiddenFields, a member of class TAdapterStub.
	Get_HiddenRecordFields (see page 1415)	This is Get_HiddenRecordFields, a member of class TAdapterStub.
	Get_LoggedIn (see page 1433)	This is Get_LoggedIn, a member of class TWebEndUserStub.
	Get_LoginFormAction (see page 1433)	This is Get_LoginFormAction, a member of class TWebEndUserStub.
	Get_LogoutAction (see page 1433)	This is Get_LogoutAction, a member of class TWebEndUserStub.
	Get_Mode (see page 1415)	This is Get_Mode, a member of class TAdapterStub.
	Get_Name_ (see page 1425)	This is Get_Name_, a member of class TBaseAdapterStub.
	Get_Records (see page 1427)	This is Get_Records, a member of class TBaseRecordsAdapterStub.
	Set_Mode (see page 1415)	This is Set_Mode, a member of class TAdapterStub.

Public Methods

	Name	Description
	Create (see page 1432)	This is Create, a member of class TWebEndUserStub.
	Get_Actions (see page 1467)	This is Get_Actions, a member of class IBaseAdapterStub.
	Get_CanModify (see page 1456)	This is Get_CanModify, a member of class IAdapterStub.
	Get_CanView (see page 1456)	This is Get_CanView, a member of class IAdapterStub.
	Get_ClassName_ (see page 1467)	This is Get_ClassName_, a member of class IBaseAdapterStub.
	Get_Errors (see page 1456)	This is Get_Errors, a member of class IAdapterStub.
	Get_Fields (see page 1467)	This is Get_Fields, a member of class IBaseAdapterStub.

	Get_HiddenFields (see page 1457)	This is Get_HiddenFields, a member of class IAdapterStub.
	Get_HiddenRecordFields (see page 1457)	This is Get_HiddenRecordFields, a member of class IAdapterStub.
	Get_Mode (see page 1457)	This is Get_Mode, a member of class IAdapterStub.
	Get_Name_ (see page 1467)	This is Get_Name_, a member of class IBaseAdapterStub.
	Get_Records (see page 1469)	This is Get_Records, a member of class IBaseRecordsAdapterStub.
	Set_Mode (see page 1457)	This is Set_Mode, a member of class IAdapterStub.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	CanModify (see page 1458)	This is CanModify, a member of class IAdapterStub.
R	CanView (see page 1458)	This is CanView, a member of class IAdapterStub.
R	DisplayName (see page 1472)	This is DisplayName, a member of class IEndUserStub.
R	Errors (see page 1458)	This is Errors, a member of class IAdapterStub.
R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.
R	HiddenFields (see page 1458)	This is HiddenFields, a member of class IAdapterStub.
R	HiddenRecordFields (see page 1459)	This is HiddenRecordFields, a member of class IAdapterStub.
R	LoggedIn (see page 1472)	This is LoggedIn, a member of class IEndUserStub.
R	LoginFormAction (see page 1472)	This is LoginFormAction, a member of class IEndUserStub.
R	LogoutAction (see page 1473)	This is LogoutAction, a member of class IEndUserStub.
	Mode (see page 1459)	This is Mode, a member of class IAdapterStub.
R	Records (see page 1469)	This is Records, a member of class IBaseRecordsAdapterStub.

10.1.20.2 TWebEndUserStub.Create Constructor

Pascal

```
constructor Create(AContext: IScriptContext); reintroduce;
```

C++

```
__fastcall TWebEndUserStub(IScriptContext AContext);
```

Description

This is Create, a member of class TWebEndUserStub.

10.1.20.3 TWebEndUserStub Methods

The methods of the TWebEndUserStub class are listed here.

Protected Methods

	Name	Description
A	CreateActionStub (see page 1432)	This is CreateActionStub, a member of class TWebEndUserStub.
	Get_DisplayName (see page 1433)	This is Get_DisplayName, a member of class TWebEndUserStub.
	Get_LoggedIn (see page 1433)	This is Get_LoggedIn, a member of class TWebEndUserStub.
	Get_LoginFormAction (see page 1433)	This is Get_LoginFormAction, a member of class TWebEndUserStub.
	Get_LogoutAction (see page 1433)	This is Get_LogoutAction, a member of class TWebEndUserStub.

10.1.20.3.1 TWebEndUserStub.CreateActionStub Method

Pascal

```
function CreateActionStub(O: TComponent): IInterface; virtual; abstract; overload;
```

C++

```
virtual __fastcall IInterface CreateActionStub(TComponent * O) = 0;
```

Description

This is CreateActionStub, a member of class TWebEndUserStub.

10.1.20.3.2 TWebEndUserStub.Get_DisplayName Method

Pascal

```
function Get_DisplayName: string;
```

C++

```
__fastcall AnsiString Get_DisplayName();
```

Description

This is Get_DisplayName, a member of class TWebEndUserStub.

10.1.20.3.3 TWebEndUserStub.Get_LoggedIn Method

Pascal

```
function Get_LoggedIn: Boolean;
```

C++

```
__fastcall Boolean Get_LoggedIn();
```

Description

This is Get_LoggedIn, a member of class TWebEndUserStub.

10.1.20.3.4 TWebEndUserStub.Get_LoginFormAction Method

Pascal

```
function Get_LoginFormAction: IInterface;
```

C++

```
__fastcall IInterface Get_LoginFormAction();
```

Description

This is Get_LoginFormAction, a member of class TWebEndUserStub.

10.1.20.3.5 TWebEndUserStub.Get_LogoutAction Method

Pascal

```
function Get_LogoutAction: IInterface;
```

C++

```
__fastcall IInterface Get_LogoutAction();
```

Description

This is Get_LogoutAction, a member of class TWebEndUserStub.

10.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IAdapterErrorsStub (see page 1434)	This is class AutoAdap.IAdapterErrorsStub.
	IAdapterErrorStub (see page 1435)	This is class AutoAdap.IAdapterErrorStub.
	IAdapterFieldStub (see page 1438)	This is class AutoAdap.IAdapterFieldStub.
	IAdapterFieldValuesStub (see page 1448)	This is class AutoAdap.IAdapterFieldValuesStub.
	IAdapterHiddenFieldsStub (see page 1450)	This is class AutoAdap.IAdapterHiddenFieldsStub.
	IAdapterHiddenFieldStub (see page 1451)	This is class AutoAdap.IAdapterHiddenFieldStub.
	IAdapterImageStub (see page 1453)	This is class AutoAdap.IAdapterImageStub.
	IAdapterRecordStub (see page 1454)	This is class AutoAdap.IAdapterRecordStub.
	IAdapterStub (see page 1455)	This is class AutoAdap.IAdapterStub.
	IAdapterValuesListStub (see page 1459)	This is class AutoAdap.IAdapterValuesListStub.
	IApplicationStub (see page 1462)	This is class AutoAdap.IApplicationStub.
	IBaseAdapterStub (see page 1466)	This is class AutoAdap.IBaseAdapterStub.
	IBaseRecordsAdapterStub (see page 1468)	This is class AutoAdap.IBaseRecordsAdapterStub.
	IEndUserStub (see page 1470)	This is class AutoAdap.IEndUserStub.
	IImageProducerStub (see page 1473)	This is class AutoAdap.IImageProducerStub.

10.2.1 IAdapterErrorsStub Interface

Class Hierarchy

Pascal

```
IAdapterErrorsStub = interface;
```

C++

```
__interface IAdapterErrorsStub;
```

File

AutoAdap

Description

This is class AutoAdap.IAdapterErrorsStub.

10.2.1.1 IAdapterErrorsStub Members

The following tables list the members exposed by IAdapterErrorsStub.

Public Methods

	Name	Description
	DefineLabel (see page 1435)	This is DefineLabel, a member of class IAdapterErrorsStub.

	FieldErrors (see page 1435)	This is FieldErrors, a member of class IAdapterErrorsStub.

10.2.1.2 IAdapterErrorsStub Methods

The methods of the IAdapterErrorsStub class are listed here.

Public Methods

	Name	Description
	DefineLabel (see page 1435)	This is DefineLabel, a member of class IAdapterErrorsStub.
	FieldErrors (see page 1435)	This is FieldErrors, a member of class IAdapterErrorsStub.

10.2.1.2.1 IAdapterErrorsStub.DefineLabel Method

Pascal

```
procedure DefineLabel(const Object_: IUnknown; const Value: string);
```

C++

```
__fastcall DefineLabel(const IUnknown Object_, const AnsiString Value);
```

Description

This is DefineLabel, a member of class IAdapterErrorsStub.

10.2.1.2.2 IAdapterErrorsStub.FieldErrors Method

Pascal

```
function FieldErrors(const Object_: IUnknown): IInterface;
```

C++

```
__fastcall IInterface FieldErrors(const IUnknown Object_);
```

Description

This is FieldErrors, a member of class IAdapterErrorsStub.

10.2.2 IAdapterErrorStub Interface

Class Hierarchy

AutoAdap.IAdapterErrorStub

Pascal

```
IAdapterErrorStub = interface;
```

C++

```
__interface IAdapterErrorStub;
```

File

AutoAdap

Description

This is class AutoAdap.IAdapterErrorStub.

10.2.2.1 IAdapterErrorStub Members

The following tables list the members exposed by IAdapterErrorStub.

Public Methods

	Name	Description
	Get_Field (see page 1436)	This is Get_Field, a member of class IAdapterErrorStub.
	Get_ID (see page 1436)	This is Get_ID, a member of class IAdapterErrorStub.
	Get_Message (see page 1437)	This is Get_Message, a member of class IAdapterErrorStub.

Public Properties

	Name	Description
R	Field (see page 1437)	This is Field, a member of class IAdapterErrorStub.
R	ID (see page 1437)	This is ID, a member of class IAdapterErrorStub.
R	Message (see page 1437)	This is Message, a member of class IAdapterErrorStub.

10.2.2.2 IAdapterErrorStub Methods

The methods of the IAdapterErrorStub class are listed here.

Public Methods

	Name	Description
	Get_Field (see page 1436)	This is Get_Field, a member of class IAdapterErrorStub.
	Get_ID (see page 1436)	This is Get_ID, a member of class IAdapterErrorStub.
	Get_Message (see page 1437)	This is Get_Message, a member of class IAdapterErrorStub.

10.2.2.2.1 IAdapterErrorStub.Get_Field Method

Pascal

```
function Get_Field: IInterface;
```

C++

```
__fastcall IInterface Get_Field();
```

Description

This is Get_Field, a member of class IAdapterErrorStub.

10.2.2.2.2 IAdapterErrorStub.Get_ID Method

Pascal

```
function Get_ID: Integer;
```

C++

```
__fastcall int Get_ID();
```

Description

This is Get_ID, a member of class IAdapterErrorStub.

10.2.2.2.3 IAdapterErrorStub.Get_Message Method

Pascal

```
function Get_Message: string;
```

C++

```
__fastcall AnsiString Get_Message();
```

Description

This is Get_Message, a member of class IAdapterErrorStub.

10.2.2.3 IAdapterErrorStub Properties

The properties of the IAdapterErrorStub class are listed here.

Public Properties

	Name	Description
R	Field (see page 1437)	This is Field, a member of class IAdapterErrorStub.
R	ID (see page 1437)	This is ID, a member of class IAdapterErrorStub.
R	Message (see page 1437)	This is Message, a member of class IAdapterErrorStub.

10.2.2.3.1 IAdapterErrorStub.Field Property

Pascal

```
property Field: IInterface;
```

C++

```
__property IInterface Field;
```

Description

This is Field, a member of class IAdapterErrorStub.

10.2.2.3.2 IAdapterErrorStub.ID Property

Pascal

```
property ID: Integer;
```

C++

```
__property int ID;
```

Description

This is ID, a member of class IAdapterErrorStub.

10.2.2.3.3 IAdapterErrorStub.Message Property

Pascal

```
property Message: string;
```

C++

```
__property AnsiString Message;
```

Description

This is Message, a member of class IAdapterErrorStub.

10.2.3 IAdapterFieldStub Interface

Class Hierarchy

AutoAdap.IAdapterFieldStub

Pascal

```
IAdapterFieldStub = interface;
```

C++

```
__interface IAdapterFieldStub;
```

File

AutoAdap

Description

This is class AutoAdap.IAdapterFieldStub.

10.2.3.1 IAdapterFieldStub Members

The following tables list the members exposed by IAdapterFieldStub.

Public Methods

	Name	Description
	Get_CanModify (see page 1439)	This is Get_CanModify, a member of class IAdapterFieldStub.
	Get_CanView (see page 1440)	This is Get_CanView, a member of class IAdapterFieldStub.
	Get_DisplayLabel (see page 1440)	This is Get_DisplayLabel, a member of class IAdapterFieldStub.
	Get_DisplayStyle (see page 1440)	This is Get_DisplayStyle, a member of class IAdapterFieldStub.
	Get_DisplayText (see page 1440)	This is Get_DisplayText, a member of class IAdapterFieldStub.
	Get_DisplayWidth (see page 1441)	This is Get_DisplayWidth, a member of class IAdapterFieldStub.
	Get_EditText (see page 1441)	This is Get_EditText, a member of class IAdapterFieldStub.
	Get_Image (see page 1441)	This is Get_Image, a member of class IAdapterFieldStub.
	Get_InputName (see page 1441)	This is Get_InputName, a member of class IAdapterFieldStub.
	Get_InputStyle (see page 1441)	This is Get_InputStyle, a member of class IAdapterFieldStub.
	Get_MaxLength (see page 1442)	This is Get_MaxLength, a member of class IAdapterFieldStub.
	Get_Name (see page 1442)	This is Get_Name, a member of class IAdapterFieldStub.
	Get_Required (see page 1442)	This is Get_Required, a member of class IAdapterFieldStub.
	Get_Value (see page 1442)	This is Get_Value, a member of class IAdapterFieldStub.
	Get_Values (see page 1443)	This is Get_Values, a member of class IAdapterFieldStub.
	Get_ValuesList (see page 1443)	This is Get_ValuesList, a member of class IAdapterFieldStub.
	Get_ViewMode (see page 1443)	This is Get_ViewMode, a member of class IAdapterFieldStub.
	Get_Visible (see page 1443)	This is Get_Visible, a member of class IAdapterFieldStub.
	IsEqual (see page 1443)	This is IsEqual, a member of class IAdapterFieldStub.

Public Properties

	Name	Description
R	CanModify (see page 1444)	This is CanModify, a member of class IAdapterFieldStub.

R	CanView (see page 1444)	This is CanView, a member of class IAdapterFieldStub.
R	DisplayLabel (see page 1445)	This is DisplayLabel, a member of class IAdapterFieldStub.
R	DisplayStyle (see page 1445)	This is DisplayStyle, a member of class IAdapterFieldStub.
R	DisplayText (see page 1445)	This is DisplayText, a member of class IAdapterFieldStub.
R	DisplayWidth (see page 1445)	This is DisplayWidth, a member of class IAdapterFieldStub.
R	EditText (see page 1445)	This is EditText, a member of class IAdapterFieldStub.
R	Image (see page 1446)	This is Image, a member of class IAdapterFieldStub.
R	InputName (see page 1446)	This is InputName, a member of class IAdapterFieldStub.
R	InputStyle (see page 1446)	This is InputStyle, a member of class IAdapterFieldStub.
R	MaxLength (see page 1446)	This is MaxLength, a member of class IAdapterFieldStub.
R	Name (see page 1447)	This is Name, a member of class IAdapterFieldStub.
R	Required (see page 1447)	This is Required, a member of class IAdapterFieldStub.
R	Value (see page 1447)	This is Value, a member of class IAdapterFieldStub.
R	Values (see page 1447)	This is Values, a member of class IAdapterFieldStub.
R	ValuesList (see page 1447)	This is ValuesList, a member of class IAdapterFieldStub.
R	ViewMode (see page 1448)	This is ViewMode, a member of class IAdapterFieldStub.
R	Visible (see page 1448)	This is Visible, a member of class IAdapterFieldStub.

10.2.3.2 IAdapterFieldStub Methods

The methods of the IAdapterFieldStub class are listed here.

Public Methods

	Name	Description
	Get_CanModify (see page 1439)	This is Get_CanModify, a member of class IAdapterFieldStub.
	Get_CanView (see page 1440)	This is Get_CanView, a member of class IAdapterFieldStub.
	Get_DisplayLabel (see page 1440)	This is Get_DisplayLabel, a member of class IAdapterFieldStub.
	Get_DisplayStyle (see page 1440)	This is Get_DisplayStyle, a member of class IAdapterFieldStub.
	Get_DisplayText (see page 1440)	This is Get_DisplayText, a member of class IAdapterFieldStub.
	Get_DisplayWidth (see page 1441)	This is Get_DisplayWidth, a member of class IAdapterFieldStub.
	Get_EditText (see page 1441)	This is Get_EditText, a member of class IAdapterFieldStub.
	Get_Image (see page 1441)	This is Get_Image, a member of class IAdapterFieldStub.
	Get_InputName (see page 1441)	This is Get_InputName, a member of class IAdapterFieldStub.
	Get_InputStyle (see page 1441)	This is Get_InputStyle, a member of class IAdapterFieldStub.
	Get_MaxLength (see page 1442)	This is Get_MaxLength, a member of class IAdapterFieldStub.
	Get_Name (see page 1442)	This is Get_Name, a member of class IAdapterFieldStub.
	Get_Required (see page 1442)	This is Get_Required, a member of class IAdapterFieldStub.
	Get_Value (see page 1442)	This is Get_Value, a member of class IAdapterFieldStub.
	Get_Values (see page 1443)	This is Get_Values, a member of class IAdapterFieldStub.
	Get_ValuesList (see page 1443)	This is Get_ValuesList, a member of class IAdapterFieldStub.
	Get_ViewMode (see page 1443)	This is Get_ViewMode, a member of class IAdapterFieldStub.
	Get_Visible (see page 1443)	This is Get_Visible, a member of class IAdapterFieldStub.
	IsEqual (see page 1443)	This is IsEqual, a member of class IAdapterFieldStub.

10.2.3.2.1 IAdapterFieldStub.Get_CanModify Method

Pascal

```
function Get_CanModify: Boolean;
```

C++

```
__fastcall Boolean Get_CanModify();
```

Description

This is Get_CanModify, a member of class IAdapterFieldStub.

10.2.3.2.2 IAdapterFieldStub.Get_CanView Method

Pascal

```
function Get_CanView: Boolean;
```

C++

```
__fastcall Boolean Get_CanView();
```

Description

This is Get_CanView, a member of class IAdapterFieldStub.

10.2.3.2.3 IAdapterFieldStub.Get_DisplayLabel Method

Pascal

```
function Get_DisplayLabel: string;
```

C++

```
__fastcall AnsiString Get_DisplayLabel();
```

Description

This is Get_DisplayLabel, a member of class IAdapterFieldStub.

10.2.3.2.4 IAdapterFieldStub.Get_DisplayStyle Method

Pascal

```
function Get_DisplayStyle: string;
```

C++

```
__fastcall AnsiString Get_DisplayStyle();
```

Description

This is Get_DisplayStyle, a member of class IAdapterFieldStub.

10.2.3.2.5 IAdapterFieldStub.Get_DisplayText Method

Pascal

```
function Get_DisplayText: string;
```

C++

```
__fastcall AnsiString Get_DisplayText();
```

Description

This is Get_DisplayText, a member of class IAdapterFieldStub.

10.2.3.2.6 IAdapterFieldStub.Get_DisplayWidth Method

Pascal

```
function Get_DisplayWidth: Integer;
```

C++

```
__fastcall int Get_DisplayWidth();
```

Description

This is Get_DisplayWidth, a member of class IAdapterFieldStub.

10.2.3.2.7 IAdapterFieldStub.Get_EditText Method

Pascal

```
function Get_EditText: string;
```

C++

```
__fastcall AnsiString Get_EditText();
```

Description

This is Get_EditText, a member of class IAdapterFieldStub.

10.2.3.2.8 IAdapterFieldStub.Get_Image Method

Pascal

```
function Get_Image: IInterface;
```

C++

```
__fastcall IInterface Get_Image();
```

Description

This is Get_Image, a member of class IAdapterFieldStub.

10.2.3.2.9 IAdapterFieldStub.Get_InputName Method

Pascal

```
function Get_InputName: string;
```

C++

```
__fastcall AnsiString Get_InputName();
```

Description

This is Get_InputName, a member of class IAdapterFieldStub.

10.2.3.2.10 IAdapterFieldStub.Get_InputStyle Method

Pascal

```
function Get_InputStyle: string;
```

C++

```
__fastcall AnsiString Get_InputStyle();
```

Description

This is Get_InputStyle, a member of class IAdapterFieldStub.

10.2.3.2.11 IAdapterFieldStub.Get_MaxLength Method

Pascal

```
function Get_MaxLength: Integer;
```

C++

```
__fastcall int Get_MaxLength();
```

Description

This is Get_MaxLength, a member of class IAdapterFieldStub.

10.2.3.2.12 IAdapterFieldStub.Get_Name Method

Pascal

```
function Get_Name: Variant;
```

C++

```
__fastcall Variant Get_Name();
```

Description

This is Get_Name, a member of class IAdapterFieldStub.

10.2.3.2.13 IAdapterFieldStub.Get_Required Method

Pascal

```
function Get_Required: Boolean;
```

C++

```
__fastcall Boolean Get_Required();
```

Description

This is Get_Required, a member of class IAdapterFieldStub.

10.2.3.2.14 IAdapterFieldStub.Get_Value Method

Pascal

```
function Get_Value: Variant;
```

C++

```
__fastcall Variant Get_Value();
```

Description

This is Get_Value, a member of class IAdapterFieldStub.

10.2.3.2.15 IAdapterFieldStub.Get_Values Method

Pascal

```
function Get_Values: IInterface;
```

C++

```
__fastcall IInterface Get_Values();
```

Description

This is Get_Values, a member of class IAdapterFieldStub.

10.2.3.2.16 IAdapterFieldStub.Get_ValuesList Method

Pascal

```
function Get_ValuesList: IInterface;
```

C++

```
__fastcall IInterface Get_ValuesList();
```

Description

This is Get_ValuesList, a member of class IAdapterFieldStub.

10.2.3.2.17 IAdapterFieldStub.Get_ViewMode Method

Pascal

```
function Get_ViewMode: string;
```

C++

```
__fastcall AnsiString Get_ViewMode();
```

Description

This is Get_ViewMode, a member of class IAdapterFieldStub.

10.2.3.2.18 IAdapterFieldStub.Get_Visible Method

Pascal

```
function Get_Visible: Boolean;
```

C++

```
__fastcall Boolean Get_Visible();
```

Description

This is Get_Visible, a member of class IAdapterFieldStub.

10.2.3.2.19 IAdapterFieldStub.IsEqual Method

Pascal

```
function IsEqual(Value: Variant): Boolean;
```

C++

```
__fastcall Boolean IsEqual(Variant Value);
```

Description

This is IsEqual, a member of class IAdapterFieldStub.

10.2.3.3 IAdapterFieldStub Properties

The properties of the IAdapterFieldStub class are listed here.

Public Properties

	Name	Description
R	CanModify (see page 1444)	This is CanModify, a member of class IAdapterFieldStub.
R	CanView (see page 1444)	This is CanView, a member of class IAdapterFieldStub.
R	DisplayLabel (see page 1445)	This is DisplayLabel, a member of class IAdapterFieldStub.
R	DisplayStyle (see page 1445)	This is DisplayStyle, a member of class IAdapterFieldStub.
R	DisplayText (see page 1445)	This is DisplayText, a member of class IAdapterFieldStub.
R	DisplayWidth (see page 1445)	This is DisplayWidth, a member of class IAdapterFieldStub.
R	EditText (see page 1445)	This is EditText, a member of class IAdapterFieldStub.
R	Image (see page 1446)	This is Image, a member of class IAdapterFieldStub.
R	InputName (see page 1446)	This is InputName, a member of class IAdapterFieldStub.
R	InputStyle (see page 1446)	This is InputStyle, a member of class IAdapterFieldStub.
R	MaxLength (see page 1446)	This is MaxLength, a member of class IAdapterFieldStub.
R	Name (see page 1447)	This is Name, a member of class IAdapterFieldStub.
R	Required (see page 1447)	This is Required, a member of class IAdapterFieldStub.
R	Value (see page 1447)	This is Value, a member of class IAdapterFieldStub.
R	Values (see page 1447)	This is Values, a member of class IAdapterFieldStub.
R	ValuesList (see page 1447)	This is ValuesList, a member of class IAdapterFieldStub.
R	ViewMode (see page 1448)	This is ViewMode, a member of class IAdapterFieldStub.
R	Visible (see page 1448)	This is Visible, a member of class IAdapterFieldStub.

10.2.3.3.1 IAdapterFieldStub.CanModify Property

Pascal

```
property CanModify: Boolean;
```

C++

```
__property Boolean CanModify;
```

Description

This is CanModify, a member of class IAdapterFieldStub.

10.2.3.3.2 IAdapterFieldStub.CanView Property

Pascal

```
property CanView: Boolean;
```

C++

```
__property Boolean CanView;
```

Description

This is CanView, a member of class IAdapterFieldStub.

10.2.3.3.3 IAdapterFieldStub.DisplayLabel Property

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

This is DisplayLabel, a member of class IAdapterFieldStub.

10.2.3.3.4 IAdapterFieldStub.DisplayStyle Property

Pascal

```
property DisplayStyle: string;
```

C++

```
__property AnsiString DisplayStyle;
```

Description

This is DisplayStyle, a member of class IAdapterFieldStub.

10.2.3.3.5 IAdapterFieldStub.DisplayText Property

Pascal

```
property DisplayText: string;
```

C++

```
__property AnsiString DisplayText;
```

Description

This is DisplayText, a member of class IAdapterFieldStub.

10.2.3.3.6 IAdapterFieldStub.DisplayWidth Property

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

This is DisplayWidth, a member of class IAdapterFieldStub.

10.2.3.3.7 IAdapterFieldStub.EditText Property

Pascal

```
property EditText: string;
```

C++

```
__property AnsiString EditText;
```

Description

This is EditText, a member of class IAdapterFieldStub.

10.2.3.3.8 IAdapterFieldStub.Image Property

Pascal

```
property Image: IInterface;
```

C++

```
__property IInterface Image;
```

Description

This is Image, a member of class IAdapterFieldStub.

10.2.3.3.9 IAdapterFieldStub.InputName Property

Pascal

```
property InputName: string;
```

C++

```
__property AnsiString InputName;
```

Description

This is InputName, a member of class IAdapterFieldStub.

10.2.3.3.10 IAdapterFieldStub.InputStyle Property

Pascal

```
property InputStyle: string;
```

C++

```
__property AnsiString InputStyle;
```

Description

This is InputStyle, a member of class IAdapterFieldStub.

10.2.3.3.11 IAdapterFieldStub.MaxLength Property

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

This is MaxLength, a member of class IAdapterFieldStub.

10.2.3.3.12 IAdapterFieldStub.Name Property

Pascal

```
property Name: Variant;
```

C++

```
__property Variant Name;
```

Description

This is Name, a member of class IAdapterFieldStub.

10.2.3.3.13 IAdapterFieldStub.Required Property

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;
```

Description

This is Required, a member of class IAdapterFieldStub.

10.2.3.3.14 IAdapterFieldStub.Value Property

Pascal

```
property Value: Variant;
```

C++

```
__property Variant Value;
```

Description

This is Value, a member of class IAdapterFieldStub.

10.2.3.3.15 IAdapterFieldStub.Values Property

Pascal

```
property Values: IInterface;
```

C++

```
__property IInterface Values;
```

Description

This is Values, a member of class IAdapterFieldStub.

10.2.3.3.16 IAdapterFieldStub.ValuesList Property

Pascal

```
property ValuesList: IInterface;
```

C++

```
__property IInterface ValuesList;
```

Description

This is ValuesList, a member of class IAdapterFieldStub.

10.2.3.3.17 IAdapterFieldStub.ViewMode Property

Pascal

```
property ViewMode: string;
```

C++

```
__property AnsiString ViewMode;
```

Description

This is ViewMode, a member of class IAdapterFieldStub.

10.2.3.3.18 IAdapterFieldStub.Visible Property

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

This is Visible, a member of class IAdapterFieldStub.

10.2.4 IAdapterFieldValuesStub Interface

Class Hierarchy

Pascal

```
IAdapterFieldValuesStub = interface(IBaseRecordsAdapterStub);
```

C++

```
__interface IAdapterFieldValuesStub : public IBaseRecordsAdapterStub;
```

File

AutoAdap

Description

This is class AutoAdap.IAdapterFieldValuesStub.

10.2.4.1 IAdapterFieldValuesStub Members

The following tables list the members exposed by IAdapterFieldValuesStub.

Public Methods

	Name	Description
	Get_Actions (see page 1467)	This is Get_Actions, a member of class IBaseAdapterStub.
	Get_ClassName_ (see page 1467)	This is Get_ClassName_, a member of class IBaseAdapterStub.
	Get_Fields (see page 1467)	This is Get_Fields, a member of class IBaseAdapterStub.
	Get_Name_ (see page 1467)	This is Get_Name_, a member of class IBaseAdapterStub.
	Get_Records (see page 1469)	This is Get_Records, a member of class IBaseRecordsAdapterStub.
	Get_Value (see page 1449)	This is Get_Value, a member of class IAdapterFieldValuesStub.
	HasValue (see page 1449)	This is HasValue, a member of class IAdapterFieldValuesStub.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.
R	Records (see page 1469)	This is Records, a member of class IBaseRecordsAdapterStub.
R	Value (see page 1450)	This is Value, a member of class IAdapterFieldValuesStub.

10.2.4.2 IAdapterFieldValuesStub Methods

The methods of the IAdapterFieldValuesStub class are listed here.

Public Methods

	Name	Description
	Get_Value (see page 1449)	This is Get_Value, a member of class IAdapterFieldValuesStub.
	HasValue (see page 1449)	This is HasValue, a member of class IAdapterFieldValuesStub.

10.2.4.2.1 IAdapterFieldValuesStub.Get_Value Method

Pascal

```
function Get_Value: Variant;
```

C++

```
__fastcall Variant Get_Value();
```

Description

This is Get_Value, a member of class IAdapterFieldValuesStub.

10.2.4.2.2 IAdapterFieldValuesStub.HasValue Method

Pascal

```
function HasValue(Value: Variant): Boolean;
```

C++

```
__fastcall Boolean HasValue(Variant Value);
```

Description

This is HasValue, a member of class IAdapterFieldValuesStub.

10.2.4.3 IAdapterFieldValuesStub Properties

The properties of the IAdapterFieldValuesStub class are listed here.

Public Properties

	Name	Description
	Value (see page 1450)	This is Value, a member of class IAdapterFieldValuesStub.

10.2.4.3.1 IAdapterFieldValuesStub.Value Property

Pascal

```
property Value: Variant;
```

C++

```
__property Variant Value;
```

Description

This is Value, a member of class IAdapterFieldValuesStub.

10.2.5 IAdapterHiddenFieldsStub Interface

Class Hierarchy

AutoAdap.IAdapterHiddenFieldsStub

Pascal

```
IAdapterHiddenFieldsStub = interface;
```

C++

```
__interface IAdapterHiddenFieldsStub;
```

File

AutoAdap

Description

This is class AutoAdap.IAdapterHiddenFieldsStub.

10.2.5.1 IAdapterHiddenFieldsStub Members

The following tables list the members exposed by IAdapterHiddenFieldsStub.

Public Methods

	Name	Description
	WriteFields (see page 1451)	This is WriteFields, a member of class IAdapterHiddenFieldsStub.

10.2.5.2 IAdapterHiddenFieldsStub Methods

The methods of the IAdapterHiddenFieldsStub class are listed here.

Public Methods

	Name	Description
	WriteFields (see page 1451)	This is WriteFields, a member of class IAdapterHiddenFieldsStub.

10.2.5.2.1 IAdapterHiddenFieldsStub.WriteFields Method

Pascal

```
procedure WriteFields(const Response: IInterface);
```

C++

```
__fastcall WriteFields(const IInterface Response);
```

Description

This is WriteFields, a member of class IAdapterHiddenFieldsStub.

10.2.6 IAdapterHiddenFieldStub Interface

Class Hierarchy

AutoAdap.IAdapterHiddenFieldStub

Pascal

```
IAdapterHiddenFieldStub = interface;
```

C++

```
__interface IAdapterHiddenFieldStub;
```

File

AutoAdap

Description

This is class AutoAdap.IAdapterHiddenFieldStub.

10.2.6.1 IAdapterHiddenFieldStub Members

The following tables list the members exposed by IAdapterHiddenFieldStub.

Public Methods

	Name	Description
	Get_Name (see page 1452)	This is Get_Name, a member of class IAdapterHiddenFieldStub.
	Get_Value (see page 1452)	This is Get_Value, a member of class IAdapterHiddenFieldStub.

Public Properties

	Name	Description
R	Name (see page 1452)	This is Name, a member of class IAdapterHiddenFieldStub.
R	Value (see page 1453)	This is Value, a member of class IAdapterHiddenFieldStub.

10.2.6.2 IAdapterHiddenFieldStub Methods

The methods of the IAdapterHiddenFieldStub class are listed here.

Public Methods

	Name	Description
	Get_Name (see page 1452)	This is Get_Name, a member of class IAdapterHiddenFieldStub.
	Get_Value (see page 1452)	This is Get_Value, a member of class IAdapterHiddenFieldStub.

10.2.6.2.1 IAdapterHiddenFieldStub.Get_Name Method

Pascal

```
function Get_Name: string;
```

C++

```
__fastcall AnsiString Get_Name();
```

Description

This is Get_Name, a member of class IAdapterHiddenFieldStub.

10.2.6.2.2 IAdapterHiddenFieldStub.Get_Value Method

Pascal

```
function Get_Value: string;
```

C++

```
__fastcall AnsiString Get_Value();
```

Description

This is Get_Value, a member of class IAdapterHiddenFieldStub.

10.2.6.3 IAdapterHiddenFieldStub Properties

The properties of the IAdapterHiddenFieldStub class are listed here.

Public Properties

	Name	Description
R	Name (see page 1452)	This is Name, a member of class IAdapterHiddenFieldStub.
R	Value (see page 1453)	This is Value, a member of class IAdapterHiddenFieldStub.

10.2.6.3.1 IAdapterHiddenFieldStub.Name Property

Pascal

```
property Name: string;
```

C++

```
__property AnsiString Name;
```

Description

This is Name, a member of class IAdapterHiddenFieldStub.

10.2.6.3.2 IAdapterHiddenFieldStub.Value Property

Pascal

```
property Value: string;
```

C++

```
__property AnsiString Value;
```

Description

This is Value, a member of class IAdapterHiddenFieldStub.

10.2.7 IAdapterImageStub Interface

Class Hierarchy

AutoAdap.IAdapterImageStub

Pascal

```
IAdapterImageStub = interface;
```

C++

```
__interface IAdapterImageStub;
```

File

AutoAdap

Description

This is class AutoAdap.IAdapterImageStub.

10.2.7.1 IAdapterImageStub Members

The following tables list the members exposed by IAdapterImageStub.

Public Methods

	Name	Description
	Get_AsHREF (see page 1454)	This is Get_AsHREF, a member of class IAdapterImageStub.

Public Properties

	Name	Description
R	AsHREF (see page 1454)	This is AsHREF, a member of class IAdapterImageStub.

10.2.7.2 IAdapterImageStub Methods

The methods of the IAdapterImageStub class are listed here.

Public Methods

	Name	Description
	Get_AsHREF (see page 1454)	This is Get_AsHREF, a member of class IAdapterImageStub.

10.2.7.2.1 IAdapterImageStub.Get_AsHREF Method

Pascal

```
function Get_AsHREF: string;
```

C++

```
__fastcall AnsiString Get_AsHREF();
```

Description

This is Get_AsHREF, a member of class IAdapterImageStub.

10.2.7.3 IAdapterImageStub Properties

The properties of the IAdapterImageStub class are listed here.

Public Properties

	Name	Description
	AsHREF (see page 1454)	This is AsHREF, a member of class IAdapterImageStub.

10.2.7.3.1 IAdapterImageStub.AsHREF Property

Pascal

```
property AsHREF: string;
```

C++

```
__property AnsiString AsHREF;
```

Description

This is AsHREF, a member of class IAdapterImageStub.

10.2.8 IAdapterRecordStub Interface

Class Hierarchy

Pascal

```
IAdapterRecordStub = interface(IBaseAdapterStub);
```

C++

```
__interface IAdapterRecordStub : public IBaseAdapterStub;
```

File

AutoAdap

Description

This is class AutoAdap.IAdapterRecordStub.

10.2.9 IAdapterStub Interface

Class Hierarchy

Pascal

```
IAdapterStub = interface(IBaseRecordsAdapterStub);
```

C++

```
__interface IAdapterStub : public IBaseRecordsAdapterStub;
```

File

AutoAdap

Description

This is class AutoAdap.IAdapterStub.

10.2.9.1 IAdapterStub Members

The following tables list the members exposed by IAdapterStub.

Public Methods

	Name	Description
	Get_Actions (see page 1467)	This is Get_Actions, a member of class IBaseAdapterStub.
	Get_CanModify (see page 1456)	This is Get_CanModify, a member of class IAdapterStub.
	Get_CanView (see page 1456)	This is Get_CanView, a member of class IAdapterStub.
	Get_ClassName_ (see page 1467)	This is Get_ClassName_, a member of class IBaseAdapterStub.
	Get_Errors (see page 1456)	This is Get_Errors, a member of class IAdapterStub.
	Get_Fields (see page 1467)	This is Get_Fields, a member of class IBaseAdapterStub.
	Get_HiddenFields (see page 1457)	This is Get_HiddenFields, a member of class IAdapterStub.
	Get_HiddenRecordFields (see page 1457)	This is Get_HiddenRecordFields, a member of class IAdapterStub.
	Get_Mode (see page 1457)	This is Get_Mode, a member of class IAdapterStub.
	Get_Name_ (see page 1467)	This is Get_Name_, a member of class IBaseAdapterStub.
	Get_Records (see page 1469)	This is Get_Records, a member of class IBaseRecordsAdapterStub.
	Set_Mode (see page 1457)	This is Set_Mode, a member of class IAdapterStub.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	CanModify (see page 1458)	This is CanModify, a member of class IAdapterStub.
R	CanView (see page 1458)	This is CanView, a member of class IAdapterStub.
R	Errors (see page 1458)	This is Errors, a member of class IAdapterStub.
R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.
R	HiddenFields (see page 1458)	This is HiddenFields, a member of class IAdapterStub.
R	HiddenRecordFields (see page 1459)	This is HiddenRecordFields, a member of class IAdapterStub.
	Mode (see page 1459)	This is Mode, a member of class IAdapterStub.
R	Records (see page 1469)	This is Records, a member of class IBaseRecordsAdapterStub.

10.2.9.2 IAdapterStub Methods

The methods of the IAdapterStub class are listed here.

Public Methods

	Name	Description
	Get_CanModify (see page 1456)	This is Get_CanModify, a member of class IAdapterStub.
	Get_CanView (see page 1456)	This is Get_CanView, a member of class IAdapterStub.
	Get_Errors (see page 1456)	This is Get_Errors, a member of class IAdapterStub.
	Get_HiddenFields (see page 1457)	This is Get_HiddenFields, a member of class IAdapterStub.
	Get_HiddenRecordFields (see page 1457)	This is Get_HiddenRecordFields, a member of class IAdapterStub.
	Get_Mode (see page 1457)	This is Get_Mode, a member of class IAdapterStub.
	Set_Mode (see page 1457)	This is Set_Mode, a member of class IAdapterStub.

10.2.9.2.1 IAdapterStub.Get_CanModify Method

Pascal

```
function Get_CanModify: Boolean;
```

C++

```
__fastcall Boolean Get_CanModify();
```

Description

This is Get_CanModify, a member of class IAdapterStub.

10.2.9.2.2 IAdapterStub.Get_CanView Method

Pascal

```
function Get_CanView: Boolean;
```

C++

```
__fastcall Boolean Get_CanView();
```

Description

This is Get_CanView, a member of class IAdapterStub.

10.2.9.2.3 IAdapterStub.Get_Errors Method

Pascal

```
function Get_Errors: IInterface;
```

C++

```
__fastcall IInterface Get_Errors();
```

Description

This is Get_Errors, a member of class IAdapterStub.

10.2.9.2.4 IAdapterStub.Get_HiddenFields Method

Pascal

```
function Get_HiddenFields: IInterface;
```

C++

```
__fastcall IInterface Get_HiddenFields();
```

Description

This is Get_HiddenFields, a member of class IAdapterStub.

10.2.9.2.5 IAdapterStub.Get_HiddenRecordFields Method

Pascal

```
function Get_HiddenRecordFields: IInterface;
```

C++

```
__fastcall IInterface Get_HiddenRecordFields();
```

Description

This is Get_HiddenRecordFields, a member of class IAdapterStub.

10.2.9.2.6 IAdapterStub.Get_Mode Method

Pascal

```
function Get_Mode: string;
```

C++

```
__fastcall AnsiString Get_Mode();
```

Description

This is Get_Mode, a member of class IAdapterStub.

10.2.9.2.7 IAdapterStub.Set_Mode Method

Pascal

```
procedure Set_Mode(const Value: string);
```

C++

```
__fastcall Set_Mode(const AnsiString Value);
```

Description

This is Set_Mode, a member of class IAdapterStub.

10.2.9.3 IAdapterStub Properties

The properties of the IAdapterStub class are listed here.

Public Properties

	Name	Description
R	CanModify (see page 1458)	This is CanModify, a member of class IAdapterStub.
R	CanView (see page 1458)	This is CanView, a member of class IAdapterStub.
R	Errors (see page 1458)	This is Errors, a member of class IAdapterStub.
R	HiddenFields (see page 1458)	This is HiddenFields, a member of class IAdapterStub.
R	HiddenRecordFields (see page 1459)	This is HiddenRecordFields, a member of class IAdapterStub.
	Mode (see page 1459)	This is Mode, a member of class IAdapterStub.

10.2.9.3.1 IAdapterStub.CanModify Property

Pascal

```
property CanModify: Boolean;
```

C++

```
__property Boolean CanModify;
```

Description

This is CanModify, a member of class IAdapterStub.

10.2.9.3.2 IAdapterStub.CanView Property

Pascal

```
property CanView: Boolean;
```

C++

```
__property Boolean CanView;
```

Description

This is CanView, a member of class IAdapterStub.

10.2.9.3.3 IAdapterStub.Errors Property

Pascal

```
property Errors: IInterface;
```

C++

```
__property IInterface Errors;
```

Description

This is Errors, a member of class IAdapterStub.

10.2.9.3.4 IAdapterStub.HiddenFields Property

Pascal

```
property HiddenFields: IInterface;
```

C++

```
__property IInterface HiddenFields;
```

Description

This is HiddenFields, a member of class IAdapterStub.

10.2.9.3.5 IAdapterStub.HiddenRecordFields Property

Pascal

```
property HiddenRecordFields: IInterface;
```

C++

```
__property IInterface HiddenRecordFields;
```

Description

This is HiddenRecordFields, a member of class IAdapterStub.

10.2.9.3.6 IAdapterStub.Mode Property

Pascal

```
property Mode: string;
```

C++

```
__property AnsiString Mode;
```

Description

This is Mode, a member of class IAdapterStub.

10.2.10 IAdapterValuesListStub Interface

Class Hierarchy

Pascal

```
IAdapterValuesListStub = interface(IBaseRecordsAdapterStub);
```

C++

```
__interface IAdapterValuesListStub : public IBaseRecordsAdapterStub;
```

File

AutoAdap

Description

This is class AutoAdap.IAdapterValuesListStub.

10.2.10.1 IAdapterValuesListStub Members

The following tables list the members exposed by IAdapterValuesListStub.

Public Methods

	Name	Description
	Get_Actions (see page 1467)	This is Get_Actions, a member of class IBaseAdapterStub.
	Get_ClassName_ (see page 1467)	This is Get_ClassName_, a member of class IBaseAdapterStub.
	Get_Fields (see page 1467)	This is Get_Fields, a member of class IBaseAdapterStub.
	Get_Image (see page 1460)	This is Get_Image, a member of class IAdapterValuesListStub.
	Get_Name_ (see page 1467)	This is Get_Name_, a member of class IBaseAdapterStub.
	Get_Records (see page 1469)	This is Get_Records, a member of class IBaseRecordsAdapterStub.
	Get_Value (see page 1460)	This is Get_Value, a member of class IAdapterValuesListStub.
	Get_ValueName (see page 1461)	This is Get_ValueName, a member of class IAdapterValuesListStub.
	ImageOfValue (see page 1461)	This is ImageOfValue, a member of class IAdapterValuesListStub.
	NameOfValue (see page 1461)	This is NameOfValue, a member of class IAdapterValuesListStub.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.
R	Image (see page 1461)	This is Image, a member of class IAdapterValuesListStub.
R	Records (see page 1469)	This is Records, a member of class IBaseRecordsAdapterStub.
R	Value (see page 1462)	This is Value, a member of class IAdapterValuesListStub.
R	ValueName (see page 1462)	This is ValueName, a member of class IAdapterValuesListStub.

10.2.10.2 IAdapterValuesListStub Methods

The methods of the IAdapterValuesListStub class are listed here.

Public Methods

	Name	Description
	Get_Image (see page 1460)	This is Get_Image, a member of class IAdapterValuesListStub.
	Get_Value (see page 1460)	This is Get_Value, a member of class IAdapterValuesListStub.
	Get_ValueName (see page 1461)	This is Get_ValueName, a member of class IAdapterValuesListStub.
	ImageOfValue (see page 1461)	This is ImageOfValue, a member of class IAdapterValuesListStub.
	NameOfValue (see page 1461)	This is NameOfValue, a member of class IAdapterValuesListStub.

10.2.10.2.1 IAdapterValuesListStub.Get_Image Method

Pascal

```
function Get_Image: IInterface;
```

C++

```
__fastcall IInterface Get_Image();
```

Description

This is Get_Image, a member of class IAdapterValuesListStub.

10.2.10.2.2 IAdapterValuesListStub.Get_Value Method

Pascal

```
function Get_Value: Variant;
```

C++

```
__fastcall Variant Get_Value();
```

Description

This is Get_Value, a member of class IAdapterValuesListStub.

10.2.10.2.3 IAdapterValuesListStub.Get_ValueName Method

Pascal

```
function Get_ValueName: string;
```

C++

```
__fastcall AnsiString Get_ValueName();
```

Description

This is Get_ValueName, a member of class IAdapterValuesListStub.

10.2.10.2.4 IAdapterValuesListStub.ImageOfValue Method

Pascal

```
function ImageOfValue(Value: Variant): IInterface;
```

C++

```
__fastcall IInterface ImageOfValue(Variant Value);
```

Description

This is ImageOfValue, a member of class IAdapterValuesListStub.

10.2.10.2.5 IAdapterValuesListStub.NameOfValue Method

Pascal

```
function NameOfValue(Value: Variant): string;
```

C++

```
__fastcall AnsiString NameOfValue(Variant Value);
```

Description

This is NameOfValue, a member of class IAdapterValuesListStub.

10.2.10.3 IAdapterValuesListStub Properties

The properties of the IAdapterValuesListStub class are listed here.

Public Properties

	Name	Description
R	Image (see page 1461)	This is Image, a member of class IAdapterValuesListStub.
R	Value (see page 1462)	This is Value, a member of class IAdapterValuesListStub.
R	ValueName (see page 1462)	This is ValueName, a member of class IAdapterValuesListStub.

10.2.10.3.1 IAdapterValuesListStub.Image Property

Pascal

```
property Image: IInterface;
```

C++

```
__property IInterface Image;
```

Description

This is Image, a member of class IAdapterValuesListStub.

10.2.10.3.2 IAdapterValuesListStub.Value Property

Pascal

```
property Value: Variant;
```

C++

```
__property Variant Value;
```

Description

This is Value, a member of class IAdapterValuesListStub.

10.2.10.3.3 IAdapterValuesListStub.ValueName Property

Pascal

```
property ValueName: string;
```

C++

```
__property AnsiString ValueName;
```

Description

This is ValueName, a member of class IAdapterValuesListStub.

10.2.11 IApplicationStub Interface

Class Hierarchy

Pascal

```
IApplicationStub = interface(IAdapterStub);
```

C++

```
__interface IApplicationStub : public IAdapterStub;
```

File

AutoAdap

Description

This is class AutoAdap.IApplicationStub.

10.2.11.1 IApplicationStub Members

The following tables list the members exposed by IApplicationStub.

Public Methods

	Name	Description
	Get_Actions (see page 1467)	This is Get_Actions, a member of class IBaseAdapterStub.
	Get_CanModify (see page 1456)	This is Get_CanModify, a member of class IAdapterStub.
	Get_CanView (see page 1456)	This is Get_CanView, a member of class IAdapterStub.
	Get_ClassName_ (see page 1467)	This is Get_ClassName_, a member of class IBaseAdapterStub.
	Get_Designing (see page 1463)	This is Get_Designing, a member of class IApplicationStub.
	Get_Errors (see page 1456)	This is Get_Errors, a member of class IAdapterStub.
	Get_Fields (see page 1467)	This is Get_Fields, a member of class IBaseAdapterStub.
	Get_HiddenFields (see page 1457)	This is Get_HiddenFields, a member of class IAdapterStub.
	Get_HiddenRecordFields (see page 1457)	This is Get_HiddenRecordFields, a member of class IAdapterStub.
	Get_Mode (see page 1457)	This is Get_Mode, a member of class IAdapterStub.
	Get_ModuleFileName (see page 1464)	This is Get_ModuleFileName, a member of class IApplicationStub.
	Get_ModulePath (see page 1464)	This is Get_ModulePath, a member of class IApplicationStub.
	Get_Name_ (see page 1467)	This is Get_Name_, a member of class IBaseAdapterStub.
	Get_Records (see page 1469)	This is Get_Records, a member of class IBaseRecordsAdapterStub.
	Get_Title (see page 1464)	This is Get_Title, a member of class IApplicationStub.
	QualifyFileName (see page 1464)	This is QualifyFileName, a member of class IApplicationStub.
	Set_Mode (see page 1457)	This is Set_Mode, a member of class IAdapterStub.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	CanModify (see page 1458)	This is CanModify, a member of class IAdapterStub.
R	CanView (see page 1458)	This is CanView, a member of class IAdapterStub.
R	Designing (see page 1465)	This is Designing, a member of class IApplicationStub.
R	Errors (see page 1458)	This is Errors, a member of class IAdapterStub.
R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.
R	HiddenFields (see page 1458)	This is HiddenFields, a member of class IAdapterStub.
R	HiddenRecordFields (see page 1459)	This is HiddenRecordFields, a member of class IAdapterStub.
	Mode (see page 1459)	This is Mode, a member of class IAdapterStub.
R	ModuleFileName (see page 1465)	This is ModuleFileName, a member of class IApplicationStub.
R	ModulePath (see page 1465)	This is ModulePath, a member of class IApplicationStub.
R	Records (see page 1469)	This is Records, a member of class IBaseRecordsAdapterStub.
R	Title (see page 1465)	This is Title, a member of class IApplicationStub.

10.2.11.2 IApplicationStub Methods

The methods of the IApplicationStub class are listed here.

Public Methods

	Name	Description
	Get_Designing (see page 1463)	This is Get_Designing, a member of class IApplicationStub.
	Get_ModuleFileName (see page 1464)	This is Get_ModuleFileName, a member of class IApplicationStub.
	Get_ModulePath (see page 1464)	This is Get_ModulePath, a member of class IApplicationStub.
	Get_Title (see page 1464)	This is Get_Title, a member of class IApplicationStub.
	QualifyFileName (see page 1464)	This is QualifyFileName, a member of class IApplicationStub.

10.2.11.2.1 IApplicationStub.Get_Designing Method

Pascal

```
function Get_Designing: Boolean;
```

C++

```
__fastcall Boolean Get_Designing();
```

Description

This is Get_Designing, a member of class IApplicationStub.

10.2.11.2.2 IApplicationStub.Get_ModuleFileName Method

Pascal

```
function Get_ModuleFileName: string;
```

C++

```
__fastcall AnsiString Get_ModuleFileName();
```

Description

This is Get_ModuleFileName, a member of class IApplicationStub.

10.2.11.2.3 IApplicationStub.Get_ModulePath Method

Pascal

```
function Get_ModulePath: string;
```

C++

```
__fastcall AnsiString Get_ModulePath();
```

Description

This is Get_ModulePath, a member of class IApplicationStub.

10.2.11.2.4 IApplicationStub.Get_Title Method

Pascal

```
function Get_Title: string;
```

C++

```
__fastcall AnsiString Get_Title();
```

Description

This is Get_Title, a member of class IApplicationStub.

10.2.11.2.5 IApplicationStub.QualifyFileName Method

Pascal

```
function QualifyFileName(const FileName: PChar): string;
```

C++

```
__fastcall AnsiString QualifyFileName(const const char * FileName);
```

Description

This is QualifyFileName, a member of class IApplicationStub.

10.2.11.3 IApplicationStub Properties

The properties of the IApplicationStub class are listed here.

Public Properties

	Name	Description
R	Designing (see page 1465)	This is Designing, a member of class IApplicationStub.
R	ModuleFileName (see page 1465)	This is ModuleFileName, a member of class IApplicationStub.
R	ModulePath (see page 1465)	This is ModulePath, a member of class IApplicationStub.
R	Title (see page 1465)	This is Title, a member of class IApplicationStub.

10.2.11.3.1 IApplicationStub.Designing Property

Pascal

```
property Designing: Boolean;
```

C++

```
__property Boolean Designing;
```

Description

This is Designing, a member of class IApplicationStub.

10.2.11.3.2 IApplicationStub.ModuleFileName Property

Pascal

```
property ModuleFileName: string;
```

C++

```
__property AnsiString ModuleFileName;
```

Description

This is ModuleFileName, a member of class IApplicationStub.

10.2.11.3.3 IApplicationStub.ModulePath Property

Pascal

```
property ModulePath: string;
```

C++

```
__property AnsiString ModulePath;
```

Description

This is ModulePath, a member of class IApplicationStub.

10.2.11.3.4 IApplicationStub.Title Property

Pascal

```
property Title: string;
```

C++

```
__property AnsiString Title;
```

Description

This is Title, a member of class IApplicationStub.

10.2.12 IBaseAdapterStub Interface

Class Hierarchy

Pascal

```
IBaseAdapterStub = interface(IComponentsStub);
```

C++

```
__interface IBaseAdapterStub : public IComponentsStub;
```

File

AutoAdap

Description

This is class AutoAdap.IBaseAdapterStub.

10.2.12.1 IBaseAdapterStub Members

The following tables list the members exposed by IBaseAdapterStub.

Public Methods

	Name	Description
	Get_Actions (see page 1467)	This is Get_Actions, a member of class IBaseAdapterStub.
	Get_ClassName_ (see page 1467)	This is Get_ClassName_, a member of class IBaseAdapterStub.
	Get_Fields (see page 1467)	This is Get_Fields, a member of class IBaseAdapterStub.
	Get_Name_ (see page 1467)	This is Get_Name_, a member of class IBaseAdapterStub.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.

10.2.12.2 IBaseAdapterStub Methods

The methods of the IBaseAdapterStub class are listed here.

Public Methods

	Name	Description
	Get_Actions (see page 1467)	This is Get_Actions, a member of class IBaseAdapterStub.
	Get_ClassName_ (see page 1467)	This is Get_ClassName_, a member of class IBaseAdapterStub.
	Get_Fields (see page 1467)	This is Get_Fields, a member of class IBaseAdapterStub.

	Get_Name_ (see page 1467)	This is Get_Name_, a member of class IBaseAdapterStub.

10.2.12.2.1 IBaseAdapterStub.Get_Actions Method

Pascal

```
function Get_Actions: IInterface;
```

C++

```
__fastcall IInterface Get_Actions();
```

Description

This is Get_Actions, a member of class IBaseAdapterStub.

10.2.12.2.2 IBaseAdapterStub.Get_ClassName_ Method

Pascal

```
function Get_ClassName_: string;
```

C++

```
__fastcall AnsiString Get_ClassName_();
```

Description

This is Get_ClassName_, a member of class IBaseAdapterStub.

10.2.12.2.3 IBaseAdapterStub.Get_Fields Method

Pascal

```
function Get_Fields: IInterface;
```

C++

```
__fastcall IInterface Get_Fields();
```

Description

This is Get_Fields, a member of class IBaseAdapterStub.

10.2.12.2.4 IBaseAdapterStub.Get_Name_ Method

Pascal

```
function Get_Name_: string;
```

C++

```
__fastcall AnsiString Get_Name_();
```

Description

This is Get_Name_, a member of class IBaseAdapterStub.

10.2.12.3 IBaseAdapterStub Properties

The properties of the IBaseAdapterStub class are listed here.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.

10.2.12.3.1 IBaseAdapterStub.Actions Property

Pascal

```
property Actions: IInterface;
```

C++

```
__property IInterface Actions;
```

Description

This is Actions, a member of class IBaseAdapterStub.

10.2.12.3.2 IBaseAdapterStub.Fields Property

Pascal

```
property Fields: IInterface;
```

C++

```
__property IInterface Fields;
```

Description

This is Fields, a member of class IBaseAdapterStub.

10.2.13 IBaseRecordsAdapterStub Interface

Class Hierarchy

Pascal

```
IBaseRecordsAdapterStub = interface(IBaseAdapterStub);
```

C++

```
__interface IBaseRecordsAdapterStub : public IBaseAdapterStub;
```

File

AutoAdap

Description

This is class AutoAdap.IBaseRecordsAdapterStub.

10.2.13.1 IBaseRecordsAdapterStub Members

The following tables list the members exposed by IBaseRecordsAdapterStub.

Public Methods

	Name	Description
	Get_Actions (see page 1467)	This is Get_Actions, a member of class IBaseAdapterStub.
	Get_ClassName_ (see page 1467)	This is Get_ClassName_, a member of class IBaseAdapterStub.
	Get_Fields (see page 1467)	This is Get_Fields, a member of class IBaseAdapterStub.
	Get_Name_ (see page 1467)	This is Get_Name_, a member of class IBaseAdapterStub.
	Get_Records (see page 1469)	This is Get_Records, a member of class IBaseRecordsAdapterStub.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.
R	Records (see page 1469)	This is Records, a member of class IBaseRecordsAdapterStub.

10.2.13.2 IBaseRecordsAdapterStub Methods

The methods of the IBaseRecordsAdapterStub class are listed here.

Public Methods

	Name	Description
	Get_Records (see page 1469)	This is Get_Records, a member of class IBaseRecordsAdapterStub.

10.2.13.2.1 IBaseRecordsAdapterStub.Get_Records Method

Pascal

```
function Get_Records: IInterface;
```

C++

```
__fastcall IInterface Get_Records();
```

Description

This is Get_Records, a member of class IBaseRecordsAdapterStub.

10.2.13.3 IBaseRecordsAdapterStub Properties

The properties of the IBaseRecordsAdapterStub class are listed here.

Public Properties

	Name	Description
R	Records (see page 1469)	This is Records, a member of class IBaseRecordsAdapterStub.

10.2.13.3.1 IBaseRecordsAdapterStub.Records Property

Pascal

```
property Records: IInterface;
```

C++

```
__property IInterface Records;
```

Description

This is Records, a member of class IBaseRecordsAdapterStub.

10.2.14 IEndUserStub Interface

Class Hierarchy

Pascal

```
IEndUserStub = interface(IAdapterStub);
```

C++

```
__interface IEndUserStub : public IAdapterStub;
```

File

AutoAdap

Description

This is class AutoAdap.IEndUserStub.

10.2.14.1 IEndUserStub Members

The following tables list the members exposed by IEndUserStub.

Public Methods

	Name	Description
	Get_Actions (see page 1467)	This is Get_Actions, a member of class IBaseAdapterStub.
	Get_CanModify (see page 1456)	This is Get_CanModify, a member of class IAdapterStub.
	Get_CanView (see page 1456)	This is Get_CanView, a member of class IAdapterStub.
	Get_ClassName_ (see page 1467)	This is Get_ClassName_, a member of class IBaseAdapterStub.
	Get_DisplayName (see page 1471)	This is Get_DisplayName, a member of class IEndUserStub.
	Get_Errors (see page 1456)	This is Get_Errors, a member of class IAdapterStub.
	Get_Fields (see page 1467)	This is Get_Fields, a member of class IBaseAdapterStub.
	Get_HiddenFields (see page 1457)	This is Get_HiddenFields, a member of class IAdapterStub.
	Get_HiddenRecordFields (see page 1457)	This is Get_HiddenRecordFields, a member of class IAdapterStub.
	Get_LoggedIn (see page 1471)	This is Get_LoggedIn, a member of class IEndUserStub.
	Get_LoginFormAction (see page 1471)	This is Get_LoginFormAction, a member of class IEndUserStub.
	Get_LogoutAction (see page 1472)	This is Get_LogoutAction, a member of class IEndUserStub.
	Get_Mode (see page 1457)	This is Get_Mode, a member of class IAdapterStub.
	Get_Name_ (see page 1467)	This is Get_Name_, a member of class IBaseAdapterStub.
	Get_Records (see page 1469)	This is Get_Records, a member of class IBaseRecordsAdapterStub.
	Set_Mode (see page 1457)	This is Set_Mode, a member of class IAdapterStub.

Public Properties

	Name	Description
R	Actions (see page 1468)	This is Actions, a member of class IBaseAdapterStub.
R	CanModify (see page 1458)	This is CanModify, a member of class IAdapterStub.
R	CanView (see page 1458)	This is CanView, a member of class IAdapterStub.
R	DisplayName (see page 1472)	This is DisplayName, a member of class IEndUserStub.
R	Errors (see page 1458)	This is Errors, a member of class IAdapterStub.
R	Fields (see page 1468)	This is Fields, a member of class IBaseAdapterStub.
R	HiddenFields (see page 1458)	This is HiddenFields, a member of class IAdapterStub.
R	HiddenRecordFields (see page 1459)	This is HiddenRecordFields, a member of class IAdapterStub.

R	LoggedIn (see page 1472)	This is LoggedIn, a member of class IEndUserStub.
R	LoginFormAction (see page 1472)	This is LoginFormAction, a member of class IEndUserStub.
R	LogoutAction (see page 1473)	This is LogoutAction, a member of class IEndUserStub.
	Mode (see page 1459)	This is Mode, a member of class IAdapterStub.
R	Records (see page 1469)	This is Records, a member of class IBaseRecordsAdapterStub.

10.2.14.2 IEndUserStub Methods

The methods of the IEndUserStub class are listed here.

Public Methods

	Name	Description
	Get_DisplayName (see page 1471)	This is Get_DisplayName, a member of class IEndUserStub.
	Get_LoggedIn (see page 1471)	This is Get_LoggedIn, a member of class IEndUserStub.
	Get_LoginFormAction (see page 1471)	This is Get_LoginFormAction, a member of class IEndUserStub.
	Get_LogoutAction (see page 1472)	This is Get_LogoutAction, a member of class IEndUserStub.

10.2.14.2.1 IEndUserStub.Get_DisplayName Method

Pascal

```
function Get_DisplayName: string;
```

C++

```
__fastcall AnsiString Get_DisplayName();
```

Description

This is Get_DisplayName, a member of class IEndUserStub.

10.2.14.2.2 IEndUserStub.Get_LoggedIn Method

Pascal

```
function Get_LoggedIn: Boolean;
```

C++

```
__fastcall Boolean Get_LoggedIn();
```

Description

This is Get_LoggedIn, a member of class IEndUserStub.

10.2.14.2.3 IEndUserStub.Get_LoginFormAction Method

Pascal

```
function Get_LoginFormAction: IInterface;
```

C++

```
__fastcall IInterface Get_LoginFormAction();
```

Description

This is Get_LoginFormAction, a member of class IEndUserStub.

10.2.14.2.4 IEndUserStub.Get_LogoutAction Method

Pascal

```
function Get_LogoutAction: IInterface;
```

C++

```
__fastcall IInterface Get_LogoutAction();
```

Description

This is Get_LogoutAction, a member of class IEndUserStub.

10.2.14.3 IEndUserStub Properties

The properties of the IEndUserStub class are listed here.

Public Properties

	Name	Description
R	DisplayName (see page 1472)	This is DisplayName, a member of class IEndUserStub.
R	LoggedIn (see page 1472)	This is LoggedIn, a member of class IEndUserStub.
R	LoginFormAction (see page 1472)	This is LoginFormAction, a member of class IEndUserStub.
R	LogoutAction (see page 1473)	This is LogoutAction, a member of class IEndUserStub.

10.2.14.3.1 IEndUserStub.DisplayName Property

Pascal

```
property DisplayName: string;
```

C++

```
__property AnsiString DisplayName;
```

Description

This is DisplayName, a member of class IEndUserStub.

10.2.14.3.2 IEndUserStub.LoggedIn Property

Pascal

```
property LoggedIn: Boolean;
```

C++

```
__property Boolean LoggedIn;
```

Description

This is LoggedIn, a member of class IEndUserStub.

10.2.14.3.3 IEndUserStub.LoginFormAction Property

Pascal

```
property LoginFormAction: IInterface;
```

C++

```
__property IInterface LoginFormAction;
```

Description

This is LoginFormAction, a member of class IEndUserStub.

10.2.14.3.4 IEndUserStub.LogoutAction Property

Pascal

```
property LogoutAction: IInterface;
```

C++

```
__property IInterface LogoutAction;
```

Description

This is LogoutAction, a member of class IEndUserStub.

10.2.15 IImageProducerStub Interface

Class Hierarchy

AutoAdap.IImageProducerStub

Pascal

```
IImageProducerStub = interface;
```

C++

```
__interface IImageProducerStub;
```

File

AutoAdap

Description

This is class AutoAdap.IImageProducerStub.

10.2.15.1 IImageProducerStub Members

The following tables list the members exposed by IImageProducerStub.

Public Methods

	Name	Description
	GetDisplayStyle (see page 1474)	This is GetDisplayStyle, a member of class IImageProducerStub.
	GetEventImage (see page 1474)	This is GetEventImage, a member of class IImageProducerStub.
	GetImage (see page 1474)	This is GetImage, a member of class IImageProducerStub.

10.2.15.2 IImageProducerStub Methods

The methods of the IImageProducerStub class are listed here.

Public Methods

	Name	Description
	GetDisplayStyle (see page 1474)	This is GetDisplayStyle, a member of class IImageProducerStub.
	GetEventImage (see page 1474)	This is GetEventImage, a member of class IImageProducerStub.
	GetImage (see page 1474)	This is GetImage, a member of class IImageProducerStub.

10.2.15.2.1 IImageProducerStub.GetDisplayStyle Method

Pascal

```
function GetDisplayStyle(const Object_: IUnknown): string;
```

C++

```
__fastcall AnsiString GetDisplayStyle(const IUnknown Object_);
```

Description

This is GetDisplayStyle, a member of class IImageProducerStub.

10.2.15.2.2 IImageProducerStub.GetEventImage Method

Pascal

```
function GetEventImage(const Object_: IUnknown; const Event: string; const Caption: string):
IInterface;
```

C++

```
__fastcall IInterface GetEventImage(const IUnknown Object_, const AnsiString Event, const
AnsiString Caption);
```

Description

This is GetEventImage, a member of class IImageProducerStub.

10.2.15.2.3 IImageProducerStub.GetImage Method

Pascal

```
function GetImage(const Object_: IUnknown; const Caption: string): IInterface;
```

C++

```
__fastcall IInterface GetImage(const IUnknown Object_, const AnsiString Caption);
```

Description

This is GetImage, a member of class IImageProducerStub.

10.3 Types

The following table lists types in this documentation.

Types

Name	Description
TAdapterStubClass (see page 1475)	This is type AutoAdap.TAdapterStubClass.

10.3.1 AutoAdap.TAdapterStubClass Type

Pascal

```
TAdapterStubClass = class of TBaseAdapterStub;
```

C++

```
TBaseAdapterStub TAdapterStubClass;
```

File

AutoAdap

Description

This is type AutoAdap.TAdapterStubClass.

11 AutoDisp Namespace

This is namespace AutoDisp.

Topics

Name	Description
Classes (see page 1478)	The following table lists classes in this documentation.

Classes

	Name	Description
	TWebDispatch (see page 1478)	TWebDispatch describes the HTTP messages to which an auto-dispatching component responds.
	TWebPathInfo (see page 1483)	TWebPathInfo describes the HTTP messages to which an auto-dispatching component responds.

11.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TWebDispatch (see page 1478)	TWebDispatch describes the HTTP messages to which an auto-dispatching component responds.
	TWebPathInfo (see page 1483)	TWebPathInfo describes the HTTP messages to which an auto-dispatching component responds.

11.1.1 TWebDispatch Class

TWebDispatch describes the HTTP messages to which an auto-dispatching component responds.

Class Hierarchy

Pascal

```
TWebDispatch = class(TPersistent);
```

C++

```
class TWebDispatch : public TPersistent;
```

File

AutoDisp

Description

TWebDispatch implements the WebDispatch property of an auto-dispatching component such as TXMLBroker, THTTPSoapDispatcher, or TWSDLHTMLPublish. It specifies the path info portion of the URL for messages directed at the component, the type of messages to which the component can respond, and allows an application to disable the auto-dispatching so that it does not respond directly to HTTP messages from a Web browser.

See Also

TXMLBroker (see page 26049)

THTTPSoapDispatcher (see page 24628)

TWSDLHTMLPublish (see page 26024)

11.1.1.1 TWebDispatch Members

The following tables list the members exposed by TWebDispatch.

Protected Methods

	Name	Description
	AssignTo (see page 1480)	Copies the properties of an object to a destination object.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPathInfo (see page 1481)	This is GetPathInfo, a member of class TWebDispatch.
	SetPathInfo (see page 1481)	This is SetPathInfo, a member of class TWebDispatch.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1480)	Creates and initializes an instance of TWebDispatch (see page 1478).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 1480)	Destroys an instance of TWebDispatch (see page 1478).
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Mask (see page 1482)	Provides a mask object for comparing the PathInfo (see page 1483) property with another path.

Published Properties

	Name	Description
	Enabled (see page 1482)	Indicates whether the Web dispatcher passes requests to the object using the TWebDispatch (see page 1478) object.
	MethodType (see page 1483)	This is MethodType, a member of class TWebDispatch.
	PathInfo (see page 1483)	Indicates the path portion of the Uniform Resource Identifier (URI) for which the auto-dispatching component handles requests.

11.1.1.2 TWebDispatch.Create Constructor

Creates and initializes an instance of TWebDispatch (see page 1478).

Pascal

```
constructor Create(AComponent: TComponent);
```

C++

```
__fastcall TWebDispatch(TComponent * AComponent);
```

Description

The TWebDispatch (see page 1478) constructor is called from the constructor of the auto-dispatching component that uses it to implement its WebDispatch property. The AComponent parameter specifies the auto-dispatching component that uses the TWebDispatch (see page 1478) instance.

11.1.1.3 TWebDispatch.Destroy Destructor

Destroys an instance of TWebDispatch (see page 1478).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebDispatch();
```

Description

Do not call Destroy. The TWebDispatch (see page 1478) instance is freed by the auto-dispatching component that uses it.

11.1.1.4 TWebDispatch Methods

The methods of the TWebDispatch class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 1480)	Copies the properties of an object to a destination object.
	GetPathInfo (see page 1481)	This is GetPathInfo, a member of class TWebDispatch.
	SetPathInfo (see page 1481)	This is SetPathInfo, a member of class TWebDispatch.

11.1.1.4.1 TWebDispatch.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should

be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign (see page 2930)

EConvertError (see page 22724)

11.1.1.4.2 TWebDispatch.GetPathInfo Method

Pascal

```
function GetPathInfo: string;
```

C++

```
__fastcall AnsiString GetPathInfo();
```

Description

This is GetPathInfo, a member of class TWebDispatch.

11.1.1.4.3 TWebDispatch.SetPathInfo Method

Pascal

```
procedure SetPathInfo(const Value: string);
```

C++

```
__fastcall SetPathInfo(const AnsiString Value);
```

Description

This is SetPathInfo, a member of class TWebDispatch.

11.1.1.5 TWebDispatch Properties

The properties of the TWebDispatch class are listed here.

Public Properties

	Name	Description
R	Mask (see page 1482)	Provides a mask object for comparing the PathInfo (see page 1483) property with another path.

Published Properties

	Name	Description
	Enabled (see page 1482)	Indicates whether the Web dispatcher passes requests to the object using the TWebDispatch (see page 1478) object.
	MethodType (see page 1483)	This is MethodType, a member of class TWebDispatch.
	PathInfo (see page 1483)	Indicates the path portion of the Uniform Resource Identifier (URI) for which the auto-dispatching component handles requests.

11.1.1.5.1 TWebDispatch.Enabled Property

Indicates whether the Web dispatcher passes requests to the object using the TWebDispatch (see page 1478) object.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Set Enabled to indicate whether the object using the Web dispatcher responds directly to HTTP request messages. By default, Enabled is true, but an application may disable the auto-dispatching of a component because

The application responds to request messages using an action item on the Web dispatcher rather than using the auto-dispatch feature of the component that uses TWebDispatch (see page 1478) as its WebDispatch property. Action items give you greater control over the order in which the dispatcher passes a request message on for handling, and let you embed the default action of the auto-dispatching component with other actions performed by the action item.

The application uses other features of the auto-dispatching component but does not want it to respond to HTTP request messages. For example, a Web client may include an XML broker to provide data packets that appear in the generated HTML pages, but not allow Web browsers to apply updates. When Enabled is false, the Web dispatcher does not pass update messages on to the XML broker.

See Also

TWebActionItem (see page 15130)

Actions (see page 15122)

11.1.1.5.2 TWebDispatch.Mask Property

Provides a mask object for comparing the PathInfo (see page 1483) property with another path.

Pascal

```
property Mask: TMask;
```

C++

```
__property TMask Mask;
```

Description

Use Mask to compare the PathInfo (see page 1483) property with the path portion of a URL. Mask is a TMask object that represents the string specified by PathInfo (see page 1483).

See Also

PathInfo (see page 1483)

11.1.1.5.3 TWebDispatch.MethodType Property

Pascal

```
property MethodType: TMethodType;
```

C++

```
__property TMethodType MethodType;
```

Description

This is MethodType, a member of class TWebDispatch.

11.1.1.5.4 TWebDispatch.PathInfo Property

Indicates the path portion of the Uniform Resource Identifier (URI) for which the auto-dispatching component handles requests.

Pascal

```
property PathInfo: string;
```

C++

```
__property AnsiString PathInfo;
```

Description

Set PathInfo to the path portion of the URI for the target of any request messages serviced by the auto-dispatching component that uses TWebDispatch (see page 1478). The Web dispatcher matches components to request messages by comparing PathInfo with the path portion of the URI specified as the target of the request. If the PathInfo properties match, and the MethodType (see page 1483) matches, the Web dispatcher invokes the auto-dispatching object so that it can respond to the message.

See Also

Mask (see page 1482)

MethodType (see page 1483)

PathInfo (see page 15185)

11.1.2 TWebPathInfo Class

TWebPathInfo describes the HTTP messages to which an auto-dispatching component responds.

Class Hierarchy

AutoDisp.TWebPathInfo

Pascal

```
TWebPathInfo = class;
```

C++

```
class TWebPathInfo;
```

File

AutoDisp

Description

TWebPageInfo implements the PathInfo (see page 1485) property of an auto-dispatching component such as TWebDispatch (see page 1478). It specifies the path info portion of the URL for messages directed at the component.

11.1.2.1 TWebPathInfo Members

The following tables list the members exposed by TWebPathInfo.

Public Methods

	Name	Description
	Create (see page 1484)	This is Create, a member of class TWebPathInfo.
V	Destroy (see page 1484)	This is Destroy, a member of class TWebPathInfo.

Public Properties

	Name	Description
R	Mask (see page 1485)	Provides a mask object for comparing the PathInfo (see page 1485) property with another path.
	PathInfo (see page 1485)	Indicates the path portion of the Uniform Resource Identifier (URI) for which the auto-dispatching component handles requests.

11.1.2.2 TWebPathInfo.Create Constructor

Pascal

```
constructor Create(AOwner: TComponent);
```

C++

```
__fastcall TWebPathInfo(TComponent * AOwner);
```

Description

This is Create, a member of class TWebPathInfo.

11.1.2.3 TWebPathInfo.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebPathInfo();
```

Description

This is Destroy, a member of class TWebPathInfo.

11.1.2.4 TWebPathInfo Properties

The properties of the TWebPathInfo class are listed here.

Public Properties

	Name	Description
R	Mask (see page 1485)	Provides a mask object for comparing the PathInfo (see page 1485) property with another path.
	PathInfo (see page 1485)	Indicates the path portion of the Uniform Resource Identifier (URI) for which the auto-dispatching component handles requests.

11.1.2.4.1 TWebPathInfo.Mask Property

Provides a mask object for comparing the PathInfo (see page 1485) property with another path.

Pascal

```
property Mask: TMask;
```

C++

```
__property TMask Mask;
```

Description

Use Mask to compare the PathInfo (see page 1485) property with the path portion of a URL. Mask is a TMask object that represents the string specified by PathInfo (see page 1485).

See Also

PathInfo (see page 1485)

11.1.2.4.2 TWebPathInfo.PathInfo Property

Indicates the path portion of the Uniform Resource Identifier (URI) for which the auto-dispatching component handles requests.

Pascal

```
property PathInfo: string;
```

C++

```
__property AnsiString PathInfo;
```

Description

Set PathInfo to the path portion of the URI for the target of any request messages serviced by the auto-dispatching component that uses PathInfo. The Web dispatcher matches components to request messages by comparing PathInfo with the path portion of the URI specified as the target of the request. If the PathInfo properties match, and the MethodType matches, the Web dispatcher invokes the auto-dispatching object so that it can respond to the message.

Mask (see page 1485)

12 AxCtrls Namespace

This is namespace AxCtrls.

Topics

Name	Description
Classes (see page 1489)	The following table lists classes in this documentation.
Interfaces (see page 1702)	The following table lists interfaces in this documentation.
Functions (see page 1709)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 1714)	The following table lists structs, records, enums in this documentation.
Types (see page 1715)	The following table lists types in this documentation.
Constants (see page 1717)	The following table lists constants in this documentation.

Classes

	Name	Description
	TActiveForm (see page 1489)	TActiveForm is the base class for a VCL Form exposed as an ActiveX control. TActiveForm represents a form that is created by a class factory (in Delphi) or using the Active Template Library (C++) and used as an ActiveX control in ActiveX host applications.
	TActiveFormControl (see page 1507)	A COM object which provides the interfaces necessary to support an ActiveX control.
	TActiveFormFactory (see page 1514)	The ActiveFormFactory object is the class factory for TActiveForm (see page 1489).
	TActiveXControl (see page 1517)	TActiveXControl is an abstract class that provides the functionality to embed a VCL control into an ActiveX Container window.
	TActiveXControlFactory (see page 1554)	TActiveXControlFactory is the factory class for ActiveX control objects.
	TActiveXPropertyPage (see page 1561)	TActiveXPropertyPage represents a COM object that provides the interfaces for supporting an ActiveX property page.
	TActiveXPropertyPageFactory (see page 1564)	TActiveXPropertyPageFactory implements a COM factory for an ActiveX property page.
	TAdapterNotifier (see page 1567)	TAdapterNotifier provides the binding between a VCL type object and comparable OLE type object.
	TConnectionPoint (see page 1570)	TConnectionPoint implements the IConnectionPoint interface for a single outgoing interface.
	TConnectionPoints (see page 1575)	TConnectionPoints implements the IConnectionPointContainer interface for a COM object that generates events on clients.
	TCustomAdapter (see page 1578)	TCustomAdapter is a base class for objects that bind VCL objects to COM interfaces.
	TFontAdapter (see page 1583)	TFontAdapter is a helper class used to connect a TFont object to an OLE font object.
	TOleGraphic (see page 1587)	TOleGraphic is a wrapper for an OLE graphical interface.

	TOleStream (see page 1595)	TOleStream reads and writes information over a streaming interface that is provided by an OLE object.
	TPictureAdapter (see page 1599)	TPictureAdapter connects a native TPicture object to an OLE picture object.
	TPropertyPage (see page 1603)	TPropertyPage is the base class for controls that represent an ActiveX control's property page.
	TPropertyPageImpl (see page 1679)	TPropertyPageImpl implements the IPropertyPage interface to provide the interfaces needed to support an ActiveX property page.
	TReflectorWindow (see page 1684)	TReflectorWindow ensures that ActiveX controls respond properly to Windows messages.
	TStringsAdapter (see page 1696)	TStringsAdapter is a helper class used to allow a TStrings object to implement an IStrings interface for use with OLE.

Constants

Name	Description
Class_DColorPropPage (see page 1717)	This is constant AxCtrls.Class_DColorPropPage.
Class_DFontPropPage (see page 1717)	This is constant AxCtrls.Class_DFontPropPage.
Class_DPicturePropPage (see page 1718)	This is constant AxCtrls.Class_DPicturePropPage.
Class_DStringPropPage (see page 1718)	This is constant AxCtrls.Class_DStringPropPage.

Functions

	Name	Description
	EnumDispatchProperties (see page 1709)	Fills a TStringList will all the property names and DispIDs in a specified IDispatch interface.
	GetOleFont (see page 1710)	Creates an OLE font object that is directly mapped to a native TFont.
	GetOlePicture (see page 1710)	Creates an OLE picture object that is directly mapped to a native TPicture.
	GetOleStrings (see page 1711)	Implements a TStrings object as an IStrings interface for use by OLE objects.
	ParkingWindow (see page 1711)	Provides a temporary parent window for ActiveX controls when the container is not ready to act as a parent.
	SetOleFont (see page 1712)	Connects an OLE font object to a TFont object and copies the properties of the OLE font object to the TFont.
	SetOlePicture (see page 1712)	Connects an OLE picture object to a TPicture object, and copies the properties of the OLE picture object to the TPicture.
	SetOleStrings (see page 1713)	Uses an IStrings interface to assign the contents of a TStrings object.

Interfaces

	Name	Description
	IAmbientDispatch (see page 1702)	This is class AxCtrls.IAmbientDispatch.
	IFontAccess (see page 1706)	This is class AxCtrls.IFontAccess.
	IPictureAccess (see page 1707)	This is class AxCtrls.IPictureAccess.

Structs, Records, Enums

	Name	Description
	TConnectionKind (see page 1714)	This is record AxCtrls.TConnectionKind.

Types

Name	Description
TActiveFormClass (see page 1715)	This is type AxCtrls.TActiveFormClass.
TActiveXControlClass (see page 1715)	This is type AxCtrls.TActiveXControlClass.
TDefinePropertyPage (see page 1716)	This is type AxCtrls.TDefinePropertyPage.
TPropertyPageClass (see page 1716)	This is type AxCtrls.TPropertyPageClass.

12.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TActiveForm (see page 1489)	TActiveForm is the base class for a VCL Form exposed as an ActiveX control. TActiveForm represents a form that is created by a class factory (in Delphi) or using the Active Template Library (C++) and used as an ActiveX control in ActiveX host applications.
	TActiveFormControl (see page 1507)	A COM object which provides the interfaces necessary to support an ActiveX control.
	TActiveFormFactory (see page 1514)	The ActiveFormFactory object is the class factory for TActiveForm (see page 1489).
	TActiveXControl (see page 1517)	TActiveXControl is an abstract class that provides the functionality to embed a VCL control into an ActiveX Container window.
	TActiveXControlFactory (see page 1554)	TActiveXControlFactory is the factory class for ActiveX control objects.
	TActiveXPropertyPage (see page 1561)	TActiveXPropertyPage represents a COM object that provides the interfaces for supporting an ActiveX property page.
	TActiveXPropertyPageFactory (see page 1564)	TActiveXPropertyPageFactory implements a COM factory for an ActiveX property page.
	TAdapterNotifier (see page 1567)	TAdapterNotifier provides the binding between a VCL type object and comparable OLE type object.
	TConnectionPoint (see page 1570)	TConnectionPoint implements the IConnectionPoint interface for a single outgoing interface.
	TConnectionPoints (see page 1575)	TConnectionPoints implements the IConnectionPointContainer interface for a COM object that generates events on clients.
	TCustomAdapter (see page 1578)	TCustomAdapter is a base class for objects that bind VCL objects to COM interfaces.
	TFontAdapter (see page 1583)	TFontAdapter is a helper class used to connect a TFont object to an OLE font object.
	TOleGraphic (see page 1587)	TOleGraphic is a wrapper for an OLE graphical interface.
	TOleStream (see page 1595)	TOleStream reads and writes information over a streaming interface that is provided by an OLE object.
	TPictureAdapter (see page 1599)	TPictureAdapter connects a native TPicture object to an OLE picture object.
	TPropertyPage (see page 1603)	TPropertyPage is the base class for controls that represent an ActiveX control's property page.
	TPropertyPageImpl (see page 1679)	TPropertyPageImpl implements the IPropertyPage interface to provide the interfaces needed to support an ActiveX property page.
	TReflectorWindow (see page 1684)	TReflectorWindow ensures that ActiveX controls respond properly to Windows messages.
	TStringsAdapter (see page 1696)	TStringsAdapter is a helper class used to allow a TStrings object to implement an IStrings interface for use with OLE.

12.1.1 TActiveForm Class

TActiveForm is the base class for a VCL Form exposed as an ActiveX control. TActiveForm represents a form that is created by a class factory (in Delphi) or using the Active Template Library (C++) and used as an ActiveX control in ActiveX host applications.

Class Hierarchy

Pascal

```
TActiveForm = class(TCustomActiveForm);
```

C++

```
class TActiveForm : public TCustomActiveForm;
```

File

AxCtrls

Description

A TActiveForm object is used to create a form ActiveX control that can be displayed and run from within Web browsers.

Note: In Delphi applications, this object is created by TActiveFormControl (see page 1507). It is a descendant of this class that you design in the Form Designer when you create an ActiveForm.

See Also

TActiveFormControl (see page 1507)

TActiveFormFactory (see page 1514)

Tform

Elements of an ActiveX Control

Generating an ActiveX Control Based On a VCL Form

12.1.1.1 TActiveForm Members

The following tables list the members exposed by TActiveForm.

Protected Events

	Name	Description
	OnActivate (see page 13943)	Occurs when the form becomes active.
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnCanResize (see page 13947)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnClick (see page 13947)	Occurs when the user clicks the control.
	OnClose (see page 13949)	Occurs when the form closes.
	OnCloseQuery (see page 13950)	Occurs when close is attempted.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnCreate (see page 13951)	Occurs when the form is created.
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

	OnDblClick (see page 13953)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDeactivate (see page 13953)	Occurs when the form loses focus.
	OnDestroy (see page 13953)	Occurs when the form is destroyed.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragDrop (see page 13954)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnDragOver (see page 13957)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnHelp (see page 13959)	Occurs when the form receives a request for help.
	OnHide (see page 13960)	Occurs when the form is hidden (that is, when its Visible (see page 13940) property is set to false).
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyDown (see page 13962)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyPress (see page 13964)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnKeyUp (see page 13966)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseActivate (see page 13967)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseDown (see page 13968)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseMove (see page 13971)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseUp (see page 13973)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnPaint (see page 13975)	Occurs when the form is redrawn.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnResize (see page 13976)	Occurs immediately after the control is resized.
	OnShortCut (see page 13977)	Occurs when the user presses a key (before the OnKeyDown (see page 13962) event).
	OnShow (see page 13977)	Occurs when the form is shown (that is, when its Visible (see page 13940) property is set to true).
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFormState (see page 13863)	This is FFormState, a member of class TCustomForm.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	Activate (see page 13865)	Activation event dispatcher.
	ActiveChanged (see page 13865)	Active (see page 13896) state event dispatcher.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustClientRect (see page 14324)	Adjusts the ClientRect property to exclude the scroll bars.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
V	AlignControls (see page 13866)	Aligns all child controls of the form that fall within a specified rectangle.
V	AlignControls (see page 14325)	Aligns the controls in the scrolling windowed control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
V	AutoScrollEnabled (see page 14325)	Indicates whether automatic scrolling is enabled.
V	AutoScrollInView (see page 14325)	Scrolls a control into the visible area of the scrolling windowed control.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
V	BeginAutoDrag (see page 13867)	Responds when the user starts dragging the form if DragMode is dmAutomatic.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.

	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	ChangeScale (see page 13867)	Repositions and resizes the form by the ratio M/D, adjusting its client area and font size as needed.
	ChangeScale (see page 14326)	Resizes the scrolling windowed control by a specific ratio.
	Click (see page 5743)	Respond to user click.
	CloseModal (see page 13868)	This is CloseModal, a member of class TCustomForm.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateParams (see page 13773)	Updates the active form's creation parameters according to the value of the AxBorderStyle (see page 13777) property.
	CreateParams (see page 13868)	Initializes the window-creation parameter record when the form window is created.
	CreateParams (see page 14326)	Initializes the window creation parameters so that the entire window is not redrawn when the width or height of the client area changes.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWindowHandle (see page 13869)	Creates a form window given a set of window-creation parameters.
	CreateWnd (see page 6137)	Creates the underlying window.
	CreateWnd (see page 13869)	Creates the form window.
	CreateWnd (see page 14327)	Creates a Windows control corresponding to the TScrollingWinControl (see page 14312) object.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	Deactivate (see page 13870)	Generates an OnDeactivate (see page 13953) event.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DefineProperties (see page 13871)	Designates methods for storing a form's unpublished data on a stream such as a form file.
	DefinePropertyPages (see page 1505)	This is DefinePropertyPages, a member of class TActiveForm.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyHandle (see page 13871)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWindowHandle (see page 13872)	Destroys the window created in the CreateWindowHandle (see page 13869) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoClose (see page 13873)	Form closing event dispatcher.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoCreate (see page 13873)	Form creation event dispatcher.
	DoDestroy (see page 1505)	Form destruction event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.

	DoDock (see page 13874)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoFlipChildren (see page 14327)	Flips the control's children.
	DoHide (see page 13874)	Form hide event dispatcher.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoShow (see page 13875)	Form show event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	EventSinkChanged (see page 1506)	This is EventSinkChanged, a member of class TActiveForm.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetBorderIconStyles (see page 13875)	This is GetBorderIconStyles, a member of class TCustomForm.
	GetBorderStyles (see page 13876)	This is GetBorderStyles, a member of class TCustomForm.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetChildren (see page 13876)	Returns the "child" components of the form; that is, those components that return the form from their GetParentComponent method.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetClientRect (see page 13876)	Returns the value of the ClientRect property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.

	GetFloating (see page 13877)	Returns the value of the Floating property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetOwnerWindow (see page 13878)	This is GetOwnerWindow, a member of class TCustomForm.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleCreateException (see page 13878)	Handles exceptions that are raised by the OnCreate (see page 13951) event handler.
	Initialize (see page 1506)	This is Initialize, a member of class TActiveForm.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	Loaded (see page 13880)	Performs fix-ups when the form is first loaded into memory.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	Notification (see page 13882)	Responds to notifications that objects are about to be inserted or removed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 13882)	Generates an OnPaint (see page 13975) event.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaintWindow (see page 13882)	Renders the image of the form.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteChanged (see page 13883)	Responds to changes in the system's palette by realizing the control's palette as returned from GetPalette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.

	QueryInterface (see page 13884)	Returns a reference to a specified interface if that interface is supported by the form.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	ReadState (see page 13884)	Reads the form's published properties, stored data, and owned components from a reader object.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	RequestAlign (see page 13885)	Instructs the form's parent (if any) to reposition the form, enforcing its Align property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	Resizing (see page 13885)	Makes any required adjustments when the form changes size.
	Resizing (see page 14328)	This is Resizing, a member of class TScrollingWinControl.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetChildOrder (see page 13886)	Changes the order in which Child appears when GetChildren (see page 13876) is called.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParent (see page 13887)	Sets the Parent property.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentBiDiMode (see page 13887)	Sets the ParentBiDiMode property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.

V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
V	UpdateActions (see page 13891)	Updates all actions associated with the form.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	UpdateWindowState (see page 13892)	Updates the WindowState (see page 13942) property to reflect the current state of the form.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	ValidateRename (see page 13892)	Determines if a form can rename one of its owned components.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	VisibleChanging (see page 13893)	Responds just before the form changes the value of its Visible (see page 13940) property.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WndProc (see page 13893)	Provides specific message responses for the form.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
R	ActiveMDIChild (see page 13897)	Specifies the MDI child that has focus.
	AlphaBlend (see page 13898)	Specifies whether the form is translucent.
	AlphaBlendValue (see page 13898)	Specifies the degree of translucency on a translucent form.
	AutoScroll (see page 13899)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	AutoScroll (see page 14329)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderIcons (see page 13899)	Specifies which icons appear on the title bar of the form.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
R	ClientHandle (see page 13904)	Provides access to the handle of the form's internal MDI client window.
W	ClientHeight (see page 13905)	Specifies the height (in pixels) of the form's client area.
W	ClientWidth (see page 13905)	Specifies the width (in pixels) of the form's client area.
	Color (see page 5812)	Specifies the background color of the control.

	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Ctl3D (see page 13909)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefaultMonitor (see page 13909)	Specifies the monitor on which the form appears.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	FormStyle (see page 13912)	Determines the form's style.
	Height (see page 13915)	Specifies the vertical size of the control in pixels.
	HorzScrollBar (see page 13916)	Represents the horizontal scroll bar for the scrolling windowed control.
	Icon (see page 13917)	Specifies the icon that appears when the form is minimized.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	MDIChildCount (see page 13921)	Specifies the number of open MDI child forms.
R	MDIChildren (see page 13922)	Provides indexed access to all MDI child forms.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ObjectMenuItem (see page 13926)	Represents an OLE object menu item that reacts to selections of OLE objects.
	OldCreateOrder (see page 13926)	Specifies when OnCreate (see page 13951) and OnDestroy (see page 13953) events occur.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentFont (see page 13927)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PixelsPerInch (see page 13928)	Represents the proportion of the font on the system on which the form was designed.
R	PopupChildren (see page 13928)	This is PopupChildren, a member of class TCustomForm.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	PopupMenu (see page 13928)	Identifies the pop-up menu associated with the control.
	Position (see page 13933)	Represents the size and placement of the form.
	PrintScale (see page 13934)	Represents the proportions of a printed form.
	Scaled (see page 13935)	Specifies whether the form is sized according to the value of the PixelsPerInch (see page 13928) property.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	TileMode (see page 13936)	Represents how MDI child forms are arranged when the Tile method is called.
	TransparentColor (see page 13938)	Specifies whether a color on the form appears transparent.
	TransparentColorValue (see page 13939)	Indicates the color on the form that appears transparent when TransparentColor (see page 13938) is true.
	VertScrollBar (see page 13939)	Represents the vertical scroll bar for the scrolling windowed control.
W	Visible (see page 13940)	Indicates whether the form is visible.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	Width (see page 13941)	Specifies the horizontal size of the control or form in pixels.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowMenu (see page 13941)	Specifies the Window menu for an MDI parent form.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 13866)	Construction event dispatcher.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 13866)	Destruction event dispatcher.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	Close (see page 13867)	Closes the form.
V	CloseQuery (see page 13868)	Close (see page 13867) attempt event dispatcher.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 13773)	Creates a new TCustomActiveForm (see page 13759) object.
V	Create (see page 13861)	Creates and initializes a new TForm (see page 13992) object.
V	Create (see page 14323)	Creates and initializes a new TScrollingWinControl (see page 14312) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	CreateNew (see page 13862)	Creates and initializes a new form.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 13870)	Provides message handling for all messages that the form does not fully process.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DefocusControl (see page 13871)	Removes focus from a control on the form.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 13862)	Removes the form from memory.
V	Destroy (see page 14323)	Removes the TScrollingWinControl (see page 14312) object from memory.
V	Destroy (see page 22287)	Disposes of an object instance.

	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	DisableAutoRange (see page 14327)	Disables automatic scrolling.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
V	Dock (see page 13872)	Handles automatic docking of the form into other windows.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EnableAutoRange (see page 14328)	Reenables automatic scrolling.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	FocusControl (see page 13875)	Sets focus to a control on the form.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFormImage (see page 13877)	Returns a bitmap of the form.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	Hide (see page 13879)	Hides the form.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	IsShortCut (see page 13880)	Processes shortcut keys when the form has focus.
	MakeFullyVisible (see page 13881)	Ensures that the form is fully visible on a specified monitor.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	MouseWheelHandler (see page 13881)	Directs mouse wheel messages to the appropriate control.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	Print (see page 13883)	Prints the form.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	RecreateAsPopup (see page 13884)	This is RecreateAsPopup, a member of class TCustomForm.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	Release (see page 13885)	Destroys the form and frees its associated memory.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	ScrollInView (see page 14328)	Scrolls a control into the visible area of the scrolling windowed control.
	SendCancelMode (see page 13886)	Cancels modes on the form.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetDesignVisible (see page 6178)	Makes a control visible at design time.
	SetFocus (see page 6179)	Gives the input focus to the control.

V	SetFocus (see page 13886)	Sets focus to the form.
V	SetFocusedControl (see page 13887)	Sets focus to a control on the form.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Show (see page 13888)	Shows the form.
V	ShowModal (see page 13890)	Shows a form as a modal dialog.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UpdateGlassFrame (see page 13892)	This is UpdateGlassFrame, a member of class TCustomForm.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.
V	WantChildKey (see page 13774)	Indicates whether the form processes keyboard input for a control it owns.
V	WantChildKey (see page 13893)	Indicates whether the form processes keyboard input for a control it owns.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Action (see page 13895)	Designates the action associated with the control.
R	Active (see page 13896)	Specifies whether the form has focus.
	ActiveControl (see page 13896)	Specifies the control that has focus on the form.
R	ActiveFormControl (see page 1506)	Pointer to the ActiveFormControl object.
	ActiveOleControl (see page 13897)	Specifies the OLE control on the form that reacts to changes in focus.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 13900)	Specifies the appearance and behavior of the form border.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 13900)	Provides access to the drawing area of the form.
	Caption (see page 13902)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	Color (see page 13908)	Specifies the background color of the control.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Designer (see page 13910)	Specifies the designer interface for the form.

	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DropTarget (see page 13910)	Specifies whether the form is the target of a drag-and-drop operation.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	Font (see page 13910)	Controls the attributes of text written on or in the control.
R	FormState (see page 13911)	Indicates transitional state information about the form.
	GlassFrame (see page 13914)	This is GlassFrame, a member of class TCustomForm.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HelpFile (see page 13916)	Specifies the name of the file the form uses to display Help.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	KeyPreview (see page 13918)	Specifies whether the form should receive keyboard events before the active control.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Menu (see page 13923)	Specifies the form's main menu.
	ModalResult (see page 13924)	Represents the return value of a form that is used as a modal dialog.
R	Monitor (see page 13926)	Provides access to the monitor on which the form appears.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	OleFormObject (see page 13927)	Specifies the IOleForm (see page 14340) interface for an in-place OLE object contained in the form.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	PopupMode (see page 13933)	This is PopupMode, a member of class TCustomForm.
	PopupParent (see page 13933)	Sets an order for stacked forms that users cannot change.
	ScreenSnap (see page 13935)	Specifies whether form snaps to edge of screen.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	SnapBuffer (see page 13936)	Specifies distance for screen snap.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
	Visible (see page 13797)	Indicates whether the form is visible.

R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.
	WindowState (see page 13942)	Represents how the form appears on the screen.

Published Events

	Name	Description
	OnActivate (see page 13799)	Occurs when the form becomes active.
	OnAlignInsertBefore (see page 14332)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 14332)	Occurs when an object with custom alignment is aligned.
	OnClick (see page 13803)	Occurs when the user clicks the control.
	OnContextPopup (see page 13805)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnCreate (see page 13805)	Occurs when the form is created.
	OnDblClick (see page 13807)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDeactivate (see page 13807)	Occurs when the form loses focus.
	OnDestroy (see page 13808)	Occurs when the form is destroyed.
	OnDragDrop (see page 13809)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 13811)	Occurs when the user drags an object over a control.
	OnKeyDown (see page 13814)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 13816)	Occurs when a key is pressed.
	OnKeyUp (see page 13817)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 13819)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 13820)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 13822)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 13823)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 13823)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 13825)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 13827)	Occurs when the form is redrawn.

Published Properties

	Name	Description
	ActiveControl (see page 13775)	Specifies the control that has focus on the form.
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 13776)	Specifies how the control is anchored to its parent.
	AutoScroll (see page 13777)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	AutoSize (see page 13777)	Specifies whether the control sizes itself automatically to accommodate its contents.
	AxBorderStyle (see page 13777)	Sets the active form's border style.
	BorderWidth (see page 13778)	Specifies the width of the control's border.
	Caption (see page 13778)	Specifies a text string that identifies the control to the user.
	Color (see page 13781)	Specifies the background color of the control.
	Constraints (see page 13782)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Font (see page 13782)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	Height (see page 13783)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.

	HorzScrollBar (see page 13784)	Represents the horizontal scroll bar for the scrolling windowed control.
	HorzScrollBar (see page 14329)	Represents the horizontal scroll bar for the scrolling windowed control.
	KeyPreview (see page 13785)	Specifies whether the form should receive keyboard events before the active control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Left (see page 13920)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldCreateOrder (see page 13788)	Specifies when OnCreate and OnDestroy events occur.
	Padding (see page 13789)	Specifies the padding of a control.
	PixelsPerInch (see page 13789)	Represents the proportion of the font on the system on which the form was designed.
	PopupMenu (see page 13789)	Identifies the pop-up menu associated with the control.
	PrintScale (see page 13794)	Represents the proportions of a printed form.
	Scaled (see page 13794)	Specifies whether the form is sized according to the value of the PixelsPerInch property.
	ShowHint (see page 13795)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Top (see page 13937)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	VertScrollBar (see page 13796)	Represents the vertical scroll bar for the scrolling windowed control.
	VertScrollBar (see page 14330)	Represents the vertical scroll bar for the scrolling windowed control.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.
	Width (see page 13798)	Specifies the horizontal size of the control or form in pixels.

12.1.1.2 TActiveForm Methods

The methods of the TActiveForm class are listed here.

Protected Methods

	Name	Description
	DefinePropertyPages (see page 1505)	This is DefinePropertyPages, a member of class TActiveForm.
	DoDestroy (see page 1505)	Form destruction event dispatcher.
	EventSinkChanged (see page 1506)	This is EventSinkChanged, a member of class TActiveForm.
	Initialize (see page 1506)	This is Initialize, a member of class TActiveForm.

12.1.1.2.1 TActiveForm.DefinePropertyPages Method

Pascal

```
procedure DefinePropertyPages(DefinePropertyPage: TDefinePropertyPage); virtual;
```

C++

```
virtual __fastcall DefinePropertyPages(TDefinePropertyPage DefinePropertyPage);
```

Description

This is DefinePropertyPages, a member of class TActiveForm.

12.1.1.2.2 TActiveForm.DoDestroy Method

Form destruction event dispatcher.

Pascal

```
procedure DoDestroy; override;
```

C++

```
virtual __fastcall DoDestroy();
```

Description

DoDestroy is called automatically when the TCustomForm object is about to be deallocated. The precise way DoDestroy is called can be modified by setting the OldCreateOrder property.

As implemented in TCustomForm, DoDestroy simply calls the OnDestroy event handler.

See Also

OnDestroy (see page 13953)

OldCreateOrder (see page 13926)

12.1.1.2.3 TActiveForm.EventSinkChanged Method

Pascal

```
procedure EventSinkChanged(const EventSink: IUnknown); virtual;
```

C++

```
virtual __fastcall EventSinkChanged(const IUnknown EventSink);
```

Description

This is EventSinkChanged, a member of class TActiveForm.

12.1.1.2.4 TActiveForm.Initialize Method

Pascal

```
procedure Initialize; virtual;
```

C++

```
virtual __fastcall Initialize();
```

Description

This is Initialize, a member of class TActiveForm.

12.1.1.3 TActiveForm Properties

The properties of the TActiveForm class are listed here.

Public Properties

	Name	Description
R	ActiveFormControl (see page 1506)	Pointer to the ActiveFormControl object.

12.1.1.3.1 TActiveForm.ActiveFormControl Property

Pointer to the ActiveFormControl object.

Pascal

```
property ActiveFormControl: TActiveFormControl;
```

C++

```
__property TActiveFormControl ActiveFormControl;
```

Description

Use ActiveFormControl to access the object that implements all the ActiveX interfaces for this ActiveForm. ActiveFormControl creates the TActiveForm (see page 1489) object.

12.1.2 TActiveFormControl Class

A COM object which provides the interfaces necessary to support an ActiveX control.

Class Hierarchy

Pascal

```
TActiveFormControl = class(TActiveXControl, IVCLComObject);
```

C++

```
class TActiveFormControl : public TActiveXControl, public IVCLComObject;
```

File

AxCtrls

Description

TActiveFormControl acts as the bridge between a Delphi C++Builder form and the ActiveX control API. It is a descendant of TActiveXControl (see page 1517) which implements the necessary interfaces for an ActiveX control. It forwards the appropriate information to the ActiveForm.

This object is used internally by the DAX framework. Normally, you would not create an instance of this class.

Elements of an ActiveX Control

Generating an ActiveX Control Based On a VCL Form

12.1.2.1 TActiveFormControl Members

The following tables list the members exposed by TActiveFormControl.

Protected Methods

	Name	Description
	_AddRef (see page 5558)	This is _AddRef, a member of class TComObject.
	_Release (see page 5558)	This is _Release, a member of class TComObject.
	Advise (see page 1525)	This is Advise, a member of class TActiveXControl.
	Close (see page 1525)	This is Close, a member of class TActiveXControl.
	ContextSensitiveHelp (see page 1525)	This is ContextSensitiveHelp, a member of class TActiveXControl.
	DAdvise (see page 1525)	This is DAdvise, a member of class TActiveXControl.
V	DefinePropertyPages (see page 1512)	This is DefinePropertyPages, a member of class TActiveFormControl.
	DoVerb (see page 1526)	This is DoVerb, a member of class TActiveXControl.
	Draw (see page 1526)	This is Draw, a member of class TActiveXControl.
	DUnadvise (see page 1526)	This is DUnadvise, a member of class TActiveXControl.
	EnableModeless (see page 1527)	This is EnableModeless, a member of class TActiveXControl.
	EnumAdvise (see page 1527)	This is EnumAdvise, a member of class TActiveXControl.
	EnumDAdvise (see page 1527)	This is EnumDAdvise, a member of class TActiveXControl.
	EnumFormatEtc (see page 1527)	This is EnumFormatEtc, a member of class TActiveXControl.
	EnumVerbs (see page 1527)	This is EnumVerbs, a member of class TActiveXControl.
	EventConnect (see page 5542)	This is EventConnect, a member of class TAutoObject.
V	EventSinkChanged (see page 1512)	This is EventSinkChanged, a member of class TActiveFormControl.
	Freeze (see page 1528)	This is Freeze, a member of class TActiveXControl.
	FreezeEvents (see page 1528)	This is FreezeEvents, a member of class TActiveXControl.
	Get_BackColor (see page 1528)	This is Get_BackColor, a member of class TActiveXControl.
	Get_Caption (see page 1528)	This is Get_Caption, a member of class TActiveXControl.
	Get_Enabled (see page 1529)	This is Get_Enabled, a member of class TActiveXControl.
	Get_Font (see page 1529)	This is Get_Font, a member of class TActiveXControl.
	Get_ForeColor (see page 1529)	This is Get_ForeColor, a member of class TActiveXControl.
	Get_HWnd (see page 1529)	This is Get_HWnd, a member of class TActiveXControl.
	Get_TabStop (see page 1529)	This is Get_TabStop, a member of class TActiveXControl.
	Get_Text (see page 1530)	This is Get_Text, a member of class TActiveXControl.
	GetAdvise (see page 1530)	This is GetAdvise, a member of class TActiveXControl.
	GetCanonicalFormatEtc (see page 1530)	This is GetCanonicalFormatEtc, a member of class TActiveXControl.
	GetClassID (see page 1530)	This is GetClassID, a member of class TActiveXControl.
	GetClassInfo (see page 5583)	Returns a pointer to a TTypedComObject (see page 5581)'s type information.
	GetClientSite (see page 1531)	This is GetClientSite, a member of class TActiveXControl.
	GetClipboardData (see page 1531)	This is GetClipboardData, a member of class TActiveXControl.

	GetColorSet (see page 1531)	This is GetColorSet, a member of class TActiveXControl.
	GetContentExtent (see page 1531)	This is GetContentExtent, a member of class TActiveXControl.
	GetControlInfo (see page 1531)	This is GetControlInfo, a member of class TActiveXControl.
	GetData (see page 1532)	This is GetData, a member of class TActiveXControl.
	GetDataHere (see page 1532)	This is GetDataHere, a member of class TActiveXControl.
	GetDisplayString (see page 1532)	This is GetDisplayString, a member of class TActiveXControl.
	GetExtent (see page 1532)	This is GetExtent, a member of class TActiveXControl.
V	GetIDsOfNames (see page 5543)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetInterfaceSafetyOptions (see page 1533)	This is GetInterfaceSafetyOptions, a member of class TActiveXControl.
	GetMiscStatus (see page 1533)	This is GetMiscStatus, a member of class TActiveXControl.
	GetMoniker (see page 1533)	This is GetMoniker, a member of class TActiveXControl.
	GetPages (see page 1533)	This is GetPages, a member of class TActiveXControl.
	GetPredefinedStrings (see page 1533)	This is GetPredefinedStrings, a member of class TActiveXControl.
	GetPredefinedValue (see page 1534)	This is GetPredefinedValue, a member of class TActiveXControl.
V	GetPropertyString (see page 1534)	This is GetPropertyString, a member of class TActiveXControl.
V	GetPropertyStrings (see page 1534)	This is GetPropertyStrings, a member of class TActiveXControl.
V	GetPropertyValue (see page 1534)	This is GetPropertyValue, a member of class TActiveXControl.
V	GetPropFromBag (see page 1535)	This is GetPropFromBag, a member of class TActiveXControl.
	GetSizeMax (see page 1535)	This is GetSizeMax, a member of class TActiveXControl.
V	GetTypeInfo (see page 5543)	Retrieves the type information for an object.
V	GetTypeInfoCount (see page 5544)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetUserClassID (see page 1535)	This is GetUserClassID, a member of class TActiveXControl.
	GetUserType (see page 1535)	This is GetUserType, a member of class TActiveXControl.
	GetWindow (see page 1536)	This is GetWindow, a member of class TActiveXControl.
	HandsOffStorage (see page 1536)	This is HandsOffStorage, a member of class TActiveXControl.
	InitFromData (see page 1536)	This is InitFromData, a member of class TActiveXControl.
	InitNew (see page 1537)	This is InitNew, a member of class TActiveXControl.
	InPlaceActivate (see page 1537)	This is InPlaceActivate, a member of class TActiveXControl.
	InPlaceDeactivate (see page 1537)	This is InPlaceDeactivate, a member of class TActiveXControl.
	InterfaceSupportsErrorInfo (see page 5559)	This is InterfaceSupportsErrorInfo, a member of class TComObject.
	IsDirty (see page 1537)	This is IsDirty, a member of class TActiveXControl.
	IsUpToDate (see page 1538)	This is IsUpToDate, a member of class TActiveXControl.
V	LoadFromStream (see page 1538)	This is LoadFromStream, a member of class TActiveXControl.
	MapPropertyToPage (see page 1538)	This is MapPropertyToPage, a member of class TActiveXControl.
	OnAmbientPropertyChange (see page 1539)	This is OnAmbientPropertyChange, a member of class TActiveXControl.
	OnDocWindowActivate (see page 1539)	This is OnDocWindowActivate, a member of class TActiveXControl.
	OnFrameWindowActivate (see page 1539)	This is OnFrameWindowActivate, a member of class TActiveXControl.
	OnMnemonic (see page 1539)	This is OnMnemonic, a member of class TActiveXControl.
V	PerformVerb (see page 1540)	This is PerformVerb, a member of class TActiveXControl.
	PersistPropBagInitNew (see page 1540)	This is PersistPropBagInitNew, a member of class TActiveXControl.
	PersistPropBagLoad (see page 1540)	This is PersistPropBagLoad, a member of class TActiveXControl.
	PersistPropBagSave (see page 1540)	This is PersistPropBagSave, a member of class TActiveXControl.
	PersistStorageInitNew (see page 1541)	This is PersistStorageInitNew, a member of class TActiveXControl.
	PersistStorageLoad (see page 1541)	This is PersistStorageLoad, a member of class TActiveXControl.
	PersistStorageSave (see page 1541)	This is PersistStorageSave, a member of class TActiveXControl.
	PersistStreamLoad (see page 1541)	This is PersistStreamLoad, a member of class TActiveXControl.
	PersistStreamSave (see page 1541)	This is PersistStreamSave, a member of class TActiveXControl.
	PostMessageFilter (see page 1542)	This is PostMessageFilter, a member of class TActiveXControl.
	PreMessageFilter (see page 1542)	This is PreMessageFilter, a member of class TActiveXControl.
V	PutPropInBag (see page 1543)	This is PutPropInBag, a member of class TActiveXControl.
	QueryGetData (see page 1544)	This is QueryGetData, a member of class TActiveXControl.
	QueryInterface (see page 5560)	This is QueryInterface, a member of class TComObject.
	QuickActivate (see page 1544)	This is QuickActivate, a member of class TActiveXControl.

	ReactivateAndUndo (see page 1544)	This is ReactivateAndUndo, a member of class TActiveXControl.
	ResizeBorder (see page 1544)	This is ResizeBorder, a member of class TActiveXControl.
	SaveCompleted (see page 1544)	This is SaveCompleted, a member of class TActiveXControl.
V	SaveToStream (see page 1545)	This is SaveToStream, a member of class TActiveXControl.
	Set_BackColor (see page 1545)	This is Set_BackColor, a member of class TActiveXControl.
	Set_Caption (see page 1545)	This is Set_Caption, a member of class TActiveXControl.
	Set_Enabled (see page 1545)	This is Set_Enabled, a member of class TActiveXControl.
	Set_Font (see page 1546)	This is Set_Font, a member of class TActiveXControl.
	Set_ForeColor (see page 1546)	This is Set_ForeColor, a member of class TActiveXControl.
	Set_TabStop (see page 1546)	This is Set_TabStop, a member of class TActiveXControl.
	Set_Text (see page 1546)	This is Set_Text, a member of class TActiveXControl.
	SetAdvise (see page 1546)	This is SetAdvise, a member of class TActiveXControl.
	SetClientSite (see page 1547)	This is SetClientSite, a member of class TActiveXControl.
	SetColorScheme (see page 1547)	This is SetColorScheme, a member of class TActiveXControl.
	SetContentExtent (see page 1547)	This is SetContentExtent, a member of class TActiveXControl.
	SetData (see page 1547)	This is SetData, a member of class TActiveXControl.
	SetExtent (see page 1548)	This is SetExtent, a member of class TActiveXControl.
	SetHostNames (see page 1548)	This is SetHostNames, a member of class TActiveXControl.
	SetInPlaceSite (see page 1548)	This is SetInPlaceSite, a member of class TActiveXControl.
V	SetInterfaceSafetyOptions (see page 1548)	This is SetInterfaceSafetyOptions, a member of class TActiveXControl.
	SetMoniker (see page 1548)	This is SetMoniker, a member of class TActiveXControl.
	SetObjectRects (see page 1549)	This is SetObjectRects, a member of class TActiveXControl.
	ShowPropertyDialog (see page 1549)	This is ShowPropertyDialog, a member of class TActiveXControl.
	StdClickEvent (see page 1549)	This is StdClickEvent, a member of class TActiveXControl.
	StdDblClickEvent (see page 1549)	This is StdDblClickEvent, a member of class TActiveXControl.
	StdKeyDownEvent (see page 1550)	This is StdKeyDownEvent, a member of class TActiveXControl.
	StdKeyPressEvent (see page 1550)	This is StdKeyPressEvent, a member of class TActiveXControl.
	StdKeyUpEvent (see page 1550)	This is StdKeyUpEvent, a member of class TActiveXControl.
	StdMouseDownEvent (see page 1550)	This is StdMouseDownEvent, a member of class TActiveXControl.
	StdMouseMoveEvent (see page 1550)	This is StdMouseMoveEvent, a member of class TActiveXControl.
	StdMouseUpEvent (see page 1551)	This is StdMouseUpEvent, a member of class TActiveXControl.
	TranslateAccelerator (see page 1551)	This is TranslateAccelerator, a member of class TActiveXControl.
	UIDeactivate (see page 1551)	This is UIDeactivate, a member of class TActiveXControl.
	Unadvise (see page 1551)	This is Unadvise, a member of class TActiveXControl.
	Unfreeze (see page 1552)	This is Unfreeze, a member of class TActiveXControl.
	Update (see page 1552)	This is Update, a member of class TActiveXControl.
	ViewObjectGetExtent (see page 1552)	This is ViewObjectGetExtent, a member of class TActiveXControl.
V	WndProc (see page 1552)	This is WndProc, a member of class TActiveXControl.

Protected Properties

	Name	Description
R	AutoFactory (see page 5545)	The class factory that created this TAutoObject (see page 5540).
R	ConnectionPoints (see page 1553)	This is ConnectionPoints, a member of class TActiveXControl.
	EventSink (see page 5545)	This is EventSink, a member of class TAutoObject.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 5555)	Instantiates a COM object that is not part of an aggregate.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateAggregated (see page 5556)	Instantiates a COM object that is part of an aggregate.
	CreateFromFactory (see page 5556)	Instantiates a COM object and initializes its values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 1522)	Destroys an instance of TActiveXControl (see page 1517).
V	Destroy (see page 5557)	Disposes of an instance of a COM object.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeOnRelease (see page 1512)	Supports the IVCLComObject interface.
	GetIDsOfNames (see page 3212)	This is GetIDsOfNames, a member of class IVCLComObject.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetTypeInfo (see page 3213)	This is GetTypeInfo, a member of class IVCLComObject.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 3213)	This is GetTypeInfoCount, a member of class IVCLComObject.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 1536)	Creates the class factory and connection object for the TActiveXControl (see page 1517).
V	Initialize (see page 5544)	Provides an interface to a method that initializes the Automation object.
V	Initialize (see page 5558)	Provides an interface to a method that initializes the COM object.
V	InitializeControl (see page 1513)	Creates InitializeControl creates the TActiveForm (see page 1489) instance and establishes a link between itself and the TActiveForm (see page 1489) referenced by the control properties.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invoke (see page 1513)	Invoke implements the OLE Automation IDispatch Invoke function.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	ObjAddRef (see page 5559)	Implements the AddRef method of the IUnknown interface.
V	ObjQueryInterface (see page 1513)	The ObjQueryInterface method takes an interface ID (the IID parameter) and returns the requested COM interface on the object.
V	ObjRelease (see page 5559)	Implements the Release method of the IUnknown interface.
	PropChanged (see page 1542)	This is the overview for the PropChanged method overload.
	PropRequestEdit (see page 1543)	This is the overview for the PropRequestEdit method overload.
	SafeCallException (see page 3213)	This is SafeCallException, a member of class IVCLComObject.
V	SafeCallException (see page 5560)	Handles OLE exceptions.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ClientSite (see page 1553)	Contains a pointer to the client site for the container on which the ActiveX control resides.
R	Control (see page 1553)	Indicates the VCL implementation of the ActiveX control.

R	Controller (see page 5561)	Specifies the controlling IUnknown interface that controls interfaces within an aggregate object.
R	Factory (see page 5561)	Specifies the class factory object for the TComObject (see page 5553) class.
R	InPlaceSite (see page 1554)	Contains a pointer to the site interface for the container on which the ActiveX control resides.
R	RefCount (see page 5562)	Indicates the number of references to the COM object that are currently in use.
	ServerExceptionHandler (see page 5562)	Provides access to the SafeCall exception notification process.

12.1.2.2 TActiveFormControl Methods

The methods of the TActiveFormControl class are listed here.

Protected Methods

	Name	Description
V	DefinePropertyPages (see page 1512)	This is DefinePropertyPages, a member of class TActiveFormControl.
V	EventSinkChanged (see page 1512)	This is EventSinkChanged, a member of class TActiveFormControl.

Public Methods

	Name	Description
	FreeOnRelease (see page 1512)	Supports the IVCLComObject interface.
V	InitializeControl (see page 1513)	Creates InitializeControl creates the TActiveForm (see page 1489) instance and establishes a link between itself and the TActiveForm (see page 1489) referenced by the control properties.
V	Invoke (see page 1513)	Invoke implements the OLE Automation IDispatch Invoke function.
V	ObjQueryInterface (see page 1513)	The ObjQueryInterface method takes an interface ID (the IID parameter) and returns the requested COM interface on the object.

12.1.2.2.1 TActiveFormControl.DefinePropertyPages Method

Pascal

```
procedure DefinePropertyPages(DefinePropertyPage: TDefinePropertyPage); override;
```

C++

```
virtual __fastcall DefinePropertyPages(TDefinePropertyPage DefinePropertyPage);
```

Description

This is DefinePropertyPages, a member of class TActiveFormControl.

12.1.2.2.2 TActiveFormControl.EventSinkChanged Method

Pascal

```
procedure EventSinkChanged(const EventSink: IUnknown); override;
```

C++

```
virtual __fastcall EventSinkChanged(const IUnknown EventSink);
```

Description

This is EventSinkChanged, a member of class TActiveFormControl.

12.1.2.2.3 TActiveFormControl.FreeOnRelease Method

Supports the IVCLComObject interface.

Pascal

```
procedure FreeOnRelease;
```

C++

```
__fastcall FreeOnRelease();
```

Description

FreeOnRelease exists solely to support the IVCLComObject interface, and has an empty implementation.

12.1.2.2.4 TActiveFormControl.InitializeControl Method

Creates InitializeControl creates the TActiveForm (see page 1489) instance and establishes a link between itself and the TActiveForm (see page 1489) referenced by the control properties.

Pascal

```
procedure InitializeControl; override;
```

C++

```
virtual __fastcall InitializeControl();
```

Description

InitializeControl also instructs the TActiveForm (see page 1489) object to perform any of its own initialization.

12.1.2.2.5 TActiveFormControl.Invoke Method

Invoke implements the OLE Automation IDispatch Invoke function.

Pascal

```
function Invoke(DispID: Integer; const IID: TGUID; LocaleID: Integer; Flags: Word; var Params;
VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer): HResult; override;
```

C++

```
virtual __fastcall HRESULT Invoke(int DispID, const TGUID IID, int LocaleID, Word Flags,
Params, void * VarResult, void * ExcepInfo, void * ArgErr);
```

Description

Call Invoke to access the property or method specified by the DispID parameter. The Flags parameter indicates whether the DispID refers to method (DISPATCH_METHOD), a property value that is being read (DISPATCH_PROPERTYGET), or a property value that is being set (DISPATCH_PROPERTYPUT or DISPATCH_PROPERTYPUTREF). The Params and ExcepInfo parameters hold parameters and exception information, respectively, and depend on the property or method identified by the DispID parameter.

Invoke returns S_OK if it is successful. Otherwise, it returns an error code defined by the IDispatch interface.

12.1.2.2.6 TActiveFormControl.ObjQueryInterface Method

The ObjQueryInterface method takes an interface ID (the IID parameter) and returns the requested COM interface on the object.

Pascal

```
function ObjQueryInterface(const IID: TGUID; out Obj): HResult; override;
```

C++

```
virtual __fastcall HRESULT ObjQueryInterface(const TGUID IID,  Obj);
```

Description

The ObjQueryInterface method forwards the call first to the associated TActiveForm (see page 1489) object if it supports the requested interface, otherwise it queries its own interface.

See Also

TActiveForm (see page 1489)

TActiveFormFactory (see page 1514)

12.1.3 TActiveFormFactory Class

The ActiveFormFactory object is the class factory for TActiveForm (see page 1489).

Class Hierarchy

Pascal

```
TActiveFormFactory = class(TActiveXControlFactory);
```

C++

```
class TActiveFormFactory : public TActiveXControlFactory;
```

File

AxCtrls

Description

The ActiveFormFactory object is the class factory responsible for creating instances of the TActiveFormControl (see page 1507) object and therefore TActiveForm (see page 1489) object.

The ActiveForm wizard adds an ActiveForm factory object in the initialization section of the unit that defines the ActiveForm.

See Also

TActiveForm (see page 1489)

TActiveFormControl (see page 1507)

12.1.3.1 TActiveFormFactory Members

The following tables list the members exposed by TActiveFormFactory.

Protected Methods

	Name	Description
	_AddRef (see page 5567)	This is _AddRef, a member of class TComObjectFactory.
	_Release (see page 5567)	This is _Release, a member of class TComObjectFactory.
	CreateInstance (see page 5568)	This is CreateInstance, a member of class TComObjectFactory.
	CreateInstanceLic (see page 5568)	This is CreateInstanceLic, a member of class TComObjectFactory.
V	GetLicenseFileName (see page 1558)	This is GetLicenseFileName, a member of class TActiveXControlFactory.

	GetLicenseString (see page 5568)	This is GetLicenseString, a member of class TComObjectFactory.
	GetLicInfo (see page 5568)	This is GetLicInfo, a member of class TComObjectFactory.
	GetProgID (see page 5569)	This is GetProgID, a member of class TComObjectFactory.
	HasMachineLicense (see page 1558)	This is HasMachineLicense, a member of class TActiveXControlFactory.
	HasMachineLicense (see page 5569)	This is HasMachineLicense, a member of class TComObjectFactory.
	LockServer (see page 5569)	This is LockServer, a member of class TComObjectFactory.
	QueryInterface (see page 5569)	This is QueryInterface, a member of class TComObjectFactory.
	RequestLicKey (see page 5570)	This is RequestLicKey, a member of class TComObjectFactory.
	ValidateUserLicense (see page 5571)	This is ValidateUserLicense, a member of class TComObjectFactory.

Public Methods

	Name	Description
	AddVerb (see page 1557)	AddVerb adds a verb to the object's list of supported verbs.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1556)	Creates and initializes a new Create object.
	Create (see page 5548)	This is Create, a member of class TAutoObjectFactory.
	Create (see page 5565)	Instantiates a class factory object.
	Create (see page 5585)	Instantiates a TTypedComObjectFactory (see page 5583) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateComObject (see page 5567)	Instantiates a TComObject (see page 5553) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 1557)	Frees the instance of the Destroy.
	Destroy (see page 5566)	Disposes of an instance of a class factory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetInterfaceTypeInfo (see page 5586)	Retrieves the type information for the typed COM object created by the factory.
	GetIntfEntry (see page 1516)	Retrieves a pointer to the dispatch interface.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	RegisterClassObject (see page 5569)	Registers the COM class associated with the factory object.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	UpdateRegistry (see page 1559)	UpdateRegistry adds or removes registry entries for the object.
	UpdateRegistry (see page 5570)	Registers COM objects created by the factory.

V	UpdateRegistry (see page 5586)	Registers the typed COM object class.

Public Properties

	Name	Description
R	ClassID (see page 5571)	This is ClassID, a member of class TComObjectFactory.
R	ClassInfo (see page 5587)	Specifies an interface reference that provides type information without having to load a type library.
R	ClassName (see page 5572)	Specifies the name of the class that the class factory instantiates.
R	ComClass (see page 5572)	This is ComClass, a member of class TComObjectFactory.
R	ComServer (see page 5572)	This is ComServer, a member of class TComObjectFactory.
R	Description (see page 5572)	Describes the class object.
R	DispIntfEntry (see page 5549)	Contains the entry for the dispatch interface implemented by the OLE Automation object created by the factory.
R	DispTypeInfo (see page 5549)	Returns an ITypeInfo interface reference to the type information for the dispinterface implemented by the OLE Automation object.
	ErrorIID (see page 5573)	Indicates the interface of the CoClass in which an error occurred.
R	EventIID (see page 5549)	This is EventIID, a member of class TAutoObjectFactory.
R	EventTypeInfo (see page 5550)	This is EventTypeInfo, a member of class TAutoObjectFactory.
R	Instancing (see page 5573)	Indicates the process space of COM object instances.
	LicString (see page 5573)	Contains licensing information about the object.
R	MiscStatus (see page 1559)	Represents a set of status bits that are stored in the registry.
R	ProgID (see page 5574)	Specifies the name of the class factory.
	ShowErrors (see page 5574)	Indicates whether the COM object factory displays a message box when exceptions are raised.
	SupportsLicensing (see page 5574)	Indicates whether the object being instantiated supports licensing.
R	ThreadingModel (see page 5575)	Indicates the type of thread support provided by objects that the factory creates.
R	ToolboxBitmapID (see page 1560)	Designates the resource identifier of the ActiveX control.
R	WinControlClass (see page 1560)	WinControlClass is the class of the VCL control that implements the Windows behavior for the ActiveX control.

12.1.3.2 TActiveFormFactory Methods

The methods of the TActiveFormFactory class are listed here.

Public Methods

	Name	Description
V	GetIntfEntry (see page 1516)	Retrieves a pointer to the dispatch interface.

12.1.3.2.1 TActiveFormFactory.GetIntfEntry Method

Retrieves a pointer to the dispatch interface.

Pascal

```
function GetIntfEntry(Guid: TGUID): PInterfaceEntry; override;
```

C++

```
virtual __fastcall PInterfaceEntry GetIntfEntry(TGUID Guid);
```

Description

The GetIntfEntry method obtains an interface, if it exists, from the TActiveForm (see page 1489) class. This is an internal method of the DAX framework. retrieves a pointer to the dispatch interface from the associated TActiveForm (see page 1489) object.

See Also

TActiveForm (see page 1489)

12.1.4 TActiveXControl Class

TActiveXControl is an abstract class that provides the functionality to embed a VCL control into an ActiveX Container window.

Class Hierarchy

Pascal

```
TActiveXControl = class(TAutoObject, IConnectionPointContainer, IDataObject, IObjectSafety,
IOleControl, IOleInPlaceActiveObject, IOleInPlaceObject, IOleObject, IPerPropertyBrowsing,
IPersistPropertyBag, IPersistStorage, IPersistStreamInit, IQuickActivate, ISimpleFrameSite,
ISpecifyPropertyPages, IViewObject, IViewObject2);
```

C++

```
class TActiveXControl : public TAutoObject, public IConnectionPointContainer, public
IDataObject, public IObjectSafety, public IOleControl, public IOleInPlaceActiveObject, public
IOleInPlaceObject, public IOleObject, public IPerPropertyBrowsing, public IPersistPropertyBag,
public IPersistStorage, public IPersistStreamInit, public IQuickActivate, public
ISimpleFrameSite, public ISpecifyPropertyPages, public IViewObject, public IViewObject2;
```

File

AxCtrls

Description

TActiveXControl defines the core behavior and interfaces required of an ActiveX control and connects that behavior to any VCL control derived from TWinControl. This allows the control to be embedded in any ActiveX container, including Internet Explorer, Visual Basic, PowerBuilder, Paradox, CodeGear C++, IntraBuilder and, of course, Delphi.

To create a new ActiveX control class, use the ActiveX control wizard. The steps for building an ActiveX control are covered in the Developer's Guide or in the online help document, Developing COM-based applications.

The TActiveXControl class is derived from TAutoObject, therefore the object resulting is a COM object that supports COM-based Automation, a type library, and has a factory. In addition, TActiveXControl implements the following behaviors:

embedding in a container (site)

in-place activation

persistence

events

property pages

property browsing

TActiveXControl is an abstract class, and so cannot be instantiated. Instead, you must derive a new class from TActiveXControl to implement an ActiveX control. This derived class is called an implementation class. An implementation class derived from TActiveXControl normally implements an automation interface as well, to specify the object's properties and methods.

Ordinarily, you do not create an instance of an implementation class directly. Instead, you create a factory object in the initialization section of the unit that contains the class declaration. The factory object will then create the ActiveX control object when asked to by the system.

In addition to the interfaces inherited from TAutoObject, TActiveXControl implements the following interfaces:

Note: See the DelCtrls demo in ..\ActiveX\Delctrls for an example of using VCL components as ActiveX controls.

12.1.4.1 TActiveXControl Members

The following tables list the members exposed by TActiveXControl.

Protected Methods

	Name	Description
	_AddRef (see page 5558)	This is _AddRef, a member of class TComObject.
	_Release (see page 5558)	This is _Release, a member of class TComObject.
	Advise (see page 1525)	This is Advise, a member of class TActiveXControl.
	Close (see page 1525)	This is Close, a member of class TActiveXControl.
	ContextSensitiveHelp (see page 1525)	This is ContextSensitiveHelp, a member of class TActiveXControl.
	DAdvise (see page 1525)	This is DAdvise, a member of class TActiveXControl.
V	DefinePropertyPages (see page 1526)	This is DefinePropertyPages, a member of class TActiveXControl.
	DoVerb (see page 1526)	This is DoVerb, a member of class TActiveXControl.
	Draw (see page 1526)	This is Draw, a member of class TActiveXControl.
	DUnadvise (see page 1526)	This is DUnadvise, a member of class TActiveXControl.
	EnableModeless (see page 1527)	This is EnableModeless, a member of class TActiveXControl.
	EnumAdvise (see page 1527)	This is EnumAdvise, a member of class TActiveXControl.
	EnumDAdvise (see page 1527)	This is EnumDAdvise, a member of class TActiveXControl.
	EnumFormatEtc (see page 1527)	This is EnumFormatEtc, a member of class TActiveXControl.

	EnumVerbs (see page 1527)	This is EnumVerbs, a member of class TActiveXControl.
	EventConnect (see page 5542)	This is EventConnect, a member of class TAutoObject.
V	EventSinkChanged (see page 5543)	This is EventSinkChanged, a member of class TAutoObject.
	Freeze (see page 1528)	This is Freeze, a member of class TActiveXControl.
	FreezeEvents (see page 1528)	This is FreezeEvents, a member of class TActiveXControl.
	Get_BackColor (see page 1528)	This is Get_BackColor, a member of class TActiveXControl.
	Get_Caption (see page 1528)	This is Get_Caption, a member of class TActiveXControl.
	Get_Enabled (see page 1529)	This is Get_Enabled, a member of class TActiveXControl.
	Get_Font (see page 1529)	This is Get_Font, a member of class TActiveXControl.
	Get_ForeColor (see page 1529)	This is Get_ForeColor, a member of class TActiveXControl.
	Get_HWnd (see page 1529)	This is Get_HWnd, a member of class TActiveXControl.
	Get_TabStop (see page 1529)	This is Get_TabStop, a member of class TActiveXControl.
	Get_Text (see page 1530)	This is Get_Text, a member of class TActiveXControl.
	GetAdvise (see page 1530)	This is GetAdvise, a member of class TActiveXControl.
	GetCanonicalFormatEtc (see page 1530)	This is GetCanonicalFormatEtc, a member of class TActiveXControl.
	GetClassID (see page 1530)	This is GetClassID, a member of class TActiveXControl.
	GetClassInfo (see page 5583)	Returns a pointer to a TTypedComObject (see page 5581)'s type information.
	GetClientSite (see page 1531)	This is GetClientSite, a member of class TActiveXControl.
	GetClipboardData (see page 1531)	This is GetClipboardData, a member of class TActiveXControl.
	GetColorSet (see page 1531)	This is GetColorSet, a member of class TActiveXControl.
	GetContentExtent (see page 1531)	This is GetContentExtent, a member of class TActiveXControl.
	GetControlInfo (see page 1531)	This is GetControlInfo, a member of class TActiveXControl.
	GetData (see page 1532)	This is GetData, a member of class TActiveXControl.
	GetDataHere (see page 1532)	This is GetDataHere, a member of class TActiveXControl.
	GetDisplayString (see page 1532)	This is GetDisplayString, a member of class TActiveXControl.
	GetExtent (see page 1532)	This is GetExtent, a member of class TActiveXControl.
V	GetIDsOfNames (see page 5543)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetInterfaceSafetyOptions (see page 1533)	This is GetInterfaceSafetyOptions, a member of class TActiveXControl.
	GetMiscStatus (see page 1533)	This is GetMiscStatus, a member of class TActiveXControl.
	GetMoniker (see page 1533)	This is GetMoniker, a member of class TActiveXControl.
	GetPages (see page 1533)	This is GetPages, a member of class TActiveXControl.
	GetPredefinedStrings (see page 1533)	This is GetPredefinedStrings, a member of class TActiveXControl.
	GetPredefinedValue (see page 1534)	This is GetPredefinedValue, a member of class TActiveXControl.
V	GetPropertyString (see page 1534)	This is GetPropertyString, a member of class TActiveXControl.
V	GetPropertyStrings (see page 1534)	This is GetPropertyStrings, a member of class TActiveXControl.
V	GetPropertyValue (see page 1534)	This is GetPropertyValue, a member of class TActiveXControl.
V	GetPropFromBag (see page 1535)	This is GetPropFromBag, a member of class TActiveXControl.
	GetSizeMax (see page 1535)	This is GetSizeMax, a member of class TActiveXControl.
V	GetTypeInfo (see page 5543)	Retrieves the type information for an object.
V	GetTypeInfoCount (see page 5544)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetUserClassID (see page 1535)	This is GetUserClassID, a member of class TActiveXControl.
	GetUserType (see page 1535)	This is GetUserType, a member of class TActiveXControl.
	GetWindow (see page 1536)	This is GetWindow, a member of class TActiveXControl.
	HandsOffStorage (see page 1536)	This is HandsOffStorage, a member of class TActiveXControl.
	InitFromData (see page 1536)	This is InitFromData, a member of class TActiveXControl.
V	InitializeControl (see page 1537)	This is InitializeControl, a member of class TActiveXControl.
	InitNew (see page 1537)	This is InitNew, a member of class TActiveXControl.
	InPlaceActivate (see page 1537)	This is InPlaceActivate, a member of class TActiveXControl.
	InPlaceDeactivate (see page 1537)	This is InPlaceDeactivate, a member of class TActiveXControl.
	InterfaceSupportsErrorInfo (see page 5559)	This is InterfaceSupportsErrorInfo, a member of class TComObject.
V	Invoke (see page 5544)	Provides access to Automation properties and methods exposed by an object that supports the IDispatch interface.
	IsDirty (see page 1537)	This is IsDirty, a member of class TActiveXControl.

	IsUpToDate (see page 1538)	This is IsUpToDate, a member of class TActiveXControl.
V	LoadFromStream (see page 1538)	This is LoadFromStream, a member of class TActiveXControl.
	MapPropertyToPage (see page 1538)	This is MapPropertyToPage, a member of class TActiveXControl.
	OnAmbientPropertyChange (see page 1539)	This is OnAmbientPropertyChange, a member of class TActiveXControl.
	OnDocWindowActivate (see page 1539)	This is OnDocWindowActivate, a member of class TActiveXControl.
	OnFrameWindowActivate (see page 1539)	This is OnFrameWindowActivate, a member of class TActiveXControl.
	OnMnemonic (see page 1539)	This is OnMnemonic, a member of class TActiveXControl.
V	PerformVerb (see page 1540)	This is PerformVerb, a member of class TActiveXControl.
	PersistPropBagInitNew (see page 1540)	This is PersistPropBagInitNew, a member of class TActiveXControl.
	PersistPropBagLoad (see page 1540)	This is PersistPropBagLoad, a member of class TActiveXControl.
	PersistPropBagSave (see page 1540)	This is PersistPropBagSave, a member of class TActiveXControl.
	PersistStorageInitNew (see page 1541)	This is PersistStorageInitNew, a member of class TActiveXControl.
	PersistStorageLoad (see page 1541)	This is PersistStorageLoad, a member of class TActiveXControl.
	PersistStorageSave (see page 1541)	This is PersistStorageSave, a member of class TActiveXControl.
	PersistStreamLoad (see page 1541)	This is PersistStreamLoad, a member of class TActiveXControl.
	PersistStreamSave (see page 1541)	This is PersistStreamSave, a member of class TActiveXControl.
	PostMessageFilter (see page 1542)	This is PostMessageFilter, a member of class TActiveXControl.
	PreMessageFilter (see page 1542)	This is PreMessageFilter, a member of class TActiveXControl.
V	PutPropInBag (see page 1543)	This is PutPropInBag, a member of class TActiveXControl.
	QueryGetData (see page 1544)	This is QueryGetData, a member of class TActiveXControl.
	QueryInterface (see page 5560)	This is QueryInterface, a member of class TComObject.
	QuickActivate (see page 1544)	This is QuickActivate, a member of class TActiveXControl.
	ReactivateAndUndo (see page 1544)	This is ReactivateAndUndo, a member of class TActiveXControl.
	ResizeBorder (see page 1544)	This is ResizeBorder, a member of class TActiveXControl.
	SaveCompleted (see page 1544)	This is SaveCompleted, a member of class TActiveXControl.
V	SaveToStream (see page 1545)	This is SaveToStream, a member of class TActiveXControl.
	Set_BackColor (see page 1545)	This is Set_BackColor, a member of class TActiveXControl.
	Set_Caption (see page 1545)	This is Set_Caption, a member of class TActiveXControl.
	Set_Enabled (see page 1545)	This is Set_Enabled, a member of class TActiveXControl.
	Set_Font (see page 1546)	This is Set_Font, a member of class TActiveXControl.
	Set_ForeColor (see page 1546)	This is Set_ForeColor, a member of class TActiveXControl.
	Set_TabStop (see page 1546)	This is Set_TabStop, a member of class TActiveXControl.
	Set_Text (see page 1546)	This is Set_Text, a member of class TActiveXControl.
	SetAdvise (see page 1546)	This is SetAdvise, a member of class TActiveXControl.
	SetClientSite (see page 1547)	This is SetClientSite, a member of class TActiveXControl.
	SetColorScheme (see page 1547)	This is SetColorScheme, a member of class TActiveXControl.
	SetContentExtent (see page 1547)	This is SetContentExtent, a member of class TActiveXControl.
	SetData (see page 1547)	This is SetData, a member of class TActiveXControl.
	SetExtent (see page 1548)	This is SetExtent, a member of class TActiveXControl.
	SetHostNames (see page 1548)	This is SetHostNames, a member of class TActiveXControl.
	SetInPlaceSite (see page 1548)	This is SetInPlaceSite, a member of class TActiveXControl.
V	SetInterfaceSafetyOptions (see page 1548)	This is SetInterfaceSafetyOptions, a member of class TActiveXControl.
	SetMoniker (see page 1548)	This is SetMoniker, a member of class TActiveXControl.
	SetObjectRects (see page 1549)	This is SetObjectRects, a member of class TActiveXControl.
	ShowPropertyDialog (see page 1549)	This is ShowPropertyDialog, a member of class TActiveXControl.
	StdClickEvent (see page 1549)	This is StdClickEvent, a member of class TActiveXControl.
	StdDblClickEvent (see page 1549)	This is StdDblClickEvent, a member of class TActiveXControl.
	StdKeyDownEvent (see page 1550)	This is StdKeyDownEvent, a member of class TActiveXControl.
	StdKeyPressEvent (see page 1550)	This is StdKeyPressEvent, a member of class TActiveXControl.
	StdKeyUpEvent (see page 1550)	This is StdKeyUpEvent, a member of class TActiveXControl.
	StdMouseDownEvent (see page 1550)	This is StdMouseDownEvent, a member of class TActiveXControl.
	StdMouseMoveEvent (see page 1550)	This is StdMouseMoveEvent, a member of class TActiveXControl.
	StdMouseUpEvent (see page 1551)	This is StdMouseUpEvent, a member of class TActiveXControl.
	TranslateAccelerator (see page 1551)	This is TranslateAccelerator, a member of class TActiveXControl.

	UIDeactivate (see page 1551)	This is UIDeactivate, a member of class TActiveXControl.
	Unadvise (see page 1551)	This is Unadvise, a member of class TActiveXControl.
	Unfreeze (see page 1552)	This is Unfreeze, a member of class TActiveXControl.
	Update (see page 1552)	This is Update, a member of class TActiveXControl.
	ViewObjectGetExtent (see page 1552)	This is ViewObjectGetExtent, a member of class TActiveXControl.
V	WndProc (see page 1552)	This is WndProc, a member of class TActiveXControl.

Protected Properties

	Name	Description
R	AutoFactory (see page 5545)	The class factory that created this TAutoObject (see page 5540).
R	ConnectionPoints (see page 1553)	This is ConnectionPoints, a member of class TActiveXControl.
	EventSink (see page 5545)	This is EventSink, a member of class TAutoObject.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 5555)	Instantiates a COM object that is not part of an aggregate.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateAggregated (see page 5556)	Instantiates a COM object that is part of an aggregate.
	CreateFromFactory (see page 5556)	Instantiates a COM object and initializes its values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 1522)	Destroys an instance of TActiveXControl (see page 1517).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 1536)	Creates the class factory and connection object for the TActiveXControl (see page 1517).
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	ObjAddRef (see page 5559)	Implements the AddRef method of the IUnknown interface.
V	ObjQueryInterface (see page 1538)	Returns a requested COM interface on the object.

V	ObjRelease (see page 5559)	Implements the Release method of the IUnknown interface.
	PropChanged (see page 1542)	This is the overview for the PropChanged method overload.
	PropRequestEdit (see page 1543)	This is the overview for the PropRequestEdit method overload.
V	SafeCallException (see page 5560)	Handles OLE exceptions.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ClientSite (see page 1553)	Contains a pointer to the client site for the container on which the ActiveX control resides.
R	Control (see page 1553)	Indicates the VCL implementation of the ActiveX control.
R	Controller (see page 5561)	Specifies the controlling IUnknown interface that controls interfaces within an aggregate object.
R	Factory (see page 5561)	Specifies the class factory object for the TComObject (see page 5553) class.
R	InPlaceSite (see page 1554)	Contains a pointer to the site interface for the container on which the ActiveX control resides.
R	RefCount (see page 5562)	Indicates the number of references to the COM object that are currently in use.
	ServerExceptionHandler (see page 5562)	Provides access to the SafeCall exception notification process.

12.1.4.2 TActiveXControl.Destroy Destructor

Destroys an instance of TActiveXControl (see page 1517).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TActiveXControl();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the ActiveX control reference is not nil before calling Destroy. Destroy frees the resources used to turn the Control (see page 1553) into an active X control. It does not destroy the object referenced by the Control (see page 1553) property.

Control (see page 1553)

Free (see page 22300)

12.1.4.3 TActiveXControl Methods

The methods of the TActiveXControl class are listed here.

Protected Methods

	Name	Description
	Advise (see page 1525)	This is Advise, a member of class TActiveXControl.
	Close (see page 1525)	This is Close, a member of class TActiveXControl.
	ContextSensitiveHelp (see page 1525)	This is ContextSensitiveHelp, a member of class TActiveXControl.
	DAdvise (see page 1525)	This is DAdvise, a member of class TActiveXControl.
V	DefinePropertyPages (see page 1526)	This is DefinePropertyPages, a member of class TActiveXControl.
	DoVerb (see page 1526)	This is DoVerb, a member of class TActiveXControl.
	Draw (see page 1526)	This is Draw, a member of class TActiveXControl.
	DUnadvise (see page 1526)	This is DUnadvise, a member of class TActiveXControl.

	EnableModeless (see page 1527)	This is EnableModeless, a member of class TActiveXControl.
	EnumAdvise (see page 1527)	This is EnumAdvise, a member of class TActiveXControl.
	EnumDAdvise (see page 1527)	This is EnumDAdvise, a member of class TActiveXControl.
	EnumFormatEtc (see page 1527)	This is EnumFormatEtc, a member of class TActiveXControl.
	EnumVerbs (see page 1527)	This is EnumVerbs, a member of class TActiveXControl.
	Freeze (see page 1528)	This is Freeze, a member of class TActiveXControl.
	FreezeEvents (see page 1528)	This is FreezeEvents, a member of class TActiveXControl.
	Get_BackColor (see page 1528)	This is Get_BackColor, a member of class TActiveXControl.
	Get_Caption (see page 1528)	This is Get_Caption, a member of class TActiveXControl.
	Get_Enabled (see page 1529)	This is Get_Enabled, a member of class TActiveXControl.
	Get_Font (see page 1529)	This is Get_Font, a member of class TActiveXControl.
	Get_ForeColor (see page 1529)	This is Get_ForeColor, a member of class TActiveXControl.
	Get_HWnd (see page 1529)	This is Get_HWnd, a member of class TActiveXControl.
	Get_TabStop (see page 1529)	This is Get_TabStop, a member of class TActiveXControl.
	Get_Text (see page 1530)	This is Get_Text, a member of class TActiveXControl.
	GetAdvise (see page 1530)	This is GetAdvise, a member of class TActiveXControl.
	GetCanonicalFormatEtc (see page 1530)	This is GetCanonicalFormatEtc, a member of class TActiveXControl.
	GetClassID (see page 1530)	This is GetClassID, a member of class TActiveXControl.
	GetClientSite (see page 1531)	This is GetClientSite, a member of class TActiveXControl.
	GetClipboardData (see page 1531)	This is GetClipboardData, a member of class TActiveXControl.
	GetColorSet (see page 1531)	This is GetColorSet, a member of class TActiveXControl.
	GetContentExtent (see page 1531)	This is GetContentExtent, a member of class TActiveXControl.
	GetControlInfo (see page 1531)	This is GetControlInfo, a member of class TActiveXControl.
	GetData (see page 1532)	This is GetData, a member of class TActiveXControl.
	GetDataHere (see page 1532)	This is GetDataHere, a member of class TActiveXControl.
	GetDisplayString (see page 1532)	This is GetDisplayString, a member of class TActiveXControl.
	GetExtent (see page 1532)	This is GetExtent, a member of class TActiveXControl.
V	GetInterfaceSafetyOptions (see page 1533)	This is GetInterfaceSafetyOptions, a member of class TActiveXControl.
	GetMiscStatus (see page 1533)	This is GetMiscStatus, a member of class TActiveXControl.
	GetMoniker (see page 1533)	This is GetMoniker, a member of class TActiveXControl.
	GetPages (see page 1533)	This is GetPages, a member of class TActiveXControl.
	GetPredefinedStrings (see page 1533)	This is GetPredefinedStrings, a member of class TActiveXControl.
	GetPredefinedValue (see page 1534)	This is GetPredefinedValue, a member of class TActiveXControl.
V	GetPropertyString (see page 1534)	This is GetPropertyString, a member of class TActiveXControl.
V	GetPropertyStrings (see page 1534)	This is GetPropertyStrings, a member of class TActiveXControl.
V	GetPropertyValue (see page 1534)	This is GetPropertyValue, a member of class TActiveXControl.
V	GetPropFromBag (see page 1535)	This is GetPropFromBag, a member of class TActiveXControl.
	GetSizeMax (see page 1535)	This is GetSizeMax, a member of class TActiveXControl.
	GetUserClassID (see page 1535)	This is GetUserClassID, a member of class TActiveXControl.
	GetUserType (see page 1535)	This is GetUserType, a member of class TActiveXControl.
	GetWindow (see page 1536)	This is GetWindow, a member of class TActiveXControl.
	HandsOffStorage (see page 1536)	This is HandsOffStorage, a member of class TActiveXControl.
	InitFromData (see page 1536)	This is InitFromData, a member of class TActiveXControl.
V	InitializeControl (see page 1537)	This is InitializeControl, a member of class TActiveXControl.
	InitNew (see page 1537)	This is InitNew, a member of class TActiveXControl.
	InPlaceActivate (see page 1537)	This is InPlaceActivate, a member of class TActiveXControl.
	InPlaceDeactivate (see page 1537)	This is InPlaceDeactivate, a member of class TActiveXControl.
	IsDirty (see page 1537)	This is IsDirty, a member of class TActiveXControl.
	IsUpToDate (see page 1538)	This is IsUpToDate, a member of class TActiveXControl.
V	LoadFromStream (see page 1538)	This is LoadFromStream, a member of class TActiveXControl.
	MapPropertyToPage (see page 1538)	This is MapPropertyToPage, a member of class TActiveXControl.
	OnAmbientPropertyChange (see page 1539)	This is OnAmbientPropertyChange, a member of class TActiveXControl.
	OnDocWindowActivate (see page 1539)	This is OnDocWindowActivate, a member of class TActiveXControl.
	OnFrameWindowActivate (see page 1539)	This is OnFrameWindowActivate, a member of class TActiveXControl.

	OnMnemonic (see page 1539)	This is OnMnemonic, a member of class TActiveXControl.
V	PerformVerb (see page 1540)	This is PerformVerb, a member of class TActiveXControl.
	PersistPropBagInitNew (see page 1540)	This is PersistPropBagInitNew, a member of class TActiveXControl.
	PersistPropBagLoad (see page 1540)	This is PersistPropBagLoad, a member of class TActiveXControl.
	PersistPropBagSave (see page 1540)	This is PersistPropBagSave, a member of class TActiveXControl.
	PersistStorageInitNew (see page 1541)	This is PersistStorageInitNew, a member of class TActiveXControl.
	PersistStorageLoad (see page 1541)	This is PersistStorageLoad, a member of class TActiveXControl.
	PersistStorageSave (see page 1541)	This is PersistStorageSave, a member of class TActiveXControl.
	PersistStreamLoad (see page 1541)	This is PersistStreamLoad, a member of class TActiveXControl.
	PersistStreamSave (see page 1541)	This is PersistStreamSave, a member of class TActiveXControl.
	PostMessageFilter (see page 1542)	This is PostMessageFilter, a member of class TActiveXControl.
	PreMessageFilter (see page 1542)	This is PreMessageFilter, a member of class TActiveXControl.
V	PutPropInBag (see page 1543)	This is PutPropInBag, a member of class TActiveXControl.
	QueryGetData (see page 1544)	This is QueryGetData, a member of class TActiveXControl.
	QuickActivate (see page 1544)	This is QuickActivate, a member of class TActiveXControl.
	ReactivateAndUndo (see page 1544)	This is ReactivateAndUndo, a member of class TActiveXControl.
	ResizeBorder (see page 1544)	This is ResizeBorder, a member of class TActiveXControl.
	SaveCompleted (see page 1544)	This is SaveCompleted, a member of class TActiveXControl.
V	SaveToStream (see page 1545)	This is SaveToStream, a member of class TActiveXControl.
	Set_BackColor (see page 1545)	This is Set_BackColor, a member of class TActiveXControl.
	Set_Caption (see page 1545)	This is Set_Caption, a member of class TActiveXControl.
	Set_Enabled (see page 1545)	This is Set_Enabled, a member of class TActiveXControl.
	Set_Font (see page 1546)	This is Set_Font, a member of class TActiveXControl.
	Set_ForeColor (see page 1546)	This is Set_ForeColor, a member of class TActiveXControl.
	Set_TabStop (see page 1546)	This is Set_TabStop, a member of class TActiveXControl.
	Set_Text (see page 1546)	This is Set_Text, a member of class TActiveXControl.
	SetAdvise (see page 1546)	This is SetAdvise, a member of class TActiveXControl.
	SetClientSite (see page 1547)	This is SetClientSite, a member of class TActiveXControl.
	SetColorScheme (see page 1547)	This is SetColorScheme, a member of class TActiveXControl.
	SetContentExtent (see page 1547)	This is SetContentExtent, a member of class TActiveXControl.
	SetData (see page 1547)	This is SetData, a member of class TActiveXControl.
	SetExtent (see page 1548)	This is SetExtent, a member of class TActiveXControl.
	SetHostNames (see page 1548)	This is SetHostNames, a member of class TActiveXControl.
	SetInPlaceSite (see page 1548)	This is SetInPlaceSite, a member of class TActiveXControl.
V	SetInterfaceSafetyOptions (see page 1548)	This is SetInterfaceSafetyOptions, a member of class TActiveXControl.
	SetMoniker (see page 1548)	This is SetMoniker, a member of class TActiveXControl.
	SetObjectRects (see page 1549)	This is SetObjectRects, a member of class TActiveXControl.
	ShowPropertyDialog (see page 1549)	This is ShowPropertyDialog, a member of class TActiveXControl.
	StdClickEvent (see page 1549)	This is StdClickEvent, a member of class TActiveXControl.
	StdDblClickEvent (see page 1549)	This is StdDblClickEvent, a member of class TActiveXControl.
	StdKeyDownEvent (see page 1550)	This is StdKeyDownEvent, a member of class TActiveXControl.
	StdKeyPressEvent (see page 1550)	This is StdKeyPressEvent, a member of class TActiveXControl.
	StdKeyUpEvent (see page 1550)	This is StdKeyUpEvent, a member of class TActiveXControl.
	StdMouseDownEvent (see page 1550)	This is StdMouseDownEvent, a member of class TActiveXControl.
	StdMouseMoveEvent (see page 1550)	This is StdMouseMoveEvent, a member of class TActiveXControl.
	StdMouseUpEvent (see page 1551)	This is StdMouseUpEvent, a member of class TActiveXControl.
	TranslateAccelerator (see page 1551)	This is TranslateAccelerator, a member of class TActiveXControl.
	UIDeactivate (see page 1551)	This is UIDeactivate, a member of class TActiveXControl.
	Unadvise (see page 1551)	This is Unadvise, a member of class TActiveXControl.
	Unfreeze (see page 1552)	This is Unfreeze, a member of class TActiveXControl.
	Update (see page 1552)	This is Update, a member of class TActiveXControl.
	ViewObjectGetExtent (see page 1552)	This is ViewObjectGetExtent, a member of class TActiveXControl.
V	WndProc (see page 1552)	This is WndProc, a member of class TActiveXControl.

Public Methods

	Name	Description
	Initialize (see page 1536)	Creates the class factory and connection object for the TActiveXControl (see page 1517).
	ObjQueryInterface (see page 1538)	Returns a requested COM interface on the object.
	PropChanged (see page 1542)	This is the overview for the PropChanged method overload.
	PropRequestEdit (see page 1543)	This is the overview for the PropRequestEdit method overload.

12.1.4.3.1 TActiveXControl.Advise Method

Pascal

```
function Advise(const advSink: IAdviseSink; out dwConnection: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Advise(const IAdviseSink advSink, Longint dwConnection);
```

Description

This is Advise, a member of class TActiveXControl.

12.1.4.3.2 TActiveXControl.Close Method

Pascal

```
function Close(dwSaveOption: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Close(Longint dwSaveOption);
```

Description

This is Close, a member of class TActiveXControl.

12.1.4.3.3 TActiveXControl.ContextSensitiveHelp Method

Pascal

```
function ContextSensitiveHelp(fEnterMode: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT ContextSensitiveHelp(BOOL fEnterMode);
```

Description

This is ContextSensitiveHelp, a member of class TActiveXControl.

12.1.4.3.4 TActiveXControl.DAdvise Method

Pascal

```
function DAdvise(const formatetc: TFormatEtc; advf: Longint; const advSink: IAdviseSink; out
dwConnection: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT DAdvise(const TFormatEtc formatetc, Longint advf, const
IAdviseSink advSink, Longint dwConnection);
```

Description

This is DAdvise, a member of class TActiveXControl.

12.1.4.3.5 TActiveXControl.DefinePropertyPages Method

Pascal

```
procedure DefinePropertyPages(DefinePropertyPage: TDefinePropertyPage); virtual;
```

C++

```
virtual __fastcall DefinePropertyPages(TDefinePropertyPage DefinePropertyPage);
```

Description

This is DefinePropertyPages, a member of class TActiveXControl.

12.1.4.3.6 TActiveXControl.DoVerb Method

Pascal

```
function DoVerb(iVerb: Longint; msg: PMsg; const activeSite: IOleClientSite; lindex: Longint;
hwndParent: HWND; const posRect: TRect): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT DoVerb(Longint iVerb, PMsg msg, const IOleClientSite activeSite,
Longint lindex, HWND hwndParent, const TRect posRect);
```

Description

This is DoVerb, a member of class TActiveXControl.

12.1.4.3.7 TActiveXControl.Draw Method

Pascal

```
function Draw(dwDrawAspect: Longint; lindex: Longint; pvAspect: Pointer; ptd: PDVTargetDevice;
hicTargetDev: HDC; hdcDraw: HDC; prcBounds: PRect; prcWBounds: PRect; fnContinue:
TContinueFunc; dwContinue: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Draw(Longint dwDrawAspect, Longint lindex, void * pvAspect,
PDVTargetDevice ptd, HDC hicTargetDev, HDC hdcDraw, PRect prcBounds, PRect prcWBounds,
TContinueFunc fnContinue, Longint dwContinue);
```

Description

This is Draw, a member of class TActiveXControl.

12.1.4.3.8 TActiveXControl.DUnadvise Method

Pascal

```
function DUnadvise(dwConnection: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT DUnadvise(Longint dwConnection);
```

Description

This is DUnadvise, a member of class TActiveXControl.

12.1.4.3.9 TActiveXControl.EnableModeless Method

Pascal

```
function EnableModeless(fEnable: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT EnableModeless(BOOL fEnable);
```

Description

This is EnableModeless, a member of class TActiveXControl.

12.1.4.3.10 TActiveXControl.EnumAdvise Method

Pascal

```
function EnumAdvise(out enumAdvise: IEnumStatData): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT EnumAdvise(IEnumStatData enumAdvise);
```

Description

This is EnumAdvise, a member of class TActiveXControl.

12.1.4.3.11 TActiveXControl.EnumDAdvise Method

Pascal

```
function EnumDAdvise(out enumAdvise: IEnumStatData): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT EnumDAdvise(IEnumStatData enumAdvise);
```

Description

This is EnumDAdvise, a member of class TActiveXControl.

12.1.4.3.12 TActiveXControl.EnumFormatEtc Method

Pascal

```
function EnumFormatEtc(dwDirection: Longint; out enumFormatEtc: IEnumFormatEtc): HResult;
stdcall;
```

C++

```
__fastcall __stdcall HRESULT EnumFormatEtc(Longint dwDirection, IEnumFormatEtc enumFormatEtc);
```

Description

This is EnumFormatEtc, a member of class TActiveXControl.

12.1.4.3.13 TActiveXControl.EnumVerbs Method

Pascal

```
function EnumVerbs(out enumOleVerb: IEnumOleVerb): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT EnumVerbs(IEnumOleVerb enumOleVerb);
```

Description

This is EnumVerbs, a member of class TActiveXControl.

12.1.4.3.14 TActiveXControl.Freeze Method

Pascal

```
function Freeze(dwDrawAspect: Longint; lindex: Longint; pvAspect: Pointer; out dwFreeze:
Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Freeze(Longint dwDrawAspect, Longint lindex, void * pvAspect,
Longint dwFreeze);
```

Description

This is Freeze, a member of class TActiveXControl.

12.1.4.3.15 TActiveXControl.FreezeEvents Method

Pascal

```
function FreezeEvents(bFreeze: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT FreezeEvents(BOOL bFreeze);
```

Description

This is FreezeEvents, a member of class TActiveXControl.

12.1.4.3.16 TActiveXControl.Get_BackColor Method

Pascal

```
function Get_BackColor: Integer; safecall;
```

C++

```
__fastcall int Get_BackColor();
```

Description

This is Get_BackColor, a member of class TActiveXControl.

12.1.4.3.17 TActiveXControl.Get_Caption Method

Pascal

```
function Get_Caption: WideString; safecall;
```

C++

```
__fastcall BSTR Get_Caption();
```

Description

This is Get_Caption, a member of class TActiveXControl.

12.1.4.3.18 TActiveXControl.Get_Enabled Method

Pascal

```
function Get_Enabled: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_Enabled();
```

Description

This is Get_Enabled, a member of class TActiveXControl.

12.1.4.3.19 TActiveXControl.Get_Font Method

Pascal

```
function Get_Font: Font; safecall;
```

C++

```
__fastcall Font Get_Font();
```

Description

This is Get_Font, a member of class TActiveXControl.

12.1.4.3.20 TActiveXControl.Get_ForeColor Method

Pascal

```
function Get_ForeColor: Integer; safecall;
```

C++

```
__fastcall int Get_ForeColor();
```

Description

This is Get_ForeColor, a member of class TActiveXControl.

12.1.4.3.21 TActiveXControl.Get_HWnd Method

Pascal

```
function Get_HWnd: Integer; safecall;
```

C++

```
__fastcall int Get_HWnd();
```

Description

This is Get_HWnd, a member of class TActiveXControl.

12.1.4.3.22 TActiveXControl.Get_TabStop Method

Pascal

```
function Get_TabStop: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_TabStop();
```

Description

This is Get_TabStop, a member of class TActiveXControl.

12.1.4.3.23 TActiveXControl.Get_Text Method

Pascal

```
function Get_Text: WideString; safecall;
```

C++

```
__fastcall BSTR Get_Text();
```

Description

This is Get_Text, a member of class TActiveXControl.

12.1.4.3.24 TActiveXControl.GetAdvise Method

Pascal

```
function GetAdvise(pAspects: PLongint; pAdvf: PLONGINT; out advSink: IAdviseSink): HResult;
stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetAdvise(PLongint pAspects, PLONGINT pAdvf, IAdviseSink advSink);
```

Description

This is GetAdvise, a member of class TActiveXControl.

12.1.4.3.25 TActiveXControl.GetCanonicalFormatEtc Method

Pascal

```
function GetCanonicalFormatEtc(const formatetc: TFormatEtc; out formatetcOut: TFormatEtc):
HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetCanonicalFormatEtc(const TFormatEtc formatetc, TFormatEtc
formatetcOut);
```

Description

This is GetCanonicalFormatEtc, a member of class TActiveXControl.

12.1.4.3.26 TActiveXControl.GetClassID Method

Pascal

```
function GetClassID(out classID: TCLSID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetClassID(TCLSID classID);
```

Description

This is GetClassID, a member of class TActiveXControl.

12.1.4.3.27 TActiveXControl.GetClientSite Method

Pascal

```
function GetClientSite(out clientSite: IOleClientSite): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetClientSite(IOleClientSite clientSite);
```

Description

This is GetClientSite, a member of class TActiveXControl.

12.1.4.3.28 TActiveXControl.GetClipboardData Method

Pascal

```
function GetClipboardData(dwReserved: Longint; out dataObject: IDataObject): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetClipboardData(Longint dwReserved, IDataObject dataObject);
```

Description

This is GetClipboardData, a member of class TActiveXControl.

12.1.4.3.29 TActiveXControl.GetColorSet Method

Pascal

```
function GetColorSet(dwDrawAspect: Longint; lindex: Longint; pvAspect: Pointer; ptd:
PDVTargetDevice; hicTargetDev: HDC; out colorSet: PLogPalette): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetColorSet(Longint dwDrawAspect, Longint lindex, void *
pvAspect, PDVTargetDevice ptd, HDC hicTargetDev, PLogPalette colorSet);
```

Description

This is GetColorSet, a member of class TActiveXControl.

12.1.4.3.30 TActiveXControl.GetContentExtent Method

Pascal

```
function GetContentExtent(out sizel: TPoint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetContentExtent(TPoint sizel);
```

Description

This is GetContentExtent, a member of class TActiveXControl.

12.1.4.3.31 TActiveXControl.GetControlInfo Method

Pascal

```
function GetControlInfo(var ci: TControlInfo): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetControlInfo(TControlInfo ci);
```

Description

This is GetControlInfo, a member of class TActiveXControl.

12.1.4.3.32 TActiveXControl.GetData Method

Pascal

```
function GetData(const formatetcIn: TFormatEtc; out medium: TStgMedium): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetData(const TFormatEtc formatetcIn, TStgMedium medium);
```

Description

This is GetData, a member of class TActiveXControl.

12.1.4.3.33 TActiveXControl.GetDataHere Method

Pascal

```
function GetDataHere(const formatetc: TFormatEtc; out medium: TStgMedium): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetDataHere(const TFormatEtc formatetc, TStgMedium medium);
```

Description

This is GetDataHere, a member of class TActiveXControl.

12.1.4.3.34 TActiveXControl.GetDisplayString Method

Pascal

```
function GetDisplayString(dispid: TDispID; out bstr: WideString): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetDisplayString(TDispID dispid, BSTR bstr);
```

Description

This is GetDisplayString, a member of class TActiveXControl.

12.1.4.3.35 TActiveXControl.GetExtent Method

Pascal

```
function GetExtent(dwDrawAspect: Longint; out size: TPoint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetExtent(Longint dwDrawAspect, TPoint size);
```

Description

This is GetExtent, a member of class TActiveXControl.

12.1.4.3.36 TActiveXControl.GetInterfaceSafetyOptions Method

Pascal

```
function GetInterfaceSafetyOptions(const IID: TIID; pdwSupportedOptions: PDWORD;
pdwEnabledOptions: PDWORD): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT GetInterfaceSafetyOptions(const TIID IID, PDWORD
pdwSupportedOptions, PDWORD pdwEnabledOptions);
```

Description

This is GetInterfaceSafetyOptions, a member of class TActiveXControl.

12.1.4.3.37 TActiveXControl.GetMiscStatus Method

Pascal

```
function GetMiscStatus(dwAspect: Longint; out dwStatus: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetMiscStatus(Longint dwAspect, Longint dwStatus);
```

Description

This is GetMiscStatus, a member of class TActiveXControl.

12.1.4.3.38 TActiveXControl.GetMoniker Method

Pascal

```
function GetMoniker(dwAssign: Longint; dwWhichMoniker: Longint; out mk: IMoniker): HResult;
stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetMoniker(Longint dwAssign, Longint dwWhichMoniker, IMoniker mk);
```

Description

This is GetMoniker, a member of class TActiveXControl.

12.1.4.3.39 TActiveXControl.GetPages Method

Pascal

```
function GetPages(out pages: TCAGUID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetPages(TCAGUID pages);
```

Description

This is GetPages, a member of class TActiveXControl.

12.1.4.3.40 TActiveXControl.GetPredefinedStrings Method

Pascal

```
function GetPredefinedStrings(dispid: TDispID; out caStringsOut: TCAPOleStr; out caCookiesOut:
```

```
TCALongint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetPredefinedStrings(TDispID dispid, TCAPOleStr caStringsOut,
TCALongint caCookiesOut);
```

Description

This is GetPredefinedStrings, a member of class TActiveXControl.

12.1.4.3.41 TActiveXControl.GetPredefinedValue Method

Pascal

```
function GetPredefinedValue(dispid: TDispID; dwCookie: Longint; out varOut: OleVariant):
HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetPredefinedValue(TDispID dispid, Longint dwCookie, OleVariant
varOut);
```

Description

This is GetPredefinedValue, a member of class TActiveXControl.

12.1.4.3.42 TActiveXControl.GetPropertyString Method

Pascal

```
function GetPropertyString(DispID: Integer; var S: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetPropertyString(int DispID, AnsiString S);
```

Description

This is GetPropertyString, a member of class TActiveXControl.

12.1.4.3.43 TActiveXControl.GetPropertyStrings Method

Pascal

```
function GetPropertyStrings(DispID: Integer; Strings: TStrings): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetPropertyStrings(int DispID, TStrings Strings);
```

Description

This is GetPropertyStrings, a member of class TActiveXControl.

12.1.4.3.44 TActiveXControl.GetPropertyValue Method

Pascal

```
procedure GetPropertyValue(DispID: Integer; Cookie: Integer; var Value: OleVariant); virtual;
```

C++

```
virtual __fastcall GetPropertyValue(int DispID, int Cookie, OleVariant Value);
```

Description

This is GetPropertyValue, a member of class TActiveXControl.

12.1.4.3.45 TActiveXControl.GetPropFromBag Method

Pascal

```
procedure GetPropFromBag(const PropName: WideString; DispatchID: Integer; PropBag:
IPropertyBag; ErrorLog: IErrorLog); virtual;
```

C++

```
virtual __fastcall GetPropFromBag(const BSTR PropName, int DispatchID, IPropertyBag PropBag,
IErrorLog ErrorLog);
```

Description

This is GetPropFromBag, a member of class TActiveXControl.

12.1.4.3.46 TActiveXControl.GetSizeMax Method

Pascal

```
function GetSizeMax(out cbSize: Largeint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetSizeMax(Largeint cbSize);
```

Description

This is GetSizeMax, a member of class TActiveXControl.

12.1.4.3.47 TActiveXControl.GetUserClassID Method

Pascal

```
function GetUserClassID(out clsid: TCLSID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetUserClassID(TCLSID clsid);
```

Description

This is GetUserClassID, a member of class TActiveXControl.

12.1.4.3.48 TActiveXControl.GetUserType Method

Pascal

```
function GetUserType(dwFormOfType: Longint; out pszUserType: POleStr): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetUserType(Longint dwFormOfType, POleStr pszUserType);
```

Description

This is GetUserType, a member of class TActiveXControl.

12.1.4.3.49 TActiveXControl.GetWindow Method

Pascal

```
function GetWindow(out wnd: HWnd): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetWindow(HWnd wnd);
```

Description

This is GetWindow, a member of class TActiveXControl.

12.1.4.3.50 TActiveXControl.HandsOffStorage Method

Pascal

```
function HandsOffStorage: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT HandsOffStorage();
```

Description

This is HandsOffStorage, a member of class TActiveXControl.

12.1.4.3.51 TActiveXControl.InitFromData Method

Pascal

```
function InitFromData(const dataObject: IDataObject; fCreation: BOOL; dwReserved: Longint):
HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT InitFromData(const IDataObject dataObject, BOOL fCreation,
Longint dwReserved);
```

Description

This is InitFromData, a member of class TActiveXControl.

12.1.4.3.52 TActiveXControl.Initialize Method

Creates the class factory and connection object for the TActiveXControl (see page 1517).

Pascal

```
procedure Initialize; override;
```

C++

```
virtual __fastcall Initialize();
```

Description

The Initialize method creates the class factory object and creates and encapsulates the VCL control.

See Also

InitializeControl (see page 1513)

12.1.4.3.53 TActiveXControl.InitializeControl Method

Pascal

```
procedure InitializeControl; virtual;
```

C++

```
virtual __fastcall InitializeControl();
```

Description

This is InitializeControl, a member of class TActiveXControl.

12.1.4.3.54 TActiveXControl.InitNew Method

Pascal

```
function InitNew: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT InitNew();
```

Description

This is InitNew, a member of class TActiveXControl.

12.1.4.3.55 TActiveXControl.InPlaceActivate Method

Pascal

```
function InPlaceActivate(ActivateUI: Boolean): HResult;
```

C++

```
__fastcall HRESULT InPlaceActivate(Boolean ActivateUI);
```

Description

This is InPlaceActivate, a member of class TActiveXControl.

12.1.4.3.56 TActiveXControl.InPlaceDeactivate Method

Pascal

```
function InPlaceDeactivate: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT InPlaceDeactivate();
```

Description

This is InPlaceDeactivate, a member of class TActiveXControl.

12.1.4.3.57 TActiveXControl.IsDirty Method

Pascal

```
function IsDirty: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT IsDirty();
```

Description

This is IsDirty, a member of class TActiveXControl.

12.1.4.3.58 TActiveXControl.IsUpToDate Method

Pascal

```
function IsUpToDate: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT IsUpToDate();
```

Description

This is IsUpToDate, a member of class TActiveXControl.

12.1.4.3.59 TActiveXControl.LoadFromStream Method

Pascal

```
procedure LoadFromStream(const Stream: IStream); virtual;
```

C++

```
virtual __fastcall LoadFromStream(const IStream Stream);
```

Description

This is LoadFromStream, a member of class TActiveXControl.

12.1.4.3.60 TActiveXControl.MapPropertyToPage Method

Pascal

```
function MapPropertyToPage(dispid: TDispID; out clsid: TCLSID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT MapPropertyToPage(TDispID dispid, TCLSID clsid);
```

Description

This is MapPropertyToPage, a member of class TActiveXControl.

12.1.4.3.61 TActiveXControl.ObjQueryInterface Method

Returns a requested COM interface on the object.

Pascal

```
function ObjQueryInterface(const IID: TGUID; out Obj): HResult; override;
```

C++

```
virtual __fastcall HRESULT ObjQueryInterface(const TGUID IID,  Obj);
```

Description

ObjQueryInterface attempts to locate the interface specified by the IID parameter, and returns it in the Obj parameter. If the requested interface is found and returned, ObjQueryInterface returns S_OK.

See Also

TActiveForm (see page 1489)

TActiveFormFactory (see page 1514)

12.1.4.3.62 TActiveXControl.OnAmbientPropertyChange Method

Pascal

```
function OnAmbientPropertyChange(dispid: TDispID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnAmbientPropertyChange(TDispID dispid);
```

Description

This is OnAmbientPropertyChange, a member of class TActiveXControl.

12.1.4.3.63 TActiveXControl.OnDocWindowActivate Method

Pascal

```
function OnDocWindowActivate(fActivate: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnDocWindowActivate(BOOL fActivate);
```

Description

This is OnDocWindowActivate, a member of class TActiveXControl.

12.1.4.3.64 TActiveXControl.OnFrameWindowActivate Method

Pascal

```
function OnFrameWindowActivate(fActivate: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnFrameWindowActivate(BOOL fActivate);
```

Description

This is OnFrameWindowActivate, a member of class TActiveXControl.

12.1.4.3.65 TActiveXControl.OnMnemonic Method

Pascal

```
function OnMnemonic(msg: PMsg): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnMnemonic(PMsg msg);
```

Description

This is OnMnemonic, a member of class TActiveXControl.

12.1.4.3.66 TActiveXControl.PerformVerb Method

Pascal

```
procedure PerformVerb(Verb: Integer); virtual;
```

C++

```
virtual __fastcall PerformVerb(int Verb);
```

Description

This is PerformVerb, a member of class TActiveXControl.

12.1.4.3.67 TActiveXControl.PersistPropBagInitNew Method

Pascal

```
function PersistPropBagInitNew: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT PersistPropBagInitNew();
```

Description

This is PersistPropBagInitNew, a member of class TActiveXControl.

12.1.4.3.68 TActiveXControl.PersistPropBagLoad Method

Pascal

```
function PersistPropBagLoad(const pPropBag: IPropertyBag; const pErrorLog: IErrorLog):
HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT PersistPropBagLoad(const IPropertyBag pPropBag, const IErrorLog
pErrorLog);
```

Description

This is PersistPropBagLoad, a member of class TActiveXControl.

12.1.4.3.69 TActiveXControl.PersistPropBagSave Method

Pascal

```
function PersistPropBagSave(const pPropBag: IPropertyBag; fClearDirty: BOOL;
fSaveAllProperties: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT PersistPropBagSave(const IPropertyBag pPropBag, BOOL fClearDirty,
BOOL fSaveAllProperties);
```

Description

This is PersistPropBagSave, a member of class TActiveXControl.

12.1.4.3.70 TActiveXControl.PersistStorageInitNew Method

Pascal

```
function PersistStorageInitNew(const stg: IStorage): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT PersistStorageInitNew(const IStorage stg);
```

Description

This is PersistStorageInitNew, a member of class TActiveXControl.

12.1.4.3.71 TActiveXControl.PersistStorageLoad Method

Pascal

```
function PersistStorageLoad(const stg: IStorage): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT PersistStorageLoad(const IStorage stg);
```

Description

This is PersistStorageLoad, a member of class TActiveXControl.

12.1.4.3.72 TActiveXControl.PersistStorageSave Method

Pascal

```
function PersistStorageSave(const stgSave: IStorage; fSameAsLoad: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT PersistStorageSave(const IStorage stgSave, BOOL fSameAsLoad);
```

Description

This is PersistStorageSave, a member of class TActiveXControl.

12.1.4.3.73 TActiveXControl.PersistStreamLoad Method

Pascal

```
function PersistStreamLoad(const stm: IStream): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT PersistStreamLoad(const IStream stm);
```

Description

This is PersistStreamLoad, a member of class TActiveXControl.

12.1.4.3.74 TActiveXControl.PersistStreamSave Method

Pascal

```
function PersistStreamSave(const stm: IStream; fClearDirty: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT PersistStreamSave(const IStream stm, BOOL fClearDirty);
```

Description

This is PersistStreamSave, a member of class TActiveXControl.

12.1.4.3.75 TActiveXControl.PostMessageFilter Method

Pascal

```
function PostMessageFilter(wnd: HWnd; msg: Integer; wp: Integer; lp: Integer; out res:
Integer; Cookie: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT PostMessageFilter(HWnd wnd, int msg, int wp, int lp, int res,
Longint Cookie);
```

Description

This is PostMessageFilter, a member of class TActiveXControl.

12.1.4.3.76 TActiveXControl.PreMessageFilter Method

Pascal

```
function PreMessageFilter(wnd: HWnd; msg: Integer; wp: Integer; lp: Integer; out res: Integer;
out Cookie: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT PreMessageFilter(HWnd wnd, int msg, int wp, int lp, int res,
Longint Cookie);
```

Description

This is PreMessageFilter, a member of class TActiveXControl.

12.1.4.3.77 PropChanged Method

This is the overview for the PropChanged method overload.

Overload List

	Name	Description
	TActiveXControl.PropChanged (TDispID) (see page 1542)	Generates an OnChanged event.
	TActiveXControl.PropChanged (WideString) (see page 1542)	Generates an OnChanged event.

12.1.4.3.77.1 TActiveXControl.PropChanged Method (TDispID)

Generates an OnChanged event.

Pascal

```
procedure PropChanged(const PropertyName: WideString); overload;
procedure PropChanged(DispID: TDispID); overload;
```

C++

```
__fastcall PropChanged(const BSTR PropertyName);
__fastcall PropChanged(TDispID DispID);
```

Description

Call PropChanged when the property specified by the DispID (or PropertyName) parameter changes. PropChanged generates an OnChanged event using the IPropertyNotifySink interface.

When possible, call this procedure with the DispID rather than the PropertyName because it is more efficient. Calling PropChanged with the PropertyName first looks up the DispID from the given PropertyName before generating the event.

12.1.4.3.78 PropRequestEdit Method

This is the overview for the PropRequestEdit method overload.

Overload List

	Name	Description
	TActiveXControl.PropRequestEdit (TDispID) (see page 1543)	Indicates whether a specified property can be changed.
	TActiveXControl.PropRequestEdit (WideString) (see page 1543)	Indicates whether a specified property can be changed.

12.1.4.3.78.1 TActiveXControl.PropRequestEdit Method (TDispID)

Indicates whether a specified property can be changed.

Pascal

```
function PropRequestEdit(const PropertyName: WideString): Boolean; overload;
function PropRequestEdit(DispID: TDispID): Boolean; overload;
```

C++

```
__fastcall Boolean PropRequestEdit(const BSTR PropertyName);
__fastcall Boolean PropRequestEdit(TDispID DispID);
```

Description

Call PropRequestEdit to determine whether the property specified by the DispID (or PropertyName) parameter can be edited. PropRequestEdit uses the IPropertyNotifySink interface to determine whether the property can be changed, and returns True if it can.

When possible, call this function with the DispID rather than the PropertyName because it is more efficient. Calling PropRequestEdit with the PropertyName first looks up the DispID from the given PropertyName before generating the event.

12.1.4.3.79 TActiveXControl.PutPropInBag Method

Pascal

```
procedure PutPropInBag(const PropName: WideString; DispatchID: Integer; PropBag:
IPropertyBag); virtual;
```

C++

```
virtual __fastcall PutPropInBag(const BSTR PropName, int DispatchID, IPropertyBag PropBag);
```

Description

This is PutPropInBag, a member of class TActiveXControl.

12.1.4.3.80 TActiveXControl.QueryGetData Method

Pascal

```
function QueryGetData(const formatetc: TFormatEtc): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT QueryGetData(const TFormatEtc formatetc);
```

Description

This is QueryGetData, a member of class TActiveXControl.

12.1.4.3.81 TActiveXControl.QuickActivate Method

Pascal

```
function QuickActivate(var qaCont: tagQACONTAINER; var qaCtrl: tagQACONTROL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT QuickActivate(tagQACONTAINER qaCont, tagQACONTROL qaCtrl);
```

Description

This is QuickActivate, a member of class TActiveXControl.

12.1.4.3.82 TActiveXControl.ReactivateAndUndo Method

Pascal

```
function ReactivateAndUndo: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT ReactivateAndUndo();
```

Description

This is ReactivateAndUndo, a member of class TActiveXControl.

12.1.4.3.83 TActiveXControl.ResizeBorder Method

Pascal

```
function ResizeBorder(const rcBorder: TRect; const uiWindow: IOleInPlaceUIWindow;
fFrameWindow: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT ResizeBorder(const TRect rcBorder, const IOleInPlaceUIWindow
uiWindow, BOOL fFrameWindow);
```

Description

This is ResizeBorder, a member of class TActiveXControl.

12.1.4.3.84 TActiveXControl.SaveCompleted Method

Pascal

```
function SaveCompleted(const stgNew: IStorage): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SaveCompleted(const IStorage stgNew);
```

Description

This is SaveCompleted, a member of class TActiveXControl.

12.1.4.3.85 TActiveXControl.SaveToStream Method

Pascal

```
procedure SaveToStream(const Stream: IStream); virtual;
```

C++

```
virtual __fastcall SaveToStream(const IStream Stream);
```

Description

This is SaveToStream, a member of class TActiveXControl.

12.1.4.3.86 TActiveXControl.Set_BackColor Method

Pascal

```
procedure Set_BackColor(Value: Integer); safecall;
```

C++

```
__fastcall Set_BackColor(int Value);
```

Description

This is Set_BackColor, a member of class TActiveXControl.

12.1.4.3.87 TActiveXControl.Set_Caption Method

Pascal

```
procedure Set_Caption(const Value: WideString); safecall;
```

C++

```
__fastcall Set_Caption(const BSTR Value);
```

Description

This is Set_Caption, a member of class TActiveXControl.

12.1.4.3.88 TActiveXControl.Set_Enabled Method

Pascal

```
procedure Set_Enabled(Value: WordBool); safecall;
```

C++

```
__fastcall Set_Enabled(WordBool Value);
```

Description

This is Set_Enabled, a member of class TActiveXControl.

12.1.4.3.89 TActiveXControl.Set_Font Method

Pascal

```
procedure Set_Font(const Value: Font); safecall;
```

C++

```
__fastcall Set_Font(const Font Value);
```

Description

This is Set_Font, a member of class TActiveXControl.

12.1.4.3.90 TActiveXControl.Set_ForeColor Method

Pascal

```
procedure Set_ForeColor(Value: Integer); safecall;
```

C++

```
__fastcall Set_ForeColor(int Value);
```

Description

This is Set_ForeColor, a member of class TActiveXControl.

12.1.4.3.91 TActiveXControl.Set_TabStop Method

Pascal

```
procedure Set_TabStop(Value: WordBool); safecall;
```

C++

```
__fastcall Set_TabStop(WordBool Value);
```

Description

This is Set_TabStop, a member of class TActiveXControl.

12.1.4.3.92 TActiveXControl.Set_Text Method

Pascal

```
procedure Set_Text(const Value: WideString); safecall;
```

C++

```
__fastcall Set_Text(const BSTR Value);
```

Description

This is Set_Text, a member of class TActiveXControl.

12.1.4.3.93 TActiveXControl.SetAdvise Method

Pascal

```
function SetAdvise(aspects: Longint; advf: Longint; const advSink: IAdviseSink): HResult;
stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetAdvise(Longint aspects, Longint advf, const IAdviseSink
advSink);
```

Description

This is SetAdvise, a member of class TActiveXControl.

12.1.4.3.94 TActiveXControl.SetClientSite Method

Pascal

```
function SetClientSite(const clientSite: IOleClientSite): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetClientSite(const IOleClientSite clientSite);
```

Description

This is SetClientSite, a member of class TActiveXControl.

12.1.4.3.95 TActiveXControl.SetColorScheme Method

Pascal

```
function SetColorScheme(const logpal: TLogPalette): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetColorScheme(const TLogPalette logpal);
```

Description

This is SetColorScheme, a member of class TActiveXControl.

12.1.4.3.96 TActiveXControl.SetContentExtent Method

Pascal

```
function SetContentExtent(const sizel: TPoint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetContentExtent(const TPoint sizel);
```

Description

This is SetContentExtent, a member of class TActiveXControl.

12.1.4.3.97 TActiveXControl.SetData Method

Pascal

```
function SetData(const formatetc: TFormatEtc; var medium: TStgMedium; fRelease: BOOL):
HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetData(const TFormatEtc formatetc, TStgMedium medium, BOOL
fRelease);
```

Description

This is SetData, a member of class TActiveXControl.

12.1.4.3.98 TActiveXControl.SetExtent Method

Pascal

```
function SetExtent(dwDrawAspect: Longint; const size: TPoint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetExtent(Longint dwDrawAspect, const TPoint size);
```

Description

This is SetExtent, a member of class TActiveXControl.

12.1.4.3.99 TActiveXControl.SetHostNames Method

Pascal

```
function SetHostNames(szContainerApp: POleStr; szContainerObj: POleStr): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetHostNames(POleStr szContainerApp, POleStr szContainerObj);
```

Description

This is SetHostNames, a member of class TActiveXControl.

12.1.4.3.100 TActiveXControl.SetInPlaceSite Method

Pascal

```
procedure SetInPlaceSite(const NewInPlaceSite: IOleInPlaceSite);
```

C++

```
__fastcall SetInPlaceSite(const IOleInPlaceSite NewInPlaceSite);
```

Description

This is SetInPlaceSite, a member of class TActiveXControl.

12.1.4.3.101 TActiveXControl.SetInterfaceSafetyOptions Method

Pascal

```
function SetInterfaceSafetyOptions(const IID: TIID; dwOptionSetMask: DWORD; dwEnabledOptions:
DWORD): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT SetInterfaceSafetyOptions(const TIID IID, DWORD
dwOptionSetMask, DWORD dwEnabledOptions);
```

Description

This is SetInterfaceSafetyOptions, a member of class TActiveXControl.

12.1.4.3.102 TActiveXControl.SetMoniker Method

Pascal

```
function SetMoniker(dwWhichMoniker: Longint; const mk: IMoniker): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetMoniker(Longint dwWhichMoniker, const IMoniker mk);
```

Description

This is SetMoniker, a member of class TActiveXControl.

12.1.4.3.103 TActiveXControl.SetObjectRects Method

Pascal

```
function SetObjectRects(const rcPosRect: TRect; const rcClipRect: TRect): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetObjectRects(const TRect rcPosRect, const TRect rcClipRect);
```

Description

This is SetObjectRects, a member of class TActiveXControl.

12.1.4.3.104 TActiveXControl.ShowPropertyDialog Method

Pascal

```
procedure ShowPropertyDialog;
```

C++

```
__fastcall ShowPropertyDialog();
```

Description

This is ShowPropertyDialog, a member of class TActiveXControl.

12.1.4.3.105 TActiveXControl.StdClickEvent Method

Pascal

```
procedure StdClickEvent(Sender: TObject);
```

C++

```
__fastcall StdClickEvent(TObject * Sender);
```

Description

This is StdClickEvent, a member of class TActiveXControl.

12.1.4.3.106 TActiveXControl.StdDblClickEvent Method

Pascal

```
procedure StdDblClickEvent(Sender: TObject);
```

C++

```
__fastcall StdDblClickEvent(TObject * Sender);
```

Description

This is StdDblClickEvent, a member of class TActiveXControl.

12.1.4.3.107 TActiveXControl.StdKeyDownEvent Method

Pascal

```
procedure StdKeyDownEvent(Sender: TObject; var Key: Word; Shift: TShiftState);
```

C++

```
__fastcall StdKeyDownEvent(TObject * Sender, Word Key, TShiftState Shift);
```

Description

This is StdKeyDownEvent, a member of class TActiveXControl.

12.1.4.3.108 TActiveXControl.StdKeyPressEvent Method

Pascal

```
procedure StdKeyPressEvent(Sender: TObject; var Key: Char);
```

C++

```
__fastcall StdKeyPressEvent(TObject * Sender, Char Key);
```

Description

This is StdKeyPressEvent, a member of class TActiveXControl.

12.1.4.3.109 TActiveXControl.StdKeyUpEvent Method

Pascal

```
procedure StdKeyUpEvent(Sender: TObject; var Key: Word; Shift: TShiftState);
```

C++

```
__fastcall StdKeyUpEvent(TObject * Sender, Word Key, TShiftState Shift);
```

Description

This is StdKeyUpEvent, a member of class TActiveXControl.

12.1.4.3.110 TActiveXControl.StdMouseDownEvent Method

Pascal

```
procedure StdMouseDownEvent(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X:
Integer; Y: Integer);
```

C++

```
__fastcall StdMouseDownEvent(TObject * Sender, TMouseButton Button, TShiftState Shift, int X,
int Y);
```

Description

This is StdMouseDownEvent, a member of class TActiveXControl.

12.1.4.3.111 TActiveXControl.StdMouseMoveEvent Method

Pascal

```
procedure StdMouseMoveEvent(Sender: TObject; Shift: TShiftState; X: Integer; Y: Integer);
```

C++

```
__fastcall StdMouseMoveEvent(TObject * Sender, TShiftState Shift, int X, int Y);
```

Description

This is StdMouseMoveEvent, a member of class TActiveXControl.

12.1.4.3.112 TActiveXControl.StdMouseUpEvent Method

Pascal

```
procedure StdMouseUpEvent(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X:
Integer; Y: Integer);
```

C++

```
__fastcall StdMouseUpEvent(TObject * Sender, TMouseButton Button, TShiftState Shift, int X,
int Y);
```

Description

This is StdMouseUpEvent, a member of class TActiveXControl.

12.1.4.3.113 TActiveXControl.TranslateAccelerator Method

Pascal

```
function TranslateAccelerator(var msg: TMsg): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT TranslateAccelerator(TMsg msg);
```

Description

This is TranslateAccelerator, a member of class TActiveXControl.

12.1.4.3.114 TActiveXControl.UIDeactivate Method

Pascal

```
function UIDeactivate: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT UIDeactivate();
```

Description

This is UIDeactivate, a member of class TActiveXControl.

12.1.4.3.115 TActiveXControl.Unadvise Method

Pascal

```
function Unadvise(dwConnection: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Unadvise(Longint dwConnection);
```

Description

This is Unadvise, a member of class TActiveXControl.

12.1.4.3.116 TActiveXControl.Unfreeze Method

Pascal

```
function Unfreeze(dwFreeze: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Unfreeze(Longint dwFreeze);
```

Description

This is Unfreeze, a member of class TActiveXControl.

12.1.4.3.117 TActiveXControl.Update Method

Pascal

```
function Update: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Update();
```

Description

This is Update, a member of class TActiveXControl.

12.1.4.3.118 TActiveXControl.ViewObjectGetExtent Method

Pascal

```
function ViewObjectGetExtent(dwDrawAspect: Longint; lindex: Longint; ptd: PDVTargetDevice; out
size: TPoint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT ViewObjectGetExtent(Longint dwDrawAspect, Longint lindex,
PDVTargetDevice ptd, TPoint size);
```

Description

This is ViewObjectGetExtent, a member of class TActiveXControl.

12.1.4.3.119 TActiveXControl.WndProc Method

Pascal

```
procedure WndProc(var Message: TMessage); virtual;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

This is WndProc, a member of class TActiveXControl.

12.1.4.4 TActiveXControl Properties

The properties of the TActiveXControl class are listed here.

Protected Properties

	Name	Description
R	ConnectionPoints (see page 1553)	This is ConnectionPoints, a member of class TActiveXControl.

Public Properties

	Name	Description
R	ClientSite (see page 1553)	Contains a pointer to the client site for the container on which the ActiveX control resides.
R	Control (see page 1553)	Indicates the VCL implementation of the ActiveX control.
R	InPlaceSite (see page 1554)	Contains a pointer to the site interface for the container on which the ActiveX control resides.

12.1.4.4.1 TActiveXControl.ClientSite Property

Contains a pointer to the client site for the container on which the ActiveX control resides.

Pascal

```
property ClientSite: IOleClientSite;
```

C++

```
__property IOleClientSite ClientSite;
```

Description

ClientSite contains an interface pointer to the object's client site. Within a compound document, each embedded object has its own client site. The client site is the place where it is displayed and through which it retrieves information about its storage, user interface, and other resources.

Use this property when you need to get client site information from the container.

See Also

InPlaceSite (see page 1554)

12.1.4.4.2 TActiveXControl.ConnectionPoints Property

Pascal

```
property ConnectionPoints: TConnectionPoints;
```

C++

```
__property TConnectionPoints ConnectionPoints;
```

Description

This is ConnectionPoints, a member of class TActiveXControl.

12.1.4.4.3 TActiveXControl.Control Property

Indicates the VCL implementation of the ActiveX control.

Pascal

```
property Control: TWinControl;
```

C++

```
__property TWinControl * Control;
```

Description

Control is the VCL control derived from TWinControl that implements the ActiveX control.

12.1.4.4.4 TActiveXControl.InPlaceSite Property

Contains a pointer to the site interface for the container on which the ActiveX control resides.

Pascal

```
property InPlaceSite: IOleInPlaceSite;
```

C++

```
__property IOleInPlaceSite InPlaceSite;
```

Description

InPlaceSite contains an interface pointer to the container's IOleInPlaceSite interface when the container supports embedding and in-place activation. Use this interface to access the windows that contain the activeX object (both the Frame window and the immediate container, or site, window).

See Also

ClientSite (see page 1553)

12.1.5 TActiveXControlFactory Class

TActiveXControlFactory is the factory class for ActiveX control objects.

Class Hierarchy

Pascal

```
TActiveXControlFactory = class(TAutoObjectFactory);
```

C++

```
class TActiveXControlFactory : public TAutoObjectFactory;
```

File

AxCtrls

Description

An ActiveX control is a COM object, which means the module it is implemented in must provide a factory object for the system to be able to create it. The TActiveXControlFactory class is a factory for ActiveX controls, which are implemented using the TActiveXControl (see page 1517) abstract class.

For more information about COM factories, see TComObjectFactory.

The ActiveX Control wizard adds To add an ActiveX control factory to your program, create the factory object in the initialization section of the unit that defines the TActiveXControl (see page 1517) object.

See Also

TActiveXControl (see page 1517)

TComObjectFactory (see page 5563)

12.1.5.1 TActiveXControlFactory Members

The following tables list the members exposed by TActiveXControlFactory.

Protected Methods

	Name	Description
	_AddRef (see page 5567)	This is _AddRef, a member of class TComObjectFactory.
	_Release (see page 5567)	This is _Release, a member of class TComObjectFactory.
	CreateInstance (see page 5568)	This is CreateInstance, a member of class TComObjectFactory.
	CreateInstanceLic (see page 5568)	This is CreateInstanceLic, a member of class TComObjectFactory.
V	GetLicenseFileName (see page 1558)	This is GetLicenseFileName, a member of class TActiveXControlFactory.
V	GetLicenseString (see page 5568)	This is GetLicenseString, a member of class TComObjectFactory.
	GetLicInfo (see page 5568)	This is GetLicInfo, a member of class TComObjectFactory.
V	GetProgID (see page 5569)	This is GetProgID, a member of class TComObjectFactory.
V	HasMachineLicense (see page 1558)	This is HasMachineLicense, a member of class TActiveXControlFactory.
	LockServer (see page 5569)	This is LockServer, a member of class TComObjectFactory.
	QueryInterface (see page 5569)	This is QueryInterface, a member of class TComObjectFactory.
	RequestLicKey (see page 5570)	This is RequestLicKey, a member of class TComObjectFactory.
V	ValidateUserLicense (see page 5571)	This is ValidateUserLicense, a member of class TComObjectFactory.

Public Methods

	Name	Description
	AddVerb (see page 1557)	AddVerb adds a verb to the object's list of supported verbs.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1556)	Creates and initializes a new Create object.
V	CreateComObject (see page 5567)	Instantiates a TComObject (see page 5553) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 1557)	Frees the instance of the Destroy.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetInterfaceTypeInfo (see page 5586)	Retrieves the type information for the typed COM object created by the factory.
V	GetIntfEntry (see page 5548)	Returns the entry for a specific interface implemented in a class.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	RegisterClassObject (see page 5569)	Registers the COM class associated with the factory object.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	UpdateRegistry (see page 1559)	UpdateRegistry adds or removes registry entries for the object.

Public Properties

	Name	Description
R	ClassID (see page 5571)	This is ClassID, a member of class TComObjectFactory.
R	ClassInfo (see page 5587)	Specifies an interface reference that provides type information without having to load a type library.
R	ClassName (see page 5572)	Specifies the name of the class that the class factory instantiates.
R	ComClass (see page 5572)	This is ComClass, a member of class TComObjectFactory.
R	ComServer (see page 5572)	This is ComServer, a member of class TComObjectFactory.
R	Description (see page 5572)	Describes the class object.
R	DispIntfEntry (see page 5549)	Contains the entry for the dispatch interface implemented by the OLE Automation object created by the factory.
R	DispTypeInfo (see page 5549)	Returns an ITypeInfo interface reference to the type information for the dispinterface implemented by the OLE Automation object.
	ErrorIID (see page 5573)	Indicates the interface of the CoClass in which an error occurred.
R	EventIID (see page 5549)	This is EventIID, a member of class TAutoObjectFactory.
R	EventTypeInfo (see page 5550)	This is EventTypeInfo, a member of class TAutoObjectFactory.
R	Instancing (see page 5573)	Indicates the process space of COM object instances.
	LicString (see page 5573)	Contains licensing information about the object.
R	MiscStatus (see page 1559)	Represents a set of status bits that are stored in the registry.
R	ProgID (see page 5574)	Specifies the name of the class factory.
	ShowErrors (see page 5574)	Indicates whether the COM object factory displays a message box when exceptions are raised.
	SupportsLicensing (see page 5574)	Indicates whether the object being instantiated supports licensing.
R	ThreadingModel (see page 5575)	Indicates the type of thread support provided by objects that the factory creates.
R	ToolboxBitmapID (see page 1560)	Designates the resource identifier of the ActiveX control.
R	WinControlClass (see page 1560)	WinControlClass is the class of the VCL control that implements the Windows behavior for the ActiveX control.

12.1.5.2 TActiveXControlFactory.Create Constructor

Creates and initializes a new Create object.

Pascal

```
constructor Create(ComServer: TComServerObject; ActiveXControlClass: TActiveXControlClass;
WinControlClass: TWinControlClass; const ClassID: TGUID; ToolboxBitmapID: Integer; const
LicStr: string; MiscStatus: Integer; ThreadingModel: TThreadingModel = tmSingle);
```

C++

```
__fastcall TActiveXControlFactory(TComServerObject ComServer, TActiveXControlClass
ActiveXControlClass, TWinControlClass WinControlClass, const TGUID ClassID, int
ToolboxBitmapID, const AnsiString LicStr, int MiscStatus, TThreadingModel ThreadingModel =
tmSingle);
```

Description

The ComServer parameter is a pointer to the COM server object for the module containing the property page factory. This is

normally a global variable, ComServer, declared in the ComServ (see page 5621) unit.

The ActiveXControlClass parameter is the class object for the controller object that implements the ActiveX control. This object should be derived from TActiveXControl (see page 1517).

The WinControlClass (see page 1560) parameter is the class object for the VCL control class that implements the Windows behavior of the control. This object should be derived from TWinControl.

The ClassID parameter is the GUID of the ActiveX control. Each COM object should have a unique GUID.

LicStr is the license string for controls created with this factory. LicStr is empty if controls created with this factory are unlicensed. MiscStatus (see page 1559) are the status bits that are stored in the registry.

ThreadingModel specifies how calls to the created ActiveX control are serialized. This determines the value of the ThreadingModel property.

See Also

ToolboxBitmapID (see page 1560)

MiscStatus (see page 1559)

12.1.5.3 TActiveXControlFactory.Destroy Destructor

Frees the instance of the Destroy.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TActiveXControlFactory();
```

Description

Do not call Destroy ~Destroy directly in an application. Factory objects are destroyed automatically when the server shuts down.

See Also

Freedelete_keyword

12.1.5.4 TActiveXControlFactory Methods

The methods of the TActiveXControlFactory class are listed here.

Protected Methods

	Name	Description
	GetLicenseFileName (see page 1558)	This is GetLicenseFileName, a member of class TActiveXControlFactory.
	HasMachineLicense (see page 1558)	This is HasMachineLicense, a member of class TActiveXControlFactory.

Public Methods

	Name	Description
	AddVerb (see page 1557)	AddVerb adds a verb to the object's list of supported verbs.
	UpdateRegistry (see page 1559)	UpdateRegistry adds or removes registry entries for the object.

12.1.5.4.1 TActiveXControlFactory.AddVerb Method

AddVerb adds a verb to the object's list of supported verbs.

Pascal

```
procedure AddVerb(Verb: Integer; const VerbName: string);
```

C++

```
__fastcall AddVerb(int Verb, const AnsiString VerbName);
```

Description

Use AddVerb to add a verb that host applications can apply to the ActiveX control. In the Verb parameter, pass a number to identify the verb. User-defined verbs are normally small positive numbers.

In the VerbName parameter, pass the text to display when presenting the user with a choice of verbs. In some ActiveX (formerly called OLE) containers, the verb text is displayed in a popup menu when the user right-clicks on a control.

Placing an ampersand (&) before a character in this string causes the character to be displayed underlined in a pop-up menu.

ActiveX defines the following commonly used verbs:

VerbName	Verb
OLEIVERB_PRIMARY	0
OLEIVERB_SHOW	–1
OLEIVERB_OPEN	–2
OLEIVERB_HIDE	–3
OLEIVERB_UIACTIVATE	–4
OLEIVERB_INPLACEACTIVATE	–5
OLEIVERB_DISCARDUNDOSTATE	–6
OLEIVERB_PROPERTIES	–7

UpdateRegistry (see page 1559)

12.1.5.4.2 TActiveXControlFactory.GetLicenseFileName Method

Pascal

```
function GetLicenseFileName: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetLicenseFileName();
```

Description

This is GetLicenseFileName, a member of class TActiveXControlFactory.

12.1.5.4.3 TActiveXControlFactory.HasMachineLicense Method

Pascal

```
function HasMachineLicense: Boolean; override;
```

C++

```
virtual __fastcall Boolean HasMachineLicense();
```

Description

This is HasMachineLicense, a member of class TActiveXControlFactory.

12.1.5.4.4 TActiveXControlFactory.UpdateRegistry Method

UpdateRegistry adds or removes registry entries for the object.

Pascal

```
procedure UpdateRegistry(Register: Boolean); override;
```

C++

```
virtual __fastcall UpdateRegistry(Boolean Register);
```

Description

This method is called to add or remove the control from the system registry. The default behavior of this method is to add normal ActiveX control registry keys, server file information, and type library information to the registry. It also adds the verbs added with the AddVerb (see page 1557) method.

If the Register parameter is True, true, the control should add its keys to the system registry. If it is False, false, the control should remove its keys from the registry.

Override this method if you want your control to store more information in the registry than the base implementation stores. If you do override this method, be sure to call the inherited implementation in the correct order. When adding registry entries (that is, Register is True), true), call the inherited method before adding custom entries. When removing registry entries (that is, Register is False), false), call the inherited method after removing the custom entries.

See Also

AddVerb (see page 1557)

12.1.5.5 TActiveXControlFactory Properties

The properties of the TActiveXControlFactory class are listed here.

Public Properties

	Name	Description
R	MiscStatus (see page 1559)	Represents a set of status bits that are stored in the registry.
R	ToolboxBitmapID (see page 1560)	Designates the resource identifier of the ActiveX control.
R	WinControlClass (see page 1560)	WinControlClass is the class of the VCL control that implements the Windows behavior for the ActiveX control.

12.1.5.5.1 TActiveXControlFactory.MiscStatus Property

Represents a set of status bits that are stored in the registry.

Pascal

```
property MiscStatus: Integer;
```

C++

```
__property int MiscStatus;
```

Description

MiscStatus is stored in a registry entry under the CLSID entry for the class. This entry provides information about the ActiveX server to a container. The entry contains a set of binary flags for which ActiveX defines specific meanings. This entry is not

required.

The following table lists the status bits that ActiveX control containers must recognize and support. For each status bit, it indicates whether container support is required for the feature and includes a brief description.

Status bit	Container support	Description
ACTIVATEWHENVISIBLE	yes	Indicates that the object should be activated when it becomes visible, even if it isn't UI-active.
IGNOREACTIVATEWHENVISIBLE	no	Needed for inactive and windowless control support.
INSIDEOUT	no	Indicates that the object should be activated inside-out (it can be in-place active as well as UI-active.) Usually used with embedded compound documents rather than with controls.
INVISIBLEATRUNTIME	yes	Designates a control that should be visible at design-time, but not at run-time.
ALWAYSRUN	yes	Indicates that the object should always be in the running state and that the default handler should not delay the loading of the object until the last possible moment.
ACTSLIKEBUTTON	no	Indicates that the object has button-like behavior. This allows the container to ask the control to draw itself as the default button or as a normal button.
ACTSLIKELABEL	no	Indicates that the object behaves like a label. This allows the container to handle the control properly when its label gets focus.
NOUIACTIVATE	yes	Indicates that the control has no user interface to activate.
ALIGNABLE	no	Indicates that the control can be aligned by the user.
SIMPLEFRAME	no	Indicates that the control is a simple holder for other controls.
SETCLIENTSITEFIRST	no	Indicates that the control needs to access the client site very early in its creation.
IMEMODE	no	Indicates that the control supports an Input Method Editor (IME) for entering extended characters. Typically, a container that supports IME provides the control with an extended IMEMode property.

12.1.5.5.2 TActiveXControlFactory.ToolboxBitmapID Property

Designates the resource identifier of the ActiveX control.

Pascal

```
property ToolboxBitmapID: Integer;
```

C++

```
__property int ToolboxBitmapID;
```

Description

Use ToolboxBitmapID to obtain the resource ID of the bitmap that is used to represent the control on a design palette.

See Also

Create (see page 1556)

12.1.5.5.3 TActiveXControlFactory.WinControlClass Property

WinControlClass is the class of the VCL control that implements the Windows behavior for the ActiveX control.

Pascal

```
property WinControlClass: TWinControlClass;
```

C++

```
__property TWinControlClass WinControlClass;
```

Description

The factory object keeps a reference to the VCL control's class information so that it can ask the class object to manufacture a VCL control when the ActiveX control is created.

See Also

TWinControl (see page 6112)

Control (see page 1553)

12.1.6 TActiveXPropertyPage Class

TActiveXPropertyPage represents a COM object that provides the interfaces for supporting an ActiveX property page.

Class Hierarchy

Pascal

```
TActiveXPropertyPage = class(TComObject, IPropertyPage, IPropertyPage2);
```

C++

```
class TActiveXPropertyPage : public TComObject, public IPropertyPage, public IPropertyPage2;
```

File

AxCtrls

Description

This class is used internally by the TPropertyPage (see page 1603) control to provide a bridge between a Delphi C++Builder form and the ActiveX property page API.

See Also

TPropertyPage (see page 1603)

12.1.6.1 TActiveXPropertyPage Members

The following tables list the members exposed by TActiveXPropertyPage.

Protected Methods

	Name	Description
	_AddRef (see page 5558)	This is _AddRef, a member of class TComObject.

	_Release (see page 5558)	This is _Release, a member of class TComObject.
	InterfaceSupportsErrorInfo (see page 5559)	This is InterfaceSupportsErrorInfo, a member of class TComObject.
	QueryInterface (see page 5560)	This is QueryInterface, a member of class TComObject.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 5555)	Instantiates a COM object that is not part of an aggregate.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateAggregated (see page 5556)	Instantiates a COM object that is part of an aggregate.
	CreateFromFactory (see page 5556)	Instantiates a COM object and initializes its values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 1563)	Frees the instance of the Destroy.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 1563)	Initializes the instance of a Initialize descendant.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	ObjAddRef (see page 5559)	Implements the AddRef method of the IUnknown interface.
V	ObjQueryInterface (see page 5559)	Implements the QueryInterface (see page 5560) method of the IUnknown interface.
V	ObjRelease (see page 5559)	Implements the Release method of the IUnknown interface.
V	SafeCallException (see page 5560)	Handles OLE exceptions.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Controller (see page 5561)	Specifies the controlling IUnknown interface that controls interfaces within an aggregate object.
R	Factory (see page 5561)	Specifies the class factory object for the TComObject (see page 5553) class.
R	PropertyPageImpl (see page 1564)	The implementation of the COM server portion of the COM object.
R	RefCount (see page 5562)	Indicates the number of references to the COM object that are currently in use.
	ServerExceptionHandler (see page 5562)	Provides access to the SafeCall exception notification process.

12.1.6.2 TActiveXPropertyPage.Destroy Destructor

Frees the instance of the Destroy.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TActiveXPropertyPage();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the TPropertyPage (see page 1603) reference is not nil before calling Destroy. ~Destroy::.

See Also

Free (see page 22300)

12.1.6.3 TActiveXPropertyPage Methods

The methods of the TActiveXPropertyPage class are listed here.

Public Methods

	Name	Description
	Initialize (see page 1563)	Initializes the instance of a Initialize descendant.

12.1.6.3.1 TActiveXPropertyPage.Initialize Method

Initializes the instance of a Initialize descendant.

Pascal

```
procedure Initialize; override;
```

C++

```
virtual __fastcall Initialize();
```

Description

Override the Initialize method to initialize an instance of a TPropertyPage (see page 1603) descendant before it is used.

See Also

Create (see page 5555)

12.1.6.4 TActiveXPropertyPage Properties

The properties of the TActiveXPropertyPage class are listed here.

Public Properties

	Name	Description
	PropertyPageImpl (see page 1564)	The implementation of the COM server portion of the COM object.

12.1.6.4.1 TActiveXPropertyPage.PropertyPageImpl Property

The implementation of the COM server portion of the COM object.

Pascal

```
property PropertyPageImpl: TPropertyPageImpl;
```

C++

```
__property TPropertyPageImpl PropertyPageImpl;
```

Description

PropertyPageImpl is the COM server portion of the implementation of the IPropertyPage interface. Applications do not create the TPropertyPageImpl (see page 1679) objects; they are created automatically when the user creates an ActiveX control object by using the ActiveX control or ActiveForms wizard.

TActiveXPropertyPage (see page 1561) implements the COM server portion of the COM object while TPropertyPageImpl (see page 1679) implements the property page portion.

12.1.7 TActiveXPropertyPageFactory Class

TActiveXPropertyPageFactory implements a COM factory for an ActiveX property page.

Class Hierarchy

Pascal

```
TActiveXPropertyPageFactory = class(TComObjectFactory);
```

C++

```
class TActiveXPropertyPageFactory : public TComObjectFactory;
```

File

AxCtrls

Description

A property page is a COM object, which means the module it is implemented in must provide a factory so that the system can create the object. TActiveXPropertyPageFactory is a factory for ActiveX property pages, which are implemented by subclassing TPropertyPage (see page 1603).

For more information about COM factories, see TComObjectFactory.

To add a property page factory to a program, create the factory object in the initialization section of the unit that defines the property page form.

See Also

TPropertyPage (see page 1603)

TComServerObject (see page 5575)

12.1.7.1 TActiveXPropertyPageFactory Members

The following tables list the members exposed by TActiveXPropertyPageFactory.

Protected Methods

	Name	Description
	_AddRef (see page 5567)	This is _AddRef, a member of class TComObjectFactory.
	_Release (see page 5567)	This is _Release, a member of class TComObjectFactory.
	CreateInstance (see page 5568)	This is CreateInstance, a member of class TComObjectFactory.
	CreateInstanceLic (see page 5568)	This is CreateInstanceLic, a member of class TComObjectFactory.
V	GetLicenseString (see page 5568)	This is GetLicenseString, a member of class TComObjectFactory.
	GetLicInfo (see page 5568)	This is GetLicInfo, a member of class TComObjectFactory.
V	GetProgID (see page 5569)	This is GetProgID, a member of class TComObjectFactory.
V	HasMachineLicense (see page 5569)	This is HasMachineLicense, a member of class TComObjectFactory.
	LockServer (see page 5569)	This is LockServer, a member of class TComObjectFactory.
	QueryInterface (see page 5569)	This is QueryInterface, a member of class TComObjectFactory.
	RequestLicKey (see page 5570)	This is RequestLicKey, a member of class TComObjectFactory.
V	ValidateUserLicense (see page 5571)	This is ValidateUserLicense, a member of class TComObjectFactory.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1566)	Creates a property page factory and binds that factory to property page class.
V	CreateComObject (see page 1567)	Instantiates a TComObject object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 5566)	Disposes of an instance of a class factory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	RegisterClassObject (see page 5569)	Registers the COM class associated with the factory object.

V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	UpdateRegistry (see page 5570)	Registers COM objects created by the factory.

Public Properties

	Name	Description
R	ClassID (see page 5571)	This is ClassID, a member of class TComObjectFactory.
R	ClassName (see page 5572)	Specifies the name of the class that the class factory instantiates.
R	ComClass (see page 5572)	This is ComClass, a member of class TComObjectFactory.
R	ComServer (see page 5572)	This is ComServer, a member of class TComObjectFactory.
R	Description (see page 5572)	Describes the class object.
	ErrorIID (see page 5573)	Indicates the interface of the CoClass in which an error occurred.
R	Instancing (see page 5573)	Indicates the process space of COM object instances.
	LicString (see page 5573)	Contains licensing information about the object.
R	ProgID (see page 5574)	Specifies the name of the class factory.
	ShowErrors (see page 5574)	Indicates whether the COM object factory displays a message box when exceptions are raised.
	SupportsLicensing (see page 5574)	Indicates whether the object being instantiated supports licensing.
R	ThreadingModel (see page 5575)	Indicates the type of thread support provided by objects that the factory creates.

12.1.7.2 TActiveXPropertyPageFactory.Create Constructor

Creates a property page factory and binds that factory to property page class.

Pascal

```
constructor Create(ComServer: TComServerObject; PropertyPageClass: TPropertyPageClass; const
ClassID: TGUID);
```

C++

```
__fastcall TActiveXPropertyPageFactory(TComServerObject ComServer, TPropertyPageClass
PropertyPageClass, const TGUID ClassID);
```

Description

The ComServer parameter is a pointer to the COM server object for the ActiveX library. This is normally the global variable, ComServer, declared in the ComServ (see page 5621) unit.

The PropertyPageClass parameter is the class object of the property page's implementing class. The implementing class must be derived form TPropertyPage (see page 1603). This class implements the form that is to appear in the property dialog.

The ClassID parameter is a GUID that identifies the property page's class. Each property page should have its own GUID. See the Developer's Programmer's Guide for information on how to create a GUID.

See Also

Create (see page 5565)

12.1.7.3 TActiveXPropertyPageFactory Methods

The methods of the TActiveXPropertyPageFactory class are listed here.

Public Methods

	Name	Description
V	CreateComObject (see page 1567)	Instantiates a TComObject object.

12.1.7.3.1 TActiveXPropertyPageFactory.CreateComObject Method

Instantiates a TComObject object.

Pascal

```
function CreateComObject(const Controller: IUnknown): TComObject; override;
```

C++

```
virtual __fastcall TComObject CreateComObject(const IUnknown Controller);
```

Description

CreateComObject is the method that instantiates the class type for which TComObjectFactory is the class factory. CreateComObject calls the CreateFromFactory constructor of the TComObject class to create a COM object. CreateComObject passes itself as the Factory parameter to CreateFromFactory.

CreateComClass creates a COM object based upon the value of the ComClass property. ComClass is the class identifier (CLSID) used by other applications to identify the COM class for which they request an object instance.

See Also

comclass (see page 5572)

CreateFromFactory (see page 5556)

TComObject (see page 5553)

12.1.8 TAdapterNotifier Class

TAdapterNotifier provides the binding between a VCL type object and comparable OLE type object.

Class Hierarchy

Pascal

```
TAdapterNotifier = class(TInterfacedObject, IPropertyNotifySink);
```

C++

```
class TAdapterNotifier : public TInterfacedObject, public IPropertyNotifySink;
```

File

AxCtrls

Description

Descendants of TCustomAdapter (see page 1578) use TAdapterNotifier to bind VCL utility objects (such as TFont) with corresponding OLE objects. For example, TFontAdapter (see page 1583) uses TAdapterNotifier to bind a TFont object with an OLE font object.

See Also

TCustomAdapter

TFontAdapter (see page 1583)

TPictureAdapter (see page 1599)

12.1.8.1 TAdapterNotifier Members

The following tables list the members exposed by TAdapterNotifier.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	OnChanged (see page 1569)	This is OnChanged, a member of class TAdapterNotifier.
	OnRequestEdit (see page 1570)	This is OnRequestEdit, a member of class TAdapterNotifier.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1569)	Creates an instance of a TAdapterNotifier (see page 1567) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

12.1.8.2 TAdapterNotifier.Create Constructor

Creates an instance of a TAdapterNotifier (see page 1567) object.

Pascal

```
constructor Create(Adapter: TCustomAdapter);
```

C++

```
__fastcall TAdapterNotifier(TCustomAdapter Adapter);
```

Description

You would normally never create an object of this class. TAdapterNotifier (see page 1567) objects are created by and bound to a descendant of TCustomAdapter (see page 1578).

See Also

Create (see page 22287)

12.1.8.3 TAdapterNotifier Methods

The methods of the TAdapterNotifier class are listed here.

Protected Methods

	Name	Description
	OnChanged (see page 1569)	This is OnChanged, a member of class TAdapterNotifier.
	OnRequestEdit (see page 1570)	This is OnRequestEdit, a member of class TAdapterNotifier.

12.1.8.3.1 TAdapterNotifier.OnChanged Method

Pascal

```
function OnChanged(dispid: TDispID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnChanged(TDispID dispid);
```

Description

This is OnChanged, a member of class TAdapterNotifier.

12.1.8.3.2 TAdapterNotifier.OnRequestEdit Method

Pascal

```
function OnRequestEdit(dispid: TDispID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnRequestEdit(TDispID dispid);
```

Description

This is OnRequestEdit, a member of class TAdapterNotifier.

12.1.9 TConnectionPoint Class

TConnectionPoint implements the IConnectionPoint interface for a single outgoing interface.

Class Hierarchy

Pascal

```
TConnectionPoint = class(TContainedObject, IConnectionPoint);
```

C++

```
class TConnectionPoint : public TContainedObject, public IConnectionPoint;
```

File

AxCtrls

Description

TConnectionPoint implements the IConnectionPoint interface, which client applications call to register an interest in a specific outgoing interface. The corresponding outgoing interface defines event handlers that the client implements. The client uses IConnectionPoint to supply its implementation of this interface (called an event sink), so that it can be called when events occur.

Wizards that generate event support code automatically create a class member of type TConnectionPoint, which maintains a list of event sinks supplied by clients.

TConnectionPoint objects support the following features:

Outgoing interfaces, such as event sets.

The ability to enumerate the IIDs of the outgoing interfaces.

The ability to connect and disconnect sinks to the object for those outgoing IIDs.

The ability to enumerate the connections that exist to a particular outgoing interface.

The IConnectionPoint and IConnectionPointContainer interfaces are used for OLE event handling. Because the wizard automatically sets up events for a control, users only need to use these interfaces directly when they wish to modify the standard VCL implementation or to add events to a COM server whose wizard does not generate event support code.

GetConnectionInterface (see page 1573), GetConnectionPointContainer (see page 1574), Advise (see page 1573), Unadvise (see page 1574), EnumConnections (see page 1573)

See Also

TConnectionPoints (see page 1575)

12.1.9.1 TConnectionPoint Members

The following tables list the members exposed by TConnectionPoint.

Protected Methods

	Name	Description
	_AddRef (see page 22250)	This is _AddRef, a member of class TAggregatedObject.
	_Release (see page 22250)	This is _Release, a member of class TAggregatedObject.
	Advise (see page 1573)	This is Advise, a member of class TConnectionPoint.
	EnumConnections (see page 1573)	This is EnumConnections, a member of class TConnectionPoint.
	GetConnectionInterface (see page 1573)	This is GetConnectionInterface, a member of class TConnectionPoint.
	GetConnectionPointContainer (see page 1574)	This is GetConnectionPointContainer, a member of class TConnectionPoint.
	QueryInterface (see page 22250)	This is QueryInterface, a member of class TAggregatedObject.
V	QueryInterface (see page 22255)	Returns a reference to a specified interface if the object supports that interface.
	Unadvise (see page 1574)	This is Unadvise, a member of class TConnectionPoint.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1572)	Instantiates a connection point object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 1572)	Destroys the instance of a connection point object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Controller (see page 22251)	Provides access to the controlling interface of the aggregate.
R	SinkList (see page 1574)	Lists the sinks for the outgoing interfaces maintained by the connection point.

12.1.9.2 TConnectionPoint.Create Constructor

Instantiates a connection point object.

Pascal

```
constructor Create(Container: TConnectionPoints; const IID: TGUID; Kind: TConnectionKind;
OnConnect: TConnectEvent);
```

C++

```
__fastcall TConnectionPoint(TConnectionPoints Container, const TGUID IID, TConnectionKind
Kind, TConnectEvent OnConnect);
```

Description

Create is called automatically by the connection point container's CreateConnectionPoint method, to instantiate a connection point object. This occurs when an ActiveX control is initialized.

Create allocates memory for a connection point object and calls the inherited Create, passing it the Container's controlling IUnknown. Container is a connection point container object. Create adds the connection point object to the Container. Then it sets the

IID as the GUID or interface identifier of the outgoing interface managed by this connection point.

IKind, indicating whether it is a single or multiple connection to that point.

OnConnect as the connection event used in the IConnectionPoint Advise (see page 1573) method.

TConnectEvent points to a procedure for the OnConnect event of the connection point. TConnectionKind (see page 1714) is a type indicating whether there are multiple connections to the connection point.

See Also

Create

Initialize (see page 1536)

Destroy (see page 1572)

CreateConnectionPoint (see page 1577)

12.1.9.3 TConnectionPoint.Destroy Destructor

Destroys the instance of a connection point object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TConnectionPoint();
```

Description

It is not necessary to explicitly free the connection point object. Connection point objects are automatically destroyed. If the connection point container object is not nil, Destroy calls on it to remove the connection point object from it.

See Also

TConnectionPoints (see page 1575)

Free (see page 22300)

12.1.9.4 TConnectionPoint Methods

The methods of the TConnectionPoint class are listed here.

Protected Methods

	Name	Description
	Advise (see page 1573)	This is Advise, a member of class TConnectionPoint.
	EnumConnections (see page 1573)	This is EnumConnections, a member of class TConnectionPoint.
	GetConnectionInterface (see page 1573)	This is GetConnectionInterface, a member of class TConnectionPoint.
	GetConnectionPointContainer (see page 1574)	This is GetConnectionPointContainer, a member of class TConnectionPoint.
	Unadvise (see page 1574)	This is Unadvise, a member of class TConnectionPoint.

12.1.9.4.1 TConnectionPoint.Advise Method

Pascal

```
function Advise(const unkSink: IUnknown; out dwCookie: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Advise(const IUnknown unkSink, Longint dwCookie);
```

Description

This is Advise, a member of class TConnectionPoint.

12.1.9.4.2 TConnectionPoint.EnumConnections Method

Pascal

```
function EnumConnections(out enumconn: IEnumConnections): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT EnumConnections(IEnumConnections enumconn);
```

Description

This is EnumConnections, a member of class TConnectionPoint.

12.1.9.4.3 TConnectionPoint.GetConnectionInterface Method

Pascal

```
function GetConnectionInterface(out iid: TIID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetConnectionInterface(TIID iid);
```

Description

This is GetConnectionInterface, a member of class TConnectionPoint.

12.1.9.4.4 TConnectionPoint.GetConnectionPointContainer Method

Pascal

```
function GetConnectionPointContainer(out cpc: IConnectionPointContainer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetConnectionPointContainer(IConnectionPointContainer cpc);
```

Description

This is GetConnectionPointContainer, a member of class TConnectionPoint.

12.1.9.4.5 TConnectionPoint.Unadvise Method

Pascal

```
function Unadvise(dwCookie: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Unadvise(Longint dwCookie);
```

Description

This is Unadvise, a member of class TConnectionPoint.

12.1.9.5 TConnectionPoint Properties

The properties of the TConnectionPoint class are listed here.

Public Properties

	Name	Description
	SinkList (see page 1574)	Lists the sinks for the outgoing interfaces maintained by the connection point.

12.1.9.5.1 TConnectionPoint.SinkList Property

Lists the sinks for the outgoing interfaces maintained by the connection point.

Pascal

```
property SinkList: TList;
```

C++

```
__property TList SinkList;
```

Description

SinkList lists the sinks managed by the connection point. These are the interfaces that clients implement for responding to server events. When a client registers an interest in the connection point, it supplies an interface pointer that is added to this list.

Each item in the list can be cast to an IUnknown and used to access the outgoing interface.

12.1.10 TConnectionPoints Class

TConnectionPoints implements the IConnectionPointContainer interface for a COM object that generates events on clients.

Class Hierarchy

AxCtrls.TConnectionPoints

Pascal

```
TConnectionPoints = class;
```

C++

```
class TConnectionPoints;
```

File

AxCtrls

Description

TConnectionPoints lets an object indicate the existence of outgoing interfaces (event interfaces). TConnectionPoints implements the IConnectionPointContainer interface, which clients use to register an interest in event notifications. COM wizards add a TConnectionPoints object as a class member to automatically generated classes that fire events on clients.

The IConnectionPoint interface provides access to an enumerator sub-object with the IEnumConnectionPoints interface. It also provides access to all the connection point sub-objects, each of which implements the IConnectionPoint interface. The IConnectionPoint interface provides access to an enumerator sub-object with the IEnumConnections interface.

TConnectionPoints objects are used to obtain access to:

An enumerator sub-object with the IEnumConnectionPoints interface. The IEnumConnectionPoints interface can be used to enumerate connection points for each outgoing IID.

Connection point sub-objects with the IConnectionPoint interface for each outgoing IID. Through the IConnectionPoint interface, a client starts or terminates an advisory loop with the connectable object and the client's own sink. The client can also use the IConnectionPoint interface to obtain an enumerator object with the IEnumConnections interface to enumerate the connections that it knows about.

Because the ActiveX wizard automatically sets up events for a control, users only need to use these interfaces directly when they wish to modify the standard VCL implementation or to add events to a non-ActiveX control automation server.

IConnectionPointContainer

See Also

TConnectionPoint (see page 1570)

12.1.10.1 TConnectionPoints Members

The following tables list the members exposed by TConnectionPoints.

Protected Methods

	Name	Description
	EnumConnectionPoints (see page 1577)	This is EnumConnectionPoints, a member of class TConnectionPoints.
	FindConnectionPoint (see page 1578)	This is FindConnectionPoint, a member of class TConnectionPoints.

Public Methods

	Name	Description
	Create (see page 1576)	Instantiates a connection points object.
	CreateConnectionPoint (see page 1577)	Instantiates a connection point object.
V	Destroy (see page 1576)	Destroys an instance of a connection points object.

Public Properties

	Name	Description
R	Controller (see page 1578)	Provides access to the IUnknown of the connection points.

12.1.10.2 TConnectionPoints.Create Constructor

Instantiates a connection points object.

Pascal

```
constructor Create(const AController: IUnknown);
```

C++

```
__fastcall TConnectionPoints(const IUnknown AController);
```

Description

It is not necessary to call Create directly. It is used internally by other objects to create the connection points object.

Create allocates memory for a connection points object and initializes the Controller (see page 1578) property using the AController parameter. Then it creates a list for the individual connection point objects that it will contain.

See Also

Controller (see page 1578)

12.1.10.3 TConnectionPoints.Destroy Destructor

Destroys an instance of a connection points object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TConnectionPoints();
```

Description

Destroy is called automatically. It is not necessary for the user to dispose of the connection points object. Destroy frees the list of connection point objects that was created in the constructor.

See Also

Free (see page 22300)

12.1.10.4 TConnectionPoints Methods

The methods of the TConnectionPoints class are listed here.

Protected Methods

	Name	Description
	EnumConnectionPoints (see page 1577)	This is EnumConnectionPoints, a member of class TConnectionPoints.
	FindConnectionPoint (see page 1578)	This is FindConnectionPoint, a member of class TConnectionPoints.

Public Methods

	Name	Description
	CreateConnectionPoint (see page 1577)	Instantiates a connection point object.

12.1.10.4.1 TConnectionPoints.CreateConnectionPoint Method

Instantiates a connection point object.

Pascal

```
function CreateConnectionPoint(const IID: TGUID; Kind: TConnectionKind; OnConnect:
TConnectEvent): TConnectionPoint;
```

C++

```
__fastcall TConnectionPoint CreateConnectionPoint(const TGUID IID, TConnectionKind Kind,
TConnectEvent OnConnect);
```

Description

CreateConnectionPoint is automatically called when an ActiveX control is initialized. CreateConnectionPoint creates and returns a connection point object. It passes to the connection point constructor:

Itself as the connection point container.

IID as the GUID or interface identifier of the outgoing interface managed by this connection point.

OnConnect as the connection event used in the IConnectionPoint Advise method.

TConnectEvent is a pointer to a procedure for the OnConnect event of the connection point object being created. TConnectionKind (see page 1714) is a type indicating whether there are multiple connections to that connection point.

See Also

Advise

Initialize (see page 1536)

Create (see page 1572)

12.1.10.4.2 TConnectionPoints.EnumConnectionPoints Method

Pascal

```
function EnumConnectionPoints(out enumconn: IEnumConnectionPoints): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT EnumConnectionPoints(IEnumConnectionPoints enumconn);
```

Description

This is EnumConnectionPoints, a member of class TConnectionPoints.

12.1.10.4.3 TConnectionPoints.FindConnectionPoint Method

Pascal

```
function FindConnectionPoint(const iid: TIID; out cp: IConnectionPoint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT FindConnectionPoint(const TIID iid, IConnectionPoint cp);
```

Description

This is FindConnectionPoint, a member of class TConnectionPoints.

12.1.10.5 TConnectionPoints Properties

The properties of the TConnectionPoints class are listed here.

Public Properties

	Name	Description
	Controller (see page 1578)	Provides access to the IUnknown of the connection points.

12.1.10.5.1 TConnectionPoints.Controller Property

Provides access to the IUnknown of the connection points.

Pascal

```
property Controller: IUnknown;
```

C++

```
__property IUnknown Controller;
```

Description

Controller is the IUnknown interface reference of the connection points object. TConnectionPoints (see page 1575) aggregates several sub-objects that share this interface as a single controlling IUnknown. The IUnknown methods implemented in the sub-objects delegate to this Controller.

When the TConnectionPoints (see page 1575) object is created, its constructor is passed a controlling IUnknown. Controller is initialized to this IUnknown in the constructor.

See Also

Create (see page 1576)

12.1.11 TCustomAdapter Class

TCustomAdapter is a base class for objects that bind VCL objects to COM interfaces.

Class Hierarchy

Pascal

```
TCustomAdapter = class(TInterfacedObject);
```

C++

```
class TCustomAdapter : public TInterfacedObject;
```

File

AxCtrls

Description

Do not create objects of this class. Instead, call the GetOleFont (see page 1710) procedure to create the binding between a TFont and an OLE font object or GetOlePicture (see page 1710) to create the binding between a TPicture and an OLE picture object.

See Also

TFontAdapter (see page 1583)

TPictureAdapter (see page 1599)

GetOleFont

GetOlePicture

12.1.11.1 TCustomAdapter Members

The following tables list the members exposed by TCustomAdapter.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Fields

	Name	Description
	Updating (see page 1581)	This is Updating, a member of class TCustomAdapter.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
V	Changed (see page 1582)	Responds when the VCL representation of the OLE object changes.
	ConnectOleObject (see page 1582)	Associates the adapter with an OLE interface.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	ReleaseOleObject (see page 1582)	Releases the associated OLE interface, allowing it to decrease its reference count.
A	Update (see page 1583)	Provides the interface for a method that responds to changes in the OLE object.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1580)	Constructs an instance of the custom adapter control.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 1581)	Destroys the custom adapter object.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

12.1.11.2 TCustomAdapter.Create Constructor

Constructs an instance of the custom adapter control.

Pascal

```
constructor Create;
```

C++

```
__fastcall TCustomAdapter();
```

Description

Never create an object of this class, only its descendants, such as TFontAdapter (see page 1583) or TPictureAdapter (see page 1599).

See Also

Destroy

12.1.11.3 TCustomAdapter.Destroy Destructor

Destroys the custom adapter object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapter();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks that the adapter is not nil before calling Destroy.

Destroy frees and disconnects the VCL object from an OLE object.

See Also

Create

Free (see page 22300)

12.1.11.4 TCustomAdapter Fields

The fields of the TCustomAdapter class are listed here.

Protected Fields

	Name	Description
	Updating (see page 1581)	This is Updating, a member of class TCustomAdapter.

12.1.11.4.1 TCustomAdapter.Updating Field

Pascal

```
Updating: Boolean;
```

C++

```
Boolean Updating;
```

Description

This is Updating, a member of class TCustomAdapter.

12.1.11.5 TCustomAdapter Methods

The methods of the TCustomAdapter class are listed here.

Protected Methods

	Name	Description
V	Changed (see page 1582)	Responds when the VCL representation of the OLE object changes.
	ConnectOleObject (see page 1582)	Associates the adapter with an OLE interface.
	ReleaseOleObject (see page 1582)	Releases the associated OLE interface, allowing it to decrease its reference count.
A	Update (see page 1583)	Provides the interface for a method that responds to changes in the OLE object.

12.1.11.5.1 TCustomAdapter.Changed Method

Responds when the VCL representation of the OLE object changes.

Pascal

```
procedure Changed; virtual;
```

C++

```
virtual __fastcall Changed();
```

Description

Changed is called automatically so that the associated OLE object can be updated to reflect changes made to the corresponding VCL object. In TCustomAdapter (see page 1578), Changed calls ReleaseOleObject (see page 1582) so that the OLE object can be re-acquired to reflect the changes in the VCL object. Descendants of TCustomAdapter (see page 1578) override Changed to use the OLE interface to make appropriate changes.

See Also

ReleaseOleObject (see page 1582)

12.1.11.5.2 TCustomAdapter.ConnectOleObject Method

Associates the adapter with an OLE interface.

Pascal

```
procedure ConnectOleObject(OleObject: IUnknown);
```

C++

```
__fastcall ConnectOleObject(IUnknown OleObject);
```

Description

ConnectOleObject is used internally to associate the adapter with the OLE object it represents.

See Also

ReleaseOleObject (see page 1582)

12.1.11.5.3 TCustomAdapter.ReleaseOleObject Method

Releases the associated OLE interface, allowing it to decrease its reference count.

Pascal

```
procedure ReleaseOleObject;
```

C++

```
__fastcall ReleaseOleObject();
```

Description

When implementing a descendant of TCustomAdapter (see page 1578), call ReleaseOleObject when the adapter no longer needs the OLE object.

See Also

ConnectOleObject (see page 1582)

12.1.11.5.4 TCustomAdapter.Update Method

Provides the interface for a method that responds to changes in the OLE object.

Pascal

```
procedure Update; virtual; abstract;
```

C++

```
virtual __fastcall Update() = 0;
```

Description

Descendants of TCustomAdapter (see page 1578) override Update to modify the associated VCL object so that it reflects changes in the corresponding OLE object. It is the converse of the Changed (see page 1582) method.

See Also

Changed (see page 1582)

12.1.12 TFontAdapter Class

TFontAdapter is a helper class used to connect a TFont object to an OLE font object.

Class Hierarchy

Pascal

```
TFontAdapter = class(TCustomAdapter, IChangeNotifier, IFontAccess);
```

C++

```
class TFontAdapter : public TCustomAdapter, public IChangeNotifier, public IFontAccess;
```

File

AxCtrls

Description

To create an instance of a TFontAdapter, call the global GetOleFont (see page 1586) procedure. GetOleFont (see page 1586) creates the binding between a TFont object and an OLE font interface.

See Also

TPictureAdapter (see page 1599)

TFont (see page 14497)

GetOleFont

SetOleFont

12.1.12.1 TFontAdapter Members

The following tables list the members exposed by TFontAdapter.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Fields

	Name	Description
	Updating (see page 1581)	This is Updating, a member of class TCustomAdapter.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
V	Changed (see page 1585)	Updates the associated IFont interface with the new properties of the font object.
	ConnectOleObject (see page 1582)	Associates the adapter with an OLE interface.
	GetOleFont (see page 1586)	Obtains the IFontDisp interface from the associated OLE object.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	ReleaseOleObject (see page 1582)	Releases the associated OLE interface, allowing it to decrease its reference count.
	SetOleFont (see page 1586)	Associates the adapter with the OLE object represented by a specified interface.
V	Update (see page 1587)	Updates the associated TFont object to reflect changes in the associated OLE font.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1585)	Creates an instance of the font adapter control.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 1581)	Destroys the custom adapter object.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

12.1.12.2 TFontAdapter.Create Constructor

Creates an instance of the font adapter control.

Pascal

```
constructor Create(Font: TFont);
```

C++

```
__fastcall TFontAdapter(TFont Font);
```

Description

Applications do not normally create objects of this class. Instead, they call the GetOleFont (see page 1586) procedure, which creates the binding between a TFont and an OLE font object.

See Also

GetOleFont

12.1.12.3 TFontAdapter Methods

The methods of the TFontAdapter class are listed here.

Protected Methods

	Name	Description
V	Changed (see page 1585)	Updates the associated IFont interface with the new properties of the font object.
	GetOleFont (see page 1586)	Obtains the IFontDisp interface from the associated OLE object.
	SetOleFont (see page 1586)	Associates the adapter with the OLE object represented by a specified interface.
V	Update (see page 1587)	Updates the associated TFont object to reflect changes in the associated OLE font.

12.1.12.3.1 TFontAdapter.Changed Method

Updates the associated IFont interface with the new properties of the font object.

Pascal

```
procedure Changed; override;
```

C++

```
virtual __fastcall Changed();
```

Description

Changed is called automatically when the TFont object changes. It ensures that the associated OLE interface is updated.

See Also

SetOleFont (see page 1586)

Update (see page 1587)

SetOleFont

12.1.12.3.2 TFontAdapter.GetOleFont Method

Obtains the IFontDisp interface from the associated OLE object.

Pascal

```
procedure GetOleFont(var OleFont: IFontDisp);
```

C++

```
__fastcall GetOleFont(IFontDisp OleFont);
```

Description

ActiveX controls that use TFontAdapter (see page 1583) call GetOleFont to obtain the interface that corresponds to the adapter's TFont object. If the OLE object for the font does not exist, GetOleFont creates it.

The IFontDisp interface is returned as the OleFont parameter.

See Also

SetOleFont (see page 1586)

ConnectOleObject (see page 1582)

12.1.12.3.3 TFontAdapter.SetOleFont Method

Associates the adapter with the OLE object represented by a specified interface.

Pascal

```
procedure SetOleFont(const OleFont: IFontDisp);
```

C++

```
__fastcall SetOleFont(const IFontDisp OleFont);
```

Description

ActiveX controls that use TFontAdapter (see page 1583) call SetOleFont to associate the adapter with the interface passed as the OleFont parameter.

See Also

GetOleFont (see page 1586)

12.1.12.3.4 TFontAdapter.Update Method

Updates the associated TFont object to reflect changes in the associated OLE font.

Pascal

```
procedure Update; override;
```

C++

```
virtual __fastcall Update();
```

Description

Update is called automatically when the associated OLE object changes. It ensures that the corresponding TFont object reflects those changes.

See Also

SetOleFont

12.1.13 TOleGraphic Class

TOleGraphic is a wrapper for an OLE graphical interface.

Class Hierarchy

Pascal

```
TOleGraphic = class(TGraphic);
```

C++

```
class TOleGraphic : public TGraphic;
```

File

AxCtrls

Description

TOleGraphic is a graphical container for icons, metafiles and bitmaps used in ActiveX controls. TOleGraphic is used internally to expose an IPicture interface as the image of the TPicture property of an ActiveX control. Because TOleGraphic is a wrapper for OLE interfaces, it cannot be used to load or save information to a file.

See Also

TActiveXControl (see page 1517)

TGraphic (see page 14516)

12.1.13.1 TOleGraphic Members

The following tables list the members exposed by TOleGraphic.

Protected Methods

	Name	Description
	_AddRef (see page 2853)	Increments the reference count for the interfaced object's interface.
	_Release (see page 2854)	Decrements the reference count for the interfaced object's interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Changed (see page 1590)	This is Changed, a member of class TOleGraphic.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 14520)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Draw (see page 1590)	This is Draw, a member of class TOleGraphic.
V	Equals (see page 14521)	This is Equals, a member of class TGraphic.
V	GetEmpty (see page 1591)	This is GetEmpty, a member of class TOleGraphic.
V	GetHeight (see page 1591)	This is GetHeight, a member of class TOleGraphic.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetPalette (see page 1591)	This is GetPalette, a member of class TOleGraphic.
V	GetTransparent (see page 1591)	This is GetTransparent, a member of class TOleGraphic.
V	GetWidth (see page 1591)	This is GetWidth, a member of class TOleGraphic.
	Progress (see page 14524)	This is Progress, a member of class TGraphic.
V	ReadData (see page 14524)	This is ReadData, a member of class TGraphic.
V	SetHeight (see page 1593)	This is SetHeight, a member of class TOleGraphic.
V	SetPalette (see page 1594)	This is SetPalette, a member of class TOleGraphic.
V	SetTransparent (see page 14527)	This is SetTransparent, a member of class TGraphic.
V	SetWidth (see page 1594)	This is SetWidth, a member of class TOleGraphic.
V	WriteData (see page 14527)	This is WriteData, a member of class TGraphic.

Public Events

	Name	Description
	OnChange (see page 14531)	Occurs whenever a graphical image changes.
	OnProgress (see page 14531)	Occurs when a graphical image is in the process of changing.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 2854)	Obtains a reference to the Owner's interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 1590)	Copies an IPicture to the OLE graphic object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 14519)	Constructs an object and initializes its data before the object is first used.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	LoadFromClipboardFormat (see page 1592)	Loads an OLE graphic from the Clipboard into the OLE graphic object.
V	LoadFromFile (see page 1592)	Prevents OleGraphics from trying to load from a file.
V	LoadFromStream (see page 1592)	Loads an IPicture interface from a stream into the OLE graphic object.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	QueryInterface (see page 2854)	Returns a reference to a specified interface if the object supports that interface.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SaveToClipboardFormat (see page 1593)	Introduces an abstract method that assigns the graphic to a variable in clipboard format.
V	SaveToFile (see page 14525)	Saves a graphics image to a file.
V	SaveToStream (see page 1593)	Saves the OLE graphic to a stream.
V	SetSize (see page 14527)	Specifies the size of the graphic.

Public Properties

	Name	Description
R	Empty (see page 14528)	Indicates whether the graphics object contains a graphic.
	Height (see page 14528)	Specifies the vertical size of the graphic in pixels.
R	MMHeight (see page 1594)	Indicates the height of the OLE graphic in 0.01 millimeter units.
R	MMWidth (see page 1595)	Indicates the width of the OLE graphic in 0.01 millimeter units.
	Modified (see page 14528)	Indicates whether the graphics object has been changed or edited.
	Palette (see page 14529)	Indicates the color palette of the graphical image.
	PaletteModified (see page 14529)	Indicates whether the palette has changed.
	Picture (see page 1595)	Specifies the interface reference for which the OLE graphic is a container.
	Transparent (see page 14529)	Indicates whether the image covers its rectangular area.
	Width (see page 14530)	Determines the maximum width of the graphics object in pixels.

12.1.13.2 TOleGraphic Methods

The methods of the TOleGraphic class are listed here.

Protected Methods

	Name	Description
V	Changed (see page 1590)	This is Changed, a member of class TOleGraphic.
V	Draw (see page 1590)	This is Draw, a member of class TOleGraphic.
V	GetEmpty (see page 1591)	This is GetEmpty, a member of class TOleGraphic.
V	GetHeight (see page 1591)	This is GetHeight, a member of class TOleGraphic.
V	GetPalette (see page 1591)	This is GetPalette, a member of class TOleGraphic.
V	GetTransparent (see page 1591)	This is GetTransparent, a member of class TOleGraphic.
V	GetWidth (see page 1591)	This is GetWidth, a member of class TOleGraphic.
V	SetHeight (see page 1593)	This is SetHeight, a member of class TOleGraphic.

	SetPalette (see page 1594)	This is SetPalette, a member of class TOleGraphic.
	SetWidth (see page 1594)	This is SetWidth, a member of class TOleGraphic.

Public Methods

	Name	Description
	Assign (see page 1590)	Copies an IPicture to the OLE graphic object.
	LoadFromClipboardFormat (see page 1592)	Loads an OLE graphic from the Clipboard into the OLE graphic object.
	LoadFromFile (see page 1592)	Prevents OleGraphics from trying to load from a file.
	LoadFromStream (see page 1592)	Loads an IPicture interface from a stream into the OLE graphic object.
	SaveToClipboardFormat (see page 1593)	Introduces an abstract method that assigns the graphic to a variable in clipboard format.
	SaveToStream (see page 1593)	Saves the OLE graphic to a stream.

12.1.13.2.1 TOleGraphic.Assign Method

Copies an IPicture to the OLE graphic object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Assign copies the IPicture contained in Source to the OLE graphic object. Assign then calls the inherited Assign. The IPicture can be a bitmap, metafile or icon image.

See Also

Assign (see page 2930)

12.1.13.2.2 TOleGraphic.Changed Method

Pascal

```
procedure Changed(Sender: TObject); override;
```

C++

```
virtual __fastcall Changed(TObject * Sender);
```

Description

This is Changed, a member of class TOleGraphic.

12.1.13.2.3 TOleGraphic.Draw Method

Pascal

```
procedure Draw(ACanvas: TCanvas; const Rect: TRect); override;
```

C++

```
virtual __fastcall Draw(TCanvas ACanvas, const TRect Rect);
```

Description

This is Draw, a member of class TOleGraphic.

12.1.13.2.4 TOleGraphic.GetEmpty Method

Pascal

```
function GetEmpty: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetEmpty();
```

Description

This is GetEmpty, a member of class TOleGraphic.

12.1.13.2.5 TOleGraphic.GetHeight Method

Pascal

```
function GetHeight: Integer; override;
```

C++

```
virtual __fastcall int GetHeight();
```

Description

This is GetHeight, a member of class TOleGraphic.

12.1.13.2.6 TOleGraphic.GetPalette Method

Pascal

```
function GetPalette: HPALETTE; override;
```

C++

```
virtual __fastcall HPALETTE GetPalette();
```

Description

This is GetPalette, a member of class TOleGraphic.

12.1.13.2.7 TOleGraphic.GetTransparent Method

Pascal

```
function GetTransparent: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetTransparent();
```

Description

This is GetTransparent, a member of class TOleGraphic.

12.1.13.2.8 TOleGraphic.GetWidth Method

Pascal

```
function GetWidth: Integer; override;
```

C++

```
virtual __fastcall int GetWidth();
```

Description

This is GetWidth, a member of class TOleGraphic.

12.1.13.2.9 TOleGraphic.LoadFromClipboardFormat Method

Loads an OLE graphic from the Clipboard into the OLE graphic object.

Pascal

```
procedure LoadFromClipboardFormat(AFormat: Word; AData: THandle; APalette: HPALETTE); override;
```

C++

```
virtual __fastcall LoadFromClipboardFormat(Word AFormat, THandle AData, HPALETTE APalette);
```

Description

LoadFromClipboardFormat is called if the OLE graphic is registered with the TPicture object using the RegisterClipboardFormat method.

LoadFromClipboardFormat replaces the current image with the data pointed to by the AData parameter. The palette for the OLE graphic is specified by the APalette parameter.

See Also

TClipboard (see page 3328)

TPicture (see page 14584)

RegisterClipboardFormat (see page 14592)

12.1.13.2.10 TOleGraphic.LoadFromFile Method

Prevents OleGraphics from trying to load from a file.

Pascal

```
procedure LoadFromFile(const Filename: string); override;
```

C++

```
virtual __fastcall LoadFromFile(const AnsiString Filename);
```

Description

LoadFromFile is overridden in TOleGraphic (see page 1587) so that it will not load a graphic from a file. Attempting to do so is not appropriate for an IPicture.

See Also

LoadFromStream (see page 1592)

SaveToFile (see page 14525)

12.1.13.2.11 TOleGraphic.LoadFromStream Method

Loads an IPicture interface from a stream into the OLE graphic object.

Pascal

```
procedure LoadFromStream(Stream: TStream); override;
```

C++

```
virtual __fastcall LoadFromStream(TStream Stream);
```

Description

To use LoadFromStream specify the stream from which the OLE graphic is to be loaded as the value of Stream.

See Also

TStream (see page 2973)

12.1.13.2.12 TOleGraphic.SaveToClipboardFormat Method

Introduces an abstract method that assigns the graphic to a variable in clipboard format.

Pascal

```
procedure SaveToClipboardFormat(var AFormat: Word; var AData: THandle; var APalette:
HPALETTE); override;
```

C++

```
virtual __fastcall SaveToClipboardFormat(Word AFormat, THandle AData, HPALETTE APalette);
```

Description

Each descendant graphic object defines a SaveToClipboardFormat method that saves that particular graphic image type to a Clipboard format. An application must have registered the format with the TGraphic object using the RegisterClipboardFormat method.

See Also

TClipboard (see page 3328)

RegisterClipboardFormat (see page 14592)

12.1.13.2.13 TOleGraphic.SaveToStream Method

Saves the OLE graphic to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream); override;
```

C++

```
virtual __fastcall SaveToStream(TStream Stream);
```

Description

Use SaveToStream to save the OLE graphic to the stream specified by the Stream parameter. SaveToStream uses the IPersistStream interface of the graphic write it to the stream.

See Also

TStream (see page 2973)

12.1.13.2.14 TOleGraphic.SetHeight Method

Pascal

```
procedure SetHeight(Value: Integer); override;
```

C++

```
virtual __fastcall SetHeight(int Value);
```

Description

This is SetHeight, a member of class TOleGraphic.

12.1.13.2.15 TOleGraphic.SetPalette Method

Pascal

```
procedure SetPalette(Value: HPALETTE); override;
```

C++

```
virtual __fastcall SetPalette(HPALETTE Value);
```

Description

This is SetPalette, a member of class TOleGraphic.

12.1.13.2.16 TOleGraphic.SetWidth Method

Pascal

```
procedure SetWidth(Value: Integer); override;
```

C++

```
virtual __fastcall SetWidth(int Value);
```

Description

This is SetWidth, a member of class TOleGraphic.

12.1.13.3 TOleGraphic Properties

The properties of the TOleGraphic class are listed here.

Public Properties

	Name	Description
R	MMHeight (see page 1594)	Indicates the height of the OLE graphic in 0.01 millimeter units.
R	MMWidth (see page 1595)	Indicates the width of the OLE graphic in 0.01 millimeter units.
	Picture (see page 1595)	Specifies the interface reference for which the OLE graphic is a container.

12.1.13.3.1 TOleGraphic.MMHeight Property

Indicates the height of the OLE graphic in 0.01 millimeter units.

Pascal

```
property MMHeight: Integer;
```

C++

```
__property int MMHeight;
```

Description

MMHeight is used for a more accurate reading of the vertical size of the graphic. The Height property, by contrast, is always in screen device pixel units; to avoid loss of precision in converting between device pixels and millimeters, set or read the

dimensions in millimeters with MMHeight.

See Also

Height

MMWidth (see page 1595)

12.1.13.3.2 TOleGraphic.MMWidth Property

Indicates the width of the OLE graphic in 0.01 millimeter units.

Pascal

```
property MMWidth: Integer;
```

C++

```
__property int MMWidth;
```

Description

MMWidth is used for a more accurate reading of the horizontal size of the graphic. The Width property, by contrast, is always in screen device pixel units; to avoid loss of precision in converting between device pixels and millimeters, set or read the dimensions in millimeters with MMWidth.

See Also

MMHeight (see page 1594)

Width

12.1.13.3.3 TOleGraphic.Picture Property

Specifies the interface reference for which the OLE graphic is a container.

Pascal

```
property Picture: IPicture;
```

C++

```
__property IPicture Picture;
```

Description

Picture is for internal use only.

12.1.14 TOleStream Class

TOleStream reads and writes information over a streaming interface that is provided by an OLE object.

Class Hierarchy

Pascal

```
TOleStream = class(TStream);
```

C++

```
class TOleStream : public TStream;
```

File

AxCtrls

Description

Use TOleStream to create a TStream wrapper for an OLE stream interface. TOleStream uses the streaming interface of the OLE stream to read and write information. TActiveXControl (see page 1517) objects use TOleStream to load themselves from a stream or save themselves to a stream.

See Also

TActiveXControl (see page 1517)

TStreamAdapter (see page 2997)

IStream

12.1.14.1 TOleStream Members

The following tables list the members exposed by TOleStream.

Protected Methods

	Name	Description
	GetIStream (see page 1598)	This is GetIStream, a member of class TOleStream.
V	GetSize (see page 2982)	This is GetSize, a member of class TStream.
V	SetSize (see page 2989)	This is the overview for the SetSize method overload.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CopyFrom (see page 2979)	Copies a specified number of bytes from one stream to another.
	Create (see page 1597)	Creates a TOleStream (see page 1595) object to represent a stream interface.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FixupResourceHeader (see page 2981)	Patches the resource header for a resource that has been written to the stream.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Read (see page 1598)	Reads up to Count bytes from the current position into Buffer.
	ReadBuffer (see page 2983)	Reads bytes from the stream into Buffer.
	ReadComponent (see page 2983)	Initiates streaming of components and their properties.
	ReadComponentRes (see page 2987)	Reads components and their properties from a stream in a resource file format.
	ReadResHeader (see page 2987)	Reads a resource-file header from the stream.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Seek (see page 1598)	Resets the current position of the stream.
V	Seek (see page 2988)	This is the overview for the Seek method overload.
V	Write (see page 1599)	Writes Count bytes from Buffer to the current position in the Ole stream and updates the current position by Count bytes.
	WriteBuffer (see page 2990)	Writes Count bytes from Buffer onto the stream and advances the current position of the stream by Count bytes.
	WriteComponent (see page 2990)	Initiates the writing of components and their properties to a stream.
	WriteComponentRes (see page 2994)	Writes components and their properties to a stream from a resource file format.
	WriteDescendent (see page 2994)	Streams components and their properties in inherited forms.
	WriteDescendentRes (see page 2995)	Streams components and their properties in inherited forms.
	WriteResourceHeader (see page 2995)	Writes a resource-file header to the stream.

Public Properties

	Name	Description
	Position (see page 2996)	Indicates the current offset into the stream for reading and writing.
	Size (see page 2997)	Indicates the size in bytes of the stream.

12.1.14.2 TOleStream.Create Constructor

Creates a TOleStream (see page 1595) object to represent a stream interface.

Pascal

```
constructor Create(const Stream: IStream);
```

C++

```
__fastcall TOleStream(const IStream Stream);
```

Description

Call Create to convert a stream interface into a TOleStream (see page 1595) object. The Stream parameter is the stream interface that the TOleStream (see page 1595) object uses for reading and writing.

12.1.14.3 TOleStream Methods

The methods of the TOleStream class are listed here.

Protected Methods

	Name	Description
	GetIStream (see page 1598)	This is GetIStream, a member of class TOleStream.

Public Methods

	Name	Description
V	Read (see page 1598)	Reads up to Count bytes from the current position into Buffer.

	Seek (see page 1598)	Resets the current position of the stream.
	Write (see page 1599)	Writes Count bytes from Buffer to the current position in the Ole stream and updates the current position by Count bytes.

12.1.14.3.1 TOleStream.GetIStream Method

Pascal

```
function GetIStream: IStream;
```

C++

```
__fastcall IStream GetIStream();
```

Description

This is GetIStream, a member of class TOleStream.

12.1.14.3.2 TOleStream.Read Method

Reads up to Count bytes from the current position into Buffer.

Pascal

```
function Read(var Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Read( Buffer, Longint Count);
```

Description

Call Read to read data from the Ole stream when it is not known how many bytes are available. Buffer must have at least Count bytes allocated to hold the data that was read from the stream.

Read uses the stream interface to transfer up to Count bytes into Buffer, starting at the current position, and then advances the current position by the number of bytes actually transferred. Read returns the number of bytes actually transferred (which may be less than the number requested in Count.)

All the other data-reading methods of an Ole stream (ReadBuffer, ReadComponent) call Read to do their actual reading.

See Also

Seek (see page 1598)

Write (see page 1599)

12.1.14.3.3 TOleStream.Seek Method

Resets the current position of the stream.

Pascal

```
function Seek(Offset: Longint; Origin: Word): Longint; override;
```

C++

```
virtual __fastcall Longint Seek(Longint Offset, Word Origin);
```

Description

Use Seek to move the current position by the indicated offset. Seek uses the stream interface to change the current position to the value indicated by the Offset and Origin parameters.

The Origin parameter indicates how to interpret the Offset parameter. Origin should be one of the following values:

Value	Meaning
soFromBeginning	Offset is from the beginning of the Ole stream. Seek moves to the position Offset. Offset must be >= 0.
soFromCurrent	Offset is from the current position in the Ole stream. Seek moves to Position + Offset.
soFromEnd	Offset is from the end of the Ole stream. Offset must be <= 0 to indicate a number of bytes before the end of the stream.

Seek returns the new value of the Position property.

See Also

Read (see page 1598)

Write (see page 1599)

12.1.14.3.4 TOleStream.Write Method

Writes Count bytes from Buffer to the current position in the Ole stream and updates the current position by Count bytes.

Pascal

```
function Write(const Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  Buffer, Longint Count);
```

Description

Use Write to write Count bytes to the Ole stream, starting at the current position. Write uses the stream interface to transfer the information from Buffer.

All the other data-writing methods of an Ole stream (WriteBuffer, WriteComponent) call Write to do their actual writing.

See Also

Seek (see page 1598)

Read (see page 1598)

12.1.15 TPictureAdapter Class

TPictureAdapter connects a native TPicture object to an OLE picture object.

Class Hierarchy

Pascal

```
TPictureAdapter = class(TCustomAdapter, IChangeNotifier, IPictureAccess);
```

C++

```
class TPictureAdapter : public TCustomAdapter, public IChangeNotifier, public IPictureAccess;
```

File

AxCtrls

Description

To create an instance of a TPictureAdapter, call the GetOlePicture (see page 1602) procedure, which creates the binding between a TPicture and an OLE picture object.

See Also

GetOlePicture

SetOlePicture

TFontAdapter (see page 1583)

TPicture (see page 14584)

12.1.15.1 TPictureAdapter Members

The following tables list the members exposed by TPictureAdapter.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Fields

	Name	Description
	Updating (see page 1581)	This is Updating, a member of class TCustomAdapter.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
V	Changed (see page 1582)	Responds when the VCL representation of the OLE object changes.
	ConnectOleObject (see page 1582)	Associates the adapter with an OLE interface.
	GetOlePicture (see page 1602)	This is GetOlePicture, a member of class TPictureAdapter.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	ReleaseOleObject (see page 1582)	Releases the associated OLE interface, allowing it to decrease its reference count.
	SetOlePicture (see page 1602)	This is SetOlePicture, a member of class TPictureAdapter.
V	Update (see page 1602)	Provides the interface for a method that responds to changes in the OLE object.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	Changed (see page 14607)	Called when a change occurs in the implementing class.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1601)	Create constructs an instance of the picture adapter control.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 1581)	Destroys the custom adapter object.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

12.1.15.2 TPictureAdapter.Create Constructor

Create constructs an instance of the picture adapter control.

Pascal

```
constructor Create(Picture: TPicture);
```

C++

```
__fastcall TPictureAdapter(TPicture Picture);
```

Description

Do not call the constructor for this class directly. Instead, call the GetOlePicture (see page 1602) procedure to create the binding between a TPicture and an OLE picture.

See Also

Destroy

GetOlePicture

12.1.15.3 TPictureAdapter Methods

The methods of the TPictureAdapter class are listed here.

Protected Methods

	Name	Description
	GetOlePicture (see page 1602)	This is GetOlePicture, a member of class TPictureAdapter.
	SetOlePicture (see page 1602)	This is SetOlePicture, a member of class TPictureAdapter.
V	Update (see page 1602)	Provides the interface for a method that responds to changes in the OLE object.

12.1.15.3.1 TPictureAdapter.GetOlePicture Method

Pascal

```
procedure GetOlePicture(var OlePicture: IPictureDisp);
```

C++

```
__fastcall GetOlePicture(IPictureDisp OlePicture);
```

Description

This is GetOlePicture, a member of class TPictureAdapter.

12.1.15.3.2 TPictureAdapter.SetOlePicture Method

Pascal

```
procedure SetOlePicture(const OlePicture: IPictureDisp);
```

C++

```
__fastcall SetOlePicture(const IPictureDisp OlePicture);
```

Description

This is SetOlePicture, a member of class TPictureAdapter.

12.1.15.3.3 TPictureAdapter.Update Method

Provides the interface for a method that responds to changes in the OLE object.

Pascal

```
procedure Update; override;
```

C++

```
virtual __fastcall Update();
```

Description

Descendants of TCustomAdapter override Update to modify the associated VCL object so that it reflects changes in the corresponding OLE object. It is the converse of the Changed method.

See Also

Changed (see page 1582)

12.1.16 TPropertyPage Class

TPropertyPage is the base class for controls that represent an ActiveX control's property page.

Class Hierarchy

Pascal

```
TPropertyPage = class(TCustomForm);
```

C++

```
class TPropertyPage : public TCustomForm;
```

File

AxCtrls

Description

TPropertyPage extends TCustomForm by adding the functionality needed to embed the form in an ActiveX property page dialog. It also adds methods to copy property values from the object to the form's controls, and vice versa.

To implement your own property page for an ActiveX object, derive a new class from TPropertyPage, design the form, then override the UpdateObject (see page 1618) and UpdatePropertyPage (see page 1619) methods. The IDE provides an expert for creating a skeleton property page. See Creating a new property page for more information.

TPropertyPage provides a helper method, Modified (see page 1618), that your form can call when any of the controls on the form are changed by the user. Calling the Modified (see page 1618) method notifies the property dialog that the user has modified the object's properties. Normally this will enable the Apply button on the property dialog.

The property page maintains a connection to the object it is editing, using the OleObject (see page 1635) or OleObjects (see page 1635) property. This property is a Variant and can be used to read and write the object's properties.

TActiveXPropertyPageFactory (see page 1564)

Creating a New Property Page

12.1.16.1 TPropertyPage Members

The following tables list the members exposed by TPropertyPage.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnCanResize (see page 13947)	Occurs when an attempt is made to resize the control.
	OnCloseQuery (see page 13950)	Occurs when close is attempted.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.

	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnHelp (see page 13959)	Occurs when the form receives a request for help.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseActivate (see page 13967)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnShortCut (see page 13977)	Occurs when the user presses a key (before the OnKeyDown (see page 13962) event).
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFormState (see page 13863)	This is FFormState, a member of class TCustomForm.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	Activate (see page 13865)	Activation event dispatcher.
	ActiveChanged (see page 13865)	Active (see page 13896) state event dispatcher.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustClientRect (see page 14324)	Adjusts the ClientRect property to exclude the scroll bars.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.

	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	AlignControls (see page 13866)	Aligns all child controls of the form that fall within a specified rectangle.
	AlignControls (see page 14325)	Aligns the controls in the scrolling windowed control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	AutoScrollEnabled (see page 14325)	Indicates whether automatic scrolling is enabled.
	AutoScrollInView (see page 14325)	Scrolls a control into the visible area of the scrolling windowed control.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	BeginAutoDrag (see page 13867)	Responds when the user starts dragging the form if DragMode is dmAutomatic.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	ChangeScale (see page 13867)	Repositions and resizes the form by the ratio M/D, adjusting its client area and font size as needed.
	ChangeScale (see page 14326)	Resizes the scrolling windowed control by a specific ratio.
	Click (see page 5743)	Respond to user click.
	CloseModal (see page 13868)	This is CloseModal, a member of class TCustomForm.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateParams (see page 13868)	Initializes the window-creation parameter record when the form window is created.
	CreateParams (see page 14326)	Initializes the window creation parameters so that the entire window is not redrawn when the width or height of the client area changes.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWindowHandle (see page 13869)	Creates a form window given a set of window-creation parameters.
	CreateWnd (see page 6137)	Creates the underlying window.
	CreateWnd (see page 13869)	Creates the form window.
	CreateWnd (see page 14327)	Creates a Windows control corresponding to the TScrollingWinControl (see page 14312) object.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	Deactivate (see page 13870)	Generates an OnDeactivate (see page 13953) event.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.

	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DefineProperties (see page 13871)	Designates methods for storing a form's unpublished data on a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyHandle (see page 13871)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWindowHandle (see page 13872)	Destroys the window created in the CreateWindowHandle (see page 13869) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoClose (see page 13873)	Form closing event dispatcher.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoCreate (see page 13873)	Form creation event dispatcher.
	DoDestroy (see page 13873)	Form destruction event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDock (see page 13874)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoFlipChildren (see page 14327)	Flips the control's children.
	DoHide (see page 13874)	Form hide event dispatcher.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoShow (see page 13875)	Form show event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetBorderIconStyles (see page 13875)	This is GetBorderIconStyles, a member of class TCustomForm.
	GetBorderStyles (see page 13876)	This is GetBorderStyles, a member of class TCustomForm.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.

	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetChildren (see page 13876)	Returns the "child" components of the form; that is, those components that return the form from their GetParentComponent method.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetClientRect (see page 13876)	Returns the value of the ClientRect property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloating (see page 13877)	Returns the value of the Floating property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetOwnerWindow (see page 13878)	This is GetOwnerWindow, a member of class TCustomForm.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleCreateException (see page 13878)	Handles exceptions that are raised by the OnCreate (see page 13951) event handler.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 13880)	Performs fix-ups when the form is first loaded into memory.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.

	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	Notification (see page 13882)	Responds to notifications that objects are about to be inserted or removed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 13882)	Generates an OnPaint (see page 13975) event.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaintWindow (see page 13882)	Renders the image of the form.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteChanged (see page 13883)	Responds to changes in the system's palette by realizing the control's palette as returned from GetPalette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	QueryInterface (see page 13884)	Returns a reference to a specified interface if that interface is supported by the form.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	ReadState (see page 13884)	Reads the form's published properties, stored data, and owned components from a reader object.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	RequestAlign (see page 13885)	Instructs the form's parent (if any) to reposition the form, enforcing its Align property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	Resizing (see page 13885)	Makes any required adjustments when the form changes size.
	Resizing (see page 14328)	This is Resizing, a member of class TScrollingWinControl.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetChildOrder (see page 13886)	Changes the order in which Child appears when GetChildren (see page 13876) is called.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.

	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParent (see page 13887)	Sets the Parent property.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
V	SetParentBiDiMode (see page 13887)	Sets the ParentBiDiMode property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
V	UpdateActions (see page 13891)	Updates all actions associated with the form.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	UpdateWindowState (see page 13892)	Updates the WindowState (see page 13942) property to reflect the current state of the form.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	ValidateRename (see page 13892)	Determines if a form can rename one of its owned components.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	VisibleChanging (see page 13893)	Responds just before the form changes the value of its Visible (see page 13940) property.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WndProc (see page 13893)	Provides specific message responses for the form.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
R	ActiveMDIChild (see page 13897)	Specifies the MDI child that has focus.
	AlphaBlend (see page 13898)	Specifies whether the form is translucent.
	AlphaBlendValue (see page 13898)	Specifies the degree of translucency on a translucent form.

	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderIcons (see page 13899)	Specifies which icons appear on the title bar of the form.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	ClientHandle (see page 13904)	Provides access to the handle of the form's internal MDI client window.
	DefaultMonitor (see page 13909)	Specifies the monitor on which the form appears.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	FormStyle (see page 13912)	Determines the form's style.
	Icon (see page 13917)	Specifies the icon that appears when the form is minimized.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	MDIChildCount (see page 13921)	Specifies the number of open MDI child forms.
R	MDIChildren (see page 13922)	Provides indexed access to all MDI child forms.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ObjectMenuItem (see page 13926)	Represents an OLE object menu item that reacts to selections of OLE objects.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
R	PopupChildren (see page 13928)	This is PopupChildren, a member of class TCustomForm.
	Position (see page 13933)	Represents the size and placement of the form.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	TileMode (see page 13936)	Represents how MDI child forms are arranged when the Tile method is called.
	TransparentColor (see page 13938)	Specifies whether a color on the form appears transparent.
	TransparentColorValue (see page 13939)	Indicates the color on the form that appears transparent when TransparentColor (see page 13938) is true.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowMenu (see page 13941)	Specifies the Window menu for an MDI parent form.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 13866)	Construction event dispatcher.

	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 13866)	Destruction event dispatcher.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	Close (see page 13867)	Closes the form.
	CloseQuery (see page 13868)	Close (see page 13867) attempt event dispatcher.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 1616)	Creates an instance of TPropertyPage (see page 1603).
	CreateNew (see page 13862)	Creates and initializes a new form.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 13870)	Provides message handling for all messages that the form does not fully process.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DefocusControl (see page 13871)	Removes focus from a control on the form.
	Destroy (see page 1617)	Frees an instance of TPropertyPage (see page 1603).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	DisableAutoRange (see page 14327)	Disables automatic scrolling.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	Dock (see page 13872)	Handles automatic docking of the form into other windows.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EnableAutoRange (see page 14328)	Reenables automatic scrolling.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	EnumCtlProps (see page 1617)	Looks for a PropType type property in a control on the form.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	FocusControl (see page 13875)	Sets focus to a control on the form.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFormImage (see page 13877)	Returns a bitmap of the form.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	Hide (see page 13879)	Hides the form.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	IsShortCut (see page 13880)	Processes shortcut keys when the form has focus.
	MakeFullyVisible (see page 13881)	Ensures that the form is fully visible on a specified monitor.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	Modified (see page 1618)	Notifies the property page's container that the user has edited one of the controls on the page.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	MouseWheelHandler (see page 13881)	Directs mouse wheel messages to the appropriate control.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	Print (see page 13883)	Prints the form.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	RecreateAsPopup (see page 13884)	This is RecreateAsPopup, a member of class TCustomForm.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	Release (see page 13885)	Destroys the form and frees its associated memory.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	ScrollInView (see page 14328)	Scrolls a control into the visible area of the scrolling windowed control.
	SendCancelMode (see page 13886)	Cancels modes on the form.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
V	SetFocus (see page 13886)	Sets focus to the form.
V	SetFocusedControl (see page 13887)	Sets focus to a control on the form.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Show (see page 13888)	Shows the form.
V	ShowModal (see page 13890)	Shows a form as a modal dialog.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UpdateGlassFrame (see page 13892)	This is UpdateGlassFrame, a member of class TCustomForm.
V	UpdateObject (see page 1618)	UpdateObject is called to copy property values from the controls on the form to the ActiveX Object.
V	UpdatePropertyPage (see page 1619)	Copies the property values from the ActiveX object to controls on the property page.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.
V	WantChildKey (see page 13893)	Indicates whether the form processes keyboard input for a control it owns.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Action (see page 13895)	Designates the action associated with the control.
R	Active (see page 13896)	Specifies whether the form has focus.
	ActiveOleControl (see page 13897)	Specifies the OLE control on the form that reacts to changes in focus.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 13900)	Specifies the appearance and behavior of the form border.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 13900)	Provides access to the drawing area of the form.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Designer (see page 13910)	Specifies the designer interface for the form.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DropTarget (see page 13910)	Specifies whether the form is the target of a drag-and-drop operation.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	FormState (see page 13911)	Indicates transitional state information about the form.
	GlassFrame (see page 13914)	This is GlassFrame, a member of class TCustomForm.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HelpFile (see page 13916)	Specifies the name of the file the form uses to display Help.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.

	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Menu (see page 13923)	Specifies the form's main menu.
	ModalResult (see page 13924)	Represents the return value of a form that is used as a modal dialog.
R	Monitor (see page 13926)	Provides access to the monitor on which the form appears.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	OleFormObject (see page 13927)	Specifies the IOleForm (see page 14340) interface for an in-place OLE object contained in the form.
R	OleObject (see page 1635)	Contains a reference to the first item in the array of ActiveX controls being edited by the page.
	OleObjects (see page 1635)	An array of Dispatch IDs for each ActiveX control being edited by the page.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	PopupMode (see page 13933)	This is PopupMode, a member of class TCustomForm.
	PopupParent (see page 13933)	Sets an order for stacked forms that users cannot change.
	ScreenSnap (see page 13935)	Specifies whether form snaps to edge of screen.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	SnapBuffer (see page 13936)	Specifies distance for screen snap.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.
	WindowState (see page 13942)	Represents how the form appears on the screen.

Published Events

	Name	Description
	OnActivate (see page 1646)	Occurs when the form becomes active.
	OnAlignInsertBefore (see page 14332)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 14332)	Occurs when an object with custom alignment is aligned.
	OnClick (see page 1650)	Occurs when the user clicks the control.
	OnClose (see page 1652)	Occurs when the form closes.
	OnContextPopup (see page 1653)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnCreate (see page 1654)	Occurs when the form is created.
	OnDblClick (see page 1655)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDeactivate (see page 1656)	Occurs when the form loses focus.
	OnDestroy (see page 1656)	Occurs when the form is destroyed.
	OnDragDrop (see page 1657)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 1659)	Occurs when the user drags an object over a control.
	OnHide (see page 1662)	Occurs when the form is hidden (that is, when its Visible property is set to false).
	OnKeyDown (see page 1664)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 1667)	Occurs when a key is pressed.
	OnKeyUp (see page 1668)	Occurs when the user releases a key that has been pressed.
	OnMouseDown (see page 1669)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 1672)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 1674)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 1676)	Occurs when the form is redrawn.

	OnResize (see page 1677)	Occurs immediately after the control is resized.
	OnShow (see page 1678)	Occurs when the form is shown (that is, when its Visible property is set to true).

Published Properties

	Name	Description
	ActiveControl (see page 1620)	Specifies the control that has focus on the form.
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	AutoScroll (see page 1621)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	Caption (see page 1621)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 1624)	Specifies the height (in pixels) of the form's client area.
	ClientWidth (see page 1624)	Specifies the width (in pixels) of the form's client area.
	Color (see page 1626)	Specifies the background color of the control.
	Ctl3D (see page 1627)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Enabled (see page 1628)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 1628)	Controls the attributes of text written on or in the control.
	Height (see page 1629)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	HorzScrollBar (see page 1630)	Represents the horizontal scroll bar for the scrolling windowed control.
	KeyPreview (see page 1631)	Specifies whether the form should receive keyboard events before the active control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Left (see page 13920)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldCreateOrder (see page 1634)	Specifies when OnCreate and OnDestroy events occur.
	ParentFont (see page 1636)	Determines where a control looks for its font information.
	PixelsPerInch (see page 1636)	Represents the proportion of the font on the system on which the form was designed.
	PopupMenu (see page 1636)	Identifies the pop-up menu associated with the control.
	PrintScale (see page 1641)	Represents the proportions of a printed form.
	Scaled (see page 1641)	Specifies whether the form is sized according to the value of the PixelsPerInch property.
	ShowHint (see page 1642)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Top (see page 13937)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	VertScrollBar (see page 1643)	Represents the vertical scroll bar for the scrolling windowed control.
	Visible (see page 1644)	Indicates whether the form is visible.
	Width (see page 1645)	Specifies the horizontal size of the control or form in pixels.

12.1.16.2 TPropertyPage.Create Constructor

Creates an instance of TPropertyPage (see page 1603).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPropertyPage(TComponent * AOwner);
```

Description

Call Create to instantiate a property page at runtime. Property pages added at design time are created automatically. Pass a single Component as an argument to assign the property page an owner that is responsible for freeing the property page.

Create instantiates the helper objects used by the property page.

12.1.16.3 TPropertyPage.Destroy Destructor

Frees an instance of TPropertyPage (see page 1603).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPropertyPage();
```

Description

Do not call Destroy directly in an application. Instead, call Free, which verifies that the property page reference is not nil, and only then calls Destroy.

Destroy frees any associated OLE objects before freeing the object instance.

See Also

Free (see page 22300)

12.1.16.4 TPropertyPage Methods

The methods of the TPropertyPage class are listed here.

Public Methods

	Name	Description
	EnumCtlProps (see page 1617)	Looks for a PropType type property in a control on the form.
	Modified (see page 1618)	Notifies the property page's container that the user has edited one of the controls on the page.
V	UpdateObject (see page 1618)	UpdateObject is called to copy property values from the controls on the form to the ActiveX Object.
V	UpdatePropertyPage (see page 1619)	Copies the property values from the ActiveX object to controls on the property page.

12.1.16.4.1 TPropertyPage.EnumCtlProps Method

Looks for a PropType type property in a control on the form.

Pascal

```
procedure EnumCtlProps(PropType: TGUID; PropNames: TStrings);
```

C++

```
__fastcall EnumCtlProps(TGUID PropType, TStrings PropNames);
```

Description

Use EnumCtlProps to locate all properties of the ActiveX object specified by OleObject (see page 1635) that use the GUID specified by the PropType parameter. The names of all properties of the specified type are added to the PropNames list. The property names can be used subsequently to read or write property values using the IDispatch interface of the ActiveX object.

Note: EnumCtlProps does not clear the PropNames list before adding property names. Applications should clear the string list before calling EnumCtlProps to avoid mistaking entries that were previously in the list for properties of the ActiveX object.

See Also

UpdateObject (see page 1618)

UpdatePropertyPage (see page 1619)

OleObject (see page 1635)

12.1.16.4.2 TPropertyPage.Modified Method

Notifies the property page's container that the user has edited one of the controls on the page.

Pascal

```
procedure Modified;
```

C++

```
__fastcall Modified();
```

Description

Call Modified from the controls on the property page when their values change. The property dialog will enable the Apply button in response to this method call.

12.1.16.4.3 TPropertyPage.UpdateObject Method

UpdateObject is called to copy property values from the controls on the form to the ActiveX Object.

Pascal

```
procedure UpdateObject; virtual;
```

C++

```
virtual __fastcall UpdateObject();
```

Description

Override this method to copy values from the controls on the property page to properties of the ActiveX Object. Cast the value of the OleObject (see page 1635) property to an IDispatch interface to set the property values.

UpdateObject is the reverse of UpdatePropertyPage (see page 1619), which copies the property values from the ActiveX Object to controls on the form.

See Also

UpdatePropertyPage (see page 1619)

OleObject (see page 1635)

12.1.16.4.4 TPropertyPage.UpdatePropertyPage Method

Copies the property values from the ActiveX object to controls on the property page.

Pascal

```
procedure UpdatePropertyPage; virtual;
```

C++

```
virtual __fastcall UpdatePropertyPage();
```

Description

This method is normally called when the property page is first shown, or when the user undoes changes to the property dialog box. The UpdatePropertyPage method implemented by TPropertyPage (see page 1603) does nothing. Override this method to copy the property values from the ActiveX object to the controls on the property page.

UpdatePropertyPage is the reverse of UpdateObject (see page 1618), which copies the property values from controls on the property page to the ActiveX object.

See Also

UpdateObject (see page 1618)

OleObject (see page 1635)

12.1.16.5 TPropertyPage Properties

The properties of the TPropertyPage class are listed here.

Public Properties

	Name	Description
R	OleObject (see page 1635)	Contains a reference to the first item in the array of ActiveX controls being edited by the page.
	OleObjects (see page 1635)	An array of Dispatch IDs for each ActiveX control being edited by the page.

Published Properties

	Name	Description
	ActiveControl (see page 1620)	Specifies the control that has focus on the form.
	AutoScroll (see page 1621)	Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.
	Caption (see page 1621)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 1624)	Specifies the height (in pixels) of the form's client area.
	ClientWidth (see page 1624)	Specifies the width (in pixels) of the form's client area.
	Color (see page 1626)	Specifies the background color of the control.
	Ctl3D (see page 1627)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Enabled (see page 1628)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 1628)	Controls the attributes of text written on or in the control.
	Height (see page 1629)	Specifies the vertical size of the control in pixels.
	HorzScrollBar (see page 1630)	Represents the horizontal scroll bar for the scrolling windowed control.
	KeyPreview (see page 1631)	Specifies whether the form should receive keyboard events before the active control.
	OldCreateOrder (see page 1634)	Specifies when OnCreate and OnDestroy events occur.
	ParentFont (see page 1636)	Determines where a control looks for its font information.
	PixelsPerInch (see page 1636)	Represents the proportion of the font on the system on which the form was designed.
	PopupMenu (see page 1636)	Identifies the pop-up menu associated with the control.

	PrintScale (see page 1641)	Represents the proportions of a printed form.
	Scaled (see page 1641)	Specifies whether the form is sized according to the value of the PixelsPerInch property.
	ShowHint (see page 1642)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	VertScrollBar (see page 1643)	Represents the vertical scroll bar for the scrolling windowed control.
	Visible (see page 1644)	Indicates whether the form is visible.
	Width (see page 1645)	Specifies the horizontal size of the control or form in pixels.

12.1.16.5.1 TPropertyPage.ActiveControl Property

Specifies the control that has focus on the form.

Pascal

```
property ActiveControl: TWinControl;
```

C++

```
__property TWinControl * ActiveControl;
```

Description

Use ActiveControl to get or set the control that has focus on the form. Only one control can have focus at a given time in an application.

If the form does not have focus, ActiveControl is the control on the form that will receive focus when the form receives focus.

Note: When focus shifts to another control, ActiveControl is updated before the OnExit event occurs.

C++ Examples:

```
/*
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
*/
void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  Timer1->Interval = 100;
  if (ActiveControl)
    ActiveControl->Left = ActiveControl->Left + 1;
}
```

Delphi Examples:

```
{
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
}
procedure TForm1.Timer1Timer(Sender: TObject);
begin
  Timer1.Interval := 100;
  if ActiveControl <> nil then
    ActiveControl.Left := ActiveControl.Left + 1;
end;
```

OnEnter (see page 6219)

Active (see page 13896)

12.1.16.5.2 TPropertyPage.AutoScroll Property

Indicates whether scroll bars appear automatically on the scrolling windowed control if it is not large enough to display all of its controls.

Pascal

```
property AutoScroll: Boolean;
```

C++

```
__property Boolean AutoScroll;
```

Description

If AutoScroll is true, the scroll bars appear automatically when necessary. For example, if the user resizes the control so that some of its controls are partially obscured, scroll bars appear.

If AutoScroll is false, scroll bars don't appear automatically. In this case, use the HorzScrollBar and VertScrollBar properties to make scroll bars appear.

See Also

AutoScrollInView (see page 14325)

HorzScrollBar (see page 14329)

VertScrollBar (see page 14330)

12.1.16.5.3 TPropertyPage.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
```

```
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
```

```
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;
```

```
procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

12.1.16.5.4 TPropertyPage.ClientHeight Property

Specifies the height (in pixels) of the form's client area.

Pascal

```
property ClientHeight: Integer;
```

C++

```
__property int ClientHeight;
```

Description

Use ClientHeight to determine the height (in pixels) of the form's client area. The client area is the usable area inside the form's border, excluding the title bar, scroll bars, and so on.

Set ClientHeight to change the height of the form's window based on the desired client area. To change the height of the form's window based on the total size of the window (including the border, menu, status bar and so on), use the Height property instead.

Delphi Examples:

```
{
This example reduces the height of the form's client area by
half when the user clicks the button on the form:
Note that only the client area is halved, not the entire form.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  ClientHeight := ClientHeight div 2;
end;
```

See Also

ClientRect

ClientWidth (see page 13905)

Height (see page 5825)

12.1.16.5.5 TPropertyPage.ClientWidth Property

Specifies the width (in pixels) of the form's client area.

Pascal

```
property ClientWidth: Integer;
```

C++

```
__property int ClientWidth;
```

Description

Use ClientWidth to determine the width (in pixels) of the form's client area. The client area is the usable area inside the form's border. Set ClientWidth to change the width of the form's window based on the desired client area. To change the width of the form's window based on the total size of the window (including the border, status bar and so on), use the Width property instead.

C++ Examples:

```
/*
This example starts the form in a position scrolled so that
the right hand edge shows:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  /* set the width of the form window to display 300 pixels in the client area */
  ClientWidth = 300;
  /* now set the range to twice the client width.
   This means that the form has a logical size
   that is twice as big as the physical window.
   Note that Range must always be at least as big as ClientWidth! */
  HorzScrollBar->Range = 600;
  /* start the form fully scrolled */
  HorzScrollBar->Position = HorzScrollBar->Range - ClientWidth;
  /* clicking the scroll arrows moves the form 10 pixels */
  HorzScrollBar->Increment = 10;
  HorzScrollBar->Visible = true;  // Show the scrollbar
}
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
```

Delphi Examples:

```
{
This example starts the form in a position scrolled so that
the right hand edge shows:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
```

```
    ClientWidth := 300;
    with HorzScrollBar do
    begin
      { Set the range to twice the ClientWidth of the form }
      { This means that the form's logical size is twice as big }
      { as the physical window. }
      { Note that Range must always be larger than the ClientWidth }
      Range := 600;
      Position := Range - ClientWidth; { start form out fully scrolled }
      Increment := 10;  { clicking the scroll arrows moves the form 10 pixels }
      Visible := True;  { Show the scrollbar }
    end;
  end;
  {
  This example shows how to use a splitter to divide a form
  into resizable panes.  All objects on the form are created
  dynamically in the OnCreate event handler of the form. To
  run this example, add ExtCtrls and FileCtrl to the uses
  clause of the form's implementation section.
  Note that when creating a splitter dynamically at runtime,
  it is important to set its position to the appropriate side
  of the control it will resize.
  }
  procedure TForm1.FormCreate(Sender: TObject);
  var
    Split: TSplitter;
    Files: TFileListBox;
    Dirs: TDirectoryListBox;
  begin
    { first add a directory list box to the form }
    Dirs := TDirectoryListBox.Create(Form1);
    { line it up on the left of the form }
    Dirs.Parent := Form1;
    Dirs.Align := alLeft;
    Dirs.Width := Form1.ClientWidth div 3;
  { now add the splitter to divide the directory pane from the file pane }
    Split := TSplitter.Create(Form1);
    Split.Parent := Form1;
    { make sure the splitter is to the right of the directory list box! }
    Split.Left := Dirs.Left + Dirs.Width + 1;
    Split.Align := Dirs.Align; { give it the same alignment as the directory }
    { each pane must be at least one quarter of the form's width }
    Split.MinSize := Form1.ClientWidth div 4;
    { Finally, create the last pane – a file list box }
    Files := TFileListBox.Create(Form1);
    Files.Parent := Form1;
    Files.Align := alClient;
    Dirs.FileList := Files; { link the file list box to the directory list box }
  end;
```

12.1.16.5.6 TPropertyPage.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

12.1.16.5.7 TPropertyPage.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

12.1.16.5.8 TPropertyPage.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

12.1.16.5.9 TPropertyPage.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
```

```
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

12.1.16.5.10 TPropertyPage.Height Property

Specifies the vertical size of the control in pixels.

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

Use the Height property to read or change the height of the control.

C++ Examples:

```
/*
This example needs only a blank form.  Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
```

```
  observe the effect on the selected text.
  */
  #include <ComCtrls.hpp>

  void __fastcall TForm1::FormCreate(TObject *Sender)
  {
    for (int I = 0; I <= 2; I++)
    {
      TRichEdit *pRich = new TRichEdit(this);
      pRich->Parent = this;
      pRich->Top = pRich->Height * I;
      pRich->Text = "This text will take the focus.";
      pRich->SelStart = 0;
      pRich->SelLength = pRich->Text.Length();
      if (I == 1)
        pRich->HideSelection = false;
    }
  }
```

Delphi Examples:

```
  {
  HideSelection, Height example
  This example needs only a blank form. Three Rich Edit
  controls are placed vertically on the form, each contain a
  line of text, and the second form has HideSelection set to
  false.  Try tabbing between the three Rich Edit controls and
  observe the effect on the selected text.
  }
  uses ComCtrls;

  procedure TForm1.FormCreate(Sender: TObject);
  var
    I: Integer;
  begin
    for I := 0 to 2 do
      with TRichEdit.Create(Self) do
      begin
        Parent := Self;
        Top := Height * I;
        Text := 'This text will take the focus.';
        SelStart := 0;
        SelLength := Length(Text);
        if (I = 1) then
          HideSelection := False;
      end;
  end;
```

12.1.16.5.11 TPropertyPage.HorzScrollBar Property

Represents the horizontal scroll bar for the scrolling windowed control.

Pascal

```
  property HorzScrollBar: TControlScrollBar;
```

C++

```
  __property TControlScrollBar HorzScrollBar;
```

Description

Use HorzScrollBar to hide, show, or manipulate the horizontal scroll bar for the scrolling windowed control.

C++ Examples:

```
/*
This example starts the form in a position scrolled so that
the right hand edge shows:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  /* set the width of the form window to display 300 pixels in the client area */
  ClientWidth = 300;
  /* now set the range to twice the client width.
   This means that the form has a logical size
   that is twice as big as the physical window.
   Note that Range must always be at least as big as ClientWidth! */
  HorzScrollBar->Range = 600;
  /* start the form fully scrolled */
  HorzScrollBar->Position = HorzScrollBar->Range - ClientWidth;
  /* clicking the scroll arrows moves the form 10 pixels */
  HorzScrollBar->Increment = 10;
  HorzScrollBar->Visible = true;  // Show the scrollbar
}
```

Delphi Examples:

```
{
This example starts the form in a position scrolled so that
the right hand edge shows:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  ClientWidth := 300;
  with HorzScrollBar do
  begin
    { Set the range to twice the ClientWidth of the form }
    { This means that the form's logical size is twice as big }
    { as the physical window. }
    { Note that Range must always be larger than the ClientWidth }
    Range := 600;
    Position := Range - ClientWidth; { start form out fully scrolled }
    Increment := 10;  { clicking the scroll arrows moves the form 10 pixels }
    Visible := True;  { Show the scrollbar }
  end;
end;
```

TControlScrollBar (see page 13744)

12.1.16.5.12 TPropertyPage.KeyPreview Property

Specifies whether the form should receive keyboard events before the active control.

Pascal

```
property KeyPreview: Boolean;
```

C++

```
__property Boolean KeyPreview;
```

Description

If KeyPreview is true, keyboard events occur on the form before they occur on the active control. (The active control is specified by the ActiveControl property.)

If KeyPreview is false, keyboard events occur only on the active control.

Navigation keys (Tab, BackTab, the arrow keys, and so on) are unaffected by KeyPreview because they do not generate keyboard events. Similarly, when a button has focus or when its Default property is true, the Enter key is unaffected by KeyPreview because it does not generate a keyboard events.

KeyPreview is false by default.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
```

```
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
    else
      ComboBox1.Text := 'KeyUp';
    WriteLn(ComboBox1.Text);
  end;
end;
{
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
}

uses Printers;

      if (not Printer.Aborted) then
      begin
        Printer.Canvas.TextOut(X, Y, Memo1.Lines[I]);
        Y := Y + 80;
        if (Y > (Printer.PageHeight - 300)) then
        begin
          Y := 200;
          Printer.NewPage;
```

```
            Sleep(1000);  // to give you time to abort!
          end;
        end;
      if (not Printer.Aborted) then Printer.EndDoc;
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
     KeyPreview := True;
  end;

  procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word; Shift: TShiftState);
  begin
  if (Key=VK_ESCAPE) and Printer.Printing then
    begin
    Printer.Abort;
    MessageDlg('Printing aborted', mtInformation, [mbOK],0);
    end;
  end;
```

12.1.16.5.13 TPropertyPage.OldCreateOrder Property

Specifies when OnCreate and OnDestroy events occur.

Pascal

```
property OldCreateOrder: Boolean;
```

C++

```
__property Boolean OldCreateOrder;
```

Description

When OldCreateOrder is false (the default) the OnCreate event occurs after all constructors are finished and the OnDestroy event occurs before any destructors are called.

This differs from earlier versions of the library (distributed with Delphi version 3 and previous and C++Builder 1), where the OnCreate event occurred when the TCustomForm constructor executed and the OnDestroy event occurred when the TCustomForm destructor executed. Applications that require the OnCreate event and OnDestroy events to occur from the constructor and destructor of the form can set OldCreateOrder to true.

See Also

OnCreate (see page 13951)

OnDestroy (see page 13953)

BeforeDestruction (see page 13866)

AfterConstruction (see page 13866)

12.1.16.5.14 TPropertyPage.OleObject Property

Contains a reference to the first item in the array of ActiveX controls being edited by the page.

Pascal

```
property OleObject: OleVariant;
```

C++

```
__property OleVariant OleObject;
```

Description

Property pages have the ability to be "hooked up to" multiple ActiveX controls, usually by multi-selecting the ActiveX controls in the form designer, and right clicking to invoke the property pages. OleObject points to the first control in the array. To access other ActiveX controls, use the property, OleObjects (see page 1635).

Cast the value of OleObject to the appropriate interface, such as IUnknown or IDispatch, and use the methods of the interface to access the property values and methods of the control.

OleObjects (see page 1635)

Updating the Object

Updating the Property Page

12.1.16.5.15 TPropertyPage.OleObjects Property

An array of Dispatch IDs for each ActiveX control being edited by the page.

Pascal

```
property OleObjects: TInterfaceList;
```

C++

```
__property TInterfaceList OleObjects;
```

Description

Property pages have the ability to be "hooked up to" multiple ActiveX controls, usually by multi-selecting the ActiveX controls in the form designer, and right clicking to invoke the property pages. Cast the value of an entry from the OleObjects Items property to the appropriate interface, such as IUnknown or IDispatch, and use the methods of the interface to access the property values and methods of the control.

UpdatePropertyPage (see page 1619)

UpdateObject (see page 1618)

OleObject (see page 1635)

Items (see page 2866)

12.1.16.5.16 TPropertyPage.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

12.1.16.5.17 TPropertyPage.PixelsPerInch Property

Represents the proportion of the font on the system on which the form was designed.

Pascal

```
property PixelsPerInch: Integer;
```

C++

```
__property int PixelsPerInch;
```

Description

Use PixelsPerInch at runtime to change how the form is scaled to the current screen resolution. If PixelsPerInch is changed from its default value, the form will not have the same proportion on every screen resolution.

At design time, PixelsPerInch is set automatically when the form is saved. Changes to PixelsPerInch made in the Object Inspector only affect the form at runtime.

The form's Scaled property must be true for PixelsPerInch to have an effect.

See Also

Scaled (see page 13935)

12.1.16.5.18 TPropertyPage.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
```

```
    {
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->PasteFromClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }
  /*
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  */
  void __fastcall TForm1::AddButtonClick(TObject *Sender)
  {
      const int num_items = 4;
      for (int index = 0; index < num_items; ++index)
      {
          TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
          PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
          NewItem->Caption = "Menu Item " + IntToStr(index);
          NewItem->Tag = index;
          NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
          TNotifyEvent();
      }
  }

  void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
  {
      TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
      if (ClickedItem)
      {
          switch (ClickedItem->Tag)
          {
              case 0:
              {
                  ShowMessage("first item clicked");
                  break;
              }
              case 1:
              {
                  ShowMessage("second item clicked");
                  break;
              }
              case 2:
              {
                  ShowMessage("third item clicked");
                  break;
              }
              case 3:
              {
                  ShowMessage("fourth item clicked");
                  break;
              }
          }
      }
  }

  /*
```

```
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
```

```
    else
      Beep;
  end;
  {
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  }

12.1.16.5.19 TPropertyPage.PrintScale Property

Represents the proportions of a printed form.

Pascal

```
property PrintScale: TPrintScale;
```

C++

```
__property TPrintScale PrintScale;
```

Description

Use PrintScale to get or set the proportions of the printed form. PrintScale can have one of the following TPrintScale values:

Value	Meaning
poNone	No special scaling occurs; therefore, the printed form and how the form appears onscreen may appear squished or stretched.
poProportional	The form is printed so that the printed image is approximately the same visible size as on the screen (WYSIWYG). The form image is scaled so that the printed image is approximately the same visible size as on the screen.
poPrintToFit	The form is printed using the same screen proportions, but in a size that just fits the printed page.

See Also

Print (see page 13883)

12.1.16.5.20 TPropertyPage.Scaled Property

Specifies whether the form is sized according to the value of the PixelsPerInch property.

Pascal

```
property Scaled: Boolean;
```

C++

```
__property Boolean Scaled;
```

Description

Scaled determines whether the form adjusts itself to differences between the font used at design time and the current system font used by a system at runtime. If Scaled is true, the form resizes itself and all its child controls to maintain the relationship between the size of controls and the height of text displayed in the default font. If Scaled is false, no such resizing occurs.

By setting Scaled to true, the form can adjust to fonts that are not scalable (that is, fonts that only supply discrete point sizes) or to differences such as forms designed using small fonts at design time that are run on systems that use large fonts.

The degree of resizing is determined by the PixelsPerInch property, which measures the proportion of the font on the system used when designing the form.

See Also

PixelsPerInch (see page 13928)

Considerations When Dynamically Resizing Forms and Controls

12.1.16.5.21 TPropertyPage.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;
```

```
    char string[10];
    char index[3];
    for(int i = 1; i <= 10; i++)
    {
      strcpy(string, "Item");
      itoa(i, index, 10);
      strcat(string, index);
      ListBox1->Items->Add(string);
    }
    ListBox1->Hint = "Select an item";
    ListBox1->ShowHint = true;
    Application->ShowHint = true;
  }
  /*
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  */
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

Displaying Fly-over Help

12.1.16.5.22 TPropertyPage.VertScrollBar Property

Represents the vertical scroll bar for the scrolling windowed control.

Pascal

```
property VertScrollBar: TControlScrollBar;
```

C++

```
__property TControlScrollBar VertScrollBar;
```

Description

Use VertScrollBar to hide, show, or manipulate the vertical scroll bar for the scrolling windowed control.

C++ Examples:

```
/*
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  const int iPageDelta = 10;

  if (Key == VK_NEXT)
    VertScrollBar->Position += iPageDelta;
  else if (Key == VK_PRIOR)
    VertScrollBar->Position -= iPageDelta;
}
```

Delphi Examples:

```
{
The following example demonstrates form scrolling with the
PgUp and PgDn keys.
}
procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word;
Shift: TShiftState);
const
  PageDelta = 10;
begin
  With VertScrollbar do
    if Key = VK_NEXT then
      Position := Position + PageDelta
    else if Key = VK_PRIOR then
      Position := Position - PageDelta;
end;
```

See Also

AutoScroll (see page 14329)

HorzScrollBar (see page 14329)

TControlScrollBar (see page 13744)

12.1.16.5.23 TPropertyPage.Visible Property

Indicates whether the form is visible.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use Visible to determine whether the form is visible.

If Visible is true, the form is visible unless it is completely obscured by other forms. If Visible is false, the form is not visible.

The Show and ShowModal methods set Visible to true and bring the form to the front of all open windows.

C++ Examples:

```
/*
The following code uses two forms. Form1 has a button on it. The
second form is used as a tool palette. This code makes the palette
form visible, and ensures it is the top form by bringing it to the
front.  To run this example, you must include Unit2.h in this
module.
*/
#include "Unit2.h"

void __fastcall TForm1::ShowPaletteButtonClick(TObject *Sender)
{
  if (!Form2->Visible)
  {
    Form2->Visible = true;
    Form2->BringToFront();
  }
}
```

Delphi Examples:

```
{
The following code uses two forms. Form1 has a button on it. The
second form is used as a tool palette. This code makes the palette
form visible, and ensures it is the top form by bringing it to the
front.  To run this example, you must add Unit2 in the uses clause
of your unit.
}
procedure TForm1.ShowPaletteButtonClick(Sender: TObject);
begin
if Form2.Visible = False then Form2.Visible := True;
Form2.BringToFront;
end;
```

See Also

BringToFront (see page 5740)

Show (see page 13888)

ShowModal (see page 13890)

12.1.16.5.24 TPropertyPage.Width Property

Specifies the horizontal size of the control or form in pixels.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

Use the Width property to read or change the width of the control.

Note: For tab sheet controls, changing this property at runtime has no effect.

See Also

ClientWidth (see page 5811)

Height (see page 5825)

Left (see page 5830)

12.1.16.6 TPropertyPage Events

The events of the TPropertyPage class are listed here.

Published Events

	Name	Description
	OnActivate (see page 1646)	Occurs when the form becomes active.
	OnClick (see page 1650)	Occurs when the user clicks the control.
	OnClose (see page 1652)	Occurs when the form closes.
	OnContextPopup (see page 1653)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnCreate (see page 1654)	Occurs when the form is created.
	OnDblClick (see page 1655)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDeactivate (see page 1656)	Occurs when the form loses focus.
	OnDestroy (see page 1656)	Occurs when the form is destroyed.
	OnDragDrop (see page 1657)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 1659)	Occurs when the user drags an object over a control.
	OnHide (see page 1662)	Occurs when the form is hidden (that is, when its Visible property is set to false).
	OnKeyDown (see page 1664)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 1667)	Occurs when a key is pressed.
	OnKeyUp (see page 1668)	Occurs when the user releases a key that has been pressed.
	OnMouseDown (see page 1669)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 1672)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 1674)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 1676)	Occurs when the form is redrawn.
	OnResize (see page 1677)	Occurs immediately after the control is resized.
	OnShow (see page 1678)	Occurs when the form is shown (that is, when its Visible property is set to true).

12.1.16.6.1 TPropertyPage.OnActivate Event

Occurs when the form becomes active.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Use OnActivate to perform special processing when the form receives focus. A form becomes active when focus is transferred to it (when the user clicks on the form, for example).

Note: The OnActivate event of the application (TApplication), not the form, occurs when Windows switches control from another application.

Delphi Examples:

```
{
Here is the code on Form1 that fills the list box.
```

```
}
var
  Form1: TForm1;
  Customers: TTable;
  Blobs: TTable;
  Form1Done : Boolean;
  procedure CreateMyTable;
  procedure CreateCustSource;
  procedure CreateBlobSource;

12.1.16.6.2 TPropertyPage.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.

- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
```

```
        PageControl := PageControl1;
        Caption := 'TabSheet' + IntToStr(i);
        with TEdit.Create(Self) do
        begin
          Parent := PageControl1.Pages[i];
          Left := Random(PageControl1.ActivePage.ClientWidth - Width);
          Top := Random(PageControl1.ActivePage.ClientHeight - Height);
        end;
      end;
      PageControl1Change(Sender);
  end;
```

12.1.16.6.3 TPropertyPage.OnClose Event

Occurs when the form closes.

Pascal

```
property OnClose: TCloseEvent;
```

C++

```
__property TCloseEvent OnClose;
```

Description

Use OnClose to perform special processing when the form closes. The OnClose event specifies which event handler to call when a form is about to close. The handler specified by OnClose might, for example, test to make sure all fields in a data-entry form have valid contents before allowing the form to close.

A form is closed by the Close method or when the user chooses Close from the form's system menu.

The TCloseEvent type points to a method that handles the closing of a form. The value of the Action parameter determines if the form actually closes. These are the possible values of Action:

Value	Meaning
caNone	The form is not allowed to close, so nothing happens.
caHide	The form is not closed, but just hidden. Your application can still access a hidden form.
caFree	The form is closed and all allocated memory for the form is freed.
caMinimize	The form is minimized, rather than closed. This is the default action for MDI child forms.

If a form is an MDI child form, and its BorderIcons property is biMinimize, then the default Action is caMinimize. If a MDI child form does not have these settings, the default Action is caNone, meaning that nothing happens when the user attempts to close the form.

If a form is an SDI child form, Action defaults to caHide.

To close the form and free it in an OnClose event, set Action to caFree.

Note: When the application shuts down, the main form receives an OnClose event, but any child forms do not receive the OnClose event.

C++ Examples:

```
/*
This example displays a message dialog box when the user
attempts to close the form. If the user clicks the Yes
button, the form closes; otherwise, the form only minimizes.
TCustomForm.Close does not allow an action of caMinimize
for a form closing itself.  Close Form2 from Form1 (from
a button?) and implement the OnClose in Form2.  Place
"Application.CreateForm(TForm2, Form2);" in the project dpr
file to open Form2 and set the Form2 Visible property to
True.
*/
void __fastcall TForm2::FormClose(TObject *Sender, TCloseAction &Action)
{
  if (MessageDlg("Close application ?", mtConfirmation, TMsgDlgButtons() << mbYes << mbNo,0)
== mrYes)
    Action = caFree;
  else
    Action = caMinimize;
}
```

12.1.16.6.4 TPropertyPage.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the

default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

12.1.16.6.5 TPropertyPage.OnCreate Event

Occurs when the form is created.

Pascal

```
property OnCreate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCreate;
```

Description

Use OnCreate to perform special processing when the form is created and is invoked by TCustomForm's constructor. Either implement this event or override the constructor of the form; do not do both. Any objects created in the OnCreate event should be freed by the OnDestroy event.

When a form is being created and its Visible property is true, the following events occur in the order listed:

1. OnCreate2. OnShow3. OnActivate4. OnPaint

Note: Use of the OnCreate event is discouraged in C++ code because it can interact badly with the form's constructor (see OldCreateOrder). It is recommended that you override the form constructor instead.

C++ Examples:

```
/*
This example requires a new TPageControl, as-is, with no new pages
created at design time, and a TUpDown control, also from the Win95
page of the component palette.  The form OnCreate event handler
adds several new TabSheet controls to the Page Control.  The
UpDown1Click event handler fires when the user clicks the up or
down button on the TUpDown control.  The SelectNextPage method of
the Page Control goes forward the comparison (Button = btNext)
evaluates as true.  If Button is not btNext, the previous Tab Page
is selected.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
const
  TColor colorPalette[12] = {
    clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
    clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *page = new TTabSheet(PageControl1);
    page->PageControl = PageControl1;
    page->Caption = AnsiString("Page") + IntToStr(i);
    page->Brush->Color = colorPalette[i];
  }
```

```
}

void __fastcall TForm1::UpDown1Click(TObject *Sender, TUDBtnType Button)
{
  PageControl1->SelectNextPage(Button == btNext);
}
```

Delphi Examples:

```
{
This example requires a new TPageControl, as-is, with no new pages
created at design time, and a TUpDown control, also from the Win95
page of the component palette.  The form OnCreate event handler
adds several new TabSheet controls to the Page Control.  The
UpDown1Click event handler fires when the user clicks the up or
down button on the TUpDown control.  The SelectNextPage method of
the Page Control goes forward the comparison (Button = btNext)
evaluates as true.  If Button is not btNext, the previous Tab Page
is selected.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
const
  colorPalette: Array[0..11] of TColor =
    (clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
    clTeal, clNavy, clMaroon, clLime, clOlive, clPurple);
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet #' + IntToStr(i);
      Brush.Color := colorPalette[i];
    end;
end;

procedure TForm1.UpDown1Click(Sender: TObject; Button: TUDBtnType);
begin
  PageControl1.SelectNextPage(Button = btNext);
end;
```

12.1.16.6.6 TPropertyPage.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

12.1.16.6.7 TPropertyPage.OnDeactivate Event

Occurs when the form loses focus.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Use OnDeactivate to perform special processing when the form transitions from being the active form to another form in the same application becoming the active form. If activation goes to another application, this event is not triggered. To determine if another application has become active, Use the TApplication object's OnDeactivate event.

See Also

OnActivate (see page 13943)

OnDeactivate (see page 13727)

12.1.16.6.8 TPropertyPage.OnDestroy Event

Occurs when the form is destroyed.

Pascal

```
property OnDestroy: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDestroy;
```

Description

Use OnDestroy to perform special processing when the form is destroyed. Either implement this event or override the destructor of the class, but not both. This event should destroy any objects created in the OnCreate event.

C++ Examples:

```
/*
The following code allocates a TBitmap object that is used
by the application when the main form is first created. The
OnDestroy method frees the bitmap as the application shuts
down.
*/
Graphics::TBitmap *LogoBmp;
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  LogoBmp = new Graphics::TBitmap();
  LogoBmp->LoadFromFile("../FACTORY.BMP");
}
```

```
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  delete LogoBmp;
}

void __fastcall TForm1::FormPaint(TObject *Sender)
{
  Canvas->Brush->Bitmap = LogoBmp;
  Canvas->FillRect(Rect(0,0,100,100));
}
```

Delphi Examples:

```
{
The following code explicitly allocates memory for a pointer
in the OnCreate event of Form1, then releases the memory in
the OnDestroy event. Assume that MyPtr is a Pointer type
field of TForm1.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  New(MyPtr);
end;

procedure TForm1.FormDestroy(Sender: TObject);
begin
  Dispose(MyPtr);
end;
```

Destroy (see page 13862)

OldCreateOrder (see page 13926)

12.1.16.6.9 TPropertyPage.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/
```

```
// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
```

```
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;

12.1.16.6.10 TPropertyPage.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
```

```
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

12.1.16.6.11 TPropertyPage.OnHide Event

Occurs when the form is hidden (that is, when its Visible property is set to false).

Pascal

```
property OnHide: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnHide;
```

Description

Use OnHide to perform special processing when the form is hidden (that is, when the form's Visible property is set to false).

C++ Examples:

```
/*
This example uses two forms, each with a label and a button.
When the user clicks a button, the other form appears and
the current form disappears. Also, a message appears in the
label of the form that is showing, indicating that the other
form is hidden. Set the OnHide event handle for each form to
FormHide.This is the implementation section of Unit1:

OnShow (see page 13977)

12.1.16.6.12 TPropertyPage.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
```

```
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}

12.1.16.6.13 TPropertyPage.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

12.1.16.6.14 TPropertyPage.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/

12.1.16.6.15 TPropertyPage.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,

12.1.16.6.16 TPropertyPage.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
```

```
      }
      else
      {
        StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
        StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
      }
      if (X > StartX)
      {
        StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
        StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
      }
      else
      {
        StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
        StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
      }
    }
  }
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
      end;
    if X > StartX then
      begin
```

```
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

12.1.16.6.17 TPropertyPage.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:

  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
```

```
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;
```

```
procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
      end;
    if X > StartX then
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
      end
    else
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
      end;
  end;
end;
```

OnMouseMove (see page 5865)

Responding to a Mouse-up Action

12.1.16.6.18 TPropertyPage.OnPaint Event

Occurs when the form is redrawn.

Pascal

```
property OnPaint: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPaint;
```

Description

Use OnPaint to perform special processing when the form is redrawn. Any special painting on the form should be done in this event. OnPaint occurs before any controls on the form are painted.

To determine which portions of the form's canvas need to be repainted, use the ClipRect property of the canvas.

If you use the form's Canvas property outside the OnPaint event, it will be erased and drawn-over by the next OnPaint event.

C++ Examples:

```
/*
The following code loads a background bitmap onto the Canvas
of the main form in the OnPaint event handler.
*/
Graphics::TBitmap *TheGraphic;

void __fastcall TForm1::FormPaint(TObject *Sender)// OnPaint event handler
{
  Form1->Canvas->Draw(0, 0, TheGraphic); // Draw the graphic on the Canvas
```

```
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TheGraphic = new Graphics::TBitmap(); // Create the bitmap object
  TheGraphic->LoadFromFile("..\\bigf.bmp"); // Load the bitmap from a file
}
//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  delete TheGraphic;
}
```

Delphi Examples:

```
{
The following code loads a background bitmap onto the Canvas
of the main form in the OnPaint event handler.
}
procedure TForm1.FormPaint(Sender: TObject); { OnPaint event handler}
begin
  Form1.Canvas.Draw(0, 0, TheGraphic); { Draw the graphic on the Canvas }
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  TheGraphic := TBitmap.Create; { Create the bitmap object }
  TheGraphic.LoadFromFile('bigf.bmp'); { Load the bitmap from a file}
end;

procedure TForm1.FormDestroy(Sender: TObject);
begin
  (TheGraphic as TObject).Free;
end;
```

12.1.16.6.19 TPropertyPage.OnResize Event

Occurs immediately after the control is resized.

Pascal

```
property OnResize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnResize;
```

Description

Use OnResize to make any final adjustments after a control is resized.

To modify the way a control responds when an attempt is made to resize it, use OnCanResize or OnConstrainedResize.

Note: Some controls call this event handler when the control is first created.

Delphi Examples:

```
{
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
```

```
}
procedure TForm1.FormResize(Sender: TObject);
begin
  Button1.Left := Form1.ClientWidth-Button1.Width;
end;
```

12.1.16.6.20 TPropertyPage.OnShow Event

Occurs when the form is shown (that is, when its Visible property is set to true).

Pascal

```
property OnShow: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnShow;
```

Description

Use OnShow to perform special processing when the form is shown (that is, when the form's Visible property is set to true).

C++ Examples:

```
/*
This project requires a Page Control.  You will need to
populate the Page Control by right clicking and selecting
New Page from the context menu. As the tabs are selected by
the user, the Page Control OnChange event fires, which
causes the form caption to display the captions of each of
the TTabSheets attached to the Page Control.
Note the use of the Form’s OnShow event handler to set the
caption when the form first appears.  This occurs before
any changes trigger the OnChange event of the Page Control.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  Caption = AnsiString("Now working on tab: " + PageControl1->ActivePage->Caption);
}

void __fastcall TForm1::FormShow(TObject *Sender)
{
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This project requires a Page Control.  You will need to
populate the Page Control by right clicking and selecting
New Page from the context menu. As the tabs are selected by
the user, the Page Control OnChange event fires, which
causes the form caption to display the captions of each of
the TTabSheets attached to the Page Control.
Note the use of the Form’s OnShow event handler to set the
caption when the form first appears.  This occurs before
any changes trigger the OnChange event of the Page Control.
}
```

```
procedure TForm1.PageControl1Change(Sender: TObject);
begin
  Caption := ' Now working on tab:  ' + PageControl1.ActivePage.Caption;
end;

procedure TForm1.FormShow(Sender: TObject);
begin
  PageControl1Change(Sender);
end;
```

12.1.17 TPropertyPageImpl Class

TPropertyPageImpl implements the IPropertyPage interface to provide the interfaces needed to support an ActiveX property page.

Class Hierarchy

Pascal

```
TPropertyPageImpl = class(TAggregatedObject, IUnknown, IPropertyPage, IPropertyPage2);
```

C++

```
class TPropertyPageImpl : public TAggregatedObject, public IUnknown, public IPropertyPage,
public IPropertyPage2;
```

File

AxCtrls

Description

Applications do not create TPropertyPageImpl objects; they are created automatically when the user creates an ActiveX control object by using the ActiveX control or ActiveForms wizard.

This class is used internally by TPropertyPage (see page 1603) to provide a bridge between a Delphi form and the ActiveX property page API. TPropertyPageImpl implements the property page portion of the COM object while TActiveXPropertyPage (see page 1561) implements the COM server portion.

12.1.17.1 TPropertyPageImpl Members

The following tables list the members exposed by TPropertyPageImpl.

Protected Methods

	Name	Description
	_AddRef (see page 22250)	This is _AddRef, a member of class TAggregatedObject.
	_Release (see page 22250)	This is _Release, a member of class TAggregatedObject.
	Activate (see page 1681)	This is Activate, a member of class TPropertyPageImpl.

	Apply (see page 1681)	This is Apply, a member of class TPropertyPageImpl.
	Deactivate (see page 1681)	This is Deactivate, a member of class TPropertyPageImpl.
	EditProperty (see page 1682)	This is EditProperty, a member of class TPropertyPageImpl.
	GetPageInfo (see page 1682)	This is GetPageInfo, a member of class TPropertyPageImpl.
	Help (see page 1682)	This is Help, a member of class TPropertyPageImpl.
	IsPageDirty (see page 1683)	This is IsPageDirty, a member of class TPropertyPageImpl.
	Move (see page 1683)	This is Move, a member of class TPropertyPageImpl.
	QueryInterface (see page 22250)	This is QueryInterface, a member of class TAggregatedObject.
	SetObjects (see page 1683)	This is SetObjects, a member of class TPropertyPageImpl.
	SetPageSite (see page 1683)	This is SetPageSite, a member of class TPropertyPageImpl.
	Show (see page 1684)	This is Show, a member of class TPropertyPageImpl.
	TranslateAccelerator (see page 1684)	This is TranslateAccelerator, a member of class TPropertyPageImpl.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22249)	Instantiates an aggregated object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	InitPropertyPage (see page 1682)	Initializes the associated property page.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Controller (see page 22251)	Provides access to the controlling interface of the aggregate.
	PropertyPage (see page 1684)	This is PropertyPage, a member of class TPropertyPageImpl.

12.1.17.2 TPropertyPageImpl Methods

The methods of the TPropertyPageImpl class are listed here.

Protected Methods

	Name	Description
	Activate (see page 1681)	This is Activate, a member of class TPropertyPageImpl.
	Apply (see page 1681)	This is Apply, a member of class TPropertyPageImpl.
	Deactivate (see page 1681)	This is Deactivate, a member of class TPropertyPageImpl.
	EditProperty (see page 1682)	This is EditProperty, a member of class TPropertyPageImpl.
	GetPageInfo (see page 1682)	This is GetPageInfo, a member of class TPropertyPageImpl.
	Help (see page 1682)	This is Help, a member of class TPropertyPageImpl.
	IsPageDirty (see page 1683)	This is IsPageDirty, a member of class TPropertyPageImpl.
	Move (see page 1683)	This is Move, a member of class TPropertyPageImpl.
	SetObjects (see page 1683)	This is SetObjects, a member of class TPropertyPageImpl.
	SetPageSite (see page 1683)	This is SetPageSite, a member of class TPropertyPageImpl.
	Show (see page 1684)	This is Show, a member of class TPropertyPageImpl.
	TranslateAccelerator (see page 1684)	This is TranslateAccelerator, a member of class TPropertyPageImpl.

Public Methods

	Name	Description
	InitPropertyPage (see page 1682)	Initializes the associated property page.

12.1.17.2.1 TPropertyPageImpl.Activate Method

Pascal

```
function Activate(hwndParent: HWnd; const rc: TRect; bModal: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Activate(HWnd hwndParent, const TRect rc, BOOL bModal);
```

Description

This is Activate, a member of class TPropertyPageImpl.

12.1.17.2.2 TPropertyPageImpl.Apply Method

Pascal

```
function Apply: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Apply();
```

Description

This is Apply, a member of class TPropertyPageImpl.

12.1.17.2.3 TPropertyPageImpl.Deactivate Method

Pascal

```
function Deactivate: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Deactivate();
```

Description

This is Deactivate, a member of class TPropertyPageImpl.

12.1.17.2.4 TPropertyPageImpl.EditProperty Method

Pascal

```
function EditProperty(dispid: TDispID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT EditProperty(TDispID dispid);
```

Description

This is EditProperty, a member of class TPropertyPageImpl.

12.1.17.2.5 TPropertyPageImpl.GetPageInfo Method

Pascal

```
function GetPageInfo(out pageInfo: TPropPageInfo): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetPageInfo(TPropPageInfo pageInfo);
```

Description

This is GetPageInfo, a member of class TPropertyPageImpl.

12.1.17.2.6 TPropertyPageImpl.Help Method

Pascal

```
function Help(pszHelpDir: POleStr): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Help(POleStr pszHelpDir);
```

Description

This is Help, a member of class TPropertyPageImpl.

12.1.17.2.7 TPropertyPageImpl.InitPropertyPage Method

Initializes the associated property page.

Pascal

```
procedure InitPropertyPage; virtual;
```

C++

```
virtual __fastcall InitPropertyPage();
```

Description

Do not call InitPropertyPage, TActiveXPropertyPage (see page 1561) calls this method after creating both the TPropertyPage (see page 1603) and TPropertyPageImpl (see page 1679) objects. It sets the TPropertyPageImpl (see page 1679)'s

PropertyPage (see page 1684) property, and then calls InitPropertyPage. InitPropertyPage sets an internal field of TPropertyPage (see page 1603) so that the TPropertyPage (see page 1603) can locate its associated TPropertyPageImpl (see page 1679). In addition, InitPropertyPage initializes some properties on the property page.

PropertyPage

12.1.17.2.8 TPropertyPageImpl.IsPageDirty Method

Pascal

```
function IsPageDirty: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT IsPageDirty();
```

Description

This is IsPageDirty, a member of class TPropertyPageImpl.

12.1.17.2.9 TPropertyPageImpl.Move Method

Pascal

```
function Move(const rect: TRect): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Move(const TRect rect);
```

Description

This is Move, a member of class TPropertyPageImpl.

12.1.17.2.10 TPropertyPageImpl.SetObjects Method

Pascal

```
function SetObjects(cObjects: Longint; pUnkList: PUnknownList): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetObjects(Longint cObjects, PUnknownList pUnkList);
```

Description

This is SetObjects, a member of class TPropertyPageImpl.

12.1.17.2.11 TPropertyPageImpl.SetPageSite Method

Pascal

```
function SetPageSite(const pageSite: IPropertyPageSite): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetPageSite(const IPropertyPageSite pageSite);
```

Description

This is SetPageSite, a member of class TPropertyPageImpl.

12.1.17.2.12 TPropertyPageImpl.Show Method

Pascal

```
function Show(nCmdShow: Integer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Show(int nCmdShow);
```

Description

This is Show, a member of class TPropertyPageImpl.

12.1.17.2.13 TPropertyPageImpl.TranslateAccelerator Method

Pascal

```
function TranslateAccelerator(msg: PMsg): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT TranslateAccelerator(PMsg msg);
```

Description

This is TranslateAccelerator, a member of class TPropertyPageImpl.

12.1.17.3 TPropertyPageImpl Properties

The properties of the TPropertyPageImpl class are listed here.

Public Properties

	Name	Description
	PropertyPage (see page 1684)	This is PropertyPage, a member of class TPropertyPageImpl.

12.1.17.3.1 TPropertyPageImpl.PropertyPage Property

Pascal

```
property PropertyPage: TPropertyPage;
```

C++

```
__property TPropertyPage PropertyPage;
```

Description

This is PropertyPage, a member of class TPropertyPageImpl.

12.1.18 TReflectorWindow Class

TReflectorWindow ensures that ActiveX controls respond properly to Windows messages.

Class Hierarchy

Pascal

```
TReflectorWindow = class(TWinControl);
```

C++

```
class TReflectorWindow : public TWinControl;
```

File

AxCtrls

Description

TReflectorWindow is for internal use only. Applications should never instantiate this class. It is used to reflect certain messages to an ActiveX control.

12.1.18.1 TReflectorWindow Members

The following tables list the members exposed by TReflectorWindow.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.

	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.

	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 1695)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.

	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.

	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.

	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).

	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 1695)	Creates an instance of TReflectorWindow (see page 1684).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.

	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.

	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.

	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.

	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

12.1.18.2 TReflectorWindow.Create Constructor

Creates an instance of TReflectorWindow (see page 1684).

Pascal

```
constructor Create(ParentWindow: HWND; Control: TControl); reintroduce;
```

C++

```
__fastcall TReflectorWindow(HWND ParentWindow, TControl * Control);
```

Description

Applications never have to instantiate TReflectorWindow (see page 1684).

See Also

TActiveXControl (see page 1517)

12.1.18.3 TReflectorWindow Methods

The methods of the TReflectorWindow class are listed here.

Protected Methods

	Name	Description
V	CreateParams (see page 1695)	Initializes a window-creation parameter data structure.

12.1.18.3.1 TReflectorWindow.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

12.1.19 TStringsAdapter Class

TStringsAdapter is a helper class used to allow a TStrings object to implement an IStrings interface for use with OLE.

Class Hierarchy

Pascal

```
TStringsAdapter = class(TAutoIntfObject, IStrings, IStringsAdapter);
```

C++

```
class TStringsAdapter : public TAutoIntfObject, public IStrings, public IStringsAdapter;
```

File

AxCtrls

Description

Use a strings adapter to adapt a TStrings object so that it supports the IStrings interface. To do so, create the strings adapter by calling GetOleStrings (see page 1711), passing the TStrings object as a parameter. Once the strings adapter is instantiated for a TStrings object, the StringsAdapter property of the TStrings object can be used to interact with the TStrings object through an IStrings interface.

See Also

TStrings (see page 3029)

GetOleStrings (see page 1711)

12.1.19.1 TStringsAdapter Members

The following tables list the members exposed by TStringsAdapter.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_NewEnum (see page 1699)	This is _NewEnum, a member of class TStringsAdapter.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	Add (see page 1699)	This is Add, a member of class TStringsAdapter.
	Clear (see page 1699)	This is Clear, a member of class TStringsAdapter.
	Count (see page 1700)	This is Count, a member of class TStringsAdapter.
	Get_ControlDefault (see page 1700)	This is Get_ControlDefault, a member of class TStringsAdapter.
	Get_Item (see page 1700)	This is Get_Item, a member of class TStringsAdapter.
	GetIDsOfNames (see page 5537)	This is GetIDsOfNames, a member of class TAutoIntfObject.
	GetTypeInfo (see page 5537)	This is GetTypeInfo, a member of class TAutoIntfObject.
	GetTypeInfoCount (see page 5537)	This is GetTypeInfoCount, a member of class TAutoIntfObject.
	InterfaceSupportsErrorInfo (see page 5538)	This is InterfaceSupportsErrorInfo, a member of class TAutoIntfObject.
	Invoke (see page 5538)	This is Invoke, a member of class TAutoIntfObject.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	ReferenceStrings (see page 1700)	This is ReferenceStrings, a member of class TStringsAdapter.
	ReleaseStrings (see page 1700)	This is ReleaseStrings, a member of class TStringsAdapter.
	Remove (see page 1701)	This is Remove, a member of class TStringsAdapter.
	Set_ControlDefault (see page 1701)	This is Set_ControlDefault, a member of class TStringsAdapter.
	Set_Item (see page 1701)	This is Set_Item, a member of class TStringsAdapter.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	Create (see page 1698)	Creates an instance of the string adapter control.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 5538)	SafeCallException is used for OLE exception handling.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	DispIID (see page 5539)	DispIID is the dispatch identifier.
R	DispIntfEntry (see page 5539)	DispIntfEntry contains the entry for the dispatch interface implemented by the automation object.
R	DispTypeInfo (see page 5539)	DispTypeInfo returns an ITypeInfo interface reference to the type information for the dispinterface implemented by the automation object.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

12.1.19.2 TStringsAdapter.Create Constructor

Creates an instance of the string adapter control.

Pascal

```
constructor Create(Strings: TStrings);
```

C++

```
__fastcall TStringsAdapter(TStrings Strings);
```

Description

Do not call the Create method directly. Instead, call the GetOleStrings (see page 1711) procedure to adapt a TStrings object so that it supports the IStrings interface.

See Also

GetOleStrings

12.1.19.3 TStringsAdapter Methods

The methods of the TStringsAdapter class are listed here.

Protected Methods

	Name	Description
	_NewEnum (see page 1699)	This is _NewEnum, a member of class TStringsAdapter.
	Add (see page 1699)	This is Add, a member of class TStringsAdapter.
	Clear (see page 1699)	This is Clear, a member of class TStringsAdapter.
	Count (see page 1700)	This is Count, a member of class TStringsAdapter.
	Get_ControlDefault (see page 1700)	This is Get_ControlDefault, a member of class TStringsAdapter.
	Get_Item (see page 1700)	This is Get_Item, a member of class TStringsAdapter.
	ReferenceStrings (see page 1700)	This is ReferenceStrings, a member of class TStringsAdapter.
	ReleaseStrings (see page 1700)	This is ReleaseStrings, a member of class TStringsAdapter.
	Remove (see page 1701)	This is Remove, a member of class TStringsAdapter.
	Set_ControlDefault (see page 1701)	This is Set_ControlDefault, a member of class TStringsAdapter.
	Set_Item (see page 1701)	This is Set_Item, a member of class TStringsAdapter.

12.1.19.3.1 TStringsAdapter._NewEnum Method

Pascal

```
function _NewEnum: IUnknown; safecall;
```

C++

```
__fastcall IUnknown _NewEnum();
```

Description

This is _NewEnum, a member of class TStringsAdapter.

12.1.19.3.2 TStringsAdapter.Add Method

Pascal

```
function Add(Item: OleVariant): Integer; safecall;
```

C++

```
__fastcall int Add(OleVariant Item);
```

Description

This is Add, a member of class TStringsAdapter.

12.1.19.3.3 TStringsAdapter.Clear Method

Pascal

```
procedure Clear; safecall;
```

C++

```
__fastcall Clear();
```

Description

This is Clear, a member of class TStringsAdapter.

12.1.19.3.4 TStringsAdapter.Count Method

Pascal

```
function Count: Integer; safecall;
```

C++

```
__fastcall int Count();
```

Description

This is Count, a member of class TStringsAdapter.

12.1.19.3.5 TStringsAdapter.Get_ControlDefault Method

Pascal

```
function Get_ControlDefault(Index: Integer): OleVariant; safecall;
```

C++

```
__fastcall OleVariant Get_ControlDefault(int Index);
```

Description

This is Get_ControlDefault, a member of class TStringsAdapter.

12.1.19.3.6 TStringsAdapter.Get_Item Method

Pascal

```
function Get_Item(Index: Integer): OleVariant; safecall;
```

C++

```
__fastcall OleVariant Get_Item(int Index);
```

Description

This is Get_Item, a member of class TStringsAdapter.

12.1.19.3.7 TStringsAdapter.ReferenceStrings Method

Pascal

```
procedure ReferenceStrings(S: TStrings);
```

C++

```
__fastcall ReferenceStrings(TStrings S);
```

Description

This is ReferenceStrings, a member of class TStringsAdapter.

12.1.19.3.8 TStringsAdapter.ReleaseStrings Method

Pascal

```
procedure ReleaseStrings;
```

C++

```
__fastcall ReleaseStrings();
```

Description

This is ReleaseStrings, a member of class TStringsAdapter.

12.1.19.3.9 TStringsAdapter.Remove Method

Pascal

```
procedure Remove(Index: Integer); safecall;
```

C++

```
__fastcall Remove(int Index);
```

Description

This is Remove, a member of class TStringsAdapter.

12.1.19.3.10 TStringsAdapter.Set_ControlDefault Method

Pascal

```
procedure Set_ControlDefault(Index: Integer; Value: OleVariant); safecall;
```

C++

```
__fastcall Set_ControlDefault(int Index, OleVariant Value);
```

Description

This is Set_ControlDefault, a member of class TStringsAdapter.

12.1.19.3.11 TStringsAdapter.Set_Item Method

Pascal

```
procedure Set_Item(Index: Integer; Value: OleVariant); safecall;
```

C++

```
__fastcall Set_Item(int Index, OleVariant Value);
```

Description

This is Set_Item, a member of class TStringsAdapter.

12.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IAmbientDispatch (see page 1702)	This is class AxCtrls.IAmbientDispatch.
	IFontAccess (see page 1706)	This is class AxCtrls.IFontAccess.
	IPictureAccess (see page 1707)	This is class AxCtrls.IPictureAccess.

12.2.1 IAmbientDispatch Interface

Class Hierarchy

AxCtrls.IAmbientDispatch

Pascal

```
IAmbientDispatch = dispinterface;
```

C++

```
class IAmbientDispatch;
```

File

AxCtrls

Description

This is class AxCtrls.IAmbientDispatch.

12.2.1.1 IAmbientDispatch Members

The following tables list the members exposed by IAmbientDispatch.

Public Properties

	Name	Description
	AutoClip (see page 1703)	This is AutoClip, a member of class IAmbientDispatch.
	BackColor (see page 1703)	This is BackColor, a member of class IAmbientDispatch.
	DisplayAsDefault (see page 1703)	This is DisplayAsDefault, a member of class IAmbientDispatch.
	DisplayName (see page 1704)	This is DisplayName, a member of class IAmbientDispatch.
	Font (see page 1704)	This is Font, a member of class IAmbientDispatch.
	ForeColor (see page 1704)	This is ForeColor, a member of class IAmbientDispatch.
	LocaleID (see page 1704)	This is LocaleID, a member of class IAmbientDispatch.
	MessageReflect (see page 1705)	This is MessageReflect, a member of class IAmbientDispatch.
	ScaleUnits (see page 1705)	This is ScaleUnits, a member of class IAmbientDispatch.
	ShowGrabHandles (see page 1705)	This is ShowGrabHandles, a member of class IAmbientDispatch.
	ShowHatching (see page 1705)	This is ShowHatching, a member of class IAmbientDispatch.
	SupportsMnemonics (see page 1705)	This is SupportsMnemonics, a member of class IAmbientDispatch.
	TextAlign (see page 1706)	This is TextAlign, a member of class IAmbientDispatch.

	UIDead (see page 1706)	This is UIDead, a member of class IAmbientDispatch.
	UserMode (see page 1706)	This is UserMode, a member of class IAmbientDispatch.

12.2.1.2 IAmbientDispatch Properties

The properties of the IAmbientDispatch class are listed here.

Public Properties

	Name	Description
	AutoClip (see page 1703)	This is AutoClip, a member of class IAmbientDispatch.
	BackColor (see page 1703)	This is BackColor, a member of class IAmbientDispatch.
	DisplayAsDefault (see page 1703)	This is DisplayAsDefault, a member of class IAmbientDispatch.
	DisplayName (see page 1704)	This is DisplayName, a member of class IAmbientDispatch.
	Font (see page 1704)	This is Font, a member of class IAmbientDispatch.
	ForeColor (see page 1704)	This is ForeColor, a member of class IAmbientDispatch.
	LocaleID (see page 1704)	This is LocaleID, a member of class IAmbientDispatch.
	MessageReflect (see page 1705)	This is MessageReflect, a member of class IAmbientDispatch.
	ScaleUnits (see page 1705)	This is ScaleUnits, a member of class IAmbientDispatch.
	ShowGrabHandles (see page 1705)	This is ShowGrabHandles, a member of class IAmbientDispatch.
	ShowHatching (see page 1705)	This is ShowHatching, a member of class IAmbientDispatch.
	SupportsMnemonics (see page 1705)	This is SupportsMnemonics, a member of class IAmbientDispatch.
	TextAlign (see page 1706)	This is TextAlign, a member of class IAmbientDispatch.
	UIDead (see page 1706)	This is UIDead, a member of class IAmbientDispatch.
	UserMode (see page 1706)	This is UserMode, a member of class IAmbientDispatch.

12.2.1.2.1 IAmbientDispatch.AutoClip Property

Pascal

```
property AutoClip: WordBool;
```

C++

```
__property WordBool AutoClip;
```

Description

This is AutoClip, a member of class IAmbientDispatch.

12.2.1.2.2 IAmbientDispatch.BackColor Property

Pascal

```
property BackColor: Integer;
```

C++

```
__property int BackColor;
```

Description

This is BackColor, a member of class IAmbientDispatch.

12.2.1.2.3 IAmbientDispatch.DisplayAsDefault Property

Pascal

```
property DisplayAsDefault: WordBool;
```

C++

```
__property WordBool DisplayAsDefault;
```

Description

This is DisplayAsDefault, a member of class IAmbientDispatch.

12.2.1.2.4 IAmbientDispatch.DisplayName Property

Pascal

```
property DisplayName: WideString;
```

C++

```
__property BSTR DisplayName;
```

Description

This is DisplayName, a member of class IAmbientDispatch.

12.2.1.2.5 IAmbientDispatch.Font Property

Pascal

```
property Font: IFontDisp;
```

C++

```
__property IFontDisp Font;
```

Description

This is Font, a member of class IAmbientDispatch.

12.2.1.2.6 IAmbientDispatch.ForeColor Property

Pascal

```
property ForeColor: Integer;
```

C++

```
__property int ForeColor;
```

Description

This is ForeColor, a member of class IAmbientDispatch.

12.2.1.2.7 IAmbientDispatch.LocaleID Property

Pascal

```
property LocaleID: Integer;
```

C++

```
__property int LocaleID;
```

Description

This is LocaleID, a member of class IAmbientDispatch.

12.2.1.2.8 IAmbientDispatch.MessageReflect Property

Pascal

```
property MessageReflect: WordBool;
```

C++

```
__property WordBool MessageReflect;
```

Description

This is MessageReflect, a member of class IAmbientDispatch.

12.2.1.2.9 IAmbientDispatch.ScaleUnits Property

Pascal

```
property ScaleUnits: WideString;
```

C++

```
__property BSTR ScaleUnits;
```

Description

This is ScaleUnits, a member of class IAmbientDispatch.

12.2.1.2.10 IAmbientDispatch.ShowGrabHandles Property

Pascal

```
property ShowGrabHandles: WordBool;
```

C++

```
__property WordBool ShowGrabHandles;
```

Description

This is ShowGrabHandles, a member of class IAmbientDispatch.

12.2.1.2.11 IAmbientDispatch.ShowHatching Property

Pascal

```
property ShowHatching: WordBool;
```

C++

```
__property WordBool ShowHatching;
```

Description

This is ShowHatching, a member of class IAmbientDispatch.

12.2.1.2.12 IAmbientDispatch.SupportsMnemonics Property

Pascal

```
property SupportsMnemonics: WordBool;
```

C++

```
__property WordBool SupportsMnemonics;
```

Description

This is SupportsMnemonics, a member of class IAmbientDispatch.

12.2.1.2.13 IAmbientDispatch.TextAlign Property

Pascal

```
property TextAlign: Smallint;
```

C++

```
__property Smallint TextAlign;
```

Description

This is TextAlign, a member of class IAmbientDispatch.

12.2.1.2.14 IAmbientDispatch.UIDead Property

Pascal

```
property UIDead: WordBool;
```

C++

```
__property WordBool UIDead;
```

Description

This is UIDead, a member of class IAmbientDispatch.

12.2.1.2.15 IAmbientDispatch.UserMode Property

Pascal

```
property UserMode: WordBool;
```

C++

```
__property WordBool UserMode;
```

Description

This is UserMode, a member of class IAmbientDispatch.

12.2.2 IFontAccess Interface

Class Hierarchy

Pascal

```
IFontAccess = interface;
```

C++

```
__interface IFontAccess;
```

File

AxCtrls

Description

This is class AxCtrls.IFontAccess.

12.2.2.1 IFontAccess Members

The following tables list the members exposed by IFontAccess.

Public Methods

	Name	Description
	GetOleFont (see page 1707)	This is GetOleFont, a member of class IFontAccess.
	SetOleFont (see page 1707)	This is SetOleFont, a member of class IFontAccess.

12.2.2.2 IFontAccess Methods

The methods of the IFontAccess class are listed here.

Public Methods

	Name	Description
	GetOleFont (see page 1707)	This is GetOleFont, a member of class IFontAccess.
	SetOleFont (see page 1707)	This is SetOleFont, a member of class IFontAccess.

12.2.2.2.1 IFontAccess.GetOleFont Method

Pascal

```
procedure GetOleFont(var OleFont: IFontDisp);
```

C++

```
__fastcall GetOleFont(IFontDisp OleFont);
```

Description

This is GetOleFont, a member of class IFontAccess.

12.2.2.2.2 IFontAccess.SetOleFont Method

Pascal

```
procedure SetOleFont(const OleFont: IFontDisp);
```

C++

```
__fastcall SetOleFont(const IFontDisp OleFont);
```

Description

This is SetOleFont, a member of class IFontAccess.

12.2.3 IPictureAccess Interface

Class Hierarchy

AxCtrls.IPictureAccess

Pascal

```
IPictureAccess = interface;
```

C++

```
__interface IPictureAccess;
```

File

AxCtrls

Description

This is class AxCtrls.IPictureAccess.

12.2.3.1 IPictureAccess Members

The following tables list the members exposed by IPictureAccess.

Public Methods

	Name	Description
	GetOlePicture (see page 1708)	This is GetOlePicture, a member of class IPictureAccess.
	SetOlePicture (see page 1708)	This is SetOlePicture, a member of class IPictureAccess.

12.2.3.2 IPictureAccess Methods

The methods of the IPictureAccess class are listed here.

Public Methods

	Name	Description
	GetOlePicture (see page 1708)	This is GetOlePicture, a member of class IPictureAccess.
	SetOlePicture (see page 1708)	This is SetOlePicture, a member of class IPictureAccess.

12.2.3.2.1 IPictureAccess.GetOlePicture Method

Pascal

```
procedure GetOlePicture(var OlePicture: IPictureDisp);
```

C++

```
__fastcall GetOlePicture(IPictureDisp OlePicture);
```

Description

This is GetOlePicture, a member of class IPictureAccess.

12.2.3.2.2 IPictureAccess.SetOlePicture Method

Pascal

```
procedure SetOlePicture(const OlePicture: IPictureDisp);
```

C++

```
__fastcall SetOlePicture(const IPictureDisp OlePicture);
```

Description

This is SetOlePicture, a member of class IPictureAccess.

12.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	EnumDispatchProperties (see page 1709)	Fills a TStringList will all the property names and DispIDs in a specified IDispatch interface.
	GetOleFont (see page 1710)	Creates an OLE font object that is directly mapped to a native TFont.
	GetOlePicture (see page 1710)	Creates an OLE picture object that is directly mapped to a native TPicture.
	GetOleStrings (see page 1711)	Implements a TStrings object as an IStrings interface for use by OLE objects.
	ParkingWindow (see page 1711)	Provides a temporary parent window for ActiveX controls when the container is not ready to act as a parent.
	SetOleFont (see page 1712)	Connects an OLE font object to a TFont object and copies the properties of the OLE font object to the TFont.
	SetOlePicture (see page 1712)	Connects an OLE picture object to a TPicture object, and copies the properties of the OLE picture object to the TPicture.
	SetOleStrings (see page 1713)	Uses an IStrings interface to assign the contents of a TStrings object.

12.3.1 AxCtrls.EnumDispatchProperties Function

Fills a TStringList will all the property names and DispIDs in a specified IDispatch interface.

Pascal

```
procedure EnumDispatchProperties(Dispatch: IDispatch; PropType: TGUID; VTCode: Integer;
PropList: TStrings);
```

C++

```
EnumDispatchProperties(IDispatch Dispatch, TGUID PropType, int VTCode, TStrings PropList);
```

File

AxCtrls

Description

Use EnumDispatchProperties to get the names of the properties supported by an IDispatch interface. The Dispatch parameter is an instance of the IDispatch interface. The PropType and VTCode parameters allow the caller to limit the list to only those properties that match a particular GUID and type identifier. To see all properties of the IDispatch interface, set PropType to GUID_NULL and VTCode to VT_EMPTY.

The property names that the IDispatch interface supports are added to the list passed in as the PropList parameter.

See Also

TStringList

SetDispatchPropValue

12.3.2 AxCtrls.GetOleFont Function

Creates an OLE font object that is directly mapped to a native TFont.

Pascal

```
procedure GetOleFont(Font: TFont; var OleFont: IFontDisp);
```

C++

```
GetOleFont(TFont Font, IFontDisp OleFont);
```

File

AxCtrls

Description

OLE conventions implement fonts as automation objects that contain the properties of the font. This routine creates an adapter object that maps the properties of a TFont object into an OLE font object, thereby allowing an OLE client to access the font properties of a VCL control. Call this function when you implement a method that retrieves a TFont value from a VCL object and returns it as an OLE font.

The Font parameter is a pointer to the native TFont. This can be the Font property of a VCL control. The OLE font is returned in the OleFont parameter. The resulting OLE font object is a direct connection to the native VCL font, so changing the OLE font's properties will change the TFont's properties, and vice-versa.

See Also

SetOleFont (see page 1712)

TFontAdapter (see page 1583)

12.3.3 AxCtrls.GetOlePicture Function

Creates an OLE picture object that is directly mapped to a native TPicture.

Pascal

```
procedure GetOlePicture(Picture: TPicture; var OlePicture: IPictureDisp);
```

C++

```
GetOlePicture(TPicture Picture, IPictureDisp OlePicture);
```

File

AxCtrls

Description

OLE conventions implement pictures as automation objects that contain the properties of the picture. This routine creates an adapter object that maps the properties of a native VCL TPicture into an OLE picture object, thereby allowing an OLE client to access the picture properties of a VCL control. Call this function when you implement a method that retrieves a TPicture value from a VCL object and returns it as an OLE picture.

The Picture parameter is a pointer to the native TPicture. This can be the Picture property of a VCL control. The OLE picture is returned in the OlePicture parameter. The resulting OLE picture object is a direct connection to the native VCL picture, so changing the OLE picture's properties will change the TPicture's properties, and vice-versa.

See Also

SetOlePicture (see page 1712)

TPictureAdapter (see page 1599)

Marshaling Data

12.3.4 AxCtrls.GetOleStrings Function

Implements a TStrings object as an IStrings interface for use by OLE objects.

Pascal

```
procedure GetOleStrings(Strings: TStrings; var OleStrings: IStrings);
```

C++

```
GetOleStrings(TStrings Strings, IStrings OleStrings);
```

File

AxCtrls

Description

When the GetOleStrings function is called, the Strings parameter is implemented as an IStrings and assigned to the StringsAdapter (TStrings) property. The IStrings interface is returned as the OleStrings parameter.

See Also

TStringsAdapter (see page 1696)

TStrings

SetOleStrings (see page 1713)

Marshaling Data

12.3.5 AxCtrls.ParkingWindow Function

Provides a temporary parent window for ActiveX controls when the container is not ready to act as a parent.

Pascal

```
function ParkingWindow: HWND;
```

C++

```
HWND ParkingWindow();
```

File

AxCtrls

Description

Call ParkingWindow to get the window handle of the parking window. This can be used as a temporary parent to activeX controls until the host application's container is ready.

See Also

TWinControl

TWinControl

12.3.6 AxCtrls.SetOleFont Function

Connects an OLE font object to a TFont object and copies the properties of the OLE font object to the TFont.

Pascal

```
procedure SetOleFont(Font: TFont; OleFont: IFontDisp);
```

C++

```
SetOleFont(TFont Font, IFontDisp OleFont);
```

File

AxCtrls

Description

OLE conventions implement fonts as automation objects that contain the properties of the font. This routine associates an OLE font object (the OleFont parameter) with a native VCL font (the Font parameter), allowing the font to be accessed by both OLE programs and VCL programs. The TFont object is initialized to have the same properties as OleFont.

Call this method when you implement an automation method that takes an OLE font as a parameter, and which needs to pass the font along as a native TFont object.

See Also

GetOleFont (see page 1710)

TFontAdapter (see page 1583)

12.3.7 AxCtrls.SetOlePicture Function

Connects an OLE picture object to a TPicture object, and copies the properties of the OLE picture object to the TPicture.

Pascal

```
procedure SetOlePicture(Picture: TPicture; OlePicture: IPictureDisp);
```

C++

```
SetOlePicture(TPicture Picture, IPictureDisp OlePicture);
```

File

AxCtrls

Description

OLE conventions implement pictures as automation objects that contain the properties of the picture. This routine associates an OLE picture object (the OlePicture parameter) with a native VCL picture (the Picture parameter), allowing the picture to be accessed by both OLE programs and VCL programs. The TPicture object is initialized to have the same properties as OlePicture.

Call this method when you implement an automation method that takes an OLE picture as a parameter, and which needs to pass

the picture along as a native TPicture object.

See Also

GetOlePicture (see page 1710)

TPictureAdapter (see page 1599)

12.3.8 AxCtrls.SetOleStrings Function

Uses an IStrings interface to assign the contents of a TStrings object.

Pascal

```
procedure SetOleStrings(Strings: TStrings; OleStrings: IStrings);
```

C++

```
SetOleStrings(TStrings Strings, IStrings OleStrings);
```

File

AxCtrls

Description

Use SetOleStrings to update a TStrings object so that it matches the strings supplied by an IStrings interface. The Strings parameter is the TStrings object to update. The OleStrings parameter is the interface used as a source.

See Also

TStringsAdapter (see page 1696)

TStrings

GetOleStrings (see page 1711)

12.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TConnectionKind (see page 1714)	This is record AxCtrls.TConnectionKind.

12.4.1 AxCtrls.TConnectionKind Enumeration

Pascal

```
TConnectionKind = (
  ckSingle,
  ckMulti
);
```

C++

```
enum TConnectionKind {
  ckSingle,
  ckMulti
};
```

File

AxCtrls

Description

This is record AxCtrls.TConnectionKind.

12.5 Types

The following table lists types in this documentation.

Types

Name	Description
TActiveFormClass (see page 1715)	This is type AxCtrls.TActiveFormClass.
TActiveXControlClass (see page 1715)	This is type AxCtrls.TActiveXControlClass.
TDefinePropertyPage (see page 1716)	This is type AxCtrls.TDefinePropertyPage.
TPropertyPageClass (see page 1716)	This is type AxCtrls.TPropertyPageClass.

12.5.1 AxCtrls.TActiveFormClass Type

Pascal

```
TActiveFormClass = class of TActiveForm;
```

C++

```
TActiveForm TActiveFormClass;
```

File

AxCtrls

Description

This is type AxCtrls.TActiveFormClass.

12.5.2 AxCtrls.TActiveXControlClass Type

Pascal

```
TActiveXControlClass = class of TActiveXControl;
```

C++

```
TActiveXControl TActiveXControlClass;
```

File

AxCtrls

Description

This is type AxCtrls.TActiveXControlClass.

12.5.3 AxCtrls.TDefinePropertyPage Type

Pascal

```
TDefinePropertyPage = procedure (const GUID: TGUID) of object;
```

C++

```
(const GUID: TGUID) ( TDefinePropertyPage)();
```

File

AxCtrls

Description

This is type AxCtrls.TDefinePropertyPage.

12.5.4 AxCtrls.TPropertyPageClass Type

Pascal

```
TPropertyPageClass = class of TPropertyPage;
```

C++

```
TPropertyPage TPropertyPageClass;
```

File

AxCtrls

Description

This is type AxCtrls.TPropertyPageClass.

12.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
Class_DColorPropPage (see page 1717)	This is constant AxCtrls.Class_DColorPropPage.
Class_DFontPropPage (see page 1717)	This is constant AxCtrls.Class_DFontPropPage.
Class_DPicturePropPage (see page 1718)	This is constant AxCtrls.Class_DPicturePropPage.
Class_DStringPropPage (see page 1718)	This is constant AxCtrls.Class_DStringPropPage.

12.6.1 AxCtrls.Class_DColorPropPage Constant

Pascal

```
Class_DColorPropPage: TGUID = '{5CFF5D59-5946-11D0-BDEF-00A024D1875C}';
```

C++

```
TGUID Class_DColorPropPage = '{5CFF5D59-5946-11D0-BDEF-00A024D1875C}';
```

File

AxCtrls

Description

This is constant AxCtrls.Class_DColorPropPage.

12.6.2 AxCtrls.Class_DFontPropPage Constant

Pascal

```
Class_DFontPropPage: TGUID = '{5CFF5D5B-5946-11D0-BDEF-00A024D1875C}';
```

C++

```
TGUID Class_DFontPropPage = '{5CFF5D5B-5946-11D0-BDEF-00A024D1875C}';
```

File

AxCtrls

Description

This is constant AxCtrls.Class_DFontPropPage.

12.6.3 AxCtrls.Class_DPicturePropPage Constant

Pascal

```
Class_DPicturePropPage: TGUID = '{5CFF5D5A-5946-11D0-BDEF-00A024D1875C}';
```

C++

```
TGUID Class_DPicturePropPage = '{5CFF5D5A-5946-11D0-BDEF-00A024D1875C}';
```

File

AxCtrls

Description

This is constant AxCtrls.Class_DPicturePropPage.

12.6.4 AxCtrls.Class_DStringPropPage Constant

Pascal

```
Class_DStringPropPage: TGUID = '{F42D677E-754B-11D0-BDFB-00A024D1875C}';
```

C++

```
TGUID Class_DStringPropPage = '{F42D677E-754B-11D0-BDFB-00A024D1875C}';
```

File

AxCtrls

Description

This is constant AxCtrls.Class_DStringPropPage.

13 BandActn Namespace

This is namespace BandActn.

Topics

Name	Description
Classes (see page 1720)	The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomizeActionBars (see page 1720)	TCustomizeActionBars is an action that causes the ActionBands customization dialog to appear.

13.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomizeActionBars (see page 1720)	TCustomizeActionBars is an action that causes the ActionBands customization dialog to appear.

13.1.1 TCustomizeActionBars Class

TCustomizeActionBars is an action that causes the ActionBands customization dialog to appear.

Class Hierarchy

Pascal

```
TCustomizeActionBars = class(TAction);
```

C++

```
class TCustomizeActionBars : public TAction;
```

File

BandActn

Description

TCustomizeActionBars is an action that causes the ActionBands customization dialog to appear. This dialog allows users to customize the ActionBands components (such as the main menu component TActionMainMenuBar) as they see fit. This action works only with the ActionBands action manager (TActionManager); it will not work with action lists by themselves.

See Also

TActionManager (see page 432)

TCustomizeDlg (see page 6528)

TActionMainMenuBar (see page 585)

TActionToolBar (see page 38)

13.1.1.1 TCustomizeActionBars Members

The following tables list the members exposed by TCustomizeActionBars.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.

	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 1725)	Creates and initializes a TCustomizeActionBars (see page 1720) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".

	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 1725)	Creates the actual ActionBands customization dialog object.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 1726)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.

	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	ActionManager (see page 1726)	Refers to the application's action manager.
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
R	CustomizeDlg (see page 1726)	Provides access to the dialog that implements the customize dialog.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.

	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

13.1.1.2 TCustomizeActionBars.Create Constructor

Creates and initializes a TCustomizeActionBars (see page 1720) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomizeActionBars(TComponent * AOwner);
```

Description

Applications do not usually create action objects explicitly. Actions are created automatically when you add them to an action manager or action list component at design time.

See Also

ActionList (see page 295)

13.1.1.3 TCustomizeActionBars Methods

The methods of the TCustomizeActionBars class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 1725)	Creates the actual ActionBands customization dialog object.
	HandlesTarget (see page 1726)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.

13.1.1.3.1 TCustomizeActionBars.ExecuteTarget Method

Creates the actual ActionBands customization dialog object.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

ExecuteTarget creates an instance of TCustomizeDlg, the ActionBands customization dialog, prepares it for use and makes it visible to the user.

See Also

ExecuteTarget (see page 2712)

HandlesTarget (see page 2713)

13.1.1.3.2 TCustomizeActionBars.HandlesTarget Method

Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

HandlesTarget was introduced in TBasicAction so that descendants can override it to check the type and state of a target. That was done in TCustomizeActionBars (see page 1720), but since Target is never really the target (the true target is always the ActionBands customization dialog, whose location is stored internally), HandlesTarget always returns true.

See Also

ExecuteTarget (see page 1725)

HandlesTarget (see page 2713)

13.1.1.4 TCustomizeActionBars Properties

The properties of the TCustomizeActionBars class are listed here.

Published Properties

	Name	Description
	ActionManager (see page 1726)	Refers to the application's action manager.
R	CustomizeDlg (see page 1726)	Provides access to the dialog that implements the customize dialog.

13.1.1.4.1 TCustomizeActionBars.ActionManager Property

Refers to the application's action manager.

Pascal

```
property ActionManager: TCustomActionManager;
```

C++

```
__property TCustomActionManager ActionManager;
```

Description

Use ActionManager to refer to the application's action manager object.

See Also

TActionManager (see page 432)

TCustomActionManager (see page 537)

13.1.1.4.2 TCustomizeActionBars.CustomizeDlg Property

Provides access to the dialog that implements the customize dialog.

Pascal

```
property CustomizeDlg: TCustomizeDlg;
```

C++

```
__property TCustomizeDlg CustomizeDlg;
```

Description

Read CustomizeDlg to access the dialog that TCustomizeActionBars (see page 1720) displays when you call the Show method.

See Also

TCustomizeDlg (see page 6528)

14 BDEReg Namespace

This is namespace BDEReg.

Topics

Name	Description
Classes (see page 1731)	The following table lists classes in this documentation.
Functions (see page 1756)	The following table lists functions in this documentation.
Constants (see page 1758)	The following table lists constants in this documentation.

Classes

	Name	Description
	TBatchMoveSprig (see page 1731)	This is class BDEReg.TBatchMoveSprig.
	TBDEDataSetSprig (see page 1732)	This is class BDEReg.TBDEDataSetSprig.
	TDatabaseSprig (see page 1733)	This is class BDEReg.TDatabaseSprig.
	TDBDataSetSprig (see page 1736)	This is class BDEReg.TDBDataSetSprig.
	TDefaultSessionSprig (see page 1738)	This is class BDEReg.TDefaultSessionSprig.
	TImpliedDatabaseSprig (see page 1739)	This is class BDEReg.TImpliedDatabaseSprig.
	TImpliedSessionSprig (see page 1742)	This is class BDEReg.TImpliedSessionSprig.
	TNestedTableSprig (see page 1743)	This is class BDEReg.TNestedTableSprig.
	TQuerySprig (see page 1744)	This is class BDEReg.TQuerySprig.
	TSessionSprig (see page 1745)	This is class BDEReg.TSessionSprig.
	TStoredProcSprig (see page 1747)	This is class BDEReg.TStoredProcSprig.
	TTableFieldLinkProperty (see page 1748)	This is class BDEReg.TTableFieldLinkProperty.
	TTableSprig (see page 1753)	This is class BDEReg.TTableSprig.
	TUpdateSQLSprig (see page 1754)	This is class BDEReg.TUpdateSQLSprig.

Constants

Name	Description
cDefaultSessionSprigName (see page 1758)	This is constant BDEReg.cDefaultSessionSprigName.
cImpliedDatabaseSprigPrefix (see page 1758)	This is constant BDEReg.cImpliedDatabaseSprigPrefix.
cImpliedSessionSprigPrefix (see page 1758)	This is constant BDEReg.cImpliedSessionSprigPrefix.

Functions

	Name	Description
	Register (see page 1756)	This is function BDEReg.Register.
	SprigBDEImpliedDatabaseName (see page 1756)	This is function BDEReg.SprigBDEImpliedDatabaseName.

	SprigBDEImpliedSessionName (see page 1757)	This is function BDEReg.SprigBDEImpliedSessionName.
	SprigBDESessionName (see page 1757)	This is function BDEReg.SprigBDESessionName.

14.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TBatchMoveSprig (see page 1731)	This is class BDEReg.TBatchMoveSprig.
	TBDEDataSetSprig (see page 1732)	This is class BDEReg.TBDEDataSetSprig.
	TDatabaseSprig (see page 1733)	This is class BDEReg.TDatabaseSprig.
	TDBDataSetSprig (see page 1736)	This is class BDEReg.TDBDataSetSprig.
	TDefaultSessionSprig (see page 1738)	This is class BDEReg.TDefaultSessionSprig.
	TImpliedDatabaseSprig (see page 1739)	This is class BDEReg.TImpliedDatabaseSprig.
	TImpliedSessionSprig (see page 1742)	This is class BDEReg.TImpliedSessionSprig.
	TNestedTableSprig (see page 1743)	This is class BDEReg.TNestedTableSprig.
	TQuerySprig (see page 1744)	This is class BDEReg.TQuerySprig.
	TSessionSprig (see page 1745)	This is class BDEReg.TSessionSprig.
	TStoredProcSprig (see page 1747)	This is class BDEReg.TStoredProcSprig.
	TTableFieldLinkProperty (see page 1748)	This is class BDEReg.TTableFieldLinkProperty.
	TTableSprig (see page 1753)	This is class BDEReg.TTableSprig.
	TUpdateSQLSprig (see page 1754)	This is class BDEReg.TUpdateSQLSprig.

14.1.1 TBatchMoveSprig Class

Class Hierarchy

Pascal

```
TBatchMoveSprig = class(TComponentSprig);
```

C++

```
class TBatchMoveSprig : public TComponentSprig;
```

File

BDEReg

Description

This is class BDEReg.TBatchMoveSprig.

14.1.1.1 TBatchMoveSprig Members

The following tables list the members exposed by TBatchMoveSprig.

Public Methods

	Name	Description
	AnyProblems (see page 1732)	This is AnyProblems, a member of class TBatchMoveSprig.
	Caption (see page 1732)	This is Caption, a member of class TBatchMoveSprig.

14.1.1.2 TBatchMoveSprig Methods

The methods of the TBatchMoveSprig class are listed here.

Public Methods

	Name	Description
	AnyProblems (see page 1732)	This is AnyProblems, a member of class TBatchMoveSprig.
	Caption (see page 1732)	This is Caption, a member of class TBatchMoveSprig.

14.1.1.2.1 TBatchMoveSprig.AnyProblems Method

Pascal

```
function AnyProblems: Boolean; override;
```

C++

```
virtual __fastcall Boolean AnyProblems();
```

Description

This is AnyProblems, a member of class TBatchMoveSprig.

14.1.1.2.2 TBatchMoveSprig.Caption Method

Pascal

```
function Caption: string; override;
```

C++

```
virtual __fastcall AnsiString Caption();
```

Description

This is Caption, a member of class TBatchMoveSprig.

14.1.2 TBDEDataSetSprig Class

Class Hierarchy

Pascal

```
TBDEDataSetSprig = class(TDataSetSprig);
```

C++

```
class TBDEDataSetSprig : public TDataSetSprig;
```

File

BDEReg

Description

This is class BDEReg.TBDEDataSetSprig.

14.1.2.1 TBDEDataSetSprig Members

The following tables list the members exposed by TBDEDataSetSprig.

Public Methods

	Name	Description
	GetDSDesignerClass (see page 1733)	This is GetDSDesignerClass, a member of class TBDEDataSetSprig.

14.1.2.2 TBDEDataSetSprig Methods

The methods of the TBDEDataSetSprig class are listed here.

Public Methods

	Name	Description
	GetDSDesignerClass (see page 1733)	This is GetDSDesignerClass, a member of class TBDEDataSetSprig.

14.1.2.2.1 TBDEDataSetSprig.GetDSDesignerClass Method

Pascal

```
function GetDSDesignerClass: TDSDesignerClass; override;
```

C++

```
virtual __fastcall TDSDesignerClass GetDSDesignerClass();
```

Description

This is GetDSDesignerClass, a member of class TBDEDataSetSprig.

14.1.3 TDatabaseSprig Class

Class Hierarchy

Pascal

```
TDatabaseSprig = class(TComponentSprig);
```

C++

```
class TDatabaseSprig : public TComponentSprig;
```

File

BDEReg

Description

This is class BDEReg.TDatabaseSprig.

14.1.3.1 TDatabaseSprig Members

The following tables list the members exposed by TDatabaseSprig.

Public Methods

	Name	Description
	AnyProblems (see page 1734)	This is AnyProblems, a member of class TDatabaseSprig.
	Caption (see page 1734)	This is Caption, a member of class TDatabaseSprig.
	DragDropTo (see page 1734)	This is DragDropTo, a member of class TDatabaseSprig.
	DragOverTo (see page 1735)	This is DragOverTo, a member of class TDatabaseSprig.
	FigureParent (see page 1735)	This is FigureParent, a member of class TDatabaseSprig.
	Name (see page 1735)	This is Name, a member of class TDatabaseSprig.
	PaletteOverTo (see page 1735)	This is PaletteOverTo, a member of class TDatabaseSprig.

14.1.3.2 TDatabaseSprig Methods

The methods of the TDatabaseSprig class are listed here.

Public Methods

	Name	Description
	AnyProblems (see page 1734)	This is AnyProblems, a member of class TDatabaseSprig.
	Caption (see page 1734)	This is Caption, a member of class TDatabaseSprig.
	DragDropTo (see page 1734)	This is DragDropTo, a member of class TDatabaseSprig.
	DragOverTo (see page 1735)	This is DragOverTo, a member of class TDatabaseSprig.
	FigureParent (see page 1735)	This is FigureParent, a member of class TDatabaseSprig.
	Name (see page 1735)	This is Name, a member of class TDatabaseSprig.
	PaletteOverTo (see page 1735)	This is PaletteOverTo, a member of class TDatabaseSprig.

14.1.3.2.1 TDatabaseSprig.AnyProblems Method

Pascal

```
function AnyProblems: Boolean; override;
```

C++

```
virtual __fastcall Boolean AnyProblems();
```

Description

This is AnyProblems, a member of class TDatabaseSprig.

14.1.3.2.2 TDatabaseSprig.Caption Method

Pascal

```
function Caption: string; override;
```

C++

```
virtual __fastcall AnsiString Caption();
```

Description

This is Caption, a member of class TDatabaseSprig.

14.1.3.2.3 TDatabaseSprig.DragDropTo Method

Pascal

```
function DragDropTo(AItem: TSprig): Boolean; override;
```

C++

```
virtual __fastcall Boolean DragDropTo(TSprig AItem);
```

Description

This is DragDropTo, a member of class TDatabaseSprig.

14.1.3.2.4 TDatabaseSprig.DragOverTo Method

Pascal

```
function DragOverTo(AItem: TSprig): Boolean; override;
```

C++

```
virtual __fastcall Boolean DragOverTo(TSprig AItem);
```

Description

This is DragOverTo, a member of class TDatabaseSprig.

14.1.3.2.5 TDatabaseSprig.FigureParent Method

Pascal

```
procedure FigureParent; override;
```

C++

```
virtual __fastcall FigureParent();
```

Description

This is FigureParent, a member of class TDatabaseSprig.

14.1.3.2.6 TDatabaseSprig.Name Method

Pascal

```
function Name: string; override;
```

C++

```
virtual __fastcall AnsiString Name();
```

Description

This is Name, a member of class TDatabaseSprig.

14.1.3.2.7 TDatabaseSprig.PaletteOverTo Method

Pascal

```
class function PaletteOverTo(AParent: TSprig; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean PaletteOverTo(TSprig AParent, TClass AClass);
```

Description

This is PaletteOverTo, a member of class TDatabaseSprig.

14.1.4 TDBDataSetSprig Class

Class Hierarchy

Pascal

```
TDBDataSetSprig = class(TBDEDataSetSprig);
```

C++

```
class TDBDataSetSprig : public TBDEDataSetSprig;
```

File

BDEReg

Description

This is class BDEReg.TDBDataSetSprig.

14.1.4.1 TDBDataSetSprig Members

The following tables list the members exposed by TDBDataSetSprig.

Public Methods

	Name	Description
	AnyProblems (see page 1736)	This is AnyProblems, a member of class TDBDataSetSprig.
	DragDropTo (see page 1737)	This is DragDropTo, a member of class TDBDataSetSprig.
	DragOverTo (see page 1737)	This is DragOverTo, a member of class TDBDataSetSprig.
	FigureParent (see page 1737)	This is FigureParent, a member of class TDBDataSetSprig.
	GetDSDesignerClass (see page 1733)	This is GetDSDesignerClass, a member of class TBDEDataSetSprig.
	PaletteOverTo (see page 1737)	This is PaletteOverTo, a member of class TDBDataSetSprig.
	Reparent (see page 1738)	This is Reparent, a member of class TDBDataSetSprig.

14.1.4.2 TDBDataSetSprig Methods

The methods of the TDBDataSetSprig class are listed here.

Public Methods

	Name	Description
	AnyProblems (see page 1736)	This is AnyProblems, a member of class TDBDataSetSprig.
	DragDropTo (see page 1737)	This is DragDropTo, a member of class TDBDataSetSprig.
	DragOverTo (see page 1737)	This is DragOverTo, a member of class TDBDataSetSprig.
	FigureParent (see page 1737)	This is FigureParent, a member of class TDBDataSetSprig.
	PaletteOverTo (see page 1737)	This is PaletteOverTo, a member of class TDBDataSetSprig.
	Reparent (see page 1738)	This is Reparent, a member of class TDBDataSetSprig.

14.1.4.2.1 TDBDataSetSprig.AnyProblems Method

Pascal

```
function AnyProblems: Boolean; override;
```

C++

```
virtual __fastcall Boolean AnyProblems();
```

Description

This is AnyProblems, a member of class TDBDataSetSprig.

14.1.4.2.2 TDBDataSetSprig.DragDropTo Method

Pascal

```
function DragDropTo(AItem: TSprig): Boolean; override;
```

C++

```
virtual __fastcall Boolean DragDropTo(TSprig AItem);
```

Description

This is DragDropTo, a member of class TDBDataSetSprig.

14.1.4.2.3 TDBDataSetSprig.DragOverTo Method

Pascal

```
function DragOverTo(AItem: TSprig): Boolean; override;
```

C++

```
virtual __fastcall Boolean DragOverTo(TSprig AItem);
```

Description

This is DragOverTo, a member of class TDBDataSetSprig.

14.1.4.2.4 TDBDataSetSprig.FigureParent Method

Pascal

```
procedure FigureParent; override;
```

C++

```
virtual __fastcall FigureParent();
```

Description

This is FigureParent, a member of class TDBDataSetSprig.

14.1.4.2.5 TDBDataSetSprig.PaletteOverTo Method

Pascal

```
class function PaletteOverTo(AParent: TSprig; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean PaletteOverTo(TSprig AParent, TClass AClass);
```

Description

This is PaletteOverTo, a member of class TDBDataSetSprig.

14.1.4.2.6 TDBDataSetSprig.Reparent Method

Pascal

```
procedure Reparent; override;
```

C++

```
virtual __fastcall Reparent();
```

Description

This is Reparent, a member of class TDBDataSetSprig.

14.1.5 TDefaultSessionSprig Class

Class Hierarchy

Pascal

```
TDefaultSessionSprig = class(TTransientSprig);
```

C++

```
class TDefaultSessionSprig : public TTransientSprig;
```

File

BDEReg

Description

This is class BDEReg.TDefaultSessionSprig.

14.1.5.1 TDefaultSessionSprig Members

The following tables list the members exposed by TDefaultSessionSprig.

Public Methods

	Name	Description
	Caption (see page 1739)	This is Caption, a member of class TDefaultSessionSprig.
	ItemClass (see page 1739)	This is ItemClass, a member of class TDefaultSessionSprig.
	UniqueName (see page 1739)	This is UniqueName, a member of class TDefaultSessionSprig.

14.1.5.2 TDefaultSessionSprig Methods

The methods of the TDefaultSessionSprig class are listed here.

Public Methods

	Name	Description
	Caption (see page 1739)	This is Caption, a member of class TDefaultSessionSprig.
	ItemClass (see page 1739)	This is ItemClass, a member of class TDefaultSessionSprig.
	UniqueName (see page 1739)	This is UniqueName, a member of class TDefaultSessionSprig.

14.1.5.2.1 TDefaultSessionSprig.Caption Method

Pascal

```
function Caption: string; override;
```

C++

```
virtual __fastcall AnsiString Caption();
```

Description

This is Caption, a member of class TDefaultSessionSprig.

14.1.5.2.2 TDefaultSessionSprig.ItemClass Method

Pascal

```
function ItemClass: TClass; override;
```

C++

```
virtual __fastcall TClass ItemClass();
```

Description

This is ItemClass, a member of class TDefaultSessionSprig.

14.1.5.2.3 TDefaultSessionSprig.UniqueName Method

Pascal

```
function UniqueName: string; override;
```

C++

```
virtual __fastcall AnsiString UniqueName();
```

Description

This is UniqueName, a member of class TDefaultSessionSprig.

14.1.6 TImpliedDatabaseSprig Class

Class Hierarchy

Pascal

```
TImpliedDatabaseSprig = class(TTransientSprig);
```

C++

```
class TImpliedDatabaseSprig : public TTransientSprig;
```

File

BDEReg

Description

This is class BDEReg.TImpliedDatabaseSprig.

14.1.6.1 TImpliedDatabaseSprig Members

The following tables list the members exposed by TImpliedDatabaseSprig.

Public Methods

	Name	Description
	AnyProblems (see page 1740)	This is AnyProblems, a member of class TImpliedDatabaseSprig.
	Caption (see page 1740)	This is Caption, a member of class TImpliedDatabaseSprig.
	DragDropTo (see page 1741)	This is DragDropTo, a member of class TImpliedDatabaseSprig.
	DragOverTo (see page 1741)	This is DragOverTo, a member of class TImpliedDatabaseSprig.
	FigureParent (see page 1741)	This is FigureParent, a member of class TImpliedDatabaseSprig.
	ItemClass (see page 1741)	This is ItemClass, a member of class TImpliedDatabaseSprig.
	UniqueName (see page 1741)	This is UniqueName, a member of class TImpliedDatabaseSprig.

14.1.6.2 TImpliedDatabaseSprig Methods

The methods of the TImpliedDatabaseSprig class are listed here.

Public Methods

	Name	Description
	AnyProblems (see page 1740)	This is AnyProblems, a member of class TImpliedDatabaseSprig.
	Caption (see page 1740)	This is Caption, a member of class TImpliedDatabaseSprig.
	DragDropTo (see page 1741)	This is DragDropTo, a member of class TImpliedDatabaseSprig.
	DragOverTo (see page 1741)	This is DragOverTo, a member of class TImpliedDatabaseSprig.
	FigureParent (see page 1741)	This is FigureParent, a member of class TImpliedDatabaseSprig.
	ItemClass (see page 1741)	This is ItemClass, a member of class TImpliedDatabaseSprig.
	UniqueName (see page 1741)	This is UniqueName, a member of class TImpliedDatabaseSprig.

14.1.6.2.1 TImpliedDatabaseSprig.AnyProblems Method

Pascal

```
function AnyProblems: Boolean; override;
```

C++

```
virtual __fastcall Boolean AnyProblems();
```

Description

This is AnyProblems, a member of class TImpliedDatabaseSprig.

14.1.6.2.2 TImpliedDatabaseSprig.Caption Method

Pascal

```
function Caption: string; override;
```

C++

```
virtual __fastcall AnsiString Caption();
```

Description

This is Caption, a member of class TImpliedDatabaseSprig.

14.1.6.2.3 TImpliedDatabaseSprig.DragDropTo Method

Pascal

```
function DragDropTo(AItem: TSprig): Boolean; override;
```

C++

```
virtual __fastcall Boolean DragDropTo(TSprig AItem);
```

Description

This is DragDropTo, a member of class TImpliedDatabaseSprig.

14.1.6.2.4 TImpliedDatabaseSprig.DragOverTo Method

Pascal

```
function DragOverTo(AItem: TSprig): Boolean; override;
```

C++

```
virtual __fastcall Boolean DragOverTo(TSprig AItem);
```

Description

This is DragOverTo, a member of class TImpliedDatabaseSprig.

14.1.6.2.5 TImpliedDatabaseSprig.FigureParent Method

Pascal

```
procedure FigureParent; override;
```

C++

```
virtual __fastcall FigureParent();
```

Description

This is FigureParent, a member of class TImpliedDatabaseSprig.

14.1.6.2.6 TImpliedDatabaseSprig.ItemClass Method

Pascal

```
function ItemClass: TClass; override;
```

C++

```
virtual __fastcall TClass ItemClass();
```

Description

This is ItemClass, a member of class TImpliedDatabaseSprig.

14.1.6.2.7 TImpliedDatabaseSprig.UniqueName Method

Pascal

```
function UniqueName: string; override;
```

C++

```
virtual __fastcall AnsiString UniqueName();
```

Description

This is UniqueName, a member of class TImpliedDatabaseSprig.

14.1.7 TImpliedSessionSprig Class

Class Hierarchy

Pascal

```
TImpliedSessionSprig = class(TTransientSprig);
```

C++

```
class TImpliedSessionSprig : public TTransientSprig;
```

File

BDEReg

Description

This is class BDEReg.TImpliedSessionSprig.

14.1.7.1 TImpliedSessionSprig Members

The following tables list the members exposed by TImpliedSessionSprig.

Public Methods

	Name	Description
	Caption (see page 1742)	This is Caption, a member of class TImpliedSessionSprig.
	ItemClass (see page 1743)	This is ItemClass, a member of class TImpliedSessionSprig.
	UniqueName (see page 1743)	This is UniqueName, a member of class TImpliedSessionSprig.

14.1.7.2 TImpliedSessionSprig Methods

The methods of the TImpliedSessionSprig class are listed here.

Public Methods

	Name	Description
	Caption (see page 1742)	This is Caption, a member of class TImpliedSessionSprig.
	ItemClass (see page 1743)	This is ItemClass, a member of class TImpliedSessionSprig.
	UniqueName (see page 1743)	This is UniqueName, a member of class TImpliedSessionSprig.

14.1.7.2.1 TImpliedSessionSprig.Caption Method

Pascal

```
function Caption: string; override;
```

C++

```
virtual __fastcall AnsiString Caption();
```

Description

This is Caption, a member of class TImpliedSessionSprig.

14.1.7.2.2 TImpliedSessionSprig.ItemClass Method

Pascal

```
function ItemClass: TClass; override;
```

C++

```
virtual __fastcall TClass ItemClass();
```

Description

This is ItemClass, a member of class TImpliedSessionSprig.

14.1.7.2.3 TImpliedSessionSprig.UniqueName Method

Pascal

```
function UniqueName: string; override;
```

C++

```
virtual __fastcall AnsiString UniqueName();
```

Description

This is UniqueName, a member of class TImpliedSessionSprig.

14.1.8 TNestedTableSprig Class

Class Hierarchy

Pascal

```
TNestedTableSprig = class(TBDEDataSetSprig);
```

C++

```
class TNestedTableSprig : public TBDEDataSetSprig;
```

File

BDEReg

Description

This is class BDEReg.TNestedTableSprig.

14.1.8.1 TNestedTableSprig Members

The following tables list the members exposed by TNestedTableSprig.

Public Methods

	Name	Description
	GetDSDesignerClass (see page 1733)	This is GetDSDesignerClass, a member of class TBDEDataSetSprig.
	ParentProperty (see page 1744)	This is ParentProperty, a member of class TNestedTableSprig.

14.1.8.2 TNestedTableSprig Methods

The methods of the TNestedTableSprig class are listed here.

Public Methods

	Name	Description
	ParentProperty (see page 1744)	This is ParentProperty, a member of class TNestedTableSprig.

14.1.8.2.1 TNestedTableSprig.ParentProperty Method

Pascal

```
class function ParentProperty: string; override;
```

C++

```
virtual __fastcall AnsiString ParentProperty();
```

Description

This is ParentProperty, a member of class TNestedTableSprig.

14.1.9 TQuerySprig Class

Class Hierarchy

Pascal

```
TQuerySprig = class(TDBDataSetSprig);
```

C++

```
class TQuerySprig : public TDBDataSetSprig;
```

File

BDEReg

Description

This is class BDEReg.TQuerySprig.

14.1.9.1 TQuerySprig Members

The following tables list the members exposed by TQuerySprig.

Public Methods

	Name	Description
	AnyProblems (see page 1745)	This is AnyProblems, a member of class TQuerySprig.

	DragDropTo (see page 1737)	This is DragDropTo, a member of class TDBDataSetSprig.
	DragOverTo (see page 1737)	This is DragOverTo, a member of class TDBDataSetSprig.
	FigureParent (see page 1737)	This is FigureParent, a member of class TDBDataSetSprig.
	GetDSDesignerClass (see page 1733)	This is GetDSDesignerClass, a member of class TBDEDataSetSprig.
	PaletteOverTo (see page 1737)	This is PaletteOverTo, a member of class TDBDataSetSprig.
	Reparent (see page 1738)	This is Reparent, a member of class TDBDataSetSprig.

14.1.9.2 TQuerySprig Methods

The methods of the TQuerySprig class are listed here.

Public Methods

	Name	Description
	AnyProblems (see page 1745)	This is AnyProblems, a member of class TQuerySprig.

14.1.9.2.1 TQuerySprig.AnyProblems Method

Pascal

```
function AnyProblems: Boolean; override;
```

C++

```
virtual __fastcall Boolean AnyProblems();
```

Description

This is AnyProblems, a member of class TQuerySprig.

14.1.10 TSessionSprig Class

Class Hierarchy

Pascal

```
TSessionSprig = class(TComponentSprig);
```

C++

```
class TSessionSprig : public TComponentSprig;
```

File

BDEReg

Description

This is class BDEReg.TSessionSprig.

14.1.10.1 TSessionSprig Members

The following tables list the members exposed by TSessionSprig.

Public Methods

	Name	Description
	AnyProblems (see page 1746)	This is AnyProblems, a member of class TSessionSprig.
	Caption (see page 1746)	This is Caption, a member of class TSessionSprig.
	Name (see page 1746)	This is Name, a member of class TSessionSprig.

14.1.10.2 TSessionSprig Methods

The methods of the TSessionSprig class are listed here.

Public Methods

	Name	Description
	AnyProblems (see page 1746)	This is AnyProblems, a member of class TSessionSprig.
	Caption (see page 1746)	This is Caption, a member of class TSessionSprig.
	Name (see page 1746)	This is Name, a member of class TSessionSprig.

14.1.10.2.1 TSessionSprig.AnyProblems Method

Pascal

```
function AnyProblems: Boolean; override;
```

C++

```
virtual __fastcall Boolean AnyProblems();
```

Description

This is AnyProblems, a member of class TSessionSprig.

14.1.10.2.2 TSessionSprig.Caption Method

Pascal

```
function Caption: string; override;
```

C++

```
virtual __fastcall AnsiString Caption();
```

Description

This is Caption, a member of class TSessionSprig.

14.1.10.2.3 TSessionSprig.Name Method

Pascal

```
function Name: string; override;
```

C++

```
virtual __fastcall AnsiString Name();
```

Description

This is Name, a member of class TSessionSprig.

14.1.11 TStoredProcSprig Class

Class Hierarchy

Pascal

```
TStoredProcSprig = class(TDBDataSetSprig);
```

C++

```
class TStoredProcSprig : public TDBDataSetSprig;
```

File

BDEReg

Description

This is class BDEReg.TStoredProcSprig.

14.1.11.1 TStoredProcSprig Members

The following tables list the members exposed by TStoredProcSprig.

Public Methods

	Name	Description
	AnyProblems (see page 1747)	This is AnyProblems, a member of class TStoredProcSprig.
	Caption (see page 1748)	This is Caption, a member of class TStoredProcSprig.
	DragDropTo (see page 1737)	This is DragDropTo, a member of class TDBDataSetSprig.
	DragOverTo (see page 1737)	This is DragOverTo, a member of class TDBDataSetSprig.
	FigureParent (see page 1737)	This is FigureParent, a member of class TDBDataSetSprig.
	GetDSDesignerClass (see page 1733)	This is GetDSDesignerClass, a member of class TBDEDataSetSprig.
	PaletteOverTo (see page 1737)	This is PaletteOverTo, a member of class TDBDataSetSprig.
	Reparent (see page 1738)	This is Reparent, a member of class TDBDataSetSprig.

14.1.11.2 TStoredProcSprig Methods

The methods of the TStoredProcSprig class are listed here.

Public Methods

	Name	Description
	AnyProblems (see page 1747)	This is AnyProblems, a member of class TStoredProcSprig.
	Caption (see page 1748)	This is Caption, a member of class TStoredProcSprig.

14.1.11.2.1 TStoredProcSprig.AnyProblems Method

Pascal

```
function AnyProblems: Boolean; override;
```

C++

```
virtual __fastcall Boolean AnyProblems();
```

Description

This is AnyProblems, a member of class TStoredProcSprig.

14.1.11.2.2 TStoredProcSprig.Caption Method

Pascal

```
function Caption: string; override;
```

C++

```
virtual __fastcall AnsiString Caption();
```

Description

This is Caption, a member of class TStoredProcSprig.

14.1.12 TTableFieldLinkProperty Class

Class Hierarchy

Pascal

```
TTableFieldLinkProperty = class(TFieldLinkProperty);
```

C++

```
class TTableFieldLinkProperty : public TFieldLinkProperty;
```

File

BDEReg

Description

This is class BDEReg.TTableFieldLinkProperty.

14.1.12.1 TTableFieldLinkProperty Members

The following tables list the members exposed by TTableFieldLinkProperty.

Protected Methods

	Name	Description
	GetFieldNamesForIndex (see page 1749)	This is GetFieldNamesForIndex, a member of class TTableFieldLinkProperty.
	GetIndexBased (see page 1750)	This is GetIndexBased, a member of class TTableFieldLinkProperty.
	GetIndexDefs (see page 1750)	This is GetIndexDefs, a member of class TTableFieldLinkProperty.
	GetIndexFieldNames (see page 1750)	This is GetIndexFieldNames, a member of class TTableFieldLinkProperty.
	GetIndexName (see page 1750)	This is GetIndexName, a member of class TTableFieldLinkProperty.
	GetMasterFields (see page 1751)	This is GetMasterFields, a member of class TTableFieldLinkProperty.
	SetIndexFieldNames (see page 1751)	This is SetIndexFieldNames, a member of class TTableFieldLinkProperty.
	SetIndexName (see page 1751)	This is SetIndexName, a member of class TTableFieldLinkProperty.
	SetMasterFields (see page 1751)	This is SetMasterFields, a member of class TTableFieldLinkProperty.

Public Methods

	Name	Description
	Edit (see page 1749)	This is Edit, a member of class TTableFieldLinkProperty.

Public Properties

	Name	Description
	IndexBased (see page 1752)	This is IndexBased, a member of class TTableFieldLinkProperty.
	IndexDefs (see page 1752)	This is IndexDefs, a member of class TTableFieldLinkProperty.
	IndexFieldNames (see page 1752)	This is IndexFieldNames, a member of class TTableFieldLinkProperty.
	IndexName (see page 1752)	This is IndexName, a member of class TTableFieldLinkProperty.
	MasterFields (see page 1753)	This is MasterFields, a member of class TTableFieldLinkProperty.

14.1.12.2 TTableFieldLinkProperty Methods

The methods of the TTableFieldLinkProperty class are listed here.

Protected Methods

	Name	Description
	GetFieldNamesForIndex (see page 1749)	This is GetFieldNamesForIndex, a member of class TTableFieldLinkProperty.
	GetIndexBased (see page 1750)	This is GetIndexBased, a member of class TTableFieldLinkProperty.
	GetIndexDefs (see page 1750)	This is GetIndexDefs, a member of class TTableFieldLinkProperty.
	GetIndexFieldNames (see page 1750)	This is GetIndexFieldNames, a member of class TTableFieldLinkProperty.
	GetIndexName (see page 1750)	This is GetIndexName, a member of class TTableFieldLinkProperty.
	GetMasterFields (see page 1751)	This is GetMasterFields, a member of class TTableFieldLinkProperty.
	SetIndexFieldNames (see page 1751)	This is SetIndexFieldNames, a member of class TTableFieldLinkProperty.
	SetIndexName (see page 1751)	This is SetIndexName, a member of class TTableFieldLinkProperty.
	SetMasterFields (see page 1751)	This is SetMasterFields, a member of class TTableFieldLinkProperty.

Public Methods

	Name	Description
	Edit (see page 1749)	This is Edit, a member of class TTableFieldLinkProperty.

14.1.12.2.1 TTableFieldLinkProperty.Edit Method

Pascal

```
procedure Edit; override;
```

C++

```
virtual __fastcall Edit();
```

Description

This is Edit, a member of class TTableFieldLinkProperty.

14.1.12.2.2 TTableFieldLinkProperty.GetFieldNamesForIndex Method

Pascal

```
procedure GetFieldNamesForIndex(List: TStrings); override;
```

C++

```
virtual __fastcall GetFieldNamesForIndex(TStrings List);
```

Description

This is GetFieldNamesForIndex, a member of class TTableFieldLinkProperty.

14.1.12.2.3 TTableFieldLinkProperty.GetIndexBased Method

Pascal

```
function GetIndexBased: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIndexBased();
```

Description

This is GetIndexBased, a member of class TTableFieldLinkProperty.

14.1.12.2.4 TTableFieldLinkProperty.GetIndexDefs Method

Pascal

```
function GetIndexDefs: TIndexDefs; override;
```

C++

```
virtual __fastcall TIndexDefs GetIndexDefs();
```

Description

This is GetIndexDefs, a member of class TTableFieldLinkProperty.

14.1.12.2.5 TTableFieldLinkProperty.GetIndexFieldNames Method

Pascal

```
function GetIndexFieldNames: string; override;
```

C++

```
virtual __fastcall AnsiString GetIndexFieldNames();
```

Description

This is GetIndexFieldNames, a member of class TTableFieldLinkProperty.

14.1.12.2.6 TTableFieldLinkProperty.GetIndexName Method

Pascal

```
function GetIndexName: string; override;
```

C++

```
virtual __fastcall AnsiString GetIndexName();
```

Description

This is GetIndexName, a member of class TTableFieldLinkProperty.

14.1.12.2.7 TTableFieldLinkProperty.GetMasterFields Method

Pascal

```
function GetMasterFields: string; override;
```

C++

```
virtual __fastcall AnsiString GetMasterFields();
```

Description

This is GetMasterFields, a member of class TTableFieldLinkProperty.

14.1.12.2.8 TTableFieldLinkProperty.SetIndexFieldNames Method

Pascal

```
procedure SetIndexFieldNames(const Value: string); override;
```

C++

```
virtual __fastcall SetIndexFieldNames(const AnsiString Value);
```

Description

This is SetIndexFieldNames, a member of class TTableFieldLinkProperty.

14.1.12.2.9 TTableFieldLinkProperty.SetIndexName Method

Pascal

```
procedure SetIndexName(const Value: string); override;
```

C++

```
virtual __fastcall SetIndexName(const AnsiString Value);
```

Description

This is SetIndexName, a member of class TTableFieldLinkProperty.

14.1.12.2.10 TTableFieldLinkProperty.SetMasterFields Method

Pascal

```
procedure SetMasterFields(const Value: string); override;
```

C++

```
virtual __fastcall SetMasterFields(const AnsiString Value);
```

Description

This is SetMasterFields, a member of class TTableFieldLinkProperty.

14.1.12.3 TTableFieldLinkProperty Properties

The properties of the TTableFieldLinkProperty class are listed here.

Public Properties

	Name	Description
R	IndexBased (see page 1752)	This is IndexBased, a member of class TTableFieldLinkProperty.
R	IndexDefs (see page 1752)	This is IndexDefs, a member of class TTableFieldLinkProperty.
	IndexFieldNames (see page 1752)	This is IndexFieldNames, a member of class TTableFieldLinkProperty.
	IndexName (see page 1752)	This is IndexName, a member of class TTableFieldLinkProperty.
	MasterFields (see page 1753)	This is MasterFields, a member of class TTableFieldLinkProperty.

14.1.12.3.1 TTableFieldLinkProperty.IndexBased Property

Pascal

```
property IndexBased: Boolean;
```

C++

```
__property Boolean IndexBased;
```

Description

This is IndexBased, a member of class TTableFieldLinkProperty.

14.1.12.3.2 TTableFieldLinkProperty.IndexDefs Property

Pascal

```
property IndexDefs: TIndexDefs;
```

C++

```
__property TIndexDefs IndexDefs;
```

Description

This is IndexDefs, a member of class TTableFieldLinkProperty.

14.1.12.3.3 TTableFieldLinkProperty.IndexFieldNames Property

Pascal

```
property IndexFieldNames: string;
```

C++

```
__property AnsiString IndexFieldNames;
```

Description

This is IndexFieldNames, a member of class TTableFieldLinkProperty.

14.1.12.3.4 TTableFieldLinkProperty.IndexName Property

Pascal

```
property IndexName: string;
```

C++

```
__property AnsiString IndexName;
```

Description

This is IndexName, a member of class TTableFieldLinkProperty.

14.1.12.3.5 TTableFieldLinkProperty.MasterFields Property

Pascal

```
property MasterFields: string;
```

C++

```
__property AnsiString MasterFields;
```

Description

This is MasterFields, a member of class TTableFieldLinkProperty.

14.1.13 TTableSprig Class

Class Hierarchy

Pascal

```
TTableSprig = class(TDBDataSetSprig);
```

C++

```
class TTableSprig : public TDBDataSetSprig;
```

File

BDEReg

Description

This is class BDEReg.TTableSprig.

14.1.13.1 TTableSprig Members

The following tables list the members exposed by TTableSprig.

Public Methods

	Name	Description
	AnyProblems (see page 1754)	This is AnyProblems, a member of class TTableSprig.
	Caption (see page 1754)	This is Caption, a member of class TTableSprig.
	DragDropTo (see page 1737)	This is DragDropTo, a member of class TDBDataSetSprig.
	DragOverTo (see page 1737)	This is DragOverTo, a member of class TDBDataSetSprig.
	FigureParent (see page 1737)	This is FigureParent, a member of class TDBDataSetSprig.
	GetDSDesignerClass (see page 1733)	This is GetDSDesignerClass, a member of class TBDEDataSetSprig.
	PaletteOverTo (see page 1737)	This is PaletteOverTo, a member of class TDBDataSetSprig.
	Reparent (see page 1738)	This is Reparent, a member of class TDBDataSetSprig.

14.1.13.2 TTableSprig Methods

The methods of the TTableSprig class are listed here.

Public Methods

	Name	Description
	AnyProblems (see page 1754)	This is AnyProblems, a member of class TTableSprig.
	Caption (see page 1754)	This is Caption, a member of class TTableSprig.

14.1.13.2.1 TTableSprig.AnyProblems Method

Pascal

```
function AnyProblems: Boolean; override;
```

C++

```
virtual __fastcall Boolean AnyProblems();
```

Description

This is AnyProblems, a member of class TTableSprig.

14.1.13.2.2 TTableSprig.Caption Method

Pascal

```
function Caption: string; override;
```

C++

```
virtual __fastcall AnsiString Caption();
```

Description

This is Caption, a member of class TTableSprig.

14.1.14 TUpdateSQLSprig Class

Class Hierarchy

Pascal

```
TUpdateSQLSprig = class(TComponentSprig);
```

C++

```
class TUpdateSQLSprig : public TComponentSprig;
```

File

BDEReg

Description

This is class BDEReg.TUpdateSQLSprig.

14.1.14.1 TUpdateSQLSprig Members

The following tables list the members exposed by TUpdateSQLSprig.

Public Methods

	Name	Description
	AnyProblems (see page 1755)	This is AnyProblems, a member of class TUpdateSQLSprig.

14.1.14.2 TUpdateSQLSprig Methods

The methods of the TUpdateSQLSprig class are listed here.

Public Methods

	Name	Description
	AnyProblems (see page 1755)	This is AnyProblems, a member of class TUpdateSQLSprig.

14.1.14.2.1 TUpdateSQLSprig.AnyProblems Method

Pascal

```
function AnyProblems: Boolean; override;
```

C++

```
virtual __fastcall Boolean AnyProblems();
```

Description

This is AnyProblems, a member of class TUpdateSQLSprig.

14.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	Register (see page 1756)	This is function BDEReg.Register.
	SprigBDEImpliedDatabaseName (see page 1756)	This is function BDEReg.SprigBDEImpliedDatabaseName.
	SprigBDEImpliedSessionName (see page 1757)	This is function BDEReg.SprigBDEImpliedSessionName.
	SprigBDESessionName (see page 1757)	This is function BDEReg.SprigBDESessionName.

14.2.1 BDEReg.Register Function

Pascal

```
procedure Register;
```

C++

```
Register();
```

File

BDEReg

Description

This is function BDEReg.Register.

14.2.2 BDEReg.SprigBDEImpliedDatabaseName Function

Pascal

```
function SprigBDEImpliedDatabaseName(const AName: string): string;
```

C++

```
AnsiString SprigBDEImpliedDatabaseName(const AnsiString AName);
```

File

BDEReg

Description

This is function BDEReg.SprigBDEImpliedDatabaseName.

14.2.3 BDEReg.SprigBDEImpliedSessionName Function

Pascal

```
function SprigBDEImpliedSessionName(const AName: string): string;
```

C++

```
AnsiString SprigBDEImpliedSessionName(const AnsiString AName);
```

File

BDEReg

Description

This is function BDEReg.SprigBDEImpliedSessionName.

14.2.4 BDEReg.SprigBDESessionName Function

Pascal

```
function SprigBDESessionName(const AName: string): string;
```

C++

```
AnsiString SprigBDESessionName(const AnsiString AName);
```

File

BDEReg

Description

This is function BDEReg.SprigBDESessionName.

14.3 Constants

The following table lists constants in this documentation.

Constants

Name	Description
cDefaultSessionSprigName (see page 1758)	This is constant BDEReg.cDefaultSessionSprigName.
cImpliedDatabaseSprigPrefix (see page 1758)	This is constant BDEReg.cImpliedDatabaseSprigPrefix.
cImpliedSessionSprigPrefix (see page 1758)	This is constant BDEReg.cImpliedSessionSprigPrefix.

14.3.1 BDEReg.cDefaultSessionSprigName Constant

Pascal

```
cDefaultSessionSprigName = '<DefaultSession>';
```

C++

```
cDefaultSessionSprigName = '<DefaultSession>';
```

File

BDEReg

Description

This is constant BDEReg.cDefaultSessionSprigName.

14.3.2 BDEReg.cImpliedDatabaseSprigPrefix Constant

Pascal

```
cImpliedDatabaseSprigPrefix = '<ImpliedDatabase>';
```

C++

```
cImpliedDatabaseSprigPrefix = '<ImpliedDatabase>';
```

File

BDEReg

Description

This is constant BDEReg.cImpliedDatabaseSprigPrefix.

14.3.3 BDEReg.cImpliedSessionSprigPrefix Constant

Pascal

```
cImpliedSessionSprigPrefix = '<ImpliedSession>';
```

C++

```
cImpliedSessionSprigPrefix = '<ImpliedSession>';
```

File

BDEReg

Description

This is constant BDEReg.cImpliedSessionSprigPrefix.

15 Borland Namespace

This is namespace Borland.

Namespaces

Name	Description
Data (see page 1762)	This is namespace Borland.Data.

15.1 Borland.Data Namespace

This is namespace Borland.Data.

Namespaces

Name	Description
AdoDbxClientProvider (see page 1762)	This is namespace Borland.Data.AdoDbxClientProvider.
DataStore (see page 1892)	This is namespace Borland.Data.DataStore.
MetaData (see page 2130)	This is namespace Borland.Data.MetaData.

15.1.1 Borland.Data.AdoDbxClientProvider Namespace

This is namespace Borland.Data.AdoDbxClientProvider.

Topics

Name	Description
Classes (see page 1763)	The following table lists classes in this documentation.
Types (see page 1890)	The following table lists types in this documentation.
Constants (see page 1891)	The following table lists constants in this documentation.

Classes

	Name	Description
	TAdoDbxCommand (see page 1763)	Represents a SQL statement or stored procedure to execute against a data source.
	TAdoDbxCommandBuilder (see page 1776)	Generates single-table commands as part of the operation of the TAdoDbxDataAdapter (see page 1814).
	TAdoDbxConnection (see page 1779)	Represents a connection to a database.
	TAdoDbxConnectionStringBuilder (see page 1790)	Class for strongly typed connection string builder.
	TAdoDbxDataAdapter (see page 1814)	Acts as a bridge between a DataSet and the underlying database.
	TAdoDbxDataReader (see page 1827)	Class to read rows forward-only from a data source.
	TAdoDbxDataSourceEnumerator (see page 1845)	Provides enumerator for finding all data sources on local network.
	TAdoDbxException (see page 1845)	Base class for all data source exceptions.
	TAdoDbxExtension (see page 1846)	Class to get information about a connection.
	TAdoDbxMetaDataColumnNames (see page 1848)	Column headers for Restrictions DataTable.
	TAdoDbxParameter (see page 1850)	Represents a parameter that is passed to or from a command.
	TAdoDbxParameterCollection (see page 1865)	Collects parameters into a .NET collection object that can be read and manipulated.
	TAdoDbxProviderFactory (see page 1874)	Base class for a provider's implementation of data source classes.
	TAdoDbxRowUpdatedEventArgs (see page 1880)	This is class Borland.Data.AdoDbxClientProvider.TAdoDbxRowUpdatedEventArgs.
	TAdoDbxRowUpdatingEventArgs (see page 1881)	This is class Borland.Data.AdoDbxClientProvider.TAdoDbxRowUpdatingEventArgs.
	TAdoDbxSchemaTableColumnNames (see page 1883)	This is class Borland.Data.AdoDbxClientProvider.TAdoDbxSchemaTableColumnNames.
	TAdoDbxTransaction (see page 1884)	Represents an instance of the TAdoDbxTransaction object.
	TConnectionStringCategories (see page 1888)	Categories used for connection string builder UI.

Constants

Name	Description
SCommandAlreadyPrepared (see page 1891)	This is constant Borland.Data.AdoDbxClientProvider.SCommandAlreadyPrepared.
SInvalidFieldType (see page 1892)	This is constant Borland.Data.AdoDbxClientProvider.SInvalidFieldType.
SUnSupported (see page 1892)	This is constant Borland.Data.AdoDbxClientProvider.SUnSupported.

Types

Name	Description
TAdoDbxRowUpdatedEventHandler (see page 1890)	Event handler for TAdoDbxDataAdapter.RowUpdated event.
TAdoDbxRowUpdatingEventHandler (see page 1890)	Event handler for TAdoDbxDataAdapter.RowUpdating event.
TObjectArray (see page 1891)	This is type Borland.Data.AdoDbxClientProvider.TObjectArray.

15.1.1.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TAdoDbxCommand (see page 1763)	Represents a SQL statement or stored procedure to execute against a data source.
	TAdoDbxCommandBuilder (see page 1776)	Generates single-table commands as part of the operation of the TAdoDbxDataAdapter (see page 1814).
	TAdoDbxConnection (see page 1779)	Represents a connection to a database.
	TAdoDbxConnectionStringBuilder (see page 1790)	Class for strongly typed connection string builder.
	TAdoDbxDataAdapter (see page 1814)	Acts as a bridge between a DataSet and the underlying database.
	TAdoDbxDataReader (see page 1827)	Class to read rows forward-only from a data source.
	TAdoDbxDataSourceEnumerator (see page 1845)	Provides enumerator for finding all data sources on local network.
	TAdoDbxException (see page 1845)	Base class for all data source exceptions.
	TAdoDbxExtension (see page 1846)	Class to get information about a connection.
	TAdoDbxMetaDataColumnNames (see page 1848)	Column headers for Restrictions DataTable.
	TAdoDbxParameter (see page 1850)	Represents a parameter that is passed to or from a command.
	TAdoDbxParameterCollection (see page 1865)	Collects parameters into a .NET collection object that can be read and manipulated.
	TAdoDbxProviderFactory (see page 1874)	Base class for a provider's implementation of data source classes.
	TAdoDbxRowUpdatedEventArgs (see page 1880)	This is class Borland.Data.AdoDbxClientProvider.TAdoDbxRowUpdatedEventArgs.
	TAdoDbxRowUpdatingEventArgs (see page 1881)	This is class Borland.Data.AdoDbxClientProvider.TAdoDbxRowUpdatingEventArgs.
	TAdoDbxSchemaTableColumnNames (see page 1883)	This is class Borland.Data.AdoDbxClientProvider.TAdoDbxSchemaTableColumnNames.
	TAdoDbxTransaction (see page 1884)	Represents an instance of the TAdoDbxTransaction object.
	TConnectionStringCategories (see page 1888)	Categories used for connection string builder UI.

15.1.1.1.1 TAdoDbxCommand Class

Represents a SQL statement or stored procedure to execute against a data source.

Class Hierarchy

Pascal

```
TAdoDbxCommand = class(DbCommand, ICloneable);
```

C++

```
class TAdoDbxCommand : public DbCommand, public ICloneable;
```

File

Borland.Data.AdoDbxClientProvider

Description

Use the TAdoDbxCommand constructor to create a new instance of a TAdoDbxCommand object. The TAdoDbxCommand object is created automatically in your project when you create a TAdoDbxDataAdapter (see page 1814) object. The TAdoDbxCommand object provides the means for executing SQL statements and stored procedures.

TAdoDbxCommand is an implementation of the .NET DbCommand class.

The CommandType (see page 1773) property specifies whether a SQL statement, a table name, or a stored procedure name is being used in the CommandText (see page 1772) property.

- The Connection property should be set to a valid TAdoDbxConnection (see page 1779).
- The Transaction (see page 1774) property must be set to a valid TAdoDbxTransaction (see page 1884) to execute a SQL statement in the context of a transaction.

Depending on the type of SQL statement being executed, you can use one of the following methods:

- ExecuteReader. Used for Select statements and stored procedures that return a reader or multiple readers. A new TAdoDbxDataReader (see page 1827) is returned if ExecuteReader successfully processes the SQL statement. You cannot update data when using a TAdoDbxDataReader (see page 1827) object. To update data, use the TAdoDbxDataAdapter (see page 1814) object.
- ExecuteScalar (see page 1768). Similar to ExecuteReader but returns only the first column of the first record as an object and is primarily used to execute SQL to return aggregate values.
- ExecuteNonQuery (see page 1768). Executes DDL or non-Select DML statements or stored procedures that return no dataset. On successful execution of a DML statement, ExecuteNonQuery (see page 1768) returns the number of rows affected in the database.

To execute parameterized SQL, you can specify the CommandText (see page 1772) values with parameter markers. The **?** character is used as a parameter marker. Currently, there is no support for named parameters. During preparation, the database-specific provider implementation takes care of converting the **?** parameter markers to database-specific parameter markers and also takes care of generating the appropriate SQL for calling a stored procedure.

When executing the same SQL repeatedly, call the Prepare (see page 1770) method once and bind parameters. You specify parameters by adding a TAdoDbxParameter (see page 1850) instance to the TAdoDbxCommand.Parameters (see page 1774) property, which is a TAdoDbxParameterCollection (see page 1865). Preparing a parameterized SQL statement on most databases creates an execution plan on the server that is then used during subsequent execution of the same SQL with different parameter values.

Once the TAdoDbxCommand is complete, calling Dispose (or Free in Delphi) frees all of the statement resources allocated by the provider.

15.1.1.1.1.1 TAdoDbxCommand Members

The following tables list the members exposed by TAdoDbxCommand.

Public Methods

	Name	Description
V	Cancel (see page 1767)	Attempts to cancel a TAdoDbxCommand (see page 1763).
	Clone (see page 1767)	This is Clone, a member of class TAdoDbxCommand.
V	Destroy (see page 1766)	Destroys a TAdoDbxCommand (see page 1763) instance.
V	ExecuteNonQuery (see page 1768)	Executes a SQL statement against a connection object.
V	ExecuteScalar (see page 1768)	Execute a SQL query and return the first column of the first row of data.
V	get_CommandText (see page 1768)	This is get_CommandText, a member of class TAdoDbxCommand.
V	get_CommandTimeout (see page 1769)	This is get_CommandTimeout, a member of class TAdoDbxCommand.
V	get_CommandType (see page 1769)	This is get_CommandType, a member of class TAdoDbxCommand.
V	get_DesignTimeVisible (see page 1770)	This is get_DesignTimeVisible, a member of class TAdoDbxCommand.
V	get_UpdatedRowSource (see page 1770)	This is get_UpdatedRowSource, a member of class TAdoDbxCommand.
V	Prepare (see page 1770)	Create a compiled version of a command on the data source.
V	set_CommandText (see page 1770)	This is set_CommandText, a member of class TAdoDbxCommand.
V	set_CommandTimeout (see page 1771)	This is set_CommandTimeout, a member of class TAdoDbxCommand.
V	set_CommandType (see page 1771)	This is set_CommandType, a member of class TAdoDbxCommand.
V	set_DesignTimeVisible (see page 1771)	This is set_DesignTimeVisible, a member of class TAdoDbxCommand.
V	set_UpdatedRowSource (see page 1772)	This is set_UpdatedRowSource, a member of class TAdoDbxCommand.

Public Properties

	Name	Description
	CommandText (see page 1772)	Gets or sets the SQL statement, table name, or stored procedure to execute at the data source.
	CommandTimeout (see page 1773)	Gets or sets the time, in seconds, before terminating a long-running SQL command.
	CommandType (see page 1773)	Gets or sets the CommandType that indicates how to interpret the CommandText (see page 1772) property.
	DesignTimeVisible (see page 1774)	Determines whether or not a command is visible at design time.
R	Parameters (see page 1774)	Returns the TAdoDbxParameterCollection (see page 1865).
	Transaction (see page 1774)	Provides the transaction in which the TAdoDbxCommand (see page 1763) executes.
	UpdateRowSource (see page 1775)	This is UpdateRowSource, a member of class TAdoDbxCommand.

Strict protected Methods

	Name	Description
	CreateDbParameter (see page 1767)	This is CreateDbParameter, a member of class TAdoDbxCommand.
	ExecuteDbDataReader (see page 1767)	This is ExecuteDbDataReader, a member of class TAdoDbxCommand.
	get_DbConnection (see page 1769)	This is get_DbConnection, a member of class TAdoDbxCommand.
	get_DbParameterCollection (see page 1769)	This is get_DbParameterCollection, a member of class TAdoDbxCommand.
	get_DbTransaction (see page 1769)	This is get_DbTransaction, a member of class TAdoDbxCommand.
	set_DbConnection (see page 1771)	This is set_DbConnection, a member of class TAdoDbxCommand.
	set_DbTransaction (see page 1771)	This is set_DbTransaction, a member of class TAdoDbxCommand.

15.1.1.1.1.2 TAdoDbxCommand.Destroy Destructor

Destroys a TAdoDbxCommand (see page 1763) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdoDbxCommand();
```

Description

This method destroys a TAdoDbxCommand (see page 1763) instance, freeing all its resources, by calling the **Close** method.

Note: Developers should rarely call Destroy directly; calling Dispose (or Free in Delphi) maps the call to the destructor.

See Also

Dispose (MSDN)

15.1.1.1.1.3 TAdoDbxCommand Methods

The methods of the TAdoDbxCommand class are listed here.

Public Methods

	Name	Description
	Cancel (see page 1767)	Attempts to cancel a TAdoDbxCommand (see page 1763).
	Clone (see page 1767)	This is Clone, a member of class TAdoDbxCommand.
	ExecuteNonQuery (see page 1768)	Executes a SQL statement against a connection object.
	ExecuteScalar (see page 1768)	Execute a SQL query and return the first column of the first row of data.
	get_CommandText (see page 1768)	This is get_CommandText, a member of class TAdoDbxCommand.
	get_CommandTimeout (see page 1769)	This is get_CommandTimeout, a member of class TAdoDbxCommand.
	get_CommandType (see page 1769)	This is get_CommandType, a member of class TAdoDbxCommand.
	get_DesignTimeVisible (see page 1770)	This is get_DesignTimeVisible, a member of class TAdoDbxCommand.
	get_UpdatedRowSource (see page 1770)	This is get_UpdatedRowSource, a member of class TAdoDbxCommand.
	Prepare (see page 1770)	Create a compiled version of a command on the data source.
	set_CommandText (see page 1770)	This is set_CommandText, a member of class TAdoDbxCommand.
	set_CommandTimeout (see page 1771)	This is set_CommandTimeout, a member of class TAdoDbxCommand.
	set_CommandType (see page 1771)	This is set_CommandType, a member of class TAdoDbxCommand.
	set_DesignTimeVisible (see page 1771)	This is set_DesignTimeVisible, a member of class TAdoDbxCommand.
	set_UpdatedRowSource (see page 1772)	This is set_UpdatedRowSource, a member of class TAdoDbxCommand.

Strict protected Methods

	Name	Description
	CreateDbParameter (see page 1767)	This is CreateDbParameter, a member of class TAdoDbxCommand.
	ExecuteDbDataReader (see page 1767)	This is ExecuteDbDataReader, a member of class TAdoDbxCommand.
	get_DbConnection (see page 1769)	This is get_DbConnection, a member of class TAdoDbxCommand.

	get_DbParameterCollection (see page 1769)	This is get_DbParameterCollection, a member of class TAdoDbxCommand.
	get_DbTransaction (see page 1769)	This is get_DbTransaction, a member of class TAdoDbxCommand.
	set_DbConnection (see page 1771)	This is set_DbConnection, a member of class TAdoDbxCommand.
	set_DbTransaction (see page 1771)	This is set_DbTransaction, a member of class TAdoDbxCommand.

15.1.1.1.1.3.1 TAdoDbxCommand.Cancel Method

Attempts to cancel a TAdoDbxCommand (see page 1763).

Pascal

```
procedure Cancel; override;
```

C++

```
virtual __fastcall Cancel();
```

Description

Cancel attempts to cancel a TAdoDbxCommand (see page 1763). If a command is in progress, it is cancelled. No exception is generated if the cancel fails. If no command is in progress, nothing happens.

See Also

Cancel (MSDN)

15.1.1.1.1.3.2 TAdoDbxCommand.Clone Method

Pascal

```
function Clone: TObject;
```

C++

```
__fastcall TObject * Clone();
```

Description

This is Clone, a member of class TAdoDbxCommand.

15.1.1.1.1.3.3 TAdoDbxCommand.CreateDbParameter Method

Pascal

```
function CreateDbParameter: DbParameter; override;
```

C++

```
virtual __fastcall DbParameter CreateDbParameter();
```

Description

This is CreateDbParameter, a member of class TAdoDbxCommand.

15.1.1.1.1.3.4 TAdoDbxCommand.ExecuteDbDataReader Method

Pascal

```
function ExecuteDbDataReader(Behavior: CommandBehavior): DbDataReader; override;
```

C++

```
virtual __fastcall DbDataReader ExecuteDbDataReader(CommandBehavior Behavior);
```

Description

This is ExecuteDbDataReader, a member of class TAdoDbxCommand.

15.1.1.1.1.3.5 TAdoDbxCommand.ExecuteNonQuery Method

Executes a SQL statement against a connection object.

Pascal

```
function ExecuteNonQuery: Integer; override;
```

C++

```
virtual __fastcall int ExecuteNonQuery();
```

Description

ExecuteNonQuery does not return data, but does allow you to perform SQL UPDATE, INSERT, or DELETE statements to modify a database. ExecuteNonQuery returns the number of rows affected for executing UPDATE, INSERT, or DELETE statements and -1 otherwise.

See Also

ExecuteNonQuery (MSDN)

ExecuteReader

ExecuteScalar (see page 1768)

15.1.1.1.1.3.6 TAdoDbxCommand.ExecuteScalar Method

Execute a SQL query and return the first column of the first row of data.

Pascal

```
function ExecuteScalar: System; override;
```

C++

```
virtual __fastcall System ExecuteScalar();
```

Description

ExecuteScalar returns only the first column of the first row of data from a SQL query.

Note: ExecuteScalar is useful for running aggregate SQL commands, such as `select sum(field) from table`.

See Also

ExecuteScalar (MSDN)

ExecuteNonQuery (see page 1768)

ExecuteReader

15.1.1.1.1.3.7 TAdoDbxCommand.get_CommandText Method

Pascal

```
function get_CommandText: String; override;
```

C++

```
virtual __fastcall AnsiString get_CommandText();
```

Description

This is get_CommandText, a member of class TAdoDbxCommand.

15.1.1.1.1.3.8 TAdoDbxCommand.get_CommandTimeout Method

Pascal

```
function get_CommandTimeout: Integer; override;
```

C++

```
virtual __fastcall int get_CommandTimeout();
```

Description

This is get_CommandTimeout, a member of class TAdoDbxCommand.

15.1.1.1.1.3.9 TAdoDbxCommand.get_CommandType Method

Pascal

```
function get_CommandType: CommandType; override;
```

C++

```
virtual __fastcall CommandType get_CommandType();
```

Description

This is get_CommandType, a member of class TAdoDbxCommand.

15.1.1.1.1.3.10 TAdoDbxCommand.get_DbConnection Method

Pascal

```
function get_DbConnection: DbConnection; override;
```

C++

```
virtual __fastcall DbConnection get_DbConnection();
```

Description

This is get_DbConnection, a member of class TAdoDbxCommand.

15.1.1.1.1.3.11 TAdoDbxCommand.get_DbParameterCollection Method

Pascal

```
function get_DbParameterCollection: DbParameterCollection; override;
```

C++

```
virtual __fastcall DbParameterCollection get_DbParameterCollection();
```

Description

This is get_DbParameterCollection, a member of class TAdoDbxCommand.

15.1.1.1.1.3.12 TAdoDbxCommand.get_DbTransaction Method

Pascal

```
function get_DbTransaction: DbTransaction; override;
```

C++

```
virtual __fastcall DbTransaction get_DbTransaction();
```

Description

This is get_DbTransaction, a member of class TAdoDbxCommand.

15.1.1.1.1.3.13 TAdoDbxCommand.get_DesignTimeVisible Method

Pascal

```
function get_DesignTimeVisible: Boolean; override;
```

C++

```
virtual __fastcall Boolean get_DesignTimeVisible();
```

Description

This is get_DesignTimeVisible, a member of class TAdoDbxCommand.

15.1.1.1.1.3.14 TAdoDbxCommand.get_UpdatedRowSource Method

Pascal

```
function get_UpdatedRowSource: UpdateRowSource; override;
```

C++

```
virtual __fastcall UpdateRowSource get_UpdatedRowSource();
```

Description

This is get_UpdatedRowSource, a member of class TAdoDbxCommand.

15.1.1.1.1.3.15 TAdoDbxCommand.Prepare Method

Create a compiled version of a command on the data source.

Pascal

```
procedure Prepare; override;
```

C++

```
virtual __fastcall Prepare();
```

Description

Prepare creates a compiled version of a SQL command on the data source. If the CommandType (see page 1773) property is **TableDirect**, Prepare does nothing.

See Also

Prepare (MSDN)

CommandType (see page 1773)

15.1.1.1.1.3.16 TAdoDbxCommand.set_CommandText Method

Pascal

```
procedure set_CommandText(CommandText: String); override;
```

C++

```
virtual __fastcall set_CommandText(AnsiString CommandText);
```

Description

This is set_CommandText, a member of class TAdoDbxCommand.

15.1.1.1.1.3.17 TAdoDbxCommand.set_CommandTimeout Method

Pascal

```
procedure set_CommandTimeout(Timeout: Integer); override;
```

C++

```
virtual __fastcall set_CommandTimeout(int Timeout);
```

Description

This is set_CommandTimeout, a member of class TAdoDbxCommand.

15.1.1.1.1.3.18 TAdoDbxCommand.set_CommandType Method

Pascal

```
procedure set_CommandType(CommandType: CommandType); override;
```

C++

```
virtual __fastcall set_CommandType(CommandType CommandType);
```

Description

This is set_CommandType, a member of class TAdoDbxCommand.

15.1.1.1.1.3.19 TAdoDbxCommand.set_DbConnection Method

Pascal

```
procedure set_DbConnection(Connection: DbConnection); override;
```

C++

```
virtual __fastcall set_DbConnection(DbConnection Connection);
```

Description

This is set_DbConnection, a member of class TAdoDbxCommand.

15.1.1.1.1.3.20 TAdoDbxCommand.set_DbTransaction Method

Pascal

```
procedure set_DbTransaction(Transaction: DbTransaction); override;
```

C++

```
virtual __fastcall set_DbTransaction(DbTransaction Transaction);
```

Description

This is set_DbTransaction, a member of class TAdoDbxCommand.

15.1.1.1.1.3.21 TAdoDbxCommand.set_DesignTimeVisible Method

Pascal

```
procedure set_DesignTimeVisible(DesignTimeVisible: Boolean); override;
```

C++

```
virtual __fastcall set_DesignTimeVisible(Boolean DesignTimeVisible);
```

Description

This is set_DesignTimeVisible, a member of class TAdoDbxCommand.

15.1.1.1.1.3.22 TAdoDbxCommand.set_UpdatedRowSource Method

Pascal

```
procedure set_UpdatedRowSource(UpdatedRowSource: UpdateRowSource); override;
```

C++

```
virtual __fastcall set_UpdatedRowSource(UpdateRowSource UpdatedRowSource);
```

Description

This is set_UpdatedRowSource, a member of class TAdoDbxCommand.

15.1.1.1.1.4 TAdoDbxCommand Properties

The properties of the TAdoDbxCommand class are listed here.

Public Properties

	Name	Description
	CommandText (see page 1772)	Gets or sets the SQL statement, table name, or stored procedure to execute at the data source.
	CommandTimeout (see page 1773)	Gets or sets the time, in seconds, before terminating a long-running SQL command.
	CommandType (see page 1773)	Gets or sets the CommandType that indicates how to interpret the CommandText (see page 1772) property.
	DesignTimeVisible (see page 1774)	Determines whether or not a command is visible at design time.
R	Parameters (see page 1774)	Returns the TAdoDbxParameterCollection (see page 1865).
	Transaction (see page 1774)	Provides the transaction in which the TAdoDbxCommand (see page 1763) executes.
	UpdateRowSource (see page 1775)	This is UpdateRowSource, a member of class TAdoDbxCommand.

15.1.1.1.1.4.1 TAdoDbxCommand.CommandText Property

Gets or sets the SQL statement, table name, or stored procedure to execute at the data source.

Pascal

```
property CommandText: String;
```

C++

```
__property AnsiString CommandText;
```

Description

When you set the CommandType (see page 1773) property to *StoredProcedure*, you set the CommandText property to the name of the stored procedure. You might need to use escape character syntax if your stored procedure name contains special characters, such as underscores. The command executes this stored procedure when you call either the ExecuteReader, ExecuteScalar (see page 1768), or ExecuteNonQuery (see page 1768) methods. When you set the CommandType (see page 1773) property to *TableDirect*, you set the CommandText property to the name of the table you want to access. You might need to use escape character syntax if any of the tables contain special characters.

See Also

CommandText (MSDN)

Building a VCL Forms dbExpress.NET Database Application

CommandType (see page 1773)

ExecuteNonQuery (see page 1768)

ExecuteReader

ExecuteScalar (see page 1768)

15.1.1.1.1.4.2 TAdoDbxCommand.CommandTimeout Property

Gets or sets the time, in seconds, before terminating a long-running SQL command.

Pascal

```
property CommandTimeout: Integer;
```

C++

```
__property int CommandTimeout;
```

Description

CommandTimeout gets or set the wait time in seconds before terminating a command and generating an error.

See Also

CommandTimeout (MSDN)

15.1.1.1.1.4.3 TAdoDbxCommand.CommandType Property

Gets or sets the CommandType that indicates how to interpret the CommandText (see page 1772) property.

Pascal

```
property CommandType: CommandType;
```

C++

```
__property CommandType CommandType;
```

Description

When you set the CommandType property to **StoredProcedure**, you should set the CommandText (see page 1772) property to the name of the stored procedure. The command executes this stored procedure when you call the ExecuteScalar (see page 1768), ExecuteReader, or ExecuteNonQuery (see page 1768) methods. The Connection, CommandType and CommandText (see page 1772) properties cannot be set if the current connection is performing an execute or fetch operation.

AdoDbxClient supports the ? symbol as a placeholder for passing parameters to a SQL statement or a stored procedure called by a TAdoDbxCommand (see page 1763) when CommandType is set to **Text**.

Type	Description
Text	A SQL command. Default.
TableDirect	If you set the CommandType property to **TableDirect**, set the CommandText (see page 1772) property to the name of the table you want to access. You might need to use escape characters or other qualifying characters if the tables contain special characters. When you call one of the Execute methods, the query returns all rows and columns.
StoredProcedure	The name of a stored procedure.

CommandType (MSDN)

CommandText (see page 1772)

ExecuteNonQuery (see page 1768)

ExecuteReader

ExecuteScalar (see page 1768)

15.1.1.1.1.4.4 TAdoDbxCommand.DesignTimeVisible Property

Determines whether or not a command is visible at design time.

Pascal

```
property DesignTimeVisible: Boolean;
```

C++

```
__property Boolean DesignTimeVisible;
```

Description

A boolean that can be set on a TAdoDbxCommand (see page 1763) to determine the command's visibility during design time.

Note: DesignTimeVisible is generally not of interest to end users, but to component writers extending ADO.NET providers.

See Also

DesignTimeVisible (MSDN)

15.1.1.1.1.4.5 TAdoDbxCommand.Parameters Property

Returns the TAdoDbxParameterCollection (see page 1865).

Pascal

```
property Parameters: DbParameterCollection;
```

C++

```
__property DbParameterCollection Parameters;
```

Description

The parameters of the SQL statement or stored procedure. The default is an empty collection.

You cannot use named parameters for passing parameters to a SQL Statement or a stored procedure called by a TAdoDbxCommand (see page 1763) when CommandType (see page 1773) is set to **Text**. In this case, the question mark (?) placeholder must be used. For example: `SELECT * FROM Employee WHERE EmployeeID = ?`. The order in which TAdoDbxParameter (see page 1850) objects are added to the TAdoDbxParameterCollection (see page 1865) must directly correspond to the position of the question mark placeholder for the parameter.

If the parameters in the collection do not match the requirements of the query to be executed, you may get an error.

See Also

Connection (MSDN)

TAdoDbxCommand (see page 1763)

TAdoDbxParameter (see page 1850)

TAdoDbxParameterCollection (see page 1865)

CommandType (see page 1773)

15.1.1.1.1.4.6 TAdoDbxCommand.Transaction Property

Provides the transaction in which the TAdoDbxCommand (see page 1763) executes.

Pascal

```
property Transaction: DbTransaction;
```

C++

```
__property DbTransaction Transaction;
```

Description

Transaction provides the transaction the command executes within. The transaction must already have been created prior to naming it with the Transaction property on the TAdoDbxCommand (see page 1763).

Warning: You cannot set the Transaction property if it is already set to a specific value and the command is in the process of executing. If you set the transaction property to a TAdoDbxTransaction (see page 1884) object that is not connected to the same TAdoDbxConnection (see page 1779) as the TAdoDbxCommand (see page 1763) object, an exception is thrown the next time you attempt to execute a statement.

```
connection.Open();
TAdoDbxTransaction transaction = connection.BeginTransaction();
string textSQL = "INSERT INTO Employee (...) VALUES (...)";
TAdoDbxCommand command = new TAdoDbxCommand(textSQL, connection, transaction);
int intRecordsAffected = command.ExecuteNonQuery();
if (intRecordsAffected == 1)
{
    MessageBox.Show("Row updated.");
    transaction.Commit();
}
else
{
    // No records affected
    MessageBox.Show("No row updated.");
    transaction.Rollback();
}
connection.Open();
TTrans: TTransaction.BeginTransaction(connection);
string textSQL = "INSERT INTO Employee (...) VALUES (...)";
TAdoDbxCommand command = new TAdoDbxCommand(textSQL, connection, TTrans);
int intRecordsAffected = command.ExecuteNonQuery();
if (intRecordsAffected == 1)
{
    MessageBox.Show("Row updated.");
    TTrans.Commit();
}
else
{
    // No records affected
    MessageBox("No row updated.", [smbOK]);
    TTrans.Rollback();
}
```

15.1.1.1.1.4.7 TAdoDbxCommand.UpdateRowSource Property

Pascal

```
property UpdateRowSource: UpdateRowSource;
```

C++

```
__property UpdateRowSource UpdateRowSource;
```

Description

This is UpdateRowSource, a member of class TAdoDbxCommand.

15.1.1.1.2 TAdoDbxCommandBuilder Class

Generates single-table commands as part of the operation of the TAdoDbxDataAdapter (see page 1814).

Class Hierarchy

Pascal

```
TAdoDbxCommandBuilder = class(DbCommandBuilder);
```

C++

```
class TAdoDbxCommandBuilder : public DbCommandBuilder;
```

File

Borland.Data.AdoDbxClientProvider

Description

The TAdoDbxCommandBuilder class is used to automatically generate single-table commands to reconcile changes made to a DataSet with its underlying database.

TAdoDbxCommandBuilder implements the ADO.NET DbCommandBuilder class.

You can generate SQL commands based on the SelectCommand property, which you must set prior to executing any of the other TAdoDbxCommandBuilder methods. The results of the SelectCommand are used to return metadata that is then used to construct the arguments to the InsertCommand, UpdateCommand, or DeleteCommand properties of TAdoDbxDataAdapter (see page 1814). If you want to achieve greater performance, you might want to consider using direct commands, rather than using the TAdoDbxCommandBuilder.

If you review the SQL statements generated for the UpdateCommand and DeleteCommand, you see that they each contain a `WHERE` clause that specifies that the row can only be updated if it contains all original values and hasn't been deleted from the database. Records are not locked and therefore the TAdoDbxCommandBuilder operates on the basis of optimistic concurrency. If you try to update or delete a record that has been changed by another user, the operation throws a DBConcurrencyException.

Note: You can only use the TAdoDbxCommandBuilder on standalone tables. If you try to update a column that participates in a foreign-key constraint, you might encounter a failure.

Warning: SelectCommand must return at least one primary key or unique column.

15.1.1.1.2.1 TAdoDbxCommandBuilder Members

The following tables list the members exposed by TAdoDbxCommandBuilder.

Public Methods

	Name	Description
	Create (see page 1777)	This is the overview for the Create constructor overload.

Strict protected Methods

	Name	Description
	AdoDbxRowUpdatingHandler (see page 1778)	This is AdoDbxRowUpdatingHandler, a member of class TAdoDbxCommandBuilder.
V	ApplyParameterInfo (see page 1778)	This is ApplyParameterInfo, a member of class TAdoDbxCommandBuilder.
V	GetParameterName (see page 1778)	This is the overview for the GetParameterName method overload.
V	GetParameterPlaceholder (see page 1779)	This is GetParameterPlaceholder, a member of class TAdoDbxCommandBuilder.
V	SetRowUpdatingHandler (see page 1779)	This is SetRowUpdatingHandler, a member of class TAdoDbxCommandBuilder.

15.1.1.1.2.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TAdoDbxCommandBuilder.Create () (see page 1777)	Creates an instance of TAdoDbxCommandBuilder (see page 1776)
	TAdoDbxCommandBuilder.Create (TAdoDbxDataAdapter) (see page 1777)	Creates an instance of TAdoDbxCommandBuilder (see page 1776)

15.1.1.1.2.2.1 TAdoDbxCommandBuilder.Create Constructor ()

Creates an instance of TAdoDbxCommandBuilder (see page 1776)

Pascal

```
constructor Create; overload;
constructor Create(Adapter: TAdoDbxDataAdapter); overload;
```

C++

```
__fastcall TAdoDbxCommandBuilder();
__fastcall TAdoDbxCommandBuilder(TAdoDbxDataAdapter Adapter);
```

Description

This constructor creates and initializes an instance of TAdoDbxCommandBuilder (see page 1776).

See Also

Create (MSDN)

15.1.1.1.2.3 TAdoDbxCommandBuilder Methods

The methods of the TAdoDbxCommandBuilder class are listed here.

Strict protected Methods

	Name	Description
	AdoDbxRowUpdatingHandler (see page 1778)	This is AdoDbxRowUpdatingHandler, a member of class TAdoDbxCommandBuilder.

	ApplyParameterInfo (see page 1778)	This is ApplyParameterInfo, a member of class TAdoDbxCommandBuilder.
	GetParameterName (see page 1778)	This is the overview for the GetParameterName method overload.
	GetParameterPlaceholder (see page 1779)	This is GetParameterPlaceholder, a member of class TAdoDbxCommandBuilder.
	SetRowUpdatingHandler (see page 1779)	This is SetRowUpdatingHandler, a member of class TAdoDbxCommandBuilder.

15.1.1.1.2.3.1 TAdoDbxCommandBuilder.AdoDbxRowUpdatingHandler Method

Pascal

```
procedure AdoDbxRowUpdatingHandler(Sender: System.Object; e: TAdoDbxRowUpdatingEventArgs);
```

C++

```
__fastcall AdoDbxRowUpdatingHandler(System.Object Sender, TAdoDbxRowUpdatingEventArgs e);
```

Description

This is AdoDbxRowUpdatingHandler, a member of class TAdoDbxCommandBuilder.

15.1.1.1.2.3.2 TAdoDbxCommandBuilder.ApplyParameterInfo Method

Pascal

```
procedure ApplyParameterInfo(parameter: DbParameter; row: DataRow; statementType:
StatementType; whereClause: Boolean); override;
```

C++

```
virtual __fastcall ApplyParameterInfo(DbParameter parameter, DataRow row, StatementType
statementType, Boolean whereClause);
```

Description

This is ApplyParameterInfo, a member of class TAdoDbxCommandBuilder.

15.1.1.1.2.3.3 GetParameterName Method

This is the overview for the GetParameterName method overload.

Overload List

	Name	Description
	TAdoDbxCommandBuilder.GetParameterName (Integer) (see page 1778)	This is GetParameterName, a member of class TAdoDbxCommandBuilder.
	TAdoDbxCommandBuilder.GetParameterName (string) (see page 1779)	This is GetParameterName, a member of class TAdoDbxCommandBuilder.

15.1.1.1.2.3.3.1 TAdoDbxCommandBuilder.GetParameterName Method (Integer)

Pascal

```
function GetParameterName(parameterOrdinal: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString GetParameterName(int parameterOrdinal);
```

Description

This is GetParameterName, a member of class TAdoDbxCommandBuilder.

15.1.1.1.2.3.3.2 TAdoDbxCommandBuilder.GetParameterName Method (string)

Pascal

```
function GetParameterName(parameterName: string): string; override;
```

C++

```
virtual __fastcall AnsiString GetParameterName(AnsiString parameterName);
```

Description

This is GetParameterName, a member of class TAdoDbxCommandBuilder.

15.1.1.1.2.3.4 TAdoDbxCommandBuilder.GetParameterPlaceholder Method

Pascal

```
function GetParameterPlaceholder(parameterOrdinal: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString GetParameterPlaceholder(int parameterOrdinal);
```

Description

This is GetParameterPlaceholder, a member of class TAdoDbxCommandBuilder.

15.1.1.1.2.3.5 TAdoDbxCommandBuilder.SetRowUpdatingHandler Method

Pascal

```
procedure SetRowUpdatingHandler(adapter: DbDataAdapter); override;
```

C++

```
virtual __fastcall SetRowUpdatingHandler(DbDataAdapter adapter);
```

Description

This is SetRowUpdatingHandler, a member of class TAdoDbxCommandBuilder.

15.1.1.1.3 TAdoDbxConnection Class

Represents a connection to a database.

Class Hierarchy

Pascal

```
TAdoDbxConnection = class(DbConnection, ICloneable);
```

C++

```
class TAdoDbxConnection : public DbConnection, public ICloneable;
```

File

Borland.Data.AdoDbxClientProvider

Description

TAdoDbxConnection represents a connection to a database. Upon creation of the object instance, all properties are set to their initial values. You must explicitly close any open connection using the Close (see page 1785) method. There is no notion of an implicit disconnection in the .NET environment.

TAdoDbxConnection is an implementation of the ADO.NET DbConnection class.

To establish a database connection, you must create a new TAdoDbxConnection object and you must set its ConnectionString (see page 1788) property. The ConnectionString (see page 1788) is a name-value pair of all the parameters needed to connect to a particular database.

TAdoDbxConnection has Open (see page 1787) and Close (see page 1785) methods to connect and disconnect from a database. The Open (see page 1787) method uses the connection parameters specified in the ConnectionString (see page 1788) property to establish a connection to a database. For every Open (see page 1787) method, you should include a corresponding Close (see page 1785) method. Otherwise, the connection might not be closed properly and any subsequent connection attempt will fail with an exception.

A valid connection must be opened before you can use the TAdoDbxConnection to create a new TAdoDbxCommand (see page 1763) or call BeginTransaction to create a new TAdoDbxTransaction (see page 1884) instance.

The following Delphi code shows the ConnectionString (see page 1788) needed to connect to InterBase.

```
// Here is a simple way to connect to an “IBCONNECTION” connection from the dbxconnections.ini file:

    Factory := System.Data.Common.DbProviderFactories.GetFactory('Borland.Data.AdoDbxClient');
    Connection := Factory.CreateConnection();
    Connection.ConnectionString := 'ConnectionName=' + ‘IBCONNECTION’;
    Connection.Open;
```

15.1.1.1.3.1 TAdoDbxConnection Members

The following tables list the members exposed by TAdoDbxConnection.

Public Methods

	Name	Description
	ChangeDatabase (see page 1784)	Changes the current database for a connection.
	Clone (see page 1785)	This is Clone, a member of class TAdoDbxConnection.
	Close (see page 1785)	Close database connection.
	Create (see page 1781)	This is the overview for the Create constructor overload.
	Destroy (see page 1782)	Destroys a TAdoDbxConnection (see page 1779) instance.
	get_ConnectionString (see page 1785)	This is get_ConnectionString, a member of class TAdoDbxConnection.
	get_ConnectionTimeout (see page 1786)	This is get_ConnectionTimeout, a member of class TAdoDbxConnection.
	get_Database (see page 1786)	This is get_Database, a member of class TAdoDbxConnection.
	get_DataSource (see page 1786)	This is get_DataSource, a member of class TAdoDbxConnection.
	get_ServerVersion (see page 1786)	This is get_ServerVersion, a member of class TAdoDbxConnection.
	get_State (see page 1786)	This is get_State, a member of class TAdoDbxConnection.

V	GetSchema (see page 1787)	This is the overview for the GetSchema method overload.
V	Open (see page 1787)	Opens a connection to a database using the connection string parameters.
V	set_ConnectionString (see page 1788)	This is set_ConnectionString, a member of class TAdoDbxConnection.

Public Properties

	Name	Description
	ConnectionString (see page 1788)	Contains the property settings necessary to connect to a database.
R	ConnectionTimeout (see page 1789)	Returns the time to wait while trying to establish a connection.
R	Database (see page 1789)	Contains the name of the current database or the database to be connected.
R	DataSource (see page 1789)	Name of database server to which to connect.
R	Dbx (see page 1790)	This is Dbx, a member of class TAdoDbxConnection.
R	ServerVersion (see page 1790)	Server version of connected database
R	State (see page 1790)	Gets or sets the current state of the connection.

Strict private Fields

	Name	Description
	FConnectionString (see page 1782)	This is FConnectionString, a member of class TAdoDbxConnection.
	FConnectionTimeout (see page 1783)	This is FConnectionTimeout, a member of class TAdoDbxConnection.
	FDbxExtension (see page 1783)	This is FDbxExtension, a member of class TAdoDbxConnection.
	FDriverName (see page 1783)	This is FDriverName, a member of class TAdoDbxConnection.
	FSchemaItems (see page 1783)	This is FSchemaItems, a member of class TAdoDbxConnection.

Strict private Methods

	Name	Description
	AdoDbxIsolation (see page 1784)	This is AdoDbxIsolation, a member of class TAdoDbxConnection.

Strict protected Methods

	Name	Description
V	BeginDbTransaction (see page 1784)	This is BeginDbTransaction, a member of class TAdoDbxConnection.
V	CreateDbCommand (see page 1785)	This is CreateDbCommand, a member of class TAdoDbxConnection.

15.1.1.1.3.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TAdoDbxConnection.Create () (see page 1781)	Creates a new instance of a TAdoDbxConnection (see page 1779) object, which represents an open connection to a specified data source.
	TAdoDbxConnection.Create (string) (see page 1781)	Creates a new instance of a TAdoDbxConnection (see page 1779) object, which represents an open connection to a specified data source.

15.1.1.1.3.2.1 TAdoDbxConnection.Create Constructor ()

Creates a new instance of a TAdoDbxConnection (see page 1779) object, which represents an open connection to a specified data source.

Pascal

```
constructor Create; overload;
constructor Create(const ConnectionString: string); overload;
```

C++

```
__fastcall TAdoDbxConnection();
__fastcall TAdoDbxConnection(const AnsiString ConnectionString);
```

Description

The TAdoDbxConnection (see page 1779) object represents a connection to a specified data source. The TAdoDbxConnection (see page 1779) object contains the connection string, along with other properties. You need to explicitly open and close connections using the Open (see page 1787) and Close (see page 1785) methods, respectively. There is no notion in the .NET framework of an implicit open or close operation.

See Also

Create (MSDN)

Close (see page 1785)

Open (see page 1787)

15.1.1.1.3.3 TAdoDbxConnection.Destroy Destructor

Destroys a TAdoDbxConnection (see page 1779) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdoDbxConnection();
```

Description

This method destroys a TAdoDbxConnection (see page 1779) instance, freeing all its resources.

Note: This method should not be called directly. Call either the Close (see page 1785) or Free method instead.

See Also

Close (see page 1785)

Create (see page 1781)

15.1.1.1.3.4 TAdoDbxConnection Fields

The fields of the TAdoDbxConnection class are listed here.

Strict private Fields

	Name	Description
	FConnectionString (see page 1782)	This is FConnectionString, a member of class TAdoDbxConnection.
	FConnectionTimeout (see page 1783)	This is FConnectionTimeout, a member of class TAdoDbxConnection.
	FDbxExtension (see page 1783)	This is FDbxExtension, a member of class TAdoDbxConnection.
	FDriverName (see page 1783)	This is FDriverName, a member of class TAdoDbxConnection.
	FSchemaItems (see page 1783)	This is FSchemaItems, a member of class TAdoDbxConnection.

15.1.1.1.3.4.1 TAdoDbxConnection.FConnectionString Field

Pascal

```
class var FConnectionString: String;
```

C++

```
AnsiString FConnectionString;
```

Description

This is FConnectionString, a member of class TAdoDbxConnection.

15.1.1.1.3.4.2 TAdoDbxConnection.FConnectionTimeout Field

Pascal

```
class var FConnectionTimeout: Integer;
```

C++

```
int FConnectionTimeout;
```

Description

This is FConnectionTimeout, a member of class TAdoDbxConnection.

15.1.1.1.3.4.3 TAdoDbxConnection.FDbxExtension Field

Pascal

```
class var FDbxExtension: TAdoDbxExtension;
```

C++

```
TAdoDbxExtension FDbxExtension;
```

Description

This is FDbxExtension, a member of class TAdoDbxConnection.

15.1.1.1.3.4.4 TAdoDbxConnection.FDriverName Field

Pascal

```
class var FDriverName: String;
```

C++

```
AnsiString FDriverName;
```

Description

This is FDriverName, a member of class TAdoDbxConnection.

15.1.1.1.3.4.5 TAdoDbxConnection.FSchemaItems Field

Pascal

```
class var FSchemaItems: TStringList;
```

C++

```
TStringList FSchemaItems;
```

Description

This is FSchemaItems, a member of class TAdoDbxConnection.

15.1.1.1.3.5 TAdoDbxConnection Methods

The methods of the TAdoDbxConnection class are listed here.

Public Methods

	Name	Description
	ChangeDatabase (see page 1784)	Changes the current database for a connection.

	Clone (see page 1785)	This is Clone, a member of class TAdoDbxConnection.
	Close (see page 1785)	Close database connection.
	get_ConnectionString (see page 1785)	This is get_ConnectionString, a member of class TAdoDbxConnection.
	get_ConnectionTimeout (see page 1786)	This is get_ConnectionTimeout, a member of class TAdoDbxConnection.
	get_Database (see page 1786)	This is get_Database, a member of class TAdoDbxConnection.
	get_DataSource (see page 1786)	This is get_DataSource, a member of class TAdoDbxConnection.
	get_ServerVersion (see page 1786)	This is get_ServerVersion, a member of class TAdoDbxConnection.
	get_State (see page 1786)	This is get_State, a member of class TAdoDbxConnection.
	GetSchema (see page 1787)	This is the overview for the GetSchema method overload.
	Open (see page 1787)	Opens a connection to a database using the connection string parameters.
	set_ConnectionString (see page 1788)	This is set_ConnectionString, a member of class TAdoDbxConnection.

Strict private Methods

	Name	Description
	AdoDbxIsolation (see page 1784)	This is AdoDbxIsolation, a member of class TAdoDbxConnection.

Strict protected Methods

	Name	Description
	BeginDbTransaction (see page 1784)	This is BeginDbTransaction, a member of class TAdoDbxConnection.
	CreateDbCommand (see page 1785)	This is CreateDbCommand, a member of class TAdoDbxConnection.

15.1.1.1.3.5.1 TAdoDbxConnection.AdoDbxIsolation Method

Pascal

```
function AdoDbxIsolation(Isolation: IsolationLevel): TDBXIsolation;
```

C++

```
__fastcall TDBXIsolation AdoDbxIsolation(IsolationLevel Isolation);
```

Description

This is AdoDbxIsolation, a member of class TAdoDbxConnection.

15.1.1.1.3.5.2 TAdoDbxConnection.BeginDbTransaction Method

Pascal

```
function BeginDbTransaction(Isolation: IsolationLevel): DbTransaction; override;
```

C++

```
virtual __fastcall DbTransaction BeginDbTransaction(IsolationLevel Isolation);
```

Description

This is BeginDbTransaction, a member of class TAdoDbxConnection.

15.1.1.1.3.5.3 TAdoDbxConnection.ChangeDatabase Method

Changes the current database for a connection.

Pascal

```
procedure ChangeDatabase(DatabaseName: String); override;
```

C++

```
virtual __fastcall ChangeDatabase(AnsiString DatabaseName);
```

Description

ChangeDatabase switches the connection to a specified database.

See Also

ChangeDatabase (MSDN)

15.1.1.1.3.5.4 TAdoDbxConnection.Clone Method

Pascal

```
function Clone: TObject;
```

C++

```
__fastcall TObject * Clone();
```

Description

This is Clone, a member of class TAdoDbxConnection.

15.1.1.1.3.5.5 TAdoDbxConnection.Close Method

Close database connection.

Pascal

```
procedure Close; override;
```

C++

```
virtual __fastcall Close();
```

Description

Close rolls back any pending transactions and releases the connection to the connection pool or closes the connection if there is no pool. Calling Close more than once does not raise an exception.

See Also

Close (MSDN)

15.1.1.1.3.5.6 TAdoDbxConnection.CreateDbCommand Method

Pascal

```
function CreateDbCommand: DbCommand; override;
```

C++

```
virtual __fastcall DbCommand CreateDbCommand();
```

Description

This is CreateDbCommand, a member of class TAdoDbxConnection.

15.1.1.1.3.5.7 TAdoDbxConnection.get_ConnectionString Method

Pascal

```
function get_ConnectionString: String; override;
```

C++

```
virtual __fastcall AnsiString get_ConnectionString();
```

Description

This is get_ConnectionString, a member of class TAdoDbxConnection.

15.1.1.1.3.5.8 TAdoDbxConnection.get_ConnectionTimeout Method

Pascal

```
function get_ConnectionTimeout: Integer; override;
```

C++

```
virtual __fastcall int get_ConnectionTimeout();
```

Description

This is get_ConnectionTimeout, a member of class TAdoDbxConnection.

15.1.1.1.3.5.9 TAdoDbxConnection.get_Database Method

Pascal

```
function get_Database: String; override;
```

C++

```
virtual __fastcall AnsiString get_Database();
```

Description

This is get_Database, a member of class TAdoDbxConnection.

15.1.1.1.3.5.10 TAdoDbxConnection.get_DataSource Method

Pascal

```
function get_DataSource: String; override;
```

C++

```
virtual __fastcall AnsiString get_DataSource();
```

Description

This is get_DataSource, a member of class TAdoDbxConnection.

15.1.1.1.3.5.11 TAdoDbxConnection.get_ServerVersion Method

Pascal

```
function get_ServerVersion: String; override;
```

C++

```
virtual __fastcall AnsiString get_ServerVersion();
```

Description

This is get_ServerVersion, a member of class TAdoDbxConnection.

15.1.1.1.3.5.12 TAdoDbxConnection.get_State Method

Pascal

```
function get_State: ConnectionState; override;
```

C++

```
virtual __fastcall ConnectionState get_State();
```

Description

This is get_State, a member of class TAdoDbxConnection.

15.1.1.1.3.5.13 GetSchema Method

This is the overview for the GetSchema method overload.

Overload List

	Name	Description
	TAdoDbxConnection.GetSchema () (see page 1787)	Gets schema information for the connected data source.
	TAdoDbxConnection.GetSchema (String) (see page 1787)	Gets schema information for the connected data source.
	TAdoDbxConnection.GetSchema (String, array of String) (see page 1787)	Gets schema information for the connected data source.

15.1.1.1.3.5.13.1 TAdoDbxConnection.GetSchema Method ()

Gets schema information for the connected data source.

Pascal

```
function GetSchema: DataTable; override;
function GetSchema(Name: String): DataTable; override;
function GetSchema(Name: String; Restrictions: array of String): DataTable; override;
```

C++

```
virtual __fastcall DataTable GetSchema();
virtual __fastcall DataTable GetSchema(AnsiString Name);
virtual __fastcall DataTable GetSchema(AnsiString Name, array of String Restrictions);
```

Description

GetSchema obtains a DataTable with schema information for the connected data source.

The Name parameter specifies the kind of metadata to get. The standard names supported by DbConnection.GetSchema are supported.

In addition, you can specify one of the name constants in the DBXMetaDataNames (see page 10685) class TDBXMetaDataCollectionName to get a particular metadata collection. You would then use the corresponding class in the DBXMetaDataNames (see page 10685) namespace to get the column information you want for that metadata collection.

For instance, to get procedure source code in a database, use the constant ProcedureSources to get a DataTable with procedure source information. Use the DBXMetaDataNames (see page 10685) classes TDBXProcedureSourcesColumns and TDBXProcedureSourcesIndex with the returned DataTable to access the procedure source information by name or ordinal.

See Also

GetSchema (MSDN)

TDBXMetaDataCollectionName (see page 10758)

TDBXProcedureSourcesColumns (see page 10807)

TDBXProcedureSourcesIndex (see page 10810)

15.1.1.1.3.5.14 TAdoDbxConnection.Open Method

Opens a connection to a database using the connection string parameters.

Pascal

```
procedure Open; override;
```

C++

```
virtual __fastcall Open();
```

Description

Open opens a connection to a database using the ConnectionString (see page 1788) parameters. The ConnectionString (see page 1788) property must be set before opening a connection. You must separate keyword value pairs by semicolons (;). Names are not case sensitive. Most applications only need to set the ConnectionName name property, which identifies a collection of properties stored in a dbxconnections.ini file. Alternatively, an application can specify all properties from the dbxconnections.ini and dbxdriver.ini file for the database being connected to.

See Also

Open (MSDN)

ConnectionString (see page 1788)

15.1.1.1.3.5.15 TAdoDbxConnection.set_ConnectionString Method

Pascal

```
procedure set_ConnectionString(ConnectionString: String); override;
```

C++

```
virtual __fastcall set_ConnectionString(AnsiString ConnectionString);
```

Description

This is set_ConnectionString, a member of class TAdoDbxConnection.

15.1.1.1.3.6 TAdoDbxConnection Properties

The properties of the TAdoDbxConnection class are listed here.

Public Properties

	Name	Description
	ConnectionString (see page 1788)	Contains the property settings necessary to connect to a database.
R	ConnectionTimeout (see page 1789)	Returns the time to wait while trying to establish a connection.
R	Database (see page 1789)	Contains the name of the current database or the database to be connected.
R	DataSource (see page 1789)	Name of database server to which to connect.
R	Dbx (see page 1790)	This is Dbx, a member of class TAdoDbxConnection.
R	ServerVersion (see page 1790)	Server version of connected database
R	State (see page 1790)	Gets or sets the current state of the connection.

15.1.1.1.3.6.1 TAdoDbxConnection.ConnectionString Property

Contains the property settings necessary to connect to a database.

Pascal

```
property ConnectionString: String;
```

C++

```
__property AnsiString ConnectionString;
```

Description

The ConnectionString property must be set before opening a connection. These keyword-value pairs must be separated by semicolons (;). You can delimit values with single or double quotes. Names are not case sensitive.

Most applications only need to set the ConnectionName property, which identifies a collection of properties stored in a

dbxconnections.ini file. Alternatively, an application can specify all properties from the dbxconnections.ini and dbxdriver.ini file for the database being connected to.

Many of the connection string values have corresponding read-only properties.

See Also

ConnectionString (MSDN)

ConnectionName (see page 1806)

15.1.1.1.3.6.2 TAdoDbxConnection.ConnectionTimeout Property

Returns the time to wait while trying to establish a connection.

Pascal

```
property ConnectionTimeout: Integer;
```

C++

```
__property int ConnectionTimeout;
```

Description

ConnectionTimeout contains the number of seconds to wait while trying to establish a connection before terminating the attempt and generating an error.

See Also

ConnectionTimeout (MSDN)

15.1.1.1.3.6.3 TAdoDbxConnection.Database Property

Contains the name of the current database or the database to be connected.

Pascal

```
property Database: String;
```

C++

```
__property AnsiString Database;
```

Description

Database contains the name of the current database or the database to be connected. You can get or set the database name.

See Also

Database (MSDN)

15.1.1.1.3.6.4 TAdoDbxConnection.DataSource Property

Name of database server to which to connect.

Pascal

```
property DataSource: String;
```

C++

```
__property AnsiString DataSource;
```

Description

DataSource holds the name of database server to which to connect.

See Also

DataSource (MSDN)

15.1.1.1.3.6.5 TAdoDbxConnection.Dbx Property

Pascal

```
property Dbx: TAdoDbxExtension;
```

C++

```
__property TAdoDbxExtension Dbx;
```

Description

This is Dbx, a member of class TAdoDbxConnection.

15.1.1.1.3.6.6 TAdoDbxConnection.ServerVersion Property

Server version of connected database

Pascal

```
property ServerVersion: String;
```

C++

```
__property AnsiString ServerVersion;
```

Description

ServerVersion contains a string representing the server version of connected database.

See Also

ServerVersion (MSDN)

15.1.1.1.3.6.7 TAdoDbxConnection.State Property

Gets or sets the current state of the connection.

Pascal

```
property State: ConnectionState;
```

C++

```
__property ConnectionState State;
```

Description

State contains the current connection state value. The format of the string returned depends on the specific type of connection you are using.

See Also

State (MSDN)

15.1.1.1.4 TAdoDbxConnectionStringBuilder Class

Class for strongly typed connection string builder.

Class Hierarchy

Pascal

```
TAdoDbxConnectionStringBuilder = class(DbConnectionStringBuilder);
```

C++

```
class TAdoDbxConnectionStringBuilder : public DbConnectionStringBuilder;
```

File

Borland.Data.AdoDbxClientProvider

Description

The TAdoDbxConnectionStringBuilder class provides a mechanism for building connection strings in a strongly typed manner. Connection string builders create and edit syntactically correct connection strings.

TAdoDbxConnectionStringBuilder is an implementation of the ADO.NET DbConnectionStringBuilder class.

Users can derive classes from this base class to assign arbitrary key-value pairs that can be tailored for a particular provider. Applications that need to provide connection strings can use TAdoDbxConnectionStringBuilder or one of its derived classes to create and modify connection strings.

This class makes no checks on strings, so it is possible to build invalid connection strings.

The properties in TAdoDbxConnectionStringBuilder correspond to the constants in DBXCommon.TDBXPropertyNames (see page 10566).

See Also

DbConnectionStringBuilder (MSDN)

TDBXPropertyNames (see page 10566)

15.1.1.1.4.1 TAdoDbxConnectionStringBuilder Members

The following tables list the members exposed by TAdoDbxConnectionStringBuilder.

Public Methods

	Name	Description
	Create (see page 1793)	Creates an instance of TAdoDbxConnectionStringBuilder (see page 1790)
	get_ConnectionName (see page 1795)	This is get_ConnectionName, a member of class TAdoDbxConnectionStringBuilder.
	get_Database (see page 1795)	This is get_Database, a member of class TAdoDbxConnectionStringBuilder.
	get_DelegateConnection (see page 1795)	This is get_DelegateConnection, a member of class TAdoDbxConnectionStringBuilder.
	get_DelegateDriver (see page 1795)	This is get_DelegateDriver, a member of class TAdoDbxConnectionStringBuilder.
	get_DriverAssembly (see page 1795)	This is get_DriverAssembly, a member of class TAdoDbxConnectionStringBuilder.
	get_DriverAssemblyLoader (see page 1796)	This is get_DriverAssemblyLoader, a member of class TAdoDbxConnectionStringBuilder.
	get_DriverName (see page 1796)	This is get_DriverName, a member of class TAdoDbxConnectionStringBuilder.
	get_DriverPackage (see page 1796)	This is get_DriverPackage, a member of class TAdoDbxConnectionStringBuilder.
	get_DriverPackageLoader (see page 1796)	This is get_DriverPackageLoader, a member of class TAdoDbxConnectionStringBuilder.
	get_DriverUnit (see page 1796)	This is get_DriverUnit, a member of class TAdoDbxConnectionStringBuilder.
	get_ErrorResourceFile (see page 1797)	This is get_ErrorResourceFile, a member of class TAdoDbxConnectionStringBuilder.
	get_GetDriverFunc (see page 1797)	This is get_GetDriverFunc, a member of class TAdoDbxConnectionStringBuilder.
	get_HostName (see page 1797)	This is get_HostName, a member of class TAdoDbxConnectionStringBuilder.
	get_IsolationLevel (see page 1797)	This is get_IsolationLevel, a member of class TAdoDbxConnectionStringBuilder.
V	get_Item (see page 1797)	This is get_Item, a member of class TAdoDbxConnectionStringBuilder.
	get_LibraryName (see page 1798)	This is get_LibraryName, a member of class TAdoDbxConnectionStringBuilder.

	get_MaxBlobSize (see page 1798)	This is get_MaxBlobSize, a member of class TAdoDbxConnectionStringBuilder.
	get_MetaDataAssemblyLoader (see page 1798)	This is get_MetaDataAssemblyLoader, a member of class TAdoDbxConnectionStringBuilder.
	get_MetaDataPackageLoader (see page 1798)	This is get_MetaDataPackageLoader, a member of class TAdoDbxConnectionStringBuilder.
	get_Password (see page 1798)	This is get_Password, a member of class TAdoDbxConnectionStringBuilder.
	get_Port (see page 1799)	This is get_Port, a member of class TAdoDbxConnectionStringBuilder.
	get_ProductVersion (see page 1799)	This is get_ProductVersion, a member of class TAdoDbxConnectionStringBuilder.
	get_Role (see page 1799)	This is get_Role, a member of class TAdoDbxConnectionStringBuilder.
	get_SchemaOverride (see page 1799)	This is get_SchemaOverride, a member of class TAdoDbxConnectionStringBuilder.
	get_User_Name (see page 1799)	This is get_User_Name, a member of class TAdoDbxConnectionStringBuilder.
	get_VendorLib (see page 1800)	This is get_VendorLib, a member of class TAdoDbxConnectionStringBuilder.
	set_ConnectionName (see page 1800)	This is set_ConnectionName, a member of class TAdoDbxConnectionStringBuilder.
	set_Database (see page 1800)	This is set_Database, a member of class TAdoDbxConnectionStringBuilder.
	set_DelegateConnection (see page 1800)	This is set_DelegateConnection, a member of class TAdoDbxConnectionStringBuilder.
	set_DelegateDriver (see page 1800)	This is set_DelegateDriver, a member of class TAdoDbxConnectionStringBuilder.
	set_DriverAssembly (see page 1801)	This is set_DriverAssembly, a member of class TAdoDbxConnectionStringBuilder.
	set_DriverAssemblyLoader (see page 1801)	This is set_DriverAssemblyLoader, a member of class TAdoDbxConnectionStringBuilder.
	set_DriverName (see page 1801)	This is set_DriverName, a member of class TAdoDbxConnectionStringBuilder.
	set_DriverPackage (see page 1801)	This is set_DriverPackage, a member of class TAdoDbxConnectionStringBuilder.
	set_DriverPackageLoader (see page 1801)	This is set_DriverPackageLoader, a member of class TAdoDbxConnectionStringBuilder.
	set_DriverUnit (see page 1802)	This is set_DriverUnit, a member of class TAdoDbxConnectionStringBuilder.
	set_ErrorResourceFile (see page 1802)	This is set_ErrorResourceFile, a member of class TAdoDbxConnectionStringBuilder.
	set_GetDriverFunc (see page 1802)	This is set_GetDriverFunc, a member of class TAdoDbxConnectionStringBuilder.
	set_HostName (see page 1802)	This is set_HostName, a member of class TAdoDbxConnectionStringBuilder.
	set_IsolationLevel (see page 1802)	This is set_IsolationLevel, a member of class TAdoDbxConnectionStringBuilder.
	set_Item (see page 1803)	This is set_Item, a member of class TAdoDbxConnectionStringBuilder.
	set_LibraryName (see page 1803)	This is set_LibraryName, a member of class TAdoDbxConnectionStringBuilder.
	set_MaxBlobSize (see page 1803)	This is set_MaxBlobSize, a member of class TAdoDbxConnectionStringBuilder.
	set_MetaDataAssemblyLoader (see page 1803)	This is set_MetaDataAssemblyLoader, a member of class TAdoDbxConnectionStringBuilder.
	set_MetaDataPackageLoader (see page 1803)	This is set_MetaDataPackageLoader, a member of class TAdoDbxConnectionStringBuilder.
	set_Password (see page 1804)	This is set_Password, a member of class TAdoDbxConnectionStringBuilder.
	set_Port (see page 1804)	This is set_Port, a member of class TAdoDbxConnectionStringBuilder.
	set_ProductVersion (see page 1804)	This is set_ProductVersion, a member of class TAdoDbxConnectionStringBuilder.
	set_Role (see page 1804)	This is set_Role, a member of class TAdoDbxConnectionStringBuilder.
	set_SchemaOverride (see page 1804)	This is set_SchemaOverride, a member of class TAdoDbxConnectionStringBuilder.
	set_User_Name (see page 1805)	This is set_User_Name, a member of class TAdoDbxConnectionStringBuilder.
	set_VendorLib (see page 1805)	This is set_VendorLib, a member of class TAdoDbxConnectionStringBuilder.
	TryGetValue (see page 1805)	Gets key value.

Public Properties

	Name	Description
	ConnectionName (see page 1806)	Name of connection.
	DelegateDriver (see page 1807)	Driver is a delegate.
	DriverName (see page 1808)	Unique name for a dbExpress driver.
	ErrorResourceFile (see page 1809)	Specify a localized error message file for Linux.

Published Properties

	Name	Description
	Database (see page 1806)	Name of a database to connect to.
	DelegateConnection (see page 1807)	Delegate connection used by this connection.
	DriverAssembly (see page 1807)	Used to load a managed driver dynamically.
	DriverAssemblyLoader (see page 1808)	Used to load a managed driver dynamically from an assembly.
	DriverPackage (see page 1808)	Used to load a native driver dynamically.
	DriverPackageLoader (see page 1809)	Native Driver loader class used to load a native driver dynamically from a package.
	DriverUnit (see page 1809)	Used to provide informative error message when driver cannot be loaded.
	GetDriverFunc (see page 1809)	Exported entry point for loading a driver prior to dbExpress 4.
	HostName (see page 1810)	Host name of a database server.
	IsolationLevel (see page 1810)	Initial transaction isolation to use when connecting to a database.
	LibraryName (see page 1811)	Name of the DBXDynalink DLL.
	MaxBlobSize (see page 1811)	Maximum BLOB size.
	MetaDataAssemblyLoader (see page 1811)	Used to load a managed driver dynamically from an assembly.
	MetaDataPackageLoader (see page 1811)	Class used to load a native driver dynamically from a package.
	Password (see page 1812)	Login password name.
	Port (see page 1812)	Port number of a database server.
	ProductVersion (see page 1812)	Driver product version.
	Role (see page 1813)	Login role.
	SchemaOverride (see page 1813)	VCL components use this setting to scope metadata requests.
	User_Name (see page 1814)	This is User_Name, a member of class TAdoDbxConnectionStringBuilder.
	VendorLib (see page 1814)	Name of a vendor specific client library.

15.1.1.1.4.2 TAdoDbxConnectionStringBuilder.Create Constructor

Creates an instance of TAdoDbxConnectionStringBuilder (see page 1790)

Pascal

```
constructor Create;
```

C++

```
__fastcall TAdoDbxConnectionStringBuilder();
```

Description

This constructor creates and initializes an instance of TAdoDbxConnectionStringBuilder (see page 1790).

Create (MSDN)

15.1.1.1.4.3 TAdoDbxConnectionStringBuilder Methods

The methods of the TAdoDbxConnectionStringBuilder class are listed here.

Public Methods

	Name	Description
	get_ConnectionName (see page 1795)	This is get_ConnectionName, a member of class TAdoDbxConnectionStringBuilder.
	get_Database (see page 1795)	This is get_Database, a member of class TAdoDbxConnectionStringBuilder.
	get_DelegateConnection (see page 1795)	This is get_DelegateConnection, a member of class TAdoDbxConnectionStringBuilder.
	get_DelegateDriver (see page 1795)	This is get_DelegateDriver, a member of class TAdoDbxConnectionStringBuilder.
	get_DriverAssembly (see page 1795)	This is get_DriverAssembly, a member of class TAdoDbxConnectionStringBuilder.

	get_DriverAssemblyLoader (see page 1796)	This is get_DriverAssemblyLoader, a member of class TAdoDbxConnectionStringBuilder.
	get_DriverName (see page 1796)	This is get_DriverName, a member of class TAdoDbxConnectionStringBuilder.
	get_DriverPackage (see page 1796)	This is get_DriverPackage, a member of class TAdoDbxConnectionStringBuilder.
	get_DriverPackageLoader (see page 1796)	This is get_DriverPackageLoader, a member of class TAdoDbxConnectionStringBuilder.
	get_DriverUnit (see page 1796)	This is get_DriverUnit, a member of class TAdoDbxConnectionStringBuilder.
	get_ErrorResourceFile (see page 1797)	This is get_ErrorResourceFile, a member of class TAdoDbxConnectionStringBuilder.
	get_GetDriverFunc (see page 1797)	This is get_GetDriverFunc, a member of class TAdoDbxConnectionStringBuilder.
	get_HostName (see page 1797)	This is get_HostName, a member of class TAdoDbxConnectionStringBuilder.
	get_IsolationLevel (see page 1797)	This is get_IsolationLevel, a member of class TAdoDbxConnectionStringBuilder.
	get_Item (see page 1797)	This is get_Item, a member of class TAdoDbxConnectionStringBuilder.
	get_LibraryName (see page 1798)	This is get_LibraryName, a member of class TAdoDbxConnectionStringBuilder.
	get_MaxBlobSize (see page 1798)	This is get_MaxBlobSize, a member of class TAdoDbxConnectionStringBuilder.
	get_MetaDataAssemblyLoader (see page 1798)	This is get_MetaDataAssemblyLoader, a member of class TAdoDbxConnectionStringBuilder.
	get_MetaDataPackageLoader (see page 1798)	This is get_MetaDataPackageLoader, a member of class TAdoDbxConnectionStringBuilder.
	get_Password (see page 1798)	This is get_Password, a member of class TAdoDbxConnectionStringBuilder.
	get_Port (see page 1799)	This is get_Port, a member of class TAdoDbxConnectionStringBuilder.
	get_ProductVersion (see page 1799)	This is get_ProductVersion, a member of class TAdoDbxConnectionStringBuilder.
	get_Role (see page 1799)	This is get_Role, a member of class TAdoDbxConnectionStringBuilder.
	get_SchemaOverride (see page 1799)	This is get_SchemaOverride, a member of class TAdoDbxConnectionStringBuilder.
	get_User_Name (see page 1799)	This is get_User_Name, a member of class TAdoDbxConnectionStringBuilder.
	get_VendorLib (see page 1800)	This is get_VendorLib, a member of class TAdoDbxConnectionStringBuilder.
	set_ConnectionName (see page 1800)	This is set_ConnectionName, a member of class TAdoDbxConnectionStringBuilder.
	set_Database (see page 1800)	This is set_Database, a member of class TAdoDbxConnectionStringBuilder.
	set_DelegateConnection (see page 1800)	This is set_DelegateConnection, a member of class TAdoDbxConnectionStringBuilder.
	set_DelegateDriver (see page 1800)	This is set_DelegateDriver, a member of class TAdoDbxConnectionStringBuilder.
	set_DriverAssembly (see page 1801)	This is set_DriverAssembly, a member of class TAdoDbxConnectionStringBuilder.
	set_DriverAssemblyLoader (see page 1801)	This is set_DriverAssemblyLoader, a member of class TAdoDbxConnectionStringBuilder.
	set_DriverName (see page 1801)	This is set_DriverName, a member of class TAdoDbxConnectionStringBuilder.
	set_DriverPackage (see page 1801)	This is set_DriverPackage, a member of class TAdoDbxConnectionStringBuilder.
	set_DriverPackageLoader (see page 1801)	This is set_DriverPackageLoader, a member of class TAdoDbxConnectionStringBuilder.
	set_DriverUnit (see page 1802)	This is set_DriverUnit, a member of class TAdoDbxConnectionStringBuilder.
	set_ErrorResourceFile (see page 1802)	This is set_ErrorResourceFile, a member of class TAdoDbxConnectionStringBuilder.
	set_GetDriverFunc (see page 1802)	This is set_GetDriverFunc, a member of class TAdoDbxConnectionStringBuilder.
	set_HostName (see page 1802)	This is set_HostName, a member of class TAdoDbxConnectionStringBuilder.
	set_IsolationLevel (see page 1802)	This is set_IsolationLevel, a member of class TAdoDbxConnectionStringBuilder.
	set_Item (see page 1803)	This is set_Item, a member of class TAdoDbxConnectionStringBuilder.
	set_LibraryName (see page 1803)	This is set_LibraryName, a member of class TAdoDbxConnectionStringBuilder.
	set_MaxBlobSize (see page 1803)	This is set_MaxBlobSize, a member of class TAdoDbxConnectionStringBuilder.
	set_MetaDataAssemblyLoader (see page 1803)	This is set_MetaDataAssemblyLoader, a member of class TAdoDbxConnectionStringBuilder.
	set_MetaDataPackageLoader (see page 1803)	This is set_MetaDataPackageLoader, a member of class TAdoDbxConnectionStringBuilder.
	set_Password (see page 1804)	This is set_Password, a member of class TAdoDbxConnectionStringBuilder.
	set_Port (see page 1804)	This is set_Port, a member of class TAdoDbxConnectionStringBuilder.
	set_ProductVersion (see page 1804)	This is set_ProductVersion, a member of class TAdoDbxConnectionStringBuilder.
	set_Role (see page 1804)	This is set_Role, a member of class TAdoDbxConnectionStringBuilder.
	set_SchemaOverride (see page 1804)	This is set_SchemaOverride, a member of class TAdoDbxConnectionStringBuilder.

	set_User_Name (see page 1805)	This is set_User_Name, a member of class TAdoDbxConnectionStringBuilder.
	set_VendorLib (see page 1805)	This is set_VendorLib, a member of class TAdoDbxConnectionStringBuilder.
	TryGetValue (see page 1805)	Gets key value.

15.1.1.1.4.3.1 TAdoDbxConnectionStringBuilder.get_ConnectionName Method

Pascal

```
function get_ConnectionName: string;
```

C++

```
__fastcall AnsiString get_ConnectionName();
```

Description

This is get_ConnectionName, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.2 TAdoDbxConnectionStringBuilder.get_Database Method

Pascal

```
function get_Database: string;
```

C++

```
__fastcall AnsiString get_Database();
```

Description

This is get_Database, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.3 TAdoDbxConnectionStringBuilder.get_DelegateConnection Method

Pascal

```
function get_DelegateConnection: string;
```

C++

```
__fastcall AnsiString get_DelegateConnection();
```

Description

This is get_DelegateConnection, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.4 TAdoDbxConnectionStringBuilder.get_DelegateDriver Method

Pascal

```
function get_DelegateDriver: string;
```

C++

```
__fastcall AnsiString get_DelegateDriver();
```

Description

This is get_DelegateDriver, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.5 TAdoDbxConnectionStringBuilder.get_DriverAssembly Method

Pascal

```
function get_DriverAssembly: string;
```

C++

```
__fastcall AnsiString get_DriverAssembly();
```

Description

This is get_DriverAssembly, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.6 TAdoDbxConnectionStringBuilder.get_DriverAssemblyLoader Method

Pascal

```
function get_DriverAssemblyLoader: string;
```

C++

```
__fastcall AnsiString get_DriverAssemblyLoader();
```

Description

This is get_DriverAssemblyLoader, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.7 TAdoDbxConnectionStringBuilder.get_DriverName Method

Pascal

```
function get_DriverName: string;
```

C++

```
__fastcall AnsiString get_DriverName();
```

Description

This is get_DriverName, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.8 TAdoDbxConnectionStringBuilder.get_DriverPackage Method

Pascal

```
function get_DriverPackage: string;
```

C++

```
__fastcall AnsiString get_DriverPackage();
```

Description

This is get_DriverPackage, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.9 TAdoDbxConnectionStringBuilder.get_DriverPackageLoader Method

Pascal

```
function get_DriverPackageLoader: string;
```

C++

```
__fastcall AnsiString get_DriverPackageLoader();
```

Description

This is get_DriverPackageLoader, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.10 TAdoDbxConnectionStringBuilder.get_DriverUnit Method

Pascal

```
function get_DriverUnit: string;
```

C++

```
__fastcall AnsiString get_DriverUnit();
```

Description

This is get_DriverUnit, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.11 TAdoDbxConnectionStringBuilder.get_ErrorResourceFile Method

Pascal

```
function get_ErrorResourceFile: string;
```

C++

```
__fastcall AnsiString get_ErrorResourceFile();
```

Description

This is get_ErrorResourceFile, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.12 TAdoDbxConnectionStringBuilder.get_GetDriverFunc Method

Pascal

```
function get_GetDriverFunc: string;
```

C++

```
__fastcall AnsiString get_GetDriverFunc();
```

Description

This is get_GetDriverFunc, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.13 TAdoDbxConnectionStringBuilder.get_HostName Method

Pascal

```
function get_HostName: string;
```

C++

```
__fastcall AnsiString get_HostName();
```

Description

This is get_HostName, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.14 TAdoDbxConnectionStringBuilder.get_IsolationLevel Method

Pascal

```
function get_IsolationLevel: Integer;
```

C++

```
__fastcall int get_IsolationLevel();
```

Description

This is get_IsolationLevel, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.15 TAdoDbxConnectionStringBuilder.get_Item Method

Pascal

```
function get_Item(keyword: string): TObject; override;
```

C++

```
virtual __fastcall TObject * get_Item(AnsiString keyword);
```

Description

This is get_Item, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.16 TAdoDbxConnectionStringBuilder.get_LibraryName Method

Pascal

```
function get_LibraryName: string;
```

C++

```
__fastcall AnsiString get_LibraryName();
```

Description

This is get_LibraryName, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.17 TAdoDbxConnectionStringBuilder.get_MaxBlobSize Method

Pascal

```
function get_MaxBlobSize: Integer;
```

C++

```
__fastcall int get_MaxBlobSize();
```

Description

This is get_MaxBlobSize, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.18 TAdoDbxConnectionStringBuilder.get_MetaDataAssemblyLoader Method

Pascal

```
function get_MetaDataAssemblyLoader: string;
```

C++

```
__fastcall AnsiString get_MetaDataAssemblyLoader();
```

Description

This is get_MetaDataAssemblyLoader, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.19 TAdoDbxConnectionStringBuilder.get_MetaDataPackageLoader Method

Pascal

```
function get_MetaDataPackageLoader: string;
```

C++

```
__fastcall AnsiString get_MetaDataPackageLoader();
```

Description

This is get_MetaDataPackageLoader, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.20 TAdoDbxConnectionStringBuilder.get_Password Method

Pascal

```
function get_Password: string;
```

C++

```
__fastcall AnsiString get_Password();
```

Description

This is get_Password, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.21 TAdoDbxConnectionStringBuilder.get_Port Method

Pascal

```
function get_Port: Integer;
```

C++

```
__fastcall int get_Port();
```

Description

This is get_Port, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.22 TAdoDbxConnectionStringBuilder.get_ProductVersion Method

Pascal

```
function get_ProductVersion: string;
```

C++

```
__fastcall AnsiString get_ProductVersion();
```

Description

This is get_ProductVersion, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.23 TAdoDbxConnectionStringBuilder.get_Role Method

Pascal

```
function get_Role: string;
```

C++

```
__fastcall AnsiString get_Role();
```

Description

This is get_Role, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.24 TAdoDbxConnectionStringBuilder.get_SchemaOverride Method

Pascal

```
function get_SchemaOverride: string;
```

C++

```
__fastcall AnsiString get_SchemaOverride();
```

Description

This is get_SchemaOverride, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.25 TAdoDbxConnectionStringBuilder.get_User_Name Method

Pascal

```
function get_User_Name: string;
```

C++

```
__fastcall AnsiString get_User_Name();
```

Description

This is get_User_Name, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.26 TAdoDbxConnectionStringBuilder.get_VendorLib Method

Pascal

```
function get_VendorLib: string;
```

C++

```
__fastcall AnsiString get_VendorLib();
```

Description

This is get_VendorLib, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.27 TAdoDbxConnectionStringBuilder.set_ConnectionName Method

Pascal

```
procedure set_ConnectionName(const Value: string);
```

C++

```
__fastcall set_ConnectionName(const AnsiString Value);
```

Description

This is set_ConnectionName, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.28 TAdoDbxConnectionStringBuilder.set_Database Method

Pascal

```
procedure set_Database(const Value: string);
```

C++

```
__fastcall set_Database(const AnsiString Value);
```

Description

This is set_Database, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.29 TAdoDbxConnectionStringBuilder.set_DelegateConnection Method

Pascal

```
procedure set_DelegateConnection(const Value: string);
```

C++

```
__fastcall set_DelegateConnection(const AnsiString Value);
```

Description

This is set_DelegateConnection, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.30 TAdoDbxConnectionStringBuilder.set_DelegateDriver Method

Pascal

```
procedure set_DelegateDriver(const Value: string);
```

C++

```
__fastcall set_DelegateDriver(const AnsiString Value);
```

Description

This is set_DelegateDriver, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.31 TAdoDbxConnectionStringBuilder.set_DriverAssembly Method

Pascal

```
procedure set_DriverAssembly(const Value: string);
```

C++

```
__fastcall set_DriverAssembly(const AnsiString Value);
```

Description

This is set_DriverAssembly, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.32 TAdoDbxConnectionStringBuilder.set_DriverAssemblyLoader Method

Pascal

```
procedure set_DriverAssemblyLoader(const Value: string);
```

C++

```
__fastcall set_DriverAssemblyLoader(const AnsiString Value);
```

Description

This is set_DriverAssemblyLoader, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.33 TAdoDbxConnectionStringBuilder.set_DriverName Method

Pascal

```
procedure set_DriverName(const Value: string);
```

C++

```
__fastcall set_DriverName(const AnsiString Value);
```

Description

This is set_DriverName, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.34 TAdoDbxConnectionStringBuilder.set_DriverPackage Method

Pascal

```
procedure set_DriverPackage(const Value: string);
```

C++

```
__fastcall set_DriverPackage(const AnsiString Value);
```

Description

This is set_DriverPackage, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.35 TAdoDbxConnectionStringBuilder.set_DriverPackageLoader Method

Pascal

```
procedure set_DriverPackageLoader(const Value: string);
```

C++

```
__fastcall set_DriverPackageLoader(const AnsiString Value);
```

Description

This is set_DriverPackageLoader, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.36 TAdoDbxConnectionStringBuilder.set_DriverUnit Method

Pascal

```
procedure set_DriverUnit(const Value: string);
```

C++

```
__fastcall set_DriverUnit(const AnsiString Value);
```

Description

This is set_DriverUnit, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.37 TAdoDbxConnectionStringBuilder.set_ErrorResourceFile Method

Pascal

```
procedure set_ErrorResourceFile(const Value: string);
```

C++

```
__fastcall set_ErrorResourceFile(const AnsiString Value);
```

Description

This is set_ErrorResourceFile, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.38 TAdoDbxConnectionStringBuilder.set_GetDriverFunc Method

Pascal

```
procedure set_GetDriverFunc(const Value: string);
```

C++

```
__fastcall set_GetDriverFunc(const AnsiString Value);
```

Description

This is set_GetDriverFunc, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.39 TAdoDbxConnectionStringBuilder.set_HostName Method

Pascal

```
procedure set_HostName(const Value: string);
```

C++

```
__fastcall set_HostName(const AnsiString Value);
```

Description

This is set_HostName, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.40 TAdoDbxConnectionStringBuilder.set_IsolationLevel Method

Pascal

```
procedure set_IsolationLevel(const Value: Integer);
```

C++

```
__fastcall set_IsolationLevel(const int Value);
```

Description

This is set_IsolationLevel, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.41 TAdoDbxConnectionStringBuilder.set_Item Method

Pascal

```
procedure set_Item(keyword: string; value: TObject); override;
```

C++

```
virtual __fastcall set_Item(AnsiString keyword, TObject * value);
```

Description

This is set_Item, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.42 TAdoDbxConnectionStringBuilder.set_LibraryName Method

Pascal

```
procedure set_LibraryName(const Value: string);
```

C++

```
__fastcall set_LibraryName(const AnsiString Value);
```

Description

This is set_LibraryName, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.43 TAdoDbxConnectionStringBuilder.set_MaxBlobSize Method

Pascal

```
procedure set_MaxBlobSize(const Value: Integer);
```

C++

```
__fastcall set_MaxBlobSize(const int Value);
```

Description

This is set_MaxBlobSize, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.44 TAdoDbxConnectionStringBuilder.set_MetaDataAssemblyLoader Method

Pascal

```
procedure set_MetaDataAssemblyLoader(const Value: string);
```

C++

```
__fastcall set_MetaDataAssemblyLoader(const AnsiString Value);
```

Description

This is set_MetaDataAssemblyLoader, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.45 TAdoDbxConnectionStringBuilder.set_MetaDataPackageLoader Method

Pascal

```
procedure set_MetaDataPackageLoader(const Value: string);
```

C++

```
__fastcall set_MetaDataPackageLoader(const AnsiString Value);
```

Description

This is set_MetaDataPackageLoader, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.46 TAdoDbxConnectionStringBuilder.set_Password Method

Pascal

```
procedure set_Password(const Value: string);
```

C++

```
__fastcall set_Password(const AnsiString Value);
```

Description

This is set_Password, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.47 TAdoDbxConnectionStringBuilder.set_Port Method

Pascal

```
procedure set_Port(const Value: Integer);
```

C++

```
__fastcall set_Port(const int Value);
```

Description

This is set_Port, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.48 TAdoDbxConnectionStringBuilder.set_ProductVersion Method

Pascal

```
procedure set_ProductVersion(const Value: string);
```

C++

```
__fastcall set_ProductVersion(const AnsiString Value);
```

Description

This is set_ProductVersion, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.49 TAdoDbxConnectionStringBuilder.set_Role Method

Pascal

```
procedure set_Role(const Value: string);
```

C++

```
__fastcall set_Role(const AnsiString Value);
```

Description

This is set_Role, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.50 TAdoDbxConnectionStringBuilder.set_SchemaOverride Method

Pascal

```
procedure set_SchemaOverride(const Value: string);
```

C++

```
__fastcall set_SchemaOverride(const AnsiString Value);
```

Description

This is set_SchemaOverride, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.51 TAdoDbxConnectionStringBuilder.set_User_Name Method

Pascal

```
procedure set_User_Name(const Value: string);
```

C++

```
__fastcall set_User_Name(const AnsiString Value);
```

Description

This is set_User_Name, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.52 TAdoDbxConnectionStringBuilder.set_VendorLib Method

Pascal

```
procedure set_VendorLib(const Value: string);
```

C++

```
__fastcall set_VendorLib(const AnsiString Value);
```

Description

This is set_VendorLib, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.3.53 TAdoDbxConnectionStringBuilder.TryGetValue Method

Gets key value.

Pascal

```
function TryGetValue(keyword: string; out value: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean TryGetValue(AnsiString keyword, TObject * value);
```

Description

TryGetValue gets a value corresponding to a given key.

TryGetValue (MSDN)

15.1.1.1.4.4 TAdoDbxConnectionStringBuilder Properties

The properties of the TAdoDbxConnectionStringBuilder class are listed here.

Public Properties

	Name	Description
	ConnectionName (see page 1806)	Name of connection.
	DelegateDriver (see page 1807)	Driver is a delegate.
	DriverName (see page 1808)	Unique name for a dbExpress driver.
	ErrorResourceFile (see page 1809)	Specify a localized error message file for Linux.

Published Properties

	Name	Description
	Database (see page 1806)	Name of a database to connect to.
	DelegateConnection (see page 1807)	Delegate connection used by this connection.
	DriverAssembly (see page 1807)	Used to load a managed driver dynamically.
	DriverAssemblyLoader (see page 1808)	Used to load a managed driver dynamically from an assembly.
	DriverPackage (see page 1808)	Used to load a native driver dynamically.
	DriverPackageLoader (see page 1809)	Native Driver loader class used to load a native driver dynamically from a package.
	DriverUnit (see page 1809)	Used to provide informative error message when driver cannot be loaded.
	GetDriverFunc (see page 1809)	Exported entry point for loading a driver prior to dbExpress 4.
	HostName (see page 1810)	Host name of a database server.
	IsolationLevel (see page 1810)	Initial transaction isolation to use when connecting to a database.
	LibraryName (see page 1811)	Name of the DBXDynalink DLL.
	MaxBlobSize (see page 1811)	Maximum BLOB size.
	MetaDataAssemblyLoader (see page 1811)	Used to load a managed driver dynamically from an assembly.
	MetaDataPackageLoader (see page 1811)	Class used to load a native driver dynamically from a package.
	Password (see page 1812)	Login password name.
	Port (see page 1812)	Port number of a database server.
	ProductVersion (see page 1812)	Driver product version.
	Role (see page 1813)	Login role.
	SchemaOverride (see page 1813)	VCL components use this setting to scope metadata requests.
	User_Name (see page 1814)	This is User_Name, a member of class TAdoDbxConnectionStringBuilder.
	VendorLib (see page 1814)	Name of a vendor specific client library.

15.1.1.1.4.4.1 TAdoDbxConnectionStringBuilder.ConnectionName Property

Name of connection.

Pascal

```
property ConnectionName: string;
```

C++

```
__property AnsiString ConnectionName;
```

Description

Name of connection. If connection properties are read from the dbxconnections.ini file, this is the ini file section name. AdoDbx Client can use this property setting for a simple one property connection string. Connection names can also be used to load a connection from a TDBXConnectionFactory instance.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.2 TAdoDbxConnectionStringBuilder.Database Property

Name of a database to connect to.

Pascal

```
[Category(TConnectionStringCategories.Database)]
property Database: string;
```

C++

```
[Category(TConnectionStringCategories.Database)]
__property AnsiString Database;
```

Description

Name of a database to connect to for this connection.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.3 TAdoDbxConnectionStringBuilder.DelegateConnection Property

Delegate connection used by this connection.

Pascal

```
[Category(TConnectionStringCategories.DriverConfiguration)]
property DelegateConnection: string;
```

C++

```
[Category(TConnectionStringCategories.DriverConfiguration)]
__property AnsiString DelegateConnection;
```

Description

Delegate connection used by this connection. Delegate connections implement the dbExpress 4 driver framework. They can perform pre or post processing of all public and protected methods before delegating to the real connection or another delegate connection.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.4 TAdoDbxConnectionStringBuilder.DelegateDriver Property

Driver is a delegate.

Pascal

```
property DelegateDriver: string;
```

C++

```
__property AnsiString DelegateDriver;
```

Description

Indicates that this driver is a delegate and can only be used in conjunction with a non-delegate driver.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.5 TAdoDbxConnectionStringBuilder.DriverAssembly Property

Used to load a managed driver dynamically.

Pascal

```
[Category(TConnectionStringCategories.DriverConfiguration)]
property DriverAssembly: string;
```

C++

```
[Category(TConnectionStringCategories.DriverConfiguration)]
__property AnsiString DriverAssembly;
```

Description

Used to load a managed driver dynamically for this connection.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.6 TAdoDbxConnectionStringBuilder.DriverAssemblyLoader Property

Used to load a managed driver dynamically from an assembly.

Pascal

```
[Category(TConnectionStringCategories.DriverConfiguration)]
property DriverAssemblyLoader: string;
```

C++

```
[Category(TConnectionStringCategories.DriverConfiguration)]
__property AnsiString DriverAssemblyLoader;
```

Description

Managed Driver loader class used to load a managed driver dynamically from an assembly.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.7 TAdoDbxConnectionStringBuilder.DriverName Property

Unique name for a dbExpress driver.

Pascal

```
property DriverName: string;
```

C++

```
__property AnsiString DriverName;
```

Description

Unique name for a dbExpress driver. Used by the dbxconnections.ini file to refer to a connections driver in the dbxdrivers.ini file.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.8 TAdoDbxConnectionStringBuilder.DriverPackage Property

Used to load a native driver dynamically.

Pascal

```
[Category(TConnectionStringCategories.DriverConfiguration)]
property DriverPackage: string;
```

C++

```
[Category(TConnectionStringCategories.DriverConfiguration)]
__property AnsiString DriverPackage;
```

Description

Used to load a native driver dynamically for this connection.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.9 TAdoDbxConnectionStringBuilder.DriverPackageLoader Property

Native Driver loader class used to load a native driver dynamically from a package.

Pascal

```
[Category(TConnectionStringCategories.DriverConfiguration)]
property DriverPackageLoader: string;
```

C++

```
[Category(TConnectionStringCategories.DriverConfiguration)]
__property AnsiString DriverPackageLoader;
```

Description

Native Driver loader class used to load a native driver dynamically from a package for this connection.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.10 TAdoDbxConnectionStringBuilder.DriverUnit Property

Used to provide informative error message when driver cannot be loaded.

Pascal

```
[Category(TConnectionStringCategories.DriverConfiguration)]
property DriverUnit: string;
```

C++

```
[Category(TConnectionStringCategories.DriverConfiguration)]
__property AnsiString DriverUnit;
```

Description

Used to provide informative error message when driver cannot be loaded for this connection.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.11 TAdoDbxConnectionStringBuilder.ErrorResourceFile Property

Specify a localized error message file for Linux.

Pascal

```
property ErrorResourceFile: string;
```

C++

```
__property AnsiString ErrorResourceFile;
```

Description

Used only by Linux versions of dbExpress to specify a localized error message file.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.12 TAdoDbxConnectionStringBuilder.GetDriverFunc Property

Exported entry point for loading a driver prior to dbExpress 4.

Pascal

```
[Category(TConnectionStringCategories.Dynalink)]
property GetDriverFunc: string;
```

C++

```
[Category(TConnectionStringCategories.Dynalink)]
__property AnsiString GetDriverFunc;
```

Description

Used by DBXDynalink drivers to specify exported entry point for loading a driver prior to dbExpress 4.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.13 TAdoDbxConnectionStringBuilder.HostName Property

Host name of a database server.

Pascal

```
[Category(TConnectionStringCategories.Database)]
property HostName: string;
```

C++

```
[Category(TConnectionStringCategories.Database)]
__property AnsiString HostName;
```

Description

Host name of a database server that a driver connects to.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.14 TAdoDbxConnectionStringBuilder.IsolationLevel Property

Initial transaction isolation to use when connecting to a database.

Pascal

```
[Category(TConnectionStringCategories.Database)]
property IsolationLevel: Integer;
```

C++

```
[Category(TConnectionStringCategories.Database)]
__property int IsolationLevel;
```

Description

Initial transaction isolation to use when connecting to a database. Transaction isolation can also be specified when a transaction is started.

See Also

IsolationLevel (MSDN)

IsolationLevel enumeration (MSDN)

TDBXPropertyNames (see page 10566)

IsolationLevel

IsolationLevel

15.1.1.1.4.4.15 TAdoDbxConnectionStringBuilder.LibraryName Property

Name of the DBXDynalink DLL.

Pascal

```
[Category(TConnectionStringCategories.Dynalink)]
property LibraryName: string;
```

C++

```
[Category(TConnectionStringCategories.Dynalink)]
__property AnsiString LibraryName;
```

Description

Used by DBXDynalink drivers to specify the name of the DBXDynalink DLL.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.16 TAdoDbxConnectionStringBuilder.MaxBlobSize Property

Maximum BLOB size.

Pascal

```
property MaxBlobSize: Integer;
```

C++

```
__property int MaxBlobSize;
```

Description

Maximum BLOB size. Set to –1 to specify no limit.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.17 TAdoDbxConnectionStringBuilder.MetaDataAssemblyLoader Property

Used to load a managed driver dynamically from an assembly.

Pascal

```
[Category(TConnectionStringCategories.DriverConfiguration)]
property MetaDataAssemblyLoader: string;
```

C++

```
[Category(TConnectionStringCategories.DriverConfiguration)]
__property AnsiString MetaDataAssemblyLoader;
```

Description

Managed MetaData (see page 2130) loader class used to load a managed driver dynamically from an assembly.

See Also

TDBXPropertyNamesEx (see page 10574)

15.1.1.1.4.4.18 TAdoDbxConnectionStringBuilder.MetaDataPackageLoader Property

Class used to load a native driver dynamically from a package.

Pascal

```
[Category(TConnectionStringCategories.DriverConfiguration)]
property MetaDataPackageLoader: string;
```

C++

```
[Category(TConnectionStringCategories.DriverConfiguration)]
__property AnsiString MetaDataPackageLoader;
```

Description

Native MetaData (see page 2130) loader class used to load a native driver dynamically from a package.

See Also

TDBXPropertyNamesEx (see page 10574)

15.1.1.1.4.4.19 TAdoDbxConnectionStringBuilder.Password Property

Login password name.

Pascal

```
[PasswordPropertyText(true)]
[Category(TConnectionStringCategories.Database)]
property Password: string;
```

C++

```
[PasswordPropertyText(true)]
[Category(TConnectionStringCategories.Database)]
__property AnsiString Password;
```

Description

Login password name used to connect to a database.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.20 TAdoDbxConnectionStringBuilder.Port Property

Port number of a database server.

Pascal

```
[Category(TConnectionStringCategories.Database)]
property Port: Integer;
```

C++

```
[Category(TConnectionStringCategories.Database)]
__property int Port;
```

Description

Port number of a database server that a driver connects to.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.21 TAdoDbxConnectionStringBuilder.ProductVersion Property

Driver product version.

Pascal

```
[Category(TConnectionStringCategories.DriverConfiguration)]
property ProductVersion: string;
```

C++

```
[Category(TConnectionStringCategories.DriverConfiguration)]
__property AnsiString ProductVersion;
```

Description

Can be specified as a driver property as an override of the TDBXConnectionEx.ProductVersion property. This may be necessary for drivers that do not have the ability to report the product version. The ProductVersion is a number in the format nn.nn.nnnn.

See Also

TDBXPropertyNamesEx (see page 10574)

15.1.1.1.4.4.22 TAdoDbxConnectionStringBuilder.Role Property

Login role.

Pascal

```
[Category(TConnectionStringCategories.Database)]
property Role: string;
```

C++

```
[Category(TConnectionStringCategories.Database)]
__property AnsiString Role;
```

Description

Login role used to connect to a database.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.23 TAdoDbxConnectionStringBuilder.SchemaOverride Property

VCL components use this setting to scope metadata requests.

Pascal

```
property SchemaOverride: string;
```

C++

```
__property AnsiString SchemaOverride;
```

Description

Most applications should not need to use this constant. It is provided for backwards compatibility of the dbExpress VCL. VCL components use this setting to scope metadata requests. This property should be set to **user-name.override-schema-name**. For example, tables created by the MSSQL sa user are placed in the dbo schema. In this case, SchemaOverride can be set to 'sa.dbo'. This causes VCL to specify the 'dbo' schema for metadata requests when a connection is made using the 'sa' user. An SQL `'%'` like pattern can also be used for the user-name and the override-schema-name. For example, `'%.%'` causes the schema to not be specified at all for all users.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.4.4.24 TAdoDbxConnectionStringBuilder.User_Name Property

Pascal

```
[Category(TConnectionStringCategories.Database)]
property User_Name: string;
```

C++

```
[Category(TConnectionStringCategories.Database)]
__property AnsiString User_Name;
```

Description

This is User_Name, a member of class TAdoDbxConnectionStringBuilder.

15.1.1.1.4.4.25 TAdoDbxConnectionStringBuilder.VendorLib Property

Name of a vendor specific client library.

Pascal

```
[Category(TConnectionStringCategories.DriverConfiguration)]
property VendorLib: string;
```

C++

```
[Category(TConnectionStringCategories.DriverConfiguration)]
__property AnsiString VendorLib;
```

Description

Used by DBXDynalink drivers. Name of a vendor specific client library.

See Also

TDBXPropertyNames (see page 10566)

15.1.1.1.5 TAdoDbxDataAdapter Class

Acts as a bridge between a DataSet and the underlying database.

Class Hierarchy

Pascal

```
TAdoDbxDataAdapter = class(DbDataAdapter);
```

C++

```
class TAdoDbxDataAdapter : public DbDataAdapter;
```

File

Borland.Data.AdoDbxClientProvider

Description

The TAdoDbxDataAdapter object is a bridge between the DataSet and the underlying database. It represents a set of data commands and a database connection that are used to fill the DataSet and update the data source. The TAdoDbxDataAdapter object exposes methods to issue SQL commands against the underlying database, as well as others to manage the DataSet object.

The TAdoDbxDataAdapter class is an implementation of the ADO.NET DbDataAdapter class.

You must set the SelectCommand (see page 1825) property with a valid SQL statement before you call the Fill method. This

establishes the structure of the data to be returned from the database to the DataSet. If you choose to update your database with changes in the DataSet, you need to set the appropriate properties, either InsertCommand (see page 1824), UpdateCommand (see page 1825), or DeleteCommand (see page 1823), before you issue the update. For example, if you delete rows from the DataSet and you want this change to be reflected in the database, you need to first set the DeleteCommand (see page 1823) property before starting your update of the database. Otherwise, if you do not set the command, there is no valid SQL command to issue against the database for the update and the update fails. In that case, the database throws an exception, which you can trap.

When the Active property on the TAdoDbxDataAdapter is set to **True**, the DataSet is automatically filled with data. You can see this behavior during design-time if you set the Active property to **True**, then connect a DataGrid component to the DataSet.

The TAdoDbxConnection (see page 1779) associated with the SelectCommand (see page 1825) is used to execute the command specified in the SelectCommand.CommandText. If the TAdoDbxConnection (see page 1779) is already opened, it is used; otherwise, Fill takes care of opening the connection, executing the SQL statement, retrieving the result set, and closing the connection. The TAdoDbxDataAdapter provides InsertCommand (see page 1824), UpdateCommand (see page 1825) and DeleteCommand (see page 1823) properties for resolving DataSet changes back into the data source. You must specify a valid parameterized SQL statement for each of these commands before calling the Update method. Based on the DataSet changes, the Update method executes `INSERT`, `UPDATE`, and `DELETE` commands and persists all the changes to the data source.

For resolving data from a stored procedure or a complex SQL such as joins, the TAdoDbxDataAdapter class's DeleteCommand (see page 1823), UpdateCommand (see page 1825) and InsertCommand (see page 1824) should be explicitly specified and you should use the Update method. Like the GetSchemaTable method in TAdoDbxDataReader (see page 1827), TAdoDbxDataAdapter has a FillSchema method that creates a DataTable and configures the metadata to match the database. Consequently, to enforce integrity constraints in the DataSet, such as primary key and unique key, you must call FillSchema before calling Fill. The TableMappings property allows column names to be mapped from the data source to more meaningful names.

The following C# code shows how to provide and resolve data with a TAdoDbxDataAdapter.

```
static void FillDataAdapter ( TAdoDbxConnection Conn )
 {
      int Rows = 0;

TAdoDbxTransaction Trans = (TAdoDbxTransaction) Conn.BeginTransaction();

    TAdoDbxDataAdapter adapter = new TAdoDbxDataAdapter();
TAdoDbxCommand Comm = new TAdoDbxCommand("SELECT * FROM TESTTABLE", Conn);
    adapter.SelectCommand = Comm;

    DataTableMapping dataTabMap = adapter.TableMappings.Add("Table1","TESTTABLE");
    DataSet ds = new DataSet();
    adapter.FillSchema(ds, SchemaType.Source, "TESTTABLE");
    Rows = adapter.Fill(ds, "TESTTABLE");

    InsertRecord(Conn, adapter, ds.Tables["TESTTABLE"]);
    adapter.Update(ds,"TESTTABLE");
    ds.AcceptChanges();

    Trans.Commit();

   }

static void InsertRecord(TAdoDbxConnection Conn, TAdoDbxDataAdapter adapter, DataTable
dataTable )
  {
    TAdoDbxCommand CommIns = new TAdoDbxCommand("INSERT INTO TESTTABLE VALUES(?)", Conn);
    TAdoDbxParameter param1 = CommIns.Parameters.Add("FCHAR",DbType.StringFixedLength, 10);
    param1.SourceColumn = "FCHAR";
```

```
    adapter.InsertCommand = CommIns;

    //Insert 10 records
    for ( int i=0; i < 10; i++)
    {
        DataRow newRow = dataTable.NewRow();
        newRow["FCHAR"] = "VINA" + i;
        dataTable.Rows.Add(newRow);
    }

  }
static void FillDataAdapter ( TAdoDbxConnection Conn )
 {
      int Rows = 0;

TAdoDbxTransaction Trans = (TAdoDbxTransaction) Conn.BeginTransaction();

    TAdoDbxDataAdapter adapter = new TAdoDbxDataAdapter();
TAdoDbxCommand Comm = new TAdoDbxCommand("SELECT * FROM TESTTABLE", Conn);
    adapter.SelectCommand = Comm;

    DataTableMapping dataTabMap = adapter.TableMappings.Add("Table1","TESTTABLE");
    DataSet ds = new DataSet();
    adapter.FillSchema(ds, SchemaType.Source, "TESTTABLE");
    Rows = adapter.Fill(ds, "TESTTABLE");

    InsertRecord(Conn, adapter, ds.Tables["TESTTABLE"]);
    adapter.Update(ds,"TESTTABLE");
    ds.AcceptChanges();

    Trans.Commit();

   }

static void InsertRecord(TAdoDbxConnection Conn, TAdoDbxDataAdapter adapter, DataTable
dataTable )
  {
TAdoDbxCommand CommIns = new TAdoDbxCommand("INSERT INTO TESTTABLE VALUES(?)", Conn);
TAdoDbxParameter param1 = CommIns.Parameters.Add("FCHAR",DbType.StringFixedLength, 10);
    param1.SourceColumn = "FCHAR";

    adapter.InsertCommand = CommIns;

    //Insert 10 records
    for ( int i=0; i < 10; i++)
    {
        DataRow newRow = dataTable.NewRow();
        newRow["FCHAR"] = "VINA" + i;
        dataTable.Rows.Add(newRow);
    }

  }
```

15.1.1.1.5.1 TAdoDbxDataAdapter Members

The following tables list the members exposed by TAdoDbxDataAdapter.

Public Events

	Name	Description
	RowUpdated (see page 1826)	Row has been updated.
	RowUpdating (see page 1826)	Row is being updated.

Public Methods

	Name	Description
	add_RowUpdated (see page 1819)	Add RowUpdated (see page 1826) event.
	add_RowUpdating (see page 1820)	Add RowUpdating (see page 1826) event.
	Create (see page 1818)	This is the overview for the Create constructor overload.
	get_DeleteCommand (see page 1820)	This is get_DeleteCommand, a member of class TAdoDbxDataAdapter.
	get_InsertCommand (see page 1820)	This is get_InsertCommand, a member of class TAdoDbxDataAdapter.
	get_SelectCommand (see page 1821)	This is get_SelectCommand, a member of class TAdoDbxDataAdapter.
	get_UpdateCommand (see page 1821)	This is get_UpdateCommand, a member of class TAdoDbxDataAdapter.
	remove_RowUpdated (see page 1821)	Remove RowUpdated (see page 1826) event.
	remove_RowUpdating (see page 1822)	Remove RowUpdating (see page 1826) event.
	set_DeleteCommand (see page 1822)	This is set_DeleteCommand, a member of class TAdoDbxDataAdapter.
	set_InsertCommand (see page 1822)	This is set_InsertCommand, a member of class TAdoDbxDataAdapter.
	set_SelectCommand (see page 1823)	This is set_SelectCommand, a member of class TAdoDbxDataAdapter.
	set_UpdateCommand (see page 1823)	This is set_UpdateCommand, a member of class TAdoDbxDataAdapter.

Public Properties

	Name	Description
	DeleteCommand (see page 1823)	A TAdoDbxCommand (see page 1763) used during Update to delete records in the data source that correspond to deleted rows in the DataSet.
	InsertCommand (see page 1824)	A TAdoDbxCommand (see page 1763) used during Update to insert records into the database that correspond to new rows in the DataSet.
	SelectCommand (see page 1825)	A TAdoDbxCommand (see page 1763) used during Fill to select records from the database for placement in the DataSet.
	UpdateCommand (see page 1825)	A TAdoDbxCommand (see page 1763) used during Update to update records in the data source that correspond to modified rows in the DataSet.

Strict private Fields

	Name	Description
	FEventRowUpdated (see page 1819)	This is FEventRowUpdated, a member of class TAdoDbxDataAdapter.
	FEventRowUpdating (see page 1819)	This is FEventRowUpdating, a member of class TAdoDbxDataAdapter.

Strict protected Methods

	Name	Description
	OnRowUpdated (see page 1821)	This is OnRowUpdated, a member of class TAdoDbxDataAdapter.
	OnRowUpdating (see page 1821)	This is OnRowUpdating, a member of class TAdoDbxDataAdapter.

15.1.1.1.5.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TAdoDbxDataAdapter.Create () (see page 1818)	Creates an instance of TAdoDbxDataAdapter (see page 1814)
	TAdoDbxDataAdapter.Create (string, string) (see page 1818)	Creates an instance of TAdoDbxDataAdapter (see page 1814)
	TAdoDbxDataAdapter.Create (string, TAdoDbxConnection) (see page 1818)	Creates an instance of TAdoDbxDataAdapter (see page 1814)
	TAdoDbxDataAdapter.Create (TAdoDbxCommand) (see page 1818)	Creates an instance of TAdoDbxDataAdapter (see page 1814)

15.1.1.1.5.2.1 TAdoDbxDataAdapter.Create Constructor ()

Creates an instance of TAdoDbxDataAdapter (see page 1814)

Pascal

```
class constructor Create; overload;
constructor Create(Command: TAdoDbxCommand); overload;
constructor Create(const selectCommandText: string; const selectConnectionString: string);
overload;
constructor Create(const selectCommandText: string; selectConnection: TAdoDbxConnection);
overload;
```

C++

```
__fastcall TAdoDbxDataAdapter();
__fastcall TAdoDbxDataAdapter(TAdoDbxCommand Command);
__fastcall TAdoDbxDataAdapter(const AnsiString selectCommandText, const AnsiString
selectConnectionString);
__fastcall TAdoDbxDataAdapter(const AnsiString selectCommandText, TAdoDbxConnection
selectConnection);
```

Description

This constructor creates and initializes an instance of TAdoDbxDataAdapter (see page 1814).

15.1.1.1.5.3 TAdoDbxDataAdapter Fields

The fields of the TAdoDbxDataAdapter class are listed here.

Strict private Fields

	Name	Description
	FEventRowUpdated (see page 1819)	This is FEventRowUpdated, a member of class TAdoDbxDataAdapter.
	FEventRowUpdating (see page 1819)	This is FEventRowUpdating, a member of class TAdoDbxDataAdapter.

15.1.1.1.5.3.1 TAdoDbxDataAdapter.FEventRowUpdated Field

Pascal

```
class var FEventRowUpdated: System.Object;
```

C++

```
System.Object FEventRowUpdated;
```

Description

This is FEventRowUpdated, a member of class TAdoDbxDataAdapter.

15.1.1.1.5.3.2 TAdoDbxDataAdapter.FEventRowUpdating Field

Pascal

```
class var FEventRowUpdating: System.Object;
```

C++

```
System.Object FEventRowUpdating;
```

Description

This is FEventRowUpdating, a member of class TAdoDbxDataAdapter.

15.1.1.1.5.4 TAdoDbxDataAdapter Methods

The methods of the TAdoDbxDataAdapter class are listed here.

Public Methods

	Name	Description
	add_RowUpdated (see page 1819)	Add RowUpdated (see page 1826) event.
	add_RowUpdating (see page 1820)	Add RowUpdating (see page 1826) event.
	get_DeleteCommand (see page 1820)	This is get_DeleteCommand, a member of class TAdoDbxDataAdapter.
	get_InsertCommand (see page 1820)	This is get_InsertCommand, a member of class TAdoDbxDataAdapter.
	get_SelectCommand (see page 1821)	This is get_SelectCommand, a member of class TAdoDbxDataAdapter.
	get_UpdateCommand (see page 1821)	This is get_UpdateCommand, a member of class TAdoDbxDataAdapter.
	remove_RowUpdated (see page 1821)	Remove RowUpdated (see page 1826) event.
	remove_RowUpdating (see page 1822)	Remove RowUpdating (see page 1826) event.
	set_DeleteCommand (see page 1822)	This is set_DeleteCommand, a member of class TAdoDbxDataAdapter.
	set_InsertCommand (see page 1822)	This is set_InsertCommand, a member of class TAdoDbxDataAdapter.
	set_SelectCommand (see page 1823)	This is set_SelectCommand, a member of class TAdoDbxDataAdapter.
	set_UpdateCommand (see page 1823)	This is set_UpdateCommand, a member of class TAdoDbxDataAdapter.

Strict protected Methods

	Name	Description
	OnRowUpdated (see page 1821)	This is OnRowUpdated, a member of class TAdoDbxDataAdapter.
	OnRowUpdating (see page 1821)	This is OnRowUpdating, a member of class TAdoDbxDataAdapter.

15.1.1.1.5.4.1 TAdoDbxDataAdapter.add_RowUpdated Method

Add RowUpdated (see page 1826) event.

Pascal

```
procedure add_RowUpdated(const Value: TAdoDbxRowUpdatedEventHandler);
```

C++

```
__fastcall add_RowUpdated(const TAdoDbxRowUpdatedEventHandler Value);
```

Description

add_RowUpdated adds a RowUpdated (see page 1826) event. This is a multicast event that can trigger multiple event handlers.

See Also

remove_RowUpdated (see page 1821)

RowUpdated (see page 1826)

TAdoDbxRowUpdatedEventHandler (see page 1890)

15.1.1.1.5.4.2 TAdoDbxDataAdapter.add_RowUpdating Method

Add RowUpdating (see page 1826) event.

Pascal

```
procedure add_RowUpdating(const Value: TAdoDbxRowUpdatingEventHandler);
```

C++

```
__fastcall add_RowUpdating(const TAdoDbxRowUpdatingEventHandler Value);
```

Description

add_RowUpdating adds a RowUpdating (see page 1826) event. This is a multicast event that can trigger multiple event handlers.

See Also

remove_RowUpdating (see page 1822)

RowUpdating (see page 1826)

TAdoDbxRowUpdatingEventHandler (see page 1890)

15.1.1.1.5.4.3 TAdoDbxDataAdapter.get_DeleteCommand Method

Pascal

```
function get_DeleteCommand: TAdoDbxCommand;
```

C++

```
__fastcall TAdoDbxCommand get_DeleteCommand();
```

Description

This is get_DeleteCommand, a member of class TAdoDbxDataAdapter.

15.1.1.1.5.4.4 TAdoDbxDataAdapter.get_InsertCommand Method

Pascal

```
function get_InsertCommand: TAdoDbxCommand;
```

C++

```
__fastcall TAdoDbxCommand get_InsertCommand();
```

Description

This is get_InsertCommand, a member of class TAdoDbxDataAdapter.

15.1.1.1.5.4.5 TAdoDbxDataAdapter.get_SelectCommand Method

Pascal

```
function get_SelectCommand: TAdoDbxCommand;
```

C++

```
__fastcall TAdoDbxCommand get_SelectCommand();
```

Description

This is get_SelectCommand, a member of class TAdoDbxDataAdapter.

15.1.1.1.5.4.6 TAdoDbxDataAdapter.get_UpdateCommand Method

Pascal

```
function get_UpdateCommand: TAdoDbxCommand;
```

C++

```
__fastcall TAdoDbxCommand get_UpdateCommand();
```

Description

This is get_UpdateCommand, a member of class TAdoDbxDataAdapter.

15.1.1.1.5.4.7 TAdoDbxDataAdapter.OnRowUpdated Method

Pascal

```
procedure OnRowUpdated(value: RowUpdatedEventArgs); override;
```

C++

```
virtual __fastcall OnRowUpdated(RowUpdatedEventArgs value);
```

Description

This is OnRowUpdated, a member of class TAdoDbxDataAdapter.

15.1.1.1.5.4.8 TAdoDbxDataAdapter.OnRowUpdating Method

Pascal

```
procedure OnRowUpdating(value: RowUpdatingEventArgs); override;
```

C++

```
virtual __fastcall OnRowUpdating(RowUpdatingEventArgs value);
```

Description

This is OnRowUpdating, a member of class TAdoDbxDataAdapter.

15.1.1.1.5.4.9 TAdoDbxDataAdapter.remove_RowUpdated Method

Remove RowUpdated (see page 1826) event.

Pascal

```
procedure remove_RowUpdated(const Value: TAdoDbxRowUpdatedEventHandler);
```

C++

```
__fastcall remove_RowUpdated(const TAdoDbxRowUpdatedEventHandler Value);
```

Description

remove_RowUpdated removes a RowUpdated (see page 1826) event. This is a multicast event that can trigger multiple event handlers.

See Also

add_RowUpdated (see page 1819)

RowUpdated (see page 1826)

TAdoDbxRowUpdatedEventHandler (see page 1890)

15.1.1.1.5.4.10 TAdoDbxDataAdapter.remove_RowUpdating Method

Remove RowUpdating (see page 1826) event.

Pascal

```
procedure remove_RowUpdating(const Value: TAdoDbxRowUpdatingEventHandler);
```

C++

```
__fastcall remove_RowUpdating(const TAdoDbxRowUpdatingEventHandler Value);
```

Description

remove_RowUpdating removes a RowUpdating (see page 1826) event. This is a multicast event that can trigger multiple event handlers.

See Also

add_RowUpdating (see page 1820)

RowUpdating (see page 1826)

TAdoDbxRowUpdatingEventHandler (see page 1890)

15.1.1.1.5.4.11 TAdoDbxDataAdapter.set_DeleteCommand Method

Pascal

```
procedure set_DeleteCommand(const Value: TAdoDbxCommand);
```

C++

```
__fastcall set_DeleteCommand(const TAdoDbxCommand Value);
```

Description

This is set_DeleteCommand, a member of class TAdoDbxDataAdapter.

15.1.1.1.5.4.12 TAdoDbxDataAdapter.set_InsertCommand Method

Pascal

```
procedure set_InsertCommand(const Value: TAdoDbxCommand);
```

C++

```
__fastcall set_InsertCommand(const TAdoDbxCommand Value);
```

Description

This is set_InsertCommand, a member of class TAdoDbxDataAdapter.

15.1.1.1.5.4.13 TAdoDbxDataAdapter.set_SelectCommand Method

Pascal

```
procedure set_SelectCommand(const Value: TAdoDbxCommand);
```

C++

```
__fastcall set_SelectCommand(const TAdoDbxCommand Value);
```

Description

This is set_SelectCommand, a member of class TAdoDbxDataAdapter.

15.1.1.1.5.4.14 TAdoDbxDataAdapter.set_UpdateCommand Method

Pascal

```
procedure set_UpdateCommand(const Value: TAdoDbxCommand);
```

C++

```
__fastcall set_UpdateCommand(const TAdoDbxCommand Value);
```

Description

This is set_UpdateCommand, a member of class TAdoDbxDataAdapter.

15.1.1.1.5.5 TAdoDbxDataAdapter Properties

The properties of the TAdoDbxDataAdapter class are listed here.

Public Properties

	Name	Description
	DeleteCommand (see page 1823)	A TAdoDbxCommand (see page 1763) used during Update to delete records in the data source that correspond to deleted rows in the DataSet.
	InsertCommand (see page 1824)	A TAdoDbxCommand (see page 1763) used during Update to insert records into the database that correspond to new rows in the DataSet.
	SelectCommand (see page 1825)	A TAdoDbxCommand (see page 1763) used during Fill to select records from the database for placement in the DataSet.
	UpdateCommand (see page 1825)	A TAdoDbxCommand (see page 1763) used during Update to update records in the data source that correspond to modified rows in the DataSet.

15.1.1.1.5.5.1 TAdoDbxDataAdapter.DeleteCommand Property

A TAdoDbxCommand (see page 1763) used during Update to delete records in the data source that correspond to deleted rows in the DataSet.

Pascal

```
property DeleteCommand: TAdoDbxCommand;
```

C++

```
__property TAdoDbxCommand DeleteCommand;
```

Description

Use this property to store a SQL DELETE statement that you intend to pass to the TAdoDbxDataAdapter (see page 1814) multiple times. This property serves as a shorthand method for storing and calling a command that you intend to use multiple times.

When you assign DeleteCommand to a previously created TAdoDbxCommand (see page 1763), the TAdoDbxCommand (see page 1763) is not cloned. The DeleteCommand maintains a reference to the previously created TAdoDbxCommand (see page 1763) object.

Note: During Update, if you don't set this property and primary key information is present in the DataSet, you can generate the DeleteCommand automatically by setting the SelectCommand (see page 1825) property and using the TAdoDbxCommandBuilder (see page 1776). Additional commands that you do not set are generated by the TAdoDbxCommandBuilder (see page 1776). This generation logic requires key column information to be present in the DataSet. For more information, see the Microsoft .NET SDK online help.

See Also

TAdoDbxCommand (see page 1763)

TAdoDbxCommandBuilder (see page 1776)

TAdoDbxDataAdapter (see page 1814)

DataSet

15.1.1.1.5.5.2 TAdoDbxDataAdapter.InsertCommand Property

A TAdoDbxCommand (see page 1763) used during Update to insert records into the database that correspond to new rows in the DataSet.

Pascal

```
property InsertCommand: TAdoDbxCommand;
```

C++

```
__property TAdoDbxCommand InsertCommand;
```

Description

This property contains a SQL INSERT statement that you specify. This property acts as a form of shorthand, allowing you to store an INSERT statement that you expect to use multiple times.

During Update, if you don't set this property and if primary key information is present in the DataSet, you can generate the InsertCommand automatically by setting the SelectCommand (see page 1825) property and using the TAdoDbxCommandBuilder (see page 1776). Then, any additional commands that you do not set are generated by the TAdoDbxCommandBuilder (see page 1776). This generation logic requires key column information to be present in the DataSet.

If execution of this command returns rows, they can be added to the DataSet depending on how you set the UpdatedRowSource property of the TAdoDbxCommand (see page 1763) object.

Note: When you assign InsertCommand to a previously created TAdoDbxCommand (see page 1763), the TAdoDbxCommand (see page 1763) is not cloned. The InsertCommand maintains a reference to the previously created TAdoDbxCommand (see page 1763) object.

See Also

InsertCommand (MSDN)

TAdoDbxCommand (see page 1763)

TAdoDbxCommandBuilder (see page 1776)

DataSet

SelectCommand (see page 1825)

UpdatedRowSource

15.1.1.1.5.5.3 TAdoDbxDataAdapter.SelectCommand Property

A TAdoDbxCommand (see page 1763) used during Fill to select records from the database for placement in the DataSet.

Pascal

```
property SelectCommand: TAdoDbxCommand;
```

C++

```
__property TAdoDbxCommand SelectCommand;
```

Description

This property contains the SQL SELECT statement you assign to it. The property serves as a shorthand method for referring to a SQL statement that you expect to use many times.

Note: When you assign the SelectCommand to a previously created TAdoDbxCommand (see page 1763), the TAdoDbxCommand (see page 1763) is not cloned. The SelectCommand maintains a reference to the previously created TAdoDbxCommand (see page 1763) object. If the SelectCommand does not return any rows, no tables are added to the DataSet, and no exception is raised.

See Also

SelectCommand (MSDN)

TAdoDbxCommand (see page 1763)

Fill

DataSet

15.1.1.1.5.5.4 TAdoDbxDataAdapter.UpdateCommand Property

A TAdoDbxCommand (see page 1763) used during Update to update records in the data source that correspond to modified rows in the DataSet.

Pascal

```
property UpdateCommand: TAdoDbxCommand;
```

C++

```
__property TAdoDbxCommand UpdateCommand;
```

Description

Use this property to get or set the SQL UPDATE statement. You can use this property as a form of shorthand to define a SQL UPDATE statement that you intend to use multiple times.

When UpdateCommand is assigned to a previously created TAdoDbxCommand (see page 1763), the TAdoDbxCommand (see page 1763) is not cloned. The UpdateCommand maintains a reference to the previously created TAdoDbxCommand (see page 1763) object. If execution of this command returns rows, these rows can be merged with the DataSet depending on how you set the UpdatedRowSource property of the TAdoDbxCommand (see page 1763) object.

Note: During Update, if you don't set this property and primary key information is present in the DataSet, the UpdateCommand can be generated automatically if you set the SelectCommand (see page 1825) property and use the TAdoDbxCommandBuilder (see page 1776). Then, any additional commands that you don't set are generated by the TAdoDbxCommandBuilder (see page 1776). This generation logic requires key column information to be present in the DataSet.

15.1.1.1.5.6 TAdoDbxDataAdapter Events

The events of the TAdoDbxDataAdapter class are listed here.

Public Events

	Name	Description
	RowUpdated (see page 1826)	Row has been updated.
	RowUpdating (see page 1826)	Row is being updated.

15.1.1.1.5.6.1 TAdoDbxDataAdapter.RowUpdated Event

Row has been updated.

Pascal

```
property RowUpdated: TAdoDbxRowUpdatedEventHandler;
```

C++

```
__property TAdoDbxRowUpdatedEventHandler RowUpdated;
```

Description

RowUpdated indicates that a row has been updated. This event occurs just before a row is updated. This is a multicast event that can trigger multiple event handlers.

See Also

add_RowUpdated (see page 1819)

remove_RowUpdated (see page 1821)

RowUpdating (see page 1826)

TAdoDbxRowUpdatedEventHandler (see page 1890)

15.1.1.1.5.6.2 TAdoDbxDataAdapter.RowUpdating Event

Row is being updated.

Pascal

```
property RowUpdating: TAdoDbxRowUpdatingEventHandler;
```

C++

```
__property TAdoDbxRowUpdatingEventHandler RowUpdating;
```

Description

RowUpdated (see page 1826) indicates that a row is being updated. This event occurs just before a row begins to be updated. This is a multicast event that can trigger multiple event handlers.

See Also

RowUpdated (see page 1826)

TAdoDbxRowUpdatingEventHandler (see page 1890)

15.1.1.1.6 TAdoDbxDataReader Class

Class to read rows forward-only from a data source.

Class Hierarchy

Pascal

```
TAdoDbxDataReader = class(DbDataReader);
```

C++

```
class TAdoDbxDataReader : public DbDataReader;
```

File

Borland.Data.AdoDbxClientProvider

Description

A TAdoDbxDataReader is returned as a result of a `SELECT` or stored procedure execution from a call to TAdoDbxCommand.ExecuteReader. Because there is no public constructor, you cannot directly instantiate a TAdoDbxDataReader. Instead, obtain the TAdoDbxDataReader through the ExecuteReader method of the TAdoDbxCommand (see page 1763) object.

The TAdoDbxDataReader class is an implementation of the ADO.NET DbDataReader class.

The TAdoDbxDataReader provides a forward-only reader and the associated metadata. TAdoDbxDataReader methods such as GetName (see page 1840), GetDataTypeName (see page 1837), GetFieldType (see page 1838) and GetDataTypeName (see page 1837) provide the metadata.

For all of these methods, you must pass the ordinal of the column, which is zero-based, in the ordinal parameter. Given a column name, GetOrdinal (see page 1840) returns the column ordinal or position in the select list. GetName (see page 1840), GetDataTypeName (see page 1837) and GetFieldType (see page 1838) return the name, SQL datatype name, and the .NET Framework System.Type, respectively, for a particular column. GetSchemaTable (see page 1840) also can be used to retrieve the metadata of a column as a DataTable.

You can call TAdoDbxDataReader.Read (see page 1842) to fetch records one after the other until a **false** value is returned, which indicates that you have hit the EOF. Before accessing individual column values, you can check to see if the data is `NULL` by calling IsDBNull (see page 1841). Then, depending on the datatype, you can call one of the field accessor methods, such as GetInt16 (see page 1839), GetInt32 (see page 1839) or GetFloat (see page 1838).

You can access BLOB data as a byte array or a character array by calling GetBytes (see page 1835) or GetChars (see page 1836). A null buffer passed to these methods returns the size of the BLOB data available. The current implementation of TAdoDbxDataReader does not support fetching BLOB data by specifying offsets.

The initial state of the TAdoDbxDataReader returned from a call to TAdoDbxCommand.ExecuteReader is **open**. Once all of the records have been fetched, you can call the Close (see page 1832) method to free all of the column-related resources. To find out if a TAdoDbxDataReader is closed, you can check the IsClosed (see page 1844) property. If the TAdoDbxDataReader is closed, it returns **True**, otherwise **False**. If the CommandBehavior parameter is **CloseConnection** in ExecuteReader, the TAdoDbxConnection (see page 1779) used for executing the SQL is also closed when the TAdoDbxDataReader is closed. The NextResult (see page 1842) method returns **True** if more results are available from a stored procedure execution.

The following C# code shows how to retrieve data using a TAdoDbxDataReader, assuming that a you already have a valid connection and command.

```
public static void ExecuteCommand ( TAdoDbxCommand Comm )
```

```
{
  Comm.CommandText  =  " SELECT * FROM EMPLOYEE";
   Comm.Prepare();
   TAdoDbxDataReader Reader = Comm.ExecuteReader();
   if ( Reader != null )
   {
      while (Reader.Read())
      {
         ShowData(Reader);
      }
      Reader.Close();
   }
   Comm.Close();
}

public static void ShowData(TAdoDbxDataReader Reader)
{
   long retVal = 0, startIndex = 0;
   int  buffSize = 0;
   char []buffer = null;

   for (Int32 index = 0; index < Reader.FieldCount; index++)
   {
      //Check for NULL
      if ( Reader.IsDBNull(index) )
      {
         Console.Write("NULL");
      }
      else
      {
         Type t =  Reader.GetFieldType(index);
         if (t == typeof(Int16) )
            Console.Write(Reader.GetInt16(index));
         else if ( t == typeof(Int32) )
            Console.Write(Reader.GetInt32(index));
         else if ( t == typeof(String) )
            Console.Write(Reader.GetString(index));
         else if ( t == typeof(float) )
            Console.Write(Reader.GetFloat(index));
         else if ( t == typeof(double) )
            Console.Write(Reader.GetDouble(index));
         else if ( t == typeof(DateTime) )
            Console.Write(Reader.GetDateTime(index));
         else if ( t == typeof(Decimal) )
            Console.Write(Reader.GetDecimal(index));
         else if ( (t == typeof(Byte[])) || (t == typeof(Char[])) )
         {
            String DataType =  Reader.GetDataTypeName(index);
            if (DataType == "Blob")
            {
               retVal = Reader.GetChars(index, 0, null, 0, 0);
               Console.Write("Blob Size = " + retVal);
               buffSize = (int) retVal;

               //Display only character blob data
               if ( retVal > 0 && (t== typeof(Char[])) )
               {
                  buffer = new char[buffSize];
                  startIndex = 0;
                  retVal = Reader.GetChars(index, startIndex, buffer, 0, buffSize);
                  for (int i = 0; i < buffer.Length; i++ )
                     Console.Write(buffer[i]);
             }

          }
```

```
            }
        }
        if (index < Reader.FieldCount -1)
          Console.Write(", ");
    }
    Console.WriteLine();
```

15.1.1.1.6.1 TAdoDbxDataReader Members

The following tables list the members exposed by TAdoDbxDataReader.

Public Methods

	Name	Description
	Close (see page 1832)	Closes the TAdoDbxDataReader (see page 1827).
	Destroy (see page 1830)	Destroys a TAdoDbxDataReader (see page 1827) instance.
	get_Depth (see page 1833)	This is get_Depth, a member of class TAdoDbxDataReader.
	get_FieldCount (see page 1833)	This is get_FieldCount, a member of class TAdoDbxDataReader.
	get_HasRows (see page 1833)	This is get_HasRows, a member of class TAdoDbxDataReader.
	get_IsClosed (see page 1833)	This is get_IsClosed, a member of class TAdoDbxDataReader.
	get_Item (see page 1834)	This is the overview for the get_Item method overload.

	get_RecordsAffected (see page 1834)	This is get_RecordsAffected, a member of class TAdoDbxDataReader.
	GetBoolean (see page 1834)	Gets the specified column value as a Boolean.
	GetByte (see page 1835)	Gets the specified column value as a byte.
	GetBytes (see page 1835)	Gets column value into an array of bytes.
	GetChar (see page 1835)	Gets the specified column value as a single character.
	GetChars (see page 1836)	Gets column value into an array of chars.
	GetData (see page 1836)	Return a data reader for the column.
	GetDataTypeName (see page 1837)	Gets name of data type for column.
	GetDateTime (see page 1837)	Gets the specified column value as a DateTime.
	GetDecimal (see page 1837)	Gets the specified column value as a Decimal.
	GetDouble (see page 1837)	Gets the specified column value as a double-precision floating point number.
	GetEnumerator (see page 1838)	Returns an IEnumerator that can iterate through rows.
	GetFieldType (see page 1838)	Gets the data type of a specified column.
	GetFloat (see page 1838)	Gets the specified column value as a single-precision floating point number.
	GetGuid (see page 1839)	Gets the specified column value as a GUID.
	GetInt16 (see page 1839)	Gets the specified column value as a 16-bit signed integer.
	GetInt32 (see page 1839)	Gets the specified column value as a 32-bit signed integer.
	GetInt64 (see page 1839)	Gets the specified column value as a 64-bit signed integer.
	GetName (see page 1840)	Gets the specified column name.
	GetOrdinal (see page 1840)	Gets the column ordinal from the name.
	GetSchemaTable (see page 1840)	Returns column metadata of the table.
	GetString (see page 1841)	Gets the specified column value as a String.
	GetValue (see page 1841)	Gets the specified column value as an Object.
	GetValues (see page 1841)	Gets all column values as an array of Objects.
	IsDBNull (see page 1841)	Indicates whether specified column value has a value.
	NextResult (see page 1842)	Advances reader to next result.
	Read (see page 1842)	Advances reader to next row in result set.

Public Properties

	Name	Description
	Depth (see page 1843)	Gets or sets the depth of nesting for the current row.
	FieldCount (see page 1843)	Number of columns in this TAdoDbxDataReader (see page 1827).
	HasRows (see page 1843)	Indicates whether TAdoDbxDataReader (see page 1827) has rows.
	IsClosed (see page 1844)	Returns a Boolean indicating whether the data reader is closed or open.
	Item (see page 1844)	Gets or sets the value of a column in its native format.
	RecordsAffected (see page 1844)	Gets the number of rows changed, inserted, or deleted by execution of SQL statement.

Strict private Fields

	Name	Description
	FCommandBehavior (see page 1831)	This is FCommandBehavior, a member of class TAdoDbxDataReader.
	FDbxCommand (see page 1831)	This is FDbxCommand, a member of class TAdoDbxDataReader.
	FDbxReader (see page 1831)	This is FDbxReader, a member of class TAdoDbxDataReader.
	FPeekAheadRead (see page 1832)	This is FPeekAheadRead, a member of class TAdoDbxDataReader.

15.1.1.1.6.2 TAdoDbxDataReader.Destroy Destructor

Destroys a TAdoDbxDataReader (see page 1827) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdoDbxDataReader();
```

Description

This method destroys a TAdoDbxDataReader (see page 1827) instance, freeing all its resources.

Note: Destroy should not be called directly. Call the Close (see page 1832) or Free method instead.

See Also

Close (see page 1832)

15.1.1.1.6.3 TAdoDbxDataReader Fields

The fields of the TAdoDbxDataReader class are listed here.

Strict private Fields

	Name	Description
	FCommandBehavior (see page 1831)	This is FCommandBehavior, a member of class TAdoDbxDataReader.
	FDbxCommand (see page 1831)	This is FDbxCommand, a member of class TAdoDbxDataReader.
	FDbxReader (see page 1831)	This is FDbxReader, a member of class TAdoDbxDataReader.
	FPeekAheadRead (see page 1832)	This is FPeekAheadRead, a member of class TAdoDbxDataReader.

15.1.1.1.6.3.1 TAdoDbxDataReader.FCommandBehavior Field

Pascal

```
FCommandBehavior: CommandBehavior;
```

C++

```
CommandBehavior FCommandBehavior;
```

Description

This is FCommandBehavior, a member of class TAdoDbxDataReader.

15.1.1.1.6.3.2 TAdoDbxDataReader.FDbxCommand Field

Pascal

```
FDbxCommand: TDBXCommand;
```

C++

```
TDBXCommand FDbxCommand;
```

Description

This is FDbxCommand, a member of class TAdoDbxDataReader.

15.1.1.1.6.3.3 TAdoDbxDataReader.FDbxReader Field

Pascal

```
FDbxReader: TDBXReader;
```

C++

```
TDBXReader FDbxReader;
```

Description

This is FDbxReader, a member of class TAdoDbxDataReader.

15.1.1.1.6.3.4 TAdoDbxDataReader.FPeekAheadRead Field

Pascal

```
FPeekAheadRead: Boolean;
```

C++

```
Boolean FPeekAheadRead;
```

Description

This is FPeekAheadRead, a member of class TAdoDbxDataReader.

15.1.1.1.6.4 TAdoDbxDataReader Methods

The methods of the TAdoDbxDataReader class are listed here.

Public Methods

	Name	Description
	Close (see page 1832)	Closes the TAdoDbxDataReader (see page 1827).
	get_Depth (see page 1833)	This is get_Depth, a member of class TAdoDbxDataReader.
	get_FieldCount (see page 1833)	This is get_FieldCount, a member of class TAdoDbxDataReader.
	get_HasRows (see page 1833)	This is get_HasRows, a member of class TAdoDbxDataReader.
	get_IsClosed (see page 1833)	This is get_IsClosed, a member of class TAdoDbxDataReader.
	get_Item (see page 1834)	This is the overview for the get_Item method overload.
	get_RecordsAffected (see page 1834)	This is get_RecordsAffected, a member of class TAdoDbxDataReader.
	GetBoolean (see page 1834)	Gets the specified column value as a Boolean.
	GetByte (see page 1835)	Gets the specified column value as a byte.
	GetBytes (see page 1835)	Gets column value into an array of bytes.
	GetChar (see page 1835)	Gets the specified column value as a single character.
	GetChars (see page 1836)	Gets column value into an array of chars.
	GetData (see page 1836)	Return a data reader for the column.
	GetDataTypeName (see page 1837)	Gets name of data type for column.
	GetDateTime (see page 1837)	Gets the specified column value as a DateTime.
	GetDecimal (see page 1837)	Gets the specified column value as a Decimal.
	GetDouble (see page 1837)	Gets the specified column value as a double-precision floating point number.
	GetEnumerator (see page 1838)	Returns an IEnumerator that can iterate through rows.
	GetFieldType (see page 1838)	Gets the data type of a specified column.
	GetFloat (see page 1838)	Gets the specified column value as a single-precision floating point number.
	GetGuid (see page 1839)	Gets the specified column value as a GUID.
	GetInt16 (see page 1839)	Gets the specified column value as a 16-bit signed integer.
	GetInt32 (see page 1839)	Gets the specified column value as a 32-bit signed integer.
	GetInt64 (see page 1839)	Gets the specified column value as a 64-bit signed integer.
	GetName (see page 1840)	Gets the specified column name.
	GetOrdinal (see page 1840)	Gets the column ordinal from the name.
	GetSchemaTable (see page 1840)	Returns column metadata of the table.
	GetString (see page 1841)	Gets the specified column value as a String.
	GetValue (see page 1841)	Gets the specified column value as an Object.
	GetValues (see page 1841)	Gets all column values as an array of Objects.
	IsDBNull (see page 1841)	Indicates whether specified column value has a value.
	NextResult (see page 1842)	Advances reader to next result.
	Read (see page 1842)	Advances reader to next row in result set.

15.1.1.1.6.4.1 TAdoDbxDataReader.Close Method

Closes the TAdoDbxDataReader (see page 1827).

Pascal

```
procedure Close; override;
```

C++

```
virtual __fastcall Close();
```

Description

Close closes the TAdoDbxDataReader (see page 1827).

Note: Close should be called as soon as the TAdoDbxDataReader (see page 1827) is no longer needed to free up resources.

See Also

Close (MSDN)

15.1.1.1.6.4.2 TAdoDbxDataReader.get_Depth Method

Pascal

```
function get_Depth: Integer; override;
```

C++

```
virtual __fastcall int get_Depth();
```

Description

This is get_Depth, a member of class TAdoDbxDataReader.

15.1.1.1.6.4.3 TAdoDbxDataReader.get_FieldCount Method

Pascal

```
function get_FieldCount: Integer; override;
```

C++

```
virtual __fastcall int get_FieldCount();
```

Description

This is get_FieldCount, a member of class TAdoDbxDataReader.

15.1.1.1.6.4.4 TAdoDbxDataReader.get_HasRows Method

Pascal

```
function get_HasRows: Boolean; override;
```

C++

```
virtual __fastcall Boolean get_HasRows();
```

Description

This is get_HasRows, a member of class TAdoDbxDataReader.

15.1.1.1.6.4.5 TAdoDbxDataReader.get_IsClosed Method

Pascal

```
function get_IsClosed: Boolean; override;
```

C++

```
virtual __fastcall Boolean get_IsClosed();
```

Description

This is get_IsClosed, a member of class TAdoDbxDataReader.

15.1.1.1.6.4.6 get_Item Method

This is the overview for the get_Item method overload.

Overload List

	Name	Description
	TAdoDbxDataReader.get_Item (Integer) (see page 1834)	This is get_Item, a member of class TAdoDbxDataReader.
	TAdoDbxDataReader.get_Item (String) (see page 1834)	This is get_Item, a member of class TAdoDbxDataReader.

15.1.1.1.6.4.6.1 TAdoDbxDataReader.get_Item Method (Integer)

Pascal

```
function get_Item(Ordinal: Integer): TObject; override; overload;
```

C++

```
virtual __fastcall TObject * get_Item(int Ordinal);
```

Description

This is get_Item, a member of class TAdoDbxDataReader.

15.1.1.1.6.4.6.2 TAdoDbxDataReader.get_Item Method (String)

Pascal

```
function get_Item(Name: String): TObject; override; overload;
```

C++

```
virtual __fastcall TObject * get_Item(AnsiString Name);
```

Description

This is get_Item, a member of class TAdoDbxDataReader.

15.1.1.1.6.4.7 TAdoDbxDataReader.get_RecordsAffected Method

Pascal

```
function get_RecordsAffected: Integer; override;
```

C++

```
virtual __fastcall int get_RecordsAffected();
```

Description

This is get_RecordsAffected, a member of class TAdoDbxDataReader.

15.1.1.1.6.4.8 TAdoDbxDataReader.GetBoolean Method

Gets the specified column value as a Boolean.

Pascal

```
function GetBoolean(Ordinal: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean GetBoolean(int Ordinal);
```

Description

GetBoolean gets the specified zero-based column value as a Boolean.

See Also

GetBoolean (MSDN)

15.1.1.1.6.4.9 TAdoDbxDataReader.GetByte Method

Gets the specified column value as a byte.

Pascal

```
function GetByte(Ordinal: Integer): Byte; override;
```

C++

```
virtual __fastcall Byte GetByte(int Ordinal);
```

Description

GetByte gets the specified zero-based column value as a byte value.

See Also

GetByte (MSDN)

15.1.1.1.6.4.10 TAdoDbxDataReader.GetBytes Method

Gets column value into an array of bytes.

Pascal

```
function GetBytes(Ordinal: Integer; DataOffset: Int64; Bytes: array of byte; BufferOffset:
Integer; Length: Integer): Int64; override;
```

C++

```
virtual __fastcall Int64 GetBytes(int Ordinal, Int64 DataOffset, array of byte Bytes, int
BufferOffset, int Length);
```

Description

GetBytes reads a column value into an array of bytes. It returns the number of bytes read. The parameters are:

Parameter	Description
Ordinal	Zero based column ordinal to read from.
DataOffset	Offset into the data to start reading from.
Bytes	Byte array to read into.
BufferOffset	Byte offset into buffer at which to write data.
Length	Maximum number of bytes to read.

See Also

GetBytes (MSDN)

15.1.1.1.6.4.11 TAdoDbxDataReader.GetChar Method

Gets the specified column value as a single character.

Pascal

```
function GetChar(Ordinal: Integer): Char; override;
```

C++

```
virtual __fastcall Char GetChar(int Ordinal);
```

Description

GetChar gets the specified zero-based column value as a single character.

See Also

GetChar (MSDN)

15.1.1.1.6.4.12 TAdoDbxDataReader.GetChars Method

Gets column value into an array of chars.

Pascal

```
function GetChars(Ordinal: Integer; DataOffset: Int64; Bytes: array of char; BufferOffset:
Integer; Length: Integer): Int64; override;
```

C++

```
virtual __fastcall Int64 GetChars(int Ordinal, Int64 DataOffset, array of char Bytes, int
BufferOffset, int Length);
```

Description

GetChars reads a column value into an array of chars. It returns the number of characters read. The parameters are:

Parameter	Description
Ordinal	Zero based column ordinal to read from.
DataOffset	Offset into the data to start reading from.
Bytes	Char array to read into.
BufferOffset	Byte offset into buffer at which to write data.
Length	Maximum number of chars to read.

See Also

GetChars (MSDN)

15.1.1.1.6.4.13 TAdoDbxDataReader.GetData Method

Return a data reader for the column.

Pascal

```
function GetData(Index: Integer): IDataReader;
```

C++

```
__fastcall IDataReader GetData(int Index);
```

Description

GetData returns an TAdoDbxDataReader (see page 1827) for the zero-based ordinal.

See Also

TAdoDbxDataReader (see page 1827)

GetData (MSDN)

15.1.1.1.6.4.14 TAdoDbxDataReader.GetDataTypeName Method

Gets name of data type for column.

Pascal

```
function GetDataTypeName(Ordinal: Integer): String; override;
```

C++

```
virtual __fastcall AnsiString GetDataTypeName(int Ordinal);
```

Description

GetDataTypeName returns a string representing the data type for a zero-based column number.

See Also

GetDataTypeName (MSDN)

15.1.1.1.6.4.15 TAdoDbxDataReader.GetDateTime Method

Gets the specified column value as a DateTime.

Pascal

```
function GetDateTime(Ordinal: Integer): DateTime; override;
```

C++

```
virtual __fastcall DateTime GetDateTime(int Ordinal);
```

Description

GetDateTime gets the specified zero-based column value as a DateTime object.

See Also

GetDateTime (MSDN)

15.1.1.1.6.4.16 TAdoDbxDataReader.GetDecimal Method

Gets the specified column value as a Decimal.

Pascal

```
function GetDecimal(Ordinal: Integer): Decimal; override;
```

C++

```
virtual __fastcall Decimal GetDecimal(int Ordinal);
```

Description

GetDecimal gets the specified zero-based column value as a Decimal object.

See Also

GetDecimal (MSDN)

15.1.1.1.6.4.17 TAdoDbxDataReader.GetDouble Method

Gets the specified column value as a double-precision floating point number.

Pascal

```
function GetDouble(Ordinal: Integer): double; override;
```

C++

```
virtual __fastcall double GetDouble(int Ordinal);
```

Description

GetDouble gets the specified zero-based column value as a double-precision floating point number.

See Also

GetDouble (MSDN)

15.1.1.1.6.4.18 TAdoDbxDataReader.GetEnumerator Method

Returns an IEnumerator that can iterate through rows.

Pascal

```
function GetEnumerator: IEnumerator; override;
```

C++

```
virtual __fastcall IEnumerator GetEnumerator();
```

Description

GetEnumerator returns an IEnumerator that can iterate through rows of a data reader.

See Also

GetEnumerator (MSDN)

IEnumerator interface (MSDN)

15.1.1.1.6.4.19 TAdoDbxDataReader.GetFieldType Method

Gets the data type of a specified column.

Pascal

```
function GetFieldType(Ordinal: Integer): System; override;
```

C++

```
virtual __fastcall System GetFieldType(int Ordinal);
```

Description

GetFieldType gets the System.Type data type of a specified zero-based column number.

See Also

GetFieldType (MSDN)

System.Type type (MSDN)

15.1.1.1.6.4.20 TAdoDbxDataReader.GetFloat Method

Gets the specified column value as a single-precision floating point number.

Pascal

```
function GetFloat(Ordinal: Integer): single; override;
```

C++

```
virtual __fastcall single GetFloat(int Ordinal);
```

Description

GetFloat gets the specified zero-based column value as a single-precision floating point number.

See Also

GetFloat (MSDN)

15.1.1.1.6.4.21 TAdoDbxDataReader.GetGuid Method

Gets the specified column value as a GUID.

Pascal

```
function GetGuid(Ordinal: Integer): Guid; override;
```

C++

```
virtual __fastcall Guid GetGuid(int Ordinal);
```

Description

GetGuid gets the specified zero-based column value as a globally-unique identifier (GUID).

See Also

GetGuid (MSDN)

15.1.1.1.6.4.22 TAdoDbxDataReader.GetInt16 Method

Gets the specified column value as a 16-bit signed integer.

Pascal

```
function GetInt16(Ordinal: Integer): Smallint; override;
```

C++

```
virtual __fastcall Smallint GetInt16(int Ordinal);
```

Description

GetInt16 gets the specified zero-based column value as a 16-bit signed integer.

See Also

GetInt16 (MSDN)

15.1.1.1.6.4.23 TAdoDbxDataReader.GetInt32 Method

Gets the specified column value as a 32-bit signed integer.

Pascal

```
function GetInt32(Ordinal: Integer): Integer; override;
```

C++

```
virtual __fastcall int GetInt32(int Ordinal);
```

Description

GetInt32 gets the specified zero-based column value as a 32-bit signed integer.

See Also

GetInt32 (MSDN)

15.1.1.1.6.4.24 TAdoDbxDataReader.GetInt64 Method

Gets the specified column value as a 64-bit signed integer.

Pascal

```
function GetInt64(Ordinal: Integer): Int64; override;
```

C++

```
virtual __fastcall Int64 GetInt64(int Ordinal);
```

Description

GetInt64 gets the specified zero-based column value as a 64-bit signed integer.

See Also

GetInt64 (MSDN)

15.1.1.1.6.4.25 TAdoDbxDataReader.GetName Method

Gets the specified column name.

Pascal

```
function GetName(Ordinal: Integer): String; override;
```

C++

```
virtual __fastcall AnsiString GetName(int Ordinal);
```

Description

GetName gets the specified zero-based column's name.

See Also

GetName (MSDN)

15.1.1.1.6.4.26 TAdoDbxDataReader.GetOrdinal Method

Gets the column ordinal from the name.

Pascal

```
function GetOrdinal(Name: String): Integer; override;
```

C++

```
virtual __fastcall int GetOrdinal(AnsiString Name);
```

Description

GetOrdinal gets the column ordinal from its name.

See Also

GetOrdinal (MSDN)

15.1.1.1.6.4.27 TAdoDbxDataReader.GetSchemaTable Method

Returns column metadata of the table.

Pascal

```
function GetSchemaTable: DataTable; override;
```

C++

```
virtual __fastcall DataTable GetSchemaTable();
```

Description

GetSchemaTable returns a DataTable describing the column metadata of the table.

See Also

GetSchemaTable (MSDN)

15.1.1.1.6.4.28 TAdoDbxDataReader.GetString Method

Gets the specified column value as a String.

Pascal

```
function GetString(Ordinal: Integer): String; override;
```

C++

```
virtual __fastcall AnsiString GetString(int Ordinal);
```

Description

GetString gets the specified zero-based column value as a String instance.

See Also

GetString (MSDN)

15.1.1.1.6.4.29 TAdoDbxDataReader.GetValue Method

Gets the specified column value as an Object.

Pascal

```
function GetValue(ordinal: Integer): TObject; override;
```

C++

```
virtual __fastcall TObject * GetValue(int ordinal);
```

Description

GetValue gets the specified zero-based column value in the current row as an Object instance.

See Also

GetValue (MSDN)

15.1.1.1.6.4.30 TAdoDbxDataReader.GetValues Method

Gets all column values as an array of Objects.

Pascal

```
function GetValues(Values: TObjectArray): Integer; override;
```

C++

```
virtual __fastcall int GetValues(TObjectArray Values);
```

Description

GetValues gets the current row's column values as an array of Object instances in the given Object array. Returns the number of array Objects.

See Also

GetValues (MSDN)

15.1.1.1.6.4.31 TAdoDbxDataReader.IsDBNull Method

Indicates whether specified column value has a value.

Pascal

```
function IsDBNull(Ordinal: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean IsDBNull(int Ordinal);
```

Description

For the specified zero-based column, IsDBNull returns true if the object is equivalent to DBNull and false otherwise.

See Also

IsDBNull (MSDN)

DBNull (MSDN)

15.1.1.1.6.4.32 TAdoDbxDataReader.NextResult Method

Advances reader to next result.

Pascal

```
function NextResult: Boolean; override;
```

C++

```
virtual __fastcall Boolean NextResult();
```

Description

NextResult advances to the next result when a provider has returned multiple result sets, such as several rows. Returns true if there is more data; false otherwise.

See Also

NextResult (MSDN)

15.1.1.1.6.4.33 TAdoDbxDataReader.Read Method

Advances reader to next row in result set.

Pascal

```
function Read: Boolean; override;
```

C++

```
virtual __fastcall Boolean Read();
```

Description

Read advances to the next row in the result set. It returns true if there are more rows and false otherwise.

Note: The starting position of a reader is before the first row, so you must call Read to start getting data.

See Also

Read (MSDN)

15.1.1.1.6.5 TAdoDbxDataReader Properties

The properties of the TAdoDbxDataReader class are listed here.

Public Properties

	Name	Description
R	Depth (see page 1843)	Gets or sets the depth of nesting for the current row.

R	FieldCount (see page 1843)	Number of columns in this TAdoDbxDataReader (see page 1827).
R	HasRows (see page 1843)	Indicates whether TAdoDbxDataReader (see page 1827) has rows.
R	IsClosed (see page 1844)	Returns a Boolean indicating whether the data reader is closed or open.
R	Item (see page 1844)	Gets or sets the value of a column in its native format.
R	RecordsAffected (see page 1844)	Gets the number of rows changed, inserted, or deleted by execution of SQL statement.

15.1.1.1.6.5.1 TAdoDbxDataReader.Depth Property

Gets or sets the depth of nesting for the current row.

Pascal

```
property Depth: Integer;
```

C++

```
__property int Depth;
```

Description

Depth returns the nesting depth of the current row in the current table. The outermost table has a depth of 0.

See Also

Depth (MSDN)

15.1.1.1.6.5.2 TAdoDbxDataReader.FieldCount Property

Number of columns in this TAdoDbxDataReader (see page 1827).

Pascal

```
property FieldCount: Integer;
```

C++

```
__property int FieldCount;
```

Description

FieldCount contains the number of columns in the TAdoDbxDataReader (see page 1827).

See Also

FieldCount (MSDN)

15.1.1.1.6.5.3 TAdoDbxDataReader.HasRows Property

Indicates whether TAdoDbxDataReader (see page 1827) has rows.

Pascal

```
property HasRows: Boolean;
```

C++

```
__property Boolean HasRows;
```

Description

HasRows is true when the TAdoDbxDataReader (see page 1827) has one or more rows; false otherwise.

See Also

HasRows (MSDN)

15.1.1.1.6.5.4 TAdoDbxDataReader.IsClosed Property

Returns a Boolean indicating whether the data reader is closed or open.

Pascal

```
property IsClosed: Boolean;
```

C++

```
__property Boolean IsClosed;
```

Description

Returns **True** if the DataReader is closed, **False** if open. The IsClosed and RecordsAffected (see page 1844) properties are the only ones that you can access after the TAdoDbxDataReader (see page 1827) instance is closed.

See Also

IsClosed (MSDN)

RecordsAffected (see page 1844)

15.1.1.1.6.5.5 TAdoDbxDataReader.Item Property

Gets or sets the value of a column in its native format.

Pascal

```
property Item [Name: String]: TObject;
```

C++

```
__property TObject * Item[AnsiString Name];
```

Description

The indexer for the TAdoDbxDataReader (see page 1827) class. You can specify either the string name of the column or the column ordinal. Using the ordinal is more efficient than using the name.

15.1.1.1.6.5.6 TAdoDbxDataReader.RecordsAffected Property

Gets the number of rows changed, inserted, or deleted by execution of SQL statement.

Pascal

```
property RecordsAffected: Integer;
```

C++

```
__property int RecordsAffected;
```

Description

The RecordsAffected property contains the number of rows changed, inserted, or deleted by SQL statements. It contains zero (0) if no rows were affected or the statement failed, and -1 for SELECT statements. The RecordsAffected property is not set until all rows are read and you close the TAdoDbxDataReader (see page 1827). The value of this property is cumulative. For example, if two records are inserted in batch mode, the value of RecordsAffected is two.

The IsClosed (see page 1844) and RecordsAffected properties are the only ones that you can call after the TAdoDbxDataReader (see page 1827) is closed.

Returns	When
0	No rows were affected or the statement failed.
-1	A SELECT statement executed.

Other numbers	The number of rows affected. The value is cumulative and reflects actual records affected by batch mode operations.

See Also

RecordsAffected (MSDN)

IsClosed (see page 1844)

15.1.1.1.7 TAdoDbxDataSourceEnumerator Class

Provides enumerator for finding all data sources on local network.

Class Hierarchy

Pascal

```
TAdoDbxDataSourceEnumerator = class(DbDataSourceEnumerator);
```

C++

```
class TAdoDbxDataSourceEnumerator : public DbDataSourceEnumerator;
```

File

Borland.Data.AdoDbxClientProvider

Description

TAdoDbxDataSourceEnumerator provides an enumerator for all available data sources on the local network. This class also provides a base for enumerating local strongly typed data sources.

The TAdoDbxDataSourceEnumerator class is an implementation of the ADO.NET DbDataSourceEnumerator class.

See Also

DbDataSourceEnumerator (MSDN)

15.1.1.1.8 TAdoDbxException Class

Base class for all data source exceptions.

Class Hierarchy

Pascal

```
TAdoDbxException = class(DbException);
```

C++

```
class TAdoDbxException : public DbException;
```

File

Borland.Data.AdoDbxClientProvider

Description

TAdoDbxException serves as a base class for provider-specific exceptions.

The TAdoDbxException class is an implementation of the ADO.NET DbException class.

See Also

DbException (MSDN)

15.1.1.1.8.1 TAdoDbxException Members

The following tables list the members exposed by TAdoDbxException.

Protected Methods

	Name	Description
	Create (see page 1846)	This is the overview for the Create constructor overload.

15.1.1.1.8.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TAdoDbxException.Create (String) (see page 1846)	This is Create, a member of class TAdoDbxException.
	TAdoDbxException.Create (TDBXError) (see page 1846)	This is Create, a member of class TAdoDbxException.

15.1.1.1.8.2.1 TAdoDbxException.Create Constructor (String)

Pascal

```
constructor Create(Message: String); overload;
```

C++

```
__fastcall TAdoDbxException(AnsiString Message);
```

Description

This is Create, a member of class TAdoDbxException.

15.1.1.1.8.2.2 TAdoDbxException.Create Constructor (TDBXError)

Pascal

```
constructor Create(DBXError: TDBXError); overload;
```

C++

```
__fastcall TAdoDbxException(TDBXError DBXError);
```

Description

This is Create, a member of class TAdoDbxException.

15.1.1.1.9 TAdoDbxExtension Class

Class to get information about a connection.

Class Hierarchy

Borland.Data.AdoDbxClientProvider.TAdoDbxExtension

Pascal

```
TAdoDbxExtension = class;
```

C++

```
class TAdoDbxExtension;
```

File

Borland.Data.AdoDbxClientProvider

Description

TAdoDbxExtension gets information about a TAdoDbxConnection (see page 1779).

See Also

TAdoDbxConnection (see page 1779)

15.1.1.1.9.1 TAdoDbxExtension Members

The following tables list the members exposed by TAdoDbxExtension.

Public Methods

	Name	Description
	Create (see page 1847)	Creates an instance of TAdoDbxExtension (see page 1846)
	GetVendorProperty (see page 1848)	Retrieves vendor specific information.

Strict private Fields

	Name	Description
	FConnection (see page 1847)	This is FConnection, a member of class TAdoDbxExtension.

15.1.1.1.9.2 TAdoDbxExtension.Create Constructor

Creates an instance of TAdoDbxExtension (see page 1846)

Pascal

```
constructor Create(Connection: TAdoDbxConnection);
```

C++

```
__fastcall TAdoDbxExtension(TAdoDbxConnection Connection);
```

Description

This constructor creates and initializes an instance of TAdoDbxExtension (see page 1846).

15.1.1.1.9.3 TAdoDbxExtension Fields

The fields of the TAdoDbxExtension class are listed here.

Strict private Fields

	Name	Description
	FConnection (see page 1847)	This is FConnection, a member of class TAdoDbxExtension.

15.1.1.1.9.3.1 TAdoDbxExtension.FConnection Field

Pascal

```
FConnection: TAdoDbxConnection;
```

C++

```
TAdoDbxConnection FConnection;
```

Description

This is FConnection, a member of class TAdoDbxExtension.

15.1.1.1.9.4 TAdoDbxExtension Methods

The methods of the TAdoDbxExtension class are listed here.

Public Methods

	Name	Description
	GetVendorProperty (see page 1848)	Retrieves vendor specific information.

15.1.1.1.9.4.1 TAdoDbxExtension.GetVendorProperty Method

Retrieves vendor specific information.

Pascal

```
function GetVendorProperty(const Name: WideString): WideString;
```

C++

```
__fastcall BSTR GetVendorProperty(const BSTR Name);
```

Description

GetVendorProperty retrieves vendor specific information. An empty string is returned if the property is not supported.

15.1.1.1.10 TAdoDbxMetaDataColumnNames Class

Column headers for Restrictions DataTable.

Class Hierarchy

Borland.Data.AdoDbxClientProvider.TAdoDbxMetaDataColumnNames

Pascal

```
TAdoDbxMetaDataColumnNames = class;
```

C++

```
class TAdoDbxMetaDataColumnNames;
```

File

Borland.Data.AdoDbxClientProvider

Description

TAdoDbxMetaDataColumnNames are the column headers of the DataTable returned when TAdoDbxConnection.GetSchema is called with DbMetaDataCollectionNames.Restrictions as the first parameter—the Restrictions DataTable.

This table contains the metadata column names.

Constant	Description
RestrictionName (see page 1849)	Name of the restriction.
RestrictionNumber (see page 1849)	Order in which the restriction should be specified in the restrictions array.

RestrictionDefault (see page 1849)	Default value if nil is specified for the restriction.

See Also

TAdoDbxConnection (see page 1779)

GetSchema (see page 1787)

15.1.1.1.10.1 TAdoDbxMetaDataColumnNames Members

The following tables list the members exposed by TAdoDbxMetaDataColumnNames.

Public Constants

	Name	Description
	RestrictionDefault (see page 1849)	This is RestrictionDefault, a member of class TAdoDbxMetaDataColumnNames.
	RestrictionName (see page 1849)	This is RestrictionName, a member of class TAdoDbxMetaDataColumnNames.
	RestrictionNumber (see page 1849)	This is RestrictionNumber, a member of class TAdoDbxMetaDataColumnNames.

15.1.1.1.10.2 TAdoDbxMetaDataColumnNames Constants

The constants of the TAdoDbxMetaDataColumnNames class are listed here.

Public Constants

	Name	Description
	RestrictionDefault (see page 1849)	This is RestrictionDefault, a member of class TAdoDbxMetaDataColumnNames.
	RestrictionName (see page 1849)	This is RestrictionName, a member of class TAdoDbxMetaDataColumnNames.
	RestrictionNumber (see page 1849)	This is RestrictionNumber, a member of class TAdoDbxMetaDataColumnNames.

15.1.1.1.10.2.1 TAdoDbxMetaDataColumnNames.RestrictionDefault Constant

Pascal

```
const RestrictionDefault = 'RestrictionDefault';
```

C++

```
RestrictionDefault = 'RestrictionDefault';
```

Description

This is RestrictionDefault, a member of class TAdoDbxMetaDataColumnNames.

15.1.1.1.10.2.2 TAdoDbxMetaDataColumnNames.RestrictionName Constant

Pascal

```
const RestrictionName = 'RestrictionName';
```

C++

```
RestrictionName = 'RestrictionName';
```

Description

This is RestrictionName, a member of class TAdoDbxMetaDataColumnNames.

15.1.1.1.10.2.3 TAdoDbxMetaDataColumnNames.RestrictionNumber Constant

Pascal

```
const RestrictionNumber = 'RestrictionNumber';
```

C++

```
RestrictionNumber = 'RestrictionNumber';
```

Description

This is RestrictionNumber, a member of class TAdoDbxMetaDataColumnNames.

15.1.1.1.11 TAdoDbxParameter Class

Represents a parameter that is passed to or from a command.

Class Hierarchy

Pascal

```
TAdoDbxParameter = class(DbParameter, ICloneable);
```

C++

```
class TAdoDbxParameter : public DbParameter, public ICloneable;
```

File

Borland.Data.AdoDbxClientProvider

Description

If you are using parameterized SQL or stored procedures, you can pass parameters to them using the TAdoDbxParameter class. The Direction (see page 1861) property determines whether a parameter is an input parameter, an output parameter, or a return value. You can create a new instance of a TAdoDbxParameter object using the simple constructor syntax. You can also specify a number of overloaded values in the constructor.

The TAdoDbxParameter class is an implementation of the ADO.NET DbParameter class.

To pass runtime parameters for a parameterized SQL statement or stored procedure, use the TAdoDbxParameterCollection (see page 1865) class. An empty TAdoDbxParameterCollection (see page 1865) is returned by the TAdoDbxCommand.Parameters property. After successfully preparing the command, parameters are added to the TAdoDbxParameterCollection (see page 1865) by calling the Add method and passing the parameter information such as name, datatype, precision, scale, size, and so on. You can use one of the overloaded Add methods or you can set individual TAdoDbxParameter properties such as Direction (see page 1861), Precision (see page 1862), Scale (see page 1863), DbType (see page 1860) and Size (see page 1863).

Parameter names must be unique, and the parameters must be added to the TAdoDbxParameterCollection (see page 1865) in the same order in which parameter markers appear in the SQL. The Direction (see page 1861) property, by default, is set to **ParameterDirection**.**Input**. In the case of stored procedures, it can be set to **Output**, **InputOutput**, or **ReturnValue** . If the inout parameter is expected to return more data than the input, you should specify the Precision (see page 1862) as a size large enough to hold the output data.

Note: Not all databases support all the different parameter directions.

While specifying the parameter datatype, you can use either System.Type or the ADO.NET logical type and the subtype. You should set the Value (see page 1865) property with the runtime value for all parameters before executing the command. After successful execution, output data is available in the Value (see page 1865) property.

15.1.1.1.11.1 TAdoDbxParameter Members

The following tables list the members exposed by TAdoDbxParameter.

Public Methods

	Name	Description
	Clone (see page 1855)	This is Clone, a member of class TAdoDbxParameter.
	Create (see page 1852)	This is the overview for the Create constructor overload.
	Destroy (see page 1853)	Destroys a TAdoDbxParameter (see page 1850) instance.
	get_DbType (see page 1855)	This is get_DbType, a member of class TAdoDbxParameter.
	get_Direction (see page 1855)	This is get_Direction, a member of class TAdoDbxParameter.
	get_IsNullable (see page 1855)	This is get_IsNullable, a member of class TAdoDbxParameter.
	get_ParameterName (see page 1856)	This is get_ParameterName, a member of class TAdoDbxParameter.
	get_Precision (see page 1856)	This is get_Precision, a member of class TAdoDbxParameter.
	get_Scale (see page 1856)	This is get_Scale, a member of class TAdoDbxParameter.
	get_Size (see page 1856)	This is get_Size, a member of class TAdoDbxParameter.
	get_SourceColumn (see page 1856)	This is get_SourceColumn, a member of class TAdoDbxParameter.
	get_SourceColumnNullMapping (see page 1857)	This is get_SourceColumnNullMapping, a member of class TAdoDbxParameter.
	get_SourceVersion (see page 1857)	This is get_SourceVersion, a member of class TAdoDbxParameter.
	get_Value (see page 1857)	This is get_Value, a member of class TAdoDbxParameter.
	ResetDbType (see page 1857)	Resets the DBType property to original settings.
	set_DbType (see page 1857)	This is set_DbType, a member of class TAdoDbxParameter.
	set_Direction (see page 1858)	This is set_Direction, a member of class TAdoDbxParameter.
	set_IsNullable (see page 1858)	This is set_IsNullable, a member of class TAdoDbxParameter.
	set_ParameterName (see page 1858)	This is set_ParameterName, a member of class TAdoDbxParameter.
	set_Precision (see page 1858)	This is set_Precision, a member of class TAdoDbxParameter.
	set_Scale (see page 1858)	This is set_Scale, a member of class TAdoDbxParameter.
	set_Size (see page 1859)	This is set_Size, a member of class TAdoDbxParameter.
	set_SourceColumn (see page 1859)	This is set_SourceColumn, a member of class TAdoDbxParameter.
	set_SourceColumnNullMapping (see page 1859)	This is set_SourceColumnNullMapping, a member of class TAdoDbxParameter.
	set_SourceVersion (see page 1859)	This is set_SourceVersion, a member of class TAdoDbxParameter.
	set_Value (see page 1859)	This is set_Value, a member of class TAdoDbxParameter.

Published Properties

	Name	Description
	DbType (see page 1860)	Gets or sets the data type of the parameter.
	DbxDataType (see page 1860)	TDBXDataTypes data type
	DbxSubType (see page 1861)	TDBXDataTypessub type

	Direction (see page 1861)	Gets or sets a value indicating whether the parameter is input-only, output-only, bidirectional, or a stored procedure return value parameter.
	IsNullable (see page 1862)	Gets or sets the value that determines whether or not a parameter value can be null.
	ParameterName (see page 1862)	Gets and sets the parameter name of the given parameter in a parameter collection.
	Precision (see page 1862)	Gets or sets the maximum number of digits used to represent the Value (see page 1865) property.
	Scale (see page 1863)	Gets and sets the scale of the Value (see page 1865) property, which contains either a numeric or decimal value.
	Size (see page 1863)	Gets and sets the size of the parameter value in bytes.
	SourceColumn (see page 1863)	The name of the source column mapped to the DataSet. The default is an empty string.
	SourceColumnNullMapping (see page 1864)	Sets or gets a value indicating whether the column can be null.
	SourceVersion (see page 1864)	Gets or sets the DataRowVersion to use when loading Value (see page 1865).
	Value (see page 1865)	Gets or sets the value of the parameter.

Strict private Fields

	Name	Description
	FConnection (see page 1853)	This is FConnection, a member of class TAdoDbxParameter.
	FDbxContext (see page 1853)	This is FDbxContext, a member of class TAdoDbxParameter.
	FSourceColumn (see page 1854)	This is FSourceColumn, a member of class TAdoDbxParameter.
	FSourceColumnNullMapping (see page 1854)	This is FSourceColumnNullMapping, a member of class TAdoDbxParameter.
	FSourceVersion (see page 1854)	This is FSourceVersion, a member of class TAdoDbxParameter.

15.1.1.1.11.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TAdoDbxParameter.Create (TDBXContext) (see page 1852)	Creates a new instance of the TAdoDbxParameter (see page 1850).
	TAdoDbxParameter.Create (TDBXParameterEx, TAdoDbxConnection) (see page 1852)	Creates a new instance of the TAdoDbxParameter (see page 1850).

15.1.1.1.11.2.1 TAdoDbxParameter.Create Constructor (TDBXContext)

Creates a new instance of the TAdoDbxParameter (see page 1850).

Pascal

```
constructor Create(DbxContext: TDBXContext); overload;
constructor Create(DbxParameter: TDBXParameterEx; Connection: TAdoDbxConnection); overload;
```

C++

```
__fastcall TAdoDbxParameter(TDBXContext DbxContext);
__fastcall TAdoDbxParameter(TDBXParameterEx DbxParameter, TAdoDbxConnection Connection);
```

Description

Creates a new instance of the TAdoDbxParameter (see page 1850) class, which represents a parameter that is passed to or from a command.

If you are using stored procedures, you can pass parameters to them using the TAdoDbxParameter (see page 1850) class. You can also retrieve values from a database column to use as a parameter to a command. The Direction (see page 1861) property determines whether a parameter is an input parameter, an output parameter, or a return value.

See Also

Create (MSDN)

Direction (see page 1861)

15.1.1.1.11.3 TAdoDbxParameter.Destroy Destructor

Destroys a TAdoDbxParameter (see page 1850) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdoDbxParameter();
```

Description

This method destroys a TAdoDbxParameter (see page 1850) instance, freeing all its resources.

See Also

Create (see page 1852)

15.1.1.1.11.4 TAdoDbxParameter Fields

The fields of the TAdoDbxParameter class are listed here.

Strict private Fields

	Name	Description
	FConnection (see page 1853)	This is FConnection, a member of class TAdoDbxParameter.
	FDbxContext (see page 1853)	This is FDbxContext, a member of class TAdoDbxParameter.
	FSourceColumn (see page 1854)	This is FSourceColumn, a member of class TAdoDbxParameter.
	FSourceColumnNullMapping (see page 1854)	This is FSourceColumnNullMapping, a member of class TAdoDbxParameter.
	FSourceVersion (see page 1854)	This is FSourceVersion, a member of class TAdoDbxParameter.

15.1.1.1.11.4.1 TAdoDbxParameter.FConnection Field

Pascal

```
FConnection: TAdoDbxConnection;
```

C++

```
TAdoDbxConnection FConnection;
```

Description

This is FConnection, a member of class TAdoDbxParameter.

15.1.1.1.11.4.2 TAdoDbxParameter.FDbxContext Field

Pascal

```
FDbxContext: TDbxContext;
```

C++

```
TDbxContext FDbxContext;
```

Description

This is FDbxContext, a member of class TAdoDbxParameter.

15.1.1.1.11.4.3 TAdoDbxParameter.FSourceColumn Field

Pascal

```
FSourceColumn: String;
```

C++

```
AnsiString FSourceColumn;
```

Description

This is FSourceColumn, a member of class TAdoDbxParameter.

15.1.1.1.11.4.4 TAdoDbxParameter.FSourceColumnNullMapping Field

Pascal

```
FSourceColumnNullMapping: Boolean;
```

C++

```
Boolean FSourceColumnNullMapping;
```

Description

This is FSourceColumnNullMapping, a member of class TAdoDbxParameter.

15.1.1.1.11.4.5 TAdoDbxParameter.FSourceVersion Field

Pascal

```
FSourceVersion: DataRowVersion;
```

C++

```
DataRowVersion FSourceVersion;
```

Description

This is FSourceVersion, a member of class TAdoDbxParameter.

15.1.1.1.11.5 TAdoDbxParameter Methods

The methods of the TAdoDbxParameter class are listed here.

Public Methods

	Name	Description
	Clone (see page 1855)	This is Clone, a member of class TAdoDbxParameter.
	get_DbType (see page 1855)	This is get_DbType, a member of class TAdoDbxParameter.
	get_Direction (see page 1855)	This is get_Direction, a member of class TAdoDbxParameter.
	get_IsNullable (see page 1855)	This is get_IsNullable, a member of class TAdoDbxParameter.
	get_ParameterName (see page 1856)	This is get_ParameterName, a member of class TAdoDbxParameter.
	get_Precision (see page 1856)	This is get_Precision, a member of class TAdoDbxParameter.
	get_Scale (see page 1856)	This is get_Scale, a member of class TAdoDbxParameter.
	get_Size (see page 1856)	This is get_Size, a member of class TAdoDbxParameter.
	get_SourceColumn (see page 1856)	This is get_SourceColumn, a member of class TAdoDbxParameter.
	get_SourceColumnNullMapping (see page 1857)	This is get_SourceColumnNullMapping, a member of class TAdoDbxParameter.
	get_SourceVersion (see page 1857)	This is get_SourceVersion, a member of class TAdoDbxParameter.
	get_Value (see page 1857)	This is get_Value, a member of class TAdoDbxParameter.
	ResetDbType (see page 1857)	Resets the DBType property to original settings.
	set_DbType (see page 1857)	This is set_DbType, a member of class TAdoDbxParameter.
	set_Direction (see page 1858)	This is set_Direction, a member of class TAdoDbxParameter.

	set_IsNullable (see page 1858)	This is set_IsNullable, a member of class TAdoDbxParameter.
	set_ParameterName (see page 1858)	This is set_ParameterName, a member of class TAdoDbxParameter.
	set_Precision (see page 1858)	This is set_Precision, a member of class TAdoDbxParameter.
	set_Scale (see page 1858)	This is set_Scale, a member of class TAdoDbxParameter.
	set_Size (see page 1859)	This is set_Size, a member of class TAdoDbxParameter.
	set_SourceColumn (see page 1859)	This is set_SourceColumn, a member of class TAdoDbxParameter.
	set_SourceColumnNullMapping (see page 1859)	This is set_SourceColumnNullMapping, a member of class TAdoDbxParameter.
	set_SourceVersion (see page 1859)	This is set_SourceVersion, a member of class TAdoDbxParameter.
	set_Value (see page 1859)	This is set_Value, a member of class TAdoDbxParameter.

15.1.1.1.11.5.1 TAdoDbxParameter.Clone Method

Pascal

```
function Clone: TObject; virtual;
```

C++

```
virtual __fastcall TObject * Clone();
```

Description

This is Clone, a member of class TAdoDbxParameter.

15.1.1.1.11.5.2 TAdoDbxParameter.get_DbType Method

Pascal

```
function get_DbType: DbType; override;
```

C++

```
virtual __fastcall DbType get_DbType();
```

Description

This is get_DbType, a member of class TAdoDbxParameter.

15.1.1.1.11.5.3 TAdoDbxParameter.get_Direction Method

Pascal

```
function get_Direction: ParameterDirection; override;
```

C++

```
virtual __fastcall ParameterDirection get_Direction();
```

Description

This is get_Direction, a member of class TAdoDbxParameter.

15.1.1.1.11.5.4 TAdoDbxParameter.get_IsNullable Method

Pascal

```
function get_IsNullable: Boolean; override;
```

C++

```
virtual __fastcall Boolean get_IsNullable();
```

Description

This is get_IsNullable, a member of class TAdoDbxParameter.

15.1.1.1.11.5.5 TAdoDbxParameter.get_ParameterName Method

Pascal

```
function get_ParameterName: String; override;
```

C++

```
virtual __fastcall AnsiString get_ParameterName();
```

Description

This is get_ParameterName, a member of class TAdoDbxParameter.

15.1.1.1.11.5.6 TAdoDbxParameter.get_Precision Method

Pascal

```
function get_Precision: Byte;
```

C++

```
__fastcall Byte get_Precision();
```

Description

This is get_Precision, a member of class TAdoDbxParameter.

15.1.1.1.11.5.7 TAdoDbxParameter.get_Scale Method

Pascal

```
function get_Scale: Byte;
```

C++

```
__fastcall Byte get_Scale();
```

Description

This is get_Scale, a member of class TAdoDbxParameter.

15.1.1.1.11.5.8 TAdoDbxParameter.get_Size Method

Pascal

```
function get_Size: Integer; override;
```

C++

```
virtual __fastcall int get_Size();
```

Description

This is get_Size, a member of class TAdoDbxParameter.

15.1.1.1.11.5.9 TAdoDbxParameter.get_SourceColumn Method

Pascal

```
function get_SourceColumn: String; override;
```

C++

```
virtual __fastcall AnsiString get_SourceColumn();
```

Description

This is get_SourceColumn, a member of class TAdoDbxParameter.

15.1.1.1.11.5.10 TAdoDbxParameter.get_SourceColumnNullMapping Method

Pascal

```
function get_SourceColumnNullMapping: Boolean; override;
```

C++

```
virtual __fastcall Boolean get_SourceColumnNullMapping();
```

Description

This is get_SourceColumnNullMapping, a member of class TAdoDbxParameter.

15.1.1.1.11.5.11 TAdoDbxParameter.get_SourceVersion Method

Pascal

```
function get_SourceVersion: DataRowVersion; override;
```

C++

```
virtual __fastcall DataRowVersion get_SourceVersion();
```

Description

This is get_SourceVersion, a member of class TAdoDbxParameter.

15.1.1.1.11.5.12 TAdoDbxParameter.get_Value Method

Pascal

```
function get_Value: TObject; override;
```

C++

```
virtual __fastcall TObject * get_Value();
```

Description

This is get_Value, a member of class TAdoDbxParameter.

15.1.1.1.11.5.13 TAdoDbxParameter.ResetDbType Method

Resets the DBType property to original settings.

Pascal

```
procedure ResetDbType; override;
```

C++

```
virtual __fastcall ResetDbType();
```

Description

ResetDbType resets the DBType property to original settings.

See Also

ResetDbType (MSDN)

DbType (see page 1860)

15.1.1.1.11.5.14 TAdoDbxParameter.set_DbType Method

Pascal

```
procedure set_DbType(DbType: DbType); override;
```

C++

```
virtual __fastcall set_DbType(DbType DbType);
```

Description

This is set_DbType, a member of class TAdoDbxParameter.

15.1.1.1.11.5.15 TAdoDbxParameter.set_Direction Method

Pascal

```
procedure set_Direction(Direction: ParameterDirection); override;
```

C++

```
virtual __fastcall set_Direction(ParameterDirection Direction);
```

Description

This is set_Direction, a member of class TAdoDbxParameter.

15.1.1.1.11.5.16 TAdoDbxParameter.set_IsNullable Method

Pascal

```
procedure set_IsNullable(IsNullable: Boolean); override;
```

C++

```
virtual __fastcall set_IsNullable(Boolean IsNullable);
```

Description

This is set_IsNullable, a member of class TAdoDbxParameter.

15.1.1.1.11.5.17 TAdoDbxParameter.set_ParameterName Method

Pascal

```
procedure set_ParameterName(ParameterName: String); override;
```

C++

```
virtual __fastcall set_ParameterName(AnsiString ParameterName);
```

Description

This is set_ParameterName, a member of class TAdoDbxParameter.

15.1.1.1.11.5.18 TAdoDbxParameter.set_Precision Method

Pascal

```
procedure set_Precision(Precision: Byte);
```

C++

```
__fastcall set_Precision(Byte Precision);
```

Description

This is set_Precision, a member of class TAdoDbxParameter.

15.1.1.1.11.5.19 TAdoDbxParameter.set_Scale Method

Pascal

```
procedure set_Scale(Scale: Byte);
```

C++

```
__fastcall set_Scale(Byte Scale);
```

Description

This is set_Scale, a member of class TAdoDbxParameter.

15.1.1.1.11.5.20 TAdoDbxParameter.set_Size Method

Pascal

```
procedure set_Size(Size: Integer); override;
```

C++

```
virtual __fastcall set_Size(int Size);
```

Description

This is set_Size, a member of class TAdoDbxParameter.

15.1.1.1.11.5.21 TAdoDbxParameter.set_SourceColumn Method

Pascal

```
procedure set_SourceColumn(SourceColumn: String); override;
```

C++

```
virtual __fastcall set_SourceColumn(AnsiString SourceColumn);
```

Description

This is set_SourceColumn, a member of class TAdoDbxParameter.

15.1.1.1.11.5.22 TAdoDbxParameter.set_SourceColumnNullMapping Method

Pascal

```
procedure set_SourceColumnNullMapping(SourceColumnNullMapping: Boolean); override;
```

C++

```
virtual __fastcall set_SourceColumnNullMapping(Boolean SourceColumnNullMapping);
```

Description

This is set_SourceColumnNullMapping, a member of class TAdoDbxParameter.

15.1.1.1.11.5.23 TAdoDbxParameter.set_SourceVersion Method

Pascal

```
procedure set_SourceVersion(SourceVersion: DataRowVersion); override;
```

C++

```
virtual __fastcall set_SourceVersion(DataRowVersion SourceVersion);
```

Description

This is set_SourceVersion, a member of class TAdoDbxParameter.

15.1.1.1.11.5.24 TAdoDbxParameter.set_Value Method

Pascal

```
procedure set_Value(Value: TObject); override;
```

C++

```
virtual __fastcall set_Value(TObject * Value);
```

Description

This is set_Value, a member of class TAdoDbxParameter.

15.1.1.1.11.6 TAdoDbxParameter Properties

The properties of the TAdoDbxParameter class are listed here.

Published Properties

	Name	Description
	DbType (see page 1860)	Gets or sets the data type of the parameter.
	DbxDataType (see page 1860)	TDBXDataTypes data type
	DbxSubType (see page 1861)	TDBXDataTypessub type
	Direction (see page 1861)	Gets or sets a value indicating whether the parameter is input-only, output-only, bidirectional, or a stored procedure return value parameter.
	IsNullable (see page 1862)	Gets or sets the value that determines whether or not a parameter value can be null.
	ParameterName (see page 1862)	Gets and sets the parameter name of the given parameter in a parameter collection.
	Precision (see page 1862)	Gets or sets the maximum number of digits used to represent the Value (see page 1865) property.
	Scale (see page 1863)	Gets and sets the scale of the Value (see page 1865) property, which contains either a numeric or decimal value.
	Size (see page 1863)	Gets and sets the size of the parameter value in bytes.
	SourceColumn (see page 1863)	The name of the source column mapped to the DataSet. The default is an empty string.
	SourceColumnNullMapping (see page 1864)	Sets or gets a value indicating whether the column can be null.
	SourceVersion (see page 1864)	Gets or sets the DataRowVersion to use when loading Value (see page 1865).
	Value (see page 1865)	Gets or sets the value of the parameter.

15.1.1.1.11.6.1 TAdoDbxParameter.DbType Property

Gets or sets the data type of the parameter.

Pascal

```
property DbType: DbType;
```

C++

```
__property DbType DbType;
```

Description

DbType is the parameter type, specified by a DbType enumeration. If the type is not specified, you can infer the .NET data provider type of the parameter from the Value (see page 1865) property of the TAdoDbxParameter (see page 1850) object though it is not explicitly set.

See Also

DbType (MSDN)

DbType enumeration (MSDN)

15.1.1.1.11.6.2 TAdoDbxParameter.DbxDataType Property

TDBXDataTypes data type

Pascal

```
property DbxDataType: Integer;
```

C++

```
__property int DbxDataType;
```

Description

DbxDataType gets and sets the TDBXDataTypes data type.

See Also

TDBXDataTypes (see page 10447)

15.1.1.1.11.6.3 TAdoDbxParameter.DbxSubType Property

TDBXDataTypessub type

Pascal

```
property DbxSubType: Integer;
```

C++

```
__property int DbxSubType;
```

Description

DbxSubType gets and sets the TDBXDataTypes sub type.

See Also

TDBXDataTypes (see page 10447)

15.1.1.1.11.6.4 TAdoDbxParameter.Direction Property

Gets or sets a value indicating whether the parameter is input-only, output-only, bidirectional, or a stored procedure return value parameter.

Pascal

```
property Direction: ParameterDirection;
```

C++

```
__property ParameterDirection Direction;
```

Description

Direction is one of the ParameterDirection enumeration values.

If you want to use output or return parameters with stored procedures, you need to set this property. If the direction is output, and execution of the associated TAdoDbxCommand (see page 1763) does not return a value, the TAdoDbxParameter (see page 1850) contains a null value. After the last row from the last result set is read, *Output*, *InputOutput*, and *ReturnValue* parameters are updated. The default is *Input*.

Constant	Description
Input	The parameter is an input parameter.
InputOutput	The parameter can accept both input and output.
Output	The parameter is an output parameter.
ReturnValue	The parameter represents a return value from an operation such as a stored procedure, built-in function, or user-defined function.

See Also

Direction (MSDN)

ParameterDirection (MSDN)

15.1.1.1.11.6.5 TAdoDbxParameter.IsNullable Property

Gets or sets the value that determines whether or not a parameter value can be null.

Pascal

```
property IsNullable: Boolean;
```

C++

```
__property Boolean IsNullable;
```

Description

Set to **True** if null values are accepted, otherwise, set to **False**. The default is **False**.

See Also

IsNullable (MSDN)

15.1.1.1.11.6.6 TAdoDbxParameter.ParameterName Property

Gets and sets the parameter name of the given parameter in a parameter collection.

Pascal

```
property ParameterName: String;
```

C++

```
__property AnsiString ParameterName;
```

Description

ParameterName defaults to an empty string.

See Also

ParameterName (MSDN)

15.1.1.1.11.6.7 TAdoDbxParameter.Precision Property

Gets or sets the maximum number of digits used to represent the Value (see page 1865) property.

Pascal

```
property Precision: Byte;
```

C++

```
__property Byte Precision;
```

Description

Gets or sets the maximum number of digits used to represent the Value (see page 1865) property. The default is 0, which indicates that the data provider sets the precision for the Value (see page 1865) property.

See Also

Value (see page 1865)

15.1.1.1.11.6.8 TAdoDbxParameter.Scale Property

Gets and sets the scale of the Value (see page 1865) property, which contains either a numeric or decimal value.

Pascal

```
property Scale: Byte;
```

C++

```
__property Byte Scale;
```

Description

Gets and sets the number of digits to the right of the decimal for the numeric or decimal value of the Value (see page 1865) property. The default is 0.

See Also

Value (see page 1865)

15.1.1.1.11.6.9 TAdoDbxParameter.Size Property

Gets and sets the size of the parameter value in bytes.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

Size is an Int32 type used for binary and string types. Size is ignored for fixed length data types. For Unicode, Size is the number of characters, not bytes. Size does not include any string terminating characters.

Size and DbType (see page 1860) can be inferred if Value (see page 1865) is set, but they are not explicitly set by setting Value (see page 1865).

Warning: If a parameter's Direction (see page 1861) is InputOutput

, **Output**, or **ReturnValue**, you must set Size.

Warning: If the size of a parameter's Value (see page 1865) exceedsSize, Value (see page 1865) data is truncated to Size.

See Also

Size (MSDN)

DbType (see page 1860)

Direction (see page 1861)

Value (see page 1865)

15.1.1.1.11.6.10 TAdoDbxParameter.SourceColumn Property

The name of the source column mapped to the DataSet. The default is an empty string.

Pascal

```
property SourceColumn: String;
```

C++

```
__property AnsiString SourceColumn;
```

Description

Use this property and the SourceVersion (see page 1864) property when you are submitting pending changes to the database and you want to validate the version of the data in the target row. To return a value from a particular column in the database, set the SourceColumn property to the name of the column. If the Direction (see page 1861) property is set to *Input*, the value is taken from the DataSet instead of the database. If the Direction (see page 1861) property is set to *Output*, the value is taken from the database.

See Also

SourceColumn (MSDN)

Direction (see page 1861)

SourceVersion (see page 1864)

15.1.1.1.11.6.11 TAdoDbxParameter.SourceColumnNullMapping Property

Sets or gets a value indicating whether the column can be null.

Pascal

```
property SourceColumnNullMapping: Boolean;
```

C++

```
__property Boolean SourceColumnNullMapping;
```

Description

SourceColumnNullMapping sets or gets a value indicating whether the column can be set to null. This value allows TAdoDbxCommandBuilder (see page 1776) to generate correct Update statements for nullable columns.

See Also

SourceColumnNullMapping (MSDN)

15.1.1.1.11.6.12 TAdoDbxParameter.SourceVersion Property

Gets or sets the DataRowVersion to use when loading Value (see page 1865).

Pascal

```
property SourceVersion: DataRowVersion;
```

C++

```
__property DataRowVersion SourceVersion;
```

Description

Use this property and the SourceColumn (see page 1863) property when you are submitting pending changes to the database and you want to validate the version of the data in the target row. Used by UpdateCommand during an Update operation to determine whether the parameter value is set to **Current** or **Original**. This allows primary keys to be updated. This property is ignored by the InsertCommand and DeleteCommand properties. This property is set to the version of the DataRow used by the Item property or the GetChildRows method of the DataRow object.

The following table lists the allowable SourceVersion values, which are DataRowVersion values.

Member	Description
Current	Current value of the column. Default.
Default	Uses the DefaultValue of the column.
Original	Original value of the column.

Proposed	Uses a Proposed value.

See Also

SourceVersion (MSDN)

Item (MSDN)

GetChildRows (MSDN)

DataRow (MSDN)

DataRowVersion enumeration (MSDN)

UpdateCommand (see page 1825)

Value (see page 1865)

Update

15.1.1.1.11.6.13 TAdoDbxParameter.Value Property

Gets or sets the value of the parameter.

Pascal

```
[TypeConverter(typeof(StringConverter))]
property Value: TObject;
```

C++

```
[TypeConverter(typeof(StringConverter))]
__property TObject * Value;
```

Description

Value contains an Object data type. You need to convert the value if you want to store it in another data type. For input parameters, the value is bound to the TAdoDbxCommand (see page 1763) that is sent to the server. If the parameter's Direction (see page 1861) is **Output** or **ReturnValue**, the value is set on completion of the TAdoDbxCommand (see page 1763) and after the TAdoDbxDataReader (see page 1827) is closed. When sending a null parameter value to the server, you must specify DBNull, not null. The null value in the system is an empty object that has no value. DBNull is used to represent null values.

If the application specifies the DbType (see page 1860), the value is converted to that type when the provider sends the data to the server. DbType (see page 1860) can be inferred from Value though it is not explicitly set by setting Value.

See Also

Value (MSDN)

DBNull (MSDN)

TAdoDbxCommand (see page 1763)

TAdoDbxDataReader (see page 1827)

DbType (see page 1860)

Direction (see page 1861)

15.1.1.1.12 TAdoDbxParameterCollection Class

Collects parameters into a .NET collection object that can be read and manipulated.

Class Hierarchy

Pascal

```
TAdoDbxParameterCollection = class(DbParameterCollection);
```

C++

```
class TAdoDbxParameterCollection : public DbParameterCollection;
```

File

Borland.Data.AdoDbxClientProvider

Description

Serves as a logical storage and management structure for a group of parameters. Collections, which can be organized as lists, arrays, and hashtables, can be read from and sometimes written to, depending on the properties of the collection. You can navigate the collection tree to locate parameters or to add parameters.

The TAdoDbxParameterCollection class is an implementation of the ADO.NET DbParameterCollection class.

See Also

DbParameterCollection (MSDN)

15.1.1.1.12.1 TAdoDbxParameterCollection Members

The following tables list the members exposed by TAdoDbxParameterCollection.

Public Methods

	Name	Description
	Add (see page 1868)	Adds a TAdoDbxParameter (see page 1850) parameter object to the parameter collection.
	AddRange (see page 1868)	Copies an array of parameters to a collection.
	Clear (see page 1869)	Removes all parameters from collection.
	Contains (see page 1869)	This is the overview for the Contains method overload.
	CopyTo (see page 1869)	Copies an array of items to collection.
	Destroy (see page 1867)	Destroys a TAdoDbxParameterCollection (see page 1865) instance.
	get_Count (see page 1870)	This is get_Count, a member of class TAdoDbxParameterCollection.
	get_IsFixedSize (see page 1870)	This is get_IsFixedSize, a member of class TAdoDbxParameterCollection.
	get_IsReadOnly (see page 1870)	This is get_IsReadOnly, a member of class TAdoDbxParameterCollection.
	get_IsSynchronized (see page 1870)	This is get_IsSynchronized, a member of class TAdoDbxParameterCollection.
	get_SyncRoot (see page 1871)	This is get_SyncRoot, a member of class TAdoDbxParameterCollection.
	GetEnumerator (see page 1871)	Returns an enumerator for the collection.
	IndexOf (see page 1872)	This is the overview for the IndexOf method overload.
	Insert (see page 1872)	Inserts a parameter in collection.
	Remove (see page 1873)	Removes a specified parameter from the collection.
	RemoveAt (see page 1873)	This is the overview for the RemoveAt method overload.

Strict private Fields

	Name	Description
	FDBXParameters (see page 1867)	This is FDBXParameters, a member of class TAdoDbxParameterCollection.
	FParameters (see page 1867)	This is FParameters, a member of class TAdoDbxParameterCollection.

Strict protected Methods

	Name	Description
	GetParameter (see page 1871)	This is the overview for the GetParameter method overload.

	SetParameter (see page 1874)	This is the overview for the SetParameter method overload.

15.1.1.1.12.2 TAdoDbxParameterCollection.Destroy Destructor

Destroys a TAdoDbxParameterCollection (see page 1865) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdoDbxParameterCollection();
```

Description

This method destroys a TAdoDbxParameterCollection (see page 1865) instance, freeing all its resources.

15.1.1.1.12.3 TAdoDbxParameterCollection Fields

The fields of the TAdoDbxParameterCollection class are listed here.

Strict private Fields

	Name	Description
	FDBXParameters (see page 1867)	This is FDBXParameters, a member of class TAdoDbxParameterCollection.
	FParameters (see page 1867)	This is FParameters, a member of class TAdoDbxParameterCollection.

15.1.1.1.12.3.1 TAdoDbxParameterCollection.FDBXParameters Field

Pascal

```
FDBXParameters: TDBXParameterList;
```

C++

```
TDBXParameterList FDBXParameters;
```

Description

This is FDBXParameters, a member of class TAdoDbxParameterCollection.

15.1.1.1.12.3.2 TAdoDbxParameterCollection.FParameters Field

Pascal

```
FParameters: ArrayList;
```

C++

```
ArrayList FParameters;
```

Description

This is FParameters, a member of class TAdoDbxParameterCollection.

15.1.1.1.12.4 TAdoDbxParameterCollection Methods

The methods of the TAdoDbxParameterCollection class are listed here.

Public Methods

	Name	Description
	Add (see page 1868)	Adds a TAdoDbxParameter (see page 1850) parameter object to the parameter collection.
	AddRange (see page 1868)	Copies an array of parameters to a collection.

	Clear (see page 1869)	Removes all parameters from collection.
	Contains (see page 1869)	This is the overview for the Contains method overload.
	CopyTo (see page 1869)	Copies an array of items to collection.
	get_Count (see page 1870)	This is get_Count, a member of class TAdoDbxParameterCollection.
	get_IsFixedSize (see page 1870)	This is get_IsFixedSize, a member of class TAdoDbxParameterCollection.
	get_IsReadOnly (see page 1870)	This is get_IsReadOnly, a member of class TAdoDbxParameterCollection.
	get_IsSynchronized (see page 1870)	This is get_IsSynchronized, a member of class TAdoDbxParameterCollection.
	get_SyncRoot (see page 1871)	This is get_SyncRoot, a member of class TAdoDbxParameterCollection.
	GetEnumerator (see page 1871)	Returns an enumerator for the collection.
	IndexOf (see page 1872)	This is the overview for the IndexOf method overload.
	Insert (see page 1872)	Inserts a parameter in collection.
	Remove (see page 1873)	Removes a specified parameter from the collection.
	RemoveAt (see page 1873)	This is the overview for the RemoveAt method overload.

Strict protected Methods

	Name	Description
	GetParameter (see page 1871)	This is the overview for the GetParameter method overload.
	SetParameter (see page 1874)	This is the overview for the SetParameter method overload.

15.1.1.1.12.4.1 TAdoDbxParameterCollection.Add Method

Adds a TAdoDbxParameter (see page 1850) parameter object to the parameter collection.

Pascal

```
function Add(Value: TObject): Integer; override;
```

C++

```
virtual __fastcall int Add(TObject * Value);
```

Description

The TAdoDbxParameterCollection (see page 1865) is a collection object that can hold a number of objects of the same type in a hierarchical list. You can derive parameters from your database columns, and add them to the TAdoDbxParameterCollection (see page 1865) in order to access them when building SQL statements using the TAdoDbxCommand (see page 1763) object or the TAdoDbxCommandBuilder (see page 1776) object.

See Also

Add (MSDN)

15.1.1.1.12.4.2 TAdoDbxParameterCollection.AddRange Method

Copies an array of parameters to a collection.

Pascal

```
procedure AddRange(Values: System.Array); override;
```

C++

```
virtual __fastcall AddRange(System.Array Values);
```

Description

AddRange adds an array of TAdoDbxParameter (see page 1850) objects to the parameter collection.

If you call AddRange multiple times in the same session, each call copies only the most recently named parameter collection.

See Also

AddRange (MSDN)

Count

15.1.1.1.12.4.3 TAdoDbxParameterCollection.Clear Method

Removes all parameters from collection.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Clear removes all TAdoDbxParameter (see page 1850) parameter objects from the parameter collection.

See Also

Clear (MSDN)

15.1.1.1.12.4.4 Contains Method

This is the overview for the Contains method overload.

Overload List

	Name	Description
	TAdoDbxParameterCollection.Contains (string) (see page 1869)	Indicates whether parameter with specified property in collection.
	TAdoDbxParameterCollection.Contains (TObject) (see page 1869)	Indicates whether parameter with specified property in collection.

15.1.1.1.12.4.4.1 TAdoDbxParameterCollection.Contains Method (TObject)

Indicates whether parameter with specified property in collection.

Pascal

```
function Contains(Value: TObject): Boolean; override;
function Contains(Value: string): Boolean; override;
```

C++

```
virtual __fastcall Boolean Contains(TObject * Value);
virtual __fastcall Boolean Contains(AnsiString Value);
```

Description

Contains Indicates whether a TAdoDbxParameter (see page 1850) parameter with the specified property is already in the collection.

See Also

Contains (MSDN)

15.1.1.1.12.4.5 TAdoDbxParameterCollection.CopyTo Method

Copies an array of items to collection.

Pascal

```
procedure CopyTo(Values: System.Array; Index: Integer); override;
```

C++

```
virtual __fastcall CopyTo(System.Array Values, int Index);
```

Description

CopyTo copies an array of items to the collection starting at a specified index.

Parameter	Description
Values	Array of items to copy.
Index	Index in the collection at which to start copying.

See Also

CopyTo (MSDN)

15.1.1.1.12.4.6 TAdoDbxParameterCollection.get_Count Method

Pascal

```
function get_Count: Integer; override;
```

C++

```
virtual __fastcall int get_Count();
```

Description

This is get_Count, a member of class TAdoDbxParameterCollection.

15.1.1.1.12.4.7 TAdoDbxParameterCollection.get_IsFixedSize Method

Pascal

```
function get_IsFixedSize: Boolean; override;
```

C++

```
virtual __fastcall Boolean get_IsFixedSize();
```

Description

This is get_IsFixedSize, a member of class TAdoDbxParameterCollection.

15.1.1.1.12.4.8 TAdoDbxParameterCollection.get_IsReadOnly Method

Pascal

```
function get_IsReadOnly: Boolean; override;
```

C++

```
virtual __fastcall Boolean get_IsReadOnly();
```

Description

This is get_IsReadOnly, a member of class TAdoDbxParameterCollection.

15.1.1.1.12.4.9 TAdoDbxParameterCollection.get_IsSynchronized Method

Pascal

```
function get_IsSynchronized: Boolean; override;
```

C++

```
virtual __fastcall Boolean get_IsSynchronized();
```

Description

This is get_IsSynchronized, a member of class TAdoDbxParameterCollection.

15.1.1.1.12.4.10 TAdoDbxParameterCollection.get_SyncRoot Method

Pascal

```
function get_SyncRoot: TObject; override;
```

C++

```
virtual __fastcall TObject * get_SyncRoot();
```

Description

This is get_SyncRoot, a member of class TAdoDbxParameterCollection.

15.1.1.1.12.4.11 TAdoDbxParameterCollection.GetEnumerator Method

Returns an enumerator for the collection.

Pascal

```
function GetEnumerator: IEnumerator; override;
```

C++

```
virtual __fastcall IEnumerator GetEnumerator();
```

Description

GetEnumerator returns an enumerator, which supports simple iteration over a collection. The returned value supports the IEnumerator Interface.

See Also

GetEnumerator (MSDN)

IEnumerator (MSDN)

15.1.1.1.12.4.12 GetParameter Method

This is the overview for the GetParameter method overload.

Overload List

	Name	Description
	TAdoDbxParameterCollection.GetParameter (Integer) (see page 1871)	This is GetParameter, a member of class TAdoDbxParameterCollection.
	TAdoDbxParameterCollection.GetParameter (String) (see page 1872)	This is GetParameter, a member of class TAdoDbxParameterCollection.

15.1.1.1.12.4.12.1 TAdoDbxParameterCollection.GetParameter Method (Integer)

Pascal

```
function GetParameter(Ordinal: Integer): DbParameter; override;
```

C++

```
virtual __fastcall DbParameter GetParameter(int Ordinal);
```

Description

This is GetParameter, a member of class TAdoDbxParameterCollection.

15.1.1.1.12.4.12.2 TAdoDbxParameterCollection.GetParameter Method (String)

Pascal

```
function GetParameter(Name: String): DbParameter; override;
```

C++

```
virtual __fastcall DbParameter GetParameter(AnsiString Name);
```

Description

This is GetParameter, a member of class TAdoDbxParameterCollection.

15.1.1.1.12.4.13 IndexOf Method

This is the overview for the IndexOf method overload.

Overload List

	Name	Description
	TAdoDbxParameterCollection.IndexOf (String) (see page 1872)	Get index of parameter in collection.
	TAdoDbxParameterCollection.IndexOf (TObject) (see page 1872)	Get index of parameter in collection.

15.1.1.1.12.4.13.1 TAdoDbxParameterCollection.IndexOf Method (String)

Get index of parameter in collection.

Pascal

```
function IndexOf(Parameter: TObject): Integer; override;
function IndexOf(Name: String): Integer; override;
```

C++

```
virtual __fastcall int IndexOf(TObject * Parameter);
virtual __fastcall int IndexOf(AnsiString Name);
```

Description

IndexOf returns the index in the collection of a given TAdoDbxParameter (see page 1850) instance.

See Also

IndexOf (MSDN)

15.1.1.1.12.4.14 TAdoDbxParameterCollection.Insert Method

Inserts a parameter in collection.

Pascal

```
procedure Insert(Ordinal: Integer; Parameter: TObject); override;
```

C++

```
virtual __fastcall Insert(int Ordinal, TObject * Parameter);
```

Description

Insert a specifed TAdoDbxParameter (see page 1850) instance into a collection at the specified index.

Parameter	Description
Ordinal	Index in collection at which to insert TAdoDbxParameter (see page 1850) instance.
Parameter	TAdoDbxParameter (see page 1850) instance to insert.

See Also

Insert (MSDN)

15.1.1.1.12.4.15 TAdoDbxParameterCollection.Remove Method

Removes a specified parameter from the collection.

Pascal

```
procedure Remove(Parameter: TObject); override;
```

C++

```
virtual __fastcall Remove(TObject * Parameter);
```

Description

Remove removes the specified TAdoDbxParameter (see page 1850) instance from the collection.

See Also

Remove (MSDN)

15.1.1.1.12.4.16 RemoveAt Method

This is the overview for the RemoveAt method overload.

Overload List

	Name	Description
	TAdoDbxParameterCollection.RemoveAt (Integer) (see page 1873)	Removes a specified parameter from the collection.
	TAdoDbxParameterCollection.RemoveAt (String) (see page 1873)	Removes a specified parameter from the collection.

15.1.1.1.12.4.16.1 TAdoDbxParameterCollection.RemoveAt Method (Integer)

Removes a specified parameter from the collection.

Pascal

```
procedure RemoveAt(Ordinal: Integer); override;
procedure RemoveAt(Name: String); override;
```

C++

```
virtual __fastcall RemoveAt(int Ordinal);
virtual __fastcall RemoveAt(AnsiString Name);
```

Description

RemoveAt removes a specified TAdoDbxParameter (see page 1850) instance from the collection. The parameter may be specified by either a String or an index into the collection.

RemoveAt (MSDN)

15.1.1.1.12.4.17 SetParameter Method

This is the overview for the SetParameter method overload.

Overload List

	Name	Description
	TAdoDbxParameterCollection.SetParameter (Integer, DbParameter) (see page 1874)	This is SetParameter, a member of class TAdoDbxParameterCollection.
	TAdoDbxParameterCollection.SetParameter (String, DbParameter) (see page 1874)	This is SetParameter, a member of class TAdoDbxParameterCollection.

15.1.1.1.12.4.17.1 TAdoDbxParameterCollection.SetParameter Method (Integer, DbParameter)

Pascal

```
procedure SetParameter(Ordinal: Integer; Parameter: DbParameter); override;
```

C++

```
virtual __fastcall SetParameter(int Ordinal, DbParameter Parameter);
```

Description

This is SetParameter, a member of class TAdoDbxParameterCollection.

15.1.1.1.12.4.17.2 TAdoDbxParameterCollection.SetParameter Method (String, DbParameter)

Pascal

```
procedure SetParameter(Name: String; Parameter: DbParameter); override;
```

C++

```
virtual __fastcall SetParameter(AnsiString Name, DbParameter Parameter);
```

Description

This is SetParameter, a member of class TAdoDbxParameterCollection.

15.1.1.1.13 TAdoDbxProviderFactory Class

Base class for a provider's implementation of data source classes.

Class Hierarchy

Pascal

```
TAdoDbxProviderFactory = class(DbProviderFactory);
```

C++

```
class TAdoDbxProviderFactory : public DbProviderFactory;
```

File

Borland.Data.AdoDbxClientProvider

Description

TAdoDbxProviderFactory furnishes a set of methods to get instances of a provider's implementation of the data source classes, such as TAdoDbxCommand (see page 1763) or TAdoDbxConnection (see page 1779). Use this factory rather than

instantiate these classes directly in your application.

The TAdoDbxProviderFactory class is an implementation of the ADO.NET DbProviderFactory class.

See Also

DbProviderFactory (MSDN)

15.1.1.1.13.1 TAdoDbxProviderFactory Members

The following tables list the members exposed by TAdoDbxProviderFactory.

Public Fields

	Name	Description
	Instance (see page 1876)	This is Instance, a member of class TAdoDbxProviderFactory.

Public Methods

	Name	Description
	AdoDbxException (see page 1877)	Raise an exception for a given error.
V	CreateCommand (see page 1877)	Gets instance of command class for provider.
V	CreateCommandBuilder (see page 1877)	Gets instance of command builder class for provider.
V	CreateConnection (see page 1878)	Gets instance of connection class for provider.
V	CreateConnectionStringBuilder (see page 1878)	Gets instance of connection string builder class for provider.
V	CreateDataAdapter (see page 1878)	Gets instance of data adapter class for provider.
V	CreateDataSourceEnumerator (see page 1879)	Gets instance of data source enumerator class for provider.
V	CreateParameter (see page 1879)	Gets instance of parameter class for provider.
	DbxToAdoType (see page 1879)	This is DbxToAdoType, a member of class TAdoDbxProviderFactory.
V	Destroy (see page 1876)	Destroys a TAdoDbxProviderFactory (see page 1874) instance.
	ReadCanCreateDataSourceEnumerator (see page 1879)	Indicates whether data source enumerator can be created.

Public Properties

	Name	Description
R	CanCreateDataSourceEnumerator (see page 1880)	Indicates whether data source enumerator can be created.

Strict private Methods

	Name	Description
	Create (see page 1875)	This is the overview for the Create constructor overload.

15.1.1.1.13.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TAdoDbxProviderFactory.Create () (see page 1875)	This is Create, a member of class TAdoDbxProviderFactory.
	TAdoDbxProviderFactory.Create (TDBXContext) (see page 1876)	This is Create, a member of class TAdoDbxProviderFactory.

15.1.1.1.13.2.1 TAdoDbxProviderFactory.Create Constructor ()

Pascal

```
class constructor Create;
```

C++

```
__fastcall TAdoDbxProviderFactory();
```

Description

This is Create, a member of class TAdoDbxProviderFactory.

15.1.1.1.13.2.2 TAdoDbxProviderFactory.Create Constructor (TDBXContext)

Pascal

```
constructor Create(DbxContext: TDBXContext);
```

C++

```
__fastcall TAdoDbxProviderFactory(TDBXContext DbxContext);
```

Description

This is Create, a member of class TAdoDbxProviderFactory.

15.1.1.1.13.3 TAdoDbxProviderFactory.Destroy Destructor

Destroys a TAdoDbxProviderFactory (see page 1874) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdoDbxProviderFactory();
```

Description

This method destroys a TAdoDbxProviderFactory (see page 1874) instance, freeing all its resources.

15.1.1.1.13.4 TAdoDbxProviderFactory Fields

The fields of the TAdoDbxProviderFactory class are listed here.

Public Fields

	Name	Description
	Instance (see page 1876)	This is Instance, a member of class TAdoDbxProviderFactory.

15.1.1.1.13.4.1 TAdoDbxProviderFactory.Instance Field

Pascal

```
class var Instance: TAdoDbxProviderFactory;
```

C++

```
TAdoDbxProviderFactory Instance;
```

Description

This is Instance, a member of class TAdoDbxProviderFactory.

15.1.1.1.13.5 TAdoDbxProviderFactory Methods

The methods of the TAdoDbxProviderFactory class are listed here.

Public Methods

	Name	Description
	AdoDbxException (see page 1877)	Raise an exception for a given error.
V	CreateCommand (see page 1877)	Gets instance of command class for provider.
V	CreateCommandBuilder (see page 1877)	Gets instance of command builder class for provider.
V	CreateConnection (see page 1878)	Gets instance of connection class for provider.
V	CreateConnectionStringBuilder (see page 1878)	Gets instance of connection string builder class for provider.
V	CreateDataAdapter (see page 1878)	Gets instance of data adapter class for provider.
V	CreateDataSourceEnumerator (see page 1879)	Gets instance of data source enumerator class for provider.
V	CreateParameter (see page 1879)	Gets instance of parameter class for provider.
	DbxToAdoType (see page 1879)	This is DbxToAdoType, a member of class TAdoDbxProviderFactory.
	ReadCanCreateDataSourceEnumerator (see page 1879)	Indicates whether data source enumerator can be created.

15.1.1.1.13.5.1 TAdoDbxProviderFactory.AdoDbxException Method

Raise an exception for a given error.

Pascal

```
procedure AdoDbxException(DBXError: TDBXError);
```

C++

```
__fastcall AdoDbxException(TDBXError DBXError);
```

Description

AdoDbxException raises a TAdoDbxException (see page 1845) for the given TDBXError instance.

See Also

TAdoDbxException (see page 1845)

TDBXError (see page 10486)

15.1.1.1.13.5.2 TAdoDbxProviderFactory.CreateCommand Method

Gets instance of command class for provider.

Pascal

```
function CreateCommand: DbCommand; override;
```

C++

```
virtual __fastcall DbCommand CreateCommand();
```

Description

CreateCommand returns an instance of the provider's class that implements TAdoDbxCommand (see page 1763).

See Also

CreateCommand (MSDN)

15.1.1.1.13.5.3 TAdoDbxProviderFactory.CreateCommandBuilder Method

Gets instance of command builder class for provider.

Pascal

```
function CreateCommandBuilder: DbCommandBuilder; override;
```

C++

```
virtual __fastcall DbCommandBuilder CreateCommandBuilder();
```

Description

CreateCommandBuilder returns an instance of the provider's class that implements TAdoDbxCommandBuilder (see page 1776).

See Also

CreateCommandBuilder (MSDN)

15.1.1.1.13.5.4 TAdoDbxProviderFactory.CreateConnection Method

Gets instance of connection class for provider.

Pascal

```
function CreateConnection: DbConnection; override;
```

C++

```
virtual __fastcall DbConnection CreateConnection();
```

Description

CreateConnection returns an instance of the provider's class that implements TAdoDbxConnection (see page 1779).

See Also

CreateConnection (MSDN)

15.1.1.1.13.5.5 TAdoDbxProviderFactory.CreateConnectionStringBuilder Method

Gets instance of connection string builder class for provider.

Pascal

```
function CreateConnectionStringBuilder: DbConnectionStringBuilder; override;
```

C++

```
virtual __fastcall DbConnectionStringBuilder CreateConnectionStringBuilder();
```

Description

CreateConnectionStringBuilder returns an instance of the provider's class that implements TAdoDbxConnectionStringBuilder (see page 1790) .

See Also

CreateConnectionStringBuilder (MSDN)

15.1.1.1.13.5.6 TAdoDbxProviderFactory.CreateDataAdapter Method

Gets instance of data adapter class for provider.

Pascal

```
function CreateDataAdapter: DbDataAdapter; override;
```

C++

```
virtual __fastcall DbDataAdapter CreateDataAdapter();
```

Description

CreateDataAdapter returns an instance of the provider's class that implements TAdoDbxDataAdapter (see page 1814).

See Also

CreateDataAdapter (MSDN)

15.1.1.1.13.5.7 TAdoDbxProviderFactory.CreateDataSourceEnumerator Method

Gets instance of data source enumerator class for provider.

Pascal

```
function CreateDataSourceEnumerator: DbDataSourceEnumerator; override;
```

C++

```
virtual __fastcall DbDataSourceEnumerator CreateDataSourceEnumerator();
```

Description

CreateDataSourceEnumerator returns an instance of the provider's class that implements TAdoDbxDataSourceEnumerator (see page 1845).

See Also

CreateDataSourceEnumerator (MSDN)

15.1.1.1.13.5.8 TAdoDbxProviderFactory.CreateParameter Method

Gets instance of parameter class for provider.

Pascal

```
function CreateParameter: DbParameter; override;
```

C++

```
virtual __fastcall DbParameter CreateParameter();
```

Description

CreateParameter returns an instance of the provider's class that implements TAdoDbxParameter (see page 1850).

See Also

CreateParameter (MSDN)

15.1.1.1.13.5.9 TAdoDbxProviderFactory.DbxToAdoType Method

Pascal

```
class function DbxToAdoType(DbxType: TDBXType): DbType; static;
```

C++

```
static __fastcall DbType DbxToAdoType(TDBXType DbxType);
```

Description

This is DbxToAdoType, a member of class TAdoDbxProviderFactory.

15.1.1.1.13.5.10 TAdoDbxProviderFactory.ReadCanCreateDataSourceEnumerator Method

Indicates whether data source enumerator can be created.

Pascal

```
function ReadCanCreateDataSourceEnumerator: Boolean;
```

C++

```
__fastcall Boolean ReadCanCreateDataSourceEnumerator();
```

Description

ReadCanCreateDataSourceEnumerator returns **True** if a TAdoDbxDataSourceEnumerator (see page 1845) can be created

and **False** otherwise. It reads the CanCreateDataSourceEnumerator (see page 1880) property.

See Also

TAdoDbxDataSourceEnumerator (see page 1845)

CanCreateDataSourceEnumerator (see page 1880)

15.1.1.1.13.6 TAdoDbxProviderFactory Properties

The properties of the TAdoDbxProviderFactory class are listed here.

Public Properties

	Name	Description
R	CanCreateDataSourceEnumerator (see page 1880)	Indicates whether data source enumerator can be created.

15.1.1.1.13.6.1 TAdoDbxProviderFactory.CanCreateDataSourceEnumerator Property

Indicates whether data source enumerator can be created.

Pascal

```
property CanCreateDataSourceEnumerator: Boolean;
```

C++

```
__property Boolean CanCreateDataSourceEnumerator;
```

Description

CanCreateDataSourceEnumerator is **True** if a TAdoDbxDataSourceEnumerator (see page 1845) can be created and **False** otherwise. The ReadCanCreateDataSourceEnumerator (see page 1879) method returns this property.

See Also

TAdoDbxDataSourceEnumerator (see page 1845)

ReadCanCreateDataSourceEnumerator (see page 1879)

15.1.1.1.14 TAdoDbxRowUpdatedEventArgs Class

Class Hierarchy

Pascal

```
TAdoDbxRowUpdatedEventArgs = class(RowUpdatedEventArgs);
```

C++

```
class TAdoDbxRowUpdatedEventArgs : public RowUpdatedEventArgs;
```

File

Borland.Data.AdoDbxClientProvider

Description

This is class Borland.Data.AdoDbxClientProvider.TAdoDbxRowUpdatedEventArgs.

15.1.1.1.14.1 TAdoDbxRowUpdatedEventArgs Members

The following tables list the members exposed by TAdoDbxRowUpdatedEventArgs.

Public Methods

	Name	Description
	get_Command (see page 1881)	This is get_Command, a member of class TAdoDbxRowUpdatedEventArgs.

Public Properties

	Name	Description
R	Command (see page 1881)	This is Command, a member of class TAdoDbxRowUpdatedEventArgs.

15.1.1.1.14.2 TAdoDbxRowUpdatedEventArgs Methods

The methods of the TAdoDbxRowUpdatedEventArgs class are listed here.

Public Methods

	Name	Description
	get_Command (see page 1881)	This is get_Command, a member of class TAdoDbxRowUpdatedEventArgs.

15.1.1.1.14.2.1 TAdoDbxRowUpdatedEventArgs.get_Command Method

Pascal

```
function get_Command: TAdoDbxCommand;
```

C++

```
__fastcall TAdoDbxCommand get_Command();
```

Description

This is get_Command, a member of class TAdoDbxRowUpdatedEventArgs.

15.1.1.1.14.3 TAdoDbxRowUpdatedEventArgs Properties

The properties of the TAdoDbxRowUpdatedEventArgs class are listed here.

Public Properties

	Name	Description
R	Command (see page 1881)	This is Command, a member of class TAdoDbxRowUpdatedEventArgs.

15.1.1.1.14.3.1 TAdoDbxRowUpdatedEventArgs.Command Property

Pascal

```
property Command: TAdoDbxCommand;
```

C++

```
__property TAdoDbxCommand Command;
```

Description

This is Command, a member of class TAdoDbxRowUpdatedEventArgs.

15.1.1.1.15 TAdoDbxRowUpdatingEventArgs Class

Class Hierarchy

Pascal

```
TAdoDbxRowUpdatingEventArgs = class(RowUpdatingEventArgs);
```

C++

```
class TAdoDbxRowUpdatingEventArgs : public RowUpdatingEventArgs;
```

File

Borland.Data.AdoDbxClientProvider

Description

This is class Borland.Data.AdoDbxClientProvider.TAdoDbxRowUpdatingEventArgs.

15.1.1.1.15.1 TAdoDbxRowUpdatingEventArgs Members

The following tables list the members exposed by TAdoDbxRowUpdatingEventArgs.

Public Methods

	Name	Description
	get_Command (see page 1882)	This is get_Command, a member of class TAdoDbxRowUpdatingEventArgs.
	set_Command (see page 1882)	This is set_Command, a member of class TAdoDbxRowUpdatingEventArgs.

Public Properties

	Name	Description
	Command (see page 1883)	This is Command, a member of class TAdoDbxRowUpdatingEventArgs.

15.1.1.1.15.2 TAdoDbxRowUpdatingEventArgs Methods

The methods of the TAdoDbxRowUpdatingEventArgs class are listed here.

Public Methods

	Name	Description
	get_Command (see page 1882)	This is get_Command, a member of class TAdoDbxRowUpdatingEventArgs.
	set_Command (see page 1882)	This is set_Command, a member of class TAdoDbxRowUpdatingEventArgs.

15.1.1.1.15.2.1 TAdoDbxRowUpdatingEventArgs.get_Command Method

Pascal

```
function get_Command: TAdoDbxCommand;
```

C++

```
__fastcall TAdoDbxCommand get_Command();
```

Description

This is get_Command, a member of class TAdoDbxRowUpdatingEventArgs.

15.1.1.1.15.2.2 TAdoDbxRowUpdatingEventArgs.set_Command Method

Pascal

```
procedure set_Command(const Value: TAdoDbxCommand);
```

C++

```
__fastcall set_Command(const TAdoDbxCommand Value);
```

Description

This is set_Command, a member of class TAdoDbxRowUpdatingEventArgs.

15.1.1.1.15.3 TAdoDbxRowUpdatingEventArgs Properties

The properties of the TAdoDbxRowUpdatingEventArgs class are listed here.

Public Properties

	Name	Description
	Command (see page 1883)	This is Command, a member of class TAdoDbxRowUpdatingEventArgs.

15.1.1.1.15.3.1 TAdoDbxRowUpdatingEventArgs.Command Property

Pascal

```
property Command: TAdoDbxCommand;
```

C++

```
__property TAdoDbxCommand Command;
```

Description

This is Command, a member of class TAdoDbxRowUpdatingEventArgs.

15.1.1.1.16 TAdoDbxSchemaTableColumnNames Class

Class Hierarchy

Borland.Data.AdoDbxClientProvider.TAdoDbxSchemaTableColumnNames

Pascal

```
TAdoDbxSchemaTableColumnNames = class;
```

C++

```
class TAdoDbxSchemaTableColumnNames;
```

File

Borland.Data.AdoDbxClientProvider

Description

This is class Borland.Data.AdoDbxClientProvider.TAdoDbxSchemaTableColumnNames.

15.1.1.1.16.1 TAdoDbxSchemaTableColumnNames Members

The following tables list the members exposed by TAdoDbxSchemaTableColumnNames.

Public Constants

	Name	Description
	DbxDataType (see page 1884)	This is DbxDataType, a member of class TAdoDbxSchemaTableColumnNames.
	DbxSubType (see page 1884)	This is DbxSubType, a member of class TAdoDbxSchemaTableColumnNames.

15.1.1.1.16.2 TAdoDbxSchemaTableColumnNames Constants

The constants of the TAdoDbxSchemaTableColumnNames class are listed here.

Public Constants

	Name	Description
	DbxDataType (see page 1884)	This is DbxDataType, a member of class TAdoDbxSchemaTableColumnNames.
	DbxSubType (see page 1884)	This is DbxSubType, a member of class TAdoDbxSchemaTableColumnNames.

15.1.1.1.16.2.1 TAdoDbxSchemaTableColumnNames.DbxDataType Constant

Pascal

```
const DbxDataType = 'DbxDataType';
```

C++

```
DbxDataType = 'DbxDataType';
```

Description

This is DbxDataType, a member of class TAdoDbxSchemaTableColumnNames.

15.1.1.1.16.2.2 TAdoDbxSchemaTableColumnNames.DbxSubType Constant

Pascal

```
const DbxSubType = 'DbxSubType';
```

C++

```
DbxSubType = 'DbxSubType';
```

Description

This is DbxSubType, a member of class TAdoDbxSchemaTableColumnNames.

15.1.1.1.17 TAdoDbxTransaction Class

Represents an instance of the TAdoDbxTransaction object.

Class Hierarchy

Pascal

```
TAdoDbxTransaction = class(DbTransaction);
```

C++

```
class TAdoDbxTransaction : public DbTransaction;
```

File

Borland.Data.AdoDbxClientProvider

Description

Use the BeginTransaction method in TAdoDbxConnection (see page 1779) to create a new instance of the TAdoDbxTransaction object. You use this method within the context of a TAdoDbxConnection (see page 1779) object. Each transaction is directly related to a specific connection. The connection must be open before calling BeginTransaction.

TAdoDbxTransaction implements the ADO.NET class DbTransaction.

TAdoDbxTransaction takes care of controlling a database transaction with respect to a connection. Calling the TAdoDbxConnection.BeginTransaction method on an opened connection returns a new TAdoDbxTransaction object. The Commit (see page 1887) and Rollback (see page 1888) methods take care of committing or rolling back a transaction. For setting different isolation levels, the IsolationLevel property can be used, and the default isolation is `ReadCommitted` . The current implementation supports nested multiple transactions on a single connection, but not overlapped multiple transactions on a single connection.

The following c# code shows runtime parameter binding and execution of a stored procedure in the context of a transaction.

```
static void BindParameter ( TAdoDbxConnection Conn, Int32 Times )
```

```
{
    Int32 Count = 0, Rows = 0;
    TAdoDbxTransaction Trans = (TAdoDbxTransaction) Conn.BeginTransaction();

    TAdoDbxCommand Comm = (TAdoDbxCommand) Conn.CreateCommand();
    Comm.Connection   = Conn;
    Comm.Transaction  = Trans;

    Comm.CommandType = CommandType.StoredProcedure;
    Comm.CommandText  = "MYTESTPROC";

    Comm.Prepare();

    TAdoDbxParameter param1 = Comm.Parameters.Add("P1",
      DbType.StringFixedLength, 10);
    TAdoDbxParameter param2 = Comm.Parameters.Add("P2",
      DbType.String, 5);
    param2.Direction = ParameterDirection.InputOutput;
    param2.Precision = 25;
    TAdoDbxParameter param3 = Comm.Parameters.Add("P3",
      DbType.Decimal);
    param3.Direction = ParameterDirection.Output;

    while ( Count < Times )
   {
       param1.Value = "Record" + Count;
       param2.Value = "Hello";
       param3.Value = null;

       Rows = Comm.ExecuteNonQuery();
       Console.WriteLine("Output param from  MYTESTPROC=  " + param2.Value );
       Console.WriteLine("InputOutput param from  MYTESTPROC=  " + param3.Value );
       Count ++;

    }

    Comm.Close();

    Trans.Commit();
}
```

BeginTransaction

Commit (see page 1887)

Rollback (see page 1888)

15.1.1.1.17.1 TAdoDbxTransaction Members

The following tables list the members exposed by TAdoDbxTransaction.

Public Methods

	Name	Description
	Commit (see page 1887)	Commits a transaction.

	Destroy (see page 1886)	Destroys a TAdoDbxTransaction (see page 1884) instance.
	get_IsolationLevel (see page 1888)	This is get_IsolationLevel, a member of class TAdoDbxTransaction.
	Rollback (see page 1888)	Discards the actions performed in a pending transaction.

Strict private Fields

	Name	Description
	FConnection (see page 1886)	This is FConnection, a member of class TAdoDbxTransaction.
	FIsolation (see page 1886)	This is FIsolation, a member of class TAdoDbxTransaction.
	FTransaction (see page 1887)	This is FTransaction, a member of class TAdoDbxTransaction.

Strict protected Methods

	Name	Description
	get_DbConnection (see page 1887)	This is get_DbConnection, a member of class TAdoDbxTransaction.

15.1.1.1.17.2 TAdoDbxTransaction.Destroy Destructor

Destroys a TAdoDbxTransaction (see page 1884) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdoDbxTransaction();
```

Description

This method destroys a TAdoDbxTransaction (see page 1884) instance, freeing all its resources.

15.1.1.1.17.3 TAdoDbxTransaction Fields

The fields of the TAdoDbxTransaction class are listed here.

Strict private Fields

	Name	Description
	FConnection (see page 1886)	This is FConnection, a member of class TAdoDbxTransaction.
	FIsolation (see page 1886)	This is FIsolation, a member of class TAdoDbxTransaction.
	FTransaction (see page 1887)	This is FTransaction, a member of class TAdoDbxTransaction.

15.1.1.1.17.3.1 TAdoDbxTransaction.FConnection Field

Pascal

```
FConnection: TAdoDbxConnection;
```

C++

```
TAdoDbxConnection FConnection;
```

Description

This is FConnection, a member of class TAdoDbxTransaction.

15.1.1.1.17.3.2 TAdoDbxTransaction.FIsolation Field

Pascal

```
FIsolation: IsolationLevel;
```

C++

```
IsolationLevel FIsolation;
```

Description

This is FIsolation, a member of class TAdoDbxTransaction.

15.1.1.1.17.3.3 TAdoDbxTransaction.FTransaction Field

Pascal

```
FTransaction: TDBXTransaction;
```

C++

```
TDBXTransaction FTransaction;
```

Description

This is FTransaction, a member of class TAdoDbxTransaction.

15.1.1.1.17.4 TAdoDbxTransaction Methods

The methods of the TAdoDbxTransaction class are listed here.

Public Methods

	Name	Description
	Commit (see page 1887)	Commits a transaction.
	get_IsolationLevel (see page 1888)	This is get_IsolationLevel, a member of class TAdoDbxTransaction.
	Rollback (see page 1888)	Discards the actions performed in a pending transaction.

Strict protected Methods

	Name	Description
	get_DbConnection (see page 1887)	This is get_DbConnection, a member of class TAdoDbxTransaction.

15.1.1.1.17.4.1 TAdoDbxTransaction.Commit Method

Commits a transaction.

Pascal

```
procedure Commit; override;
```

C++

```
virtual __fastcall Commit();
```

Description

If the commit fails, this method throws an exception, typically indicating that the transaction has been committed already, does not exist, or that the connection is broken.

See Also

Commit (MSDN)

15.1.1.1.17.4.2 TAdoDbxTransaction.get_DbConnection Method

Pascal

```
function get_DbConnection: DbConnection; override;
```

C++

```
virtual __fastcall DbConnection get_DbConnection();
```

Description

This is get_DbConnection, a member of class TAdoDbxTransaction.

15.1.1.1.17.4.3 TAdoDbxTransaction.get_IsolationLevel Method

Pascal

```
function get_IsolationLevel: IsolationLevel; override;
```

C++

```
virtual __fastcall IsolationLevel get_IsolationLevel();
```

Description

This is get_IsolationLevel, a member of class TAdoDbxTransaction.

15.1.1.1.17.4.4 TAdoDbxTransaction.Rollback Method

Discards the actions performed in a pending transaction.

Pascal

```
procedure Rollback; override;
```

C++

```
virtual __fastcall Rollback();
```

Description

The transaction can only be rolled back from a pending state, after BeginTransaction has been called, but before Commit (see page 1887) is called.

See Also

Rollback (MSDN)

TAdoDbxConnection (see page 1779)

15.1.1.1.18 TConnectionStringCategories Class

Categories used for connection string builder UI.

Class Hierarchy

Pascal

```
TConnectionStringCategories = class;
```

C++

```
class TConnectionStringCategories;
```

File

Borland.Data.AdoDbxClientProvider

Description

TConnectionStringCategories lists categories used for the connection string builder user interface.

This table contains the categories.

Constant	Description
Dynalink (see page 1889)	Dynalink (see page 1889) related properties.
DriverConfiguration (see page 1889)	Driver configuration related properties.
DataBase (see page 1889)	Database related properties.

15.1.1.1.18.1 TConnectionStringCategories Members

The following tables list the members exposed by TConnectionStringCategories.

Public Constants

	Name	Description
	DataBase (see page 1889)	This is DataBase, a member of class TConnectionStringCategories.
	DriverConfiguration (see page 1889)	This is DriverConfiguration, a member of class TConnectionStringCategories.
	Dynalink (see page 1889)	This is Dynalink, a member of class TConnectionStringCategories.

15.1.1.1.18.2 TConnectionStringCategories Constants

The constants of the TConnectionStringCategories class are listed here.

Public Constants

	Name	Description
	DataBase (see page 1889)	This is DataBase, a member of class TConnectionStringCategories.
	DriverConfiguration (see page 1889)	This is DriverConfiguration, a member of class TConnectionStringCategories.
	Dynalink (see page 1889)	This is Dynalink, a member of class TConnectionStringCategories.

15.1.1.1.18.2.1 TConnectionStringCategories.DataBase Constant

Pascal

```
const DataBase = 'Database';
```

C++

```
DataBase = 'Database';
```

Description

This is DataBase, a member of class TConnectionStringCategories.

15.1.1.1.18.2.2 TConnectionStringCategories.DriverConfiguration Constant

Pascal

```
const DriverConfiguration = 'Driver Configuration';
```

C++

```
DriverConfiguration = 'Driver Configuration';
```

Description

This is DriverConfiguration, a member of class TConnectionStringCategories.

15.1.1.1.18.2.3 TConnectionStringCategories.Dynalink Constant

Pascal

```
const Dynalink = 'Dynalink';
```

C++

```
Dynalink = 'Dynalink';
```

Description

This is Dynalink, a member of class TConnectionStringCategories.

15.1.1.2 Types

The following table lists types in this documentation.

Types

Name	Description
TAdoDbxRowUpdatedEventHandler (see page 1890)	Event handler for TAdoDbxDataAdapter.RowUpdated event.
TAdoDbxRowUpdatingEventHandler (see page 1890)	Event handler for TAdoDbxDataAdapter.RowUpdating event.
TObjectArray (see page 1891)	This is type Borland.Data.AdoDbxClientProvider.TObjectArray.

15.1.1.2.1 Borland.Data.AdoDbxClientProvider.TAdoDbxRowUpdatedEventHandler Type

Event handler for TAdoDbxDataAdapter.RowUpdated event.

Pascal

```
TAdoDbxRowUpdatedEventHandler = procedure (Sender: System.Object; e:
TAdoDbxRowUpdatedEventArgs) of object;
```

C++

```
(Sender: System.Object; e: TAdoDbxRowUpdatedEventArgs) ( TAdoDbxRowUpdatedEventHandler)();
```

File

Borland.Data.AdoDbxClientProvider

Description

TAdoDbxRowUpdatedEventHandler is an event handler that can be set on the TAdoDbxDataAdapter.RowUpdated event.

See Also

RowUpdated (see page 1826)

RowUpdating (see page 1826)

TAdoDbxRowUpdatingEventHandler (see page 1890)

15.1.1.2.2 Borland.Data.AdoDbxClientProvider.TAdoDbxRowUpdatingEventHandler Type

Event handler for TAdoDbxDataAdapter.RowUpdating event.

Pascal

```
TAdoDbxRowUpdatingEventHandler = procedure (Sender: System.Object; e:
TAdoDbxRowUpdatingEventArgs) of object;
```

C++

```
(Sender: System.Object; e: TAdoDbxRowUpdatingEventArgs) ( TAdoDbxRowUpdatingEventHandler)();
```

File

Borland.Data.AdoDbxClientProvider

Description

TAdoDbxRowUpdatingEventHandler is an event handler that can be set on the TAdoDbxDataAdapter.RowUpdating event.

See Also

RowUpdated (see page 1826)

RowUpdating (see page 1826)

TAdoDbxRowUpdatedEventHandler (see page 1890)

15.1.1.2.3 Borland.Data.AdoDbxClientProvider.TObjectArray Type

Pascal

```
TObjectArray = array of System.Object;
```

C++

```
array of System.Object TObjectArray;
```

File

Borland.Data.AdoDbxClientProvider

Description

This is type Borland.Data.AdoDbxClientProvider.TObjectArray.

15.1.1.3 Constants

The following table lists constants in this documentation.

Constants

Name	Description
SCommandAlreadyPrepared (see page 1891)	This is constant Borland.Data.AdoDbxClientProvider.SCommandAlreadyPrepared.
SInvalidFieldType (see page 1892)	This is constant Borland.Data.AdoDbxClientProvider.SInvalidFieldType.
SUnSupported (see page 1892)	This is constant Borland.Data.AdoDbxClientProvider.SUnSupported.

15.1.1.3.1 Borland.Data.AdoDbxClientProvider.SCommandAlreadyPrepared Constant

Pascal

```
SCommandAlreadyPrepared = 'Command already prepared';
```

C++

```
SCommandAlreadyPrepared = 'Command already prepared';
```

File

Borland.Data.AdoDbxClientProvider

Description

This is constant Borland.Data.AdoDbxClientProvider.SCommandAlreadyPrepared.

15.1.1.3.2 Borland.Data.AdoDbxClientProvider.SInvalidFieldType Constant

Pascal

```
SInvalidFieldType = 'Invalid field type:  %s';
```

C++

```
SInvalidFieldType = 'Invalid field type:  %s';
```

File

Borland.Data.AdoDbxClientProvider

Description

This is constant Borland.Data.AdoDbxClientProvider.SInvalidFieldType.

15.1.1.3.3 Borland.Data.AdoDbxClientProvider.SUnSupported Constant

Pascal

```
SUnSupported = 'Unsupported Operation';
```

C++

```
SUnSupported = 'Unsupported Operation';
```

File

Borland.Data.AdoDbxClientProvider

Description

This is constant Borland.Data.AdoDbxClientProvider.SUnSupported.

15.1.2 Borland.Data.DataStore Namespace

This is namespace Borland.Data.DataStore.

Topics

Name	Description
Classes (see page 1893)	The following table lists classes in this documentation.
Types (see page 2129)	The following table lists types in this documentation.

Classes

	Name	Description
	ConColumns (see page 1894)	Table returned by the builtin stored procedure DB_ADMIN.GET_CONNECTIONS(). Provides a table of information about open connections for a BlackfishSQL server.
	ConnectionProperties (see page 1897)	Names of connection properties supported by Blackfish SQL driver.
	DatabaseColumns (see page 1906)	Column names for result table returned from DB_ADMIN.GET_DATABASE_PROPS.

	DatabaseStatusTable (see page 1910)	Provides the column names for the result table returned from the builtin stored procedure DB_ADMIN.GET_DATABASE_STATUS(). The DB_ADMIN.GET_DATABASE_STATUS() stored procedure provides a table of information about the status of the connected database.
	DataStoreCommand (see page 1912)	Provides execution of SQL statements and execution of stored procedures.
	DataStoreConnection (see page 1923)	Provides a connection to a Blackfish SQL database.
	DataStoreDataAdapter (see page 1933)	Fills a DataSet (see page 1937) and updates a Blackfish SQL database.
	DataStoreErrorCode (see page 1939)	Symbolic error codes for Blackfish SQL database.
	DataStoreParameter (see page 2033)	Specifies parameter for DataStoreCommand (see page 1912).
	DataStoreParameterCollection (see page 2041)	Collection of parameters for DataStoreCommand (see page 1912).
	DataStoreRowUpdatedEventArgs (see page 2053)	Holds data for RowUpdated event of DataStoreDataAdapter (see page 1933).
	DataStoreRowUpdatingEventArgs (see page 2054)	Holds data for RowUpdating event of DataStoreDataAdapter (see page 1933).
	DataStoreTransaction (see page 2056)	This is class Borland.Data.DataStore.DataStoreTransaction.
	LicenseColumns (see page 2059)	Column names for result table returned from DB_ADMIN.GET_LICENSE and DB_ADMIN.GET_ALL_LICENSES.
	LockColumns (see page 2062)	Provides column names for result table from built-in stored procedure DB_ADMIN.GET_LOCKS.
	LogFilter (see page 2065)	Provides names of events to be logged.
	MirrorStatusColumns (see page 2069)	Provides columns of result table from built-in stored procedure DB_ADMIN.GET_MIRRORS.
	MirrorTypes (see page 2072)	Contains the valid values for the TYPE column from DB_ADMIN.GET_MIRRORS stored procedure.
	ProtocolValue (see page 2074)	Contains constant strings for the protocol connection property.
	ScheduleColumns (see page 2076)	Extends SysMirrors (see page 2089) with additional status information.
	SchedulePeriod (see page 2078)	Possible values for SysSchedule.PERIOD column.
	SqlStateCode (see page 2079)	Provides the possible values of the SQLState property of a SQLException raised by Blackfish SQL.
	StatusLogColumns (see page 2087)	Provides column names for result table from built-in stored procedure DB_ADMIN.GET_STATUS_LOGS.
	SysMirrors (see page 2089)	Provides the column names of the system table **SYS.MIRRORS**.
	SysSchedule (see page 2095)	Provides column names from system table **SYS.MIRROR_SCHEDULE**.
	SystemProperties (see page 2097)	Specifies names of system properties that should be applied to all databases open in a process.
	TriggerContext (see page 2101)	An instance of the TriggerContext class is passed to each trigger.
	TriggerReadRow (see page 2103)	Provides read access to a row of data.
	TriggerReadWriteRow (see page 2117)	Provides write access to a row of data.

Types

Name	Description
DataStoreRowUpdatedEventHandler (see page 2129)	This is type Borland.Data.DataStore.DataStoreRowUpdatedEventHandler.
DataStoreRowUpdatingEventHandler (see page 2129)	This is type Borland.Data.DataStore.DataStoreRowUpdatingEventHandler.

15.1.2.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ConColumns (see page 1894)	Table returned by the builtin stored procedure DB_ADMIN.GET_CONNECTIONS(). Provides a table of information about open connections for a BlackfishSQL server.
	ConnectionProperties (see page 1897)	Names of connection properties supported by Blackfish SQL driver.
	DatabaseColumns (see page 1906)	Column names for result table returned from DB_ADMIN.GET_DATABASE_PROPS.
	DatabaseStatusTable (see page 1910)	Provides the column names for the result table returned from the builtin stored procedure DB_ADMIN.GET_DATABASE_STATUS(). The DB_ADMIN.GET_DATABASE_STATUS() stored procedure provides a table of information about the status of the connected database.

	DataStoreCommand (see page 1912)	Provides execution of SQL statements and execution of stored procedures.
	DataStoreConnection (see page 1923)	Provides a connection to a Blackfish SQL database.
	DataStoreDataAdapter (see page 1933)	Fills a DataSet (see page 1937) and updates a Blackfish SQL database.
	DataStoreErrorCode (see page 1939)	Symbolic error codes for Blackfish SQL database.
	DataStoreParameter (see page 2033)	Specifies parameter for DataStoreCommand (see page 1912).
	DataStoreParameterCollection (see page 2041)	Collection of parameters for DataStoreCommand (see page 1912).
	DataStoreRowUpdatedEventArgs (see page 2053)	Holds data for RowUpdated event of DataStoreDataAdapter (see page 1933).
	DataStoreRowUpdatingEventArgs (see page 2054)	Holds data for RowUpdating event of DataStoreDataAdapter (see page 1933).
	DataStoreTransaction (see page 2056)	This is class Borland.Data.DataStore.DataStoreTransaction.
	LicenseColumns (see page 2059)	Column names for result table returned from DB_ADMIN.GET_LICENSE and DB_ADMIN.GET_ALL_LICENSES.
	LockColumns (see page 2062)	Provides column names for result table from built-in stored procedure DB_ADMIN.GET_LOCKS.
	LogFilter (see page 2065)	Provides names of events to be logged.
	MirrorStatusColumns (see page 2069)	Provides columns of result table from built-in stored procedure DB_ADMIN.GET_MIRRORS.
	MirrorTypes (see page 2072)	Contains the valid values for the TYPE column from DB_ADMIN.GET_MIRRORS stored procedure.
	ProtocolValue (see page 2074)	Contains constant strings for the protocol connection property.
	ScheduleColumns (see page 2076)	Extends SysMirrors (see page 2089) with additional status information.
	SchedulePeriod (see page 2078)	Possible values for SysSchedule.PERIOD column.
	SqlStateCode (see page 2079)	Provides the possible values of the SQLState property of a SQLException raised by Blackfish SQL.
	StatusLogColumns (see page 2087)	Provides column names for result table from built-in stored procedure DB_ADMIN.GET_STATUS_LOGS.
	SysMirrors (see page 2089)	Provides the column names of the system table **SYS.MIRRORS**.
	SysSchedule (see page 2095)	Provides column names from system table **SYS.MIRROR_SCHEDULE**.
	SystemProperties (see page 2097)	Specifies names of system properties that should be applied to all databases open in a process.
	TriggerContext (see page 2101)	An instance of the TriggerContext class is passed to each trigger.
	TriggerReadRow (see page 2103)	Provides read access to a row of data.
	TriggerReadWriteRow (see page 2117)	Provides write access to a row of data.

15.1.2.1.1 ConColumns Class

Table returned by the builtin stored procedure DB_ADMIN.GET_CONNECTIONS(). Provides a table of information about open connections for a BlackfishSQL server.

Class Hierarchy

Borland.Data.DataStore.ConColumns

Pascal

```
ConColumns = class;
```

C++

```
class ConColumns;
```

File

ConColumns.cs

Description

The table returned by the builtin stored procedure DB_ADMIN.GET_CONNECTIONS(). Provides a table of information about open connections for a BlackfishSQL server.

The columns of the result table are:

Constant	Description
Id (see page 1896)	Unique id for the connection. Note that this id is reused if the connection is closed.
User (see page 1897)	Name of the user that created this connection.
Ip (see page 1896)	IP address for this connection.
Host (see page 1896)	Host (see page 1896) name for this connection
FileName (see page 1896)	File name of database connected to.
Remarks (see page 1897)	Optional remarks that explain the reason for this connection.
Birth (see page 1896)	Timestamp of the point in time the connection was created.
RemotePort (see page 1897)	Remote port that this connection is using.

15.1.2.1.1.1 ConColumns Members

The following tables list the members exposed by ConColumns.

Public Fields

	Name	Description
	Birth (see page 1896)	This is Birth, a member of class ConColumns.
	FileName (see page 1896)	This is FileName, a member of class ConColumns.
	Host (see page 1896)	This is Host, a member of class ConColumns.
	Id (see page 1896)	This is Id, a member of class ConColumns.
	Ip (see page 1896)	This is Ip, a member of class ConColumns.
	Remarks (see page 1897)	This is Remarks, a member of class ConColumns.
	RemotePort (see page 1897)	This is RemotePort, a member of class ConColumns.
	User (see page 1897)	This is User, a member of class ConColumns.

15.1.2.1.1.2 ConColumns Fields

The fields of the ConColumns class are listed here.

Public Fields

	Name	Description
	Birth (see page 1896)	This is Birth, a member of class ConColumns.
	FileName (see page 1896)	This is FileName, a member of class ConColumns.
	Host (see page 1896)	This is Host, a member of class ConColumns.
	Id (see page 1896)	This is Id, a member of class ConColumns.
	Ip (see page 1896)	This is Ip, a member of class ConColumns.
	Remarks (see page 1897)	This is Remarks, a member of class ConColumns.
	RemotePort (see page 1897)	This is RemotePort, a member of class ConColumns.
	User (see page 1897)	This is User, a member of class ConColumns.

15.1.2.1.1.2.1 ConColumns.Birth Field

Pascal

```
const Birth: string = "BIRTH";
```

C++

```
string Birth = "BIRTH";
```

Description

This is Birth, a member of class ConColumns.

15.1.2.1.1.2.2 ConColumns.FileName Field

Pascal

```
const FileName: string = "FILE_NAME";
```

C++

```
string FileName = "FILE_NAME";
```

Description

This is FileName, a member of class ConColumns.

15.1.2.1.1.2.3 ConColumns.Host Field

Pascal

```
const Host: string = "HOST";
```

C++

```
string Host = "HOST";
```

Description

This is Host, a member of class ConColumns.

15.1.2.1.1.2.4 ConColumns.Id Field

Pascal

```
const Id: string = "ID";
```

C++

```
string Id = "ID";
```

Description

This is Id, a member of class ConColumns.

15.1.2.1.1.2.5 ConColumns.Ip Field

Pascal

```
const Ip: string = "IP";
```

C++

```
string Ip = "IP";
```

Description

This is Ip, a member of class ConColumns.

15.1.2.1.1.2.6 ConColumns.Remarks Field

Pascal

```
const Remarks: string = "REMARKS";
```

C++

```
string Remarks = "REMARKS";
```

Description

This is Remarks, a member of class ConColumns.

15.1.2.1.1.2.7 ConColumns.RemotePort Field

Pascal

```
const RemotePort: string = "REMOTE_PORT";
```

C++

```
string RemotePort = "REMOTE_PORT";
```

Description

This is RemotePort, a member of class ConColumns.

15.1.2.1.1.2.8 ConColumns.User Field

Pascal

```
const User: string = "USER";
```

C++

```
string User = "USER";
```

Description

This is User, a member of class ConColumns.

15.1.2.1.2 ConnectionProperties Class

Names of connection properties supported by Blackfish SQL driver.

Class Hierarchy

Pascal

```
ConnectionProperties = class;
```

C++

```
class ConnectionProperties;
```

File

ConnectionProperties.cs

Description

This class specifies the names of connection properties supported by the Blackfish SQL driver. These constants can be used to ensure that an application is using the correct name for a property. Connection properties should be combined with semicolons into a string, which is used for the ConnectionString property.

This table contains connection property names.

Name	Description
User (see page 1906)	User (see page 1906) name for Connection.
Password (see page 1903)	Password (see page 1903) for Connection.
LockWaitTime (see page 1902)	Amount of time in milliseconds to wait for a lock before timing out. Default is 30,000 milliseconds.
ReadOnlyTxDelay (see page 1905)	Specifies maximum amount of time in milliseconds the readOnlyTx connection's view of the data can be shared with other read-only transactions. Default is 5,000 milliseconds. This enables the system to optimize by allowing multiple connections to share the same view (cached data). This also controls how "out of date" the readOnly view of the data is for a readOnly transaction. A value of 0 indicates there should be no delay or sharing of the cached view.
ReadOnlyTx (see page 1905)	Create a connections with read-only transactions. When set to true, only read access is allowed for this connection. Only committed data is seen. Other connections can write to the same database without being blocked by reads from this connection. Default is **false**.
ReadOnly (see page 1905)	Open database in read-only mode. When set, only read access is allowed. Unlike **ReadOnlyTx (see page 1905)**, this property prevents any connection from performing any write operation to the database. This setting is ideal for databases that reside on read-only devices such as a CD-ROM.
TableLockTables (see page 1906)	Disable row locks for the specified tables. List of comma separated names of tables that the lock manager should use table locks instead of row locks. A value of "*" disables row locks for all tables.
LogFilters (see page 1903)	Enable logging for the specified events. This property can be set to one of two types of values: 1) List of comma separated LogFilter (see page 2065) **String** values. 2) The string representation of the one or more LogFilterCodes that have been ORed together before converted to a **String** value.
MaxRowLocks (see page 1903)	Set the maximal number of row locks per table. If the number of acquired row locks exceeds this number for a table, the lock manager escalates to a table lock. Default is 50.
CreateDb (see page 1901)	Set to **true** to create the database that is being opened if it does not already exist. Default is **false**.
HeuristicCompletion (see page 1902)	This property is currently only supported for Java (see page 15681) applications. This property allows you to control the behavior when one or more databases fail during a two-phase commit. When XA transactions are prepared but not finished (no commit or rollback), you can specify one of three possible string settings for this property: • **commit**: causes the transaction to be heuristically committed when DataStore (see page 1892) reopens the database. • **rollback**: causes the transaction to be heuristically rolled back when DataStore (see page 1892) reopens the database. • **none**: causes DataStore (see page 1892) to keep the transaction state when reopening a database. When this option is used, the locks that were held when the transaction was prepared are reacquired and held until the transaction is committed or rolled back by a JTA /JTS-compliant transaction manager.
ShutdownServer (see page 1905)	If **true**, causes a Blackfish SQL Server to close all open databases and shutdown.

PingServer (see page 1904)	If **true**, pings the server without creating a connection.
Fileio (see page 1902)	This property only affects Java (see page 15681) servers file IO. This is used to specify the file IO APIs used for database and log files. This property can be set to **new** or **native**. Setting this property can improve performance, but **new** works only for JDK 1.4 platforms and **native** is currently only implemented for Win32 platforms. See com.borland.datastore.cons.FileIO for more details.
Database (see page 1901)	Specifies file name of database to open.
Host (see page 1902)	Specify host server to connect to.
Port (see page 1904)	Specify port to communicate with a remote server. Default is 2508.
ExtendedMetadata (see page 1902)	Add extra columns to metadata requests. This property only affects Java (see page 15681) drivers. When this boolean property is set to **true**, additional columns of information for java.sql.DatabaseMetaData methods like view source for views and additional metadata columns for tables are provided.
Protocol (see page 1904)	Specify network protocol to access server. The possible values are the strings: **TCP** and **InProcess**. Default is **InProcess**.
Remarks (see page 1905)	Optional remarks explaining reason for this connection.
CommitOnClose (see page 1901)	Commit active transaction when connection is closed. Default is **true**.
Pooling (see page 1904)	Create a connection pool. Set this to **false** if no connection pool is wanted. Default is **true**.
MaxPoolSize (see page 1903)	Maximum number of connections in connection pool. Default is 20.
MinPoolSize (see page 1903)	Initial number of connections created in a new connection pool. Default is 1.
ConnectionTimeout (see page 1901)	Maximum time (in seconds) to wait for a free connection from the pool. Default is 1.
PriorFileName (see page 1904)	File name of a prior version of database. This can be used to open the current database. Currently this is only used to open encrypted databases that have been damaged from the crash recovery of an encrypted database. There is also a DataStoreConnection.setPriorFileName. Note that the prior database is only used to decrypt the user table that is not supposed to be encrypted in the first place. If user connecting does not have startup rights in both the prior and current database, the prior database is not used for the open operation. Once the database affected by this defect has been opened, it should be copied or packed into a new database file.

15.1.2.1.2.1 ConnectionProperties Members

The following tables list the members exposed by ConnectionProperties.

Public Fields

	Name	Description
	ClientDataDirectory (see page 1901)	This is ClientDataDirectory, a member of class ConnectionProperties.
	CommitOnClose (see page 1901)	This is CommitOnClose, a member of class ConnectionProperties.
	ConnectionTimeout (see page 1901)	This is ConnectionTimeout, a member of class ConnectionProperties.
	CreateDb (see page 1901)	This is CreateDb, a member of class ConnectionProperties.
	Database (see page 1901)	This is Database, a member of class ConnectionProperties.
	ExtendedMetadata (see page 1902)	This is ExtendedMetadata, a member of class ConnectionProperties.

	Fileio (see page 1902)	This is Fileio, a member of class ConnectionProperties.
	HeuristicCompletion (see page 1902)	This is HeuristicCompletion, a member of class ConnectionProperties.
	Host (see page 1902)	This is Host, a member of class ConnectionProperties.
	LockWaitTime (see page 1902)	This is LockWaitTime, a member of class ConnectionProperties.
	LogFilters (see page 1903)	This is LogFilters, a member of class ConnectionProperties.
	MaxPoolSize (see page 1903)	This is MaxPoolSize, a member of class ConnectionProperties.
	MaxRowLocks (see page 1903)	This is MaxRowLocks, a member of class ConnectionProperties.
	MinPoolSize (see page 1903)	This is MinPoolSize, a member of class ConnectionProperties.
	Password (see page 1903)	This is Password, a member of class ConnectionProperties.
	PingServer (see page 1904)	This is PingServer, a member of class ConnectionProperties.
	Pooling (see page 1904)	This is Pooling, a member of class ConnectionProperties.
	Port (see page 1904)	This is Port, a member of class ConnectionProperties.
	PriorFileName (see page 1904)	This is PriorFileName, a member of class ConnectionProperties.
	Protocol (see page 1904)	This is Protocol, a member of class ConnectionProperties.
	ReadOnly (see page 1905)	This is ReadOnly, a member of class ConnectionProperties.
	ReadOnlyTx (see page 1905)	This is ReadOnlyTx, a member of class ConnectionProperties.
	ReadOnlyTxDelay (see page 1905)	This is ReadOnlyTxDelay, a member of class ConnectionProperties.
	Remarks (see page 1905)	This is Remarks, a member of class ConnectionProperties.
	ShutdownServer (see page 1905)	This is ShutdownServer, a member of class ConnectionProperties.
	TableLockTables (see page 1906)	This is TableLockTables, a member of class ConnectionProperties.
	User (see page 1906)	This is User, a member of class ConnectionProperties.

15.1.2.1.2.2 ConnectionProperties Fields

The fields of the ConnectionProperties class are listed here.

Public Fields

	Name	Description
	ClientDataDirectory (see page 1901)	This is ClientDataDirectory, a member of class ConnectionProperties.
	CommitOnClose (see page 1901)	This is CommitOnClose, a member of class ConnectionProperties.
	ConnectionTimeout (see page 1901)	This is ConnectionTimeout, a member of class ConnectionProperties.
	CreateDb (see page 1901)	This is CreateDb, a member of class ConnectionProperties.
	Database (see page 1901)	This is Database, a member of class ConnectionProperties.
	ExtendedMetadata (see page 1902)	This is ExtendedMetadata, a member of class ConnectionProperties.
	Fileio (see page 1902)	This is Fileio, a member of class ConnectionProperties.
	HeuristicCompletion (see page 1902)	This is HeuristicCompletion, a member of class ConnectionProperties.
	Host (see page 1902)	This is Host, a member of class ConnectionProperties.
	LockWaitTime (see page 1902)	This is LockWaitTime, a member of class ConnectionProperties.
	LogFilters (see page 1903)	This is LogFilters, a member of class ConnectionProperties.
	MaxPoolSize (see page 1903)	This is MaxPoolSize, a member of class ConnectionProperties.
	MaxRowLocks (see page 1903)	This is MaxRowLocks, a member of class ConnectionProperties.
	MinPoolSize (see page 1903)	This is MinPoolSize, a member of class ConnectionProperties.
	Password (see page 1903)	This is Password, a member of class ConnectionProperties.
	PingServer (see page 1904)	This is PingServer, a member of class ConnectionProperties.
	Pooling (see page 1904)	This is Pooling, a member of class ConnectionProperties.
	Port (see page 1904)	This is Port, a member of class ConnectionProperties.
	PriorFileName (see page 1904)	This is PriorFileName, a member of class ConnectionProperties.
	Protocol (see page 1904)	This is Protocol, a member of class ConnectionProperties.
	ReadOnly (see page 1905)	This is ReadOnly, a member of class ConnectionProperties.
	ReadOnlyTx (see page 1905)	This is ReadOnlyTx, a member of class ConnectionProperties.
	ReadOnlyTxDelay (see page 1905)	This is ReadOnlyTxDelay, a member of class ConnectionProperties.
	Remarks (see page 1905)	This is Remarks, a member of class ConnectionProperties.
	ShutdownServer (see page 1905)	This is ShutdownServer, a member of class ConnectionProperties.
	TableLockTables (see page 1906)	This is TableLockTables, a member of class ConnectionProperties.
	User (see page 1906)	This is User, a member of class ConnectionProperties.

15.1.2.1.2.2.1 ConnectionProperties.ClientDataDirectory Field

Pascal

```
const ClientDataDirectory: string = "clientDataDirectory";
```

C++

```
string ClientDataDirectory = "clientDataDirectory";
```

Description

This is ClientDataDirectory, a member of class ConnectionProperties.

15.1.2.1.2.2.2 ConnectionProperties.CommitOnClose Field

Pascal

```
const CommitOnClose: string = "commitOnClose";
```

C++

```
string CommitOnClose = "commitOnClose";
```

Description

This is CommitOnClose, a member of class ConnectionProperties.

15.1.2.1.2.2.3 ConnectionProperties.ConnectionTimeout Field

Pascal

```
const ConnectionTimeout: string = "connectionTimeout";
```

C++

```
string ConnectionTimeout = "connectionTimeout";
```

Description

This is ConnectionTimeout, a member of class ConnectionProperties.

15.1.2.1.2.2.4 ConnectionProperties.CreateDb Field

Pascal

```
const CreateDb: string = "create";
```

C++

```
string CreateDb = "create";
```

Description

This is CreateDb, a member of class ConnectionProperties.

15.1.2.1.2.2.5 ConnectionProperties.Database Field

Pascal

```
const Database: string = "database";
```

C++

```
string Database = "database";
```

Description

This is Database, a member of class ConnectionProperties.

15.1.2.1.2.2.6 ConnectionProperties.ExtendedMetadata Field

Pascal

```
const ExtendedMetadata: string = "extendedMetaData";
```

C++

```
string ExtendedMetadata = "extendedMetaData";
```

Description

This is ExtendedMetadata, a member of class ConnectionProperties.

15.1.2.1.2.2.7 ConnectionProperties.Fileio Field

Pascal

```
const Fileio: string = "fileio";
```

C++

```
string Fileio = "fileio";
```

Description

This is Fileio, a member of class ConnectionProperties.

15.1.2.1.2.2.8 ConnectionProperties.HeuristicCompletion Field

Pascal

```
const HeuristicCompletion: string = "heuristicCompletion";
```

C++

```
string HeuristicCompletion = "heuristicCompletion";
```

Description

This is HeuristicCompletion, a member of class ConnectionProperties.

15.1.2.1.2.2.9 ConnectionProperties.Host Field

Pascal

```
const Host: string = "host";
```

C++

```
string Host = "host";
```

Description

This is Host, a member of class ConnectionProperties.

15.1.2.1.2.2.10 ConnectionProperties.LockWaitTime Field

Pascal

```
const LockWaitTime: string = "lockWaitTime";
```

C++

```
string LockWaitTime = "lockWaitTime";
```

Description

This is LockWaitTime, a member of class ConnectionProperties.

15.1.2.1.2.2.11 ConnectionProperties.LogFilters Field

Pascal

```
const LogFilters: string = "logFilters";
```

C++

```
string LogFilters = "logFilters";
```

Description

This is LogFilters, a member of class ConnectionProperties.

15.1.2.1.2.2.12 ConnectionProperties.MaxPoolSize Field

Pascal

```
const MaxPoolSize: string = "maxPoolSize";
```

C++

```
string MaxPoolSize = "maxPoolSize";
```

Description

This is MaxPoolSize, a member of class ConnectionProperties.

15.1.2.1.2.2.13 ConnectionProperties.MaxRowLocks Field

Pascal

```
const MaxRowLocks: string = "maxRowLocks";
```

C++

```
string MaxRowLocks = "maxRowLocks";
```

Description

This is MaxRowLocks, a member of class ConnectionProperties.

15.1.2.1.2.2.14 ConnectionProperties.MinPoolSize Field

Pascal

```
const MinPoolSize: string = "minPoolSize";
```

C++

```
string MinPoolSize = "minPoolSize";
```

Description

This is MinPoolSize, a member of class ConnectionProperties.

15.1.2.1.2.2.15 ConnectionProperties.Password Field

Pascal

```
const Password: string = "password";
```

C++

```
string Password = "password";
```

Description

This is Password, a member of class ConnectionProperties.

15.1.2.1.2.2.16 ConnectionProperties.PingServer Field

Pascal

```
const PingServer: string = "pingServer";
```

C++

```
string PingServer = "pingServer";
```

Description

This is PingServer, a member of class ConnectionProperties.

15.1.2.1.2.2.17 ConnectionProperties.Pooling Field

Pascal

```
const Pooling: string = "pooling";
```

C++

```
string Pooling = "pooling";
```

Description

This is Pooling, a member of class ConnectionProperties.

15.1.2.1.2.2.18 ConnectionProperties.Port Field

Pascal

```
const Port: string = Borland.Data.DataStore.SystemProperties.Port;
```

C++

```
string Port = Borland.Data.DataStore.SystemProperties.Port;
```

Description

This is Port, a member of class ConnectionProperties.

15.1.2.1.2.2.19 ConnectionProperties.PriorFileName Field

Pascal

```
const PriorFileName: string = "priorFileName";
```

C++

```
string PriorFileName = "priorFileName";
```

Description

This is PriorFileName, a member of class ConnectionProperties.

15.1.2.1.2.2.20 ConnectionProperties.Protocol Field

Pascal

```
const Protocol: string = "protocol";
```

C++

```
string Protocol = "protocol";
```

Description

This is Protocol, a member of class ConnectionProperties.

15.1.2.1.2.2.21 ConnectionProperties.ReadOnly Field

Pascal

```
const ReadOnly: string = "readonly";
```

C++

```
string ReadOnly = "readonly";
```

Description

This is ReadOnly, a member of class ConnectionProperties.

15.1.2.1.2.2.22 ConnectionProperties.ReadOnlyTx Field

Pascal

```
const ReadOnlyTx: string = "readOnlyTx";
```

C++

```
string ReadOnlyTx = "readOnlyTx";
```

Description

This is ReadOnlyTx, a member of class ConnectionProperties.

15.1.2.1.2.2.23 ConnectionProperties.ReadOnlyTxDelay Field

Pascal

```
const ReadOnlyTxDelay: string = "readOnlyTxDelay";
```

C++

```
string ReadOnlyTxDelay = "readOnlyTxDelay";
```

Description

This is ReadOnlyTxDelay, a member of class ConnectionProperties.

15.1.2.1.2.2.24 ConnectionProperties.Remarks Field

Pascal

```
const Remarks: string = "remarks";
```

C++

```
string Remarks = "remarks";
```

Description

This is Remarks, a member of class ConnectionProperties.

15.1.2.1.2.2.25 ConnectionProperties.ShutdownServer Field

Pascal

```
const ShutdownServer: string = "shutdownServer";
```

C++

```
string ShutdownServer = "shutdownServer";
```

Description

This is ShutdownServer, a member of class ConnectionProperties.

15.1.2.1.2.2.26 ConnectionProperties.TableLockTables Field

Pascal

```
const TableLockTables: string = "tableLockTables";
```

C++

```
string TableLockTables = "tableLockTables";
```

Description

This is TableLockTables, a member of class ConnectionProperties.

15.1.2.1.2.2.27 ConnectionProperties.User Field

Pascal

```
const User: string = "user";
```

C++

```
string User = "user";
```

Description

This is User, a member of class ConnectionProperties.

15.1.2.1.3 DatabaseColumns Class

Column names for result table returned from DB_ADMIN.GET_DATABASE_PROPS.

Class Hierarchy

Borland.Data.DataStore.DatabaseColumns

Pascal

```
DatabaseColumns = class;
```

C++

```
class DatabaseColumns;
```

File

DatabaseColumns.cs

Description

Column names for result table returned from the built-in stored procedure DB_ADMIN.GET_DATABASE_PROPS. The result table contains one row with the following columns:

Column	Description
BLOCK_SIZE	Database block size. The size in bytes of each read/write operation for the database file. A row of a table must fit in a block.
STORE_VERSION	Database file version. One of the values from **StoreVersion (see page 1910)**.
LOG_BLOCK_SIZE	Block size used for log files.
A_LOG_DIR	Directory for log files.
MAX_OPEN_LOGS	Maximum log files open at one time.
MAX_LOG_SIZE	Maximum log file size in bytes.
RECORD_STATUS	Send log output to the status log files.

LOG_ENABLED	Transaction logging enabled.
LOG_PREALLOCATE_COUNT	Pre-allocation log file count.
SOFT_COMMIT	Soft commit enabled.
CHECKPOINT_FREQUENCY	Checkpoint frequency.
DEFAULT_SCHEMA_NAME	The default schema for the current user. If the user has not created his/her own schema this is **DEFAULT_SCHEMA**. If a user has created his/her own schema this will be the current user name.

15.1.2.1.3.1 DatabaseColumns Members

The following tables list the members exposed by DatabaseColumns.

Public Fields

	Name	Description
	ALogDir (see page 1908)	This is ALogDir, a member of class DatabaseColumns.
	BlockSize (see page 1908)	This is BlockSize, a member of class DatabaseColumns.
	CheckpointFrequency (see page 1908)	This is CheckpointFrequency, a member of class DatabaseColumns.
	DefaultSchemaName (see page 1908)	This is DefaultSchemaName, a member of class DatabaseColumns.
	LogBlockSize (see page 1908)	This is LogBlockSize, a member of class DatabaseColumns.
	LogEnabled (see page 1909)	This is LogEnabled, a member of class DatabaseColumns.
	LogPreallocateCount (see page 1909)	This is LogPreallocateCount, a member of class DatabaseColumns.
	MaxLogSize (see page 1909)	This is MaxLogSize, a member of class DatabaseColumns.
	MaxOpenLogs (see page 1909)	This is MaxOpenLogs, a member of class DatabaseColumns.
	RecordStatus (see page 1909)	This is RecordStatus, a member of class DatabaseColumns.
	SoftCommit (see page 1910)	This is SoftCommit, a member of class DatabaseColumns.
	StoreVersion (see page 1910)	This is StoreVersion, a member of class DatabaseColumns.

15.1.2.1.3.2 DatabaseColumns Fields

The fields of the DatabaseColumns class are listed here.

Public Fields

	Name	Description
	ALogDir (see page 1908)	This is ALogDir, a member of class DatabaseColumns.
	BlockSize (see page 1908)	This is BlockSize, a member of class DatabaseColumns.
	CheckpointFrequency (see page 1908)	This is CheckpointFrequency, a member of class DatabaseColumns.
	DefaultSchemaName (see page 1908)	This is DefaultSchemaName, a member of class DatabaseColumns.
	LogBlockSize (see page 1908)	This is LogBlockSize, a member of class DatabaseColumns.
	LogEnabled (see page 1909)	This is LogEnabled, a member of class DatabaseColumns.
	LogPreallocateCount (see page 1909)	This is LogPreallocateCount, a member of class DatabaseColumns.
	MaxLogSize (see page 1909)	This is MaxLogSize, a member of class DatabaseColumns.
	MaxOpenLogs (see page 1909)	This is MaxOpenLogs, a member of class DatabaseColumns.
	RecordStatus (see page 1909)	This is RecordStatus, a member of class DatabaseColumns.
	SoftCommit (see page 1910)	This is SoftCommit, a member of class DatabaseColumns.
	StoreVersion (see page 1910)	This is StoreVersion, a member of class DatabaseColumns.

15.1.2.1.3.2.1 DatabaseColumns.ALogDir Field

Pascal

```
const ALogDir: string = "A_LOG_DIR";
```

C++

```
string ALogDir = "A_LOG_DIR";
```

Description

This is ALogDir, a member of class DatabaseColumns.

15.1.2.1.3.2.2 DatabaseColumns.BlockSize Field

Pascal

```
const BlockSize: string = "BLOCK_SIZE";
```

C++

```
string BlockSize = "BLOCK_SIZE";
```

Description

This is BlockSize, a member of class DatabaseColumns.

15.1.2.1.3.2.3 DatabaseColumns.CheckpointFrequency Field

Pascal

```
const CheckpointFrequency: string = "CHECKPOINT_FREQUENCY";
```

C++

```
string CheckpointFrequency = "CHECKPOINT_FREQUENCY";
```

Description

This is CheckpointFrequency, a member of class DatabaseColumns.

15.1.2.1.3.2.4 DatabaseColumns.DefaultSchemaName Field

Pascal

```
const DefaultSchemaName: string = "DEFAULT_SCHEMA_NAME";
```

C++

```
string DefaultSchemaName = "DEFAULT_SCHEMA_NAME";
```

Description

This is DefaultSchemaName, a member of class DatabaseColumns.

15.1.2.1.3.2.5 DatabaseColumns.LogBlockSize Field

Pascal

```
const LogBlockSize: string = "LOG_BLOCK_SIZE";
```

C++

```
string LogBlockSize = "LOG_BLOCK_SIZE";
```

Description

This is LogBlockSize, a member of class DatabaseColumns.

15.1.2.1.3.2.6 DatabaseColumns.LogEnabled Field

Pascal

```
const LogEnabled: string = "LOG_ENABLED";
```

C++

```
string LogEnabled = "LOG_ENABLED";
```

Description

This is LogEnabled, a member of class DatabaseColumns.

15.1.2.1.3.2.7 DatabaseColumns.LogPreallocateCount Field

Pascal

```
const LogPreallocateCount: string = "LOG_PREALLOCATE_COUNT";
```

C++

```
string LogPreallocateCount = "LOG_PREALLOCATE_COUNT";
```

Description

This is LogPreallocateCount, a member of class DatabaseColumns.

15.1.2.1.3.2.8 DatabaseColumns.MaxLogSize Field

Pascal

```
const MaxLogSize: string = "MAX_LOG_SIZE";
```

C++

```
string MaxLogSize = "MAX_LOG_SIZE";
```

Description

This is MaxLogSize, a member of class DatabaseColumns.

15.1.2.1.3.2.9 DatabaseColumns.MaxOpenLogs Field

Pascal

```
const MaxOpenLogs: string = "MAX_OPEN_LOGS";
```

C++

```
string MaxOpenLogs = "MAX_OPEN_LOGS";
```

Description

This is MaxOpenLogs, a member of class DatabaseColumns.

15.1.2.1.3.2.10 DatabaseColumns.RecordStatus Field

Pascal

```
const RecordStatus: string = "RECORD_STATUS";
```

C++

```
string RecordStatus = "RECORD_STATUS";
```

Description

This is RecordStatus, a member of class DatabaseColumns.

15.1.2.1.3.2.11 DatabaseColumns.SoftCommit Field

Pascal

```
const SoftCommit: string = "SOFT_COMMIT";
```

C++

```
string SoftCommit = "SOFT_COMMIT";
```

Description

This is SoftCommit, a member of class DatabaseColumns.

15.1.2.1.3.2.12 DatabaseColumns.StoreVersion Field

Pascal

```
const StoreVersion: string = "STORE_VERSION";
```

C++

```
string StoreVersion = "STORE_VERSION";
```

Description

This is StoreVersion, a member of class DatabaseColumns.

15.1.2.1.4 DatabaseStatusTable Class

Provides the column names for the result table returned from the builtin stored procedure DB_ADMIN.GET_DATABASE_STATUS(). The DB_ADMIN.GET_DATABASE_STATUS() stored procedure provides a table of information about the status of the connected database.

Class Hierarchy

Pascal

```
DatabaseStatusTable = class;
```

C++

```
class DatabaseStatusTable;
```

File

DatabaseStatusColumns.cs

Description

Provides the column names for the result table returned from the builtin stored procedure DB_ADMIN.GET_DATABASE_STATUS(). The DB_ADMIN.GET_DATABASE_STATUS() stored procedure provides a table of information about the status of the connected database.

The columns of the result table are:

Constant	Description
LowestLsn (see page 1911)	Lowest log sequence number.
LowestLsnRemarks (see page 1912)	Lowest log sequence number remarks.
HighestLsn (see page 1911)	Highest log sequence number.
LastCheckpointLsn (see page 1911)	Last checkpoint log sequence number.

15.1.2.1.4.1 DatabaseStatusTable Members

The following tables list the members exposed by DatabaseStatusTable.

Public Fields

	Name	Description
	HighestLsn (see page 1911)	This is HighestLsn, a member of class DatabaseStatusTable.
	LastCheckpointLsn (see page 1911)	This is LastCheckpointLsn, a member of class DatabaseStatusTable.
	LowestLsn (see page 1911)	This is LowestLsn, a member of class DatabaseStatusTable.
	LowestLsnRemarks (see page 1912)	This is LowestLsnRemarks, a member of class DatabaseStatusTable.

15.1.2.1.4.2 DatabaseStatusTable Fields

The fields of the DatabaseStatusTable class are listed here.

Public Fields

	Name	Description
	HighestLsn (see page 1911)	This is HighestLsn, a member of class DatabaseStatusTable.
	LastCheckpointLsn (see page 1911)	This is LastCheckpointLsn, a member of class DatabaseStatusTable.
	LowestLsn (see page 1911)	This is LowestLsn, a member of class DatabaseStatusTable.
	LowestLsnRemarks (see page 1912)	This is LowestLsnRemarks, a member of class DatabaseStatusTable.

15.1.2.1.4.2.1 DatabaseStatusTable.HighestLsn Field

Pascal

```
const HighestLsn: string = "HIGHEST_LSN";
```

C++

```
string HighestLsn = "HIGHEST_LSN";
```

Description

This is HighestLsn, a member of class DatabaseStatusTable.

15.1.2.1.4.2.2 DatabaseStatusTable.LastCheckpointLsn Field

Pascal

```
const LastCheckpointLsn: string = "LAST_CHECKPOINT_LSN";
```

C++

```
string LastCheckpointLsn = "LAST_CHECKPOINT_LSN";
```

Description

This is LastCheckpointLsn, a member of class DatabaseStatusTable.

15.1.2.1.4.2.3 DatabaseStatusTable.LowestLsn Field

Pascal

```
const LowestLsn: string = "LOWEST_LSN";
```

C++

```
string LowestLsn = "LOWEST_LSN";
```

Description

This is LowestLsn, a member of class DatabaseStatusTable.

15.1.2.1.4.2.4 DatabaseStatusTable.LowestLsnRemarks Field

Pascal

```
const LowestLsnRemarks: string = "LOWEST_LSN_REMARKS";
```

C++

```
string LowestLsnRemarks = "LOWEST_LSN_REMARKS";
```

Description

This is LowestLsnRemarks, a member of class DatabaseStatusTable.

15.1.2.1.5 DataStoreCommand Class

Provides execution of SQL statements and execution of stored procedures.

Class Hierarchy

Pascal

```
DataStoreCommand = class(DbCommand, IDbCommand, ICloneable, IDisposable);
```

C++

```
class DataStoreCommand : public DbCommand, public IDbCommand, public ICloneable, public
IDisposable;
```

File

Ado.Net20.cs

Description

DataStoreCommand provides execution of SQL statements and execution of stored procedures.

DataStoreCommand is an implementation of the .NET DbCommand class.

After associating a command object with a connection object, the CommandText (see page 1919) property should be set to a SQL statement or a stored procedure name. If a stored procedure name is used, the CommandType (see page 1920) property should be set to CommandType (see page 1920).**StoredProcedure**. Then the command can be executed using one of these methods:

- ExecuteReader (see page 1918): Executes a command that returns rows. Most **SELECT** statements should use this method. If the actual command has no rows, the resulting DataStoreDataReader returns **false** from the DataStoreDataReader.Read method and the DataStoreDataReader.FieldCount property yields 0.
- ExecuteNonQuery (see page 1917): Executes a command that does not return rows, such as **INSERT**, **UPDATE**, **DELETE** and **DDL** statements. If the actual command has result rows, they are discarded at the server.
- ExecuteScalar (see page 1918): Retrieves a single value from a resulting row. CommandText (see page 1919) can be assigned a different value after executing one statement.

15.1.2.1.5.1 DataStoreCommand Members

The following tables list the members exposed by DataStoreCommand.

Internal Methods

	Name	Description
	DataReaderClosed (see page 1916)	This is DataReaderClosed, a member of class DataStoreCommand.
	FailIfNotOpen (see page 1919)	This is FailIfNotOpen, a member of class DataStoreCommand.

Protected Methods

	Name	Description
	CreateDbParameter (see page 1916)	This is CreateDbParameter, a member of class DataStoreCommand.
	ExecuteDbDataReader (see page 1917)	This is ExecuteDbDataReader, a member of class DataStoreCommand.

Protected Properties

	Name	Description
	DbConnection (see page 1921)	This is DbConnection, a member of class DataStoreCommand.
	DbParameterCollection (see page 1921)	This is DbParameterCollection, a member of class DataStoreCommand.
	DbTransaction (see page 1922)	This is DbTransaction, a member of class DataStoreCommand.

Public Methods

	Name	Description
	Cancel (see page 1915)	Attempts to cancels execution of a DataStoreCommand (see page 1912).
	Clone (see page 1915)	Creates a new object that is a copy of the current instance.
	Close (see page 1916)	Release resources held by command.
	CreateParameter (see page 1916)	Creates and returns a DataStoreParameter (see page 2033) that can be added to the Parameters (see page 1922) of this command.
	DataStoreCommand (see page 1914)	This is the overview for the DataStoreCommand constructor overload.
	Dispose (see page 1917)	This is the overview for the Dispose method overload.
	ExecuteNonQuery (see page 1917)	Executes a SQL statement and returns the number of rows affected.
	ExecuteReader (see page 1918)	This is the overview for the ExecuteReader method overload.
	ExecuteScalar (see page 1918)	Executes query and returns first column of first row in result set.
	Prepare (see page 1919)	Prepares statement for execution on server.

Public Properties

	Name	Description
	CommandText (see page 1919)	Gets or sets Blackfish SQL SQL statement or stored procedure name.
	CommandTimeout (see page 1920)	Gets or sets wait time before terminating the execution of command.
	CommandType (see page 1920)	Gets or sets a value specifying how the CommandText (see page 1919) property should be used.
	Connection (see page 1921)	Gets or sets the DataStoreConnection (see page 1923) used by this command.
	DesignTimeVisible (see page 1922)	Command object should be visible in customized interface control.
	Parameters (see page 1922)	Gets the DataStoreParameterCollection (see page 2041) for this command.
	RecordsAffected (see page 1922)	This is RecordsAffected, a member of class DataStoreCommand.
	Transaction (see page 1923)	Get transaction of command.

	UpdatedRowSource (see page 1923)	How command results are applied to DataRow when used by Update method of DataStoreDataAdapter (see page 1933).

15.1.2.1.5.2 DataStoreCommand Constructor

This is the overview for the DataStoreCommand constructor overload.

Overload List

	Name	Description
	DataStoreCommand.DataStoreCommand () (see page 1914)	Initializes a new instance of the DataStoreCommand class.
	DataStoreCommand.DataStoreCommand (string) (see page 1914)	Initializes a new instance of the DataStoreCommand class.
	DataStoreCommand.DataStoreCommand (string, DataStoreConnection) (see page 1914)	Initializes a new instance of the DataStoreCommand class.
	DataStoreCommand.DataStoreCommand (string, DataStoreConnection, DataStoreTransaction) (see page 1914)	Initializes a new instance of the DataStoreCommand class.

15.1.2.1.5.2.1 DataStoreCommand.DataStoreCommand Constructor ()

Initializes a new instance of the DataStoreCommand class.

Pascal

```
constructor Create;
constructor Create(cmdText: string);
constructor Create(cmdText: string; connection: DataStoreConnection);
constructor Create(cmdText: string; connection: DataStoreConnection; transaction:
DataStoreTransaction);
```

C++

```
DataStoreCommand();
DataStoreCommand(string cmdText);
DataStoreCommand(string cmdText, DataStoreConnection connection);
DataStoreCommand(string cmdText, DataStoreConnection connection, DataStoreTransaction
transaction);
```

Description

DataStoreCommand initializes a new instance of the DataStoreCommand class, which is an implementation of the DbCommand class.

When a new instance of DataStoreCommand is created, the command properties Connection (see page 1921) and CommandText (see page 1919) should be set.

One form of this constructor sets the initial value for CommandText (see page 1919).

One form of this constructor sets the initial value for the properties CommandText (see page 1919) and Connection (see page 1921).

See Also

DbCommand (MSDN)

CommandText (see page 1919)

Connection (see page 1921)

15.1.2.1.5.3 DataStoreCommand Methods

The methods of the DataStoreCommand class are listed here.

Internal Methods

	Name	Description
	DataReaderClosed (see page 1916)	This is DataReaderClosed, a member of class DataStoreCommand.
	FailIfNotOpen (see page 1919)	This is FailIfNotOpen, a member of class DataStoreCommand.

Protected Methods

	Name	Description
	CreateDbParameter (see page 1916)	This is CreateDbParameter, a member of class DataStoreCommand.
	ExecuteDbDataReader (see page 1917)	This is ExecuteDbDataReader, a member of class DataStoreCommand.

Public Methods

	Name	Description
	Cancel (see page 1915)	Attempts to cancels execution of a DataStoreCommand (see page 1912).
	Clone (see page 1915)	Creates a new object that is a copy of the current instance.
	Close (see page 1916)	Release resources held by command.
	CreateParameter (see page 1916)	Creates and returns a DataStoreParameter (see page 2033) that can be added to the Parameters (see page 1922) of this command.
	Dispose (see page 1917)	This is the overview for the Dispose method overload.
	ExecuteNonQuery (see page 1917)	Executes a SQL statement and returns the number of rows affected.
	ExecuteReader (see page 1918)	This is the overview for the ExecuteReader method overload.
	ExecuteScalar (see page 1918)	Executes query and returns first column of first row in result set.
	Prepare (see page 1919)	Prepares statement for execution on server.

15.1.2.1.5.3.1 DataStoreCommand.Cancel Method

Attempts to cancels execution of a DataStoreCommand (see page 1912).

Pascal

```
function Cancel: void;
```

C++

```
void Cancel();
```

Description

Attempts to cancels the execution of a DataStoreCommand (see page 1912).

See Also

Cancel (MSDN)

15.1.2.1.5.3.2 DataStoreCommand.Clone Method

Creates a new object that is a copy of the current instance.

Pascal

```
function Clone: DataStoreCommand;
```

C++

```
DataStoreCommand Clone();
```

Description

Clone creates a new object that is a copy of the current instance.

See Also

Clone (MSDN)

15.1.2.1.5.3.3 DataStoreCommand.Close Method

Release resources held by command.

Pascal

```
function Close: void;
```

C++

```
void Close();
```

Description

Close releases the resources held by this command.

15.1.2.1.5.3.4 DataStoreCommand.CreateDbParameter Method

Pascal

```
function CreateDbParameter: DbParameter;
```

C++

```
DbParameter CreateDbParameter();
```

Description

This is CreateDbParameter, a member of class DataStoreCommand.

15.1.2.1.5.3.5 DataStoreCommand.CreateParameter Method

Creates and returns a DataStoreParameter (see page 2033) that can be added to the Parameters (see page 1922) of this command.

Pascal

```
function CreateParameter: DataStoreParameter;
```

C++

```
DataStoreParameter CreateParameter();
```

Description

CreateParameter creates and returns a DataStoreParameter (see page 2033) that can be added to the Parameters (see page 1922) of this command.

See Also

CreateParameter (MSDN)

15.1.2.1.5.3.6 DataStoreCommand.DataReaderClosed Method

Pascal

```
function DataReaderClosed(behavior: CommandBehavior): void;
```

C++

```
void DataReaderClosed(CommandBehavior behavior);
```

Description

This is DataReaderClosed, a member of class DataStoreCommand.

15.1.2.1.5.3.7 Dispose Method

This is the overview for the Dispose method overload.

Overload List

	Name	Description
	DataStoreCommand.Dispose () (see page 1917)	Releases the resources used by the DataStoreCommand (see page 1912).
	DataStoreCommand.Dispose (bool) (see page 1917)	Releases the resources used by the DataStoreCommand (see page 1912).

15.1.2.1.5.3.7.1 DataStoreCommand.Dispose Method ()

Releases the resources used by the DataStoreCommand (see page 1912).

Pascal

```
function Dispose: void;
function Dispose(disposing: bool): void;
```

C++

```
void Dispose();
void Dispose(bool disposing);
```

Description

Dispose releases the resources used by the DataStoreCommand (see page 1912).

See Also

Dispose (MSDN)

15.1.2.1.5.3.8 DataStoreCommand.ExecuteDbDataReader Method

Pascal

```
function ExecuteDbDataReader(behavior: CommandBehavior): DbDataReader;
```

C++

```
DbDataReader ExecuteDbDataReader(CommandBehavior behavior);
```

Description

This is ExecuteDbDataReader, a member of class DataStoreCommand.

15.1.2.1.5.3.9 DataStoreCommand.ExecuteNonQuery Method

Executes a SQL statement and returns the number of rows affected.

Pascal

```
function ExecuteNonQuery: Integer;
```

C++

```
int ExecuteNonQuery();
```

Description

ExecuteNonQuery executes a SQL statement and returns the number of rows affected by executing this command. Use this method to execute SQL statements that do not generate a result table.

See Also

ExecuteNonQuery (MSDN)

15.1.2.1.5.3.10 ExecuteReader Method

This is the overview for the ExecuteReader method overload.

Overload List

	Name	Description
	DataStoreCommand.ExecuteReader () (see page 1918)	Returns a DataStoreDataReader instance.
	DataStoreCommand.ExecuteReader (CommandBehavior) (see page 1918)	Returns a DataStoreDataReader instance.

15.1.2.1.5.3.10.1 DataStoreCommand.ExecuteReader Method ()

Returns a DataStoreDataReader instance.

Pascal

```
function ExecuteReader: DataStoreDataReader;
function ExecuteReader(behavior: CommandBehavior): DataStoreDataReader;
```

C++

```
DataStoreDataReader ExecuteReader();
DataStoreDataReader ExecuteReader(CommandBehavior behavior);
```

Description

ExecuteReader returns a DataStoreDataReader instance.

The parameter **behavior** is one of the **CommandBehavior** constants. Only **CommandBehavior**.**CloseConnection** is currently supported.

See Also

ExecuteReader (MSDN)

15.1.2.1.5.3.11 DataStoreCommand.ExecuteScalar Method

Executes query and returns first column of first row in result set.

Pascal

```
function ExecuteScalar: object;
```

C++

```
object ExecuteScalar();
```

Description

ExecuteScalar executes the query and returns the first column of the first row in the result set returned by the query. Extra columns or rows are ignored. Returns the value of the first column of the first row or DBNull.Value if no such value exists.

See Also

ExecuteScalar (MSDN)

15.1.2.1.5.3.12 DataStoreCommand.FailIfNotOpen Method

Pascal

```
function FailIfNotOpen: void;
```

C++

```
void FailIfNotOpen();
```

Description

This is FailIfNotOpen, a member of class DataStoreCommand.

15.1.2.1.5.3.13 DataStoreCommand.Prepare Method

Prepares statement for execution on server.

Pascal

```
function Prepare: void;
```

C++

```
void Prepare();
```

Description

This method prepares the statement for execution on the server.

See Also

Prepare (MSDN)

15.1.2.1.5.4 DataStoreCommand Properties

The properties of the DataStoreCommand class are listed here.

Protected Properties

	Name	Description
	DbConnection (see page 1921)	This is DbConnection, a member of class DataStoreCommand.
	DbParameterCollection (see page 1921)	This is DbParameterCollection, a member of class DataStoreCommand.
	DbTransaction (see page 1922)	This is DbTransaction, a member of class DataStoreCommand.

Public Properties

	Name	Description
	CommandText (see page 1919)	Gets or sets Blackfish SQL SQL statement or stored procedure name.
	CommandTimeout (see page 1920)	Gets or sets wait time before terminating the execution of command.
	CommandType (see page 1920)	Gets or sets a value specifying how the CommandText (see page 1919) property should be used.
	Connection (see page 1921)	Gets or sets the DataStoreConnection (see page 1923) used by this command.
	DesignTimeVisible (see page 1922)	Command object should be visible in customized interface control.
	Parameters (see page 1922)	Gets the DataStoreParameterCollection (see page 2041) for this command.
	RecordsAffected (see page 1922)	This is RecordsAffected, a member of class DataStoreCommand.
	Transaction (see page 1923)	Get transaction of command.
	UpdatedRowSource (see page 1923)	How command results are applied to DataRow when used by Update method of DataStoreDataAdapter (see page 1933).

15.1.2.1.5.4.1 DataStoreCommand.CommandText Property

Gets or sets Blackfish SQL SQL statement or stored procedure name.

Pascal

```
property CommandText: string;
```

C++

```
__property string CommandText;
```

Description

CommandText holds the Blackfish SQL SQL statement or stored procedure name to execute.

When the CommandType (see page 1920) property is set to CommandType (see page 1920).**Text**, this property should be set to a SQL statement. Parameters (see page 1922) can be marked with either a question mark (?) or named parameter markers. For example:

```
SELECT * FROM EMPLOYEE WHERE EMP_NO=?
SELECT * FROM EMPLOYEE WHERE EMP_NO=EMP
```

When question marks (?) are used, the order of the parameters in Parameters (see page 1922) must match the order in which they appear in the SQL statement. When named parameters are used the names must match, but the order doesn't matter.

When the CommandType (see page 1920) property is set to CommandType (see page 1920).**StoredProcedure**, this property should be set to a stored procedure name. The parameters are implicit. For example:

```
DB_UTIL.SIN
MYSCHEMA.MYPROCEDURE
```

The parameters are given by the name of the parameters of the stored procedure. You can find the names of the stored procedure from ISQL or from the built-in stored procedure DB_ADMIN.GET_PROCEDURE_COLUMNS.

See Also

CommandText (MSDN)

DB_ADMIN

GET_PROCEDURE_COLUMNS

15.1.2.1.5.4.2 DataStoreCommand.CommandTimeout Property

Gets or sets wait time before terminating the execution of command.

Pascal

```
property CommandTimeout: Integer;
```

C++

```
__property int CommandTimeout;
```

Description

CommandTimeout gets or sets the wait time before terminating the execution a command and generating an error. Zero indicates an indefinite time-out period.

See Also

CommandTimeout (MSDN)

15.1.2.1.5.4.3 DataStoreCommand.CommandType Property

Gets or sets a value specifying how the CommandText (see page 1919) property should be used.

Pascal

```
property CommandType: CommandType;
```

C++

```
__property CommandType CommandType;
```

Description

CommandType gets or sets a value specifying how the CommandText (see page 1919) property should be used. Must be one of CommandType.**Text**, CommandType.**StoredProcedure**, CommandType.**Table** values. Default is CommandType.**Text**.

See Also

CommandType (MSDN)

CommandText (see page 1919)

15.1.2.1.5.4.4 DataStoreCommand.Connection Property

Gets or sets the DataStoreConnection (see page 1923) used by this command.

Pascal

```
property Connection: DataStoreConnection;
```

C++

```
__property DataStoreConnection Connection;
```

Description

Connection gets or sets the DataStoreConnection (see page 1923) used by this command.

See Also

Connection (MSDN)

DataStoreConnection (see page 1923)

15.1.2.1.5.4.5 DataStoreCommand.DbConnection Property

Pascal

```
property DbConnection: DbConnection;
```

C++

```
__property DbConnection DbConnection;
```

Description

This is DbConnection, a member of class DataStoreCommand.

15.1.2.1.5.4.6 DataStoreCommand.DbParameterCollection Property

Pascal

```
property DbParameterCollection: DbParameterCollection;
```

C++

```
__property DbParameterCollection DbParameterCollection;
```

Description

This is DbParameterCollection, a member of class DataStoreCommand.

15.1.2.1.5.4.7 DataStoreCommand.DbTransaction Property

Pascal

```
property DbTransaction: DbTransaction;
```

C++

```
__property DbTransaction DbTransaction;
```

Description

This is DbTransaction, a member of class DataStoreCommand.

15.1.2.1.5.4.8 DataStoreCommand.DesignTimeVisible Property

Command object should be visible in customized interface control.

Pascal

```
property DesignTimeVisible: bool;
```

C++

```
__property bool DesignTimeVisible;
```

Description

DesignTimeVisible gets or sets a value indicating whether the command object should be visible in a customized interface control.

See Also

DesignTimeVisible (MSDN)

15.1.2.1.5.4.9 DataStoreCommand.Parameters Property

Gets the DataStoreParameterCollection (see page 2041) for this command.

Pascal

```
property Parameters: DataStoreParameterCollection;
```

C++

```
__property DataStoreParameterCollection Parameters;
```

Description

Parameters gets the DataStoreParameterCollection (see page 2041) for this command. See CommandText (see page 1919) property for information on how parameter markers are specified.

See Also

Parameters (MSDN)

DataStoreParameterCollection (see page 2041)

CommandText (see page 1919)

15.1.2.1.5.4.10 DataStoreCommand.RecordsAffected Property

Pascal

```
property RecordsAffected: Integer;
```

C++

```
__property int RecordsAffected;
```

Description

This is RecordsAffected, a member of class DataStoreCommand.

15.1.2.1.5.4.11 DataStoreCommand.Transaction Property

Get transaction of command.

Pascal

```
property Transaction: DataStoreTransaction;
```

C++

```
__property DataStoreTransaction Transaction;
```

Description

Transactiongets the transaction of the command.

See Also

Transaction (MSDN)

15.1.2.1.5.4.12 DataStoreCommand.UpdatedRowSource Property

How command results are applied to DataRow when used by Update method of DataStoreDataAdapter (see page 1933).

Pascal

```
property UpdatedRowSource: UpdateRowSource;
```

C++

```
__property UpdateRowSource UpdatedRowSource;
```

Description

UpdatedRowSource gets or sets how command results are applied to the DataRow when used by the Update method of the DataStoreDataAdapter (see page 1933)

See Also

UpdatedRowSource (MSDN)

Update (MSDN)

DataStoreDataAdapter (see page 1933)

15.1.2.1.6 DataStoreConnection Class

Provides a connection to a Blackfish SQL database.

Class Hierarchy

Pascal

```
DataStoreConnection = class(DbConnection, IDbConnection, ICloneable, IDisposable);
```

C++

```
class DataStoreConnection : public DbConnection, public IDbConnection, public ICloneable,
public IDisposable;
```

File

Ado.Net20.cs

Description

DataStoreConnection provides a connection to a Blackfish SQL database.

DataStoreConnection is an implementation of the .NET DbConnection class.

Each connection provides a separate transactional context. The following example creates an in-process connection:

```
DataStoreConnection con = new DataStoreConnection();
con.ConnectionString = "database=c:\\tmp\\x.jds;user=USERNAME;password=PASSWORD";
con.Open();
```

It is possible to create the database by including `create=true` in the ConnectionString (see page 1930).

See Also

DbConnection (MSDN)

ConnectionString (see page 1930)

15.1.2.1.6.1 DataStoreConnection Members

The following tables list the members exposed by DataStoreConnection.

Internal Methods

	Name	Description
	EndTransaction (see page 1929)	This is EndTransaction, a member of class DataStoreConnection.
	FailIfNotOpen (see page 1929)	This is FailIfNotOpen, a member of class DataStoreConnection.

Internal Properties

	Name	Description
	InternalState (see page 1932)	This is InternalState, a member of class DataStoreConnection.
	MetaDataGenerator (see page 1932)	This is MetaDataGenerator, a member of class DataStoreConnection.

Protected Methods

	Name	Description
	BeginDbTransaction (see page 1926)	This is BeginDbTransaction, a member of class DataStoreConnection.
	CreateDbCommand (see page 1928)	This is CreateDbCommand, a member of class DataStoreConnection.

Public Methods

	Name	Description
	BeginTransaction (see page 1926)	This is the overview for the BeginTransaction method overload.
	ChangeDatabase (see page 1927)	Changes current database for open connection.
	Clone (see page 1927)	Creates a new object that is a copy of the current instance.
	Close (see page 1927)	Closes the connection to the database.
	CreateCommand (see page 1928)	Creates and returns a DataStoreCommand (see page 1912) that uses current connection.
	DataStoreConnection (see page 1925)	This is the overview for the DataStoreConnection constructor overload.
	Dispose (see page 1928)	This is the overview for the Dispose method overload.
	GetSchema (see page 1929)	This is the overview for the GetSchema method overload.
	Open (see page 1930)	Opens a database connection with the property settings specified by the ConnectionString (see page 1930).

Public Properties

	Name	Description
	ConnectionString (see page 1930)	String used to open a Blackfish SQL database.
	ConnectionTimeout (see page 1931)	Wait time before while establishing connection before terminating attempt.
	Database (see page 1931)	Database name of connection.
	DataSource (see page 1931)	Database (see page 1931) server name of the connection.
	ServerVersion (see page 1932)	Version of server if connected.
	State (see page 1932)	Current state of connection.

15.1.2.1.6.2 DataStoreConnection Constructor

This is the overview for the DataStoreConnection constructor overload.

Overload List

	Name	Description
	DataStoreConnection.DataStoreConnection () (see page 1925)	Initializes a new instance of the DataStoreConnection class.
	DataStoreConnection.DataStoreConnection (string) (see page 1925)	Initializes a new instance of the DataStoreConnection class.

15.1.2.1.6.2.1 DataStoreConnection.DataStoreConnection Constructor ()

Initializes a new instance of the DataStoreConnection class.

Pascal

```
constructor Create;
constructor Create(initialConnectionString: string);
```

C++

```
DataStoreConnection();
DataStoreConnection(string initialConnectionString);
```

Description

DataStoreConnection initializes a new instance of the DataStoreConnection class, which is an implementation of the DbConnection class.

When a new instance is created, the connection properties should be set with the ConnectionString (see page 1930) property.

One form of this constructor allows you to specify an initial ConnectionString (see page 1930).

See Also

DbConnection (MSDN)

ConnectionString (see page 1930)

15.1.2.1.6.3 DataStoreConnection Methods

The methods of the DataStoreConnection class are listed here.

Internal Methods

	Name	Description
	EndTransaction (see page 1929)	This is EndTransaction, a member of class DataStoreConnection.
	FailIfNotOpen (see page 1929)	This is FailIfNotOpen, a member of class DataStoreConnection.

Protected Methods

	Name	Description
	BeginDbTransaction (see page 1926)	This is BeginDbTransaction, a member of class DataStoreConnection.
	CreateDbCommand (see page 1928)	This is CreateDbCommand, a member of class DataStoreConnection.

Public Methods

	Name	Description
	BeginTransaction (see page 1926)	This is the overview for the BeginTransaction method overload.
	ChangeDatabase (see page 1927)	Changes current database for open connection.
	Clone (see page 1927)	Creates a new object that is a copy of the current instance.
	Close (see page 1927)	Closes the connection to the database.
	CreateCommand (see page 1928)	Creates and returns a DataStoreCommand (see page 1912) that uses current connection.
	Dispose (see page 1928)	This is the overview for the Dispose method overload.
	GetSchema (see page 1929)	This is the overview for the GetSchema method overload.
	Open (see page 1930)	Opens a database connection with the property settings specified by the ConnectionString (see page 1930).

15.1.2.1.6.3.1 DataStoreConnection.BeginDbTransaction Method

Pascal

```
function BeginDbTransaction(isolationLevel: IsolationLevel): DbTransaction;
```

C++

```
DbTransaction BeginDbTransaction(IsolationLevel isolationLevel);
```

Description

This is BeginDbTransaction, a member of class DataStoreConnection.

15.1.2.1.6.3.2 BeginTransaction Method

This is the overview for the BeginTransaction method overload.

Overload List

	Name	Description
	DataStoreConnection.BeginTransaction () (see page 1926)	Begins database transaction.
	DataStoreConnection.BeginTransaction (IsolationLevel) (see page 1926)	Begins database transaction.

15.1.2.1.6.3.2.1 DataStoreConnection.BeginTransaction Method ()

Begins database transaction.

Pascal

```
function BeginTransaction: DataStoreTransaction;
function BeginTransaction(level: IsolationLevel): DataStoreTransaction;
```

C++

```
DataStoreTransaction BeginTransaction();
DataStoreTransaction BeginTransaction(IsolationLevel level);
```

Description

BeginTransaction begins a database transaction. By default, the connection operates in auto-commit mode. After a transaction is

started, all changes made are pending until Commit is called on the transaction object. After the commit, the connection operates in auto-commit mode again.

Returns an DataStoreTransaction (see page 2056) instance representing the transaction.

The transaction isolation level is set to the passed level for the remainder of this transaction.

See Also

BeginTransaction (MSDN)

DataStoreTransaction (see page 2056)

Commit (see page 2057)

15.1.2.1.6.3.3 DataStoreConnection.ChangeDatabase Method

Changes current database for open connection.

Pascal

```
function ChangeDatabase(database: string): void;
```

C++

```
void ChangeDatabase(string database);
```

Description

ChangeDatabase changes the current database for an open connection.

See Also

ChangeDatabase (MSDN)

15.1.2.1.6.3.4 DataStoreConnection.Clone Method

Creates a new object that is a copy of the current instance.

Pascal

```
function Clone: DataStoreConnection;
```

C++

```
DataStoreConnection Clone();
```

Description

Clone creates a new object that is a copy of the current instance.

See Also

Clone (MSDN)

15.1.2.1.6.3.5 DataStoreConnection.Close Method

Closes the connection to the database.

Pascal

```
function Close: void;
```

C++

```
void Close();
```

Description

This method closes the connection to the database.

See Also

Close (MSDN)

15.1.2.1.6.3.6 DataStoreConnection.CreateCommand Method

Creates and returns a DataStoreCommand (see page 1912) that uses current connection.

Pascal

```
function CreateCommand: DataStoreCommand;
```

C++

```
DataStoreCommand CreateCommand();
```

Description

CreateCommand creates and returns a DataStoreCommand (see page 1912) that uses the current connection.

See Also

CreateCommand (MSDN)

15.1.2.1.6.3.7 DataStoreConnection.CreateDbCommand Method

Pascal

```
function CreateDbCommand: DbCommand;
```

C++

```
DbCommand CreateDbCommand();
```

Description

This is CreateDbCommand, a member of class DataStoreConnection.

15.1.2.1.6.3.8 Dispose Method

This is the overview for the Dispose method overload.

Overload List

	Name	Description
	DataStoreConnection.Dispose () (see page 1928)	Releases resources used by object.
	DataStoreConnection.Dispose (bool) (see page 1928)	Releases resources used by object.

15.1.2.1.6.3.8.1 DataStoreConnection.Dispose Method ()

Releases resources used by object.

Pascal

```
function Dispose: void;
function Dispose(disposing: bool): void;
```

C++

```
void Dispose();
void Dispose(bool disposing);
```

Description

Dispose releases the resources used by the object.

See Also

Dispose (MSDN)

15.1.2.1.6.3.9 DataStoreConnection.EndTransaction Method

Pascal

```
function EndTransaction(outerMost: bool; commitWork: bool): void;
```

C++

```
void EndTransaction(bool outerMost, bool commitWork);
```

Description

This is EndTransaction, a member of class DataStoreConnection.

15.1.2.1.6.3.10 DataStoreConnection.FailIfNotOpen Method

Pascal

```
function FailIfNotOpen: void;
```

C++

```
void FailIfNotOpen();
```

Description

This is FailIfNotOpen, a member of class DataStoreConnection.

15.1.2.1.6.3.11 GetSchema Method

This is the overview for the GetSchema method overload.

Overload List

	Name	Description
	DataStoreConnection.GetSchema () (see page 1929)	Returns schema information for data source of DataStoreConnection (see page 1923).
	DataStoreConnection.GetSchema (string) (see page 1929)	Returns schema information for data source of DataStoreConnection (see page 1923).
	DataStoreConnection.GetSchema (string, string[]) (see page 1929)	Returns schema information for data source of DataStoreConnection (see page 1923).

15.1.2.1.6.3.11.1 DataStoreConnection.GetSchema Method ()

Returns schema information for data source of DataStoreConnection (see page 1923).

Pascal

```
function GetSchema: DataTable;
function GetSchema(collectionName: string): DataTable;
function GetSchema(collectionName: string; restrictionValues: string[]): DataTable;
```

C++

```
DataTable GetSchema();
DataTable GetSchema(string collectionName);
```

```
DataTable GetSchema(string collectionName, string[] restrictionValues);
```

Description

GetSchema returns schema information for the data source of DataStoreConnection (see page 1923).

See Also

GetSchema (MSDN)

15.1.2.1.6.3.12 DataStoreConnection.Open Method

Opens a database connection with the property settings specified by the ConnectionString (see page 1930).

Pascal

```
function Open: void;
```

C++

```
void Open();
```

Description

This method opens a database connection with the property settings specified by the ConnectionString (see page 1930).

See Also

Open (MSDN)

15.1.2.1.6.4 DataStoreConnection Properties

The properties of the DataStoreConnection class are listed here.

Internal Properties

	Name	Description
	InternalState (see page 1932)	This is InternalState, a member of class DataStoreConnection.
	MetaDataGenerator (see page 1932)	This is MetaDataGenerator, a member of class DataStoreConnection.

Public Properties

	Name	Description
	ConnectionString (see page 1930)	String used to open a Blackfish SQL database.
	ConnectionTimeout (see page 1931)	Wait time before while establishing connection before terminating attempt.
	Database (see page 1931)	Database name of connection.
	DataSource (see page 1931)	Database (see page 1931) server name of the connection.
	ServerVersion (see page 1932)	Version of server if connected.
	State (see page 1932)	Current state of connection.

15.1.2.1.6.4.1 DataStoreConnection.ConnectionString Property

String used to open a Blackfish SQL database.

Pascal

```
property ConnectionString: string;
```

C++

```
__property string ConnectionString;
```

Description

ConnectionString gets or sets the string used to open a Blackfish SQL database. It specifies which database to connect to and miscellaneous other connection settings. Here is a typical connection string:

```
"database=c:\\db\\hr.jds;user=USER;password=PASSWORD"
```

By default, the database is started in-process with your client code. If the database is started out of process, include the following options in the connection string: `protocol=TCP;host=MYSERVERNAME`. The "protocol" option is only valid for the Borland.Ds.Server assembly. The assembly Borland.DS.Driver can only connect out of process. The assembly Borland.DS.Mobile can only connect in-process. For a complete list of connection options, see **ConnectionProperties (see page 1897)**.

See Also

ConnectionString (MSDN)

15.1.2.1.6.4.2 DataStoreConnection.ConnectionTimeout Property

Wait time before while establishing connection before terminating attempt.

Pascal

```
property ConnectionTimeout: Integer;
```

C++

```
__property int ConnectionTimeout;
```

Description

ConnectionTimeout gets or sets the wait time while trying to establish a connection before terminating the attempt and generating an error.

See Also

ConnectionTimeout (MSDN)

15.1.2.1.6.4.3 DataStoreConnection.Database Property

Database name of connection.

Pascal

```
property Database: string;
```

C++

```
__property string Database;
```

Description

Database gets the database name of the connection. Use ConnectionString (see page 1930) to set this value.

See Also

Database (MSDN)

ConnectionString (see page 1930)

15.1.2.1.6.4.4 DataStoreConnection.DataSource Property

Database (see page 1931) server name of the connection.

Pascal

```
property DataSource: string;
```

C++

```
__property string DataSource;
```

Description

DataSource gets the database server name of the connection. Use ConnectionString (see page 1930) to set this value.

See Also

DataSource (MSDN)

ConnectionString (see page 1930)

15.1.2.1.6.4.5 DataStoreConnection.InternalState Property

Pascal

```
property InternalState: ConnectionState;
```

C++

```
__property ConnectionState InternalState;
```

Description

This is InternalState, a member of class DataStoreConnection.

15.1.2.1.6.4.6 DataStoreConnection.MetaDataGenerator Property

Pascal

```
property MetaDataGenerator: MetaDataGenerator;
```

C++

```
__property MetaDataGenerator MetaDataGenerator;
```

Description

This is MetaDataGenerator, a member of class DataStoreConnection.

15.1.2.1.6.4.7 DataStoreConnection.ServerVersion Property

Version of server if connected.

Pascal

```
property ServerVersion: string;
```

C++

```
__property string ServerVersion;
```

Description

ServerVersion gets the version of the server if connected. Use ConnectionString (see page 1930) to set this value.

See Also

ServerVersion (MSDN)

ConnectionString (see page 1930)

15.1.2.1.6.4.8 DataStoreConnection.State Property

Current state of connection.

Pascal

```
property State: ConnectionState;
```

C++

```
__property ConnectionState State;
```

Description

State gets the current state of the connection.

See Also

State (MSDN)

15.1.2.1.7 DataStoreDataAdapter Class

Fills a DataSet (see page 1937) and updates a Blackfish SQL database.

Class Hierarchy

Pascal

```
DataStoreDataAdapter = class(DbDataAdapter, IDbDataAdapter, ICloneable, ISupportInitialize);
```

C++

```
class DataStoreDataAdapter : public DbDataAdapter, public IDbDataAdapter, public ICloneable,
public ISupportInitialize;
```

File

Ado.Net20.cs

Description

DataStoreDataAdapter specifies an object that can be used to fill a DataSet (see page 1937) and update a Blackfish SQL database. It contains a DataStoreConnection (see page 1923) instance and up to 4 DataStoreCommand (see page 1912) instances.

DataStoreCommand (see page 1912) is an implementation of the .NET DbDataAdapter class.

See Also

DbDataAdapter (MSDN)

DataStoreCommand (see page 1912)

DataStoreConnection (see page 1923)

15.1.2.1.7.1 DataStoreDataAdapter Members

The following tables list the members exposed by DataStoreDataAdapter.

Protected Methods

	Name	Description
	CreateRowUpdatedEvent (see page 1935)	This is CreateRowUpdatedEvent, a member of class DataStoreDataAdapter.
	CreateRowUpdatingEvent (see page 1936)	This is CreateRowUpdatingEvent, a member of class DataStoreDataAdapter.
	OnRowUpdated (see page 1936)	This is OnRowUpdated, a member of class DataStoreDataAdapter.
	OnRowUpdating (see page 1936)	This is OnRowUpdating, a member of class DataStoreDataAdapter.

Public Events

	Name	Description
	RowUpdated (see page 1939)	Occurs during Update after a command is executed against data source.
	RowUpdating (see page 1939)	Occurs during Update before a command is executed against the data source.

Public Methods

	Name	Description
	BeginInit (see page 1935)	Processing that occurs before initialization.
	DataStoreDataAdapter (see page 1934)	This is the overview for the DataStoreDataAdapter constructor overload.
	EndInit (see page 1936)	Processing that occurs after initialization.

Public Properties

	Name	Description
	DataSet (see page 1937)	Live Data (see page 1762) for Design???.
	DeleteCommand (see page 1937)	DataStoreCommand (see page 1912) used to delete records from Blackfish SQL database.
	InsertCommand (see page 1937)	DataStoreCommand (see page 1912) used to insert new records into Blackfish SQL database.
	SelectCommand (see page 1938)	DataStoreCommand (see page 1912) used to select records from Blackfish SQL database into a DataSet (see page 1937).
	UpdateCommand (see page 1938)	DataStoreCommand (see page 1912) used to update records from DataSet (see page 1937) into Blackfish SQL database.

15.1.2.1.7.2 DataStoreDataAdapter Constructor

This is the overview for the DataStoreDataAdapter constructor overload.

Overload List

	Name	Description
	DataStoreDataAdapter.DataStoreDataAdapter () (see page 1934)	Initializes a new instance of the DataStoreDataAdapter class.
	DataStoreDataAdapter.DataStoreDataAdapter (DataStoreCommand) (see page 1934)	Initializes a new instance of the DataStoreDataAdapter class.
	DataStoreDataAdapter.DataStoreDataAdapter (string, DataStoreConnection) (see page 1934)	Initializes a new instance of the DataStoreDataAdapter class.
	DataStoreDataAdapter.DataStoreDataAdapter (string, string) (see page 1934)	Initializes a new instance of the DataStoreDataAdapter class.

15.1.2.1.7.2.1 DataStoreDataAdapter.DataStoreDataAdapter Constructor ()

Initializes a new instance of the DataStoreDataAdapter class.

Pascal

```
constructor Create;
constructor Create(selectCommand: DataStoreCommand);
constructor Create(selectQuery: string; connectionString: string);
constructor Create(selectQuery: string; connection: DataStoreConnection);
```

C++

```
DataStoreDataAdapter();
DataStoreDataAdapter(DataStoreCommand selectCommand);
DataStoreDataAdapter(string selectQuery, string connectionString);
DataStoreDataAdapter(string selectQuery, DataStoreConnection connection);
```

Description

DataStoreDataAdapter initializes a new instance of the DataStoreDataAdapter class, which is an implementation of the DbDataAdapter class.

See Also

DbDataAdapter (MSDN)

15.1.2.1.7.3 DataStoreDataAdapter Methods

The methods of the DataStoreDataAdapter class are listed here.

Protected Methods

	Name	Description
	CreateRowUpdatedEvent (see page 1935)	This is CreateRowUpdatedEvent, a member of class DataStoreDataAdapter.
	CreateRowUpdatingEvent (see page 1936)	This is CreateRowUpdatingEvent, a member of class DataStoreDataAdapter.
	OnRowUpdated (see page 1936)	This is OnRowUpdated, a member of class DataStoreDataAdapter.
	OnRowUpdating (see page 1936)	This is OnRowUpdating, a member of class DataStoreDataAdapter.

Public Methods

	Name	Description
	BeginInit (see page 1935)	Processing that occurs before initialization.
	EndInit (see page 1936)	Processing that occurs after initialization.

15.1.2.1.7.3.1 DataStoreDataAdapter.BeginInit Method

Processing that occurs before initialization.

Pascal

```
function BeginInit: void;
```

C++

```
void BeginInit();
```

Description

BeginInit specifies any processing that occurs before initialization. Enter any code you wish to execute prior to initialization of the DataStoreDataAdapter (see page 1933).

See Also

EndInit (see page 1936)

15.1.2.1.7.3.2 DataStoreDataAdapter.CreateRowUpdatedEvent Method

Pascal

```
function CreateRowUpdatedEvent(dataRow: DataRow; command: IDbCommand; statementType:
StatementType; tableMapping: DataTableMapping): RowUpdatedEventArgs;
```

C++

```
RowUpdatedEventArgs CreateRowUpdatedEvent(DataRow dataRow, IDbCommand command, StatementType
statementType, DataTableMapping tableMapping);
```

Description

This is CreateRowUpdatedEvent, a member of class DataStoreDataAdapter.

15.1.2.1.7.3.3 DataStoreDataAdapter.CreateRowUpdatingEvent Method

Pascal

```
function CreateRowUpdatingEvent(dataRow: DataRow; command: IDbCommand; statementType:
StatementType; tableMapping: DataTableMapping): RowUpdatingEventArgs;
```

C++

```
RowUpdatingEventArgs CreateRowUpdatingEvent(DataRow dataRow, IDbCommand command, StatementType
statementType, DataTableMapping tableMapping);
```

Description

This is CreateRowUpdatingEvent, a member of class DataStoreDataAdapter.

15.1.2.1.7.3.4 DataStoreDataAdapter.EndInit Method

Processing that occurs after initialization.

Pascal

```
function EndInit: void;
```

C++

```
void EndInit();
```

Description

BeginInit (see page 1935) specifies any processing that occurs after initialization. Enter any code you wish to execute after initialization of the DataStoreDataAdapter (see page 1933).

See Also

BeginInit (see page 1935)

15.1.2.1.7.3.5 DataStoreDataAdapter.OnRowUpdated Method

Pascal

```
function OnRowUpdated(value: RowUpdatedEventArgs): void;
```

C++

```
void OnRowUpdated(RowUpdatedEventArgs value);
```

Description

This is OnRowUpdated, a member of class DataStoreDataAdapter.

15.1.2.1.7.3.6 DataStoreDataAdapter.OnRowUpdating Method

Pascal

```
function OnRowUpdating(value: RowUpdatingEventArgs): void;
```

C++

```
void OnRowUpdating(RowUpdatingEventArgs value);
```

Description

This is OnRowUpdating, a member of class DataStoreDataAdapter.

15.1.2.1.7.4 DataStoreDataAdapter Properties

The properties of the DataStoreDataAdapter class are listed here.

Public Properties

	Name	Description
	DataSet (see page 1937)	Live Data (see page 1762) for Design???.
	DeleteCommand (see page 1937)	DataStoreCommand (see page 1912) used to delete records from Blackfish SQL database.
	InsertCommand (see page 1937)	DataStoreCommand (see page 1912) used to insert new records into Blackfish SQL database.
	SelectCommand (see page 1938)	DataStoreCommand (see page 1912) used to select records from Blackfish SQL database into a DataSet (see page 1937).
	UpdateCommand (see page 1938)	DataStoreCommand (see page 1912) used to update records from DataSet (see page 1937) into Blackfish SQL database.

15.1.2.1.7.4.1 DataStoreDataAdapter.DataSet Property

Live Data (see page 1762) for Design???.

Pascal

```
property DataSet: DataSet;
```

C++

```
__property DataSet DataSet;
```

Description

Live Data (see page 1762) for Design:.

15.1.2.1.7.4.2 DataStoreDataAdapter.DeleteCommand Property

DataStoreCommand (see page 1912) used to delete records from Blackfish SQL database.

Pascal

```
property DeleteCommand: DataStoreCommand;
```

C++

```
__property DataStoreCommand DeleteCommand;
```

Description

DeleteCommand gets or sets the DataStoreCommand (see page 1912) used to delete records identified by a DataSet (see page 1937) from a Blackfish SQL database.

See Also

DeleteCommand (MSDN)

InsertCommand (see page 1937)

SelectCommand (see page 1938)

UpdateCommand (see page 1938)

15.1.2.1.7.4.3 DataStoreDataAdapter.InsertCommand Property

DataStoreCommand (see page 1912) used to insert new records into Blackfish SQL database.

Pascal

```
property InsertCommand: DataStoreCommand;
```

C++

```
__property DataStoreCommand InsertCommand;
```

Description

InsertCommand gets or sets the DataStoreCommand (see page 1912) used to insert new records from a DataSet (see page 1937) into a Blackfish SQL database.

See Also

InsertCommand (MSDN)

DeleteCommand (see page 1937)

SelectCommand (see page 1938)

UpdateCommand (see page 1938)

15.1.2.1.7.4.4 DataStoreDataAdapter.SelectCommand Property

DataStoreCommand (see page 1912) used to select records from Blackfish SQL database into a DataSet (see page 1937).

Pascal

```
property SelectCommand: DataStoreCommand;
```

C++

```
__property DataStoreCommand SelectCommand;
```

Description

SelectCommand gets or sets the DataStoreCommand (see page 1912) used to select records from a Blackfish SQL database into a DataSet (see page 1937).

See Also

SelectCommand (MSDN)

DeleteCommand (see page 1937)

InsertCommand (see page 1937)

UpdateCommand (see page 1938)

15.1.2.1.7.4.5 DataStoreDataAdapter.UpdateCommand Property

DataStoreCommand (see page 1912) used to update records from DataSet (see page 1937) into Blackfish SQL database.

Pascal

```
property UpdateCommand: DataStoreCommand;
```

C++

```
__property DataStoreCommand UpdateCommand;
```

Description

UpdateCommand gets or sets the DataStoreCommand (see page 1912) used to update records from a DataSet (see page 1937) into a Blackfish SQL database.

See Also

UpdateCommand (MSDN)

DeleteCommand (see page 1937)

InsertCommand (see page 1937)

SelectCommand (see page 1938)

15.1.2.1.7.5 DataStoreDataAdapter Events

The events of the DataStoreDataAdapter class are listed here.

Public Events

	Name	Description
	RowUpdated (see page 1939)	Occurs during Update after a command is executed against data source.
	RowUpdating (see page 1939)	Occurs during Update before a command is executed against the data source.

15.1.2.1.7.5.1 DataStoreDataAdapter.RowUpdated Event

Occurs during Update after a command is executed against data source.

Pascal

```
property RowUpdated: DataStoreRowUpdatedEventHandler;
```

C++

```
__property DataStoreRowUpdatedEventHandler RowUpdated;
```

Description

RowUpdated occurs during Update after a command is executed against the data source. The attempt to update is made, so the event fires.

See Also

Update (MSDN)

15.1.2.1.7.5.2 DataStoreDataAdapter.RowUpdating Event

Occurs during Update before a command is executed against the data source.

Pascal

```
property RowUpdating: DataStoreRowUpdatingEventHandler;
```

C++

```
__property DataStoreRowUpdatingEventHandler RowUpdating;
```

Description

RowUpdating occurs during Update before a command is executed against the data source. The attempt to update is made, so the event fires.

See Also

Update (MSDN)

15.1.2.1.8 DataStoreErrorCode Class

Symbolic error codes for Blackfish SQL database.

Class Hierarchy

Borland.Data.DataStore.DataStoreErrorCode

Pascal

```
DataStoreErrorCode = class;
```

C++

```
class DataStoreErrorCode;
```

File

DataStoreErrorCode.cs

Description

DataStoreErrorCode provides symbolic error codes for the Blackfish SQL database.

This table contains error codes.

Constant	Description
GenericError (see page 1987)	Undefined error.
NoUpdatableColumns (see page 2013)	Could not find any updatable columns when saving dataset data.
UnknownColumnName (see page 2029)	Cannot find column with given column name.
ColumnTypeConflict (see page 1975)	Attempt to add column with same name, but different data type as existing **DataColumn**.
InvalidColumnPosition (see page 1993)	Column position is out of range.
ColumnAlreadyBound (see page 1974)	Column already bound to a DataSet. Use `(Column)Column.clone()` to add this column.
CannotChangeColumnDataType (see page 1971)	Cannot change column data type because associated column already has data.
UnrecognizedDataType (see page 2030)	Unknown data type.
DatasetHasNoTables (see page 1979)	Cannot be saved. No updatable columns have a table name.
PartialSearchForString (see page 2016)	Partial search option can only be used when last column searched on is of **String** type".
NeedLocateStartOption (see page 2006)	Must specify one of **First**, **Last**, **Next** or **Prior Locate** for locate operations.
LinkColumnsError (see page 2000)	The number and data type of columns in the DataSet **MasterLinkColumns** and **DetailLinkColumns** must match.
DatasetCorrupt (see page 1978)	Operation failed. DataSet structurally corrupt.
DuplicateColumnName (see page 1984)	Duplicate column name.
NotUpdateable (see page 2013)	DataSet has no unique row identifiers and is not updatable.
DatasetOpen (see page 1979)	Operation cannot be performed on an open DataSet. Close the DataSet first.
DatasetNotOpen (see page 1979)	Operation failed. DataSet is not open.
ExceptionChain (see page 1985)	Chained exception. To access the lower level exception(s) call `getExceptionChain`. Also, `printStackTrace` displays all exceptions in the chain.
InvalidSortColumn (see page 1997)	Operation failed. Attempt to sort on non sortable column, i.e. BinaryColumn.

NullColumnName (see page 2014)	Trying to perform an operation that requires a column name without having specified one.
ResolveInProgress (see page 2020)	DataSet changes are currently being saved. Retry operation later.
InvalidColumnFormat (see page 1992)	Column formatting error for default, minimum, maximum values using edit mask or display format.
OnepassInputStream (see page 2015)	Attempting to read twice from a java.io.InputStream implementation that throws an exception when `InputStream.reset` is called and `InputStream.available` returns 0 bytes. To correct this, use an InputStream implementation that supports `reset`.
InsufficientRowid (see page 1990)	`DataSet.refetchRow` was called with insufficient row id.
NonExistentRowid (see page 2009)	`DataSet.refetchRow` was called with non existent row id
RefreshrowNotSupported (see page 2020)	Current DataSet does not refetchRow
IoError (see page 1999)	Operation failed due to an IO error.
FieldPostError (see page 1986)	Occurs when a DataSet requests that a data aware control post field values being edited and the field value cannot be posted (most likely due to a validation error). Unfortunately controls do not currently provide any information on why a post failed.
ClassNotFoundError (see page 1974)	Class could not be found during deserialization process.
ReadOnlyStore (see page 2019)	Store property setting is read-only.
ProcedureFailed (see page 2017)	Execution of procedure failed.
InvalidStoreName (see page 1997)	The **storeName** (storage name) property must be one or more characters in length.
NeedsRecalc (see page 2007)	Prevents write access if **StorageDataSet.CalcListener** or **StorageDataSet.AggCalcListener** have not been set on a **StorageDataSet** component. Should only occur with **StorageDataSets** that use DataStore (see page 1892) for a backing store. DataStore (see page 1892) persists the class names of calc listeners. Thus if a **StorageDataSet** component opens without specifying a **StorageDataSet.CalcListener** or **StorageDataSet.AggCalcListener** that were used previously, the **StorageDataSet** is marked read-only. To correct, 1. add the appropriate listeners, or 2. call **StorageDataSet.recalc**
DuplicatePrimary (see page 1984)	Attempt to specify different primary key when one already exists.
NoPrimaryKey (see page 2010)	Attempt to specify primary Sort without specifying any sortKey columns.
InvalidSortAsInserted (see page 1997)	Sort as inserted not supported with descending sort orders.
InvalidSort (see page 1997)	No keys specified to create index for **SortDescriptor**
TooManyAutoIncrements (see page 2026)	There can only be one autoincrement column in a table.

InvalidConstraintName (see page 1993)	This constraint name does not exist.
ReadOnlyColumn (see page 2018)	Attempting to assign a value to a read-only column.
ReadOnlyDataset (see page 2019)	Attempting to assign a value to a read-only table.
LessThanMin (see page 1999)	Value entered for column is less than the column **min** property.
GreaterThanMax (see page 1987)	Value entered for column is greater than the column **max** property.
InvalidPrecision (see page 1996)	String values for this column cannot exceed the precision length set in the **Column.precision** property. This property can be implicitly set when data is retrieved from a provider. If data is being provided from a JDBC driver, the precision specified by the JDBC result set is propagated to the **Column.precision** property. This propagation can be overridden by explicitly setting the **Column.precision** property.
InvalidFormat (see page 1994)	Cannot parse value or generic format error.
NoRowsToDelete (see page 2011)	No rows to delete.
InsertNotAllowed (see page 1990)	Row insertion not allowed.
UpdateNotAllowed (see page 2031)	Row editing not allowed.
DeleteNotAllowed (see page 1982)	Row deleting not allowed.
DuplicateKey (see page 1984)	The key value is a duplicate.
ForeignKeyViolation (see page 1987)	Violation of foreign key constraint has occurred.
ForeignKeyError (see page 1986)	Violation of foreign key constraint definition error.
ConstraintNameExists (see page 1977)	Could not add constraint because a unique or foreign key constraint already exists with that name.
StoreNameNotSet (see page 2024)	Operation failed. **StoreName** property for Table component not set.
InternalDuplicateKey (see page 1990)	Operation failed. Attempt to add duplicate key value. This is different than ValidationException.DUPLICATE_KEY error. This error is an internal unexpected key violation, not unique constraint.
RowTooWide (see page 2023)	Max row size exceeded. Too many columns and/or high **Column.MaxInline** properties used. There are two ways to remedy this problem: 1) set **Column.MaxInline** property for columns with data types of **Variant.STRING**, **Variant.INPUTSTREAM** or **Variant.OBJECT** to a value less than 16. By default, the maximum inline storage for such fields does not go below 16 unless the **Column.MaxInline** property is set lower. 2) Create your DataStore (see page 1892) with a larger block size by setting the **DataStore.BlockSize** property.
DatasetAlreadyOpen (see page 1978)	Attempt to open table with a StorageDataSet that has a different set of columns.
CannotRestructure (see page 1972)	Cannot restructure when table is opened by more than one StorageDataSet.

ColumnNeedsRestructure (see page 1975)	Column is new or its data type has changed. Restructure the DataSet with `DataSet.setRestructure(false);`
DatastoreNotOpen (see page 1981)	Operation failed. DataStore (see page 1892) not open.
DatastoreNotFound (see page 1980)	DataStore (see page 1892) not found by **DataStore.storeExists** method or **DataStoreConnection.FileName** property is null.
DatastoreInvalid (see page 1980)	File specified by **DataStore.FileName** property does not appear to be a valid DataStore (see page 1892) file. File signature or size is invalid.
InternalUpdateFailed (see page 1991)	Previous update failed. Shut down and reopen the DataStore (see page 1892).
StreamOpenTwice (see page 2025)	Unexpected internal condition. call **DataStore.shutDown** and then **DataStore.open**.
NameNotUnique (see page 2006)	Name of storage file or table being added, undeleted, or renamed is not unique.
StoreOperationUnsupported (see page 2025)	Unexpected internal condition. Operation not supported on this stream.
DatastoreExists (see page 1980)	**ResponseEvent**occurred. If **DataStore.ResponseListener** does not exist or file is not deleted by ResponseListener, an IOException is thrown. This element is deprecated.
DatastoreOpen (see page 1981)	Operation failed. Operation cannot be performed on an opened DataStore (see page 1892).
WriteBlockError (see page 2032)	Error writing to DataStore (see page 1892). Unexpected cache block contents.
ReadBlockError (see page 2018)	Error reading from DataStore (see page 1892). Unexpected block contents.
AggOperatorNotFound (see page 1966)	AggOperator class could not be loaded. The class is probably not in the classpath.
OperationCanceled (see page 2015)	Operation canceled. Used for canceling long running operations such as sorting or restructuring.
RestructureDataLoss (see page 2021)	Restructure operation is converting from one data type to another. Old values are not converted to new data type.
RestructurePrecisionLoss (see page 2021)	Restructure operation is converting from one data type to another. Type conversion may result in precision loss when values of old data type are converted to values of new data type.
RestructureParseError (see page 2021)	Restructure operation is converting from one data type to another. One or more parse errors occurred converting a **String** data type to a non **String** data type.
BigdecimalPrecisionError (see page 1970)	Precision of BigDecimal exceeded.
DatastoreAlreadyOpen (see page 1980)	DataStore (see page 1892) is already opened by another process.
StreamClosed (see page 2025)	InputStream from a DataStore (see page 1892) has been closed and is no longer accessible.
CantCreateOpenStream (see page 1974)	Can't create or delete a stream that is still open.
CantCreateOpenFile (see page 1974)	Use **CANT_CREATE_OPEN_STREAM** This element is deprecated.
StreamNotFound (see page 2025)	Stream not found in DataStore (see page 1892).

FileNotFound (see page 1986)	See **STREAM_NOT_FOUN**D This element is deprecated.
NewerVersion (see page 2008)	DataStore (see page 1892) cannot be opened because it was created by a newer a version of the DataStore (see page 1892) component.
DatasetExists (see page 1979)	Cannot create a file stream with the same name as an existing table stream.
FileExists (see page 1986)	Cannot create a DataSet stream with the same name as an existing file.
RowNotFound (see page 2023)	Unexpected condition. Internal row not found.
TooManyErrors (see page 2026)	Too many errors detected by the stream verifier.
ReadOnly (see page 2018)	Write operation failed. The DataStore (see page 1892) is read-only.
OlderVersion (see page 2014)	Cannot perform operation on DataStore (see page 1892) because it was created with an older version of DataStore (see page 1892). To upgrade the DataStore (see page 1892) file, use `DataStoreConnection.copyStreams`.
InlineTooSmall (see page 1989)	**Column.MaxInline** property setting is too small.
DataHasDuplicates (see page 1978)	An attempt to create a unique index failed, because the table had duplicate row values for the given column combination.
InvalidPattern (see page 1996)	Invalid escape sequence in **String** pattern at character offset. Escape character of '\' can only precede '*', '?' or '\' characters.
IncompatibleBlockSize (see page 1988)	Incompatible **DataStore.BlockSize** property for copyStream operation. If copying between two DataStores, both DataStores must currently have the same **DataStore.BlockSize** property setting.
CannotOpen (see page 1972)	Could not create a lock dir for DataStore (see page 1892) file. Make sure the DataStore (see page 1892) file exists and that you have permission to create a subdirectory.
CannotLockDir (see page 1971)	Same as **CannotOpen (see page 1972)**.
InvalidDirectoryAttributes (see page 1994)	Cannot open DataSet because it has invalid directory attributes.
DatastoreIsUnlicensed (see page 1980)	DataStore (see page 1892) is unlicensed.
ConnectionCountExceeded (see page 1976)	Connection count exceeded for DataStore (see page 1892) license.
SecurityError (see page 2023)	Security error.
InvalidSavepoint (see page 1996)	Invalid Savepoint. Savepoint is out of date or was created for a different connection.
CreateErrorMethodExists (see page 1977)	An attempt was made to create a Java (see page 15681) Method that already exists.
MethodNonexistent (see page 2003)	An attempt was made to drop or reference a Java (see page 15681) Method that doesn't exist.
MethodClassMissing (see page 2002)	The class of a Java (see page 15681) Method is missing from the classpath.
MethodNameMissing (see page 2002)	The class of a Java (see page 15681) Method does not contain any methods matching its definition.
ConflictingMethodDef (see page 1976)	This class of a Java (see page 15681) Method has conflicting definitions for this method.

DropErrorDependentView (see page 1983)	This table or view cannot be dropped because it has a dependent view.
DropErrorForeignKey (see page 1983)	This table cannot be dropped because it appears in a foreign key.
DropSchemaError (see page 1984)	This schema cannot be dropped because it still has tables, views, or methods.
RevokeErrorDependentView (see page 2022)	This privilege or role revoke cannot be performed because a dependent view exists.
RevokeErrorForeignKey (see page 2022)	This privilege or role revoke cannot be performed because a dependent foreign key exists.
RevokeErrorDependentPrivilege (see page 2022)	This privilege or role revoke cannot be performed because a dependent privilege exists.
TableNonexistent (see page 2026)	An attempt was made to reference a table that doesn't exist.
DropErrorRoleGrant (see page 1984)	This role cannot be dropped because it is granted to a user or a role.
MirrorError (see page 2003)	An error occurred in the management of fail safe mirrors.
CannotStartServer (see page 1973)	DataStore (see page 1892) server could not be started. This usually occurs because the port is in use by another process.
NewerVersionForOperation (see page 2008)	The functionality invoked can only be used in database files. Consult the documentation for alternative functionality.
CyclesInViewDefinition (see page 1978)	An **ALTER VIEW** would result in a cyclic view definition where the view depends on it own definition. This is illegal.
DbAdminError (see page 1981)	An Error occurred processing a `DB_ADMIN` stored procedure call.
ReadonlyTimeout (see page 2019)	Unexpected time-out constructing a transactionally consistent read only view of the database.
DesktopLicense (see page 1982)	Desktop license can only connect to localhost or 127.0.0.1 host name.
AfterLast (see page 1966)	The ResultSet is positioned after the last result row. It is an error to access columns in this state.
AggNotValidHere (see page 1966)	A SQL aggregate function such as **COUNT**, **SUM**, **AVG**, **MIN** or **MAX** was found in an improper context. These functions may only appear in certain expressions in a **SELECT** expression: In the select list and in a **HAVING** clause.
AmbiguousType (see page 1967)	The type of a SQL parameter marker cannot be identified by the surrounding operators. Use the `CAST` function to identify the type, eg. `CAST ( ? AS DATE )`.
BadColumnIndex (see page 1967)	A column index is out of range. Note: In JDBC, these indices are 1 based.
BadDirection (see page 1968)	An invalid **FETCH** direction was given.
BadFetchsize (see page 1968)	An invalid **FETCH** size was specified.
BadMaxfieldsize (see page 1968)	An invalid maximum field size was specified. This number must be non negative.
BadMaxrows (see page 1968)	An invalid number for maximum wanted rows in a ResultSet was specified. This number must be non negative.

BadOrdinal (see page 1969)	An invalid ordinal was specified in an **ORDER BY** clause or **GROUP BY** of a **SELECT** statement. `ORDER BY 1` means sort in the order of the first output column etc.
BadUrl (see page 1969)	An invalid connection URL was given for the database.
BeforeFirst (see page 1969)	The ResultSet is positioned before the first result row. It is an error to access columns in this state.
CannotAssignTypes (see page 1970)	An assignment was attempted with a value of the wrong type. This can be a **DEFAULT** value of a column, or an **INSERT** or **UPDATE** statement.
CannotCast (see page 1970)	A cast from one type to another type was impossible.
CannotUseInternalrow (see page 1973)	An INTERNALROW column cannot be set from an **INSERT** or **UPDATE** statement. This column is a pseudo column and is maintained by the database system.
CannotUseViewHere (see page 1973)	A VIEW cannot be altered in an **ALTER** statement. Instead **DROP** the view and redefine it.
ColumnNotInLeftRef (see page 1975)	A column name listed in a **USING** clause of a table **JOIN** does not exist in the left table expression.
ColumnNotInRightRef (see page 1975)	A column name listed in a **USING** clause of a table **JOIN** does not exist in the right table expression.
ColumnSpecifiedTwice (see page 1975)	A column name is specified twice in the column list for the **INSERT** statement, i.e. two values are given for the same column.
ConnectionClosed (see page 1976)	An attempt has been made to use a connection that was closed earlier.
ConnectionError (see page 1976)	A connection error was encountered. Read the message string for details.
DifferentDegree (see page 1982)	The table expression cannot be evaluated because the two tables involved have a different column count.
DifferentSymbol (see page 1982)	The SQL statement could not be parsed. Check the syntax and correct the error. Notice the column information in the error message.
DivideByZero (see page 1983)	A divide by zero occurred during execution of SQL statement.
EofExpected (see page 1985)	The SQL statement could not be parsed. Note only one statement can be can be parsed and executed at a time.
FeatureNotSupp (see page 1985)	This feature is not supported by the current driver.
FloatPrecision (see page 1986)	The maximum **FLOAT** precision supported is 52 bits.
ForwardOnly (see page 1987)	This is a **FORWARD_ONLY** cursor. Therefore **next** is the only valid navigation method for this cursor.
HasResultset (see page 1987)	The **executeUpdate** method was called to execute a SQL query, which produced a ResultSet. Use **executeQuery** instead, or if the nature of the query is unknown, use **execute**.
IllegalCatalog (see page 1988)	Catalogs are not supported.
IllegalCharacter (see page 1988)	This character cannot be part of a SQL syntax unless it appears in quotes.
IllegalExprStart (see page 1988)	Syntax error in SQL. The parser expects an expression, but does not recognize this symbol as the start of an expression.

IncompatibleTypes (see page 1989)	The table expression cannot be evaluated because the two tables involved have a different column type for the column index mentioned in error message.
IncompatibleTypesForOp (see page 1989)	A type mismatch was found for the given operator.
IndexAlreadyExists (see page 1989)	An index with this name has already been created.
InternalError (see page 1991)	An internal error has happened. Please submit the exception and, if possible, a reproducible test case to CodeGear.
InvalidAggExpr (see page 1991)	A SQL aggregate function such as **COUNT**, **SUM**, **AVG**, **MIN** or **MAX** was found with an invalid expression argument. If such an argument expression has multiple column references, those column references must all be part of the same **SELECT** expression. It is an illegal aggregate expression if there is a mix of inner and outer column references.
InvalidBinaryString (see page 1992)	The binary string contains non binary characters. The valid repertoires are: B'01' and X'0123456789abcdef' or X'0123456789ABCDEF'.
InvalidColumnname (see page 1992)	The named column was not found in the current scope.
InvalidColumnRef (see page 1993)	The dot "." separated column syntax was used more than 4 levels deep. That syntax is only recognized for 4 levels: catalog.schema.table.column.
InvalidEscapeCharInLike (see page 1994)	The string for the escape character in a **LIKE** operator evaluated to a string that was not exactly one character long.
InvalidExtractField (see page 1994)	The extract field for the **EXTRACT** function was incorrect. Check the syntax.
InvalidIndexname (see page 1995)	The specified index does not exist on the specified table.
InvalidLikePattern (see page 1995)	The pattern string in a **LIKE** operator did not evaluate to a valid pattern string.
InvalidTableRef (see page 1998)	The dot "." separated column syntax was used more than 3 levels deep. That syntax for a table only recognizes 3 levels: catalog.schema.table.
InvalidTablename (see page 1998)	The named table was not found as a **VIEW** or **TABLE**.
InvalidTrimChar (see page 1998)	The string for the trim character of the **TRIM** function evaluated to a string that was not exactly one character long.
InvalidViewDefinition (see page 1998)	The view was invalidated by changes to a parent table.
InvalidJoin (see page 1995)	An invalid **JOIN** expression was given. A **JOIN** expression must have at least one of the following specifiers: **NATURAL**, **UNION**, **CROSS**, **ON** or **USING**.
IoNetError (see page 1999)	An connection related problem occurred during the execution of this operation.
IoProtocolError (see page 1999)	A protocol error was found during execution of this operation. The connection between client and server may be unstable.
IsInsertRow (see page 1999)	Delete and update operations cannot happen while editing the special driver insert row.
MalformedDateOrTime (see page 2001)	The given date or time string did not represent a date or a time.
MalformedDecimal (see page 2001)	The given decimal value is not properly formatted.
MalformedFloating (see page 2001)	The given floating point value is not properly formatted.

MethodArgMismatch (see page 2002)	A parameter mismatch was found for the stored procedure.
MethodNotFound (see page 2003)	No such method was found in the database.
MismatchInsertColumnCount (see page 2004)	The number of insert values doesn't match the number needed for the **INSERT** statement.
MismatchColumnlistCount (see page 2003)	The number of columns in the column list doesn't match the number of columns in the table expression.
MismatchIntoParamCount (see page 2004)	The number of output parameters doesn't match the number of output columns in this single row **SELECT** query.
MoreThanOneRow (see page 2005)	A scalar subquery resulted in a ResultSet with more than one row.
MustBeSingleColumn (see page 2006)	This subquery resulted in a ResultSet with more than one column, which is not valid in current context.
NegativeSqrtArgument (see page 2007)	The argument to the **SQRT** function is negative.
NegativeSubstringLength (see page 2007)	The length argument to the **SUBSTRING** function is negative
NestedAggregators (see page 2008)	Nested aggregator functions such as **COUNT**, **SUM**, **AVG**, **MIN** or **MAX** is not valid.
NoGroupingColumn (see page 2009)	This column must be in the **GROUP BY** clause or appear inside an aggregate function.
NoReadonly (see page 2010)	The connection should not be opened in read only mode, because it is already open in read-write mode.
NoResultsetProduced (see page 2011)	The query that was executed with **executeQuery** did not yield a ResultSet.
NoServerFound (see page 2011)	A remote connection could not be made because database server was not found.
NoSuchParameter (see page 2012)	An attempt was made to set or get from a parameter that doesn't exist in the query.
NodefaultForBinary (see page 2009)	No DEFAULT value is accepted for binary columns.
NonPrimitiveRequired (see page 2010)	A NULL value was passed for a parameter that does not accept NULL values. Correct the parameter or change the store procedure to accept NULL values by using non primitive data types in Java (see page 15681), i.e. use java.lang.Integer instead of int, and so on.
NonTransactional (see page 2010)	The data store is not transactional, and therefore cannot be opened through a SQL based driver.
NotAnOutputParameter (see page 2012)	An attempt was made to register this parameter as an output parameter, however the parameter does not represent an output parameter in the SQL query.
NotInsertRow (see page 2012)	Inserts in driver can only happen from special driver insert row.
ResultNotUpdateable (see page 2022)	An attempt to update current ResultSet was made. However the query that was run was not an updatable query.
NowReadonly (see page 2014)	The connection should not be opened in read- write mode, because it is already open in read-only mode.
NumericOverflow (see page 2014)	A floating point operation yielded a numeric overflow value.

NumericUnderflow (see page 2014)	A floating point operation yielded a numeric underflow value.
OutParameterRequired (see page 2015)	An output parameter is required at this position, because the stored procedure is an in-out parameter.
ParameterValueNotSet (see page 2016)	This input parameter was not set to a value prior to executing the query.
PrivilegeMix (see page 2016)	Cannot mix system and object privileges.
ProtocolVersion (see page 2017)	An incompatible version of driver client and server was used.
ColumnIsReadonly (see page 1974)	An attempt was made to update a read-only column.
RenamedTwice (see page 2020)	A column was renamed twice in the same **ALTER TABLE** statement.
ResultsetClosed (see page 2022)	An attempt was made to access a closed ResultSet.
SingleRowHasMoreRows (see page 2024)	A single row SELECT statement yielded more than one1 row.
StatementClosed (see page 2024)	An attempt was made to access a closed statement.
StringTooLong (see page 2025)	A string was too large to transport over the wire from the client to the database server.
TableAlreadyExists (see page 2026)	A table or a view already exists with that name.
Toomanyspecs (see page 2027)	An invalid **JOIN** expression was given. A **JOIN** expression cannot have more than one of the following specifiers: **NATURAL**, **UNION**, **CROSS**, **ON** or **USING**.
TypenameExpected (see page 2028)	An unrecognized data type was found in the SQL query.
UnclosedComment (see page 2028)	An unclosed comment was found.
UnclosedIdentifier (see page 2028)	An unclosed quoted identifier was found.
UnclosedStringLiteral (see page 2029)	An unclosed string literal was found.
UnknownColumn (see page 2029)	A column name was not found in the ResultSet.
UnrecognizedEscape (see page 2030)	An unrecognized escape sequence or escape function was found.
ViewNotUpdatable (see page 2032)	An attempt to update a non updatable **VIEW** was made.
WithCheckOptionViolation (see page 2032)	An insert or an update was made to a row in a view, which caused that row to be filtered out of that view.
IllegalMethodCall (see page 1988)	A method call was attempted that caused an IllegalAccessException. Check if the method is public and static and is the class public.
IntegerRequired (see page 1990)	A function that takes an integer argument was given a numeric parameter with significant decimal digits.
OverloadedDiffParams (see page 2015)	A function is overloaded with different parameter names, so it cannot be called using named parameters.

WrongSchemaname (see page 2033)	A create schema must be run by the owner of that schema.
WrongCreateschemaname (see page 2032)	If present, the schema name of an object created in a **CREATE SCHEMA** statement must match that schema.
WrongTableType (see page 2033)	A view operation was attempted on a table, or a table operation was attempted on a view.
SyntaxError (see page 2026)	An error occurred during syntax or semantic check of query.
RuntimeError (see page 2023)	An error happened during run of query.
FailoverError (see page 1985)	An error occurred attempting to fail over to another server.
CannotMixNamedParameters (see page 1972)	The SQL parameters must be accessed by either name or ordinal. Mixing these access methods is not supported.
UnknownParameter (see page 2030)	A reference to an unknown SQL parameter name was made.
ConnectionTimeout (see page 1977)	Connection time-out waiting for an available connection in the connection pool.
ConnectionPoolClosed (see page 1977)	The connection pool was closed while waiting for an available connection.
UnsupportedDbxType (see page 2031)	Unspported dbExpress data type from **TDBXDataTypes** class.
MaxResolveFailed (see page 2002)	If the **StorageDataSet.MaxResolveErrors** property is set, a ResolutionException with this error code is thrown when the maximum errors are encountered. The resolution process is aborted (i.e. changes are rolled back).
ResolvePartial (see page 2021)	If the **StorageDataSet.MaxResolveErrors** property is set, a ResolutionException with this error code is thrown when all rows have been processed. Any successfully processed rows will be committed.
LogExists (see page 2001)	Existing log files and/or log anchor file found in the directory where the system is attempting to create new log files.
NeedALogdir (see page 2006)	'B' log directory specified without specifying 'A' log directory. The 'A' log directory must be specified. 'B' log directory is an optional duplexing of the 'B' log.
LogdirMismatch (see page 2000)	'A' and 'B' log directories specified for DataStore (see page 1892), but one of them does not exist. The log files must both exist or both not exist. This ensures that the duplexed logs are in sync.
AmbiguousLogdir (see page 1966)	Persistent DataStore (see page 1892) log directory setting contradicts **TxManager** log directory setting and the persistent DataStore (see page 1892) log directory still contains log files. If the log files were copied to the new directory specified by the **TxManager**, the log files in the old location (persisted in the DataStore (see page 1892) file) must be renamed or deleted.
InvalidAnchorLength (see page 1992)	Anchor file has an invalid length. It is probably corrupt, but this should be a rare error, since the previous anchor is copied to at least two separate files. The system redundantly copies this anchor inside the DataStore (see page 1892) file itself, so this could be a recoverable failure. Log duplexing is another way to recover from such a failure. If the log is being duplexed (by setting the **TxManager.BLogDir** property), the A and B anchors are examined and the newest, valid anchor is used.
InvalidAnchorFile (see page 1991)	Anchor file could not be read or has an invalid contents. It is probably corrupt, but this should be a rare error, since the previous anchor is copied to at least two separate files. The system redundantly copies this anchor inside the DataStore (see page 1892) file itself, so this could be a recoverable failure. Log duplexing is another way to recover from such a failure. If the log is being duplexed (by setting the **TxManager.BLogDir** property), The A and B anchors are examined and the newest, valid anchor is used.

BirthstampMismatch (see page 1970)	Birthstamp for "A" anchor file and "B" anchor file do not match. This probably means that the log files were not created for the same DataStore (see page 1892) file.
AnchorTooOld (see page 1967)	Anchor timestamp is older then timestamp of DataStore (see page 1892) file. This is probably because the log files are out of date with the DataStore (see page 1892) file.
TooManyOpenFiles (see page 2027)	Too many simultaneous open files by log manager. This should not occur, but if it does, shut down and restart the system.
InvalidUserName (see page 1998)	Invalid user name for **DataStoreConnection.UserName** property. Typically caused when the property has never been set.
NotTransactional (see page 2013)	Attempted transactional operation when its associated **DataStore.TransacitonMan** property is null.
InvalidLsn (see page 1995)	Unexpected internal condition. Invalid address into a log file.
MissingLogFile (see page 2004)	Missing log file.
MissingCheckpointFile (see page 2004)	Missing checkpoint log file.
TxManagerInuse (see page 2027)	Attempt to use a **TxManager** component instance for two different DataStores.
TxRequired (see page 2028)	This connection cannot be opened because the DataStore (see page 1892) is not transactional or read-only. This error can be corrected by setting the **DataStore.ReadOnly (see page 2018)** property to **true** or by setting the **DataStore.TxManager** property to a non-null **TxManager** instance. the DataStore (see page 1892) JDBC driver can only open connections to transactional or read-only DataStores. Once a DataStore (see page 1892) component is opened with the **TxManager** property set, the DataStore (see page 1892) file is marked transactional and all **TxManager** properties are persisted in the DataStore (see page 1892) file. This operation only needs to be performed once.
TxNotAllowed (see page 2028)	Can't make this DataStore (see page 1892) transactional because it is an older file format.
RecoveryDenied (see page 2019)	Recovery denied by ResponseListener event handler. To prevent this exception and allow recovery to complete, do not deny this event in your application's ResponseListener handler.
ActionComplete (see page 1965)	Do not document or make public. Used internally during recovery.
LockTimeout (see page 2000)	Time-out waiting for lock. This can be caused by a deadlock scenario or because a connection with a lock is taking a long time to commit the transaction that has acquired a lock.
OldLog (see page 2015)	Log file appears to be older than the DataStore (see page 1892) it is associated with. This may be caused by copying old log files to the directory of a DataStore (see page 1892) database file that has more recent changes. You can open the DataStore (see page 1892) in read-only mode (see **DataStoreConnection.setReadOnly**) and copy its contents (see **DataStoreConnection.copyStreams**) to set up new log files.
RowLockTimeout (see page 2023)	Time-out waiting for row lock. This can be caused by a deadlock scenario or because a connection with a lock is taking a long time to commit the transaction that has acquired a lock.
XaActive (see page 2033)	Prepared XA transaction needs to be committed or rolled back.

Deadlock (see page 1981)	Two or more connections have transactions that are acquiring two or more record and/or table locks in an opposite order. Here are some typical scenarios. Read/write access when updating a row. When a transaction reads a row, a share lock is acquired. If the transaction writes to the same row, an exclusive lock must be acquired to update the same row. Share locks can be held by more than one transaction for the same row, but exclusive locks can only be held by one transaction. So if transaction t1 and t2 first acquire a share lock for row 3 and then both try to acquire an exclusive row lock for the same row, a dead lock occurs, because neither transaction can acquire an exclusive lock for the row that they both have share locks on. The most typical solution for this problem is to use the **FOR UPDATE** clause when executing SQL **SELECT** statements for rows that are modified or deleted. Table lock escalation. If more than one thread acquires more than the maximum number of row locks for a table, a deadlock can occur. This is because a shared table lock that prevents exclusive table locks is acquired before row locks are acquired. When the lock manager decides to acquire an exclusive table lock because maximum row locks setting has been exceeded, a dead lock can occur if other transactions are also attempting the same escalation. This is because more than one transaction has a shared lock for the same table they are also trying to get exclusive locks for. Possible solutions include: 1) catch the deadlock exception and retry the operation. These exceptions are typically detected very quickly and automatically rollback the transaction. 2) Use a higher setting for the **maxRowLocks** property setting. Use short-duration write transactions. Connections should try to use short-duration transactions in high concurrency environments. However, in low- or no-concurrency environments, a long-duration transaction can provide better throughput, since fewer commit requests are made. There is a significant overhead to the commit operation, because it must guarantee the durability of a transaction. Using read-only transactions for transactions that do not perform write operations. Read-only transactions aren't blocked by writers or other readers, and because they don't acquire locks, they never block other transactions. To make JDBC connections use read-only transactions, set the **readOnly** property of the java.sql.Connection object (returned by the java.sql.DriverManager.getConnection and com.borland.dx.sql.dataset.Database.getJdbcConnection methods) to **true**. When using DataStoreConnection (see page 1923) objects, set the **readOnlyTx** property to **true** before opening the connection. Read-only transactions work by simulating a snapshot of the database. The snapshot sees only data from transactions that are committed at the point the read-only transaction starts; otherwise, the connection would have to see if there were pending changes and roll them back whenever it accessed the data. A snapshot begins when the DataStoreConnection (see page 1923) opens. It is refreshed every time the commit method is called. See also com.borland.datastore.driver.cons.ExtendedProperties.MAX_ROW_LOCKS.
AppendFailed (see page 1967)	Prepared XA transaction needs to be committed or rolled back.
TxAlreadyStarted (see page 2027)	Operation cannot be completed because transaction already started.
PhysUndoNeeded (see page 2016)	Physical undo needed. Try `DataStoreConnection.setTableLockTables(new String[])` first.
ReadonlytxStartFailed (see page 2019)	Read-only transaction could not start because connection with modifications to the database has not committed.

15.1.2.1.8.1 DataStoreErrorCode Members

The following tables list the members exposed by DataStoreErrorCode.

Internal Fields

	Name	Description
	ActionComplete (see page 1965)	This is ActionComplete, a member of class DataStoreErrorCode.

Public Fields

	Name	Description
	AfterLast (see page 1966)	This is AfterLast, a member of class DataStoreErrorCode.
	AggNotValidHere (see page 1966)	This is AggNotValidHere, a member of class DataStoreErrorCode.
	AggOperatorNotFound (see page 1966)	This is AggOperatorNotFound, a member of class DataStoreErrorCode.
	AlreadyLoading (see page 1966)	This is AlreadyLoading, a member of class DataStoreErrorCode.
	AmbiguousLogdir (see page 1966)	This is AmbiguousLogdir, a member of class DataStoreErrorCode.
	AmbiguousType (see page 1967)	This is AmbiguousType, a member of class DataStoreErrorCode.
	AnchorTooOld (see page 1967)	This is AnchorTooOld, a member of class DataStoreErrorCode.
	AppendFailed (see page 1967)	This is AppendFailed, a member of class DataStoreErrorCode.
	ApplicationError (see page 1967)	This is ApplicationError, a member of class DataStoreErrorCode.
	BadColumnIndex (see page 1967)	This is BadColumnIndex, a member of class DataStoreErrorCode.
	BadDirection (see page 1968)	This is BadDirection, a member of class DataStoreErrorCode.
	BadFetchsize (see page 1968)	This is BadFetchsize, a member of class DataStoreErrorCode.
	BadFieldlist (see page 1968)	This is BadFieldlist, a member of class DataStoreErrorCode.
	BadMaxfieldsize (see page 1968)	This is BadMaxfieldsize, a member of class DataStoreErrorCode.
	BadMaxrows (see page 1968)	This is BadMaxrows, a member of class DataStoreErrorCode.
	BadOrdinal (see page 1969)	This is BadOrdinal, a member of class DataStoreErrorCode.
	BadProcedureProperties (see page 1969)	This is BadProcedureProperties, a member of class DataStoreErrorCode.
	BadQueryProperties (see page 1969)	This is BadQueryProperties, a member of class DataStoreErrorCode.
	BadUrl (see page 1969)	This is BadUrl, a member of class DataStoreErrorCode.
	BeforeFirst (see page 1969)	This is BeforeFirst, a member of class DataStoreErrorCode.
	BigdecimalPrecisionError (see page 1970)	This is BigdecimalPrecisionError, a member of class DataStoreErrorCode.
	BirthstampMismatch (see page 1970)	This is BirthstampMismatch, a member of class DataStoreErrorCode.
	CannotAssignTypes (see page 1970)	This is CannotAssignTypes, a member of class DataStoreErrorCode.
	CannotCast (see page 1970)	This is CannotCast, a member of class DataStoreErrorCode.
	CannotChangeColumn (see page 1970)	This is CannotChangeColumn, a member of class DataStoreErrorCode.
	CannotChangeColumnDataType (see page 1971)	This is CannotChangeColumnDataType, a member of class DataStoreErrorCode.
	CannotDittoExisting (see page 1971)	This is CannotDittoExisting, a member of class DataStoreErrorCode.
	CannotFindTableName (see page 1971)	This is CannotFindTableName, a member of class DataStoreErrorCode.
	CannotImportNullDataset (see page 1971)	This is CannotImportNullDataset, a member of class DataStoreErrorCode.
	CannotLockDir (see page 1971)	This is CannotLockDir, a member of class DataStoreErrorCode.
	CannotMixNamedParameters (see page 1972)	This is CannotMixNamedParameters, a member of class DataStoreErrorCode.
	CannotOpen (see page 1972)	This is CannotOpen, a member of class DataStoreErrorCode.
	CannotOrphanDetails (see page 1972)	This is CannotOrphanDetails, a member of class DataStoreErrorCode.
	CannotRefresh (see page 1972)	This is CannotRefresh, a member of class DataStoreErrorCode.
	CannotRestructure (see page 1972)	This is CannotRestructure, a member of class DataStoreErrorCode.
	CannotSaveChanges (see page 1973)	This is CannotSaveChanges, a member of class DataStoreErrorCode.
	CannotStartServer (see page 1973)	This is CannotStartServer, a member of class DataStoreErrorCode.
	CannotUpdateScopedDataRow (see page 1973)	This is CannotUpdateScopedDataRow, a member of class DataStoreErrorCode.
	CannotUseInternalrow (see page 1973)	This is CannotUseInternalrow, a member of class DataStoreErrorCode.
	CannotUseViewHere (see page 1973)	This is CannotUseViewHere, a member of class DataStoreErrorCode.
	CantCreateOpenFile (see page 1974)	This is CantCreateOpenFile, a member of class DataStoreErrorCode.
	CantCreateOpenStream (see page 1974)	This is CantCreateOpenStream, a member of class DataStoreErrorCode.
	ClassNotFoundError (see page 1974)	This is ClassNotFoundError, a member of class DataStoreErrorCode.
	ColumnAlreadyBound (see page 1974)	This is ColumnAlreadyBound, a member of class DataStoreErrorCode.
	ColumnIsReadonly (see page 1974)	This is ColumnIsReadonly, a member of class DataStoreErrorCode.
	ColumnNeedsRestructure (see page 1975)	This is ColumnNeedsRestructure, a member of class DataStoreErrorCode.
	ColumnNotInLeftRef (see page 1975)	This is ColumnNotInLeftRef, a member of class DataStoreErrorCode.
	ColumnNotInRightRef (see page 1975)	This is ColumnNotInRightRef, a member of class DataStoreErrorCode.

	ColumnSpecifiedTwice (see page 1975)	This is ColumnSpecifiedTwice, a member of class DataStoreErrorCode.
	ColumnTypeConflict (see page 1975)	This is ColumnTypeConflict, a member of class DataStoreErrorCode.
	ConflictingMethodDef (see page 1976)	This is ConflictingMethodDef, a member of class DataStoreErrorCode.
	ConnectionClosed (see page 1976)	This is ConnectionClosed, a member of class DataStoreErrorCode.
	ConnectionCountExceeded (see page 1976)	This is ConnectionCountExceeded, a member of class DataStoreErrorCode.
	ConnectionDescriptorNotSet (see page 1976)	This is ConnectionDescriptorNotSet, a member of class DataStoreErrorCode.
	ConnectionError (see page 1976)	This is ConnectionError, a member of class DataStoreErrorCode.
	ConnectionNotClosed (see page 1977)	This is ConnectionNotClosed, a member of class DataStoreErrorCode.
	ConnectionPoolClosed (see page 1977)	This is ConnectionPoolClosed, a member of class DataStoreErrorCode.
	ConnectionTimeout (see page 1977)	This is ConnectionTimeout, a member of class DataStoreErrorCode.
	ConstraintNameExists (see page 1977)	This is ConstraintNameExists, a member of class DataStoreErrorCode.
	CreateErrorMethodExists (see page 1977)	This is CreateErrorMethodExists, a member of class DataStoreErrorCode.
	CyclesInViewDefinition (see page 1978)	This is CyclesInViewDefinition, a member of class DataStoreErrorCode.
	DataFileLoadFailed (see page 1978)	This is DataFileLoadFailed, a member of class DataStoreErrorCode.
	DataHasDuplicates (see page 1978)	This is DataHasDuplicates, a member of class DataStoreErrorCode.
	DatasetAlreadyOpen (see page 1978)	This is DatasetAlreadyOpen, a member of class DataStoreErrorCode.
	DatasetCorrupt (see page 1978)	This is DatasetCorrupt, a member of class DataStoreErrorCode.
	DatasetExists (see page 1979)	This is DatasetExists, a member of class DataStoreErrorCode.
	DatasetHasNoRows (see page 1979)	This is DatasetHasNoRows, a member of class DataStoreErrorCode.
	DatasetHasNoTables (see page 1979)	This is DatasetHasNoTables, a member of class DataStoreErrorCode.
	DatasetNotOpen (see page 1979)	This is DatasetNotOpen, a member of class DataStoreErrorCode.
	DatasetOpen (see page 1979)	This is DatasetOpen, a member of class DataStoreErrorCode.
	DatastoreAlreadyOpen (see page 1980)	This is DatastoreAlreadyOpen, a member of class DataStoreErrorCode.
	DatastoreExists (see page 1980)	This is DatastoreExists, a member of class DataStoreErrorCode.
	DatastoreInvalid (see page 1980)	This is DatastoreInvalid, a member of class DataStoreErrorCode.
	DatastoreIsUnlicensed (see page 1980)	This is DatastoreIsUnlicensed, a member of class DataStoreErrorCode.
	DatastoreNotFound (see page 1980)	This is DatastoreNotFound, a member of class DataStoreErrorCode.
	DatastoreNotOpen (see page 1981)	This is DatastoreNotOpen, a member of class DataStoreErrorCode.
	DatastoreOpen (see page 1981)	This is DatastoreOpen, a member of class DataStoreErrorCode.
	DbAdminError (see page 1981)	This is DbAdminError, a member of class DataStoreErrorCode.
	Deadlock (see page 1981)	This is Deadlock, a member of class DataStoreErrorCode.
	DeleteDuplicates (see page 1981)	This is DeleteDuplicates, a member of class DataStoreErrorCode.
	DeleteFailed (see page 1982)	This is DeleteFailed, a member of class DataStoreErrorCode.
	DeleteNotAllowed (see page 1982)	This is DeleteNotAllowed, a member of class DataStoreErrorCode.
	DesktopLicense (see page 1982)	This is DesktopLicense, a member of class DataStoreErrorCode.
	DifferentDegree (see page 1982)	This is DifferentDegree, a member of class DataStoreErrorCode.
	DifferentSymbol (see page 1982)	This is DifferentSymbol, a member of class DataStoreErrorCode.
	DivideByZero (see page 1983)	This is DivideByZero, a member of class DataStoreErrorCode.
	DriverNotLoadedAtRuntime (see page 1983)	This is DriverNotLoadedAtRuntime, a member of class DataStoreErrorCode.
	DriverNotLoadedInDesign (see page 1983)	This is DriverNotLoadedInDesign, a member of class DataStoreErrorCode.
	DropErrorDependentView (see page 1983)	This is DropErrorDependentView, a member of class DataStoreErrorCode.
	DropErrorForeignKey (see page 1983)	This is DropErrorForeignKey, a member of class DataStoreErrorCode.
	DropErrorRoleGrant (see page 1984)	This is DropErrorRoleGrant, a member of class DataStoreErrorCode.
	DropSchemaError (see page 1984)	This is DropSchemaError, a member of class DataStoreErrorCode.
	DuplicateColumnName (see page 1984)	This is DuplicateColumnName, a member of class DataStoreErrorCode.
	DuplicateKey (see page 1984)	This is DuplicateKey, a member of class DataStoreErrorCode.
	DuplicatePrimary (see page 1984)	This is DuplicatePrimary, a member of class DataStoreErrorCode.
	EmptyColumnNames (see page 1985)	This is EmptyColumnNames, a member of class DataStoreErrorCode.
	EofExpected (see page 1985)	This is EofExpected, a member of class DataStoreErrorCode.
	ExceptionChain (see page 1985)	This is ExceptionChain, a member of class DataStoreErrorCode.
	FailoverError (see page 1985)	This is FailoverError, a member of class DataStoreErrorCode.
	FeatureNotSupp (see page 1985)	This is FeatureNotSupp, a member of class DataStoreErrorCode.
	FieldPostError (see page 1986)	This is FieldPostError, a member of class DataStoreErrorCode.
	FileExists (see page 1986)	This is FileExists, a member of class DataStoreErrorCode.

	FileNotFound (see page 1986)	This is FileNotFound, a member of class DataStoreErrorCode.
	FloatPrecision (see page 1986)	This is FloatPrecision, a member of class DataStoreErrorCode.
	ForeignKeyError (see page 1986)	This is ForeignKeyError, a member of class DataStoreErrorCode.
	ForeignKeyViolation (see page 1987)	This is ForeignKeyViolation, a member of class DataStoreErrorCode.
	ForwardOnly (see page 1987)	This is ForwardOnly, a member of class DataStoreErrorCode.
	GenericError (see page 1987)	This is GenericError, a member of class DataStoreErrorCode.
	GreaterThanMax (see page 1987)	This is GreaterThanMax, a member of class DataStoreErrorCode.
	HasResultset (see page 1987)	This is HasResultset, a member of class DataStoreErrorCode.
	IllegalCatalog (see page 1988)	This is IllegalCatalog, a member of class DataStoreErrorCode.
	IllegalCharacter (see page 1988)	This is IllegalCharacter, a member of class DataStoreErrorCode.
	IllegalExprStart (see page 1988)	This is IllegalExprStart, a member of class DataStoreErrorCode.
	IllegalMethodCall (see page 1988)	This is IllegalMethodCall, a member of class DataStoreErrorCode.
	IncompatibleBlockSize (see page 1988)	This is IncompatibleBlockSize, a member of class DataStoreErrorCode.
	IncompatibleDataRow (see page 1989)	This is IncompatibleDataRow, a member of class DataStoreErrorCode.
	IncompatibleTypes (see page 1989)	This is IncompatibleTypes, a member of class DataStoreErrorCode.
	IncompatibleTypesForOp (see page 1989)	This is IncompatibleTypesForOp, a member of class DataStoreErrorCode.
	IndexAlreadyExists (see page 1989)	This is IndexAlreadyExists, a member of class DataStoreErrorCode.
	InlineTooSmall (see page 1989)	This is InlineTooSmall, a member of class DataStoreErrorCode.
	InsertFailed (see page 1990)	This is InsertFailed, a member of class DataStoreErrorCode.
	InsertNotAllowed (see page 1990)	This is InsertNotAllowed, a member of class DataStoreErrorCode.
	InsufficientRowid (see page 1990)	This is InsufficientRowid, a member of class DataStoreErrorCode.
	IntegerRequired (see page 1990)	This is IntegerRequired, a member of class DataStoreErrorCode.
	InternalDuplicateKey (see page 1990)	This is InternalDuplicateKey, a member of class DataStoreErrorCode.
	InternalError (see page 1991)	This is InternalError, a member of class DataStoreErrorCode.
	InternalUpdateFailed (see page 1991)	This is InternalUpdateFailed, a member of class DataStoreErrorCode.
	InvalidAggDescriptor (see page 1991)	This is InvalidAggDescriptor, a member of class DataStoreErrorCode.
	InvalidAggExpr (see page 1991)	This is InvalidAggExpr, a member of class DataStoreErrorCode.
	InvalidAnchorFile (see page 1991)	This is InvalidAnchorFile, a member of class DataStoreErrorCode.
	InvalidAnchorLength (see page 1992)	This is InvalidAnchorLength, a member of class DataStoreErrorCode.
	InvalidBinaryString (see page 1992)	This is InvalidBinaryString, a member of class DataStoreErrorCode.
	InvalidClass (see page 1992)	This is InvalidClass, a member of class DataStoreErrorCode.
	InvalidColumnFormat (see page 1992)	This is InvalidColumnFormat, a member of class DataStoreErrorCode.
	InvalidColumnname (see page 1992)	This is InvalidColumnname, a member of class DataStoreErrorCode.
	InvalidColumnPosition (see page 1993)	This is InvalidColumnPosition, a member of class DataStoreErrorCode.
	InvalidColumnRef (see page 1993)	This is InvalidColumnRef, a member of class DataStoreErrorCode.
	InvalidColumnType (see page 1993)	This is InvalidColumnType, a member of class DataStoreErrorCode.
	InvalidColumnValue (see page 1993)	This is InvalidColumnValue, a member of class DataStoreErrorCode.
	InvalidConstraintName (see page 1993)	This is InvalidConstraintName, a member of class DataStoreErrorCode.
	InvalidDataFileFormat (see page 1994)	This is InvalidDataFileFormat, a member of class DataStoreErrorCode.
	InvalidDirectoryAttributes (see page 1994)	This is InvalidDirectoryAttributes, a member of class DataStoreErrorCode.
	InvalidEscapeCharInLike (see page 1994)	This is InvalidEscapeCharInLike, a member of class DataStoreErrorCode.
	InvalidExtractField (see page 1994)	This is InvalidExtractField, a member of class DataStoreErrorCode.
	InvalidFormat (see page 1994)	This is InvalidFormat, a member of class DataStoreErrorCode.
	InvalidIndexname (see page 1995)	This is InvalidIndexname, a member of class DataStoreErrorCode.
	InvalidIteratorUse (see page 1995)	This is InvalidIteratorUse, a member of class DataStoreErrorCode.
	InvalidJoin (see page 1995)	This is InvalidJoin, a member of class DataStoreErrorCode.
	InvalidLikePattern (see page 1995)	This is InvalidLikePattern, a member of class DataStoreErrorCode.
	InvalidLsn (see page 1995)	This is InvalidLsn, a member of class DataStoreErrorCode.
	InvalidPattern (see page 1996)	This is InvalidPattern, a member of class DataStoreErrorCode.
	InvalidPrecision (see page 1996)	This is InvalidPrecision, a member of class DataStoreErrorCode.
	InvalidRowValues (see page 1996)	This is InvalidRowValues, a member of class DataStoreErrorCode.
	InvalidSavepoint (see page 1996)	This is InvalidSavepoint, a member of class DataStoreErrorCode.
	InvalidSchemaFile (see page 1996)	This is InvalidSchemaFile, a member of class DataStoreErrorCode.
	InvalidSort (see page 1997)	This is InvalidSort, a member of class DataStoreErrorCode.

	InvalidSortAsInserted (see page 1997)	This is InvalidSortAsInserted, a member of class DataStoreErrorCode.
	InvalidSortColumn (see page 1997)	This is InvalidSortColumn, a member of class DataStoreErrorCode.
	InvalidStoreClass (see page 1997)	This is InvalidStoreClass, a member of class DataStoreErrorCode.
	InvalidStoreName (see page 1997)	This is InvalidStoreName, a member of class DataStoreErrorCode.
	InvalidTablename (see page 1998)	This is InvalidTablename, a member of class DataStoreErrorCode.
	InvalidTableRef (see page 1998)	This is InvalidTableRef, a member of class DataStoreErrorCode.
	InvalidTrimChar (see page 1998)	This is InvalidTrimChar, a member of class DataStoreErrorCode.
	InvalidUserName (see page 1998)	This is InvalidUserName, a member of class DataStoreErrorCode.
	InvalidViewDefinition (see page 1998)	This is InvalidViewDefinition, a member of class DataStoreErrorCode.
	IoError (see page 1999)	This is IoError, a member of class DataStoreErrorCode.
	IoNetError (see page 1999)	This is IoNetError, a member of class DataStoreErrorCode.
	IoProtocolError (see page 1999)	This is IoProtocolError, a member of class DataStoreErrorCode.
	IsInsertRow (see page 1999)	This is IsInsertRow, a member of class DataStoreErrorCode.
	LessThanMin (see page 1999)	This is LessThanMin, a member of class DataStoreErrorCode.
	LinkColumnsError (see page 2000)	This is LinkColumnsError, a member of class DataStoreErrorCode.
	LinkfieldInUserparameters (see page 2000)	This is LinkfieldInUserparameters, a member of class DataStoreErrorCode.
	LoadingNotStarted (see page 2000)	This is LoadingNotStarted, a member of class DataStoreErrorCode.
	LockTimeout (see page 2000)	This is LockTimeout, a member of class DataStoreErrorCode.
	LogdirMismatch (see page 2000)	This is LogdirMismatch, a member of class DataStoreErrorCode.
	LogExists (see page 2001)	This is LogExists, a member of class DataStoreErrorCode.
	MalformedDateOrTime (see page 2001)	This is MalformedDateOrTime, a member of class DataStoreErrorCode.
	MalformedDecimal (see page 2001)	This is MalformedDecimal, a member of class DataStoreErrorCode.
	MalformedFloating (see page 2001)	This is MalformedFloating, a member of class DataStoreErrorCode.
	MasterDetailViewError (see page 2001)	This is MasterDetailViewError, a member of class DataStoreErrorCode.
	MasterNavigationError (see page 2002)	This is MasterNavigationError, a member of class DataStoreErrorCode.
	MaxResolveFailed (see page 2002)	This is MaxResolveFailed, a member of class DataStoreErrorCode.
	MethodArgMismatch (see page 2002)	This is MethodArgMismatch, a member of class DataStoreErrorCode.
	MethodClassMissing (see page 2002)	This is MethodClassMissing, a member of class DataStoreErrorCode.
	MethodNameMissing (see page 2002)	This is MethodNameMissing, a member of class DataStoreErrorCode.
	MethodNonexistent (see page 2003)	This is MethodNonexistent, a member of class DataStoreErrorCode.
	MethodNotFound (see page 2003)	This is MethodNotFound, a member of class DataStoreErrorCode.
	MirrorError (see page 2003)	This is MirrorError, a member of class DataStoreErrorCode.
	MismatchColumnlistCount (see page 2003)	This is MismatchColumnlistCount, a member of class DataStoreErrorCode.
	MismatchedParameterFormat (see page 2003)	This is MismatchedParameterFormat, a member of class DataStoreErrorCode.
	MismatchInsertColumnCount (see page 2004)	This is MismatchInsertColumnCount, a member of class DataStoreErrorCode.
	MismatchIntoParamCount (see page 2004)	This is MismatchIntoParamCount, a member of class DataStoreErrorCode.
	MismatchParamResult (see page 2004)	This is MismatchParamResult, a member of class DataStoreErrorCode.
	MissingCheckpointFile (see page 2004)	This is MissingCheckpointFile, a member of class DataStoreErrorCode.
	MissingLogFile (see page 2004)	This is MissingLogFile, a member of class DataStoreErrorCode.
	MissingMasterDataset (see page 2005)	This is MissingMasterDataset, a member of class DataStoreErrorCode.
	MissingReplacestorerow (see page 2005)	This is MissingReplacestorerow, a member of class DataStoreErrorCode.
	MissingResolver (see page 2005)	This is MissingResolver, a member of class DataStoreErrorCode.
	MoreThanOneRow (see page 2005)	This is MoreThanOneRow, a member of class DataStoreErrorCode.
	MultipleRowsAffected (see page 2005)	This is MultipleRowsAffected, a member of class DataStoreErrorCode.
	MustBeSingleColumn (see page 2006)	This is MustBeSingleColumn, a member of class DataStoreErrorCode.
	NameNotUnique (see page 2006)	This is NameNotUnique, a member of class DataStoreErrorCode.
	NeedALogdir (see page 2006)	This is NeedALogdir, a member of class DataStoreErrorCode.
	NeedLocateStartOption (see page 2006)	This is NeedLocateStartOption, a member of class DataStoreErrorCode.
	NeedProcedureprovider (see page 2006)	This is NeedProcedureprovider, a member of class DataStoreErrorCode.
	NeedQueryprovider (see page 2007)	This is NeedQueryprovider, a member of class DataStoreErrorCode.
	NeedsRecalc (see page 2007)	This is NeedsRecalc, a member of class DataStoreErrorCode.
	NeedStoragedataset (see page 2007)	This is NeedStoragedataset, a member of class DataStoreErrorCode.
	NegativeSqrtArgument (see page 2007)	This is NegativeSqrtArgument, a member of class DataStoreErrorCode.
	NegativeSubstringLength (see page 2007)	This is NegativeSubstringLength, a member of class DataStoreErrorCode.

	NestedAggregators (see page 2008)	This is NestedAggregators, a member of class DataStoreErrorCode.
	NewerVersion (see page 2008)	This is NewerVersion, a member of class DataStoreErrorCode.
	NewerVersionForOperation (see page 2008)	This is NewerVersionForOperation, a member of class DataStoreErrorCode.
	NoCalcAggFields (see page 2008)	This is NoCalcAggFields, a member of class DataStoreErrorCode.
	NoCalcFields (see page 2008)	This is NoCalcFields, a member of class DataStoreErrorCode.
	NoDatabaseToResolve (see page 2009)	This is NoDatabaseToResolve, a member of class DataStoreErrorCode.
	NodefaultForBinary (see page 2009)	This is NodefaultForBinary, a member of class DataStoreErrorCode.
	NoGroupingColumn (see page 2009)	This is NoGroupingColumn, a member of class DataStoreErrorCode.
	NonExistentRowid (see page 2009)	This is NonExistentRowid, a member of class DataStoreErrorCode.
	NoNonBlobColumns (see page 2009)	This is NoNonBlobColumns, a member of class DataStoreErrorCode.
	NonPrimitiveRequired (see page 2010)	This is NonPrimitiveRequired, a member of class DataStoreErrorCode.
	NonTransactional (see page 2010)	This is NonTransactional, a member of class DataStoreErrorCode.
	NoPrimaryKey (see page 2010)	This is NoPrimaryKey, a member of class DataStoreErrorCode.
	NoPriorOriginalRow (see page 2010)	This is NoPriorOriginalRow, a member of class DataStoreErrorCode.
	NoReadonly (see page 2010)	This is NoReadonly, a member of class DataStoreErrorCode.
	NoResultSet (see page 2011)	This is NoResultSet, a member of class DataStoreErrorCode.
	NoResultsetProduced (see page 2011)	This is NoResultsetProduced, a member of class DataStoreErrorCode.
	NoRowsAffected (see page 2011)	This is NoRowsAffected, a member of class DataStoreErrorCode.
	NoRowsToDelete (see page 2011)	This is NoRowsToDelete, a member of class DataStoreErrorCode.
	NoServerFound (see page 2011)	This is NoServerFound, a member of class DataStoreErrorCode.
	NoSuchParameter (see page 2012)	This is NoSuchParameter, a member of class DataStoreErrorCode.
	NotAnOutputParameter (see page 2012)	This is NotAnOutputParameter, a member of class DataStoreErrorCode.
	NotDatabaseResolver (see page 2012)	This is NotDatabaseResolver, a member of class DataStoreErrorCode.
	NotImplemented (see page 2012)	This is NotImplemented, a member of class DataStoreErrorCode.
	NotInsertRow (see page 2012)	This is NotInsertRow, a member of class DataStoreErrorCode.
	NotSelectQuery (see page 2013)	This is NotSelectQuery, a member of class DataStoreErrorCode.
	NotTransactional (see page 2013)	This is NotTransactional, a member of class DataStoreErrorCode.
	NotUpdateable (see page 2013)	This is NotUpdateable, a member of class DataStoreErrorCode.
	NoUpdatableColumns (see page 2013)	This is NoUpdatableColumns, a member of class DataStoreErrorCode.
	NoWhereClause (see page 2013)	This is NoWhereClause, a member of class DataStoreErrorCode.
	NowReadonly (see page 2014)	This is NowReadonly, a member of class DataStoreErrorCode.
	NullColumnName (see page 2014)	This is NullColumnName, a member of class DataStoreErrorCode.
	NumericOverflow (see page 2014)	This is NumericOverflow, a member of class DataStoreErrorCode.
	NumericUnderflow (see page 2014)	This is NumericUnderflow, a member of class DataStoreErrorCode.
	OlderVersion (see page 2014)	This is OlderVersion, a member of class DataStoreErrorCode.
	OldLog (see page 2015)	This is OldLog, a member of class DataStoreErrorCode.
	OnepassInputStream (see page 2015)	This is OnepassInputStream, a member of class DataStoreErrorCode.
	OperationCanceled (see page 2015)	This is OperationCanceled, a member of class DataStoreErrorCode.
	OutParameterRequired (see page 2015)	This is OutParameterRequired, a member of class DataStoreErrorCode.
	OverloadedDiffParams (see page 2015)	This is OverloadedDiffParams, a member of class DataStoreErrorCode.
	ParameterCountMismatch (see page 2016)	This is ParameterCountMismatch, a member of class DataStoreErrorCode.
	ParameterValueNotSet (see page 2016)	This is ParameterValueNotSet, a member of class DataStoreErrorCode.
	PartialSearchForString (see page 2016)	This is PartialSearchForString, a member of class DataStoreErrorCode.
	PhysUndoNeeded (see page 2016)	This is PhysUndoNeeded, a member of class DataStoreErrorCode.
	PrivilegeMix (see page 2016)	This is PrivilegeMix, a member of class DataStoreErrorCode.
	ProcedureFailed (see page 2017)	This is ProcedureFailed, a member of class DataStoreErrorCode.
	ProcedureInProcess (see page 2017)	This is ProcedureInProcess, a member of class DataStoreErrorCode.
	ProtocolVersion (see page 2017)	This is ProtocolVersion, a member of class DataStoreErrorCode.
	ProviderFailed (see page 2017)	This is ProviderFailed, a member of class DataStoreErrorCode.
	ProviderOwned (see page 2017)	This is ProviderOwned, a member of class DataStoreErrorCode.
	QueryFailed (see page 2018)	This is QueryFailed, a member of class DataStoreErrorCode.
	QueryInProcess (see page 2018)	This is QueryInProcess, a member of class DataStoreErrorCode.
	ReadBlockError (see page 2018)	This is ReadBlockError, a member of class DataStoreErrorCode.
	ReadOnly (see page 2018)	This is ReadOnly, a member of class DataStoreErrorCode.

	ReadOnlyColumn (see page 2018)	This is ReadOnlyColumn, a member of class DataStoreErrorCode.
	ReadOnlyDataset (see page 2019)	This is ReadOnlyDataset, a member of class DataStoreErrorCode.
	ReadOnlyStore (see page 2019)	This is ReadOnlyStore, a member of class DataStoreErrorCode.
	ReadonlyTimeout (see page 2019)	This is ReadonlyTimeout, a member of class DataStoreErrorCode.
	ReadonlytxStartFailed (see page 2019)	This is ReadonlytxStartFailed, a member of class DataStoreErrorCode.
	RecoveryDenied (see page 2019)	This is RecoveryDenied, a member of class DataStoreErrorCode.
	RefreshrowNotSupported (see page 2020)	This is RefreshrowNotSupported, a member of class DataStoreErrorCode.
	RenamedTwice (see page 2020)	This is RenamedTwice, a member of class DataStoreErrorCode.
	ReopenFailure (see page 2020)	This is ReopenFailure, a member of class DataStoreErrorCode.
	ResolveFailed (see page 2020)	This is ResolveFailed, a member of class DataStoreErrorCode.
	ResolveInProgress (see page 2020)	This is ResolveInProgress, a member of class DataStoreErrorCode.
	ResolvePartial (see page 2021)	This is ResolvePartial, a member of class DataStoreErrorCode.
	RestructureDataLoss (see page 2021)	This is RestructureDataLoss, a member of class DataStoreErrorCode.
	RestructureInProgress (see page 2021)	This is RestructureInProgress, a member of class DataStoreErrorCode.
	RestructureParseError (see page 2021)	This is RestructureParseError, a member of class DataStoreErrorCode.
	RestructurePrecisionLoss (see page 2021)	This is RestructurePrecisionLoss, a member of class DataStoreErrorCode.
	ResultNotUpdateable (see page 2022)	This is ResultNotUpdateable, a member of class DataStoreErrorCode.
	ResultsetClosed (see page 2022)	This is ResultsetClosed, a member of class DataStoreErrorCode.
	RevokeErrorDependentPrivilege (see page 2022)	This is RevokeErrorDependentPrivilege, a member of class DataStoreErrorCode.
	RevokeErrorDependentView (see page 2022)	This is RevokeErrorDependentView, a member of class DataStoreErrorCode.
	RevokeErrorForeignKey (see page 2022)	This is RevokeErrorForeignKey, a member of class DataStoreErrorCode.
	RowLockTimeout (see page 2023)	This is RowLockTimeout, a member of class DataStoreErrorCode.
	RowNotFound (see page 2023)	This is RowNotFound, a member of class DataStoreErrorCode.
	RowTooWide (see page 2023)	This is RowTooWide, a member of class DataStoreErrorCode.
	RuntimeError (see page 2023)	This is RuntimeError, a member of class DataStoreErrorCode.
	SecurityError (see page 2023)	This is SecurityError, a member of class DataStoreErrorCode.
	SetCalculatedFailure (see page 2024)	This is SetCalculatedFailure, a member of class DataStoreErrorCode.
	SingleRowHasMoreRows (see page 2024)	This is SingleRowHasMoreRows, a member of class DataStoreErrorCode.
	SqlError (see page 2024)	This is SqlError, a member of class DataStoreErrorCode.
	StatementClosed (see page 2024)	This is StatementClosed, a member of class DataStoreErrorCode.
	StoreNameNotSet (see page 2024)	This is StoreNameNotSet, a member of class DataStoreErrorCode.
	StoreOperationUnsupported (see page 2025)	This is StoreOperationUnsupported, a member of class DataStoreErrorCode.
	StreamClosed (see page 2025)	This is StreamClosed, a member of class DataStoreErrorCode.
	StreamNotFound (see page 2025)	This is StreamNotFound, a member of class DataStoreErrorCode.
	StreamOpenTwice (see page 2025)	This is StreamOpenTwice, a member of class DataStoreErrorCode.
	StringTooLong (see page 2025)	This is StringTooLong, a member of class DataStoreErrorCode.
	SyntaxError (see page 2026)	This is SyntaxError, a member of class DataStoreErrorCode.
	TableAlreadyExists (see page 2026)	This is TableAlreadyExists, a member of class DataStoreErrorCode.
	TableNonexistent (see page 2026)	This is TableNonexistent, a member of class DataStoreErrorCode.
	TooManyAutoIncrements (see page 2026)	This is TooManyAutoIncrements, a member of class DataStoreErrorCode.
	TooManyErrors (see page 2026)	This is TooManyErrors, a member of class DataStoreErrorCode.
	TooManyOpenFiles (see page 2027)	This is TooManyOpenFiles, a member of class DataStoreErrorCode.
	Toomanyspecs (see page 2027)	This is Toomanyspecs, a member of class DataStoreErrorCode.
	TransactionIsolationLevelNotSupported (see page 2027)	This is TransactionIsolationLevelNotSupported, a member of class DataStoreErrorCode.
	TxAlreadyStarted (see page 2027)	This is TxAlreadyStarted, a member of class DataStoreErrorCode.
	TxManagerInuse (see page 2027)	This is TxManagerInuse, a member of class DataStoreErrorCode.
	TxNotAllowed (see page 2028)	This is TxNotAllowed, a member of class DataStoreErrorCode.
	TxRequired (see page 2028)	This is TxRequired, a member of class DataStoreErrorCode.
	TypenameExpected (see page 2028)	This is TypenameExpected, a member of class DataStoreErrorCode.
	UnclosedComment (see page 2028)	This is UnclosedComment, a member of class DataStoreErrorCode.
	UnclosedIdentifier (see page 2028)	This is UnclosedIdentifier, a member of class DataStoreErrorCode.
	UnclosedStringLiteral (see page 2029)	This is UnclosedStringLiteral, a member of class DataStoreErrorCode.
	UnexpectedEndOfQuery (see page 2029)	This is UnexpectedEndOfQuery, a member of class DataStoreErrorCode.
	UnknownColumn (see page 2029)	This is UnknownColumn, a member of class DataStoreErrorCode.

	UnknownColumnName (see page 2029)	This is UnknownColumnName, a member of class DataStoreErrorCode.
	UnknownDetailName (see page 2029)	This is UnknownDetailName, a member of class DataStoreErrorCode.
	UnknownParameter (see page 2030)	This is UnknownParameter, a member of class DataStoreErrorCode.
	UnknownParamName (see page 2030)	This is UnknownParamName, a member of class DataStoreErrorCode.
	UnrecognizedDataType (see page 2030)	This is UnrecognizedDataType, a member of class DataStoreErrorCode.
	UnrecognizedEscape (see page 2030)	This is UnrecognizedEscape, a member of class DataStoreErrorCode.
	UnsupportedColumntype (see page 2030)	This is UnsupportedColumntype, a member of class DataStoreErrorCode.
	UnsupportedDbxType (see page 2031)	This is UnsupportedDbxType, a member of class DataStoreErrorCode.
	UpdateFailed (see page 2031)	This is UpdateFailed, a member of class DataStoreErrorCode.
	UpdateNotAllowed (see page 2031)	This is UpdateNotAllowed, a member of class DataStoreErrorCode.
	UrlNotFound (see page 2031)	This is UrlNotFound, a member of class DataStoreErrorCode.
	UrlNotFoundInDesign (see page 2031)	This is UrlNotFoundInDesign, a member of class DataStoreErrorCode.
	ViewNotUpdatable (see page 2032)	This is ViewNotUpdatable, a member of class DataStoreErrorCode.
	WithCheckOptionViolation (see page 2032)	This is WithCheckOptionViolation, a member of class DataStoreErrorCode.
	WriteBlockError (see page 2032)	This is WriteBlockError, a member of class DataStoreErrorCode.
	WrongCreateschemaname (see page 2032)	This is WrongCreateschemaname, a member of class DataStoreErrorCode.
	WrongDatabase (see page 2032)	This is WrongDatabase, a member of class DataStoreErrorCode.
	WrongSchemaname (see page 2033)	This is WrongSchemaname, a member of class DataStoreErrorCode.
	WrongTableType (see page 2033)	This is WrongTableType, a member of class DataStoreErrorCode.
	XaActive (see page 2033)	This is XaActive, a member of class DataStoreErrorCode.

15.1.2.1.8.2 DataStoreErrorCode Fields

The fields of the DataStoreErrorCode class are listed here.

Internal Fields

	Name	Description
	ActionComplete (see page 1965)	This is ActionComplete, a member of class DataStoreErrorCode.

Public Fields

	Name	Description
	AfterLast (see page 1966)	This is AfterLast, a member of class DataStoreErrorCode.
	AggNotValidHere (see page 1966)	This is AggNotValidHere, a member of class DataStoreErrorCode.
	AggOperatorNotFound (see page 1966)	This is AggOperatorNotFound, a member of class DataStoreErrorCode.
	AlreadyLoading (see page 1966)	This is AlreadyLoading, a member of class DataStoreErrorCode.
	AmbiguousLogdir (see page 1966)	This is AmbiguousLogdir, a member of class DataStoreErrorCode.
	AmbiguousType (see page 1967)	This is AmbiguousType, a member of class DataStoreErrorCode.
	AnchorTooOld (see page 1967)	This is AnchorTooOld, a member of class DataStoreErrorCode.
	AppendFailed (see page 1967)	This is AppendFailed, a member of class DataStoreErrorCode.
	ApplicationError (see page 1967)	This is ApplicationError, a member of class DataStoreErrorCode.
	BadColumnIndex (see page 1967)	This is BadColumnIndex, a member of class DataStoreErrorCode.
	BadDirection (see page 1968)	This is BadDirection, a member of class DataStoreErrorCode.
	BadFetchsize (see page 1968)	This is BadFetchsize, a member of class DataStoreErrorCode.
	BadFieldlist (see page 1968)	This is BadFieldlist, a member of class DataStoreErrorCode.
	BadMaxfieldsize (see page 1968)	This is BadMaxfieldsize, a member of class DataStoreErrorCode.
	BadMaxrows (see page 1968)	This is BadMaxrows, a member of class DataStoreErrorCode.
	BadOrdinal (see page 1969)	This is BadOrdinal, a member of class DataStoreErrorCode.
	BadProcedureProperties (see page 1969)	This is BadProcedureProperties, a member of class DataStoreErrorCode.
	BadQueryProperties (see page 1969)	This is BadQueryProperties, a member of class DataStoreErrorCode.
	BadUrl (see page 1969)	This is BadUrl, a member of class DataStoreErrorCode.
	BeforeFirst (see page 1969)	This is BeforeFirst, a member of class DataStoreErrorCode.
	BigdecimalPrecisionError (see page 1970)	This is BigdecimalPrecisionError, a member of class DataStoreErrorCode.
	BirthstampMismatch (see page 1970)	This is BirthstampMismatch, a member of class DataStoreErrorCode.
	CannotAssignTypes (see page 1970)	This is CannotAssignTypes, a member of class DataStoreErrorCode.
	CannotCast (see page 1970)	This is CannotCast, a member of class DataStoreErrorCode.

	CannotChangeColumn (see page 1970)	This is CannotChangeColumn, a member of class DataStoreErrorCode.
	CannotChangeColumnDataType (see page 1971)	This is CannotChangeColumnDataType, a member of class DataStoreErrorCode.
	CannotDittoExisting (see page 1971)	This is CannotDittoExisting, a member of class DataStoreErrorCode.
	CannotFindTableName (see page 1971)	This is CannotFindTableName, a member of class DataStoreErrorCode.
	CannotImportNullDataset (see page 1971)	This is CannotImportNullDataset, a member of class DataStoreErrorCode.
	CannotLockDir (see page 1971)	This is CannotLockDir, a member of class DataStoreErrorCode.
	CannotMixNamedParameters (see page 1972)	This is CannotMixNamedParameters, a member of class DataStoreErrorCode.
	CannotOpen (see page 1972)	This is CannotOpen, a member of class DataStoreErrorCode.
	CannotOrphanDetails (see page 1972)	This is CannotOrphanDetails, a member of class DataStoreErrorCode.
	CannotRefresh (see page 1972)	This is CannotRefresh, a member of class DataStoreErrorCode.
	CannotRestructure (see page 1972)	This is CannotRestructure, a member of class DataStoreErrorCode.
	CannotSaveChanges (see page 1973)	This is CannotSaveChanges, a member of class DataStoreErrorCode.
	CannotStartServer (see page 1973)	This is CannotStartServer, a member of class DataStoreErrorCode.
	CannotUpdateScopedDataRow (see page 1973)	This is CannotUpdateScopedDataRow, a member of class DataStoreErrorCode.
	CannotUseInternalrow (see page 1973)	This is CannotUseInternalrow, a member of class DataStoreErrorCode.
	CannotUseViewHere (see page 1973)	This is CannotUseViewHere, a member of class DataStoreErrorCode.
	CantCreateOpenFile (see page 1974)	This is CantCreateOpenFile, a member of class DataStoreErrorCode.
	CantCreateOpenStream (see page 1974)	This is CantCreateOpenStream, a member of class DataStoreErrorCode.
	ClassNotFoundError (see page 1974)	This is ClassNotFoundError, a member of class DataStoreErrorCode.
	ColumnAlreadyBound (see page 1974)	This is ColumnAlreadyBound, a member of class DataStoreErrorCode.
	ColumnIsReadonly (see page 1974)	This is ColumnIsReadonly, a member of class DataStoreErrorCode.
	ColumnNeedsRestructure (see page 1975)	This is ColumnNeedsRestructure, a member of class DataStoreErrorCode.
	ColumnNotInLeftRef (see page 1975)	This is ColumnNotInLeftRef, a member of class DataStoreErrorCode.
	ColumnNotInRightRef (see page 1975)	This is ColumnNotInRightRef, a member of class DataStoreErrorCode.
	ColumnSpecifiedTwice (see page 1975)	This is ColumnSpecifiedTwice, a member of class DataStoreErrorCode.
	ColumnTypeConflict (see page 1975)	This is ColumnTypeConflict, a member of class DataStoreErrorCode.
	ConflictingMethodDef (see page 1976)	This is ConflictingMethodDef, a member of class DataStoreErrorCode.
	ConnectionClosed (see page 1976)	This is ConnectionClosed, a member of class DataStoreErrorCode.
	ConnectionCountExceeded (see page 1976)	This is ConnectionCountExceeded, a member of class DataStoreErrorCode.
	ConnectionDescriptorNotSet (see page 1976)	This is ConnectionDescriptorNotSet, a member of class DataStoreErrorCode.
	ConnectionError (see page 1976)	This is ConnectionError, a member of class DataStoreErrorCode.
	ConnectionNotClosed (see page 1977)	This is ConnectionNotClosed, a member of class DataStoreErrorCode.
	ConnectionPoolClosed (see page 1977)	This is ConnectionPoolClosed, a member of class DataStoreErrorCode.
	ConnectionTimeout (see page 1977)	This is ConnectionTimeout, a member of class DataStoreErrorCode.
	ConstraintNameExists (see page 1977)	This is ConstraintNameExists, a member of class DataStoreErrorCode.
	CreateErrorMethodExists (see page 1977)	This is CreateErrorMethodExists, a member of class DataStoreErrorCode.
	CyclesInViewDefinition (see page 1978)	This is CyclesInViewDefinition, a member of class DataStoreErrorCode.
	DataFileLoadFailed (see page 1978)	This is DataFileLoadFailed, a member of class DataStoreErrorCode.
	DataHasDuplicates (see page 1978)	This is DataHasDuplicates, a member of class DataStoreErrorCode.
	DatasetAlreadyOpen (see page 1978)	This is DatasetAlreadyOpen, a member of class DataStoreErrorCode.
	DatasetCorrupt (see page 1978)	This is DatasetCorrupt, a member of class DataStoreErrorCode.
	DatasetExists (see page 1979)	This is DatasetExists, a member of class DataStoreErrorCode.
	DatasetHasNoRows (see page 1979)	This is DatasetHasNoRows, a member of class DataStoreErrorCode.
	DatasetHasNoTables (see page 1979)	This is DatasetHasNoTables, a member of class DataStoreErrorCode.
	DatasetNotOpen (see page 1979)	This is DatasetNotOpen, a member of class DataStoreErrorCode.
	DatasetOpen (see page 1979)	This is DatasetOpen, a member of class DataStoreErrorCode.
	DatastoreAlreadyOpen (see page 1980)	This is DatastoreAlreadyOpen, a member of class DataStoreErrorCode.
	DatastoreExists (see page 1980)	This is DatastoreExists, a member of class DataStoreErrorCode.
	DatastoreInvalid (see page 1980)	This is DatastoreInvalid, a member of class DataStoreErrorCode.
	DatastoreIsUnlicensed (see page 1980)	This is DatastoreIsUnlicensed, a member of class DataStoreErrorCode.
	DatastoreNotFound (see page 1980)	This is DatastoreNotFound, a member of class DataStoreErrorCode.
	DatastoreNotOpen (see page 1981)	This is DatastoreNotOpen, a member of class DataStoreErrorCode.
	DatastoreOpen (see page 1981)	This is DatastoreOpen, a member of class DataStoreErrorCode.
	DbAdminError (see page 1981)	This is DbAdminError, a member of class DataStoreErrorCode.

	Deadlock (see page 1981)	This is Deadlock, a member of class DataStoreErrorCode.
	DeleteDuplicates (see page 1981)	This is DeleteDuplicates, a member of class DataStoreErrorCode.
	DeleteFailed (see page 1982)	This is DeleteFailed, a member of class DataStoreErrorCode.
	DeleteNotAllowed (see page 1982)	This is DeleteNotAllowed, a member of class DataStoreErrorCode.
	DesktopLicense (see page 1982)	This is DesktopLicense, a member of class DataStoreErrorCode.
	DifferentDegree (see page 1982)	This is DifferentDegree, a member of class DataStoreErrorCode.
	DifferentSymbol (see page 1982)	This is DifferentSymbol, a member of class DataStoreErrorCode.
	DivideByZero (see page 1983)	This is DivideByZero, a member of class DataStoreErrorCode.
	DriverNotLoadedAtRuntime (see page 1983)	This is DriverNotLoadedAtRuntime, a member of class DataStoreErrorCode.
	DriverNotLoadedInDesign (see page 1983)	This is DriverNotLoadedInDesign, a member of class DataStoreErrorCode.
	DropErrorDependentView (see page 1983)	This is DropErrorDependentView, a member of class DataStoreErrorCode.
	DropErrorForeignKey (see page 1983)	This is DropErrorForeignKey, a member of class DataStoreErrorCode.
	DropErrorRoleGrant (see page 1984)	This is DropErrorRoleGrant, a member of class DataStoreErrorCode.
	DropSchemaError (see page 1984)	This is DropSchemaError, a member of class DataStoreErrorCode.
	DuplicateColumnName (see page 1984)	This is DuplicateColumnName, a member of class DataStoreErrorCode.
	DuplicateKey (see page 1984)	This is DuplicateKey, a member of class DataStoreErrorCode.
	DuplicatePrimary (see page 1984)	This is DuplicatePrimary, a member of class DataStoreErrorCode.
	EmptyColumnNames (see page 1985)	This is EmptyColumnNames, a member of class DataStoreErrorCode.
	EofExpected (see page 1985)	This is EofExpected, a member of class DataStoreErrorCode.
	ExceptionChain (see page 1985)	This is ExceptionChain, a member of class DataStoreErrorCode.
	FailoverError (see page 1985)	This is FailoverError, a member of class DataStoreErrorCode.
	FeatureNotSupp (see page 1985)	This is FeatureNotSupp, a member of class DataStoreErrorCode.
	FieldPostError (see page 1986)	This is FieldPostError, a member of class DataStoreErrorCode.
	FileExists (see page 1986)	This is FileExists, a member of class DataStoreErrorCode.
	FileNotFound (see page 1986)	This is FileNotFound, a member of class DataStoreErrorCode.
	FloatPrecision (see page 1986)	This is FloatPrecision, a member of class DataStoreErrorCode.
	ForeignKeyError (see page 1986)	This is ForeignKeyError, a member of class DataStoreErrorCode.
	ForeignKeyViolation (see page 1987)	This is ForeignKeyViolation, a member of class DataStoreErrorCode.
	ForwardOnly (see page 1987)	This is ForwardOnly, a member of class DataStoreErrorCode.
	GenericError (see page 1987)	This is GenericError, a member of class DataStoreErrorCode.
	GreaterThanMax (see page 1987)	This is GreaterThanMax, a member of class DataStoreErrorCode.
	HasResultset (see page 1987)	This is HasResultset, a member of class DataStoreErrorCode.
	IllegalCatalog (see page 1988)	This is IllegalCatalog, a member of class DataStoreErrorCode.
	IllegalCharacter (see page 1988)	This is IllegalCharacter, a member of class DataStoreErrorCode.
	IllegalExprStart (see page 1988)	This is IllegalExprStart, a member of class DataStoreErrorCode.
	IllegalMethodCall (see page 1988)	This is IllegalMethodCall, a member of class DataStoreErrorCode.
	IncompatibleBlockSize (see page 1988)	This is IncompatibleBlockSize, a member of class DataStoreErrorCode.
	IncompatibleDataRow (see page 1989)	This is IncompatibleDataRow, a member of class DataStoreErrorCode.
	IncompatibleTypes (see page 1989)	This is IncompatibleTypes, a member of class DataStoreErrorCode.
	IncompatibleTypesForOp (see page 1989)	This is IncompatibleTypesForOp, a member of class DataStoreErrorCode.
	IndexAlreadyExists (see page 1989)	This is IndexAlreadyExists, a member of class DataStoreErrorCode.
	InlineTooSmall (see page 1989)	This is InlineTooSmall, a member of class DataStoreErrorCode.
	InsertFailed (see page 1990)	This is InsertFailed, a member of class DataStoreErrorCode.
	InsertNotAllowed (see page 1990)	This is InsertNotAllowed, a member of class DataStoreErrorCode.
	InsufficientRowid (see page 1990)	This is InsufficientRowid, a member of class DataStoreErrorCode.
	IntegerRequired (see page 1990)	This is IntegerRequired, a member of class DataStoreErrorCode.
	InternalDuplicateKey (see page 1990)	This is InternalDuplicateKey, a member of class DataStoreErrorCode.
	InternalError (see page 1991)	This is InternalError, a member of class DataStoreErrorCode.
	InternalUpdateFailed (see page 1991)	This is InternalUpdateFailed, a member of class DataStoreErrorCode.
	InvalidAggDescriptor (see page 1991)	This is InvalidAggDescriptor, a member of class DataStoreErrorCode.
	InvalidAggExpr (see page 1991)	This is InvalidAggExpr, a member of class DataStoreErrorCode.
	InvalidAnchorFile (see page 1991)	This is InvalidAnchorFile, a member of class DataStoreErrorCode.
	InvalidAnchorLength (see page 1992)	This is InvalidAnchorLength, a member of class DataStoreErrorCode.
	InvalidBinaryString (see page 1992)	This is InvalidBinaryString, a member of class DataStoreErrorCode.

	InvalidClass (see page 1992)	This is InvalidClass, a member of class DataStoreErrorCode.
	InvalidColumnFormat (see page 1992)	This is InvalidColumnFormat, a member of class DataStoreErrorCode.
	InvalidColumnname (see page 1992)	This is InvalidColumnname, a member of class DataStoreErrorCode.
	InvalidColumnPosition (see page 1993)	This is InvalidColumnPosition, a member of class DataStoreErrorCode.
	InvalidColumnRef (see page 1993)	This is InvalidColumnRef, a member of class DataStoreErrorCode.
	InvalidColumnType (see page 1993)	This is InvalidColumnType, a member of class DataStoreErrorCode.
	InvalidColumnValue (see page 1993)	This is InvalidColumnValue, a member of class DataStoreErrorCode.
	InvalidConstraintName (see page 1993)	This is InvalidConstraintName, a member of class DataStoreErrorCode.
	InvalidDataFileFormat (see page 1994)	This is InvalidDataFileFormat, a member of class DataStoreErrorCode.
	InvalidDirectoryAttributes (see page 1994)	This is InvalidDirectoryAttributes, a member of class DataStoreErrorCode.
	InvalidEscapeCharInLike (see page 1994)	This is InvalidEscapeCharInLike, a member of class DataStoreErrorCode.
	InvalidExtractField (see page 1994)	This is InvalidExtractField, a member of class DataStoreErrorCode.
	InvalidFormat (see page 1994)	This is InvalidFormat, a member of class DataStoreErrorCode.
	InvalidIndexname (see page 1995)	This is InvalidIndexname, a member of class DataStoreErrorCode.
	InvalidIteratorUse (see page 1995)	This is InvalidIteratorUse, a member of class DataStoreErrorCode.
	InvalidJoin (see page 1995)	This is InvalidJoin, a member of class DataStoreErrorCode.
	InvalidLikePattern (see page 1995)	This is InvalidLikePattern, a member of class DataStoreErrorCode.
	InvalidLsn (see page 1995)	This is InvalidLsn, a member of class DataStoreErrorCode.
	InvalidPattern (see page 1996)	This is InvalidPattern, a member of class DataStoreErrorCode.
	InvalidPrecision (see page 1996)	This is InvalidPrecision, a member of class DataStoreErrorCode.
	InvalidRowValues (see page 1996)	This is InvalidRowValues, a member of class DataStoreErrorCode.
	InvalidSavepoint (see page 1996)	This is InvalidSavepoint, a member of class DataStoreErrorCode.
	InvalidSchemaFile (see page 1996)	This is InvalidSchemaFile, a member of class DataStoreErrorCode.
	InvalidSort (see page 1997)	This is InvalidSort, a member of class DataStoreErrorCode.
	InvalidSortAsInserted (see page 1997)	This is InvalidSortAsInserted, a member of class DataStoreErrorCode.
	InvalidSortColumn (see page 1997)	This is InvalidSortColumn, a member of class DataStoreErrorCode.
	InvalidStoreClass (see page 1997)	This is InvalidStoreClass, a member of class DataStoreErrorCode.
	InvalidStoreName (see page 1997)	This is InvalidStoreName, a member of class DataStoreErrorCode.
	InvalidTablename (see page 1998)	This is InvalidTablename, a member of class DataStoreErrorCode.
	InvalidTableRef (see page 1998)	This is InvalidTableRef, a member of class DataStoreErrorCode.
	InvalidTrimChar (see page 1998)	This is InvalidTrimChar, a member of class DataStoreErrorCode.
	InvalidUserName (see page 1998)	This is InvalidUserName, a member of class DataStoreErrorCode.
	InvalidViewDefinition (see page 1998)	This is InvalidViewDefinition, a member of class DataStoreErrorCode.
	IoError (see page 1999)	This is IoError, a member of class DataStoreErrorCode.
	IoNetError (see page 1999)	This is IoNetError, a member of class DataStoreErrorCode.
	IoProtocolError (see page 1999)	This is IoProtocolError, a member of class DataStoreErrorCode.
	IsInsertRow (see page 1999)	This is IsInsertRow, a member of class DataStoreErrorCode.
	LessThanMin (see page 1999)	This is LessThanMin, a member of class DataStoreErrorCode.
	LinkColumnsError (see page 2000)	This is LinkColumnsError, a member of class DataStoreErrorCode.
	LinkfieldInUserparameters (see page 2000)	This is LinkfieldInUserparameters, a member of class DataStoreErrorCode.
	LoadingNotStarted (see page 2000)	This is LoadingNotStarted, a member of class DataStoreErrorCode.
	LockTimeout (see page 2000)	This is LockTimeout, a member of class DataStoreErrorCode.
	LogdirMismatch (see page 2000)	This is LogdirMismatch, a member of class DataStoreErrorCode.
	LogExists (see page 2001)	This is LogExists, a member of class DataStoreErrorCode.
	MalformedDateOrTime (see page 2001)	This is MalformedDateOrTime, a member of class DataStoreErrorCode.
	MalformedDecimal (see page 2001)	This is MalformedDecimal, a member of class DataStoreErrorCode.
	MalformedFloating (see page 2001)	This is MalformedFloating, a member of class DataStoreErrorCode.
	MasterDetailViewError (see page 2001)	This is MasterDetailViewError, a member of class DataStoreErrorCode.
	MasterNavigationError (see page 2002)	This is MasterNavigationError, a member of class DataStoreErrorCode.
	MaxResolveFailed (see page 2002)	This is MaxResolveFailed, a member of class DataStoreErrorCode.
	MethodArgMismatch (see page 2002)	This is MethodArgMismatch, a member of class DataStoreErrorCode.
	MethodClassMissing (see page 2002)	This is MethodClassMissing, a member of class DataStoreErrorCode.
	MethodNameMissing (see page 2002)	This is MethodNameMissing, a member of class DataStoreErrorCode.
	MethodNonexistent (see page 2003)	This is MethodNonexistent, a member of class DataStoreErrorCode.

	MethodNotFound (see page 2003)	This is MethodNotFound, a member of class DataStoreErrorCode.
	MirrorError (see page 2003)	This is MirrorError, a member of class DataStoreErrorCode.
	MismatchColumnlistCount (see page 2003)	This is MismatchColumnlistCount, a member of class DataStoreErrorCode.
	MismatchedParameterFormat (see page 2003)	This is MismatchedParameterFormat, a member of class DataStoreErrorCode.
	MismatchInsertColumnCount (see page 2004)	This is MismatchInsertColumnCount, a member of class DataStoreErrorCode.
	MismatchIntoParamCount (see page 2004)	This is MismatchIntoParamCount, a member of class DataStoreErrorCode.
	MismatchParamResult (see page 2004)	This is MismatchParamResult, a member of class DataStoreErrorCode.
	MissingCheckpointFile (see page 2004)	This is MissingCheckpointFile, a member of class DataStoreErrorCode.
	MissingLogFile (see page 2004)	This is MissingLogFile, a member of class DataStoreErrorCode.
	MissingMasterDataset (see page 2005)	This is MissingMasterDataset, a member of class DataStoreErrorCode.
	MissingReplacestorerow (see page 2005)	This is MissingReplacestorerow, a member of class DataStoreErrorCode.
	MissingResolver (see page 2005)	This is MissingResolver, a member of class DataStoreErrorCode.
	MoreThanOneRow (see page 2005)	This is MoreThanOneRow, a member of class DataStoreErrorCode.
	MultipleRowsAffected (see page 2005)	This is MultipleRowsAffected, a member of class DataStoreErrorCode.
	MustBeSingleColumn (see page 2006)	This is MustBeSingleColumn, a member of class DataStoreErrorCode.
	NameNotUnique (see page 2006)	This is NameNotUnique, a member of class DataStoreErrorCode.
	NeedALogdir (see page 2006)	This is NeedALogdir, a member of class DataStoreErrorCode.
	NeedLocateStartOption (see page 2006)	This is NeedLocateStartOption, a member of class DataStoreErrorCode.
	NeedProcedureprovider (see page 2006)	This is NeedProcedureprovider, a member of class DataStoreErrorCode.
	NeedQueryprovider (see page 2007)	This is NeedQueryprovider, a member of class DataStoreErrorCode.
	NeedsRecalc (see page 2007)	This is NeedsRecalc, a member of class DataStoreErrorCode.
	NeedStoragedataset (see page 2007)	This is NeedStoragedataset, a member of class DataStoreErrorCode.
	NegativeSqrtArgument (see page 2007)	This is NegativeSqrtArgument, a member of class DataStoreErrorCode.
	NegativeSubstringLength (see page 2007)	This is NegativeSubstringLength, a member of class DataStoreErrorCode.
	NestedAggregators (see page 2008)	This is NestedAggregators, a member of class DataStoreErrorCode.
	NewerVersion (see page 2008)	This is NewerVersion, a member of class DataStoreErrorCode.
	NewerVersionForOperation (see page 2008)	This is NewerVersionForOperation, a member of class DataStoreErrorCode.
	NoCalcAggFields (see page 2008)	This is NoCalcAggFields, a member of class DataStoreErrorCode.
	NoCalcFields (see page 2008)	This is NoCalcFields, a member of class DataStoreErrorCode.
	NoDatabaseToResolve (see page 2009)	This is NoDatabaseToResolve, a member of class DataStoreErrorCode.
	NodefaultForBinary (see page 2009)	This is NodefaultForBinary, a member of class DataStoreErrorCode.
	NoGroupingColumn (see page 2009)	This is NoGroupingColumn, a member of class DataStoreErrorCode.
	NonExistentRowid (see page 2009)	This is NonExistentRowid, a member of class DataStoreErrorCode.
	NoNonBlobColumns (see page 2009)	This is NoNonBlobColumns, a member of class DataStoreErrorCode.
	NonPrimitiveRequired (see page 2010)	This is NonPrimitiveRequired, a member of class DataStoreErrorCode.
	NonTransactional (see page 2010)	This is NonTransactional, a member of class DataStoreErrorCode.
	NoPrimaryKey (see page 2010)	This is NoPrimaryKey, a member of class DataStoreErrorCode.
	NoPriorOriginalRow (see page 2010)	This is NoPriorOriginalRow, a member of class DataStoreErrorCode.
	NoReadonly (see page 2010)	This is NoReadonly, a member of class DataStoreErrorCode.
	NoResultSet (see page 2011)	This is NoResultSet, a member of class DataStoreErrorCode.
	NoResultsetProduced (see page 2011)	This is NoResultsetProduced, a member of class DataStoreErrorCode.
	NoRowsAffected (see page 2011)	This is NoRowsAffected, a member of class DataStoreErrorCode.
	NoRowsToDelete (see page 2011)	This is NoRowsToDelete, a member of class DataStoreErrorCode.
	NoServerFound (see page 2011)	This is NoServerFound, a member of class DataStoreErrorCode.
	NoSuchParameter (see page 2012)	This is NoSuchParameter, a member of class DataStoreErrorCode.
	NotAnOutputParameter (see page 2012)	This is NotAnOutputParameter, a member of class DataStoreErrorCode.
	NotDatabaseResolver (see page 2012)	This is NotDatabaseResolver, a member of class DataStoreErrorCode.
	NotImplemented (see page 2012)	This is NotImplemented, a member of class DataStoreErrorCode.
	NotInsertRow (see page 2012)	This is NotInsertRow, a member of class DataStoreErrorCode.
	NotSelectQuery (see page 2013)	This is NotSelectQuery, a member of class DataStoreErrorCode.
	NotTransactional (see page 2013)	This is NotTransactional, a member of class DataStoreErrorCode.
	NotUpdateable (see page 2013)	This is NotUpdateable, a member of class DataStoreErrorCode.
	NoUpdatableColumns (see page 2013)	This is NoUpdatableColumns, a member of class DataStoreErrorCode.
	NoWhereClause (see page 2013)	This is NoWhereClause, a member of class DataStoreErrorCode.

	NowReadonly (see page 2014)	This is NowReadonly, a member of class DataStoreErrorCode.
	NullColumnName (see page 2014)	This is NullColumnName, a member of class DataStoreErrorCode.
	NumericOverflow (see page 2014)	This is NumericOverflow, a member of class DataStoreErrorCode.
	NumericUnderflow (see page 2014)	This is NumericUnderflow, a member of class DataStoreErrorCode.
	OlderVersion (see page 2014)	This is OlderVersion, a member of class DataStoreErrorCode.
	OldLog (see page 2015)	This is OldLog, a member of class DataStoreErrorCode.
	OnepassInputStream (see page 2015)	This is OnepassInputStream, a member of class DataStoreErrorCode.
	OperationCanceled (see page 2015)	This is OperationCanceled, a member of class DataStoreErrorCode.
	OutParameterRequired (see page 2015)	This is OutParameterRequired, a member of class DataStoreErrorCode.
	OverloadedDiffParams (see page 2015)	This is OverloadedDiffParams, a member of class DataStoreErrorCode.
	ParameterCountMismatch (see page 2016)	This is ParameterCountMismatch, a member of class DataStoreErrorCode.
	ParameterValueNotSet (see page 2016)	This is ParameterValueNotSet, a member of class DataStoreErrorCode.
	PartialSearchForString (see page 2016)	This is PartialSearchForString, a member of class DataStoreErrorCode.
	PhysUndoNeeded (see page 2016)	This is PhysUndoNeeded, a member of class DataStoreErrorCode.
	PrivilegeMix (see page 2016)	This is PrivilegeMix, a member of class DataStoreErrorCode.
	ProcedureFailed (see page 2017)	This is ProcedureFailed, a member of class DataStoreErrorCode.
	ProcedureInProcess (see page 2017)	This is ProcedureInProcess, a member of class DataStoreErrorCode.
	ProtocolVersion (see page 2017)	This is ProtocolVersion, a member of class DataStoreErrorCode.
	ProviderFailed (see page 2017)	This is ProviderFailed, a member of class DataStoreErrorCode.
	ProviderOwned (see page 2017)	This is ProviderOwned, a member of class DataStoreErrorCode.
	QueryFailed (see page 2018)	This is QueryFailed, a member of class DataStoreErrorCode.
	QueryInProcess (see page 2018)	This is QueryInProcess, a member of class DataStoreErrorCode.
	ReadBlockError (see page 2018)	This is ReadBlockError, a member of class DataStoreErrorCode.
	ReadOnly (see page 2018)	This is ReadOnly, a member of class DataStoreErrorCode.
	ReadOnlyColumn (see page 2018)	This is ReadOnlyColumn, a member of class DataStoreErrorCode.
	ReadOnlyDataset (see page 2019)	This is ReadOnlyDataset, a member of class DataStoreErrorCode.
	ReadOnlyStore (see page 2019)	This is ReadOnlyStore, a member of class DataStoreErrorCode.
	ReadonlyTimeout (see page 2019)	This is ReadonlyTimeout, a member of class DataStoreErrorCode.
	ReadonlytxStartFailed (see page 2019)	This is ReadonlytxStartFailed, a member of class DataStoreErrorCode.
	RecoveryDenied (see page 2019)	This is RecoveryDenied, a member of class DataStoreErrorCode.
	RefreshrowNotSupported (see page 2020)	This is RefreshrowNotSupported, a member of class DataStoreErrorCode.
	RenamedTwice (see page 2020)	This is RenamedTwice, a member of class DataStoreErrorCode.
	ReopenFailure (see page 2020)	This is ReopenFailure, a member of class DataStoreErrorCode.
	ResolveFailed (see page 2020)	This is ResolveFailed, a member of class DataStoreErrorCode.
	ResolveInProgress (see page 2020)	This is ResolveInProgress, a member of class DataStoreErrorCode.
	ResolvePartial (see page 2021)	This is ResolvePartial, a member of class DataStoreErrorCode.
	RestructureDataLoss (see page 2021)	This is RestructureDataLoss, a member of class DataStoreErrorCode.
	RestructureInProgress (see page 2021)	This is RestructureInProgress, a member of class DataStoreErrorCode.
	RestructureParseError (see page 2021)	This is RestructureParseError, a member of class DataStoreErrorCode.
	RestructurePrecisionLoss (see page 2021)	This is RestructurePrecisionLoss, a member of class DataStoreErrorCode.
	ResultNotUpdateable (see page 2022)	This is ResultNotUpdateable, a member of class DataStoreErrorCode.
	ResultsetClosed (see page 2022)	This is ResultsetClosed, a member of class DataStoreErrorCode.
	RevokeErrorDependentPrivilege (see page 2022)	This is RevokeErrorDependentPrivilege, a member of class DataStoreErrorCode.
	RevokeErrorDependentView (see page 2022)	This is RevokeErrorDependentView, a member of class DataStoreErrorCode.
	RevokeErrorForeignKey (see page 2022)	This is RevokeErrorForeignKey, a member of class DataStoreErrorCode.
	RowLockTimeout (see page 2023)	This is RowLockTimeout, a member of class DataStoreErrorCode.
	RowNotFound (see page 2023)	This is RowNotFound, a member of class DataStoreErrorCode.
	RowTooWide (see page 2023)	This is RowTooWide, a member of class DataStoreErrorCode.
	RuntimeError (see page 2023)	This is RuntimeError, a member of class DataStoreErrorCode.
	SecurityError (see page 2023)	This is SecurityError, a member of class DataStoreErrorCode.
	SetCalculatedFailure (see page 2024)	This is SetCalculatedFailure, a member of class DataStoreErrorCode.
	SingleRowHasMoreRows (see page 2024)	This is SingleRowHasMoreRows, a member of class DataStoreErrorCode.
	SqlError (see page 2024)	This is SqlError, a member of class DataStoreErrorCode.
	StatementClosed (see page 2024)	This is StatementClosed, a member of class DataStoreErrorCode.

	StoreNameNotSet (see page 2024)	This is StoreNameNotSet, a member of class DataStoreErrorCode.
	StoreOperationUnsupported (see page 2025)	This is StoreOperationUnsupported, a member of class DataStoreErrorCode.
	StreamClosed (see page 2025)	This is StreamClosed, a member of class DataStoreErrorCode.
	StreamNotFound (see page 2025)	This is StreamNotFound, a member of class DataStoreErrorCode.
	StreamOpenTwice (see page 2025)	This is StreamOpenTwice, a member of class DataStoreErrorCode.
	StringTooLong (see page 2025)	This is StringTooLong, a member of class DataStoreErrorCode.
	SyntaxError (see page 2026)	This is SyntaxError, a member of class DataStoreErrorCode.
	TableAlreadyExists (see page 2026)	This is TableAlreadyExists, a member of class DataStoreErrorCode.
	TableNonexistent (see page 2026)	This is TableNonexistent, a member of class DataStoreErrorCode.
	TooManyAutoIncrements (see page 2026)	This is TooManyAutoIncrements, a member of class DataStoreErrorCode.
	TooManyErrors (see page 2026)	This is TooManyErrors, a member of class DataStoreErrorCode.
	TooManyOpenFiles (see page 2027)	This is TooManyOpenFiles, a member of class DataStoreErrorCode.
	Toomanyspecs (see page 2027)	This is Toomanyspecs, a member of class DataStoreErrorCode.
	TransactionIsolationLevelNotSupported (see page 2027)	This is TransactionIsolationLevelNotSupported, a member of class DataStoreErrorCode.
	TxAlreadyStarted (see page 2027)	This is TxAlreadyStarted, a member of class DataStoreErrorCode.
	TxManagerInuse (see page 2027)	This is TxManagerInuse, a member of class DataStoreErrorCode.
	TxNotAllowed (see page 2028)	This is TxNotAllowed, a member of class DataStoreErrorCode.
	TxRequired (see page 2028)	This is TxRequired, a member of class DataStoreErrorCode.
	TypenameExpected (see page 2028)	This is TypenameExpected, a member of class DataStoreErrorCode.
	UnclosedComment (see page 2028)	This is UnclosedComment, a member of class DataStoreErrorCode.
	UnclosedIdentifier (see page 2028)	This is UnclosedIdentifier, a member of class DataStoreErrorCode.
	UnclosedStringLiteral (see page 2029)	This is UnclosedStringLiteral, a member of class DataStoreErrorCode.
	UnexpectedEndOfQuery (see page 2029)	This is UnexpectedEndOfQuery, a member of class DataStoreErrorCode.
	UnknownColumn (see page 2029)	This is UnknownColumn, a member of class DataStoreErrorCode.
	UnknownColumnName (see page 2029)	This is UnknownColumnName, a member of class DataStoreErrorCode.
	UnknownDetailName (see page 2029)	This is UnknownDetailName, a member of class DataStoreErrorCode.
	UnknownParameter (see page 2030)	This is UnknownParameter, a member of class DataStoreErrorCode.
	UnknownParamName (see page 2030)	This is UnknownParamName, a member of class DataStoreErrorCode.
	UnrecognizedDataType (see page 2030)	This is UnrecognizedDataType, a member of class DataStoreErrorCode.
	UnrecognizedEscape (see page 2030)	This is UnrecognizedEscape, a member of class DataStoreErrorCode.
	UnsupportedColumntype (see page 2030)	This is UnsupportedColumntype, a member of class DataStoreErrorCode.
	UnsupportedDbxType (see page 2031)	This is UnsupportedDbxType, a member of class DataStoreErrorCode.
	UpdateFailed (see page 2031)	This is UpdateFailed, a member of class DataStoreErrorCode.
	UpdateNotAllowed (see page 2031)	This is UpdateNotAllowed, a member of class DataStoreErrorCode.
	UrlNotFound (see page 2031)	This is UrlNotFound, a member of class DataStoreErrorCode.
	UrlNotFoundInDesign (see page 2031)	This is UrlNotFoundInDesign, a member of class DataStoreErrorCode.
	ViewNotUpdatable (see page 2032)	This is ViewNotUpdatable, a member of class DataStoreErrorCode.
	WithCheckOptionViolation (see page 2032)	This is WithCheckOptionViolation, a member of class DataStoreErrorCode.
	WriteBlockError (see page 2032)	This is WriteBlockError, a member of class DataStoreErrorCode.
	WrongCreateschemaname (see page 2032)	This is WrongCreateschemaname, a member of class DataStoreErrorCode.
	WrongDatabase (see page 2032)	This is WrongDatabase, a member of class DataStoreErrorCode.
	WrongSchemaname (see page 2033)	This is WrongSchemaname, a member of class DataStoreErrorCode.
	WrongTableType (see page 2033)	This is WrongTableType, a member of class DataStoreErrorCode.
	XaActive (see page 2033)	This is XaActive, a member of class DataStoreErrorCode.

15.1.2.1.8.2.1 DataStoreErrorCode.ActionComplete Field

Pascal

```
const ActionComplete: Integer = 6000 + 23;
```

C++

```
int ActionComplete = 6000 + 23;
```

Description

This is ActionComplete, a member of class DataStoreErrorCode.

15.1.2.1.8.2.2 DataStoreErrorCode.AfterLast Field

Pascal

```
const AfterLast: Integer = 3000 + 1;
```

C++

```
int AfterLast = 3000 + 1;
```

Description

This is AfterLast, a member of class DataStoreErrorCode.

15.1.2.1.8.2.3 DataStoreErrorCode.AggNotValidHere Field

Pascal

```
const AggNotValidHere: Integer = 3000 + 2;
```

C++

```
int AggNotValidHere = 3000 + 2;
```

Description

This is AggNotValidHere, a member of class DataStoreErrorCode.

15.1.2.1.8.2.4 DataStoreErrorCode.AggOperatorNotFound Field

Pascal

```
const AggOperatorNotFound: Integer = 2000 + 24;
```

C++

```
int AggOperatorNotFound = 2000 + 24;
```

Description

This is AggOperatorNotFound, a member of class DataStoreErrorCode.

15.1.2.1.8.2.5 DataStoreErrorCode.AlreadyLoading Field

Pascal

```
const AlreadyLoading: Integer = 0 + 28;
```

C++

```
int AlreadyLoading = 0 + 28;
```

Description

This is AlreadyLoading, a member of class DataStoreErrorCode.

15.1.2.1.8.2.6 DataStoreErrorCode.AmbiguousLogdir Field

Pascal

```
const AmbiguousLogdir: Integer = 6000 + 5;
```

C++

```
int AmbiguousLogdir = 6000 + 5;
```

Description

This is AmbiguousLogdir, a member of class DataStoreErrorCode.

15.1.2.1.8.2.7 DataStoreErrorCode.AmbiguousType Field

Pascal

```
const AmbiguousType: Integer = 3000 + 4;
```

C++

```
int AmbiguousType = 3000 + 4;
```

Description

This is AmbiguousType, a member of class DataStoreErrorCode.

15.1.2.1.8.2.8 DataStoreErrorCode.AnchorTooOld Field

Pascal

```
const AnchorTooOld: Integer = 6000 + 9;
```

C++

```
int AnchorTooOld = 6000 + 9;
```

Description

This is AnchorTooOld, a member of class DataStoreErrorCode.

15.1.2.1.8.2.9 DataStoreErrorCode.AppendFailed Field

Pascal

```
const AppendFailed: Integer = 6000 + 29;
```

C++

```
int AppendFailed = 6000 + 29;
```

Description

This is AppendFailed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.10 DataStoreErrorCode.ApplicationError Field

Pascal

```
const ApplicationError: Integer = 1000 + 12;
```

C++

```
int ApplicationError = 1000 + 12;
```

Description

This is ApplicationError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.11 DataStoreErrorCode.BadColumnIndex Field

Pascal

```
const BadColumnIndex: Integer = 3000 + 5;
```

C++

```
int BadColumnIndex = 3000 + 5;
```

Description

This is BadColumnIndex, a member of class DataStoreErrorCode.

15.1.2.1.8.2.12 DataStoreErrorCode.BadDirection Field

Pascal

```
const BadDirection: Integer = 3000 + 6;
```

C++

```
int BadDirection = 3000 + 6;
```

Description

This is BadDirection, a member of class DataStoreErrorCode.

15.1.2.1.8.2.13 DataStoreErrorCode.BadFetchsize Field

Pascal

```
const BadFetchsize: Integer = 3000 + 7;
```

C++

```
int BadFetchsize = 3000 + 7;
```

Description

This is BadFetchsize, a member of class DataStoreErrorCode.

15.1.2.1.8.2.14 DataStoreErrorCode.BadFieldlist Field

Pascal

```
const BadFieldlist: Integer = 7000 + 2;
```

C++

```
int BadFieldlist = 7000 + 2;
```

Description

This is BadFieldlist, a member of class DataStoreErrorCode.

15.1.2.1.8.2.15 DataStoreErrorCode.BadMaxfieldsize Field

Pascal

```
const BadMaxfieldsize: Integer = 3000 + 8;
```

C++

```
int BadMaxfieldsize = 3000 + 8;
```

Description

This is BadMaxfieldsize, a member of class DataStoreErrorCode.

15.1.2.1.8.2.16 DataStoreErrorCode.BadMaxrows Field

Pascal

```
const BadMaxrows: Integer = 3000 + 9;
```

C++

```
int BadMaxrows = 3000 + 9;
```

Description

This is BadMaxrows, a member of class DataStoreErrorCode.

15.1.2.1.8.2.17 DataStoreErrorCode.BadOrdinal Field

Pascal

```
const BadOrdinal: Integer = 3000 + 10;
```

C++

```
int BadOrdinal = 3000 + 10;
```

Description

This is BadOrdinal, a member of class DataStoreErrorCode.

15.1.2.1.8.2.18 DataStoreErrorCode.BadProcedureProperties Field

Pascal

```
const BadProcedureProperties: Integer = 0 + 89;
```

C++

```
int BadProcedureProperties = 0 + 89;
```

Description

This is BadProcedureProperties, a member of class DataStoreErrorCode.

15.1.2.1.8.2.19 DataStoreErrorCode.BadQueryProperties Field

Pascal

```
const BadQueryProperties: Integer = 0 + 1;
```

C++

```
int BadQueryProperties = 0 + 1;
```

Description

This is BadQueryProperties, a member of class DataStoreErrorCode.

15.1.2.1.8.2.20 DataStoreErrorCode.BadUrl Field

Pascal

```
const BadUrl: Integer = 3000 + 11;
```

C++

```
int BadUrl = 3000 + 11;
```

Description

This is BadUrl, a member of class DataStoreErrorCode.

15.1.2.1.8.2.21 DataStoreErrorCode.BeforeFirst Field

Pascal

```
const BeforeFirst: Integer = 3000 + 12;
```

C++

```
int BeforeFirst = 3000 + 12;
```

Description

This is BeforeFirst, a member of class DataStoreErrorCode.

15.1.2.1.8.2.22 DataStoreErrorCode.BigdecimalPrecisionError Field

Pascal

```
const BigdecimalPrecisionError: Integer = 2000 + 29;
```

C++

```
int BigdecimalPrecisionError = 2000 + 29;
```

Description

This is BigdecimalPrecisionError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.23 DataStoreErrorCode.BirthstampMismatch Field

Pascal

```
const BirthstampMismatch: Integer = 6000 + 8;
```

C++

```
int BirthstampMismatch = 6000 + 8;
```

Description

This is BirthstampMismatch, a member of class DataStoreErrorCode.

15.1.2.1.8.2.24 DataStoreErrorCode.CannotAssignTypes Field

Pascal

```
const CannotAssignTypes: Integer = 3000 + 14;
```

C++

```
int CannotAssignTypes = 3000 + 14;
```

Description

This is CannotAssignTypes, a member of class DataStoreErrorCode.

15.1.2.1.8.2.25 DataStoreErrorCode.CannotCast Field

Pascal

```
const CannotCast: Integer = 3000 + 15;
```

C++

```
int CannotCast = 3000 + 15;
```

Description

This is CannotCast, a member of class DataStoreErrorCode.

15.1.2.1.8.2.26 DataStoreErrorCode.CannotChangeColumn Field

Pascal

```
const CannotChangeColumn: Integer = 0 + 70;
```

C++

```
int CannotChangeColumn = 0 + 70;
```

Description

This is CannotChangeColumn, a member of class DataStoreErrorCode.

15.1.2.1.8.2.27 DataStoreErrorCode.CannotChangeColumnDataType Field

Pascal

```
const CannotChangeColumnDataType: Integer = 0 + 14;
```

C++

```
int CannotChangeColumnDataType = 0 + 14;
```

Description

This is CannotChangeColumnDataType, a member of class DataStoreErrorCode.

15.1.2.1.8.2.28 DataStoreErrorCode.CannotDittoExisting Field

Pascal

```
const CannotDittoExisting: Integer = 1000 + 10;
```

C++

```
int CannotDittoExisting = 1000 + 10;
```

Description

This is CannotDittoExisting, a member of class DataStoreErrorCode.

15.1.2.1.8.2.29 DataStoreErrorCode.CannotFindTableName Field

Pascal

```
const CannotFindTableName: Integer = 0 + 7;
```

C++

```
int CannotFindTableName = 0 + 7;
```

Description

This is CannotFindTableName, a member of class DataStoreErrorCode.

15.1.2.1.8.2.30 DataStoreErrorCode.CannotImportNullDataset Field

Pascal

```
const CannotImportNullDataset: Integer = 0 + 9;
```

C++

```
int CannotImportNullDataset = 0 + 9;
```

Description

This is CannotImportNullDataset, a member of class DataStoreErrorCode.

15.1.2.1.8.2.31 DataStoreErrorCode.CannotLockDir Field

Pascal

```
const CannotLockDir: Integer = CannotOpen;
```

C++

```
int CannotLockDir = CannotOpen;
```

Description

This is CannotLockDir, a member of class DataStoreErrorCode.

15.1.2.1.8.2.32 DataStoreErrorCode.CannotMixNamedParameters Field

Pascal

```
const CannotMixNamedParameters: Integer = 3000 + 116;
```

C++

```
int CannotMixNamedParameters = 3000 + 116;
```

Description

This is CannotMixNamedParameters, a member of class DataStoreErrorCode.

15.1.2.1.8.2.33 DataStoreErrorCode.CannotOpen Field

Pascal

```
const CannotOpen: Integer = 2000 + 47;
```

C++

```
int CannotOpen = 2000 + 47;
```

Description

This is CannotOpen, a member of class DataStoreErrorCode.

15.1.2.1.8.2.34 DataStoreErrorCode.CannotOrphanDetails Field

Pascal

```
const CannotOrphanDetails: Integer = 1000 + 3;
```

C++

```
int CannotOrphanDetails = 1000 + 3;
```

Description

This is CannotOrphanDetails, a member of class DataStoreErrorCode.

15.1.2.1.8.2.35 DataStoreErrorCode.CannotRefresh Field

Pascal

```
const CannotRefresh: Integer = 0 + 77;
```

C++

```
int CannotRefresh = 0 + 77;
```

Description

This is CannotRefresh, a member of class DataStoreErrorCode.

15.1.2.1.8.2.36 DataStoreErrorCode.CannotRestructure Field

Pascal

```
const CannotRestructure: Integer = 2000 + 8;
```

C++

```
int CannotRestructure = 2000 + 8;
```

Description

This is CannotRestructure, a member of class DataStoreErrorCode.

15.1.2.1.8.2.37 DataStoreErrorCode.CannotSaveChanges Field

Pascal

```
const CannotSaveChanges: Integer = 0 + 76;
```

C++

```
int CannotSaveChanges = 0 + 76;
```

Description

This is CannotSaveChanges, a member of class DataStoreErrorCode.

15.1.2.1.8.2.38 DataStoreErrorCode.CannotStartServer Field

Pascal

```
const CannotStartServer: Integer = 2000 + 67;
```

C++

```
int CannotStartServer = 2000 + 67;
```

Description

This is CannotStartServer, a member of class DataStoreErrorCode.

15.1.2.1.8.2.39 DataStoreErrorCode.CannotUpdateScopedDataRow Field

Pascal

```
const CannotUpdateScopedDataRow: Integer = 0 + 30;
```

C++

```
int CannotUpdateScopedDataRow = 0 + 30;
```

Description

This is CannotUpdateScopedDataRow, a member of class DataStoreErrorCode.

15.1.2.1.8.2.40 DataStoreErrorCode.CannotUseInternalrow Field

Pascal

```
const CannotUseInternalrow: Integer = 3000 + 17;
```

C++

```
int CannotUseInternalrow = 3000 + 17;
```

Description

This is CannotUseInternalrow, a member of class DataStoreErrorCode.

15.1.2.1.8.2.41 DataStoreErrorCode.CannotUseViewHere Field

Pascal

```
const CannotUseViewHere: Integer = 3000 + 18;
```

C++

```
int CannotUseViewHere = 3000 + 18;
```

Description

This is CannotUseViewHere, a member of class DataStoreErrorCode.

15.1.2.1.8.2.42 DataStoreErrorCode.CantCreateOpenFile Field

Pascal

```
const CantCreateOpenFile: Integer = CantCreateOpenStream;
```

C++

```
int CantCreateOpenFile = CantCreateOpenStream;
```

Description

This is CantCreateOpenFile, a member of class DataStoreErrorCode.

15.1.2.1.8.2.43 DataStoreErrorCode.CantCreateOpenStream Field

Pascal

```
const CantCreateOpenStream: Integer = 2000 + 32;
```

C++

```
int CantCreateOpenStream = 2000 + 32;
```

Description

This is CantCreateOpenStream, a member of class DataStoreErrorCode.

15.1.2.1.8.2.44 DataStoreErrorCode.ClassNotFoundError Field

Pascal

```
const ClassNotFoundError: Integer = 0 + 99;
```

C++

```
int ClassNotFoundError = 0 + 99;
```

Description

This is ClassNotFoundError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.45 DataStoreErrorCode.ColumnAlreadyBound Field

Pascal

```
const ColumnAlreadyBound: Integer = 0 + 13;
```

C++

```
int ColumnAlreadyBound = 0 + 13;
```

Description

This is ColumnAlreadyBound, a member of class DataStoreErrorCode.

15.1.2.1.8.2.46 DataStoreErrorCode.ColumnIsReadonly Field

Pascal

```
const ColumnIsReadonly: Integer = 3000 + 91;
```

C++

```
int ColumnIsReadonly = 3000 + 91;
```

Description

This is ColumnIsReadonly, a member of class DataStoreErrorCode.

15.1.2.1.8.2.47 DataStoreErrorCode.ColumnNeedsRestructure Field

Pascal

```
const ColumnNeedsRestructure: Integer = 2000 + 9;
```

C++

```
int ColumnNeedsRestructure = 2000 + 9;
```

Description

This is ColumnNeedsRestructure, a member of class DataStoreErrorCode.

15.1.2.1.8.2.48 DataStoreErrorCode.ColumnNotInLeftRef Field

Pascal

```
const ColumnNotInLeftRef: Integer = 3000 + 19;
```

C++

```
int ColumnNotInLeftRef = 3000 + 19;
```

Description

This is ColumnNotInLeftRef, a member of class DataStoreErrorCode.

15.1.2.1.8.2.49 DataStoreErrorCode.ColumnNotInRightRef Field

Pascal

```
const ColumnNotInRightRef: Integer = 3000 + 20;
```

C++

```
int ColumnNotInRightRef = 3000 + 20;
```

Description

This is ColumnNotInRightRef, a member of class DataStoreErrorCode.

15.1.2.1.8.2.50 DataStoreErrorCode.ColumnSpecifiedTwice Field

Pascal

```
const ColumnSpecifiedTwice: Integer = 3000 + 21;
```

C++

```
int ColumnSpecifiedTwice = 3000 + 21;
```

Description

This is ColumnSpecifiedTwice, a member of class DataStoreErrorCode.

15.1.2.1.8.2.51 DataStoreErrorCode.ColumnTypeConflict Field

Pascal

```
const ColumnTypeConflict: Integer = 0 + 11;
```

C++

```
int ColumnTypeConflict = 0 + 11;
```

Description

This is ColumnTypeConflict, a member of class DataStoreErrorCode.

15.1.2.1.8.2.52 DataStoreErrorCode.ConflictingMethodDef Field

Pascal

```
const ConflictingMethodDef: Integer = 2000 + 57;
```

C++

```
int ConflictingMethodDef = 2000 + 57;
```

Description

This is ConflictingMethodDef, a member of class DataStoreErrorCode.

15.1.2.1.8.2.53 DataStoreErrorCode.ConnectionClosed Field

Pascal

```
const ConnectionClosed: Integer = 3000 + 22;
```

C++

```
int ConnectionClosed = 3000 + 22;
```

Description

This is ConnectionClosed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.54 DataStoreErrorCode.ConnectionCountExceeded Field

Pascal

```
const ConnectionCountExceeded: Integer = 2000 + 50;
```

C++

```
int ConnectionCountExceeded = 2000 + 50;
```

Description

This is ConnectionCountExceeded, a member of class DataStoreErrorCode.

15.1.2.1.8.2.55 DataStoreErrorCode.ConnectionDescriptorNotSet Field

Pascal

```
const ConnectionDescriptorNotSet: Integer = 0 + 45;
```

C++

```
int ConnectionDescriptorNotSet = 0 + 45;
```

Description

This is ConnectionDescriptorNotSet, a member of class DataStoreErrorCode.

15.1.2.1.8.2.56 DataStoreErrorCode.ConnectionError Field

Pascal

```
const ConnectionError: Integer = 3000 + 23;
```

C++

```
int ConnectionError = 3000 + 23;
```

Description

This is ConnectionError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.57 DataStoreErrorCode.ConnectionNotClosed Field

Pascal

```
const ConnectionNotClosed: Integer = 0 + 80;
```

C++

```
int ConnectionNotClosed = 0 + 80;
```

Description

This is ConnectionNotClosed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.58 DataStoreErrorCode.ConnectionPoolClosed Field

Pascal

```
const ConnectionPoolClosed: Integer = 3000 + 119;
```

C++

```
int ConnectionPoolClosed = 3000 + 119;
```

Description

This is ConnectionPoolClosed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.59 DataStoreErrorCode.ConnectionTimeout Field

Pascal

```
const ConnectionTimeout: Integer = 3000 + 118;
```

C++

```
int ConnectionTimeout = 3000 + 118;
```

Description

This is ConnectionTimeout, a member of class DataStoreErrorCode.

15.1.2.1.8.2.60 DataStoreErrorCode.ConstraintNameExists Field

Pascal

```
const ConstraintNameExists: Integer = 1000 + 20;
```

C++

```
int ConstraintNameExists = 1000 + 20;
```

Description

This is ConstraintNameExists, a member of class DataStoreErrorCode.

15.1.2.1.8.2.61 DataStoreErrorCode.CreateErrorMethodExists Field

Pascal

```
const CreateErrorMethodExists: Integer = 2000 + 53;
```

C++

```
int CreateErrorMethodExists = 2000 + 53;
```

Description

This is CreateErrorMethodExists, a member of class DataStoreErrorCode.

15.1.2.1.8.2.62 DataStoreErrorCode.CyclesInViewDefinition Field

Pascal

```
const CyclesInViewDefinition: Integer = 2000 + 69;
```

C++

```
int CyclesInViewDefinition = 2000 + 69;
```

Description

This is CyclesInViewDefinition, a member of class DataStoreErrorCode.

15.1.2.1.8.2.63 DataStoreErrorCode.DataFileLoadFailed Field

Pascal

```
const DataFileLoadFailed: Integer = 0 + 60;
```

C++

```
int DataFileLoadFailed = 0 + 60;
```

Description

This is DataFileLoadFailed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.64 DataStoreErrorCode.DataHasDuplicates Field

Pascal

```
const DataHasDuplicates: Integer = 2000 + 44;
```

C++

```
int DataHasDuplicates = 2000 + 44;
```

Description

This is DataHasDuplicates, a member of class DataStoreErrorCode.

15.1.2.1.8.2.65 DataStoreErrorCode.DatasetAlreadyOpen Field

Pascal

```
const DatasetAlreadyOpen: Integer = 2000 + 7;
```

C++

```
int DatasetAlreadyOpen = 2000 + 7;
```

Description

This is DatasetAlreadyOpen, a member of class DataStoreErrorCode.

15.1.2.1.8.2.66 DataStoreErrorCode.DatasetCorrupt Field

Pascal

```
const DatasetCorrupt: Integer = 0 + 35;
```

C++

```
int DatasetCorrupt = 0 + 35;
```

Description

This is DatasetCorrupt, a member of class DataStoreErrorCode.

15.1.2.1.8.2.67 DataStoreErrorCode.DatasetExists Field

Pascal

```
const DatasetExists: Integer = 2000 + 35;
```

C++

```
int DatasetExists = 2000 + 35;
```

Description

This is DatasetExists, a member of class DataStoreErrorCode.

15.1.2.1.8.2.68 DataStoreErrorCode.DatasetHasNoRows Field

Pascal

```
const DatasetHasNoRows: Integer = 0 + 41;
```

C++

```
int DatasetHasNoRows = 0 + 41;
```

Description

This is DatasetHasNoRows, a member of class DataStoreErrorCode.

15.1.2.1.8.2.69 DataStoreErrorCode.DatasetHasNoTables Field

Pascal

```
const DatasetHasNoTables: Integer = 0 + 18;
```

C++

```
int DatasetHasNoTables = 0 + 18;
```

Description

This is DatasetHasNoTables, a member of class DataStoreErrorCode.

15.1.2.1.8.2.70 DataStoreErrorCode.DatasetNotOpen Field

Pascal

```
const DatasetNotOpen: Integer = 0 + 42;
```

C++

```
int DatasetNotOpen = 0 + 42;
```

Description

This is DatasetNotOpen, a member of class DataStoreErrorCode.

15.1.2.1.8.2.71 DataStoreErrorCode.DatasetOpen Field

Pascal

```
const DatasetOpen: Integer = 0 + 39;
```

C++

```
int DatasetOpen = 0 + 39;
```

Description

This is DatasetOpen, a member of class DataStoreErrorCode.

15.1.2.1.8.2.72 DataStoreErrorCode.DatastoreAlreadyOpen Field

Pascal

```
const DatastoreAlreadyOpen: Integer = 2000 + 30;
```

C++

```
int DatastoreAlreadyOpen = 2000 + 30;
```

Description

This is DatastoreAlreadyOpen, a member of class DataStoreErrorCode.

15.1.2.1.8.2.73 DataStoreErrorCode.DatastoreExists Field

Pascal

```
const DatastoreExists: Integer = 2000 + 17;
```

C++

```
int DatastoreExists = 2000 + 17;
```

Description

This is DatastoreExists, a member of class DataStoreErrorCode.

15.1.2.1.8.2.74 DataStoreErrorCode.DatastoreInvalid Field

Pascal

```
const DatastoreInvalid: Integer = 2000 + 12;
```

C++

```
int DatastoreInvalid = 2000 + 12;
```

Description

This is DatastoreInvalid, a member of class DataStoreErrorCode.

15.1.2.1.8.2.75 DataStoreErrorCode.DatastoreIsUnlicensed Field

Pascal

```
const DatastoreIsUnlicensed: Integer = 2000 + 49;
```

C++

```
int DatastoreIsUnlicensed = 2000 + 49;
```

Description

This is DatastoreIsUnlicensed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.76 DataStoreErrorCode.DatastoreNotFound Field

Pascal

```
const DatastoreNotFound: Integer = 2000 + 11;
```

C++

```
int DatastoreNotFound = 2000 + 11;
```

Description

This is DatastoreNotFound, a member of class DataStoreErrorCode.

15.1.2.1.8.2.77 DataStoreErrorCode.DatastoreNotOpen Field

Pascal

```
const DatastoreNotOpen: Integer = 2000 + 10;
```

C++

```
int DatastoreNotOpen = 2000 + 10;
```

Description

This is DatastoreNotOpen, a member of class DataStoreErrorCode.

15.1.2.1.8.2.78 DataStoreErrorCode.DatastoreOpen Field

Pascal

```
const DatastoreOpen: Integer = 2000 + 19;
```

C++

```
int DatastoreOpen = 2000 + 19;
```

Description

This is DatastoreOpen, a member of class DataStoreErrorCode.

15.1.2.1.8.2.79 DataStoreErrorCode.DbAdminError Field

Pascal

```
const DbAdminError: Integer = 2000 + 70;
```

C++

```
int DbAdminError = 2000 + 70;
```

Description

This is DbAdminError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.80 DataStoreErrorCode.Deadlock Field

Pascal

```
const Deadlock: Integer = 6000 + 28;
```

C++

```
int Deadlock = 6000 + 28;
```

Description

This is Deadlock, a member of class DataStoreErrorCode.

15.1.2.1.8.2.81 DataStoreErrorCode.DeleteDuplicates Field

Pascal

```
const DeleteDuplicates: Integer = 0 + 105;
```

C++

```
int DeleteDuplicates = 0 + 105;
```

Description

This is DeleteDuplicates, a member of class DataStoreErrorCode.

15.1.2.1.8.2.82 DataStoreErrorCode.DeleteFailed Field

Pascal

```
const DeleteFailed: Integer = 5000 + 2;
```

C++

```
int DeleteFailed = 5000 + 2;
```

Description

This is DeleteFailed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.83 DataStoreErrorCode.DeleteNotAllowed Field

Pascal

```
const DeleteNotAllowed: Integer = 1000 + 16;
```

C++

```
int DeleteNotAllowed = 1000 + 16;
```

Description

This is DeleteNotAllowed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.84 DataStoreErrorCode.DesktopLicense Field

Pascal

```
const DesktopLicense: Integer = 2000 + 72;
```

C++

```
int DesktopLicense = 2000 + 72;
```

Description

This is DesktopLicense, a member of class DataStoreErrorCode.

15.1.2.1.8.2.85 DataStoreErrorCode.DifferentDegree Field

Pascal

```
const DifferentDegree: Integer = 3000 + 24;
```

C++

```
int DifferentDegree = 3000 + 24;
```

Description

This is DifferentDegree, a member of class DataStoreErrorCode.

15.1.2.1.8.2.86 DataStoreErrorCode.DifferentSymbol Field

Pascal

```
const DifferentSymbol: Integer = 3000 + 25;
```

C++

```
int DifferentSymbol = 3000 + 25;
```

Description

This is DifferentSymbol, a member of class DataStoreErrorCode.

15.1.2.1.8.2.87 DataStoreErrorCode.DivideByZero Field

Pascal

```
const DivideByZero: Integer = 3000 + 26;
```

C++

```
int DivideByZero = 3000 + 26;
```

Description

This is DivideByZero, a member of class DataStoreErrorCode.

15.1.2.1.8.2.88 DataStoreErrorCode.DriverNotLoadedAtRuntime Field

Pascal

```
const DriverNotLoadedAtRuntime: Integer = 0 + 83;
```

C++

```
int DriverNotLoadedAtRuntime = 0 + 83;
```

Description

This is DriverNotLoadedAtRuntime, a member of class DataStoreErrorCode.

15.1.2.1.8.2.89 DataStoreErrorCode.DriverNotLoadedInDesign Field

Pascal

```
const DriverNotLoadedInDesign: Integer = 0 + 82;
```

C++

```
int DriverNotLoadedInDesign = 0 + 82;
```

Description

This is DriverNotLoadedInDesign, a member of class DataStoreErrorCode.

15.1.2.1.8.2.90 DataStoreErrorCode.DropErrorDependentView Field

Pascal

```
const DropErrorDependentView: Integer = 2000 + 58;
```

C++

```
int DropErrorDependentView = 2000 + 58;
```

Description

This is DropErrorDependentView, a member of class DataStoreErrorCode.

15.1.2.1.8.2.91 DataStoreErrorCode.DropErrorForeignKey Field

Pascal

```
const DropErrorForeignKey: Integer = 2000 + 59;
```

C++

```
int DropErrorForeignKey = 2000 + 59;
```

Description

This is DropErrorForeignKey, a member of class DataStoreErrorCode.

15.1.2.1.8.2.92 DataStoreErrorCode.DropErrorRoleGrant Field

Pascal

```
const DropErrorRoleGrant: Integer = 2000 + 65;
```

C++

```
int DropErrorRoleGrant = 2000 + 65;
```

Description

This is DropErrorRoleGrant, a member of class DataStoreErrorCode.

15.1.2.1.8.2.93 DataStoreErrorCode.DropSchemaError Field

Pascal

```
const DropSchemaError: Integer = 2000 + 60;
```

C++

```
int DropSchemaError = 2000 + 60;
```

Description

This is DropSchemaError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.94 DataStoreErrorCode.DuplicateColumnName Field

Pascal

```
const DuplicateColumnName: Integer = 0 + 36;
```

C++

```
int DuplicateColumnName = 0 + 36;
```

Description

This is DuplicateColumnName, a member of class DataStoreErrorCode.

15.1.2.1.8.2.95 DataStoreErrorCode.DuplicateKey Field

Pascal

```
const DuplicateKey: Integer = 1000 + 17;
```

C++

```
int DuplicateKey = 1000 + 17;
```

Description

This is DuplicateKey, a member of class DataStoreErrorCode.

15.1.2.1.8.2.96 DataStoreErrorCode.DuplicatePrimary Field

Pascal

```
const DuplicatePrimary: Integer = 0 + 110;
```

C++

```
int DuplicatePrimary = 0 + 110;
```

Description

This is DuplicatePrimary, a member of class DataStoreErrorCode.

15.1.2.1.8.2.97 DataStoreErrorCode.EmptyColumnNames Field

Pascal

```
const EmptyColumnNames: Integer = 0 + 20;
```

C++

```
int EmptyColumnNames = 0 + 20;
```

Description

This is EmptyColumnNames, a member of class DataStoreErrorCode.

15.1.2.1.8.2.98 DataStoreErrorCode.EofExpected Field

Pascal

```
const EofExpected: Integer = 3000 + 28;
```

C++

```
int EofExpected = 3000 + 28;
```

Description

This is EofExpected, a member of class DataStoreErrorCode.

15.1.2.1.8.2.99 DataStoreErrorCode.ExceptionChain Field

Pascal

```
const ExceptionChain: Integer = 0 + 47;
```

C++

```
int ExceptionChain = 0 + 47;
```

Description

This is ExceptionChain, a member of class DataStoreErrorCode.

15.1.2.1.8.2.100 DataStoreErrorCode.FailoverError Field

Pascal

```
const FailoverError: Integer = 3000 + 115;
```

C++

```
int FailoverError = 3000 + 115;
```

Description

This is FailoverError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.101 DataStoreErrorCode.FeatureNotSupp Field

Pascal

```
const FeatureNotSupp: Integer = 3000 + 29;
```

C++

```
int FeatureNotSupp = 3000 + 29;
```

Description

This is FeatureNotSupp, a member of class DataStoreErrorCode.

15.1.2.1.8.2.102 DataStoreErrorCode.FieldPostError Field

Pascal

```
const FieldPostError: Integer = 0 + 81;
```

C++

```
int FieldPostError = 0 + 81;
```

Description

This is FieldPostError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.103 DataStoreErrorCode.FileExists Field

Pascal

```
const FileExists: Integer = 2000 + 36;
```

C++

```
int FileExists = 2000 + 36;
```

Description

This is FileExists, a member of class DataStoreErrorCode.

15.1.2.1.8.2.104 DataStoreErrorCode.FileNotFound Field

Pascal

```
const FileNotFound: Integer = StreamNotFound;
```

C++

```
int FileNotFound = StreamNotFound;
```

Description

This is FileNotFound, a member of class DataStoreErrorCode.

15.1.2.1.8.2.105 DataStoreErrorCode.FloatPrecision Field

Pascal

```
const FloatPrecision: Integer = 3000 + 30;
```

C++

```
int FloatPrecision = 3000 + 30;
```

Description

This is FloatPrecision, a member of class DataStoreErrorCode.

15.1.2.1.8.2.106 DataStoreErrorCode.ForeignKeyError Field

Pascal

```
const ForeignKeyError: Integer = 1000 + 19;
```

C++

```
int ForeignKeyError = 1000 + 19;
```

Description

This is ForeignKeyError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.107 DataStoreErrorCode.ForeignKeyViolation Field

Pascal

```
const ForeignKeyViolation: Integer = 1000 + 18;
```

C++

```
int ForeignKeyViolation = 1000 + 18;
```

Description

This is ForeignKeyViolation, a member of class DataStoreErrorCode.

15.1.2.1.8.2.108 DataStoreErrorCode.ForwardOnly Field

Pascal

```
const ForwardOnly: Integer = 3000 + 31;
```

C++

```
int ForwardOnly = 3000 + 31;
```

Description

This is ForwardOnly, a member of class DataStoreErrorCode.

15.1.2.1.8.2.109 DataStoreErrorCode.GenericError Field

Pascal

```
const GenericError: Integer = 0 + 0;
```

C++

```
int GenericError = 0 + 0;
```

Description

This is GenericError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.110 DataStoreErrorCode.GreaterThanMax Field

Pascal

```
const GreaterThanMax: Integer = 1000 + 8;
```

C++

```
int GreaterThanMax = 1000 + 8;
```

Description

This is GreaterThanMax, a member of class DataStoreErrorCode.

15.1.2.1.8.2.111 DataStoreErrorCode.HasResultset Field

Pascal

```
const HasResultset: Integer = 3000 + 34;
```

C++

```
int HasResultset = 3000 + 34;
```

Description

This is HasResultset, a member of class DataStoreErrorCode.

15.1.2.1.8.2.112 DataStoreErrorCode.IllegalCatalog Field

Pascal

```
const IllegalCatalog: Integer = 3000 + 35;
```

C++

```
int IllegalCatalog = 3000 + 35;
```

Description

This is IllegalCatalog, a member of class DataStoreErrorCode.

15.1.2.1.8.2.113 DataStoreErrorCode.IllegalCharacter Field

Pascal

```
const IllegalCharacter: Integer = 3000 + 36;
```

C++

```
int IllegalCharacter = 3000 + 36;
```

Description

This is IllegalCharacter, a member of class DataStoreErrorCode.

15.1.2.1.8.2.114 DataStoreErrorCode.IllegalExprStart Field

Pascal

```
const IllegalExprStart: Integer = 3000 + 37;
```

C++

```
int IllegalExprStart = 3000 + 37;
```

Description

This is IllegalExprStart, a member of class DataStoreErrorCode.

15.1.2.1.8.2.115 DataStoreErrorCode.IllegalMethodCall Field

Pascal

```
const IllegalMethodCall: Integer = 3000 + 107;
```

C++

```
int IllegalMethodCall = 3000 + 107;
```

Description

This is IllegalMethodCall, a member of class DataStoreErrorCode.

15.1.2.1.8.2.116 DataStoreErrorCode.IncompatibleBlockSize Field

Pascal

```
const IncompatibleBlockSize: Integer = 2000 + 46;
```

C++

```
int IncompatibleBlockSize = 2000 + 46;
```

Description

This is IncompatibleBlockSize, a member of class DataStoreErrorCode.

15.1.2.1.8.2.117 DataStoreErrorCode.IncompatibleDataRow Field

Pascal

```
const IncompatibleDataRow: Integer = 0 + 31;
```

C++

```
int IncompatibleDataRow = 0 + 31;
```

Description

This is IncompatibleDataRow, a member of class DataStoreErrorCode.

15.1.2.1.8.2.118 DataStoreErrorCode.IncompatibleTypes Field

Pascal

```
const IncompatibleTypes: Integer = 3000 + 38;
```

C++

```
int IncompatibleTypes = 3000 + 38;
```

Description

This is IncompatibleTypes, a member of class DataStoreErrorCode.

15.1.2.1.8.2.119 DataStoreErrorCode.IncompatibleTypesForOp Field

Pascal

```
const IncompatibleTypesForOp: Integer = 3000 + 39;
```

C++

```
int IncompatibleTypesForOp = 3000 + 39;
```

Description

This is IncompatibleTypesForOp, a member of class DataStoreErrorCode.

15.1.2.1.8.2.120 DataStoreErrorCode.IndexAlreadyExists Field

Pascal

```
const IndexAlreadyExists: Integer = 3000 + 40;
```

C++

```
int IndexAlreadyExists = 3000 + 40;
```

Description

This is IndexAlreadyExists, a member of class DataStoreErrorCode.

15.1.2.1.8.2.121 DataStoreErrorCode.InlineTooSmall Field

Pascal

```
const InlineTooSmall: Integer = 2000 + 42;
```

C++

```
int InlineTooSmall = 2000 + 42;
```

Description

This is InlineTooSmall, a member of class DataStoreErrorCode.

15.1.2.1.8.2.122 DataStoreErrorCode.InsertFailed Field

Pascal

```
const InsertFailed: Integer = 5000 + 1;
```

C++

```
int InsertFailed = 5000 + 1;
```

Description

This is InsertFailed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.123 DataStoreErrorCode.InsertNotAllowed Field

Pascal

```
const InsertNotAllowed: Integer = 1000 + 14;
```

C++

```
int InsertNotAllowed = 1000 + 14;
```

Description

This is InsertNotAllowed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.124 DataStoreErrorCode.InsufficientRowid Field

Pascal

```
const InsufficientRowid: Integer = 0 + 73;
```

C++

```
int InsufficientRowid = 0 + 73;
```

Description

This is InsufficientRowid, a member of class DataStoreErrorCode.

15.1.2.1.8.2.125 DataStoreErrorCode.IntegerRequired Field

Pascal

```
const IntegerRequired: Integer = 3000 + 108;
```

C++

```
int IntegerRequired = 3000 + 108;
```

Description

This is IntegerRequired, a member of class DataStoreErrorCode.

15.1.2.1.8.2.126 DataStoreErrorCode.InternalDuplicateKey Field

Pascal

```
const InternalDuplicateKey: Integer = 2000 + 4;
```

C++

```
int InternalDuplicateKey = 2000 + 4;
```

Description

This is InternalDuplicateKey, a member of class DataStoreErrorCode.

15.1.2.1.8.2.127 DataStoreErrorCode.InternalError Field

Pascal

```
const InternalError: Integer = 3000 + 41;
```

C++

```
int InternalError = 3000 + 41;
```

Description

This is InternalError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.128 DataStoreErrorCode.InternalUpdateFailed Field

Pascal

```
const InternalUpdateFailed: Integer = 2000 + 13;
```

C++

```
int InternalUpdateFailed = 2000 + 13;
```

Description

This is InternalUpdateFailed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.129 DataStoreErrorCode.InvalidAggDescriptor Field

Pascal

```
const InvalidAggDescriptor: Integer = 0 + 46;
```

C++

```
int InvalidAggDescriptor = 0 + 46;
```

Description

This is InvalidAggDescriptor, a member of class DataStoreErrorCode.

15.1.2.1.8.2.130 DataStoreErrorCode.InvalidAggExpr Field

Pascal

```
const InvalidAggExpr: Integer = 3000 + 42;
```

C++

```
int InvalidAggExpr = 3000 + 42;
```

Description

This is InvalidAggExpr, a member of class DataStoreErrorCode.

15.1.2.1.8.2.131 DataStoreErrorCode.InvalidAnchorFile Field

Pascal

```
const InvalidAnchorFile: Integer = 6000 + 7;
```

C++

```
int InvalidAnchorFile = 6000 + 7;
```

Description

This is InvalidAnchorFile, a member of class DataStoreErrorCode.

15.1.2.1.8.2.132 DataStoreErrorCode.InvalidAnchorLength Field

Pascal

```
const InvalidAnchorLength: Integer = 6000 + 6;
```

C++

```
int InvalidAnchorLength = 6000 + 6;
```

Description

This is InvalidAnchorLength, a member of class DataStoreErrorCode.

15.1.2.1.8.2.133 DataStoreErrorCode.InvalidBinaryString Field

Pascal

```
const InvalidBinaryString: Integer = 3000 + 43;
```

C++

```
int InvalidBinaryString = 3000 + 43;
```

Description

This is InvalidBinaryString, a member of class DataStoreErrorCode.

15.1.2.1.8.2.134 DataStoreErrorCode.InvalidClass Field

Pascal

```
const InvalidClass: Integer = 0 + 106;
```

C++

```
int InvalidClass = 0 + 106;
```

Description

This is InvalidClass, a member of class DataStoreErrorCode.

15.1.2.1.8.2.135 DataStoreErrorCode.InvalidColumnFormat Field

Pascal

```
const InvalidColumnFormat: Integer = 0 + 71;
```

C++

```
int InvalidColumnFormat = 0 + 71;
```

Description

This is InvalidColumnFormat, a member of class DataStoreErrorCode.

15.1.2.1.8.2.136 DataStoreErrorCode.InvalidColumnname Field

Pascal

```
const InvalidColumnname: Integer = 3000 + 46;
```

C++

```
int InvalidColumnname = 3000 + 46;
```

Description

This is InvalidColumnname, a member of class DataStoreErrorCode.

15.1.2.1.8.2.137 DataStoreErrorCode.InvalidColumnPosition Field

Pascal

```
const InvalidColumnPosition: Integer = 0 + 12;
```

C++

```
int InvalidColumnPosition = 0 + 12;
```

Description

This is InvalidColumnPosition, a member of class DataStoreErrorCode.

15.1.2.1.8.2.138 DataStoreErrorCode.InvalidColumnRef Field

Pascal

```
const InvalidColumnRef: Integer = 3000 + 45;
```

C++

```
int InvalidColumnRef = 3000 + 45;
```

Description

This is InvalidColumnRef, a member of class DataStoreErrorCode.

15.1.2.1.8.2.139 DataStoreErrorCode.InvalidColumnType Field

Pascal

```
const InvalidColumnType: Integer = 0 + 49;
```

C++

```
int InvalidColumnType = 0 + 49;
```

Description

This is InvalidColumnType, a member of class DataStoreErrorCode.

15.1.2.1.8.2.140 DataStoreErrorCode.InvalidColumnValue Field

Pascal

```
const InvalidColumnValue: Integer = 1000 + 4;
```

C++

```
int InvalidColumnValue = 1000 + 4;
```

Description

This is InvalidColumnValue, a member of class DataStoreErrorCode.

15.1.2.1.8.2.141 DataStoreErrorCode.InvalidConstraintName Field

Pascal

```
const InvalidConstraintName: Integer = 0 + 115;
```

C++

```
int InvalidConstraintName = 0 + 115;
```

Description

This is InvalidConstraintName, a member of class DataStoreErrorCode.

15.1.2.1.8.2.142 DataStoreErrorCode.InvalidDataFileFormat Field

Pascal

```
const InvalidDataFileFormat: Integer = 0 + 32;
```

C++

```
int InvalidDataFileFormat = 0 + 32;
```

Description

This is InvalidDataFileFormat, a member of class DataStoreErrorCode.

15.1.2.1.8.2.143 DataStoreErrorCode.InvalidDirectoryAttributes Field

Pascal

```
const InvalidDirectoryAttributes: Integer = 2000 + 48;
```

C++

```
int InvalidDirectoryAttributes = 2000 + 48;
```

Description

This is InvalidDirectoryAttributes, a member of class DataStoreErrorCode.

15.1.2.1.8.2.144 DataStoreErrorCode.InvalidEscapeCharInLike Field

Pascal

```
const InvalidEscapeCharInLike: Integer = 3000 + 48;
```

C++

```
int InvalidEscapeCharInLike = 3000 + 48;
```

Description

This is InvalidEscapeCharInLike, a member of class DataStoreErrorCode.

15.1.2.1.8.2.145 DataStoreErrorCode.InvalidExtractField Field

Pascal

```
const InvalidExtractField: Integer = 3000 + 49;
```

C++

```
int InvalidExtractField = 3000 + 49;
```

Description

This is InvalidExtractField, a member of class DataStoreErrorCode.

15.1.2.1.8.2.146 DataStoreErrorCode.InvalidFormat Field

Pascal

```
const InvalidFormat: Integer = 1000 + 11;
```

C++

```
int InvalidFormat = 1000 + 11;
```

Description

This is InvalidFormat, a member of class DataStoreErrorCode.

15.1.2.1.8.2.147 DataStoreErrorCode.InvalidIndexname Field

Pascal

```
const InvalidIndexname: Integer = 3000 + 50;
```

C++

```
int InvalidIndexname = 3000 + 50;
```

Description

This is InvalidIndexname, a member of class DataStoreErrorCode.

15.1.2.1.8.2.148 DataStoreErrorCode.InvalidIteratorUse Field

Pascal

```
const InvalidIteratorUse: Integer = 0 + 109;
```

C++

```
int InvalidIteratorUse = 0 + 109;
```

Description

This is InvalidIteratorUse, a member of class DataStoreErrorCode.

15.1.2.1.8.2.149 DataStoreErrorCode.InvalidJoin Field

Pascal

```
const InvalidJoin: Integer = 3000 + 56;
```

C++

```
int InvalidJoin = 3000 + 56;
```

Description

This is InvalidJoin, a member of class DataStoreErrorCode.

15.1.2.1.8.2.150 DataStoreErrorCode.InvalidLikePattern Field

Pascal

```
const InvalidLikePattern: Integer = 3000 + 51;
```

C++

```
int InvalidLikePattern = 3000 + 51;
```

Description

This is InvalidLikePattern, a member of class DataStoreErrorCode.

15.1.2.1.8.2.151 DataStoreErrorCode.InvalidLsn Field

Pascal

```
const InvalidLsn: Integer = 6000 + 15;
```

C++

```
int InvalidLsn = 6000 + 15;
```

Description

This is InvalidLsn, a member of class DataStoreErrorCode.

15.1.2.1.8.2.152 DataStoreErrorCode.InvalidPattern Field

Pascal

```
const InvalidPattern: Integer = 2000 + 45;
```

C++

```
int InvalidPattern = 2000 + 45;
```

Description

This is InvalidPattern, a member of class DataStoreErrorCode.

15.1.2.1.8.2.153 DataStoreErrorCode.InvalidPrecision Field

Pascal

```
const InvalidPrecision: Integer = 1000 + 9;
```

C++

```
int InvalidPrecision = 1000 + 9;
```

Description

This is InvalidPrecision, a member of class DataStoreErrorCode.

15.1.2.1.8.2.154 DataStoreErrorCode.InvalidRowValues Field

Pascal

```
const InvalidRowValues: Integer = 1000 + 5;
```

C++

```
int InvalidRowValues = 1000 + 5;
```

Description

This is InvalidRowValues, a member of class DataStoreErrorCode.

15.1.2.1.8.2.155 DataStoreErrorCode.InvalidSavepoint Field

Pascal

```
const InvalidSavepoint: Integer = 2000 + 52;
```

C++

```
int InvalidSavepoint = 2000 + 52;
```

Description

This is InvalidSavepoint, a member of class DataStoreErrorCode.

15.1.2.1.8.2.156 DataStoreErrorCode.InvalidSchemaFile Field

Pascal

```
const InvalidSchemaFile: Integer = 0 + 50;
```

C++

```
int InvalidSchemaFile = 0 + 50;
```

Description

This is InvalidSchemaFile, a member of class DataStoreErrorCode.

15.1.2.1.8.2.157 DataStoreErrorCode.InvalidSort Field

Pascal

```
const InvalidSort: Integer = 0 + 113;
```

C++

```
int InvalidSort = 0 + 113;
```

Description

This is InvalidSort, a member of class DataStoreErrorCode.

15.1.2.1.8.2.158 DataStoreErrorCode.InvalidSortAsInserted Field

Pascal

```
const InvalidSortAsInserted: Integer = 0 + 112;
```

C++

```
int InvalidSortAsInserted = 0 + 112;
```

Description

This is InvalidSortAsInserted, a member of class DataStoreErrorCode.

15.1.2.1.8.2.159 DataStoreErrorCode.InvalidSortColumn Field

Pascal

```
const InvalidSortColumn: Integer = 0 + 48;
```

C++

```
int InvalidSortColumn = 0 + 48;
```

Description

This is InvalidSortColumn, a member of class DataStoreErrorCode.

15.1.2.1.8.2.160 DataStoreErrorCode.InvalidStoreClass Field

Pascal

```
const InvalidStoreClass: Integer = 0 + 108;
```

C++

```
int InvalidStoreClass = 0 + 108;
```

Description

This is InvalidStoreClass, a member of class DataStoreErrorCode.

15.1.2.1.8.2.161 DataStoreErrorCode.InvalidStoreName Field

Pascal

```
const InvalidStoreName: Integer = 0 + 104;
```

C++

```
int InvalidStoreName = 0 + 104;
```

Description

This is InvalidStoreName, a member of class DataStoreErrorCode.

15.1.2.1.8.2.162 DataStoreErrorCode.InvalidTablename Field

Pascal

```
const InvalidTablename: Integer = 3000 + 53;
```

C++

```
int InvalidTablename = 3000 + 53;
```

Description

This is InvalidTablename, a member of class DataStoreErrorCode.

15.1.2.1.8.2.163 DataStoreErrorCode.InvalidTableRef Field

Pascal

```
const InvalidTableRef: Integer = 3000 + 52;
```

C++

```
int InvalidTableRef = 3000 + 52;
```

Description

This is InvalidTableRef, a member of class DataStoreErrorCode.

15.1.2.1.8.2.164 DataStoreErrorCode.InvalidTrimChar Field

Pascal

```
const InvalidTrimChar: Integer = 3000 + 54;
```

C++

```
int InvalidTrimChar = 3000 + 54;
```

Description

This is InvalidTrimChar, a member of class DataStoreErrorCode.

15.1.2.1.8.2.165 DataStoreErrorCode.InvalidUserName Field

Pascal

```
const InvalidUserName: Integer = 6000 + 11;
```

C++

```
int InvalidUserName = 6000 + 11;
```

Description

This is InvalidUserName, a member of class DataStoreErrorCode.

15.1.2.1.8.2.166 DataStoreErrorCode.InvalidViewDefinition Field

Pascal

```
const InvalidViewDefinition: Integer = 3000 + 55;
```

C++

```
int InvalidViewDefinition = 3000 + 55;
```

Description

This is InvalidViewDefinition, a member of class DataStoreErrorCode.

15.1.2.1.8.2.167 DataStoreErrorCode.IoError Field

Pascal

```
const IoError: Integer = 0 + 79;
```

C++

```
int IoError = 0 + 79;
```

Description

This is IoError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.168 DataStoreErrorCode.IoNetError Field

Pascal

```
const IoNetError: Integer = 3000 + 57;
```

C++

```
int IoNetError = 3000 + 57;
```

Description

This is IoNetError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.169 DataStoreErrorCode.IoProtocolError Field

Pascal

```
const IoProtocolError: Integer = 3000 + 58;
```

C++

```
int IoProtocolError = 3000 + 58;
```

Description

This is IoProtocolError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.170 DataStoreErrorCode.IsInsertRow Field

Pascal

```
const IsInsertRow: Integer = 3000 + 59;
```

C++

```
int IsInsertRow = 3000 + 59;
```

Description

This is IsInsertRow, a member of class DataStoreErrorCode.

15.1.2.1.8.2.171 DataStoreErrorCode.LessThanMin Field

Pascal

```
const LessThanMin: Integer = 1000 + 7;
```

C++

```
int LessThanMin = 1000 + 7;
```

Description

This is LessThanMin, a member of class DataStoreErrorCode.

15.1.2.1.8.2.172 DataStoreErrorCode.LinkColumnsError Field

Pascal

```
const LinkColumnsError: Integer = 0 + 33;
```

C++

```
int LinkColumnsError = 0 + 33;
```

Description

This is LinkColumnsError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.173 DataStoreErrorCode.LinkfieldInUserparameters Field

Pascal

```
const LinkfieldInUserparameters: Integer = 0 + 86;
```

C++

```
int LinkfieldInUserparameters = 0 + 86;
```

Description

This is LinkfieldInUserparameters, a member of class DataStoreErrorCode.

15.1.2.1.8.2.174 DataStoreErrorCode.LoadingNotStarted Field

Pascal

```
const LoadingNotStarted: Integer = 0 + 29;
```

C++

```
int LoadingNotStarted = 0 + 29;
```

Description

This is LoadingNotStarted, a member of class DataStoreErrorCode.

15.1.2.1.8.2.175 DataStoreErrorCode.LockTimeout Field

Pascal

```
const LockTimeout: Integer = 6000 + 24;
```

C++

```
int LockTimeout = 6000 + 24;
```

Description

This is LockTimeout, a member of class DataStoreErrorCode.

15.1.2.1.8.2.176 DataStoreErrorCode.LogdirMismatch Field

Pascal

```
const LogdirMismatch: Integer = 6000 + 4;
```

C++

```
int LogdirMismatch = 6000 + 4;
```

Description

This is LogdirMismatch, a member of class DataStoreErrorCode.

15.1.2.1.8.2.177 DataStoreErrorCode.LogExists Field

Pascal

```
const LogExists: Integer = 6000 + 0;
```

C++

```
int LogExists = 6000 + 0;
```

Description

This is LogExists, a member of class DataStoreErrorCode.

15.1.2.1.8.2.178 DataStoreErrorCode.MalformedDateOrTime Field

Pascal

```
const MalformedDateOrTime: Integer = 3000 + 60;
```

C++

```
int MalformedDateOrTime = 3000 + 60;
```

Description

This is MalformedDateOrTime, a member of class DataStoreErrorCode.

15.1.2.1.8.2.179 DataStoreErrorCode.MalformedDecimal Field

Pascal

```
const MalformedDecimal: Integer = 3000 + 61;
```

C++

```
int MalformedDecimal = 3000 + 61;
```

Description

This is MalformedDecimal, a member of class DataStoreErrorCode.

15.1.2.1.8.2.180 DataStoreErrorCode.MalformedFloating Field

Pascal

```
const MalformedFloating: Integer = 3000 + 62;
```

C++

```
int MalformedFloating = 3000 + 62;
```

Description

This is MalformedFloating, a member of class DataStoreErrorCode.

15.1.2.1.8.2.181 DataStoreErrorCode.MasterDetailViewError Field

Pascal

```
const MasterDetailViewError: Integer = 0 + 34;
```

C++

```
int MasterDetailViewError = 0 + 34;
```

Description

This is MasterDetailViewError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.182 DataStoreErrorCode.MasterNavigationError Field

Pascal

```
const MasterNavigationError: Integer = 0 + 43;
```

C++

```
int MasterNavigationError = 0 + 43;
```

Description

This is MasterNavigationError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.183 DataStoreErrorCode.MaxResolveFailed Field

Pascal

```
const MaxResolveFailed: Integer = 5000 + 4;
```

C++

```
int MaxResolveFailed = 5000 + 4;
```

Description

This is MaxResolveFailed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.184 DataStoreErrorCode.MethodArgMismatch Field

Pascal

```
const MethodArgMismatch: Integer = 3000 + 63;
```

C++

```
int MethodArgMismatch = 3000 + 63;
```

Description

This is MethodArgMismatch, a member of class DataStoreErrorCode.

15.1.2.1.8.2.185 DataStoreErrorCode.MethodClassMissing Field

Pascal

```
const MethodClassMissing: Integer = 2000 + 55;
```

C++

```
int MethodClassMissing = 2000 + 55;
```

Description

This is MethodClassMissing, a member of class DataStoreErrorCode.

15.1.2.1.8.2.186 DataStoreErrorCode.MethodNameMissing Field

Pascal

```
const MethodNameMissing: Integer = 2000 + 56;
```

C++

```
int MethodNameMissing = 2000 + 56;
```

Description

This is MethodNameMissing, a member of class DataStoreErrorCode.

15.1.2.1.8.2.187 DataStoreErrorCode.MethodNonexistent Field

Pascal

```
const MethodNonexistent: Integer = 2000 + 54;
```

C++

```
int MethodNonexistent = 2000 + 54;
```

Description

This is MethodNonexistent, a member of class DataStoreErrorCode.

15.1.2.1.8.2.188 DataStoreErrorCode.MethodNotFound Field

Pascal

```
const MethodNotFound: Integer = 3000 + 64;
```

C++

```
int MethodNotFound = 3000 + 64;
```

Description

This is MethodNotFound, a member of class DataStoreErrorCode.

15.1.2.1.8.2.189 DataStoreErrorCode.MirrorError Field

Pascal

```
const MirrorError: Integer = 2000 + 66;
```

C++

```
int MirrorError = 2000 + 66;
```

Description

This is MirrorError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.190 DataStoreErrorCode.MismatchColumnlistCount Field

Pascal

```
const MismatchColumnlistCount: Integer = 3000 + 66;
```

C++

```
int MismatchColumnlistCount = 3000 + 66;
```

Description

This is MismatchColumnlistCount, a member of class DataStoreErrorCode.

15.1.2.1.8.2.191 DataStoreErrorCode.MismatchedParameterFormat Field

Pascal

```
const MismatchedParameterFormat: Integer = 0 + 5;
```

C++

```
int MismatchedParameterFormat = 0 + 5;
```

Description

This is MismatchedParameterFormat, a member of class DataStoreErrorCode.

15.1.2.1.8.2.192 DataStoreErrorCode.MismatchInsertColumnCount Field

Pascal

```
const MismatchInsertColumnCount: Integer = 3000 + 65;
```

C++

```
int MismatchInsertColumnCount = 3000 + 65;
```

Description

This is MismatchInsertColumnCount, a member of class DataStoreErrorCode.

15.1.2.1.8.2.193 DataStoreErrorCode.MismatchIntoParamCount Field

Pascal

```
const MismatchIntoParamCount: Integer = 3000 + 67;
```

C++

```
int MismatchIntoParamCount = 3000 + 67;
```

Description

This is MismatchIntoParamCount, a member of class DataStoreErrorCode.

15.1.2.1.8.2.194 DataStoreErrorCode.MismatchParamResult Field

Pascal

```
const MismatchParamResult: Integer = 0 + 93;
```

C++

```
int MismatchParamResult = 0 + 93;
```

Description

This is MismatchParamResult, a member of class DataStoreErrorCode.

15.1.2.1.8.2.195 DataStoreErrorCode.MissingCheckpointFile Field

Pascal

```
const MissingCheckpointFile: Integer = 6000 + 17;
```

C++

```
int MissingCheckpointFile = 6000 + 17;
```

Description

This is MissingCheckpointFile, a member of class DataStoreErrorCode.

15.1.2.1.8.2.196 DataStoreErrorCode.MissingLogFile Field

Pascal

```
const MissingLogFile: Integer = 6000 + 16;
```

C++

```
int MissingLogFile = 6000 + 16;
```

Description

This is MissingLogFile, a member of class DataStoreErrorCode.

15.1.2.1.8.2.197 DataStoreErrorCode.MissingMasterDataset Field

Pascal

```
const MissingMasterDataset: Integer = 0 + 65;
```

C++

```
int MissingMasterDataset = 0 + 65;
```

Description

This is MissingMasterDataset, a member of class DataStoreErrorCode.

15.1.2.1.8.2.198 DataStoreErrorCode.MissingReplacestorerow Field

Pascal

```
const MissingReplacestorerow: Integer = 0 + 102;
```

C++

```
int MissingReplacestorerow = 0 + 102;
```

Description

This is MissingReplacestorerow, a member of class DataStoreErrorCode.

15.1.2.1.8.2.199 DataStoreErrorCode.MissingResolver Field

Pascal

```
const MissingResolver: Integer = 0 + 64;
```

C++

```
int MissingResolver = 0 + 64;
```

Description

This is MissingResolver, a member of class DataStoreErrorCode.

15.1.2.1.8.2.200 DataStoreErrorCode.MoreThanOneRow Field

Pascal

```
const MoreThanOneRow: Integer = 3000 + 68;
```

C++

```
int MoreThanOneRow = 3000 + 68;
```

Description

This is MoreThanOneRow, a member of class DataStoreErrorCode.

15.1.2.1.8.2.201 DataStoreErrorCode.MultipleRowsAffected Field

Pascal

```
const MultipleRowsAffected: Integer = 0 + 38;
```

C++

```
int MultipleRowsAffected = 0 + 38;
```

Description

This is MultipleRowsAffected, a member of class DataStoreErrorCode.

15.1.2.1.8.2.202 DataStoreErrorCode.MustBeSingleColumn Field

Pascal

```
const MustBeSingleColumn: Integer = 3000 + 69;
```

C++

```
int MustBeSingleColumn = 3000 + 69;
```

Description

This is MustBeSingleColumn, a member of class DataStoreErrorCode.

15.1.2.1.8.2.203 DataStoreErrorCode.NameNotUnique Field

Pascal

```
const NameNotUnique: Integer = 2000 + 15;
```

C++

```
int NameNotUnique = 2000 + 15;
```

Description

This is NameNotUnique, a member of class DataStoreErrorCode.

15.1.2.1.8.2.204 DataStoreErrorCode.NeedALogdir Field

Pascal

```
const NeedALogdir: Integer = 6000 + 3;
```

C++

```
int NeedALogdir = 6000 + 3;
```

Description

This is NeedALogdir, a member of class DataStoreErrorCode.

15.1.2.1.8.2.205 DataStoreErrorCode.NeedLocateStartOption Field

Pascal

```
const NeedLocateStartOption: Integer = 0 + 24;
```

C++

```
int NeedLocateStartOption = 0 + 24;
```

Description

This is NeedLocateStartOption, a member of class DataStoreErrorCode.

15.1.2.1.8.2.206 DataStoreErrorCode.NeedProcedureprovider Field

Pascal

```
const NeedProcedureprovider: Integer = 0 + 96;
```

C++

```
int NeedProcedureprovider = 0 + 96;
```

Description

This is NeedProcedureprovider, a member of class DataStoreErrorCode.

15.1.2.1.8.2.207 DataStoreErrorCode.NeedQueryprovider Field

Pascal

```
const NeedQueryprovider: Integer = 0 + 95;
```

C++

```
int NeedQueryprovider = 0 + 95;
```

Description

This is NeedQueryprovider, a member of class DataStoreErrorCode.

15.1.2.1.8.2.208 DataStoreErrorCode.NeedsRecalc Field

Pascal

```
const NeedsRecalc: Integer = 0 + 107;
```

C++

```
int NeedsRecalc = 0 + 107;
```

Description

This is NeedsRecalc, a member of class DataStoreErrorCode.

15.1.2.1.8.2.209 DataStoreErrorCode.NeedStoragedataset Field

Pascal

```
const NeedStoragedataset: Integer = 0 + 90;
```

C++

```
int NeedStoragedataset = 0 + 90;
```

Description

This is NeedStoragedataset, a member of class DataStoreErrorCode.

15.1.2.1.8.2.210 DataStoreErrorCode.NegativeSqrtArgument Field

Pascal

```
const NegativeSqrtArgument: Integer = 3000 + 70;
```

C++

```
int NegativeSqrtArgument = 3000 + 70;
```

Description

This is NegativeSqrtArgument, a member of class DataStoreErrorCode.

15.1.2.1.8.2.211 DataStoreErrorCode.NegativeSubstringLength Field

Pascal

```
const NegativeSubstringLength: Integer = 3000 + 71;
```

C++

```
int NegativeSubstringLength = 3000 + 71;
```

Description

This is NegativeSubstringLength, a member of class DataStoreErrorCode.

15.1.2.1.8.2.212 DataStoreErrorCode.NestedAggregators Field

Pascal

```
const NestedAggregators: Integer = 3000 + 72;
```

C++

```
int NestedAggregators = 3000 + 72;
```

Description

This is NestedAggregators, a member of class DataStoreErrorCode.

15.1.2.1.8.2.213 DataStoreErrorCode.NewerVersion Field

Pascal

```
const NewerVersion: Integer = 2000 + 34;
```

C++

```
int NewerVersion = 2000 + 34;
```

Description

This is NewerVersion, a member of class DataStoreErrorCode.

15.1.2.1.8.2.214 DataStoreErrorCode.NewerVersionForOperation Field

Pascal

```
const NewerVersionForOperation: Integer = 2000 + 68;
```

C++

```
int NewerVersionForOperation = 2000 + 68;
```

Description

This is NewerVersionForOperation, a member of class DataStoreErrorCode.

15.1.2.1.8.2.215 DataStoreErrorCode.NoCalcAggFields Field

Pascal

```
const NoCalcAggFields: Integer = 0 + 92;
```

C++

```
int NoCalcAggFields = 0 + 92;
```

Description

This is NoCalcAggFields, a member of class DataStoreErrorCode.

15.1.2.1.8.2.216 DataStoreErrorCode.NoCalcFields Field

Pascal

```
const NoCalcFields: Integer = 0 + 44;
```

C++

```
int NoCalcFields = 0 + 44;
```

Description

This is NoCalcFields, a member of class DataStoreErrorCode.

15.1.2.1.8.2.217 DataStoreErrorCode.NoDatabaseToResolve Field

Pascal

```
const NoDatabaseToResolve: Integer = 0 + 97;
```

C++

```
int NoDatabaseToResolve = 0 + 97;
```

Description

This is NoDatabaseToResolve, a member of class DataStoreErrorCode.

15.1.2.1.8.2.218 DataStoreErrorCode.NodefaultForBinary Field

Pascal

```
const NodefaultForBinary: Integer = 3000 + 78;
```

C++

```
int NodefaultForBinary = 3000 + 78;
```

Description

This is NodefaultForBinary, a member of class DataStoreErrorCode.

15.1.2.1.8.2.219 DataStoreErrorCode.NoGroupingColumn Field

Pascal

```
const NoGroupingColumn: Integer = 3000 + 73;
```

C++

```
int NoGroupingColumn = 3000 + 73;
```

Description

This is NoGroupingColumn, a member of class DataStoreErrorCode.

15.1.2.1.8.2.220 DataStoreErrorCode.NonExistentRowid Field

Pascal

```
const NonExistentRowid: Integer = 0 + 74;
```

C++

```
int NonExistentRowid = 0 + 74;
```

Description

This is NonExistentRowid, a member of class DataStoreErrorCode.

15.1.2.1.8.2.221 DataStoreErrorCode.NoNonBlobColumns Field

Pascal

```
const NoNonBlobColumns: Integer = 0 + 21;
```

C++

```
int NoNonBlobColumns = 0 + 21;
```

Description

This is NoNonBlobColumns, a member of class DataStoreErrorCode.

15.1.2.1.8.2.222 DataStoreErrorCode.NonPrimitiveRequired Field

Pascal

```
const NonPrimitiveRequired: Integer = 3000 + 79;
```

C++

```
int NonPrimitiveRequired = 3000 + 79;
```

Description

This is NonPrimitiveRequired, a member of class DataStoreErrorCode.

15.1.2.1.8.2.223 DataStoreErrorCode.NonTransactional Field

Pascal

```
const NonTransactional: Integer = 3000 + 80;
```

C++

```
int NonTransactional = 3000 + 80;
```

Description

This is NonTransactional, a member of class DataStoreErrorCode.

15.1.2.1.8.2.224 DataStoreErrorCode.NoPrimaryKey Field

Pascal

```
const NoPrimaryKey: Integer = 0 + 111;
```

C++

```
int NoPrimaryKey = 0 + 111;
```

Description

This is NoPrimaryKey, a member of class DataStoreErrorCode.

15.1.2.1.8.2.225 DataStoreErrorCode.NoPriorOriginalRow Field

Pascal

```
const NoPriorOriginalRow: Integer = 0 + 100;
```

C++

```
int NoPriorOriginalRow = 0 + 100;
```

Description

This is NoPriorOriginalRow, a member of class DataStoreErrorCode.

15.1.2.1.8.2.226 DataStoreErrorCode.NoReadonly Field

Pascal

```
const NoReadonly: Integer = 3000 + 74;
```

C++

```
int NoReadonly = 3000 + 74;
```

Description

This is NoReadonly, a member of class DataStoreErrorCode.

15.1.2.1.8.2.227 DataStoreErrorCode.NoResultSet Field

Pascal

```
const NoResultSet: Integer = 0 + 78;
```

C++

```
int NoResultSet = 0 + 78;
```

Description

This is NoResultSet, a member of class DataStoreErrorCode.

15.1.2.1.8.2.228 DataStoreErrorCode.NoResultsetProduced Field

Pascal

```
const NoResultsetProduced: Integer = 3000 + 75;
```

C++

```
int NoResultsetProduced = 3000 + 75;
```

Description

This is NoResultsetProduced, a member of class DataStoreErrorCode.

15.1.2.1.8.2.229 DataStoreErrorCode.NoRowsAffected Field

Pascal

```
const NoRowsAffected: Integer = 0 + 51;
```

C++

```
int NoRowsAffected = 0 + 51;
```

Description

This is NoRowsAffected, a member of class DataStoreErrorCode.

15.1.2.1.8.2.230 DataStoreErrorCode.NoRowsToDelete Field

Pascal

```
const NoRowsToDelete: Integer = 1000 + 13;
```

C++

```
int NoRowsToDelete = 1000 + 13;
```

Description

This is NoRowsToDelete, a member of class DataStoreErrorCode.

15.1.2.1.8.2.231 DataStoreErrorCode.NoServerFound Field

Pascal

```
const NoServerFound: Integer = 3000 + 76;
```

C++

```
int NoServerFound = 3000 + 76;
```

Description

This is NoServerFound, a member of class DataStoreErrorCode.

15.1.2.1.8.2.232 DataStoreErrorCode.NoSuchParameter Field

Pascal

```
const NoSuchParameter: Integer = 3000 + 77;
```

C++

```
int NoSuchParameter = 3000 + 77;
```

Description

This is NoSuchParameter, a member of class DataStoreErrorCode.

15.1.2.1.8.2.233 DataStoreErrorCode.NotAnOutputParameter Field

Pascal

```
const NotAnOutputParameter: Integer = 3000 + 81;
```

C++

```
int NotAnOutputParameter = 3000 + 81;
```

Description

This is NotAnOutputParameter, a member of class DataStoreErrorCode.

15.1.2.1.8.2.234 DataStoreErrorCode.NotDatabaseResolver Field

Pascal

```
const NotDatabaseResolver: Integer = 0 + 67;
```

C++

```
int NotDatabaseResolver = 0 + 67;
```

Description

This is NotDatabaseResolver, a member of class DataStoreErrorCode.

15.1.2.1.8.2.235 DataStoreErrorCode.NotImplemented Field

Pascal

```
const NotImplemented: Integer = 7000 + 3;
```

C++

```
int NotImplemented = 7000 + 3;
```

Description

This is NotImplemented, a member of class DataStoreErrorCode.

15.1.2.1.8.2.236 DataStoreErrorCode.NotInsertRow Field

Pascal

```
const NotInsertRow: Integer = 3000 + 82;
```

C++

```
int NotInsertRow = 3000 + 82;
```

Description

This is NotInsertRow, a member of class DataStoreErrorCode.

15.1.2.1.8.2.237 DataStoreErrorCode.NotSelectQuery Field

Pascal

```
const NotSelectQuery: Integer = 0 + 2;
```

C++

```
int NotSelectQuery = 0 + 2;
```

Description

This is NotSelectQuery, a member of class DataStoreErrorCode.

15.1.2.1.8.2.238 DataStoreErrorCode.NotTransactional Field

Pascal

```
const NotTransactional: Integer = 6000 + 14;
```

C++

```
int NotTransactional = 6000 + 14;
```

Description

This is NotTransactional, a member of class DataStoreErrorCode.

15.1.2.1.8.2.239 DataStoreErrorCode.NotUpdateable Field

Pascal

```
const NotUpdateable: Integer = 0 + 37;
```

C++

```
int NotUpdateable = 0 + 37;
```

Description

This is NotUpdateable, a member of class DataStoreErrorCode.

15.1.2.1.8.2.240 DataStoreErrorCode.NoUpdatableColumns Field

Pascal

```
const NoUpdatableColumns: Integer = 0 + 8;
```

C++

```
int NoUpdatableColumns = 0 + 8;
```

Description

This is NoUpdatableColumns, a member of class DataStoreErrorCode.

15.1.2.1.8.2.241 DataStoreErrorCode.NoWhereClause Field

Pascal

```
const NoWhereClause: Integer = 0 + 40;
```

C++

```
int NoWhereClause = 0 + 40;
```

Description

This is NoWhereClause, a member of class DataStoreErrorCode.

15.1.2.1.8.2.242 DataStoreErrorCode.NowReadonly Field

Pascal

```
const NowReadonly: Integer = 3000 + 84;
```

C++

```
int NowReadonly = 3000 + 84;
```

Description

This is NowReadonly, a member of class DataStoreErrorCode.

15.1.2.1.8.2.243 DataStoreErrorCode.NullColumnName Field

Pascal

```
const NullColumnName: Integer = 0 + 68;
```

C++

```
int NullColumnName = 0 + 68;
```

Description

This is NullColumnName, a member of class DataStoreErrorCode.

15.1.2.1.8.2.244 DataStoreErrorCode.NumericOverflow Field

Pascal

```
const NumericOverflow: Integer = 3000 + 85;
```

C++

```
int NumericOverflow = 3000 + 85;
```

Description

This is NumericOverflow, a member of class DataStoreErrorCode.

15.1.2.1.8.2.245 DataStoreErrorCode.NumericUnderflow Field

Pascal

```
const NumericUnderflow: Integer = 3000 + 86;
```

C++

```
int NumericUnderflow = 3000 + 86;
```

Description

This is NumericUnderflow, a member of class DataStoreErrorCode.

15.1.2.1.8.2.246 DataStoreErrorCode.OlderVersion Field

Pascal

```
const OlderVersion: Integer = 2000 + 41;
```

C++

```
int OlderVersion = 2000 + 41;
```

Description

This is OlderVersion, a member of class DataStoreErrorCode.

15.1.2.1.8.2.247 DataStoreErrorCode.OldLog Field

Pascal

```
const OldLog: Integer = 6000 + 25;
```

C++

```
int OldLog = 6000 + 25;
```

Description

This is OldLog, a member of class DataStoreErrorCode.

15.1.2.1.8.2.248 DataStoreErrorCode.OnepassInputStream Field

Pascal

```
const OnepassInputStream: Integer = 0 + 72;
```

C++

```
int OnepassInputStream = 0 + 72;
```

Description

This is OnepassInputStream, a member of class DataStoreErrorCode.

15.1.2.1.8.2.249 DataStoreErrorCode.OperationCanceled Field

Pascal

```
const OperationCanceled: Integer = 2000 + 25;
```

C++

```
int OperationCanceled = 2000 + 25;
```

Description

This is OperationCanceled, a member of class DataStoreErrorCode.

15.1.2.1.8.2.250 DataStoreErrorCode.OutParameterRequired Field

Pascal

```
const OutParameterRequired: Integer = 3000 + 87;
```

C++

```
int OutParameterRequired = 3000 + 87;
```

Description

This is OutParameterRequired, a member of class DataStoreErrorCode.

15.1.2.1.8.2.251 DataStoreErrorCode.OverloadedDiffParams Field

Pascal

```
const OverloadedDiffParams: Integer = 3000 + 109;
```

C++

```
int OverloadedDiffParams = 3000 + 109;
```

Description

This is OverloadedDiffParams, a member of class DataStoreErrorCode.

15.1.2.1.8.2.252 DataStoreErrorCode.ParameterCountMismatch Field

Pascal

```
const ParameterCountMismatch: Integer = 0 + 6;
```

C++

```
int ParameterCountMismatch = 0 + 6;
```

Description

This is ParameterCountMismatch, a member of class DataStoreErrorCode.

15.1.2.1.8.2.253 DataStoreErrorCode.ParameterValueNotSet Field

Pascal

```
const ParameterValueNotSet: Integer = 3000 + 88;
```

C++

```
int ParameterValueNotSet = 3000 + 88;
```

Description

This is ParameterValueNotSet, a member of class DataStoreErrorCode.

15.1.2.1.8.2.254 DataStoreErrorCode.PartialSearchForString Field

Pascal

```
const PartialSearchForString: Integer = 0 + 23;
```

C++

```
int PartialSearchForString = 0 + 23;
```

Description

This is PartialSearchForString, a member of class DataStoreErrorCode.

15.1.2.1.8.2.255 DataStoreErrorCode.PhysUndoNeeded Field

Pascal

```
const PhysUndoNeeded: Integer = 6000 + 32;
```

C++

```
int PhysUndoNeeded = 6000 + 32;
```

Description

This is PhysUndoNeeded, a member of class DataStoreErrorCode.

15.1.2.1.8.2.256 DataStoreErrorCode.PrivilegeMix Field

Pascal

```
const PrivilegeMix: Integer = 3000 + 89;
```

C++

```
int PrivilegeMix = 3000 + 89;
```

Description

This is PrivilegeMix, a member of class DataStoreErrorCode.

15.1.2.1.8.2.257 DataStoreErrorCode.ProcedureFailed Field

Pascal

```
const ProcedureFailed: Integer = 0 + 103;
```

C++

```
int ProcedureFailed = 0 + 103;
```

Description

This is ProcedureFailed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.258 DataStoreErrorCode.ProcedureInProcess Field

Pascal

```
const ProcedureInProcess: Integer = 0 + 94;
```

C++

```
int ProcedureInProcess = 0 + 94;
```

Description

This is ProcedureInProcess, a member of class DataStoreErrorCode.

15.1.2.1.8.2.259 DataStoreErrorCode.ProtocolVersion Field

Pascal

```
const ProtocolVersion: Integer = 3000 + 90;
```

C++

```
int ProtocolVersion = 3000 + 90;
```

Description

This is ProtocolVersion, a member of class DataStoreErrorCode.

15.1.2.1.8.2.260 DataStoreErrorCode.ProviderFailed Field

Pascal

```
const ProviderFailed: Integer = 0 + 87;
```

C++

```
int ProviderFailed = 0 + 87;
```

Description

This is ProviderFailed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.261 DataStoreErrorCode.ProviderOwned Field

Pascal

```
const ProviderOwned: Integer = 0 + 88;
```

C++

```
int ProviderOwned = 0 + 88;
```

Description

This is ProviderOwned, a member of class DataStoreErrorCode.

15.1.2.1.8.2.262 DataStoreErrorCode.QueryFailed Field

Pascal

```
const QueryFailed: Integer = 0 + 62;
```

C++

```
int QueryFailed = 0 + 62;
```

Description

This is QueryFailed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.263 DataStoreErrorCode.QueryInProcess Field

Pascal

```
const QueryInProcess: Integer = 0 + 26;
```

C++

```
int QueryInProcess = 0 + 26;
```

Description

This is QueryInProcess, a member of class DataStoreErrorCode.

15.1.2.1.8.2.264 DataStoreErrorCode.ReadBlockError Field

Pascal

```
const ReadBlockError: Integer = 2000 + 23;
```

C++

```
int ReadBlockError = 2000 + 23;
```

Description

This is ReadBlockError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.265 DataStoreErrorCode.ReadOnly Field

Pascal

```
const ReadOnly: Integer = 2000 + 40;
```

C++

```
int ReadOnly = 2000 + 40;
```

Description

This is ReadOnly, a member of class DataStoreErrorCode.

15.1.2.1.8.2.266 DataStoreErrorCode.ReadOnlyColumn Field

Pascal

```
const ReadOnlyColumn: Integer = 1000 + 1;
```

C++

```
int ReadOnlyColumn = 1000 + 1;
```

Description

This is ReadOnlyColumn, a member of class DataStoreErrorCode.

15.1.2.1.8.2.267 DataStoreErrorCode.ReadOnlyDataset Field

Pascal

```
const ReadOnlyDataset: Integer = 1000 + 2;
```

C++

```
int ReadOnlyDataset = 1000 + 2;
```

Description

This is ReadOnlyDataset, a member of class DataStoreErrorCode.

15.1.2.1.8.2.268 DataStoreErrorCode.ReadOnlyStore Field

Pascal

```
const ReadOnlyStore: Integer = 0 + 101;
```

C++

```
int ReadOnlyStore = 0 + 101;
```

Description

This is ReadOnlyStore, a member of class DataStoreErrorCode.

15.1.2.1.8.2.269 DataStoreErrorCode.ReadonlyTimeout Field

Pascal

```
const ReadonlyTimeout: Integer = 2000 + 71;
```

C++

```
int ReadonlyTimeout = 2000 + 71;
```

Description

This is ReadonlyTimeout, a member of class DataStoreErrorCode.

15.1.2.1.8.2.270 DataStoreErrorCode.ReadonlytxStartFailed Field

Pascal

```
const ReadonlytxStartFailed: Integer = 6000 + 33;
```

C++

```
int ReadonlytxStartFailed = 6000 + 33;
```

Description

This is ReadonlytxStartFailed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.271 DataStoreErrorCode.RecoveryDenied Field

Pascal

```
const RecoveryDenied: Integer = 6000 + 22;
```

C++

```
int RecoveryDenied = 6000 + 22;
```

Description

This is RecoveryDenied, a member of class DataStoreErrorCode.

15.1.2.1.8.2.272 DataStoreErrorCode.RefreshrowNotSupported Field

Pascal

```
const RefreshrowNotSupported: Integer = 0 + 75;
```

C++

```
int RefreshrowNotSupported = 0 + 75;
```

Description

This is RefreshrowNotSupported, a member of class DataStoreErrorCode.

15.1.2.1.8.2.273 DataStoreErrorCode.RenamedTwice Field

Pascal

```
const RenamedTwice: Integer = 3000 + 92;
```

C++

```
int RenamedTwice = 3000 + 92;
```

Description

This is RenamedTwice, a member of class DataStoreErrorCode.

15.1.2.1.8.2.274 DataStoreErrorCode.ReopenFailure Field

Pascal

```
const ReopenFailure: Integer = 0 + 61;
```

C++

```
int ReopenFailure = 0 + 61;
```

Description

This is ReopenFailure, a member of class DataStoreErrorCode.

15.1.2.1.8.2.275 DataStoreErrorCode.ResolveFailed Field

Pascal

```
const ResolveFailed: Integer = 0 + 63;
```

C++

```
int ResolveFailed = 0 + 63;
```

Description

This is ResolveFailed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.276 DataStoreErrorCode.ResolveInProgress Field

Pascal

```
const ResolveInProgress: Integer = 0 + 69;
```

C++

```
int ResolveInProgress = 0 + 69;
```

Description

This is ResolveInProgress, a member of class DataStoreErrorCode.

15.1.2.1.8.2.277 DataStoreErrorCode.ResolvePartial Field

Pascal

```
const ResolvePartial: Integer = 5000 + 5;
```

C++

```
int ResolvePartial = 5000 + 5;
```

Description

This is ResolvePartial, a member of class DataStoreErrorCode.

15.1.2.1.8.2.278 DataStoreErrorCode.RestructureDataLoss Field

Pascal

```
const RestructureDataLoss: Integer = 2000 + 26;
```

C++

```
int RestructureDataLoss = 2000 + 26;
```

Description

This is RestructureDataLoss, a member of class DataStoreErrorCode.

15.1.2.1.8.2.279 DataStoreErrorCode.RestructureInProgress Field

Pascal

```
const RestructureInProgress: Integer = 0 + 27;
```

C++

```
int RestructureInProgress = 0 + 27;
```

Description

This is RestructureInProgress, a member of class DataStoreErrorCode.

15.1.2.1.8.2.280 DataStoreErrorCode.RestructureParseError Field

Pascal

```
const RestructureParseError: Integer = 2000 + 28;
```

C++

```
int RestructureParseError = 2000 + 28;
```

Description

This is RestructureParseError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.281 DataStoreErrorCode.RestructurePrecisionLoss Field

Pascal

```
const RestructurePrecisionLoss: Integer = 2000 + 27;
```

C++

```
int RestructurePrecisionLoss = 2000 + 27;
```

Description

This is RestructurePrecisionLoss, a member of class DataStoreErrorCode.

15.1.2.1.8.2.282 DataStoreErrorCode.ResultNotUpdateable Field

Pascal

```
const ResultNotUpdateable: Integer = 3000 + 83;
```

C++

```
int ResultNotUpdateable = 3000 + 83;
```

Description

This is ResultNotUpdateable, a member of class DataStoreErrorCode.

15.1.2.1.8.2.283 DataStoreErrorCode.ResultsetClosed Field

Pascal

```
const ResultsetClosed: Integer = 3000 + 93;
```

C++

```
int ResultsetClosed = 3000 + 93;
```

Description

This is ResultsetClosed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.284 DataStoreErrorCode.RevokeErrorDependentPrivilege Field

Pascal

```
const RevokeErrorDependentPrivilege: Integer = 2000 + 63;
```

C++

```
int RevokeErrorDependentPrivilege = 2000 + 63;
```

Description

This is RevokeErrorDependentPrivilege, a member of class DataStoreErrorCode.

15.1.2.1.8.2.285 DataStoreErrorCode.RevokeErrorDependentView Field

Pascal

```
const RevokeErrorDependentView: Integer = 2000 + 61;
```

C++

```
int RevokeErrorDependentView = 2000 + 61;
```

Description

This is RevokeErrorDependentView, a member of class DataStoreErrorCode.

15.1.2.1.8.2.286 DataStoreErrorCode.RevokeErrorForeignKey Field

Pascal

```
const RevokeErrorForeignKey: Integer = 2000 + 62;
```

C++

```
int RevokeErrorForeignKey = 2000 + 62;
```

Description

This is RevokeErrorForeignKey, a member of class DataStoreErrorCode.

15.1.2.1.8.2.287 DataStoreErrorCode.RowLockTimeout Field

Pascal

```
const RowLockTimeout: Integer = 6000 + 26;
```

C++

```
int RowLockTimeout = 6000 + 26;
```

Description

This is RowLockTimeout, a member of class DataStoreErrorCode.

15.1.2.1.8.2.288 DataStoreErrorCode.RowNotFound Field

Pascal

```
const RowNotFound: Integer = 2000 + 38;
```

C++

```
int RowNotFound = 2000 + 38;
```

Description

This is RowNotFound, a member of class DataStoreErrorCode.

15.1.2.1.8.2.289 DataStoreErrorCode.RowTooWide Field

Pascal

```
const RowTooWide: Integer = 2000 + 6;
```

C++

```
int RowTooWide = 2000 + 6;
```

Description

This is RowTooWide, a member of class DataStoreErrorCode.

15.1.2.1.8.2.290 DataStoreErrorCode.RuntimeError Field

Pascal

```
const RuntimeError: Integer = 3000 + 114;
```

C++

```
int RuntimeError = 3000 + 114;
```

Description

This is RuntimeError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.291 DataStoreErrorCode.SecurityError Field

Pascal

```
const SecurityError: Integer = 2000 + 51;
```

C++

```
int SecurityError = 2000 + 51;
```

Description

This is SecurityError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.292 DataStoreErrorCode.SetCalculatedFailure Field

Pascal

```
const SetCalculatedFailure: Integer = 0 + 15;
```

C++

```
int SetCalculatedFailure = 0 + 15;
```

Description

This is SetCalculatedFailure, a member of class DataStoreErrorCode.

15.1.2.1.8.2.293 DataStoreErrorCode.SingleRowHasMoreRows Field

Pascal

```
const SingleRowHasMoreRows: Integer = 3000 + 94;
```

C++

```
int SingleRowHasMoreRows = 3000 + 94;
```

Description

This is SingleRowHasMoreRows, a member of class DataStoreErrorCode.

15.1.2.1.8.2.294 DataStoreErrorCode.SqlError Field

Pascal

```
const SqlError: Integer = 0 + 66;
```

C++

```
int SqlError = 0 + 66;
```

Description

This is SqlError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.295 DataStoreErrorCode.StatementClosed Field

Pascal

```
const StatementClosed: Integer = 3000 + 95;
```

C++

```
int StatementClosed = 3000 + 95;
```

Description

This is StatementClosed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.296 DataStoreErrorCode.StoreNameNotSet Field

Pascal

```
const StoreNameNotSet: Integer = 2000 + 1;
```

C++

```
int StoreNameNotSet = 2000 + 1;
```

Description

This is StoreNameNotSet, a member of class DataStoreErrorCode.

15.1.2.1.8.2.297 DataStoreErrorCode.StoreOperationUnsupported Field

Pascal

```
const StoreOperationUnsupported: Integer = 2000 + 16;
```

C++

```
int StoreOperationUnsupported = 2000 + 16;
```

Description

This is StoreOperationUnsupported, a member of class DataStoreErrorCode.

15.1.2.1.8.2.298 DataStoreErrorCode.StreamClosed Field

Pascal

```
const StreamClosed: Integer = 2000 + 31;
```

C++

```
int StreamClosed = 2000 + 31;
```

Description

This is StreamClosed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.299 DataStoreErrorCode.StreamNotFound Field

Pascal

```
const StreamNotFound: Integer = 2000 + 33;
```

C++

```
int StreamNotFound = 2000 + 33;
```

Description

This is StreamNotFound, a member of class DataStoreErrorCode.

15.1.2.1.8.2.300 DataStoreErrorCode.StreamOpenTwice Field

Pascal

```
const StreamOpenTwice: Integer = 2000 + 14;
```

C++

```
int StreamOpenTwice = 2000 + 14;
```

Description

This is StreamOpenTwice, a member of class DataStoreErrorCode.

15.1.2.1.8.2.301 DataStoreErrorCode.StringTooLong Field

Pascal

```
const StringTooLong: Integer = 3000 + 96;
```

C++

```
int StringTooLong = 3000 + 96;
```

Description

This is StringTooLong, a member of class DataStoreErrorCode.

15.1.2.1.8.2.302 DataStoreErrorCode.SyntaxError Field

Pascal

```
const SyntaxError: Integer = 3000 + 113;
```

C++

```
int SyntaxError = 3000 + 113;
```

Description

This is SyntaxError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.303 DataStoreErrorCode.TableAlreadyExists Field

Pascal

```
const TableAlreadyExists: Integer = 3000 + 97;
```

C++

```
int TableAlreadyExists = 3000 + 97;
```

Description

This is TableAlreadyExists, a member of class DataStoreErrorCode.

15.1.2.1.8.2.304 DataStoreErrorCode.TableNonexistent Field

Pascal

```
const TableNonexistent: Integer = 2000 + 64;
```

C++

```
int TableNonexistent = 2000 + 64;
```

Description

This is TableNonexistent, a member of class DataStoreErrorCode.

15.1.2.1.8.2.305 DataStoreErrorCode.TooManyAutoIncrements Field

Pascal

```
const TooManyAutoIncrements: Integer = 0 + 114;
```

C++

```
int TooManyAutoIncrements = 0 + 114;
```

Description

This is TooManyAutoIncrements, a member of class DataStoreErrorCode.

15.1.2.1.8.2.306 DataStoreErrorCode.TooManyErrors Field

Pascal

```
const TooManyErrors: Integer = 2000 + 39;
```

C++

```
int TooManyErrors = 2000 + 39;
```

Description

This is TooManyErrors, a member of class DataStoreErrorCode.

15.1.2.1.8.2.307 DataStoreErrorCode.TooManyOpenFiles Field

Pascal

```
const TooManyOpenFiles: Integer = 6000 + 10;
```

C++

```
int TooManyOpenFiles = 6000 + 10;
```

Description

This is TooManyOpenFiles, a member of class DataStoreErrorCode.

15.1.2.1.8.2.308 DataStoreErrorCode.Toomanyspecs Field

Pascal

```
const Toomanyspecs: Integer = 3000 + 98;
```

C++

```
int Toomanyspecs = 3000 + 98;
```

Description

This is Toomanyspecs, a member of class DataStoreErrorCode.

15.1.2.1.8.2.309 DataStoreErrorCode.TransactionIsolationLevelNotSupported Field

Pascal

```
const TransactionIsolationLevelNotSupported: Integer = 0 + 22;
```

C++

```
int TransactionIsolationLevelNotSupported = 0 + 22;
```

Description

This is TransactionIsolationLevelNotSupported, a member of class DataStoreErrorCode.

15.1.2.1.8.2.310 DataStoreErrorCode.TxAlreadyStarted Field

Pascal

```
const TxAlreadyStarted: Integer = 6000 + 30;
```

C++

```
int TxAlreadyStarted = 6000 + 30;
```

Description

This is TxAlreadyStarted, a member of class DataStoreErrorCode.

15.1.2.1.8.2.311 DataStoreErrorCode.TxManagerInuse Field

Pascal

```
const TxManagerInuse: Integer = 6000 + 18;
```

C++

```
int TxManagerInuse = 6000 + 18;
```

Description

This is TxManagerInuse, a member of class DataStoreErrorCode.

15.1.2.1.8.2.312 DataStoreErrorCode.TxNotAllowed Field

Pascal

```
const TxNotAllowed: Integer = 6000 + 21;
```

C++

```
int TxNotAllowed = 6000 + 21;
```

Description

This is TxNotAllowed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.313 DataStoreErrorCode.TxRequired Field

Pascal

```
const TxRequired: Integer = 6000 + 20;
```

C++

```
int TxRequired = 6000 + 20;
```

Description

This is TxRequired, a member of class DataStoreErrorCode.

15.1.2.1.8.2.314 DataStoreErrorCode.TypenameExpected Field

Pascal

```
const TypenameExpected: Integer = 3000 + 99;
```

C++

```
int TypenameExpected = 3000 + 99;
```

Description

This is TypenameExpected, a member of class DataStoreErrorCode.

15.1.2.1.8.2.315 DataStoreErrorCode.UnclosedComment Field

Pascal

```
const UnclosedComment: Integer = 3000 + 100;
```

C++

```
int UnclosedComment = 3000 + 100;
```

Description

This is UnclosedComment, a member of class DataStoreErrorCode.

15.1.2.1.8.2.316 DataStoreErrorCode.UnclosedIdentifier Field

Pascal

```
const UnclosedIdentifier: Integer = 3000 + 101;
```

C++

```
int UnclosedIdentifier = 3000 + 101;
```

Description

This is UnclosedIdentifier, a member of class DataStoreErrorCode.

15.1.2.1.8.2.317 DataStoreErrorCode.UnclosedStringLiteral Field

Pascal

```
const UnclosedStringLiteral: Integer = 3000 + 102;
```

C++

```
int UnclosedStringLiteral = 3000 + 102;
```

Description

This is UnclosedStringLiteral, a member of class DataStoreErrorCode.

15.1.2.1.8.2.318 DataStoreErrorCode.UnexpectedEndOfQuery Field

Pascal

```
const UnexpectedEndOfQuery: Integer = 0 + 3;
```

C++

```
int UnexpectedEndOfQuery = 0 + 3;
```

Description

This is UnexpectedEndOfQuery, a member of class DataStoreErrorCode.

15.1.2.1.8.2.319 DataStoreErrorCode.UnknownColumn Field

Pascal

```
const UnknownColumn: Integer = 3000 + 103;
```

C++

```
int UnknownColumn = 3000 + 103;
```

Description

This is UnknownColumn, a member of class DataStoreErrorCode.

15.1.2.1.8.2.320 DataStoreErrorCode.UnknownColumnName Field

Pascal

```
const UnknownColumnName: Integer = 0 + 10;
```

C++

```
int UnknownColumnName = 0 + 10;
```

Description

This is UnknownColumnName, a member of class DataStoreErrorCode.

15.1.2.1.8.2.321 DataStoreErrorCode.UnknownDetailName Field

Pascal

```
const UnknownDetailName: Integer = 0 + 98;
```

C++

```
int UnknownDetailName = 0 + 98;
```

Description

This is UnknownDetailName, a member of class DataStoreErrorCode.

15.1.2.1.8.2.322 DataStoreErrorCode.UnknownParameter Field

Pascal

```
const UnknownParameter: Integer = 3000 + 117;
```

C++

```
int UnknownParameter = 3000 + 117;
```

Description

This is UnknownParameter, a member of class DataStoreErrorCode.

15.1.2.1.8.2.323 DataStoreErrorCode.UnknownParamName Field

Pascal

```
const UnknownParamName: Integer = 0 + 4;
```

C++

```
int UnknownParamName = 0 + 4;
```

Description

This is UnknownParamName, a member of class DataStoreErrorCode.

15.1.2.1.8.2.324 DataStoreErrorCode.UnrecognizedDataType Field

Pascal

```
const UnrecognizedDataType: Integer = 0 + 16;
```

C++

```
int UnrecognizedDataType = 0 + 16;
```

Description

This is UnrecognizedDataType, a member of class DataStoreErrorCode.

15.1.2.1.8.2.325 DataStoreErrorCode.UnrecognizedEscape Field

Pascal

```
const UnrecognizedEscape: Integer = 3000 + 104;
```

C++

```
int UnrecognizedEscape = 3000 + 104;
```

Description

This is UnrecognizedEscape, a member of class DataStoreErrorCode.

15.1.2.1.8.2.326 DataStoreErrorCode.UnsupportedColumntype Field

Pascal

```
const UnsupportedColumntype: Integer = 7000 + 1;
```

C++

```
int UnsupportedColumntype = 7000 + 1;
```

Description

This is UnsupportedColumntype, a member of class DataStoreErrorCode.

15.1.2.1.8.2.327 DataStoreErrorCode.UnsupportedDbxType Field

Pascal

```
const UnsupportedDbxType: Integer = 3000 + 120;
```

C++

```
int UnsupportedDbxType = 3000 + 120;
```

Description

This is UnsupportedDbxType, a member of class DataStoreErrorCode.

15.1.2.1.8.2.328 DataStoreErrorCode.UpdateFailed Field

Pascal

```
const UpdateFailed: Integer = 5000 + 3;
```

C++

```
int UpdateFailed = 5000 + 3;
```

Description

This is UpdateFailed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.329 DataStoreErrorCode.UpdateNotAllowed Field

Pascal

```
const UpdateNotAllowed: Integer = 1000 + 15;
```

C++

```
int UpdateNotAllowed = 1000 + 15;
```

Description

This is UpdateNotAllowed, a member of class DataStoreErrorCode.

15.1.2.1.8.2.330 DataStoreErrorCode.UrlNotFound Field

Pascal

```
const UrlNotFound: Integer = 0 + 84;
```

C++

```
int UrlNotFound = 0 + 84;
```

Description

This is UrlNotFound, a member of class DataStoreErrorCode.

15.1.2.1.8.2.331 DataStoreErrorCode.UrlNotFoundInDesign Field

Pascal

```
const UrlNotFoundInDesign: Integer = 0 + 85;
```

C++

```
int UrlNotFoundInDesign = 0 + 85;
```

Description

This is UrlNotFoundInDesign, a member of class DataStoreErrorCode.

15.1.2.1.8.2.332 DataStoreErrorCode.ViewNotUpdatable Field

Pascal

```
const ViewNotUpdatable: Integer = 3000 + 105;
```

C++

```
int ViewNotUpdatable = 3000 + 105;
```

Description

This is ViewNotUpdatable, a member of class DataStoreErrorCode.

15.1.2.1.8.2.333 DataStoreErrorCode.WithCheckOptionViolation Field

Pascal

```
const WithCheckOptionViolation: Integer = 3000 + 106;
```

C++

```
int WithCheckOptionViolation = 3000 + 106;
```

Description

This is WithCheckOptionViolation, a member of class DataStoreErrorCode.

15.1.2.1.8.2.334 DataStoreErrorCode.WriteBlockError Field

Pascal

```
const WriteBlockError: Integer = 2000 + 22;
```

C++

```
int WriteBlockError = 2000 + 22;
```

Description

This is WriteBlockError, a member of class DataStoreErrorCode.

15.1.2.1.8.2.335 DataStoreErrorCode.WrongCreateschemaname Field

Pascal

```
const WrongCreateschemaname: Integer = 3000 + 111;
```

C++

```
int WrongCreateschemaname = 3000 + 111;
```

Description

This is WrongCreateschemaname, a member of class DataStoreErrorCode.

15.1.2.1.8.2.336 DataStoreErrorCode.WrongDatabase Field

Pascal

```
const WrongDatabase: Integer = 0 + 91;
```

C++

```
int WrongDatabase = 0 + 91;
```

Description

This is WrongDatabase, a member of class DataStoreErrorCode.

15.1.2.1.8.2.337 DataStoreErrorCode.WrongSchemaname Field

Pascal

```
const WrongSchemaname: Integer = 3000 + 110;
```

C++

```
int WrongSchemaname = 3000 + 110;
```

Description

This is WrongSchemaname, a member of class DataStoreErrorCode.

15.1.2.1.8.2.338 DataStoreErrorCode.WrongTableType Field

Pascal

```
const WrongTableType: Integer = 3000 + 112;
```

C++

```
int WrongTableType = 3000 + 112;
```

Description

This is WrongTableType, a member of class DataStoreErrorCode.

15.1.2.1.8.2.339 DataStoreErrorCode.XaActive Field

Pascal

```
const XaActive: Integer = 6000 + 27;
```

C++

```
int XaActive = 6000 + 27;
```

Description

This is XaActive, a member of class DataStoreErrorCode.

15.1.2.1.9 DataStoreParameter Class

Specifies parameter for DataStoreCommand (see page 1912).

Class Hierarchy

Pascal

```
DataStoreParameter = class(DbParameter, IDbDataParameter, ICloneable);
```

C++

```
class DataStoreParameter : public DbParameter, public IDbDataParameter, public ICloneable;
```

File

Ado.Net20.cs

Description

DataStoreParameter specifies a parameter for a DataStoreCommand (see page 1912). Parameter names are case sensitive.

DataStoreParameter is an implementation of the .NET DbParameter class.

See Also

DbParameter (MSDN)

DataStoreCommand (see page 1912)

15.1.2.1.9.1 DataStoreParameter Members

The following tables list the members exposed by DataStoreParameter.

Internal Properties

	Name	Description
	WasPrepared (see page 2041)	This is WasPrepared, a member of class DataStoreParameter.

Public Methods

	Name	Description
	Clone (see page 2036)	Creates a new object that is a copy of the current instance.
	DataStoreParameter (see page 2034)	This is the overview for the DataStoreParameter constructor overload.
	ResetDbType (see page 2036)	Resets DbType (see page 2037) property to original settings.

Public Properties

	Name	Description
	DbType (see page 2037)	Gets and sets expected data type of parameter.
	Direction (see page 2037)	Gets or sets direction of parameter.
	IsNullable (see page 2037)	Indicates whether parameter accepts null values.
	JDSType (see page 2038)	Gets and sets expected JDSType of parameter.
	ParameterName (see page 2038)	Gets or sets parameter name.
	Precision (see page 2038)	Gets or sets maximum number of digits used to represent Value (see page 2041) property.
	Scale (see page 2039)	Gets and sets scale of Value (see page 2041) property, which contains either numeric or decimal value.
	Size (see page 2039)	Gets and sets the size of the parameter value in bytes.
	SourceColumn (see page 2039)	The name of the source column mapped to the DataSet. The default is an empty string.
	SourceColumnNullMapping (see page 2040)	Sets or gets a value indicating whether the column can be null.
	SourceVersion (see page 2040)	Gets or sets the DataRowVersion to use when loading Value (see page 2041).
	Value (see page 2041)	Gets or sets value of parameter.

15.1.2.1.9.2 DataStoreParameter Constructor

This is the overview for the DataStoreParameter constructor overload.

Overload List

	Name	Description
	DataStoreParameter.DataStoreParameter () (see page 2035)	Creates a new instance of a DataStoreCommand (see page 1912) class.
	DataStoreParameter.DataStoreParameter (string, DbType) (see page 2035)	Creates a new instance of a DataStoreCommand (see page 1912) class.

	DataStoreParameter.DataStoreParameter (string, DbType, ParameterDirection, string, DataRowVersion) (see page 2035)	Creates a new instance of a DataStoreCommand (see page 1912) class.
	DataStoreParameter.DataStoreParameter (string, JDSType) (see page 2035)	Creates a new instance of a DataStoreCommand (see page 1912) class.
	DataStoreParameter.DataStoreParameter (string, JDSType, ParameterDirection, string, DataRowVersion) (see page 2035)	Creates a new instance of a DataStoreCommand (see page 1912) class.

15.1.2.1.9.2.1 DataStoreParameter.DataStoreParameter Constructor ()

Creates a new instance of a DataStoreCommand (see page 1912) class.

Pascal

```
constructor Create;
constructor Create(parameterName: string; type: DbType);
constructor Create(parameterName: string; type: JDSType);
constructor Create(parameterName: string; type: DbType; paramDirection: ParameterDirection;
sourceColumn: string; sourceVersion: DataRowVersion);
constructor Create(parameterName: string; type: JDSType; paramDirection: ParameterDirection;
sourceColumn: string; sourceVersion: DataRowVersion);
```

C++

```
DataStoreParameter();
DataStoreParameter(string parameterName, DbType type);
DataStoreParameter(string parameterName, JDSType type);
DataStoreParameter(string parameterName, DbType type, ParameterDirection paramDirection,
string sourceColumn, DataRowVersion sourceVersion);
DataStoreParameter(string parameterName, JDSType type, ParameterDirection paramDirection,
string sourceColumn, DataRowVersion sourceVersion);
```

Description

Creates a new instance of a DataStoreCommand (see page 1912) class, which is an implementation of the .NET DbParameter class.

There are several forms of this constructor:

- Creates a new instance of a DataStoreCommand (see page 1912) class.
- Creates a new instance of a DataStoreCommand (see page 1912) class with a given name and expected data type. The parameter **parameterName** is the name of this parameter. The parameter **type** is the type of the parameter.
- Creates a new instance of a DataStoreCommand (see page 1912) class with a given name and expected data type. The parameter **parameterName** is the name of this parameter. The parameter **type** is the JDSType (see page 2038) of the parameter.
- Creates a new instance of a DataStoreCommand (see page 1912) class with a given name, expected data type, parameter direction, source column name, and source version. The parameter **parameterName** is the name of this parameter. The parameter **type** is the type of this parameter. The parameter **paramDirection** is the direction: Input, Output, InputOutput, ReturnValue. The parameter **sourceColumn** is the name of the source column that is mapped to a DataSet to get and set the value. The parameter **sourceVersion** is the version of the value to get from the DataSet.
- Creates a new instance of a DataStoreCommand (see page 1912) class with a given name, expected data type, parameter direction, source column name, and source version. The parameter **parameterName** is the name of this parameter. The parameter **type** is the JDSType (see page 2038) of this parameter. The parameter **paramDirection** is the direction: Input, Output, InputOutput, ReturnValue. The parameter **sourceColumn** is the name of the source column that is mapped to a DataSet to get and set the value. The parameter **sourceVersion** is specified the version of the value to get from the DataSet.

15.1.2.1.9.3 DataStoreParameter Methods

The methods of the DataStoreParameter class are listed here.

Public Methods

	Name	Description
	Clone (see page 2036)	Creates a new object that is a copy of the current instance.
	ResetDbType (see page 2036)	Resets DbType (see page 2037) property to original settings.

15.1.2.1.9.3.1 DataStoreParameter.Clone Method

Creates a new object that is a copy of the current instance.

Pascal

```
function Clone: DataStoreParameter;
```

C++

```
DataStoreParameter Clone();
```

Description

Clone creates a new object that is a copy of the current instance.

See Also

Clone (MSDN)

15.1.2.1.9.3.2 DataStoreParameter.ResetDbType Method

Resets DbType (see page 2037) property to original settings.

Pascal

```
function ResetDbType: void;
```

C++

```
void ResetDbType();
```

Description

ResetDbType resets the DbType (see page 2037) property to its original settings.

See Also

ResetDbType (MSDN)

DbType (see page 2037)

15.1.2.1.9.4 DataStoreParameter Properties

The properties of the DataStoreParameter class are listed here.

Internal Properties

	Name	Description
	WasPrepared (see page 2041)	This is WasPrepared, a member of class DataStoreParameter.

Public Properties

	Name	Description
	DbType (see page 2037)	Gets and sets expected data type of parameter.

	Direction (see page 2037)	Gets or sets direction of parameter.
	IsNullable (see page 2037)	Indicates whether parameter accepts null values.
	JDSType (see page 2038)	Gets and sets expected JDSType of parameter.
	ParameterName (see page 2038)	Gets or sets parameter name.
	Precision (see page 2038)	Gets or sets maximum number of digits used to represent Value (see page 2041) property.
	Scale (see page 2039)	Gets and sets scale of Value (see page 2041) property, which contains either numeric or decimal value.
	Size (see page 2039)	Gets and sets the size of the parameter value in bytes.
	SourceColumn (see page 2039)	The name of the source column mapped to the DataSet. The default is an empty string.
	SourceColumnNullMapping (see page 2040)	Sets or gets a value indicating whether the column can be null.
	SourceVersion (see page 2040)	Gets or sets the DataRowVersion to use when loading Value (see page 2041).
	Value (see page 2041)	Gets or sets value of parameter.

15.1.2.1.9.4.1 DataStoreParameter.DbType Property

Gets and sets expected data type of parameter.

Pascal

```
property DbType: DbType;
```

C++

```
__property DbType DbType;
```

Description

DbType gets and sets the expected data type of the parameter.

See Also

DbType (MSDN)

JDSType (see page 2038)

15.1.2.1.9.4.2 DataStoreParameter.Direction Property

Gets or sets direction of parameter.

Pascal

```
property Direction: ParameterDirection;
```

C++

```
__property ParameterDirection Direction;
```

Description

Direction gets or sets the direction of this parameter.

See Also

Direction (MSDN)

15.1.2.1.9.4.3 DataStoreParameter.IsNullable Property

Indicates whether parameter accepts null values.

Pascal

```
property IsNullable: Boolean;
```

C++

```
__property Boolean IsNullable;
```

Description

IsNullable gets or sets a value that indicates whether the parameter accepts null values.

See Also

IsNullable (MSDN)

15.1.2.1.9.4.4 DataStoreParameter.JDSType Property

Gets and sets expected JDSType of parameter.

Pascal

```
property JDSType: JDSType;
```

C++

```
__property JDSType JDSType;
```

Description

JDSType gets and sets the expected JDSType of the parameter.

See Also

DbType (MSDN)

DbType (see page 2037)

15.1.2.1.9.4.5 DataStoreParameter.ParameterName Property

Gets or sets parameter name.

Pascal

```
property ParameterName: String;
```

C++

```
__property AnsiString ParameterName;
```

Description

ParameterName gets or sets the name of this parameter.

See Also

ParameterName (MSDN)

15.1.2.1.9.4.6 DataStoreParameter.Precision Property

Gets or sets maximum number of digits used to represent Value (see page 2041) property.

Pascal

```
property Precision: byte;
```

C++

```
__property byte Precision;
```

Description

Precision gets or sets the maximum number of digits used to represent the Value (see page 2041) property. The default is 0, which indicates that the data provider sets the precision for the Value (see page 2041) property.

See Also

Value (see page 2041)

15.1.2.1.9.4.7 DataStoreParameter.Scale Property

Gets and sets scale of Value (see page 2041) property, which contains either numeric or decimal value.

Pascal

```
property Scale: byte;
```

C++

```
__property byte Scale;
```

Description

Scale gets and sets the number of digits to the right of the decimal for the numeric or decimal value of the Value (see page 2041) property. The default is 0.

See Also

Value (see page 2041)

15.1.2.1.9.4.8 DataStoreParameter.Size Property

Gets and sets the size of the parameter value in bytes.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

Size is used for binary and string types. Size is ignored for fixed length data types. For Unicode, Size is the number of characters, not bytes. Size does not include any string terminating characters.

Size and DbType (see page 2037) can be inferred if Value (see page 2041) is set, but they are not explicitly set by setting Value (see page 2041).

See Also

Size (MSDN)

DbType (see page 1860)

Value (see page 1865)

15.1.2.1.9.4.9 DataStoreParameter.SourceColumn Property

The name of the source column mapped to the DataSet. The default is an empty string.

Pascal

```
property SourceColumn: String;
```

C++

```
__property AnsiString SourceColumn;
```

Description

Use this property and the SourceColumn property when you are submitting pending changes to the database and you want to validate the version of the data in the target row. To return a value from a particular column in the database, set the SourceColumn property to the name of the column. If the Direction (see page 2037) property is set to *Input*, the value is taken from the DataSet instead of the database. If the Direction (see page 2037) property is set to *Output*, the value is taken from the database.

See Also

SourceColumn (MSDN)

Direction (see page 2037)

15.1.2.1.9.4.10 DataStoreParameter.SourceColumnNullMapping Property

Sets or gets a value indicating whether the column can be null.

Pascal

```
property SourceColumnNullMapping: Boolean;
```

C++

```
__property Boolean SourceColumnNullMapping;
```

Description

SourceColumnNullMapping sets or gets a value indicating whether the column can be set to null. This value allows DataStoreCommandBuilder to generate correct Update statements for nullable columns.

See Also

SourceColumnNullMapping (MSDN)

DataStoreCommandBuilder

15.1.2.1.9.4.11 DataStoreParameter.SourceVersion Property

Gets or sets the DataRowVersion to use when loading Value (see page 2041).

Pascal

```
property SourceVersion: DataRowVersion;
```

C++

```
__property DataRowVersion SourceVersion;
```

Description

Use this property and the SourceColumn (see page 2039) property when you are submitting pending changes to the database and you want to validate the version of the data in the target row. Used by UpdateCommand during an Update operation to determine whether the parameter value is set to **Current** or **Original**. This allows primary keys to be updated. This property is ignored by the InsertCommand and DeleteCommand properties. This property is set to the version of the DataRow used by the Item property or the GetChildRows method of the DataRow object.

The following table lists the allowable SourceVersion values, which are DataRowVersion values.

Member	Description
Current	Current value of the column. Default.
Default	Uses the DefaultValue of the column.
Original	Original value of the column.
Proposed	Uses a Proposed value.

Value (see page 2041)

Update

15.1.2.1.9.4.12 DataStoreParameter.Value Property

Gets or sets value of parameter.

Pascal

```
property Value: object;
```

C++

```
__property object Value;
```

Description

Value gets or sets the value of this parameter. Null values are accepted as either null or DBNull. If the parameter's Direction (see page 2037) is **Output** or **ReturnValue**, any null values received are DBNull values. The input type is inferred from the value itself. Binary data can be accepted as a byte[] or as an instance of a System.IO.Stream class. Binary output will be a System.IO.Stream instance.

See Also

Value (MSDN)

DBNull (MSDN)

Direction (see page 2037)

15.1.2.1.9.4.13 DataStoreParameter.WasPrepared Property

Pascal

```
property WasPrepared: bool;
```

C++

```
__property bool WasPrepared;
```

Description

This is WasPrepared, a member of class DataStoreParameter.

15.1.2.1.10 DataStoreParameterCollection Class

Collection of parameters for DataStoreCommand (see page 1912).

Class Hierarchy

Pascal

```
DataStoreParameterCollection = class(DbParameterCollection, IDataParameterCollection, IList,
ICollection, IEnumerable);
```

C++

```
class DataStoreParameterCollection : public DbParameterCollection, public
IDataParameterCollection, public IList, public ICollection, public IEnumerable;
```

File

Ado.Net20.cs

Description

DataStoreParameterCollection specifies a collection of DataStoreParameters for a DataStoreCommand (see page 1912).

DataStoreParameterCollection is an implementation of the .NET DbParameterCollection class.

See Also

DbParameterCollection (MSDN)

DataStoreCommand (see page 1912)

DataStoreParameter (see page 2033)

15.1.2.1.10.1 DataStoreParameterCollection Members

The following tables list the members exposed by DataStoreParameterCollection.

Internal Methods

	Name	Description
	InvalidatePreparation (see page 2048)	This is InvalidatePreparation, a member of class DataStoreParameterCollection.

Protected Methods

	Name	Description
	GetParameter (see page 2047)	This is the overview for the GetParameter method overload.
	SetParameter (see page 2050)	This is the overview for the SetParameter method overload.

Public Methods

	Name	Description
	Add (see page 2044)	This is the overview for the Add method overload.
	AddRange (see page 2045)	Adds array of items with specified values to DataStoreParameterCollection (see page 2041).
	Clear (see page 2045)	Removes all DataStoreParameter (see page 2033) values from DataStoreParameterCollection (see page 2041).
	Contains (see page 2045)	This is the overview for the Contains method overload.
	CopyTo (see page 2046)	Copies an array of items to collection.
	DataStoreParameterCollection (see page 2043)	Initializes a new instance of the DataStoreParameterCollection class.
	GetEnumerator (see page 2046)	Returns an enumerator for the collection.
	IndexOf (see page 2047)	This is the overview for the IndexOf method overload.
	Insert (see page 2048)	Inserts a parameter in collection.
	Remove (see page 2049)	Removes specified parameter from collection.
	RemoveAt (see page 2049)	This is the overview for the RemoveAt method overload.
	this (see page 2050)	This is the overview for the this indexer overload.

Public Properties

	Name	Description
	Count (see page 2051)	Returns a count of the number of parameters in the collection.

	IsFixedSize (see page 2051)	Returns a Boolean indicating whether the collection object has a fixed size or whether it is automatically expanding to accommodate addition of new items.
	IsReadOnly (see page 2052)	Returns a Boolean indicating whether the collection object is read-only or read-write.
	IsSynchronized (see page 2052)	Returns a Boolean indicating whether or not the collection is synchronized and therefore thread-safe.
	SyncRoot (see page 2052)	Returns the SyncRoot of the collection.

15.1.2.1.10.2 DataStoreParameterCollection.DataStoreParameterCollection Constructor

Initializes a new instance of the DataStoreParameterCollection class.

Pascal

```
constructor Create;
```

C++

```
DataStoreParameterCollection();
```

Description

DataStoreParameterCollection initializes a new instance of the DataStoreParameterCollection class, which is an implementation of the DbParameterCollection class.

See Also

DbParameterCollection constructor (MSDN)

DbParameterCollection class (MSDN)

15.1.2.1.10.3 DataStoreParameterCollection Methods

The methods of the DataStoreParameterCollection class are listed here.

Internal Methods

	Name	Description
	InvalidatePreparation (see page 2048)	This is InvalidatePreparation, a member of class DataStoreParameterCollection.

Protected Methods

	Name	Description
	GetParameter (see page 2047)	This is the overview for the GetParameter method overload.
	SetParameter (see page 2050)	This is the overview for the SetParameter method overload.

Public Methods

	Name	Description
	Add (see page 2044)	This is the overview for the Add method overload.
	AddRange (see page 2045)	Adds array of items with specified values to DataStoreParameterCollection (see page 2041).
	Clear (see page 2045)	Removes all DataStoreParameter (see page 2033) values from DataStoreParameterCollection (see page 2041).
	Contains (see page 2045)	This is the overview for the Contains method overload.
	CopyTo (see page 2046)	Copies an array of items to collection.
	GetEnumerator (see page 2046)	Returns an enumerator for the collection.
	IndexOf (see page 2047)	This is the overview for the IndexOf method overload.
	Insert (see page 2048)	Inserts a parameter in collection.
	Remove (see page 2049)	Removes specified parameter from collection.
	RemoveAt (see page 2049)	This is the overview for the RemoveAt method overload.
	this (see page 2050)	This is the overview for the this indexer overload.

15.1.2.1.10.3.1 Add Method

This is the overview for the Add method overload.

Overload List

	Name	Description
	DataStoreParameterCollection.Add (DataStoreParameter) (see page 2044)	Adds DataStoreParameter (see page 2033) object to collection.
	DataStoreParameterCollection.Add (object) (see page 2044)	Adds DataStoreParameter (see page 2033) object to collection.
	DataStoreParameterCollection.Add (string, DbType) (see page 2044)	Adds DataStoreParameter (see page 2033) object to collection.
	DataStoreParameterCollection.Add (string, DbType, ParameterDirection, string, DataRowVersion) (see page 2044)	Adds DataStoreParameter (see page 2033) object to collection.
	DataStoreParameterCollection.Add (string, JDSType) (see page 2044)	Adds DataStoreParameter (see page 2033) object to collection.
	DataStoreParameterCollection.Add (string, JDSType, ParameterDirection, string, DataRowVersion) (see page 2044)	Adds DataStoreParameter (see page 2033) object to collection.

15.1.2.1.10.3.1.1 DataStoreParameterCollection.Add Method (DataStoreParameter)

Adds DataStoreParameter (see page 2033) object to collection.

Pascal

```
function Add(value: object): Integer;
function Add(value: DataStoreParameter): Integer;
function Add(parameterName: string; type: DbType): DataStoreParameter;
function Add(parameterName: string; type: JDSType): DataStoreParameter;
function Add(parameterName: string; dbType: DbType; direction: ParameterDirection;
sourceColumn: string; version: DataRowVersion): DataStoreParameter;
function Add(parameterName: string; type: JDSType; direction: ParameterDirection;
sourceColumn: string; version: DataRowVersion): DataStoreParameter;
```

C++

```
int Add(object value);
int Add(DataStoreParameter value);
DataStoreParameter Add(string parameterName, DbType type);
DataStoreParameter Add(string parameterName, JDSType type);
DataStoreParameter Add(string parameterName, DbType dbType, ParameterDirection direction,
string sourceColumn, DataRowVersion version);
DataStoreParameter Add(string parameterName, JDSType type, ParameterDirection direction,
string sourceColumn, DataRowVersion version);
```

Description

Add adds a DataStoreParameter (see page 2033) to the DataStoreParameterCollection (see page 2041). It has several forms:

- Adds the specified DataStoreParameter (see page 2033) object to the collection.
- Adds the specified DataStoreParameter (see page 2033) object to the collection. Returns the index of the parameter in the collection.
- Adds a DataStoreParameter (see page 2033) with the specified name and type to the collection. Returns the DataStoreParameter (see page 2033) added.

- Adds a DataStoreParameter (see page 2033) with the specified name and JDSType to the collection. Returns the DataStoreParameter (see page 2033) added.
- Adds a DataStoreParameter (see page 2033) with the specified name, type, direction, source column, and source version to the collection. Returns the DataStoreParameter (see page 2033) added.
- Adds a DataStoreParameter (see page 2033) with the specified name, JDSType, direction, source column, and source version to the collection. Returns the DataStoreParameter (see page 2033) added.

See Also

Add (MSDN)

DataStoreParameter (see page 2033)

15.1.2.1.10.3.2 DataStoreParameterCollection.AddRange Method

Adds array of items with specified values to DataStoreParameterCollection (see page 2041).

Pascal

```
function AddRange(values: Array): void;
```

C++

```
void AddRange(Array values);
```

Description

AddRange adds an array of items with the specified values to the DataStoreParameterCollection (see page 2041).

See Also

AddRange (MSDN)

15.1.2.1.10.3.3 DataStoreParameterCollection.Clear Method

Removes all DataStoreParameter (see page 2033) values from DataStoreParameterCollection (see page 2041).

Pascal

```
function Clear: void;
```

C++

```
void Clear();
```

Description

Clear removes all DataStoreParameter (see page 2033) values from the DataStoreParameterCollection (see page 2041).

See Also

Clear (MSDN)

DataStoreParameter (see page 2033)

15.1.2.1.10.3.4 Contains Method

This is the overview for the Contains method overload.

Overload List

	Name	Description
	DataStoreParameterCollection.Contains (object) (see page 2046)	Checks if parameter exists in collection.

	DataStoreParameterCollection.Contains (string) (see page 2046)	Checks if parameter exists in collection.

15.1.2.1.10.3.4.1 DataStoreParameterCollection.Contains Method (object)

Checks if parameter exists in collection.

Pascal

```
function Contains(value: object): bool;
function Contains(parameterName: string): bool;
```

C++

```
bool Contains(object value);
bool Contains(string parameterName);
```

Description

There are several forms of this method:

- Checks if a specific parameter exists in the collection. The parameter **value** is value of the parameter. Returns **true** if the parameter is present.
- Checks if a parameter with the specified name exists in the collection. The parameter **parameterName** is name of the parameter. Returns **true** if the parameter is present.

See Also

Contains (MSDN)

15.1.2.1.10.3.5 DataStoreParameterCollection.CopyTo Method

Copies an array of items to collection.

Pascal

```
function CopyTo(array: Array; index: Integer): void;
```

C++

```
void CopyTo(Array array, int index);
```

Description

CopyTo copies an array of items to the collection starting at a specified index.

Parameter	Description
Values	Array of items to copy.
Index	Index in the collection at which to start copying.

See Also

CopyTo (MSDN)

15.1.2.1.10.3.6 DataStoreParameterCollection.GetEnumerator Method

Returns an enumerator for the collection.

Pascal

```
function GetEnumerator: IEnumerator;
```

C++

```
IEnumerator GetEnumerator();
```

Description

GetEnumerator returns an enumerator, which supports simple iteration over a collection. The returned value supports the IEnumerator Interface.

See Also

GetEnumerator (MSDN)

IEnumerator (MSDN)

15.1.2.1.10.3.7 GetParameter Method

This is the overview for the GetParameter method overload.

Overload List

	Name	Description
	DataStoreParameterCollection.GetParameter (int) (see page 2047)	This is GetParameter, a member of class DataStoreParameterCollection.
	DataStoreParameterCollection.GetParameter (string) (see page 2047)	This is GetParameter, a member of class DataStoreParameterCollection.

15.1.2.1.10.3.7.1 DataStoreParameterCollection.GetParameter Method (int)

Pascal

```
function GetParameter(index: Integer): DbParameter;
```

C++

```
DbParameter GetParameter(int index);
```

Description

This is GetParameter, a member of class DataStoreParameterCollection.

15.1.2.1.10.3.7.2 DataStoreParameterCollection.GetParameter Method (string)

Pascal

```
function GetParameter(parameterName: string): DbParameter;
```

C++

```
DbParameter GetParameter(string parameterName);
```

Description

This is GetParameter, a member of class DataStoreParameterCollection.

15.1.2.1.10.3.8 IndexOf Method

This is the overview for the IndexOf method overload.

Overload List

	Name	Description
	DataStoreParameterCollection.IndexOf (object) (see page 2048)	Returns index in collection of parameter.
	DataStoreParameterCollection.IndexOf (string) (see page 2048)	Returns index in collection of parameter.

15.1.2.1.10.3.8.1 DataStoreParameterCollection.IndexOf Method (object)

Returns index in collection of parameter.

Pascal

```
function IndexOf(value: object): Integer;
function IndexOf(parameterName: string): Integer;
```

C++

```
int IndexOf(object value);
int IndexOf(string parameterName);
```

Description

This method has several forms:

- Returns the index in the collection of a parameter value. The parameter **value** is name of the parameter.
- Returns the index in the collection of a parameter with the specified name. The parameter **parameterName** is name of the parameter.

See Also

IndexOf (MSDN)

15.1.2.1.10.3.9 DataStoreParameterCollection.Insert Method

Inserts a parameter in collection.

Pascal

```
function Insert(index: Integer; value: object): void;
```

C++

```
void Insert(int index, object value);
```

Description

Insert a specified DataStoreParameter (see page 2033) instance into a collection at the specified index.

Parameter	Description
Ordinal	Index in collection at which to insert DataStoreParameter (see page 2033) instance.
Parameter	DataStoreParameter (see page 2033) instance to insert.

See Also

Insert (MSDN)

15.1.2.1.10.3.10 DataStoreParameterCollection.InvalidatePreparation Method

Pascal

```
function InvalidatePreparation: void;
```

C++

```
void InvalidatePreparation();
```

Description

This is InvalidatePreparation, a member of class DataStoreParameterCollection.

15.1.2.1.10.3.11 DataStoreParameterCollection.Remove Method

Removes specified parameter from collection.

Pascal

```
function Remove(value: object): void;
```

C++

```
void Remove(object value);
```

Description

Remove removes the specified DataStoreParameter (see page 2033) instance from the collection.

See Also

Remove (MSDN)

15.1.2.1.10.3.12 RemoveAt Method

This is the overview for the RemoveAt method overload.

Overload List

	Name	Description
	DataStoreParameterCollection.RemoveAt (int) (see page 2049)	Removes a specified parameter from the collection.
	DataStoreParameterCollection.RemoveAt (string) (see page 2049)	Removes a specified parameter from the collection.

15.1.2.1.10.3.12.1 DataStoreParameterCollection.RemoveAt Method (int)

Removes a specified parameter from the collection.

Pascal

```
function RemoveAt(index: Integer): void;
function RemoveAt(parameterName: string): void;
```

C++

```
void RemoveAt(int index);
void RemoveAt(string parameterName);
```

Description

RemoveAt removes a specified DataStoreParameter (see page 2033) instance from the collection. The parameter may be specified by either a String or an index into the collection.

See Also

RemoveAt (MSDN)

15.1.2.1.10.3.13 SetParameter Method

This is the overview for the SetParameter method overload.

Overload List

	Name	Description
	DataStoreParameterCollection.SetParameter (int, DbParameter) (see page 2050)	This is SetParameter, a member of class DataStoreParameterCollection.
	DataStoreParameterCollection.SetParameter (string, DbParameter) (see page 2050)	This is SetParameter, a member of class DataStoreParameterCollection.

15.1.2.1.10.3.13.1 DataStoreParameterCollection.SetParameter Method (int, DbParameter)

Pascal

```
function SetParameter(index: Integer; value: DbParameter): void;
```

C++

```
void SetParameter(int index, DbParameter value);
```

Description

This is SetParameter, a member of class DataStoreParameterCollection.

15.1.2.1.10.3.13.2 DataStoreParameterCollection.SetParameter Method (string, DbParameter)

Pascal

```
function SetParameter(parameterName: string; value: DbParameter): void;
```

C++

```
void SetParameter(string parameterName, DbParameter value);
```

Description

This is SetParameter, a member of class DataStoreParameterCollection.

15.1.2.1.10.3.14 this Indexer

This is the overview for the this indexer overload.

Overload List

	Name	Description
	DataStoreParameterCollection.this (int) (see page 2050)	This is this, a member of class DataStoreParameterCollection.
	DataStoreParameterCollection.this (string) (see page 2051)	This is this, a member of class DataStoreParameterCollection.

15.1.2.1.10.3.14.1 DataStoreParameterCollection.this Indexer (int)

Pascal

```
this(index: Integer);
```

C++

```
DataStoreParameter this(int index);
```

Description

This is this, a member of class DataStoreParameterCollection.

15.1.2.1.10.3.14.2 DataStoreParameterCollection.this Indexer (string)

Pascal

```
this(index: string);
```

C++

```
DataStoreParameter this(string index);
```

Description

This is this, a member of class DataStoreParameterCollection.

15.1.2.1.10.4 DataStoreParameterCollection Properties

The properties of the DataStoreParameterCollection class are listed here.

Public Properties

	Name	Description
	Count (see page 2051)	Returns a count of the number of parameters in the collection.
	IsFixedSize (see page 2051)	Returns a Boolean indicating whether the collection object has a fixed size or whether it is automatically expanding to accommodate addition of new items.
	IsReadOnly (see page 2052)	Returns a Boolean indicating whether the collection object is read-only or read-write.
	IsSynchronized (see page 2052)	Returns a Boolean indicating whether or not the collection is synchronized and therefore thread-safe.
	SyncRoot (see page 2052)	Returns the SyncRoot of the collection.

15.1.2.1.10.4.1 DataStoreParameterCollection.Count Property

Returns a count of the number of parameters in the collection.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Use this method to retrieve a count of the number of parameters in the collection. You might, for example, use the method to set a count parameter to control the number of times you must loop through the list of parameters.

See Also

Count (MSDN)

15.1.2.1.10.4.2 DataStoreParameterCollection.IsFixedSize Property

Returns a Boolean indicating whether the collection object has a fixed size or whether it is automatically expanding to accommodate addition of new items.

Pascal

```
property IsFixedSize: bool;
```

C++

```
__property bool IsFixedSize;
```

Description

By default, .NET collection objects are dynamically allocated and automatically expand to accommodate new members. You can set a limit on the size, which can improve performance. The Boolean returned by IsFixedSize is **True** if the parameter is a fixed size and **False** if it is variable.

See Also

IsFixedSize (MSDN)

15.1.2.1.10.4.3 DataStoreParameterCollection.IsReadOnly Property

Returns a Boolean indicating whether the collection object is read-only or read-write.

Pascal

```
property IsReadOnly: bool;
```

C++

```
__property bool IsReadOnly;
```

Description

If the collection object is read-only you can read and copy the parameter values, but you are unable to update the values as the result of an event. If the collection is read-write, you can modify the value of the parameters in the collection. The Boolean returned by IsReadOnly is **True** if the parameter collection is read-only and **False** if it is read-write.

See Also

IsReadOnly (MSDN)

15.1.2.1.10.4.4 DataStoreParameterCollection.IsSynchronized Property

Returns a Boolean indicating whether or not the collection is synchronized and therefore thread-safe.

Pascal

```
property IsSynchronized: bool;
```

C++

```
__property bool IsSynchronized;
```

Description

Synchronization of a collection, list, array, or hashtable object ensures that the object is thread-safe, meaning that it is safe from being modified by another thread. The Boolean returned by IsSynchronized is **True** if the parameter collection is synchronized and **False** if it is not.

See Also

IsSynchronized (MSDN)

15.1.2.1.10.4.5 DataStoreParameterCollection.SyncRoot Property

Returns the SyncRoot of the collection.

Pascal

```
property SyncRoot: object;
```

C++

```
__property object SyncRoot;
```

Description

Each collection, whether a list, array, or hashtable, has a SyncRoot. Each collection contains a single root and multiple nodes or branches below that root. When multiple threads access a collection, they might update values in the collection. When you want to use the values of the collection, your thread might not have an accurate and current snapshot of the collection that has been modified numerous times since you first retrieved it.

Perform the synchronization on the SyncRoot, not on the collection directly. Synchronization, starting at the SyncRoot, ripples the updates throughout the tree to give you an accurate collection. Nonetheless, even when the collection is synchronized, other threads can modify the collection, which then causes the enumerator to throw an exception. You might consider trapping the exception to make sure that you know when your collection is modified by another thread.

See Also

SyncRoot (MSDN)

15.1.2.1.11 DataStoreRowUpdatedEventArgs Class

Holds data for RowUpdated event of DataStoreDataAdapter (see page 1933).

Class Hierarchy

Pascal

```
DataStoreRowUpdatedEventArgs = class(RowUpdatedEventArgs);
```

C++

```
class DataStoreRowUpdatedEventArgs : public RowUpdatedEventArgs;
```

File

Ado.Net20.cs

Description

DataStoreRowUpdatedEventArgs provides an object to hold the data for the RowUpdated event of a DataStoreDataAdapter (see page 1933).

See Also

DataStoreDataAdapter (see page 1933)

RowUpdated (see page 1939)

15.1.2.1.11.1 DataStoreRowUpdatedEventArgs Members

The following tables list the members exposed by DataStoreRowUpdatedEventArgs.

Public Methods

	Name	Description
	DataStoreRowUpdatedEventArgs (see page 2054)	This is DataStoreRowUpdatedEventArgs, a member of class DataStoreRowUpdatedEventArgs.

Public Properties

	Name	Description
	Command (see page 2054)	DataStoreCommand (see page 1912) that triggered event.

15.1.2.1.11.2 DataStoreRowUpdatedEventArgs.DataStoreRowUpdatedEventArgs Constructor

Pascal

```
constructor Create(row: DataRow; command: IDbCommand; statementType: StatementType;
tableMapping: DataTableMapping);
```

C++

```
DataStoreRowUpdatedEventArgs(DataRow row, IDbCommand command, StatementType statementType,
DataTableMapping tableMapping);
```

Description

This is DataStoreRowUpdatedEventArgs, a member of class DataStoreRowUpdatedEventArgs.

15.1.2.1.11.3 DataStoreRowUpdatedEventArgs Properties

The properties of the DataStoreRowUpdatedEventArgs class are listed here.

Public Properties

	Name	Description
	Command (see page 2054)	DataStoreCommand (see page 1912) that triggered event.

15.1.2.1.11.3.1 DataStoreRowUpdatedEventArgs.Command Property

DataStoreCommand (see page 1912) that triggered event.

Pascal

```
property Command: DataStoreCommand;
```

C++

```
__property DataStoreCommand Command;
```

Description

Command returns the DataStoreCommand (see page 1912) that triggered the row updated event.

See Also

DataStoreCommand (see page 1912)

15.1.2.1.12 DataStoreRowUpdatingEventArgs Class

Holds data for RowUpdating event of DataStoreDataAdapter (see page 1933).

Class Hierarchy

Pascal

```
DataStoreRowUpdatingEventArgs = class(RowUpdatingEventArgs);
```

C++

```
class DataStoreRowUpdatingEventArgs : public RowUpdatingEventArgs;
```

File

Ado.Net20.cs

Description

DataStoreRowUpdatingEventArgs provides an object to hold the data for the RowUpdating event of a DataStoreDataAdapter (see page 1933).

See Also

DataStoreDataAdapter (see page 1933)

RowUpdating (see page 1939)

15.1.2.1.12.1 DataStoreRowUpdatingEventArgs Members

The following tables list the members exposed by DataStoreRowUpdatingEventArgs.

Public Methods

	Name	Description
	DataStoreRowUpdatingEventArgs (see page 2055)	This is DataStoreRowUpdatingEventArgs, a member of class DataStoreRowUpdatingEventArgs.

Public Properties

	Name	Description
	Command (see page 2055)	DataStoreCommand (see page 1912) that triggered event.

15.1.2.1.12.2 DataStoreRowUpdatingEventArgs.DataStoreRowUpdatingEventArgs Constructor

Pascal

```
constructor Create(row: DataRow; command: IDbCommand; statementType: StatementType;
tableMapping: DataTableMapping);
```

C++

```
DataStoreRowUpdatingEventArgs(DataRow row, IDbCommand command, StatementType statementType,
DataTableMapping tableMapping);
```

Description

This is DataStoreRowUpdatingEventArgs, a member of class DataStoreRowUpdatingEventArgs.

15.1.2.1.12.3 DataStoreRowUpdatingEventArgs Properties

The properties of the DataStoreRowUpdatingEventArgs class are listed here.

Public Properties

	Name	Description
	Command (see page 2055)	DataStoreCommand (see page 1912) that triggered event.

15.1.2.1.12.3.1 DataStoreRowUpdatingEventArgs.Command Property

DataStoreCommand (see page 1912) that triggered event.

Pascal

```
property Command: DataStoreCommand;
```

C++

```
__property DataStoreCommand Command;
```

Description

Command gets and sets the DataStoreCommand (see page 1912) that triggered the row updating event.

See Also

DataStoreCommand (see page 1912)

15.1.2.1.13 DataStoreTransaction Class

Class Hierarchy

Pascal

```
DataStoreTransaction = class(DbTransaction, IDbTransaction, IDisposable);
```

C++

```
class DataStoreTransaction : public DbTransaction, public IDbTransaction, public IDisposable;
```

File

Ado.Net20.cs

Description

This is class Borland.Data.DataStore.DataStoreTransaction.

15.1.2.1.13.1 DataStoreTransaction Members

The following tables list the members exposed by DataStoreTransaction.

Internal Methods

	Name	Description
	DataStoreTransaction (see page 2056)	This is DataStoreTransaction, a member of class DataStoreTransaction.

Protected Properties

	Name	Description
	DbConnection (see page 2058)	This is DbConnection, a member of class DataStoreTransaction.

Public Methods

	Name	Description
	Commit (see page 2057)	Commits the current transaction..
	Dispose (see page 2057)	This is the overview for the Dispose method overload.
	Rollback (see page 2058)	Rolls back the current transaction..

Public Properties

	Name	Description
	Connection (see page 2058)	Gets the connection on which the transaction was started.
	IsolationLevel (see page 2058)	Gets the transaction isolation level for this transaction.

15.1.2.1.13.2 DataStoreTransaction.DataStoreTransaction Constructor

Pascal

```
constructor Create(connection: DataStoreConnection; outerMost: bool);
```

C++

```
DataStoreTransaction(DataStoreConnection connection, bool outerMost);
```

Description

This is DataStoreTransaction, a member of class DataStoreTransaction.

15.1.2.1.13.3 DataStoreTransaction Methods

The methods of the DataStoreTransaction class are listed here.

Public Methods

	Name	Description
	Commit (see page 2057)	Commits the current transaction..
	Dispose (see page 2057)	This is the overview for the Dispose method overload.
	Rollback (see page 2058)	Rolls back the current transaction..

15.1.2.1.13.3.1 DataStoreTransaction.Commit Method

Commits the current transaction..

Pascal

```
function Commit: void;
```

C++

```
void Commit();
```

Description

Commit commits the current transaction.

15.1.2.1.13.3.2 Dispose Method

This is the overview for the Dispose method overload.

Overload List

	Name	Description
	DataStoreTransaction.Dispose () (see page 2057)	Disposes this object.
	DataStoreTransaction.Dispose (bool) (see page 2057)	Disposes this object.

15.1.2.1.13.3.2.1 DataStoreTransaction.Dispose Method ()

Disposes this object.

Pascal

```
function Dispose: void;
function Dispose(disposing: bool): void;
```

C++

```
void Dispose();
void Dispose(bool disposing);
```

Description

Dispose disposes this object.

15.1.2.1.13.3.3 DataStoreTransaction.Rollback Method

Rolls back the current transaction..

Pascal

```
function Rollback: void;
```

C++

```
void Rollback();
```

Description

Rollback rolls back the current transaction.

15.1.2.1.13.4 DataStoreTransaction Properties

The properties of the DataStoreTransaction class are listed here.

Protected Properties

	Name	Description
	DbConnection (see page 2058)	This is DbConnection, a member of class DataStoreTransaction.

Public Properties

	Name	Description
	Connection (see page 2058)	Gets the connection on which the transaction was started.
	IsolationLevel (see page 2058)	Gets the transaction isolation level for this transaction.

15.1.2.1.13.4.1 DataStoreTransaction.Connection Property

Gets the connection on which the transaction was started.

Pascal

```
property Connection: DataStoreConnection;
```

C++

```
__property DataStoreConnection Connection;
```

Description

Connection gets the connection on which the transaction was started.

15.1.2.1.13.4.2 DataStoreTransaction.DbConnection Property

Pascal

```
property DbConnection: DbConnection;
```

C++

```
__property DbConnection DbConnection;
```

Description

This is DbConnection, a member of class DataStoreTransaction.

15.1.2.1.13.4.3 DataStoreTransaction.IsolationLevel Property

Gets the transaction isolation level for this transaction.

Pascal

```
property IsolationLevel: IsolationLevel;
```

C++

```
__property IsolationLevel IsolationLevel;
```

Description

IsolationLevel gets the transaction isolation level for this transaction.

15.1.2.1.14 LicenseColumns Class

Column names for result table returned from DB_ADMIN.GET_LICENSE and DB_ADMIN.GET_ALL_LICENSES.

Class Hierarchy

Borland.Data.DataStore.LicenseColumns

Pascal

```
LicenseColumns = class;
```

C++

```
class LicenseColumns;
```

File

LicenseColumns.cs

Description

LicenseColumns contains column names for result table returned from DB_ADMIN.GET_LICENSE and DB_ADMIN.GET_ALL_LICENSES

The columns of the result table are:

Property Names	Description
USER_LIMIT	Maximum number of database users allowed across all databases.
FILE_SIZE_LIMIT	Maximum database file size in megabytes. Once this size is exceeded, the database can be read, but no longer allows any write operations.
DESKTOP	If this is **true**, applications can only connect to databases on the local desktop computer. If a remote connection is being used, that connection can only connect to the localhost host.
DEPLOYMENT_LIMIT	Maximum times a database application can be deployed.
EXPIRED	Location of the license file used for this deployment.
SERIAL_NUMBER	Serial number.
PRODUCT_ID	Product ID.
SKU_ID	SKU ID.
FILE_NAME	Location of the license file used for this deployment.

15.1.2.1.14.1 LicenseColumns Members

The following tables list the members exposed by LicenseColumns.

Public Fields

	Name	Description
	CacheSizeLimit (see page 2060)	This is CacheSizeLimit, a member of class LicenseColumns.
	DeploymentLimit (see page 2060)	This is DeploymentLimit, a member of class LicenseColumns.
	Desktop (see page 2060)	This is Desktop, a member of class LicenseColumns.

	Expired (see page 2061)	This is Expired, a member of class LicenseColumns.
	FileName (see page 2061)	This is FileName, a member of class LicenseColumns.
	FileSizeLimit (see page 2061)	This is FileSizeLimit, a member of class LicenseColumns.
	ProductId (see page 2061)	This is ProductId, a member of class LicenseColumns.
	SerialNumber (see page 2061)	This is SerialNumber, a member of class LicenseColumns.
	SkuId (see page 2062)	This is SkuId, a member of class LicenseColumns.
	UserLimit (see page 2062)	This is UserLimit, a member of class LicenseColumns.

15.1.2.1.14.2 LicenseColumns Fields

The fields of the LicenseColumns class are listed here.

Public Fields

	Name	Description
	CacheSizeLimit (see page 2060)	This is CacheSizeLimit, a member of class LicenseColumns.
	DeploymentLimit (see page 2060)	This is DeploymentLimit, a member of class LicenseColumns.
	Desktop (see page 2060)	This is Desktop, a member of class LicenseColumns.
	Expired (see page 2061)	This is Expired, a member of class LicenseColumns.
	FileName (see page 2061)	This is FileName, a member of class LicenseColumns.
	FileSizeLimit (see page 2061)	This is FileSizeLimit, a member of class LicenseColumns.
	ProductId (see page 2061)	This is ProductId, a member of class LicenseColumns.
	SerialNumber (see page 2061)	This is SerialNumber, a member of class LicenseColumns.
	SkuId (see page 2062)	This is SkuId, a member of class LicenseColumns.
	UserLimit (see page 2062)	This is UserLimit, a member of class LicenseColumns.

15.1.2.1.14.2.1 LicenseColumns.CacheSizeLimit Field

Pascal

```
const CacheSizeLimit: string = "CacheSizeLimit";
```

C++

```
string CacheSizeLimit = "CacheSizeLimit";
```

Description

This is CacheSizeLimit, a member of class LicenseColumns.

15.1.2.1.14.2.2 LicenseColumns.DeploymentLimit Field

Pascal

```
const DeploymentLimit: string = "DeploymentLimit";
```

C++

```
string DeploymentLimit = "DeploymentLimit";
```

Description

This is DeploymentLimit, a member of class LicenseColumns.

15.1.2.1.14.2.3 LicenseColumns.Desktop Field

Pascal

```
const Desktop: string = "Desktop";
```

C++

```
string Desktop = "Desktop";
```

Description

This is Desktop, a member of class LicenseColumns.

15.1.2.1.14.2.4 LicenseColumns.Expired Field

Pascal

```
const Expired: string = "Expired";
```

C++

```
string Expired = "Expired";
```

Description

This is Expired, a member of class LicenseColumns.

15.1.2.1.14.2.5 LicenseColumns.FileName Field

Pascal

```
const FileName: string = "FileName";
```

C++

```
string FileName = "FileName";
```

Description

This is FileName, a member of class LicenseColumns.

15.1.2.1.14.2.6 LicenseColumns.FileSizeLimit Field

Pascal

```
const FileSizeLimit: string = "FileSizeLimit";
```

C++

```
string FileSizeLimit = "FileSizeLimit";
```

Description

This is FileSizeLimit, a member of class LicenseColumns.

15.1.2.1.14.2.7 LicenseColumns.ProductId Field

Pascal

```
const ProductId: string = "ProductId";
```

C++

```
string ProductId = "ProductId";
```

Description

This is ProductId, a member of class LicenseColumns.

15.1.2.1.14.2.8 LicenseColumns.SerialNumber Field

Pascal

```
const SerialNumber: string = "SerialNumber";
```

C++

```
string SerialNumber = "SerialNumber";
```

Description

This is SerialNumber, a member of class LicenseColumns.

15.1.2.1.14.2.9 LicenseColumns.SkuId Field

Pascal

```
const SkuId: string = "SKUId";
```

C++

```
string SkuId = "SKUId";
```

Description

This is SkuId, a member of class LicenseColumns.

15.1.2.1.14.2.10 LicenseColumns.UserLimit Field

Pascal

```
const UserLimit: string = "UserLimit";
```

C++

```
string UserLimit = "UserLimit";
```

Description

This is UserLimit, a member of class LicenseColumns.

15.1.2.1.15 LockColumns Class

Provides column names for result table from built-in stored procedure DB_ADMIN.GET_LOCKS.

Class Hierarchy

Borland.Data.DataStore.LockColumns

Pascal

```
LockColumns = class;
```

C++

```
class LockColumns;
```

File

LockColumns.cs

Description

LockColumns provides the column names for the result table from the built-in stored procedure DB_ADMIN.GET_LOCKS. The columns of the result table are:

Constant	Description
NAME	Name (see page 2064) of object that lock applies to. Typically this is the name of a table.
TYPE	The type of lock, which can be table or row.
GRANTED	Indicates whether or not the lock has been granted.
SHARED	Indicates whether or not the lock can be shared with another shared lock. If **false**, this is an exclusive lock that cannot share.

USER	User (see page 2065) that holds the lock.
ROW	If the **TYPE** column is set to row, this is the row that the lock applies to. Otherwise this is set to null.
COMP_MASK	If the **TYPE** column is set to **TABLE**, this is set to a collection of bits that this table lock is compatible with.
LOCK_MASK	If the TYPE column is set to **TABLE**, this will be set to a collection of bits that this table lock is locking.
ROW_LOCK	Row (see page 2064) lock.
TABLE_LOCK	Table lock.

GET_LOCKS

15.1.2.1.15.1 LockColumns Members

The following tables list the members exposed by LockColumns.

Public Fields

	Name	Description
	CompMask (see page 2063)	This is CompMask, a member of class LockColumns.
	Granted (see page 2064)	This is Granted, a member of class LockColumns.
	LockMask (see page 2064)	This is LockMask, a member of class LockColumns.
	Name (see page 2064)	This is Name, a member of class LockColumns.
	Row (see page 2064)	This is Row, a member of class LockColumns.
	RowLock (see page 2064)	This is RowLock, a member of class LockColumns.
	Shared (see page 2065)	This is Shared, a member of class LockColumns.
	TableLock (see page 2065)	This is TableLock, a member of class LockColumns.
	Type (see page 2065)	This is Type, a member of class LockColumns.
	User (see page 2065)	This is User, a member of class LockColumns.

15.1.2.1.15.2 LockColumns Fields

The fields of the LockColumns class are listed here.

Public Fields

	Name	Description
	CompMask (see page 2063)	This is CompMask, a member of class LockColumns.
	Granted (see page 2064)	This is Granted, a member of class LockColumns.
	LockMask (see page 2064)	This is LockMask, a member of class LockColumns.
	Name (see page 2064)	This is Name, a member of class LockColumns.
	Row (see page 2064)	This is Row, a member of class LockColumns.
	RowLock (see page 2064)	This is RowLock, a member of class LockColumns.
	Shared (see page 2065)	This is Shared, a member of class LockColumns.
	TableLock (see page 2065)	This is TableLock, a member of class LockColumns.
	Type (see page 2065)	This is Type, a member of class LockColumns.
	User (see page 2065)	This is User, a member of class LockColumns.

15.1.2.1.15.2.1 LockColumns.CompMask Field

Pascal

```
const CompMask: string = "COMP_MASK";
```

C++

```
string CompMask = "COMP_MASK";
```

Description

This is CompMask, a member of class LockColumns.

15.1.2.1.15.2.2 LockColumns.Granted Field

Pascal

```
const Granted: string = "GRANTED";
```

C++

```
string Granted = "GRANTED";
```

Description

This is Granted, a member of class LockColumns.

15.1.2.1.15.2.3 LockColumns.LockMask Field

Pascal

```
const LockMask: string = "LOCK_MASK";
```

C++

```
string LockMask = "LOCK_MASK";
```

Description

This is LockMask, a member of class LockColumns.

15.1.2.1.15.2.4 LockColumns.Name Field

Pascal

```
const Name: string = "NAME";
```

C++

```
string Name = "NAME";
```

Description

This is Name, a member of class LockColumns.

15.1.2.1.15.2.5 LockColumns.Row Field

Pascal

```
const Row: string = "ROW";
```

C++

```
string Row = "ROW";
```

Description

This is Row, a member of class LockColumns.

15.1.2.1.15.2.6 LockColumns.RowLock Field

Pascal

```
const RowLock: string = "ROW_LOCK";
```

C++

```
string RowLock = "ROW_LOCK";
```

Description

This is RowLock, a member of class LockColumns.

15.1.2.1.15.2.7 LockColumns.Shared Field

Pascal

```
const Shared: string = "SHARED";
```

C++

```
string Shared = "SHARED";
```

Description

This is Shared, a member of class LockColumns.

15.1.2.1.15.2.8 LockColumns.TableLock Field

Pascal

```
const TableLock: string = "TABLE_LOCK";
```

C++

```
string TableLock = "TABLE_LOCK";
```

Description

This is TableLock, a member of class LockColumns.

15.1.2.1.15.2.9 LockColumns.Type Field

Pascal

```
const Type: string = "TYPE";
```

C++

```
string Type = "TYPE";
```

Description

This is Type, a member of class LockColumns.

15.1.2.1.15.2.10 LockColumns.User Field

Pascal

```
const User: string = "USER";
```

C++

```
string User = "USER";
```

Description

This is User, a member of class LockColumns.

15.1.2.1.16 LogFilter Class

Provides names of events to be logged.

Class Hierarchy

Borland.Data.DataStore.LogFilter

Pascal

```
LogFilter = class;
```

C++

```
class LogFilter;
```

File

LogFilter.cs

Description

LogFilter provides the names of events to be logged. Certain database events can be logged to a status text file placed in the same directory as the database.

This table contains events that can be logged.

Event	Description
Init (see page 2068)	The initial property settings for a new connection.
Connect (see page 2067)	Connect (see page 2067) and disconnect events.
Prepare (see page 2068)	SQL Statement prepare.
SetParameter (see page 2068)	SQL parameter settings.
Execute (see page 2067)	SQL Statement execution.
Transactions (see page 2069)	Transaction commit and rollback operations.
Errors (see page 2067)	Exceptions encountered.
LockErrors (see page 2068)	Lock errors like time-outs and deadlocks.
Xa (see page 2069)	Distributed computing XA related operations.
Mirror (see page 2068)	Database mirroring operations.
System (see page 2069)	System (see page 2069) operations, such as database startup/shutdown, log file creation and truncation.

15.1.2.1.16.1 LogFilter Members

The following tables list the members exposed by LogFilter.

Public Fields

	Name	Description
	Connect (see page 2067)	This is Connect, a member of class LogFilter.
	Errors (see page 2067)	This is Errors, a member of class LogFilter.
	Execute (see page 2067)	This is Execute, a member of class LogFilter.
	Init (see page 2068)	This is Init, a member of class LogFilter.

	LockErrors (see page 2068)	This is LockErrors, a member of class LogFilter.
	Mirror (see page 2068)	This is Mirror, a member of class LogFilter.
	Prepare (see page 2068)	This is Prepare, a member of class LogFilter.
	SetParameter (see page 2068)	This is SetParameter, a member of class LogFilter.
	System (see page 2069)	This is System, a member of class LogFilter.
	Transactions (see page 2069)	This is Transactions, a member of class LogFilter.
	Xa (see page 2069)	This is Xa, a member of class LogFilter.

15.1.2.1.16.2 LogFilter Fields

The fields of the LogFilter class are listed here.

Public Fields

	Name	Description
	Connect (see page 2067)	This is Connect, a member of class LogFilter.
	Errors (see page 2067)	This is Errors, a member of class LogFilter.
	Execute (see page 2067)	This is Execute, a member of class LogFilter.
	Init (see page 2068)	This is Init, a member of class LogFilter.
	LockErrors (see page 2068)	This is LockErrors, a member of class LogFilter.
	Mirror (see page 2068)	This is Mirror, a member of class LogFilter.
	Prepare (see page 2068)	This is Prepare, a member of class LogFilter.
	SetParameter (see page 2068)	This is SetParameter, a member of class LogFilter.
	System (see page 2069)	This is System, a member of class LogFilter.
	Transactions (see page 2069)	This is Transactions, a member of class LogFilter.
	Xa (see page 2069)	This is Xa, a member of class LogFilter.

15.1.2.1.16.2.1 LogFilter.Connect Field

Pascal

```
const Connect: string = "CONNECT";
```

C++

```
string Connect = "CONNECT";
```

Description

This is Connect, a member of class LogFilter.

15.1.2.1.16.2.2 LogFilter.Errors Field

Pascal

```
const Errors: string = "ERRORS";
```

C++

```
string Errors = "ERRORS";
```

Description

This is Errors, a member of class LogFilter.

15.1.2.1.16.2.3 LogFilter.Execute Field

Pascal

```
const Execute: string = "EXECUTE";
```

C++

```
string Execute = "EXECUTE";
```

Description

This is Execute, a member of class LogFilter.

15.1.2.1.16.2.4 LogFilter.Init Field

Pascal

```
const Init: string = "INIT";
```

C++

```
string Init = "INIT";
```

Description

This is Init, a member of class LogFilter.

15.1.2.1.16.2.5 LogFilter.LockErrors Field

Pascal

```
const LockErrors: string = "LOCK_ERRORS";
```

C++

```
string LockErrors = "LOCK_ERRORS";
```

Description

This is LockErrors, a member of class LogFilter.

15.1.2.1.16.2.6 LogFilter.Mirror Field

Pascal

```
const Mirror: string = "MIRROR";
```

C++

```
string Mirror = "MIRROR";
```

Description

This is Mirror, a member of class LogFilter.

15.1.2.1.16.2.7 LogFilter.Prepare Field

Pascal

```
const Prepare: string = "PREPARE";
```

C++

```
string Prepare = "PREPARE";
```

Description

This is Prepare, a member of class LogFilter.

15.1.2.1.16.2.8 LogFilter.SetParameter Field

Pascal

```
const SetParameter: string = "SET_PARAMETER";
```

C++

```
string SetParameter = "SET_PARAMETER";
```

Description

This is SetParameter, a member of class LogFilter.

15.1.2.1.16.2.9 LogFilter.System Field

Pascal

```
const System: string = "SYSTEM";
```

C++

```
string System = "SYSTEM";
```

Description

This is System, a member of class LogFilter.

15.1.2.1.16.2.10 LogFilter.Transactions Field

Pascal

```
const Transactions: string = "TRANSACTIONS";
```

C++

```
string Transactions = "TRANSACTIONS";
```

Description

This is Transactions, a member of class LogFilter.

15.1.2.1.16.2.11 LogFilter.Xa Field

Pascal

```
const Xa: string = "XA";
```

C++

```
string Xa = "XA";
```

Description

This is Xa, a member of class LogFilter.

15.1.2.1.17 MirrorStatusColumns Class

Provides columns of result table from built-in stored procedure DB_ADMIN.GET_MIRRORS.

Class Hierarchy

Pascal

```
MirrorStatusColumns = class(Borland.Data.DataStore.SysMirrors);
```

C++

```
class MirrorStatusColumns : public Borland.Data.DataStore.SysMirrors;
```

File

MirrorStatusColumns.cs

Description

The DB_ADMIN.GET_MIRRORS function provides a result table consisting of columns from SysMirrors (see page 2089) and

the status columns specified below. The checkStatus parameter of DB_ADMIN.GET_MIRRORS must be true for any data to be returned in the status columns.

The status columns are:

Constant	Description
MIRROR_REPLAY_STAMP	A stamp that marks the last time the log files were replayed against this mirror.
ATTACHED_AUTO_FAIL_OVER_COUNT	The number of mirrors configured for automatic fail over that are attached to by the primary mirror. The majority of all automatic fail over mirrors are attached for automatic fail over to be enabled.
TOTAL_AUTO_FAIL_OVER_COUNT	The total number of all mirrors configured for automatic fail over. The majority of all automatic fail over mirrors must be attached for automatic fail over to be enabled.
ATTACHED_INSTANT_SYNCH_COUNT	The number of mirrors configured for instant synchronization with this mirror that are attached to this mirror.
TOTAL_INSTANT_SYNCH_COUNT	The number of mirrors configured for instant synchronization with this mirror.
CONNECT_ERROR	Exception Object encountered when trying to retrieve status on this mirror.
HIGHEST_REDO_STAMP	A stamp that marks the most recent redo record applied to the database.

15.1.2.1.17.1 MirrorStatusColumns Members

The following tables list the members exposed by MirrorStatusColumns.

Public Fields

	Name	Description
	AttachedAutoFailOverCount (see page 2071)	This is AttachedAutoFailOverCount, a member of class MirrorStatusColumns.
	AttachedInstantSynchCount (see page 2071)	This is AttachedInstantSynchCount, a member of class MirrorStatusColumns.
	AutoFailOver (see page 2092)	This is AutoFailOver, a member of class SysMirrors.
	BirthStamp (see page 2092)	This is BirthStamp, a member of class SysMirrors.
	ClientHashCode (see page 2092)	This is ClientHashCode, a member of class SysMirrors.
	ConnectError (see page 2071)	This is ConnectError, a member of class MirrorStatusColumns.
	FailOverPriority (see page 2092)	This is FailOverPriority, a member of class SysMirrors.
	FileName (see page 2093)	This is FileName, a member of class SysMirrors.
	HighestRedoStamp (see page 2071)	This is HighestRedoStamp, a member of class MirrorStatusColumns.
	Host (see page 2093)	This is Host, a member of class SysMirrors.
	Id (see page 2093)	This is Id, a member of class SysMirrors.
	InstantSynch (see page 2093)	This is InstantSynch, a member of class SysMirrors.
	LastKnownReplay (see page 2093)	This is LastKnownReplay, a member of class SysMirrors.
	MirrorReplayStamp (see page 2072)	This is MirrorReplayStamp, a member of class MirrorStatusColumns.
	Name (see page 2094)	This is Name, a member of class SysMirrors.
	Port (see page 2094)	This is Port, a member of class SysMirrors.
	SynchMirrorName (see page 2094)	This is SynchMirrorName, a member of class SysMirrors.
	TotalAutoFailOverCount (see page 2072)	This is TotalAutoFailOverCount, a member of class MirrorStatusColumns.
	TotalInstantSynchCount (see page 2072)	This is TotalInstantSynchCount, a member of class MirrorStatusColumns.
	Type (see page 2094)	This is Type, a member of class SysMirrors.
	ValidatedPrimary (see page 2094)	This is ValidatedPrimary, a member of class SysMirrors.

15.1.2.1.17.2 MirrorStatusColumns Fields

The fields of the MirrorStatusColumns class are listed here.

Public Fields

	Name	Description
	AttachedAutoFailOverCount (see page 2071)	This is AttachedAutoFailOverCount, a member of class MirrorStatusColumns.
	AttachedInstantSynchCount (see page 2071)	This is AttachedInstantSynchCount, a member of class MirrorStatusColumns.
	ConnectError (see page 2071)	This is ConnectError, a member of class MirrorStatusColumns.
	HighestRedoStamp (see page 2071)	This is HighestRedoStamp, a member of class MirrorStatusColumns.
	MirrorReplayStamp (see page 2072)	This is MirrorReplayStamp, a member of class MirrorStatusColumns.
	TotalAutoFailOverCount (see page 2072)	This is TotalAutoFailOverCount, a member of class MirrorStatusColumns.
	TotalInstantSynchCount (see page 2072)	This is TotalInstantSynchCount, a member of class MirrorStatusColumns.

15.1.2.1.17.2.1 MirrorStatusColumns.AttachedAutoFailOverCount Field

Pascal

```
const AttachedAutoFailOverCount: string = "ATTACHED_AUTO_FAIL_OVER_COUNT";
```

C++

```
string AttachedAutoFailOverCount = "ATTACHED_AUTO_FAIL_OVER_COUNT";
```

Description

This is AttachedAutoFailOverCount, a member of class MirrorStatusColumns.

15.1.2.1.17.2.2 MirrorStatusColumns.AttachedInstantSynchCount Field

Pascal

```
const AttachedInstantSynchCount: string = "ATTACHED_INSTANT_SYNCH_COUNT";
```

C++

```
string AttachedInstantSynchCount = "ATTACHED_INSTANT_SYNCH_COUNT";
```

Description

This is AttachedInstantSynchCount, a member of class MirrorStatusColumns.

15.1.2.1.17.2.3 MirrorStatusColumns.ConnectError Field

Pascal

```
const ConnectError: string = "CONNECT_ERROR";
```

C++

```
string ConnectError = "CONNECT_ERROR";
```

Description

This is ConnectError, a member of class MirrorStatusColumns.

15.1.2.1.17.2.4 MirrorStatusColumns.HighestRedoStamp Field

Pascal

```
const HighestRedoStamp: string = "HIGHEST_REDO_STAMP";
```

C++

```
string HighestRedoStamp = "HIGHEST_REDO_STAMP";
```

Description

This is HighestRedoStamp, a member of class MirrorStatusColumns.

15.1.2.1.17.2.5 MirrorStatusColumns.MirrorReplayStamp Field

Pascal

```
const MirrorReplayStamp: string = "MIRROR_REPLAY_STAMP";
```

C++

```
string MirrorReplayStamp = "MIRROR_REPLAY_STAMP";
```

Description

This is MirrorReplayStamp, a member of class MirrorStatusColumns.

15.1.2.1.17.2.6 MirrorStatusColumns.TotalAutoFailOverCount Field

Pascal

```
const TotalAutoFailOverCount: string = "TOTAL_AUTO_FAIL_OVER_COUNT";
```

C++

```
string TotalAutoFailOverCount = "TOTAL_AUTO_FAIL_OVER_COUNT";
```

Description

This is TotalAutoFailOverCount, a member of class MirrorStatusColumns.

15.1.2.1.17.2.7 MirrorStatusColumns.TotalInstantSynchCount Field

Pascal

```
const TotalInstantSynchCount: string = "TOTAL_INSTANT_SYNCH_COUNT";
```

C++

```
string TotalInstantSynchCount = "TOTAL_INSTANT_SYNCH_COUNT";
```

Description

This is TotalInstantSynchCount, a member of class MirrorStatusColumns.

15.1.2.1.18 MirrorTypes Class

Contains the valid values for the TYPE column from DB_ADMIN.GET_MIRRORS stored procedure.

Class Hierarchy

Pascal

```
MirrorTypes = class;
```

C++

```
class MirrorTypes;
```

File

MirrorTypes.cs

Description

MirrorTypes contains the valid values for the TYPE column from DB_ADMIN.GET_MIRRORS stored procedure. These values

are also found in the system table SYS.SYSMIRRORS.

The valid values are:

Constant	Description
NONE	Mirroring not enabled.
PRIMARY	There is only one primary mirror. It is the only mirror that supports any form of write operation on the database.
READONLY	There can be one or more **READONLY** MIRRORS. **READONLY** mirrors support read operations, but not write operations. **READONLY** mirrors provide a view of the PRIMARY database at the point in time they were last synchronized with the **PRIMARY**.
DIRECTORY	There can be one or more **DIRECTORY** MIRRORS. **DIRECTORY** mirrors support read operations, but not write operations. A **DIRECTORY** mirror mirrors the **SYS.MIRRORS** table, but not the data itself. Connection requests to a **DIRECTORY** mirror are redirected to the **PRIMARY** mirror if a writable connection is needed. Otherwise a load balancing algorithm is used to decide which **READONLY** mirror should be used for the connection.

See Also

SysMirrors (see page 2089)

15.1.2.1.18.1 MirrorTypes Members

The following tables list the members exposed by MirrorTypes.

Public Fields

	Name	Description
	Directory (see page 2073)	This is Directory, a member of class MirrorTypes.
	None (see page 2074)	This is None, a member of class MirrorTypes.
	Primary (see page 2074)	This is Primary, a member of class MirrorTypes.
	Readonly (see page 2074)	This is Readonly, a member of class MirrorTypes.

15.1.2.1.18.2 MirrorTypes Fields

The fields of the MirrorTypes class are listed here.

Public Fields

	Name	Description
	Directory (see page 2073)	This is Directory, a member of class MirrorTypes.
	None (see page 2074)	This is None, a member of class MirrorTypes.
	Primary (see page 2074)	This is Primary, a member of class MirrorTypes.
	Readonly (see page 2074)	This is Readonly, a member of class MirrorTypes.

15.1.2.1.18.2.1 MirrorTypes.Directory Field

Pascal

```
const Directory: string = "DIRECTORY";
```

C++

```
string Directory = "DIRECTORY";
```

Description

This is Directory, a member of class MirrorTypes.

15.1.2.1.18.2.2 MirrorTypes.None Field

Pascal

```
const None: string = "NONE";
```

C++

```
string None = "NONE";
```

Description

This is None, a member of class MirrorTypes.

15.1.2.1.18.2.3 MirrorTypes.Primary Field

Pascal

```
const Primary: string = "PRIMARY";
```

C++

```
string Primary = "PRIMARY";
```

Description

This is Primary, a member of class MirrorTypes.

15.1.2.1.18.2.4 MirrorTypes.Readonly Field

Pascal

```
const Readonly: string = "READONLY";
```

C++

```
string Readonly = "READONLY";
```

Description

This is Readonly, a member of class MirrorTypes.

15.1.2.1.19 ProtocolValue Class

Contains constant strings for the protocol connection property.

Class Hierarchy

Borland.Data.DataStore.ProtocolValue

Pascal

```
ProtocolValue = class;
```

C++

```
class ProtocolValue;
```

File

ProtocolValue.cs

Description

The ProtocolValue class contains constant strings for the protocol connection property.

The columns of the result table are:

Constant	Description
InProcess (see page 2075)	Specify this protocol when the server should be run in process with the client code. Note that a database file can only be accessed by one server process at any given time.
Tcp (see page 2075)	Specify this protocol for using the DataStore (see page 1892) TCP/IP protocol.

See Also

Borland.Data.DataStore.ConnectionPropertiesProtocol

15.1.2.1.19.1 ProtocolValue Members

The following tables list the members exposed by ProtocolValue.

Public Fields

	Name	Description
	InProcess (see page 2075)	This is InProcess, a member of class ProtocolValue.
	Tcp (see page 2075)	This is Tcp, a member of class ProtocolValue.

15.1.2.1.19.2 ProtocolValue Fields

The fields of the ProtocolValue class are listed here.

Public Fields

	Name	Description
	InProcess (see page 2075)	This is InProcess, a member of class ProtocolValue.
	Tcp (see page 2075)	This is Tcp, a member of class ProtocolValue.

15.1.2.1.19.2.1 ProtocolValue.InProcess Field

Pascal

```
const InProcess: string = "InProcess";
```

C++

```
string InProcess = "InProcess";
```

Description

This is InProcess, a member of class ProtocolValue.

15.1.2.1.19.2.2 ProtocolValue.Tcp Field

Pascal

```
const Tcp: string = "TCP";
```

C++

```
string Tcp = "TCP";
```

Description

This is Tcp, a member of class ProtocolValue.

15.1.2.1.20 ScheduleColumns Class

Extends SysMirrors (see page 2089) with additional status information.

Class Hierarchy

Borland.Data.DataStore.ScheduleColumns

Pascal

```
ScheduleColumns = class;
```

C++

```
class ScheduleColumns;
```

File

ScheduleColumns.cs

Description

ScheduleColumns extends SysMirrors (see page 2089) with additional status information on if a mirror is accessible, how recently it was synchronized, and whether enough mirrors are accessible to enable automatic fail over.

This table contains scheduling constants.

Constant	Description
JAVA_METHOD	String name of Java (see page 15681) method to call for the period specified in **PERIOD**, **DAY**, **TIME** and **MILLIS** columns.
PERIOD	A String that is one of the values in the SchedulePeriod (see page 2078) interface.
DAY	Only used when **PERIOD** is set to **MONTH** or **WEEK**.
TIME	Only used when **PERIOD** is set to **MONTH**, **WEEK**, or **DAY**.
MILLIS	Only used when **PERIOD** is set to **MILLIS**.

See Also

SchedulePeriod (see page 2078)

SysMirrors (see page 2089)

15.1.2.1.20.1 ScheduleColumns Members

The following tables list the members exposed by ScheduleColumns.

Public Fields

	Name	Description
	Day (see page 2077)	This is Day, a member of class ScheduleColumns.
	JavaMethod (see page 2077)	This is JavaMethod, a member of class ScheduleColumns.
	Millis (see page 2077)	This is Millis, a member of class ScheduleColumns.
	Period (see page 2077)	This is Period, a member of class ScheduleColumns.
	Time (see page 2078)	This is Time, a member of class ScheduleColumns.

15.1.2.1.20.2 ScheduleColumns Fields

The fields of the ScheduleColumns class are listed here.

Public Fields

	Name	Description
	Day (see page 2077)	This is Day, a member of class ScheduleColumns.
	JavaMethod (see page 2077)	This is JavaMethod, a member of class ScheduleColumns.
	Millis (see page 2077)	This is Millis, a member of class ScheduleColumns.
	Period (see page 2077)	This is Period, a member of class ScheduleColumns.
	Time (see page 2078)	This is Time, a member of class ScheduleColumns.

15.1.2.1.20.2.1 ScheduleColumns.Day Field

Pascal

```
const Day: string = "DAY";
```

C++

```
string Day = "DAY";
```

Description

This is Day, a member of class ScheduleColumns.

15.1.2.1.20.2.2 ScheduleColumns.JavaMethod Field

Pascal

```
const JavaMethod: string = "JAVA_METHOD";
```

C++

```
string JavaMethod = "JAVA_METHOD";
```

Description

This is JavaMethod, a member of class ScheduleColumns.

15.1.2.1.20.2.3 ScheduleColumns.Millis Field

Pascal

```
const Millis: string = "MILLIS";
```

C++

```
string Millis = "MILLIS";
```

Description

This is Millis, a member of class ScheduleColumns.

15.1.2.1.20.2.4 ScheduleColumns.Period Field

Pascal

```
const Period: string = "PERIOD";
```

C++

```
string Period = "PERIOD";
```

Description

This is Period, a member of class ScheduleColumns.

15.1.2.1.20.2.5 ScheduleColumns.Time Field

Pascal

```
const Time: string = "TIME";
```

C++

```
string Time = "TIME";
```

Description

This is Time, a member of class ScheduleColumns.

15.1.2.1.21 SchedulePeriod Class

Possible values for SysSchedule.PERIOD column.

Class Hierarchy

Borland.Data.DataStore.SchedulePeriod

Pascal

```
SchedulePeriod = class;
```

C++

```
class SchedulePeriod;
```

File

SchedulePeriod.cs

Description

SchedulePeriod contains possible values for the SysSchedule.PERIOD column.

Constant	Description
WEEK	Schedule a weekly call to a Java (see page 15681) method.
DAY	Schedule a daily call to a Java (see page 15681) method.
MILLIS	Schedule a call to a Java (see page 15681) method on a millisecond interval.

See Also

SysSchedule (see page 2095)

15.1.2.1.21.1 SchedulePeriod Members

The following tables list the members exposed by SchedulePeriod.

Public Fields

	Name	Description
	Day (see page 2079)	This is Day, a member of class SchedulePeriod.
	Millis (see page 2079)	This is Millis, a member of class SchedulePeriod.
	Week (see page 2079)	This is Week, a member of class SchedulePeriod.

15.1.2.1.21.2 SchedulePeriod Fields

The fields of the SchedulePeriod class are listed here.

Public Fields

	Name	Description
	Day (see page 2079)	This is Day, a member of class SchedulePeriod.
	Millis (see page 2079)	This is Millis, a member of class SchedulePeriod.
	Week (see page 2079)	This is Week, a member of class SchedulePeriod.

15.1.2.1.21.2.1 SchedulePeriod.Day Field

Pascal

```
const Day: string = "DAY";
```

C++

```
string Day = "DAY";
```

Description

This is Day, a member of class SchedulePeriod.

15.1.2.1.21.2.2 SchedulePeriod.Millis Field

Pascal

```
const Millis: string = "MILLIS";
```

C++

```
string Millis = "MILLIS";
```

Description

This is Millis, a member of class SchedulePeriod.

15.1.2.1.21.2.3 SchedulePeriod.Week Field

Pascal

```
const Week: string = "WEEK";
```

C++

```
string Week = "WEEK";
```

Description

This is Week, a member of class SchedulePeriod.

15.1.2.1.22 SqlStateCode Class

Provides the possible values of the SQLState property of a SQLException raised by Blackfish SQL.

Class Hierarchy

Pascal

```
SqlStateCode = class;
```

C++

```
class SqlStateCode;
```

File

SqlStateCode.cs

Description

Provides the possible values of the SQLState property of a SQLException raised by Blackfish SQL.

Each value is a 5 character error code defined in the SQL92 standard. The first 2 characters are an error class value, and the latter 3 characters are a subclass error value.

This table lists the possible error class values (the first two characters in the error code):

Error Class	Description
02	No data.
08	Connection error.
0A	Feature not supported.
21	Cardinality violation.
22	Data (see page 1762) exception.
24	Invalid cursor state.
42	Syntax or access violation.
44	Check option violation.
HZ	Remote database access error.
IM	Non standard error class.

This table lists the 5–character SQL error codes:

Constant	Description
Sql02000 (see page 2082)	Query has no result set.
Sql08001 (see page 2082)	SQL connection could not be made.
Sql08003 (see page 2082)	SQL connection was never made or was previously closed.
Sql08004 (see page 2083)	SQL connection rejected by server.
Sql08006 (see page 2083)	General connection error.
Sql0A000 (see page 2083)	Feature not supported.
Sql21000 (see page 2083)	Cardinality error.
Sql22000 (see page 2083)	General data exception.
Sql22001 (see page 2084)	String data with too many chars/bytes.
Sql22003 (see page 2084)	Numeric value out of range.
Sql22005 (see page 2084)	Value could not be casted to target type.
Sql22007 (see page 2084)	Malformed date/time value.
Sql22011 (see page 2084)	SUBSTRING error.
Sql22012 (see page 2085)	Divide by zero error.
Sql22019 (see page 2085)	Invalid escape character in LIKE operator.
Sql22023 (see page 2085)	Invalid parameter.
Sql22025 (see page 2085)	Invalid LIKE pattern.
Sql22027 (see page 2085)	TRIM error.
Sql23000 (see page 2086)	Integrity constraint violation.
Sql24000 (see page 2086)	Invalid cursor state.

Sql42000 (see page 2086)	Syntax or access violation.
Sql44000 (see page 2086)	With check option violation.
SqlHz309 (see page 2086)	Unknown protocol request encountered.
SqlHz316 (see page 2087)	Network protocol error.
SqlHz320 (see page 2087)	Network protocol version mismatch.
SqlIm000 (see page 2087)	General error category.

15.1.2.1.22.1 SqlStateCode Members

The following tables list the members exposed by SqlStateCode.

Public Fields

	Name	Description
	Sql02000 (see page 2082)	This is Sql02000, a member of class SqlStateCode.
	Sql08001 (see page 2082)	This is Sql08001, a member of class SqlStateCode.
	Sql08003 (see page 2082)	This is Sql08003, a member of class SqlStateCode.
	Sql08004 (see page 2083)	This is Sql08004, a member of class SqlStateCode.
	Sql08006 (see page 2083)	This is Sql08006, a member of class SqlStateCode.
	Sql0A000 (see page 2083)	This is Sql0A000, a member of class SqlStateCode.
	Sql21000 (see page 2083)	This is Sql21000, a member of class SqlStateCode.
	Sql22000 (see page 2083)	This is Sql22000, a member of class SqlStateCode.
	Sql22001 (see page 2084)	This is Sql22001, a member of class SqlStateCode.
	Sql22003 (see page 2084)	This is Sql22003, a member of class SqlStateCode.
	Sql22005 (see page 2084)	This is Sql22005, a member of class SqlStateCode.
	Sql22007 (see page 2084)	This is Sql22007, a member of class SqlStateCode.
	Sql22011 (see page 2084)	This is Sql22011, a member of class SqlStateCode.
	Sql22012 (see page 2085)	This is Sql22012, a member of class SqlStateCode.
	Sql22019 (see page 2085)	This is Sql22019, a member of class SqlStateCode.
	Sql22023 (see page 2085)	This is Sql22023, a member of class SqlStateCode.
	Sql22025 (see page 2085)	This is Sql22025, a member of class SqlStateCode.
	Sql22027 (see page 2085)	This is Sql22027, a member of class SqlStateCode.
	Sql23000 (see page 2086)	This is Sql23000, a member of class SqlStateCode.
	Sql24000 (see page 2086)	This is Sql24000, a member of class SqlStateCode.
	Sql42000 (see page 2086)	This is Sql42000, a member of class SqlStateCode.
	Sql44000 (see page 2086)	This is Sql44000, a member of class SqlStateCode.
	SqlHz309 (see page 2086)	This is SqlHz309, a member of class SqlStateCode.
	SqlHz316 (see page 2087)	This is SqlHz316, a member of class SqlStateCode.
	SqlHz320 (see page 2087)	This is SqlHz320, a member of class SqlStateCode.
	SqlIm000 (see page 2087)	This is SqlIm000, a member of class SqlStateCode.

15.1.2.1.22.2 SqlStateCode Fields

The fields of the SqlStateCode class are listed here.

Public Fields

	Name	Description
	Sql02000 (see page 2082)	This is Sql02000, a member of class SqlStateCode.
	Sql08001 (see page 2082)	This is Sql08001, a member of class SqlStateCode.
	Sql08003 (see page 2082)	This is Sql08003, a member of class SqlStateCode.
	Sql08004 (see page 2083)	This is Sql08004, a member of class SqlStateCode.
	Sql08006 (see page 2083)	This is Sql08006, a member of class SqlStateCode.

	Sql0A000 (see page 2083)	This is Sql0A000, a member of class SqlStateCode.
	Sql21000 (see page 2083)	This is Sql21000, a member of class SqlStateCode.
	Sql22000 (see page 2083)	This is Sql22000, a member of class SqlStateCode.
	Sql22001 (see page 2084)	This is Sql22001, a member of class SqlStateCode.
	Sql22003 (see page 2084)	This is Sql22003, a member of class SqlStateCode.
	Sql22005 (see page 2084)	This is Sql22005, a member of class SqlStateCode.
	Sql22007 (see page 2084)	This is Sql22007, a member of class SqlStateCode.
	Sql22011 (see page 2084)	This is Sql22011, a member of class SqlStateCode.
	Sql22012 (see page 2085)	This is Sql22012, a member of class SqlStateCode.
	Sql22019 (see page 2085)	This is Sql22019, a member of class SqlStateCode.
	Sql22023 (see page 2085)	This is Sql22023, a member of class SqlStateCode.
	Sql22025 (see page 2085)	This is Sql22025, a member of class SqlStateCode.
	Sql22027 (see page 2085)	This is Sql22027, a member of class SqlStateCode.
	Sql23000 (see page 2086)	This is Sql23000, a member of class SqlStateCode.
	Sql24000 (see page 2086)	This is Sql24000, a member of class SqlStateCode.
	Sql42000 (see page 2086)	This is Sql42000, a member of class SqlStateCode.
	Sql44000 (see page 2086)	This is Sql44000, a member of class SqlStateCode.
	SqlHz309 (see page 2086)	This is SqlHz309, a member of class SqlStateCode.
	SqlHz316 (see page 2087)	This is SqlHz316, a member of class SqlStateCode.
	SqlHz320 (see page 2087)	This is SqlHz320, a member of class SqlStateCode.
	SqlIm000 (see page 2087)	This is SqlIm000, a member of class SqlStateCode.

15.1.2.1.22.2.1 SqlStateCode.Sql02000 Field

Pascal

```
const Sql02000: string = "02000";
```

C++

```
string Sql02000 = "02000";
```

Description

This is Sql02000, a member of class SqlStateCode.

15.1.2.1.22.2.2 SqlStateCode.Sql08001 Field

Pascal

```
const Sql08001: string = "08001";
```

C++

```
string Sql08001 = "08001";
```

Description

This is Sql08001, a member of class SqlStateCode.

15.1.2.1.22.2.3 SqlStateCode.Sql08003 Field

Pascal

```
const Sql08003: string = "08003";
```

C++

```
string Sql08003 = "08003";
```

Description

This is Sql08003, a member of class SqlStateCode.

15.1.2.1.22.2.4 SqlStateCode.Sql08004 Field

Pascal

```
const Sql08004: string = "08004";
```

C++

```
string Sql08004 = "08004";
```

Description

This is Sql08004, a member of class SqlStateCode.

15.1.2.1.22.2.5 SqlStateCode.Sql08006 Field

Pascal

```
const Sql08006: string = "08006";
```

C++

```
string Sql08006 = "08006";
```

Description

This is Sql08006, a member of class SqlStateCode.

15.1.2.1.22.2.6 SqlStateCode.Sql0A000 Field

Pascal

```
const Sql0A000: string = "0A000";
```

C++

```
string Sql0A000 = "0A000";
```

Description

This is Sql0A000, a member of class SqlStateCode.

15.1.2.1.22.2.7 SqlStateCode.Sql21000 Field

Pascal

```
const Sql21000: string = "21000";
```

C++

```
string Sql21000 = "21000";
```

Description

This is Sql21000, a member of class SqlStateCode.

15.1.2.1.22.2.8 SqlStateCode.Sql22000 Field

Pascal

```
const Sql22000: string = "22000";
```

C++

```
string Sql22000 = "22000";
```

Description

This is Sql22000, a member of class SqlStateCode.

15.1.2.1.22.2.9 SqlStateCode.Sql22001 Field

Pascal

```
const Sql22001: string = "22001";
```

C++

```
string Sql22001 = "22001";
```

Description

This is Sql22001, a member of class SqlStateCode.

15.1.2.1.22.2.10 SqlStateCode.Sql22003 Field

Pascal

```
const Sql22003: string = "22003";
```

C++

```
string Sql22003 = "22003";
```

Description

This is Sql22003, a member of class SqlStateCode.

15.1.2.1.22.2.11 SqlStateCode.Sql22005 Field

Pascal

```
const Sql22005: string = "22005";
```

C++

```
string Sql22005 = "22005";
```

Description

This is Sql22005, a member of class SqlStateCode.

15.1.2.1.22.2.12 SqlStateCode.Sql22007 Field

Pascal

```
const Sql22007: string = "22007";
```

C++

```
string Sql22007 = "22007";
```

Description

This is Sql22007, a member of class SqlStateCode.

15.1.2.1.22.2.13 SqlStateCode.Sql22011 Field

Pascal

```
const Sql22011: string = "22011";
```

C++

```
string Sql22011 = "22011";
```

Description

This is Sql22011, a member of class SqlStateCode.

15.1.2.1.22.2.14 SqlStateCode.Sql22012 Field

Pascal

```
const Sql22012: string = "22012";
```

C++

```
string Sql22012 = "22012";
```

Description

This is Sql22012, a member of class SqlStateCode.

15.1.2.1.22.2.15 SqlStateCode.Sql22019 Field

Pascal

```
const Sql22019: string = "22019";
```

C++

```
string Sql22019 = "22019";
```

Description

This is Sql22019, a member of class SqlStateCode.

15.1.2.1.22.2.16 SqlStateCode.Sql22023 Field

Pascal

```
const Sql22023: string = "22023";
```

C++

```
string Sql22023 = "22023";
```

Description

This is Sql22023, a member of class SqlStateCode.

15.1.2.1.22.2.17 SqlStateCode.Sql22025 Field

Pascal

```
const Sql22025: string = "22025";
```

C++

```
string Sql22025 = "22025";
```

Description

This is Sql22025, a member of class SqlStateCode.

15.1.2.1.22.2.18 SqlStateCode.Sql22027 Field

Pascal

```
const Sql22027: string = "22027";
```

C++

```
string Sql22027 = "22027";
```

Description

This is Sql22027, a member of class SqlStateCode.

15.1.2.1.22.2.19 SqlStateCode.Sql23000 Field

Pascal

```
const Sql23000: string = "23000";
```

C++

```
string Sql23000 = "23000";
```

Description

This is Sql23000, a member of class SqlStateCode.

15.1.2.1.22.2.20 SqlStateCode.Sql24000 Field

Pascal

```
const Sql24000: string = "24000";
```

C++

```
string Sql24000 = "24000";
```

Description

This is Sql24000, a member of class SqlStateCode.

15.1.2.1.22.2.21 SqlStateCode.Sql42000 Field

Pascal

```
const Sql42000: string = "42000";
```

C++

```
string Sql42000 = "42000";
```

Description

This is Sql42000, a member of class SqlStateCode.

15.1.2.1.22.2.22 SqlStateCode.Sql44000 Field

Pascal

```
const Sql44000: string = "44000";
```

C++

```
string Sql44000 = "44000";
```

Description

This is Sql44000, a member of class SqlStateCode.

15.1.2.1.22.2.23 SqlStateCode.SqlHz309 Field

Pascal

```
const SqlHz309: string = "HZ309";
```

C++

```
string SqlHz309 = "HZ309";
```

Description

This is SqlHz309, a member of class SqlStateCode.

15.1.2.1.22.2.24 SqlStateCode.SqlHz316 Field

Pascal

```
const SqlHz316: string = "HZ316";
```

C++

```
string SqlHz316 = "HZ316";
```

Description

This is SqlHz316, a member of class SqlStateCode.

15.1.2.1.22.2.25 SqlStateCode.SqlHz320 Field

Pascal

```
const SqlHz320: string = "HZ320";
```

C++

```
string SqlHz320 = "HZ320";
```

Description

This is SqlHz320, a member of class SqlStateCode.

15.1.2.1.22.2.26 SqlStateCode.SqlIm000 Field

Pascal

```
const SqlIm000: string = "IM000";
```

C++

```
string SqlIm000 = "IM000";
```

Description

This is SqlIm000, a member of class SqlStateCode.

15.1.2.1.23 StatusLogColumns Class

Provides column names for result table from built-in stored procedure DB_ADMIN.GET_STATUS_LOGS.

Class Hierarchy

Borland.Data.DataStore.StatusLogColumns

Pascal

```
StatusLogColumns = class;
```

C++

```
class StatusLogColumns;
```

File

StatusLogColumns.cs

Description

StatusLogColumns provides the column names for the result table from the built-in stored procedure DB_ADMIN.GET_STATUS_LOGS. Each row in the result table describes an existing status log file for the current database. The columns of the result table are:

Column	Description
ID	A name of a column in the result table from DB_ADMIN.GET_STATUS_LOGS representing the ID of a status log file.
NAME	A name of a column in the result table from DB_ADMIN.GET_STATUS_LOGS representing the name of the status log file.
LAST_MODIFIED	A name of a column in the result table from DB_ADMIN.GET_STATUS_LOGS representing the time the status log file was last changed.
LENGTH	A name of a column in the result table from DB_ADMIN.GET_STATUS_LOGS representing the length of the status log file.

GET_STATUS_LOGS

15.1.2.1.23.1 StatusLogColumns Members

The following tables list the members exposed by StatusLogColumns.

Public Fields

	Name	Description
	Id (see page 2088)	This is Id, a member of class StatusLogColumns.
	LastModified (see page 2088)	This is LastModified, a member of class StatusLogColumns.
	Length (see page 2089)	This is Length, a member of class StatusLogColumns.
	Name (see page 2089)	This is Name, a member of class StatusLogColumns.

15.1.2.1.23.2 StatusLogColumns Fields

The fields of the StatusLogColumns class are listed here.

Public Fields

	Name	Description
	Id (see page 2088)	This is Id, a member of class StatusLogColumns.
	LastModified (see page 2088)	This is LastModified, a member of class StatusLogColumns.
	Length (see page 2089)	This is Length, a member of class StatusLogColumns.
	Name (see page 2089)	This is Name, a member of class StatusLogColumns.

15.1.2.1.23.2.1 StatusLogColumns.Id Field

Pascal

```
const Id: string = "ID";
```

C++

```
string Id = "ID";
```

Description

This is Id, a member of class StatusLogColumns.

15.1.2.1.23.2.2 StatusLogColumns.LastModified Field

Pascal

```
const LastModified: string = "LAST_MODIFIED";
```

C++

```
string LastModified = "LAST_MODIFIED";
```

Description

This is LastModified, a member of class StatusLogColumns.

15.1.2.1.23.2.3 StatusLogColumns.Length Field

Pascal

```
const Length: string = "LENGTH";
```

C++

```
string Length = "LENGTH";
```

Description

This is Length, a member of class StatusLogColumns.

15.1.2.1.23.2.4 StatusLogColumns.Name Field

Pascal

```
const Name: string = "NAME";
```

C++

```
string Name = "NAME";
```

Description

This is Name, a member of class StatusLogColumns.

15.1.2.1.24 SysMirrors Class

Provides the column names of the system table **SYS.MIRRORS**.

Class Hierarchy

Borland.Data.DataStore.SysMirrors

Pascal

```
SysMirrors = class;
```

C++

```
class SysMirrors;
```

File

SysMirrors.cs

Description

Provides the column names of the system table **SYS.MIRRORS**. In addition to providing the column names for the system table **SYS.MIRRORS**, the same column names should be used to create a property string for the built-in stored procedures DB_ADMIN.CREATE_MIRROR and DB_ADMIN.ALTER_MIRROR. The columns of the system table **SYS.MIRRORS** are:

Column	Description
ID	This is assigned a unique value when a mirror is first created. Although a mirror's name can be changed, its ID can never be changed. If a mirror definition is deleted, its ID is not reused by mirrors created afterwards.

NAME	Unique name for this mirror.
TYPE	Type (see page 2094) of mirror. This can only be set to one of the values in **MirrorTypes (see page 2072)**.
HOST	The host computer name that this mirror can be accessed from. This is needed for remotely connecting to this mirror.
PORT	The port of computer through which this mirror can be accessed. This is needed for remotely connecting to this mirror. Defaults to **DataStoreServer.DEFAULT_PORT**.
FILE_NAME	The file name for this mirror located on the HOST computer
AUTO_FAIL_OVER	This boolean property can be set to true for **READONLY** and **PRIMARY** mirrors. When a **READONLY** mirror has this property set to **true**, all write transactions are guaranteed to be durable on this mirror and the PRIMARY mirror. This allows one of the READONLY mirrors with this property setting to automatically become the PRIMARY mirror if the existing PRIMARY mirror should fail. It is useful to set this property to true for a PRIMARY mirror, so that if the PRIMARY mirror fails and another mirror automatically becomes the PRIMARY, the old PRIMARY knows to assume the role of a READONLY mirror with the **AUTO_FAIL_OVER** option enabled. To prevent more than one PRIMARY mirror existing at one time, a majority of the mirrors that have the **AUTO_FAIL_OVER** column set to **true** must be attachable (connected to). This implies that 3 or more mirrors must be configured with the **AUTO_FAIL_OVER** column set to true. In addition, a PRIMARY mirror does not allow transactions to start or commit if the log records for such a transaction cannot be durably written to a majority of **AUTO_FAIL_OVER** mirrors. The combination of these two rules are needed to prevent automatic fail over from allowing two primary mirrors to simultaneously accept write transactions. Automatic fail over will also be disabled if a majority of **AUTO_FAIL_OVER** mirrors do not have the same contents for the **SYS.MIRRORS** table. This can happen even if the **AUTO_FAIL_OVER** mirrors have the most recent log records from the PRIMARY mirror. Whenever the contents of the **SYS.MIRRORS** table are changed, an attempt is made to synchronize all mirrors. If a mirror is off line it will not be synchronized and the DB_ADMIN.SYNCH_MIRROR method needs to be called when that mirror is brought back on online. Note that in the situation where a majority of **AUTO_FAIL_OVER** mirrors cannot be attached to by the PRIMARY mirror, the PRIMARY mirror can be made writable by setting the **AUTO_FAIL_OVER** column to **false** for the PRIMARY mirror. This disables automatic fail over for the PRIMARY mirror. When a client's connection begins to encounter network errors indicating that the PRIMARY server has failed or there is a network failure, the client initiates an automatic fail over process when its failed transaction is rolled back. This process starts off by connecting to one of the READONLY mirrors with **AUTO_FAIL_OVER** set to **true** that has the lowest value in its FAIL_OVER_PRIORITY column. The highest priority mirror is asked to become the new PRIMARY mirror. If two mirrors have the same priority, then the ID column is used as the tie breaker. Again, this only succeeds if the PRIMARY candidate can connect to a majority of other **AUTO_FAIL_OVER** mirrors that have also lost their connection with the existing PRIMARY mirror.
FAIL_OVER_PRIORITY	Mirrors with a higher priority are chosen for fail over before mirrors with a lower priority setting.
INSTANT_SYNCH	This causes a mirror to have all log records of committed transactions. These mirrors can slow down the write performance of applications, since no transaction can commit until all of the **INSTANT_SYNCH** mirrors have made the transaction durable. **INSTANT_SYNCH** is automatically set to **true** if **AUTO_FAIL_OVER** is set to **true**. However, **INSTANT_SYNCH** can be enabled without enabling **AUTO_FAIL_OVER**. Note that this setting only causes the mirror's log files to be updated with the committed log records from the primary mirror. The database does not reflect these changes until these log records have been replayed by calling the DB_ADMIN.SYNCH_MIRROR method.

SYNCH_MIRROR_NAME	The name of another mirror that this mirror is synchronized from. This can only be set to one of the **NAME** column values of another mirror in the **SYS.MIRRORS** table. Mirrors with **AUTO_FAIL_OVER** do not need to specify a value for this column, since they always synchronize with the primary mirror. Mirrors with either **INSTANT_SYNCH** or **AUTO_FAIL_OVER** set to **true** have their log files kept in sync with their sync mirror on all commit/rollback operations. However the log files are only replayed when DB_ADMIN.SYNCH_MIRROR method is called.
BIRTH_STAMP	Birth stamp used by the primary mirror that this mirror is owned by.
LAST_KNOWN_REPLAY	Last known replay address for this mirror. Used internally to determine if old log files can be dropped.
CLIENT_HASH_CODE	Unique client side hash code.
VALIDATED_PRIMARY	Only meaningful for mirror configurations that have enabled automatic fail over. When set to **true**, this indicates that this mirror has been verified as the primary mirror and can accept write transactions.

	SynchMirrorName (see page 2094)	This is SynchMirrorName, a member of class SysMirrors.
	Type (see page 2094)	This is Type, a member of class SysMirrors.
	ValidatedPrimary (see page 2094)	This is ValidatedPrimary, a member of class SysMirrors.

15.1.2.1.24.2.1 SysMirrors.AutoFailOver Field

Pascal

```
const AutoFailOver: string = "AUTO_FAIL_OVER";
```

C++

```
string AutoFailOver = "AUTO_FAIL_OVER";
```

Description

This is AutoFailOver, a member of class SysMirrors.

15.1.2.1.24.2.2 SysMirrors.BirthStamp Field

Pascal

```
const BirthStamp: string = "BIRTH_STAMP";
```

C++

```
string BirthStamp = "BIRTH_STAMP";
```

Description

This is BirthStamp, a member of class SysMirrors.

15.1.2.1.24.2.3 SysMirrors.ClientHashCode Field

Pascal

```
const ClientHashCode: string = "CLIENT_HASH_CODE";
```

C++

```
string ClientHashCode = "CLIENT_HASH_CODE";
```

Description

This is ClientHashCode, a member of class SysMirrors.

15.1.2.1.24.2.4 SysMirrors.FailOverPriority Field

Pascal

```
const FailOverPriority: string = "FAIL_OVER_PRIORITY";
```

C++

```
string FailOverPriority = "FAIL_OVER_PRIORITY";
```

Description

This is FailOverPriority, a member of class SysMirrors.

15.1.2.1.24.2.5 SysMirrors.FileName Field

Pascal

```
const FileName: string = "FILE_NAME";
```

C++

```
string FileName = "FILE_NAME";
```

Description

This is FileName, a member of class SysMirrors.

15.1.2.1.24.2.6 SysMirrors.Host Field

Pascal

```
const Host: string = "HOST";
```

C++

```
string Host = "HOST";
```

Description

This is Host, a member of class SysMirrors.

15.1.2.1.24.2.7 SysMirrors.Id Field

Pascal

```
const Id: string = "ID";
```

C++

```
string Id = "ID";
```

Description

This is Id, a member of class SysMirrors.

15.1.2.1.24.2.8 SysMirrors.InstantSynch Field

Pascal

```
const InstantSynch: string = "INSTANT_SYNCH";
```

C++

```
string InstantSynch = "INSTANT_SYNCH";
```

Description

This is InstantSynch, a member of class SysMirrors.

15.1.2.1.24.2.9 SysMirrors.LastKnownReplay Field

Pascal

```
const LastKnownReplay: string = "LAST_KNOWN_REPLAY";
```

C++

```
string LastKnownReplay = "LAST_KNOWN_REPLAY";
```

Description

This is LastKnownReplay, a member of class SysMirrors.

15.1.2.1.24.2.10 SysMirrors.Name Field

Pascal

```
const Name: string = "NAME";
```

C++

```
string Name = "NAME";
```

Description

This is Name, a member of class SysMirrors.

15.1.2.1.24.2.11 SysMirrors.Port Field

Pascal

```
const Port: string = "PORT";
```

C++

```
string Port = "PORT";
```

Description

This is Port, a member of class SysMirrors.

15.1.2.1.24.2.12 SysMirrors.SynchMirrorName Field

Pascal

```
const SynchMirrorName: string = "SYNCH_MIRROR_NAME";
```

C++

```
string SynchMirrorName = "SYNCH_MIRROR_NAME";
```

Description

This is SynchMirrorName, a member of class SysMirrors.

15.1.2.1.24.2.13 SysMirrors.Type Field

Pascal

```
const Type: string = "TYPE";
```

C++

```
string Type = "TYPE";
```

Description

This is Type, a member of class SysMirrors.

15.1.2.1.24.2.14 SysMirrors.ValidatedPrimary Field

Pascal

```
const ValidatedPrimary: string = "VALIDATED_PRIMARY";
```

C++

```
string ValidatedPrimary = "VALIDATED_PRIMARY";
```

Description

This is ValidatedPrimary, a member of class SysMirrors.

15.1.2.1.25 SysSchedule Class

Provides column names from system table **SYS.MIRROR_SCHEDULE**.

Class Hierarchy

Borland.Data.DataStore.SysSchedule

Pascal

```
SysSchedule = class;
```

C++

```
class SysSchedule;
```

File

SysSchedule.cs

Description

SysSchedule provides the column names from the system table **SYS.MIRROR_SCHEDULE**. In addition to being the column of the system table **SYS.MIRROR_SCHEDULE**, the same column names should be used to construct a property string for the built-in stored procedure DB_ADMIN.CREATE_MIRROR_SCHEDULE??? and DB_ADMIN.ALTER_MIRROR_SCHEDULE. The columns are:

Constant	Description
ID	Unique identifier **long int** for this schedule item.
REF	**long int** reference to an object that this schedule item applies to.
SCHEDULE_ITEM_CLASS	String that is name of class that extends the **ScheduleItem**. The execute method of this class is called at the scheduled time interval.
PERIOD	String that is one of the values in the SchedulePeriod (see page 2078) class.
DAY	Only used when **PERIOD** is set to **WEEK**.
TIME	Only used when **PERIOD** is set to **WEEK** or **DAY**.
MILLIS	Only used when **PERIOD** is set to **MILLIS**.

CREATE_MIRROR_SCHEDULE

15.1.2.1.25.1 SysSchedule Members

The following tables list the members exposed by SysSchedule.

Public Fields

	Name	Description
	Day (see page 2096)	This is Day, a member of class SysSchedule.
	Id (see page 2096)	This is Id, a member of class SysSchedule.
	Millis (see page 2096)	This is Millis, a member of class SysSchedule.
	Period (see page 2096)	This is Period, a member of class SysSchedule.

	Ref (see page 2097)	This is Ref, a member of class SysSchedule.
	ScheduleItemClass (see page 2097)	This is ScheduleItemClass, a member of class SysSchedule.
	Time (see page 2097)	This is Time, a member of class SysSchedule.

15.1.2.1.25.2 SysSchedule Fields

The fields of the SysSchedule class are listed here.

Public Fields

	Name	Description
	Day (see page 2096)	This is Day, a member of class SysSchedule.
	Id (see page 2096)	This is Id, a member of class SysSchedule.
	Millis (see page 2096)	This is Millis, a member of class SysSchedule.
	Period (see page 2096)	This is Period, a member of class SysSchedule.
	Ref (see page 2097)	This is Ref, a member of class SysSchedule.
	ScheduleItemClass (see page 2097)	This is ScheduleItemClass, a member of class SysSchedule.
	Time (see page 2097)	This is Time, a member of class SysSchedule.

15.1.2.1.25.2.1 SysSchedule.Day Field

Pascal

```
const Day: string = "DAY";
```

C++

```
string Day = "DAY";
```

Description

This is Day, a member of class SysSchedule.

15.1.2.1.25.2.2 SysSchedule.Id Field

Pascal

```
const Id: string = "ID";
```

C++

```
string Id = "ID";
```

Description

This is Id, a member of class SysSchedule.

15.1.2.1.25.2.3 SysSchedule.Millis Field

Pascal

```
const Millis: string = "MILLIS";
```

C++

```
string Millis = "MILLIS";
```

Description

This is Millis, a member of class SysSchedule.

15.1.2.1.25.2.4 SysSchedule.Period Field

Pascal

```
const Period: string = "PERIOD";
```

C++

```
string Period = "PERIOD";
```

Description

This is Period, a member of class SysSchedule.

15.1.2.1.25.2.5 SysSchedule.Ref Field

Pascal

```
const Ref: string = "REF";
```

C++

```
string Ref = "REF";
```

Description

This is Ref, a member of class SysSchedule.

15.1.2.1.25.2.6 SysSchedule.ScheduleItemClass Field

Pascal

```
const ScheduleItemClass: string = "SCHEDULE_ITEM_CLASS";
```

C++

```
string ScheduleItemClass = "SCHEDULE_ITEM_CLASS";
```

Description

This is ScheduleItemClass, a member of class SysSchedule.

15.1.2.1.25.2.7 SysSchedule.Time Field

Pascal

```
const Time: string = "TIME";
```

C++

```
string Time = "TIME";
```

Description

This is Time, a member of class SysSchedule.

15.1.2.1.26 SystemProperties Class

Specifies names of system properties that should be applied to all databases open in a process.

Class Hierarchy

Pascal

```
SystemProperties = class;
```

C++

```
class SystemProperties;
```

File

SystemProperties.cs

Description

This class specifies the names of system properties that should be applied to all databases open in a process. Some of these properties can also be specified as a connection property as well.

Blackfish SQL for Windows calls the `AppDomain.CurrentDomain.GetData` method with the string "blackfishsql." prepended to the property name to obtain system property settings. Here is how to set the default server port:

```
AppDomain.CurrentDomain.SetData("blackfishsql.port", "2508");
```

These settings can also be specified in the launcher config files as:

```
<appSettings> <add key="ServiceName" value="BlackfishSQL" />
            <add key="blackfishsql.port" value="2508" /> <add
            key="blackfishsql.tempDir" value="" /> </appSettings>
```

Blackfish SQL for Java (see page 15681) calls the `java.lang.System.getProperty` method with the string "blackfishsql." prepended to the property name to obtain system property settings. Here is how to set the default server port:

```
System.setProperty("blackfishsql.port", "2508");
```

These settings can also be specified in the launcher config files as:

```
vmparam -Dblackfishsql.port=2508
```

SystemProperties can be specified in the BSQLServer.exe.config file. Here is an example after a clean install:

```
<?xml version="1.0" encoding="utf-8" ?> <configuration>
            <startup> <supportedRuntime version="v2.0.50727" />
            <supportedRuntime version="v1.1.4322" /> <supportedRuntime
            version="v1.0.3705" /> </startup> <appSettings> <add
            key="ServiceName" value="BlackfishSQL" /> <!— Blackfish SQL system properties are
            documented in the Borland.Data.DataStore.SystemProperties class. Empty or missing
values
            cause default settings to be used. --> <add key="blackfishsql.minCacheSize"
            value="" /> <add key="blackfishsql.maxSortBuffer" value="" /> <add
            key="blackfishsql.tempDir" value="" /> <add key="blackfishsql.licenseDirectory"
            value="" /> <add key="blackfishsql.port" value="2508" /> <add
            key="blackfishsql.dataDirectory" value="" /> </appSettings>
            </configuration>
```

This table contains system property names.

System (see page 22079) Property Name	**Description**
MinCacheSize (see page 2101)	Sets the minimum number of cache blocks in the cache. Note that all databases opened in the same process share the same cache.
MaxSortBuffer (see page 2101)	Maximum sort buffer size in bytes. When sorting operations are performed for operations like index building, this is the maximum memory in bytes that is used for a sort buffer. Increasing this number may speed up very large sorts. Cannot be set to less than 32K (32*1024). Default is 12M (12*1024*1024).
TempDir (see page 2101)	Specify directory for temp files. Used for operations like large sorts. If this is not set, the directory of the **DATABASE** property is used for temporary files.
Port (see page 2101)	Specify the port to communicate with a remote server. Default is 2508.

LicenseDirectory (see page 2100)	If this directory location is specified, it is the only directory searched for licenses.
DataDirectory (see page 2100)	If this directory location is specified, this is used to replace the macro `|DataDirectory (see page 2100)|` at the beginning of a database file name specification.

15.1.2.1.26.1 SystemProperties Members

The following tables list the members exposed by SystemProperties.

Public Fields

	Name	Description
	AssemblyPath (see page 2099)	This is AssemblyPath, a member of class SystemProperties.
	BlackfishSqlNamespace (see page 2100)	This is BlackfishSqlNamespace, a member of class SystemProperties.
	DataDirectory (see page 2100)	This is DataDirectory, a member of class SystemProperties.
	LicenseDirectory (see page 2100)	This is LicenseDirectory, a member of class SystemProperties.
	LogFile (see page 2100)	This is LogFile, a member of class SystemProperties.
	LogFilters (see page 2100)	This is LogFilters, a member of class SystemProperties.
	MaxSortBuffer (see page 2101)	This is MaxSortBuffer, a member of class SystemProperties.
	MinCacheSize (see page 2101)	This is MinCacheSize, a member of class SystemProperties.
	Port (see page 2101)	This is Port, a member of class SystemProperties.
	TempDir (see page 2101)	This is TempDir, a member of class SystemProperties.

15.1.2.1.26.2 SystemProperties Fields

The fields of the SystemProperties class are listed here.

Public Fields

	Name	Description
	AssemblyPath (see page 2099)	This is AssemblyPath, a member of class SystemProperties.
	BlackfishSqlNamespace (see page 2100)	This is BlackfishSqlNamespace, a member of class SystemProperties.
	DataDirectory (see page 2100)	This is DataDirectory, a member of class SystemProperties.
	LicenseDirectory (see page 2100)	This is LicenseDirectory, a member of class SystemProperties.
	LogFile (see page 2100)	This is LogFile, a member of class SystemProperties.
	LogFilters (see page 2100)	This is LogFilters, a member of class SystemProperties.
	MaxSortBuffer (see page 2101)	This is MaxSortBuffer, a member of class SystemProperties.
	MinCacheSize (see page 2101)	This is MinCacheSize, a member of class SystemProperties.
	Port (see page 2101)	This is Port, a member of class SystemProperties.
	TempDir (see page 2101)	This is TempDir, a member of class SystemProperties.

15.1.2.1.26.2.1 SystemProperties.AssemblyPath Field

Pascal

```
const AssemblyPath: string = "assemblyPath";
```

C++

```
string AssemblyPath = "assemblyPath";
```

Description

This is AssemblyPath, a member of class SystemProperties.

15.1.2.1.26.2.2 SystemProperties.BlackfishSqlNamespace Field

Pascal

```
const BlackfishSqlNamespace: string = "blackfishsql";
```

C++

```
string BlackfishSqlNamespace = "blackfishsql";
```

Description

This is BlackfishSqlNamespace, a member of class SystemProperties.

15.1.2.1.26.2.3 SystemProperties.DataDirectory Field

Pascal

```
const DataDirectory: string = "dataDirectory";
```

C++

```
string DataDirectory = "dataDirectory";
```

Description

This is DataDirectory, a member of class SystemProperties.

15.1.2.1.26.2.4 SystemProperties.LicenseDirectory Field

Pascal

```
const LicenseDirectory: string = "licenseDirectory";
```

C++

```
string LicenseDirectory = "licenseDirectory";
```

Description

This is LicenseDirectory, a member of class SystemProperties.

15.1.2.1.26.2.5 SystemProperties.LogFile Field

Pascal

```
const LogFile: string = "logFile";
```

C++

```
string LogFile = "logFile";
```

Description

This is LogFile, a member of class SystemProperties.

15.1.2.1.26.2.6 SystemProperties.LogFilters Field

Pascal

```
const LogFilters: string = "logFilters";
```

C++

```
string LogFilters = "logFilters";
```

Description

This is LogFilters, a member of class SystemProperties.

15.1.2.1.26.2.7 SystemProperties.MaxSortBuffer Field

Pascal

```
const MaxSortBuffer: string = "maxSortBuffer";
```

C++

```
string MaxSortBuffer = "maxSortBuffer";
```

Description

This is MaxSortBuffer, a member of class SystemProperties.

15.1.2.1.26.2.8 SystemProperties.MinCacheSize Field

Pascal

```
const MinCacheSize: string = "minCacheSize";
```

C++

```
string MinCacheSize = "minCacheSize";
```

Description

This is MinCacheSize, a member of class SystemProperties.

15.1.2.1.26.2.9 SystemProperties.Port Field

Pascal

```
const Port: string = "port";
```

C++

```
string Port = "port";
```

Description

This is Port, a member of class SystemProperties.

15.1.2.1.26.2.10 SystemProperties.TempDir Field

Pascal

```
const TempDir: string = "tempDir";
```

C++

```
string TempDir = "tempDir";
```

Description

This is TempDir, a member of class SystemProperties.

15.1.2.1.27 TriggerContext Class

An instance of the TriggerContext class is passed to each trigger.

Class Hierarchy

Pascal

```
TriggerContext = class;
```

C++

```
class TriggerContext;
```

File

TriggerContext.cs

Description

An instance of the TriggerContext class is passed to each trigger. From the context, it is possible to get access to a connection instance, and access to the new and old rows.

See Also

TriggerReadRow (see page 2103)

TriggerReadWriteRow (see page 2117)

15.1.2.1.27.1 TriggerContext Members

The following tables list the members exposed by TriggerContext.

Internal Fields

	Name	Description
	method (see page 2102)	This is method, a member of class TriggerContext.

Public Properties

	Name	Description
	Connection (see page 2103)	Current connection performing insert/update/delete.
	NewRow (see page 2103)	New row being inserted or values being updated.
	OldRow (see page 2103)	Old row being deleted or original values before update.

15.1.2.1.27.2 TriggerContext Fields

The fields of the TriggerContext class are listed here.

Internal Fields

	Name	Description
	method (see page 2102)	This is method, a member of class TriggerContext.

15.1.2.1.27.2.1 TriggerContext.method Field

Pascal

```
method: TriggerMethod;
```

C++

```
TriggerMethod method;
```

Description

This is method, a member of class TriggerContext.

15.1.2.1.27.3 TriggerContext Properties

The properties of the TriggerContext class are listed here.

Public Properties

	Name	Description
	Connection (see page 2103)	Current connection performing insert/update/delete.

	NewRow (see page 2103)	New row being inserted or values being updated.
	OldRow (see page 2103)	Old row being deleted or original values before update.

15.1.2.1.27.3.1 TriggerContext.Connection Property

Current connection performing insert/update/delete.

Pascal

```
property Connection: DataStoreConnection;
```

C++

```
__property DataStoreConnection Connection;
```

Description

Connection gets the current connection which is performing the insert/update/delete.

15.1.2.1.27.3.2 TriggerContext.NewRow Property

New row being inserted or values being updated.

Pascal

```
property NewRow: TriggerReadWriteRow;
```

C++

```
__property TriggerReadWriteRow NewRow;
```

Description

NewRow gets access to the new row being inserted or the values being updated.

See Also

OldRow (see page 2103)

15.1.2.1.27.3.3 TriggerContext.OldRow Property

Old row being deleted or original values before update.

Pascal

```
property OldRow: TriggerReadRow;
```

C++

```
__property TriggerReadRow OldRow;
```

Description

OldRow gets access to the old row being deleted or the original values before the update.

See Also

NewRow (see page 2103)

15.1.2.1.28 TriggerReadRow Class

Provides read access to a row of data.

Class Hierarchy

Borland.Data.DataStore.TriggerReadRow

Pascal

```
TriggerReadRow = class;
```

C++

```
class TriggerReadRow;
```

File

TriggerReadRow.cs

Description

The TriggerReadRow class provides read access to a row of data. It has methods to read values from each column.

See Also

TriggerContext (see page 2101)

TriggerReadWriteRow (see page 2117)

15.1.2.1.28.1 TriggerReadRow Members

The following tables list the members exposed by TriggerReadRow.

Internal Fields

	Name	Description
	method (see page 2105)	This is method, a member of class TriggerReadRow.

Public Methods

	Name	Description
	FindModified (see page 2105)	Returns first column ordinal starting with and including **startOrdinal** whose value changed.
	GetArrayLength (see page 2106)	Returns the length of the byte[] value of a given column.
	GetBoolean (see page 2106)	This is the overview for the GetBoolean method overload.
	GetByte (see page 2106)	This is the overview for the GetByte method overload.
	GetBytes (see page 2107)	This is the overview for the GetBytes method overload.
	GetColumnNames (see page 2108)	Returns an array containing names of first **columnCount** column names.
	GetDateTime (see page 2108)	This is the overview for the GetDateTime method overload.
	GetDecimal (see page 2109)	This is the overview for the GetDecimal method overload.
	GetDouble (see page 2109)	This is the overview for the GetDouble method overload.
	GetFloat (see page 2110)	This is the overview for the GetFloat method overload.
	GetInt16 (see page 2110)	This is the overview for the GetInt16 method overload.
	GetInt32 (see page 2111)	This is the overview for the GetInt32 method overload.
	GetInt64 (see page 2112)	This is the overview for the GetInt64 method overload.
	GetObject (see page 2112)	This is the overview for the GetObject method overload.
	GetOrdinal (see page 2113)	Returns ordinal in row of given column.
	GetString (see page 2113)	This is the overview for the GetString method overload.
	IsAssignedNull (see page 2114)	This is the overview for the IsAssignedNull method overload.
	IsModified (see page 2114)	This is the overview for the IsModified method overload.
	IsNull (see page 2115)	This is the overview for the IsNull method overload.
	IsUnassignedNull (see page 2116)	This is the overview for the IsUnassignedNull method overload.
	ToString (see page 2116)	Returns String representation of TriggerReadRow (see page 2103) object.

Public Properties

	Name	Description
	FieldCount (see page 2117)	Gets number of columns in row.

15.1.2.1.28.2 TriggerReadRow Fields

The fields of the TriggerReadRow class are listed here.

Internal Fields

	Name	Description
	method (see page 2105)	This is method, a member of class TriggerReadRow.

15.1.2.1.28.2.1 TriggerReadRow.method Field

Pascal

```
method: TriggerMethod;
```

C++

```
TriggerMethod method;
```

Description

This is method, a member of class TriggerReadRow.

15.1.2.1.28.3 TriggerReadRow Methods

The methods of the TriggerReadRow class are listed here.

Public Methods

	Name	Description
	FindModified (see page 2105)	Returns first column ordinal starting with and including **startOrdinal** whose value changed.
	GetArrayLength (see page 2106)	Returns the length of the byte[] value of a given column.
	GetBoolean (see page 2106)	This is the overview for the GetBoolean method overload.
	GetByte (see page 2106)	This is the overview for the GetByte method overload.
	GetBytes (see page 2107)	This is the overview for the GetBytes method overload.
	GetColumnNames (see page 2108)	Returns an array containing names of first **columnCount** column names.
	GetDateTime (see page 2108)	This is the overview for the GetDateTime method overload.
	GetDecimal (see page 2109)	This is the overview for the GetDecimal method overload.
	GetDouble (see page 2109)	This is the overview for the GetDouble method overload.
	GetFloat (see page 2110)	This is the overview for the GetFloat method overload.
	GetInt16 (see page 2110)	This is the overview for the GetInt16 method overload.
	GetInt32 (see page 2111)	This is the overview for the GetInt32 method overload.
	GetInt64 (see page 2112)	This is the overview for the GetInt64 method overload.
	GetObject (see page 2112)	This is the overview for the GetObject method overload.
	GetOrdinal (see page 2113)	Returns ordinal in row of given column.
	GetString (see page 2113)	This is the overview for the GetString method overload.
	IsAssignedNull (see page 2114)	This is the overview for the IsAssignedNull method overload.
	IsModified (see page 2114)	This is the overview for the IsModified method overload.
	IsNull (see page 2115)	This is the overview for the IsNull method overload.
	IsUnassignedNull (see page 2116)	This is the overview for the IsUnassignedNull method overload.
	ToString (see page 2116)	Returns String representation of TriggerReadRow (see page 2103) object.

15.1.2.1.28.3.1 TriggerReadRow.FindModified Method

Returns first column ordinal starting with and including **startOrdinal** whose value changed.

Pascal

```
function FindModified(startOrdinal: Integer): Integer;
```

C++

```
int FindModified(int startOrdinal);
```

Description

FindModified returns the first column ordinal starting with and including the **startOrdinal** whose value has been changed. The parameter **startOrdinal** is the first ordinal to check.

15.1.2.1.28.3.2 TriggerReadRow.GetArrayLength Method

Returns the length of the byte[] value of a given column.

Pascal

```
function GetArrayLength(columnName: string): Integer;
```

C++

```
int GetArrayLength(string columnName);
```

Description

GetArrayLength returns the length of the byte[] value of a given column whose name is in the parameter **columnName**.

15.1.2.1.28.3.3 GetBoolean Method

This is the overview for the GetBoolean method overload.

Overload List

	Name	Description
	TriggerReadRow.GetBoolean (int) (see page 2106)	Returns boolean value of given column.
	TriggerReadRow.GetBoolean (string) (see page 2106)	Returns boolean value of given column.

15.1.2.1.28.3.3.1 TriggerReadRow.GetBoolean Method (int)

Returns boolean value of given column.

Pascal

```
function GetBoolean(columnName: string): bool;
function GetBoolean(ordinal: Integer): bool;
```

C++

```
bool GetBoolean(string columnName);
bool GetBoolean(int ordinal);
```

Description

GetBoolean has several forms, depending on the input parameter:

- Returns the boolean value of a given column. The parameter **columnName** is the name of the column containing the wanted value.
- Returns the boolean value of a given column. The parameter **ordinal** is the ordinal of the column containing the wanted value.

15.1.2.1.28.3.4 GetByte Method

This is the overview for the GetByte method overload.

Overload List

	Name	Description
	TriggerReadRow.GetByte (int) (see page 2107)	Returns the byte value of a given column.
	TriggerReadRow.GetByte (string) (see page 2107)	Returns the byte value of a given column.

15.1.2.1.28.3.4.1 TriggerReadRow.GetByte Method (int)

Returns the byte value of a given column.

Pascal

```
function GetByte(columnName: string): byte;
function GetByte(ordinal: Integer): byte;
```

C++

```
byte GetByte(string columnName);
byte GetByte(int ordinal);
```

Description

GetByte has several forms, depending on the input parameter:

- Returns the value in the Column named **columnName** as a byte. The parameter **columnName** is the name of the column containing the wanted value.
- Returns the value in the column indicated by its ordinal as a byte. The parameter **ordinal** is the ordinal of the column containing the wanted value.

See Also

GetBytes (see page 2107)

15.1.2.1.28.3.5 GetBytes Method

This is the overview for the GetBytes method overload.

Overload List

	Name	Description
	TriggerReadRow.GetBytes (int) (see page 2107)	Returns the byte[] value of a given column.
	TriggerReadRow.GetBytes (string) (see page 2107)	Returns the byte[] value of a given column.

15.1.2.1.28.3.5.1 TriggerReadRow.GetBytes Method (int)

Returns the byte[] value of a given column.

Pascal

```
function GetBytes(columnName: string): byte[];
function GetBytes(ordinal: Integer): byte[];
```

C++

```
byte[] GetBytes(string columnName);
byte[] GetBytes(int ordinal);
```

Description

GetBytes has several forms, depending on the input parameter:

- Returns the value in the column named **columnName** as a byte[]. The parameter **columnName** is the name of the column containing the wanted value.
- Returns the value in the column indicated by its ordinal as a byte[]. The parameter **ordinal** is the ordinal of the column containing the wanted value.

See Also

GetByte (see page 2107)

15.1.2.1.28.3.6 TriggerReadRow.GetColumnNames Method

Returns an array containing names of first **columnCount** column names.

Pascal

```
function GetColumnNames(columnCount: Integer): string[];
```

C++

```
string[] GetColumnNames(int columnCount);
```

Description

GetColumnNames returns an array containing the names of the first **columnCount** column names. The parameter **columnCount** is the maximum number of column names requested.

15.1.2.1.28.3.7 GetDateTime Method

This is the overview for the GetDateTime method overload.

Overload List

	Name	Description
	TriggerReadRow.GetDateTime (int) (see page 2108)	Returns DateTime value of given column.
	TriggerReadRow.GetDateTime (string) (see page 2108)	Returns DateTime value of given column.

15.1.2.1.28.3.7.1 TriggerReadRow.GetDateTime Method (int)

Returns DateTime value of given column.

Pascal

```
function GetDateTime(columnName: string): DateTime;
function GetDateTime(ordinal: Integer): DateTime;
```

C++

```
DateTime GetDateTime(string columnName);
DateTime GetDateTime(int ordinal);
```

Description

GetDateTime has several forms, depending on the input parameter:

- Returns the DateTime value of a given column. The parameter **columnName** is the name of the column containing the wanted value.
- Returns the DateTime value of a given column. The parameter **ordinal** is the ordinal of the column containing the wanted

value.

15.1.2.1.28.3.8 GetDecimal Method

This is the overview for the GetDecimal method overload.

Overload List

	Name	Description
	TriggerReadRow.GetDecimal (int) (see page 2109)	Returns the Decimal value of a given column.
	TriggerReadRow.GetDecimal (string) (see page 2109)	Returns the Decimal value of a given column.

15.1.2.1.28.3.8.1 TriggerReadRow.GetDecimal Method (int)

Returns the Decimal value of a given column.

Pascal

```
function GetDecimal(columnName: string): Decimal;
function GetDecimal(ordinal: Integer): Decimal;
```

C++

```
Decimal GetDecimal(string columnName);
Decimal GetDecimal(int ordinal);
```

Description

GetDecimal has several forms, depending on the input parameter:

- Returns the Decimal value of a given column. The parameter **columnName** is the name of the column containing the wanted value.
- Returns the Decimal value of a given column. The parameter **ordinal** is the ordinal of the column containing the wanted value.

See Also

GetDouble (see page 2109)

GetFloat (see page 2110)

15.1.2.1.28.3.9 GetDouble Method

This is the overview for the GetDouble method overload.

Overload List

	Name	Description
	TriggerReadRow.GetDouble (int) (see page 2109)	Returns the double value of a given column.
	TriggerReadRow.GetDouble (string) (see page 2109)	Returns the double value of a given column.

15.1.2.1.28.3.9.1 TriggerReadRow.GetDouble Method (int)

Returns the double value of a given column.

Pascal

```
function GetDouble(columnName: string): double;
```

```
function GetDouble(ordinal: Integer): double;
```

C++

```
double GetDouble(string columnName);
double GetDouble(int ordinal);
```

Description

GetDouble has several forms, depending on the input parameter:

- Returns the double value of a given column. The parameter **columnName** is the name of the column containing the wanted value.
- Returns the double value of a given column. The parameter **ordinal** is the ordinal of the column containing the wanted value.

See Also

GetDecimal (see page 2109)

GetFloat (see page 2110)

15.1.2.1.28.3.10 GetFloat Method

This is the overview for the GetFloat method overload.

Overload List

	Name	Description
	TriggerReadRow.GetFloat (int) (see page 2110)	Returns float value of given column.
	TriggerReadRow.GetFloat (string) (see page 2110)	Returns float value of given column.

15.1.2.1.28.3.10.1 TriggerReadRow.GetFloat Method (int)

Returns float value of given column.

Pascal

```
function GetFloat(columnName: string): float;
function GetFloat(ordinal: Integer): float;
```

C++

```
float GetFloat(string columnName);
float GetFloat(int ordinal);
```

Description

GetFloat has several forms, depending on the input parameter:

- Returns the float value of a given column. The parameter **columnName** is the name of the column containing the wanted value.
- Returns the float value of a given column. The parameter **ordinal** is the ordinal of the column containing the wanted value.

See Also

GetDecimal (see page 2109)

GetDouble (see page 2109)

15.1.2.1.28.3.11 GetInt16 Method

This is the overview for the GetInt16 method overload.

Overload List

	Name	Description
	TriggerReadRow.GetInt16 (int) (see page 2111)	Returns short value of given column.
	TriggerReadRow.GetInt16 (string) (see page 2111)	Returns short value of given column.

15.1.2.1.28.3.11.1 TriggerReadRow.GetInt16 Method (int)

Returns short value of given column.

Pascal

```
function GetInt16(columnName: string): short;
function GetInt16(ordinal: Integer): short;
```

C++

```
short GetInt16(string columnName);
short GetInt16(int ordinal);
```

Description

GetInt16 has several forms, depending on the input parameter:

- Returns the short value of a given column. The parameter **columnName** is the name of the column containing the wanted value.
- Returns the short value of a given column. The parameter **ordinal** is the ordinal of the column containing the wanted value.

See Also

GetInt32 (see page 2111)

GetInt64 (see page 2112)

15.1.2.1.28.3.12 GetInt32 Method

This is the overview for the GetInt32 method overload.

Overload List

	Name	Description
	TriggerReadRow.GetInt32 (int) (see page 2111)	Returns int value of given column.
	TriggerReadRow.GetInt32 (string) (see page 2111)	Returns int value of given column.

15.1.2.1.28.3.12.1 TriggerReadRow.GetInt32 Method (int)

Returns int value of given column.

Pascal

```
function GetInt32(columnName: string): Integer;
function GetInt32(ordinal: Integer): Integer;
```

C++

```
int GetInt32(string columnName);
int GetInt32(int ordinal);
```

Description

GetInt32 has several forms, depending on the input parameter:

- Returns the int value of a given column. The parameter **columnName** is the name of the column containing the wanted value.
- Returns the int value of a given column. The parameter **ordinal** is the ordinal of the column containing the wanted value.

See Also

GetInt16 (see page 2111)

GetInt64 (see page 2112)

15.1.2.1.28.3.13 GetInt64 Method

This is the overview for the GetInt64 method overload.

Overload List

	Name	Description
	TriggerReadRow.GetInt64 (int) (see page 2112)	Returns long value of given column.
	TriggerReadRow.GetInt64 (string) (see page 2112)	Returns long value of given column.

15.1.2.1.28.3.13.1 TriggerReadRow.GetInt64 Method (int)

Returns long value of given column.

Pascal

```
function GetInt64(columnName: string): long;
function GetInt64(ordinal: Integer): long;
```

C++

```
long GetInt64(string columnName);
long GetInt64(int ordinal);
```

Description

GetInt64 has several forms, depending on the input parameter:

- Returns the long value of a given column. The parameter **columnName** is the name of the column containing the wanted value.
- Returns the long value of a given column. The parameter **ordinal** is the ordinal of the column containing the wanted value.

See Also

GetInt16 (see page 2111)

GetInt32 (see page 2111)

15.1.2.1.28.3.14 GetObject Method

This is the overview for the GetObject method overload.

Overload List

	Name	Description
	TriggerReadRow.GetObject (int) (see page 2113)	Returns value of given column.

	TriggerReadRow.GetObject (string) (see page 2113)	Returns value of given column.

15.1.2.1.28.3.14.1 TriggerReadRow.GetObject Method (int)

Returns value of given column.

Pascal

```
function GetObject(columnName: string): object;
function GetObject(ordinal: Integer): object;
```

C++

```
object GetObject(string columnName);
object GetObject(int ordinal);
```

Description

GetObject has several forms, depending on the input parameter:

- Returns the value of a given column. The parameter **columnName** is the name of the column containing the wanted value.
- Returns the value of a given column. The parameter **ordinal** is the ordinal of the column containing the wanted value.

15.1.2.1.28.3.15 TriggerReadRow.GetOrdinal Method

Returns ordinal in row of given column.

Pascal

```
function GetOrdinal(columnName: string): Integer;
```

C++

```
int GetOrdinal(string columnName);
```

Description

GetOrdinal returns the ordinal in the row of a given column. The parameter **columnName** is the name of the wanted column.

15.1.2.1.28.3.16 GetString Method

This is the overview for the GetString method overload.

Overload List

	Name	Description
	TriggerReadRow.GetString (int) (see page 2113)	Returns the string value of a given column.
	TriggerReadRow.GetString (string) (see page 2113)	Returns the string value of a given column.

15.1.2.1.28.3.16.1 TriggerReadRow.GetString Method (int)

Returns the string value of a given column.

Pascal

```
function GetString(columnName: string): string;
function GetString(ordinal: Integer): string;
```

C++

```
string GetString(string columnName);
string GetString(int ordinal);
```

Description

GetString has several forms, depending on the input parameter:

- Returns the string value of a given column. The parameter **columnName** is the name of the column containing the wanted value.
- Returns the string value of a given column. The parameter **ordinal** is the ordinal of the column containing the wanted value.

See Also

ToString (see page 2116)

15.1.2.1.28.3.17 IsAssignedNull Method

This is the overview for the IsAssignedNull method overload.

Overload List

	Name	Description
	TriggerReadRow.IsAssignedNull (int) (see page 2114)	Returns **true** if value of given column is assigned null.
	TriggerReadRow.IsAssignedNull (string) (see page 2114)	Returns **true** if value of given column is assigned null.

15.1.2.1.28.3.17.1 TriggerReadRow.IsAssignedNull Method (int)

Returns **true** if value of given column is assigned null.

Pascal

```
function IsAssignedNull(columnName: string): bool;
function IsAssignedNull(ordinal: Integer): bool;
```

C++

```
bool IsAssignedNull(string columnName);
bool IsAssignedNull(int ordinal);
```

Description

IsAssignedNull has several forms, depending on the input parameter:

- Returns **true** if the value in the column named **columnName** is assigned null. The parameter **columnName** is the name of the column containing the wanted value.
- Returns **true** if the value in the column indicated by its ordinal is assigned null. The parameter **ordinal** is the ordinal of the column containing the wanted value.

IsNull (see page 2115)

IsUnassignedNull (see page 2116)

15.1.2.1.28.3.18 IsModified Method

This is the overview for the IsModified method overload.

Overload List

	Name	Description
	TriggerReadRow.IsModified (int) (see page 2115)	Returns **true** if value of given column has been changed.
	TriggerReadRow.IsModified (string) (see page 2115)	Returns **true** if value of given column has been changed.

15.1.2.1.28.3.18.1 TriggerReadRow.IsModified Method (int)

Returns **true** if value of given column has been changed.

Pascal

```
function IsModified(ordinal: Integer): bool;
function IsModified(columnName: string): bool;
```

C++

```
bool IsModified(int ordinal);
bool IsModified(string columnName);
```

Description

IsModified has several forms, depending on the input parameter:

- Returns **true** if the value of a given column has been changed. The parameter **columnName** is the name of the column in question.
- Returns **true** if the value of a given column has been changed. The parameter **ordinal** is the ordinal of the column in question.

15.1.2.1.28.3.19 IsNull Method

This is the overview for the IsNull method overload.

Overload List

	Name	Description
	TriggerReadRow.IsNull (int) (see page 2115)	Returns **true** if the value of a given column is null.
	TriggerReadRow.IsNull (string) (see page 2115)	Returns **true** if the value of a given column is null.

15.1.2.1.28.3.19.1 TriggerReadRow.IsNull Method (int)

Returns **true** if the value of a given column is null.

Pascal

```
function IsNull(columnName: string): bool;
function IsNull(ordinal: Integer): bool;
```

C++

```
bool IsNull(string columnName);
bool IsNull(int ordinal);
```

Description

IsNull has several forms, depending on the input parameter:

- Returns **true** if the value of a given column is null. The parameter **columnName** is the name of the column containing the wanted value.
- Returns **true** if the value of a given column is NULL. The parameter **ordinal** is the ordinal of the column containing the wanted

value.

IsAssignedNull (see page 2114)

IsUnassignedNull (see page 2116)

15.1.2.1.28.3.20 IsUnassignedNull Method

This is the overview for the IsUnassignedNull method overload.

Overload List

	Name	Description
	TriggerReadRow.IsUnassignedNull (int) (see page 2116)	Returns **true**if value of given column is unassigned null.
	TriggerReadRow.IsUnassignedNull (string) (see page 2116)	Returns **true**if value of given column is unassigned null.

15.1.2.1.28.3.20.1 TriggerReadRow.IsUnassignedNull Method (int)

Returns **true**if value of given column is unassigned null.

Pascal

```
function IsUnassignedNull(columnName: string): bool;
function IsUnassignedNull(ordinal: Integer): bool;
```

C++

```
bool IsUnassignedNull(string columnName);
bool IsUnassignedNull(int ordinal);
```

Description

IsUnassignedNull has several forms, depending on the input parameter:

- Returns **true** if the value of a given column is an unassigned null. The parameter **columnName** is the name of the column containing the wanted value.
- Returns **true** if the value of a given column is unassigned null. The parameter **ordinal** is the ordinal of the column containing the wanted value.

See Also

IsAssignedNull (see page 2114)

IsNull (see page 2115)

15.1.2.1.28.3.21 TriggerReadRow.ToString Method

Returns String representation of TriggerReadRow (see page 2103) object.

Pascal

```
function ToString: string;
```

C++

```
string ToString();
```

Description

ToString returns a String representation of this TriggerReadRow (see page 2103) object.

See Also

GetString (see page 2113)

15.1.2.1.28.4 TriggerReadRow Properties

The properties of the TriggerReadRow class are listed here.

Public Properties

	Name	Description
	FieldCount (see page 2117)	Gets number of columns in row.

15.1.2.1.28.4.1 TriggerReadRow.FieldCount Property

Gets number of columns in row.

Pascal

```
property FieldCount: Integer;
```

C++

```
__property int FieldCount;
```

Description

FieldCount gets the number of columns in the row.

15.1.2.1.29 TriggerReadWriteRow Class

Provides write access to a row of data.

Class Hierarchy

Pascal

```
TriggerReadWriteRow = class(TriggerReadRow);
```

C++

```
class TriggerReadWriteRow : public TriggerReadRow;
```

File

TriggerReadWriteRow.cs

Description

The TriggerReadWriteRow class provides write access to a row of data. It has methods to write values into each column.

See Also

TriggerContext (see page 2101)

TriggerReadRow (see page 2103)

15.1.2.1.29.1 TriggerReadWriteRow Members

The following tables list the members exposed by TriggerReadWriteRow.

Internal Fields

	Name	Description
	method (see page 2105)	This is method, a member of class TriggerReadRow.

Public Methods

	Name	Description
	ClearValues (see page 2119)	Nulls out all values of row.
	FindModified (see page 2105)	Returns first column ordinal starting with and including **startOrdinal** whose value changed.
	GetArrayLength (see page 2106)	Returns the length of the byte[] value of a given column.
	GetBoolean (see page 2106)	This is the overview for the GetBoolean method overload.
	GetByte (see page 2106)	This is the overview for the GetByte method overload.
	GetBytes (see page 2107)	This is the overview for the GetBytes method overload.
	GetColumnNames (see page 2108)	Returns an array containing names of first **columnCount** column names.
	GetDateTime (see page 2108)	This is the overview for the GetDateTime method overload.
	GetDecimal (see page 2109)	This is the overview for the GetDecimal method overload.
	GetDouble (see page 2109)	This is the overview for the GetDouble method overload.
	GetFloat (see page 2110)	This is the overview for the GetFloat method overload.
	GetInt16 (see page 2110)	This is the overview for the GetInt16 method overload.
	GetInt32 (see page 2111)	This is the overview for the GetInt32 method overload.
	GetInt64 (see page 2112)	This is the overview for the GetInt64 method overload.
	GetObject (see page 2112)	This is the overview for the GetObject method overload.
	GetOrdinal (see page 2113)	Returns ordinal in row of given column.
	GetString (see page 2113)	This is the overview for the GetString method overload.
	IsAssignedNull (see page 2114)	This is the overview for the IsAssignedNull method overload.
	IsModified (see page 2114)	This is the overview for the IsModified method overload.
	IsNull (see page 2115)	This is the overview for the IsNull method overload.
	IsUnassignedNull (see page 2116)	This is the overview for the IsUnassignedNull method overload.
	SetAssignedNull (see page 2119)	This is the overview for the SetAssignedNull method overload.
	SetBoolean (see page 2120)	This is the overview for the SetBoolean method overload.
	SetByte (see page 2120)	This is the overview for the SetByte method overload.
	SetBytes (see page 2121)	This is the overview for the SetBytes method overload.
	SetDateTime (see page 2122)	This is the overview for the SetDateTime method overload.
	SetDecimal (see page 2122)	This is the overview for the SetDecimal method overload.
	SetDefault (see page 2123)	This is the overview for the SetDefault method overload.
	SetDefaultValues (see page 2123)	Sets values of all columns to default values.
	SetDouble (see page 2124)	This is the overview for the SetDouble method overload.
	SetFloat (see page 2124)	This is the overview for the SetFloat method overload.
	SetInt16 (see page 2125)	This is the overview for the SetInt16 method overload.
	SetInt32 (see page 2126)	This is the overview for the SetInt32 method overload.
	SetInt64 (see page 2126)	This is the overview for the SetInt64 method overload.
	SetObject (see page 2127)	This is the overview for the SetObject method overload.
	SetString (see page 2128)	This is the overview for the SetString method overload.
	SetUnassignedNull (see page 2128)	This is the overview for the SetUnassignedNull method overload.
	ToString (see page 2116)	Returns String representation of TriggerReadRow (see page 2103) object.

Public Properties

	Name	Description
	FieldCount (see page 2117)	Gets number of columns in row.

15.1.2.1.29.2 TriggerReadWriteRow Methods

The methods of the TriggerReadWriteRow class are listed here.

Public Methods

	Name	Description
	ClearValues (see page 2119)	Nulls out all values of row.
	SetAssignedNull (see page 2119)	This is the overview for the SetAssignedNull method overload.
	SetBoolean (see page 2120)	This is the overview for the SetBoolean method overload.
	SetByte (see page 2120)	This is the overview for the SetByte method overload.
	SetBytes (see page 2121)	This is the overview for the SetBytes method overload.
	SetDateTime (see page 2122)	This is the overview for the SetDateTime method overload.
	SetDecimal (see page 2122)	This is the overview for the SetDecimal method overload.
	SetDefault (see page 2123)	This is the overview for the SetDefault method overload.
V	SetDefaultValues (see page 2123)	Sets values of all columns to default values.
	SetDouble (see page 2124)	This is the overview for the SetDouble method overload.
	SetFloat (see page 2124)	This is the overview for the SetFloat method overload.
	SetInt16 (see page 2125)	This is the overview for the SetInt16 method overload.
	SetInt32 (see page 2126)	This is the overview for the SetInt32 method overload.
	SetInt64 (see page 2126)	This is the overview for the SetInt64 method overload.
	SetObject (see page 2127)	This is the overview for the SetObject method overload.
	SetString (see page 2128)	This is the overview for the SetString method overload.
	SetUnassignedNull (see page 2128)	This is the overview for the SetUnassignedNull method overload.

15.1.2.1.29.2.1 TriggerReadWriteRow.ClearValues Method

Nulls out all values of row.

Pascal

```
function ClearValues: void;
```

C++

```
void ClearValues();
```

Description

ClearValues nulls out all values of the row. It sets them to unassigned nulls.

15.1.2.1.29.2.2 SetAssignedNull Method

This is the overview for the SetAssignedNull method overload.

Overload List

	Name	Description
	TriggerReadWriteRow.SetAssignedNull (int) (see page 2119)	Sets the value of a given column to assigned null.
	TriggerReadWriteRow.SetAssignedNull (string) (see page 2119)	Sets the value of a given column to assigned null.

15.1.2.1.29.2.2.1 TriggerReadWriteRow.SetAssignedNull Method (int)

Sets the value of a given column to assigned null.

Pascal

```
function SetAssignedNull(columnName: string): void;
function SetAssignedNull(ordinal: Integer): void;
```

C++

```
void SetAssignedNull(string columnName);
```

```
void SetAssignedNull(int ordinal);
```

Description

SetAssignedNull has several forms, depending on the input parameter:

- Sets the value of a given column to assigned null. The parameter **columnName** is the name of the column containing the value to be changed.
- Sets the value of a given column to assigned null. The parameter **ordinal** is the ordinal of the column containing the value to be changed.

See Also

SetUnassignedNull (see page 2129)

15.1.2.1.29.2.3 SetBoolean Method

This is the overview for the SetBoolean method overload.

Overload List

	Name	Description
	TriggerReadWriteRow.SetBoolean (int, bool) (see page 2120)	Sets the boolean value of a given column.
	TriggerReadWriteRow.SetBoolean (string, bool) (see page 2120)	Sets the boolean value of a given column.

15.1.2.1.29.2.3.1 TriggerReadWriteRow.SetBoolean Method (int, bool)

Sets the boolean value of a given column.

Pascal

```
function SetBoolean(columnName: string; value: bool): void;
function SetBoolean(ordinal: Integer; value: bool): void;
```

C++

```
void SetBoolean(string columnName, bool value);
void SetBoolean(int ordinal, bool value);
```

Description

SetBoolean has several forms, depending on the input parameter:

- Sets the boolean value of a given column. The parameter **columnName** is the name of the column containing the value to be changed. The parameter **value** is the new value as a boolean.
- Sets the boolean value of a given column. The parameter **ordinal** is the ordinal of the column containing the value to be changed. The parameter **value** is the new value as a boolean.

15.1.2.1.29.2.4 SetByte Method

This is the overview for the SetByte method overload.

Overload List

	Name	Description
	TriggerReadWriteRow.SetByte (int, byte) (see page 2121)	Sets byte value of given column.
	TriggerReadWriteRow.SetByte (string, byte) (see page 2121)	Sets byte value of given column.

15.1.2.1.29.2.4.1 TriggerReadWriteRow.SetByte Method (int, byte)

Sets byte value of given column.

Pascal

```
function SetByte(columnName: string; value: byte): void;
function SetByte(ordinal: Integer; value: byte): void;
```

C++

```
void SetByte(string columnName, byte value);
void SetByte(int ordinal, byte value);
```

Description

SetByte has several forms, depending on the input parameter:

- Sets the byte value of a given column. The parameter **columnName** is the name of the column containing the value to be changed. The parameter **value** is the new value as a byte.
- Sets the byte value of a given column. The parameter **ordinal** is the ordinal of the column containing the value to be changed. The parameter **value** is the new value as a byte.

See Also

SetBytes (see page 2121)

15.1.2.1.29.2.5 SetBytes Method

This is the overview for the SetBytes method overload.

Overload List

	Name	Description
	TriggerReadWriteRow.SetBytes (int, byte[], int) (see page 2121)	Sets the byte[] value of a given column.
	TriggerReadWriteRow.SetBytes (string, byte[], int) (see page 2121)	Sets the byte[] value of a given column.

15.1.2.1.29.2.5.1 TriggerReadWriteRow.SetBytes Method (int, byte[], int)

Sets the byte[] value of a given column.

Pascal

```
function SetBytes(columnName: string; value: byte[]; length: Integer): void;
function SetBytes(ordinal: Integer; value: byte[]; length: Integer): void;
```

C++

```
void SetBytes(string columnName, byte[] value, int length);
void SetBytes(int ordinal, byte[] value, int length);
```

Description

SetBytes has several forms, depending on the input parameters:

- Sets the byte[] value of a given column. The parameter **columnName** is the name of the column containing the value to be changed. The parameter value is the new value as a byte[]. The parameter **length** is the length of the byte[].
- Sets the byte[] value of a given column. The parameter **ordinal** is the ordinal of the column containing the value to be changed. The parameter **value** is the new value as a byte[]. The parameter **length** is the length of the byte[].

See Also

SetByte (see page 2121)

15.1.2.1.29.2.6 SetDateTime Method

This is the overview for the SetDateTime method overload.

Overload List

	Name	Description
	TriggerReadWriteRow.SetDateTime (int, DateTime) (see page 2122)	Sets DateTime value of given column.
	TriggerReadWriteRow.SetDateTime (string, DateTime) (see page 2122)	Sets DateTime value of given column.

15.1.2.1.29.2.6.1 TriggerReadWriteRow.SetDateTime Method (int, DateTime)

Sets DateTime value of given column.

Pascal

```
function SetDateTime(columnName: string; value: DateTime): void;
function SetDateTime(ordinal: Integer; value: DateTime): void;
```

C++

```
void SetDateTime(string columnName, DateTime value);
void SetDateTime(int ordinal, DateTime value);
```

Description

SetDateTime has several forms, depending on the input parameter:

- Sets the DateTime value of a given column. The parameter **columnName** is the name of the column containing the value to be changed. The parameter **value** is the new value as a DateTime.
- Sets the DateTime value of a given column. The parameter **ordinal** is the ordinal of the column containing the value to be changed. The parameter **value** is the new value as a DateTime.

15.1.2.1.29.2.7 SetDecimal Method

This is the overview for the SetDecimal method overload.

Overload List

	Name	Description
	TriggerReadWriteRow.SetDecimal (int, Decimal) (see page 2122)	Sets the Decimal value of a given column.
	TriggerReadWriteRow.SetDecimal (string, Decimal) (see page 2122)	Sets the Decimal value of a given column.

15.1.2.1.29.2.7.1 TriggerReadWriteRow.SetDecimal Method (int, Decimal)

Sets the Decimal value of a given column.

Pascal

```
function SetDecimal(columnName: string; value: Decimal): void;
function SetDecimal(ordinal: Integer; value: Decimal): void;
```

C++

```
void SetDecimal(string columnName, Decimal value);
void SetDecimal(int ordinal, Decimal value);
```

Description

SetDecimal has several forms, depending on the input parameters:

- Sets the Decimal value of a given column. The parameter **columnName** is the name of the column containing the value to be changed. The parameter **value** is the new value as a Decimal.
- Sets the Decimal value of a given column. The parameter **ordinal** is the ordinal of the column containing the value to be changed. The parameter **value** is the new value as a Decimal.

See Also

SetDouble (see page 2124)

SetFloat (see page 2125)

15.1.2.1.29.2.8 SetDefault Method

This is the overview for the SetDefault method overload.

Overload List

	Name	Description
	TriggerReadWriteRow.SetDefault (int) (see page 2123)	Sets the value of a given column to its default value.
	TriggerReadWriteRow.SetDefault (string) (see page 2123)	Sets the value of a given column to its default value.

15.1.2.1.29.2.8.1 TriggerReadWriteRow.SetDefault Method (int)

Sets the value of a given column to its default value.

Pascal

```
function SetDefault(columnName: string): void;
function SetDefault(ordinal: Integer): void;
```

C++

```
void SetDefault(string columnName);
void SetDefault(int ordinal);
```

Description

SetDefault has several forms, depending on the input parameter:

- Sets the value of a given column to its default value. The parameter **columnName** is the name of the column containing the value to be changed.
- Sets the value of a given column to its default value. The parameter **ordinal** is the ordinal of the column containing the value to be changed.

See Also

SetDefaultValues (see page 2123)

15.1.2.1.29.2.9 TriggerReadWriteRow.SetDefaultValues Method

Sets values of all columns to default values.

Pascal

```
function SetDefaultValues: void;
```

C++

```
void SetDefaultValues();
```

Description

SetDefaultValues sets the values of all columns to their default values.

See Also

SetDefault (see page 2123)

15.1.2.1.29.2.10 SetDouble Method

This is the overview for the SetDouble method overload.

Overload List

	Name	Description
	TriggerReadWriteRow.SetDouble (int, double) (see page 2124)	Sets double value of given column.
	TriggerReadWriteRow.SetDouble (string, double) (see page 2124)	Sets double value of given column.

15.1.2.1.29.2.10.1 TriggerReadWriteRow.SetDouble Method (int, double)

Sets double value of given column.

Pascal

```
function SetDouble(columnName: string; value: double): void;
function SetDouble(ordinal: Integer; value: double): void;
```

C++

```
void SetDouble(string columnName, double value);
void SetDouble(int ordinal, double value);
```

Description

SetDouble has several forms, depending on the input parameters:

- Sets the double value of a given column. The parameter **columnName** is the name of the column containing the value to be changed. The parameter **value** is the new value as a double.
- Sets the double value of a given column. The parameter **ordinal** is the ordinal of the column containing the value to be changed. The parameter **value** is the new value as a double.

See Also

SetDecimal (see page 2122)

SetFloat (see page 2125)

15.1.2.1.29.2.11 SetFloat Method

This is the overview for the SetFloat method overload.

Overload List

	Name	Description
	TriggerReadWriteRow.SetFloat (int, float) (see page 2125)	Sets float value of given column.
	TriggerReadWriteRow.SetFloat (string, float) (see page 2125)	Sets float value of given column.

15.1.2.1.29.2.11.1 TriggerReadWriteRow.SetFloat Method (int, float)

Sets float value of given column.

Pascal

```
function SetFloat(columnName: string; value: float): void;
function SetFloat(ordinal: Integer; value: float): void;
```

C++

```
void SetFloat(string columnName, float value);
void SetFloat(int ordinal, float value);
```

Description

SetFloat has several forms, depending on the input parameters:

- Sets the float value of a given column. The parameter **columnName** is the name of the column containing the value to be changed. The parameter **value** is the new value as a float.
- Sets the float value of a given column. The parameter **ordinal** is the ordinal of the column containing the value to be changed. The parameter **value** is the new value as a float.

See Also

SetDecimal (see page 2122)

SetDouble (see page 2124)

15.1.2.1.29.2.12 SetInt16 Method

This is the overview for the SetInt16 method overload.

Overload List

	Name	Description
	TriggerReadWriteRow.SetInt16 (int, short) (see page 2125)	Sets short value of given column.
	TriggerReadWriteRow.SetInt16 (string, short) (see page 2125)	Sets short value of given column.

15.1.2.1.29.2.12.1 TriggerReadWriteRow.SetInt16 Method (int, short)

Sets short value of given column.

Pascal

```
function SetInt16(columnName: string; value: short): void;
function SetInt16(ordinal: Integer; value: short): void;
```

C++

```
void SetInt16(string columnName, short value);
```

```
void SetInt16(int ordinal, short value);
```

Description

SetInt16 has several forms, depending on the input parameters:

- Sets the short value of a given column. The parameter **columnName** is the name of the column containing the value to be changed. The parameter **value** is the new value as a short.
- Sets the short value of a given column. The parameter **ordinal** is the ordinal of the column containing the value to be changed. The parameter **value** is the new value as a short.

See Also

SetInt32 (see page 2126)

SetInt64 (see page 2127)

15.1.2.1.29.2.13 SetInt32 Method

This is the overview for the SetInt32 method overload.

Overload List

	Name	Description
	TriggerReadWriteRow.SetInt32 (int, int) (see page 2126)	Sets int value of given column.
	TriggerReadWriteRow.SetInt32 (string, int) (see page 2126)	Sets int value of given column.

15.1.2.1.29.2.13.1 TriggerReadWriteRow.SetInt32 Method (int, int)

Sets int value of given column.

Pascal

```
function SetInt32(columnName: string; value: Integer): void;
function SetInt32(ordinal: Integer; value: Integer): void;
```

C++

```
void SetInt32(string columnName, int value);
void SetInt32(int ordinal, int value);
```

Description

SetInt32 has several forms, depending on the input parameters:

- Sets the int value of a given column. The parameter **columnName** is the name of the column containing the value to be changed. The parameter **value** is the new value as an int.
- Sets the int value of a given column. The parameter **ordinal** is the ordinal of the column containing the value to be changed. The parameter **value** is the new value as an int.

See Also

SetInt16 (see page 2125)

SetInt64 (see page 2127)

15.1.2.1.29.2.14 SetInt64 Method

This is the overview for the SetInt64 method overload.

Overload List

	Name	Description
	TriggerReadWriteRow.SetInt64 (int, long) (see page 2127)	Sets long value of given column.
	TriggerReadWriteRow.SetInt64 (string, long) (see page 2127)	Sets long value of given column.

15.1.2.1.29.2.14.1 TriggerReadWriteRow.SetInt64 Method (int, long)

Sets long value of given column.

Pascal

```
function SetInt64(columnName: string; value: long): void;
function SetInt64(ordinal: Integer; value: long): void;
```

C++

```
void SetInt64(string columnName, long value);
void SetInt64(int ordinal, long value);
```

Description

SetInt32 (see page 2126) has several forms, depending on the input parameters:

- Sets the long value of a given column. The parameter **columnName** is the name of the column containing the value to be changed. The parameter **value** is the new value as a long.
- Sets the long value of a given column. The parameter **ordinal** is the ordinal of the column containing the value to be changed. The parameter **value** is the new value as a long.

See Also

SetInt16 (see page 2125)

SetInt32 (see page 2126)

15.1.2.1.29.2.15 SetObject Method

This is the overview for the SetObject method overload.

Overload List

	Name	Description
	TriggerReadWriteRow.SetObject (int, object) (see page 2127)	Sets value of given column.
	TriggerReadWriteRow.SetObject (string, object) (see page 2127)	Sets value of given column.

15.1.2.1.29.2.15.1 TriggerReadWriteRow.SetObject Method (int, object)

Sets value of given column.

Pascal

```
function SetObject(columnName: string; value: object): void;
function SetObject(ordinal: Integer; value: object): void;
```

C++

```
void SetObject(string columnName, object value);
```

```
void SetObject(int ordinal, object value);
```

Description

SetObject has several forms, depending on the input parameters:

- Sets the value of a given column. The parameter **columnName** is the name of the column containing the value to be changed. The parameter **value** is the new value.
- Sets the value of a given column. The parameter **ordinal** is the ordinal of the column containing the value to be changed. The parameter **value** is the new value.

15.1.2.1.29.2.16 SetString Method

This is the overview for the SetString method overload.

Overload List

	Name	Description
	TriggerReadWriteRow.SetString (int, string) (see page 2128)	Sets string value of given column.
	TriggerReadWriteRow.SetString (string, string) (see page 2128)	Sets string value of given column.

15.1.2.1.29.2.16.1 TriggerReadWriteRow.SetString Method (int, string)

Sets string value of given column.

Pascal

```
function SetString(columnName: string; value: string): void;
function SetString(ordinal: Integer; value: string): void;
```

C++

```
void SetString(string columnName, string value);
void SetString(int ordinal, string value);
```

Description

SetString has several forms, depending on the input parameters:

- Sets the string value of a given column. The parameter **columnName** is the name of the column containing the value to be changed. The parameter **value** is the new value as a string.
- Sets the string value of a given column. The parameter **ordinal** is the ordinal of the column containing the value to be changed. The parameter **value** is the new value as a string.

15.1.2.1.29.2.17 SetUnassignedNull Method

This is the overview for the SetUnassignedNull method overload.

Overload List

	Name	Description
	TriggerReadWriteRow.SetUnassignedNull (int) (see page 2129)	Sets the value of a given column to unassigned null.
	TriggerReadWriteRow.SetUnassignedNull (string) (see page 2129)	Sets the value of a given column to unassigned null.

15.1.2.1.29.2.17.1 TriggerReadWriteRow.SetUnassignedNull Method (int)

Sets the value of a given column to unassigned null.

Pascal

```
function SetUnassignedNull(columnName: string): void;
function SetUnassignedNull(ordinal: Integer): void;
```

C++

```
void SetUnassignedNull(string columnName);
void SetUnassignedNull(int ordinal);
```

Description

SetUnassignedNull has several forms, depending on the input parameters:

- Sets the value of a given column to unassigned null. The parameter **columnName** is the name of the column containing the value to be changed.
- Sets the value of a given column to unassigned null. The parameter **ordinal** is the ordinal of the column containing the value to be changed.

SetAssignedNull (see page 2119)

15.1.2.2 Types

The following table lists types in this documentation.

Types

Name	Description
DataStoreRowUpdatedEventHandler (see page 2129)	This is type Borland.Data.DataStore.DataStoreRowUpdatedEventHandler.
DataStoreRowUpdatingEventHandler (see page 2129)	This is type Borland.Data.DataStore.DataStoreRowUpdatingEventHandler.

15.1.2.2.1 Borland.Data.DataStore.DataStoreRowUpdatedEventHandler Type

Pascal

```
DataStoreRowUpdatedEventHandler = ;
```

C++

```
delegate void  DataStoreRowUpdatedEventHandler();
```

File

Ado.Net20.cs

Description

This is type Borland.Data.DataStore.DataStoreRowUpdatedEventHandler.

15.1.2.2.2 Borland.Data.DataStore.DataStoreRowUpdatingEventHandler Type

Pascal

```
DataStoreRowUpdatingEventHandler = ;
```

C++

```
delegate void  DataStoreRowUpdatingEventHandler();
```

File

Ado.Net20.cs

Description

This is type Borland.Data.DataStore.DataStoreRowUpdatingEventHandler.

15.1.3 Borland.Data.MetaData Namespace

This is namespace Borland.Data.MetaData.

Topics

Name	Description
Classes (see page 2131)	The following table lists classes in this documentation.

Classes

	Name	Description
	CatalogsColumns (see page 2132)	Reserved for future use.
	ColumnConstraintsColumns (see page 2133)	Reserved for future use.
	ColumnsColumns (see page 2135)	Column names for result table from built-in stored procedure DB_ADMIN.GET_COLUMNS and DataStoreConnection.GetSchema(MetaDataCollectionName.Columns)
	DataTypesColumns (see page 2140)	Column names for result table from the built-in stored procedure DB_ADMIN.GET_DATATYPES. and DataStoreConnection.GetSchema(MetaDataCollectionName.DataTypes).
	ForeignKeyColumnsColumns (see page 2149)	Column names for result table from the built-in stored procedure DB_ADMIN.GET_FOREIGN_KEY_COLUMNS and DataStoreConnection.GetSchema(MetaDataCollectionName.ForeignKeyColumns).
	ForeignKeysColumns (see page 2153)	Column names for result table from the built-in stored procedure DB_ADMIN.GET_FOREIGN_KEYS and DataStoreConnection.GetSchema(MetaDataCollectionName.ForeignKeys).
	IndexColumnsColumns (see page 2154)	Column names for result table from the built-in stored procedure DB_ADMIN.GET_INDEX_COLUMNS and DataStoreConnection.GetSchema(MetaDataCollectionName.IndexColumns).
	IndexesColumns (see page 2157)	Provides the column names for the result table from the built-in stored procedure DB_ADMIN.GET_INDEXES and DataStoreConnection.GetSchema(MetaDataCollectionName.IndexColumns).
	MetaDataCollectionName (see page 2160)	Collection names that can be passed to DataStoreConnection.GetSchema to receive metadata collections.
	ProcedureParametersColumns (see page 2175)	Column names for result table from the built-in stored procedure DB_ADMIN.GET_PROCEDURE_COLUMNS and DataStoreConnection.GetSchema(MetaDataCollectionName.ProcedureParamete rs).
	ProceduresColumns (see page 2180)	Provides the column names for the result table from the built-in stored procedure DB_ADMIN.GET_PROCEDURES and DataStoreConnection.GetSchema(MetaDataCollectionName.Procedures).
	ProcedureSourcesColumns (see page 2182)	Column names for the result table from the built-in stored procedure DB_ADMIN.GET_PROCEDURES and DataStoreConnection.GetSchema(MetaDataCollectionName.ProcedureSources).
	ReservedWordsColumns (see page 2184)	Column names for result table from the built-in stored procedure DB_ADMIN.GET_KEYWORDS and DataStoreConnection.GetSchema(MetaDataCollectionName.ReservedWords).
	RolesColumns (see page 2185)	Column names for the result table from the built-in stored procedure DB_ADMIN.GET_ROLES and DataStoreConnection.GetSchema(MetaDataCollectionName.Roles).
	SchemasColumns (see page 2187)	Column names for the result table from the built-in stored procedure DB_ADMIN.GET_SCHEMAS and DataStoreConnection.GetSchema(MetaDataCollectionName.Schemas).
	SynonymsColumns (see page 2188)	Reserved for future use.

	TablesColumns (see page 2190)	Column names for the result table from the built-in stored procedure DB_ADMIN.GET_TABLES and DataStoreConnection.GetSchema(MetaDataCollectionName.Tables).
	UsersColumns (see page 2192)	Column names for the result table from the built-in stored procedure DB_ADMIN.GET_USERS and DataStoreConnection.GetSchema(MetaDataCollectionName.Users).
	ViewsColumns (see page 2193)	Column names for the result table from the built-in stored procedure DB_ADMIN.GET_VIEWS DataStoreConnection.GetSchema(MetaDataCollectionName.Views).

15.1.3.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	CatalogsColumns (see page 2132)	Reserved for future use.
	ColumnConstraintsColumns (see page 2133)	Reserved for future use.
	ColumnsColumns (see page 2135)	Column names for result table from built-in stored procedure DB_ADMIN.GET_COLUMNS and DataStoreConnection.GetSchema(MetaDataCollectionName.Columns)
	DataTypesColumns (see page 2140)	Column names for result table from the built-in stored procedure DB_ADMIN.GET_DATATYPES. and DataStoreConnection.GetSchema(MetaDataCollectionName.DataTypes).
	ForeignKeyColumnsColumns (see page 2149)	Column names for result table from the built-in stored procedure DB_ADMIN.GET_FOREIGN_KEY_COLUMNS and DataStoreConnection.GetSchema(MetaDataCollectionName.ForeignKeyColumns).
	ForeignKeysColumns (see page 2153)	Column names for result table from the built-in stored procedure DB_ADMIN.GET_FOREIGN_KEYS and DataStoreConnection.GetSchema(MetaDataCollectionName.ForeignKeys).
	IndexColumnsColumns (see page 2154)	Column names for result table from the built-in stored procedure DB_ADMIN.GET_INDEX_COLUMNS and DataStoreConnection.GetSchema(MetaDataCollectionName.IndexColumns).
	IndexesColumns (see page 2157)	Provides the column names for the result table from the built-in stored procedure DB_ADMIN.GET_INDEXES and DataStoreConnection.GetSchema(MetaDataCollectionName.IndexColumns).
	MetaDataCollectionName (see page 2160)	Collection names that can be passed to DataStoreConnection.GetSchema to receive metadata collections.
	ProcedureParametersColumns (see page 2175)	Column names for result table from the built-in stored procedure DB_ADMIN.GET_PROCEDURE_COLUMNS and DataStoreConnection.GetSchema(MetaDataCollectionName.ProcedureParamete rs).
	ProceduresColumns (see page 2180)	Provides the column names for the result table from the built-in stored procedure DB_ADMIN.GET_PROCEDURES and DataStoreConnection.GetSchema(MetaDataCollectionName.Procedures).
	ProcedureSourcesColumns (see page 2182)	Column names for the result table from the built-in stored procedure DB_ADMIN.GET_PROCEDURES and DataStoreConnection.GetSchema(MetaDataCollectionName.ProcedureSources).
	ReservedWordsColumns (see page 2184)	Column names for result table from the built-in stored procedure DB_ADMIN.GET_KEYWORDS and DataStoreConnection.GetSchema(MetaDataCollectionName.ReservedWords).
	RolesColumns (see page 2185)	Column names for the result table from the built-in stored procedure DB_ADMIN.GET_ROLES and DataStoreConnection.GetSchema(MetaDataCollectionName.Roles).
	SchemasColumns (see page 2187)	Column names for the result table from the built-in stored procedure DB_ADMIN.GET_SCHEMAS and DataStoreConnection.GetSchema(MetaDataCollectionName.Schemas).
	SynonymsColumns (see page 2188)	Reserved for future use.
	TablesColumns (see page 2190)	Column names for the result table from the built-in stored procedure DB_ADMIN.GET_TABLES and DataStoreConnection.GetSchema(MetaDataCollectionName.Tables).

	UsersColumns (see page 2192)	Column names for the result table from the built-in stored procedure DB_ADMIN.GET_USERS and DataStoreConnection.GetSchema(MetaDataCollectionName.Users).
	ViewsColumns (see page 2193)	Column names for the result table from the built-in stored procedure DB_ADMIN.GET_VIEWS DataStoreConnection.GetSchema(MetaDataCollectionName.Views).

15.1.3.1.1 CatalogsColumns Class

Reserved for future use.

Class Hierarchy

Borland.Data.MetaData.CatalogsColumns

Pascal

```
CatalogsColumns = class;
```

C++

```
class CatalogsColumns;
```

File

CatalogsColumns.cs

Description

Reserved for future use.

The columns of the result table are:

Constant	Description
CatalogName (see page 2133)	Used to access the CatalogName (see page 2133) column in the Catalogs metadata collection. The data in this column specifies the catalog name.

See Also

Blackfish SQL Developer's Guide.

15.1.3.1.1.1 CatalogsColumns Members

The following tables list the members exposed by CatalogsColumns.

Public Fields

	Name	Description
	CatalogName (see page 2133)	This is CatalogName, a member of class CatalogsColumns.

15.1.3.1.1.2 CatalogsColumns Fields

The fields of the CatalogsColumns class are listed here.

Public Fields

	Name	Description
	CatalogName (see page 2133)	This is CatalogName, a member of class CatalogsColumns.

15.1.3.1.1.2.1 CatalogsColumns.CatalogName Field

Pascal

```
const CatalogName: string = "CatalogName";
```

C++

```
string CatalogName = "CatalogName";
```

Description

This is CatalogName, a member of class CatalogsColumns.

15.1.3.1.2 ColumnConstraintsColumns Class

Reserved for future use.

Class Hierarchy

Borland.Data.MetaData.ColumnConstraintsColumns

Pascal

```
ColumnConstraintsColumns = class;
```

C++

```
class ColumnConstraints Columns;
```

File

ColumnConstraintsColumns.cs

Description

Reserved for future use.

Blackfish SQL Developer's Guide.

15.1.3.1.2.1 ColumnConstraintsColumns Members

The following tables list the members exposed by ColumnConstraintsColumns.

Public Fields

	Name	Description
	CatalogName (see page 2134)	This is CatalogName, a member of class ColumnConstraintsColumns.
	ColumnName (see page 2134)	This is ColumnName, a member of class ColumnConstraintsColumns.
	ConstraintName (see page 2134)	This is ConstraintName, a member of class ColumnConstraintsColumns.
	SchemaName (see page 2134)	This is SchemaName, a member of class ColumnConstraintsColumns.
	TableName (see page 2134)	This is TableName, a member of class ColumnConstraintsColumns.

15.1.3.1.2.2 ColumnConstraintsColumns Fields

The fields of the ColumnConstraintsColumns class are listed here.

Public Fields

	Name	Description
	CatalogName (see page 2134)	This is CatalogName, a member of class ColumnConstraintsColumns.
	ColumnName (see page 2134)	This is ColumnName, a member of class ColumnConstraintsColumns.
	ConstraintName (see page 2134)	This is ConstraintName, a member of class ColumnConstraintsColumns.

	SchemaName (see page 2134)	This is SchemaName, a member of class ColumnConstraintsColumns.
	TableName (see page 2134)	This is TableName, a member of class ColumnConstraintsColumns.

15.1.3.1.2.2.1 ColumnConstraintsColumns.CatalogName Field

Pascal

```
const CatalogName: string = "CatalogName";
```

C++

```
string CatalogName = "CatalogName";
```

Description

This is CatalogName, a member of class ColumnConstraintsColumns.

15.1.3.1.2.2.2 ColumnConstraintsColumns.ColumnName Field

Pascal

```
const ColumnName: string = "ColumnName";
```

C++

```
string ColumnName = "ColumnName";
```

Description

This is ColumnName, a member of class ColumnConstraintsColumns.

15.1.3.1.2.2.3 ColumnConstraintsColumns.ConstraintName Field

Pascal

```
const ConstraintName: string = "ConstraintName";
```

C++

```
string ConstraintName = "ConstraintName";
```

Description

This is ConstraintName, a member of class ColumnConstraintsColumns.

15.1.3.1.2.2.4 ColumnConstraintsColumns.SchemaName Field

Pascal

```
const SchemaName: string = "SchemaName";
```

C++

```
string SchemaName = "SchemaName";
```

Description

This is SchemaName, a member of class ColumnConstraintsColumns.

15.1.3.1.2.2.5 ColumnConstraintsColumns.TableName Field

Pascal

```
const TableName: string = "TableName";
```

C++

```
string TableName = "TableName";
```

Description

This is TableName, a member of class ColumnConstraintsColumns.

15.1.3.1.3 ColumnsColumns Class

Column names for result table from built-in stored procedure DB_ADMIN.GET_COLUMNS and DataStoreConnection.GetSchema(MetaDataCollectionName.Columns)

Class Hierarchy

Borland.Data.MetaData.ColumnsColumns

Pascal

```
ColumnsColumns = class;
```

C++

```
class ColumnsColumns;
```

File

ColumnsColumns.cs

Description

ColumnsColumns provides the column names for the result table from the built-in stored procedure DB_ADMIN.GET_COLUMNS and DataStoreConnection.GetSchema(MetaDataCollectionName.Columns). Each row in the result table of DB_ADMIN.GET_COLUMNS describes a column from a table in a database.

The columns of the result table are:

Constant	Description
CatalogName (see page 2137)	Used to access the CatalogName (see page 2137) column in the Columns metadata collection. The data in this column specifies the catalog name.
SchemaName (see page 2140)	Used to access the SchemaName (see page 2140) column in the Columns metadata collection. The data in this column specifies the schema name.
TableName (see page 2140)	Used to access the TableName (see page 2140) column in the Columns metadata collection. The data in this column specifies the table name.
ColumnName (see page 2137)	Used to access the ColumnName (see page 2137) column in the Columns metadata collection. The data in this column specifies the column name.
TypeName (see page 2140)	Used to access the TypeName (see page 2140) column in the Columns metadata collection. The data in this column specifies the database specific data type name.
Precision (see page 2139)	Used to access the Precision (see page 2139) column in the Columns metadata collection.The data in this column specifies the precision of this type. For a string data type, this is the maximum number of characters. For a decimal types, this is the maximum number digits including digits from the scale.
Scale (see page 2140)	Used to access the Scale (see page 2140) column in the Columns metadata collection. The data in this column specifies the scale of a decimal type.
Ordinal (see page 2139)	Used to access the Ordinal (see page 2139) column in the Columns metadata collection. The data in this column specifies the position in the columns of the table starting with 1.

DefaultValue (see page 2138)	Used to access the DefaultValue (see page 2138) column in the Columns metadata collection. The data in this column specifies the default value.
IsNullable (see page 2138)	Used to access the IsNullable (see page 2138) column in the Columns metadata collection. The data in this column specifies that the column can accept NULL values.
IsAutoIncrement (see page 2138)	Used to access the IsAutoIncrement (see page 2138) column in the Columns metadata collection. The data in this column specifies that the column is an autoincrement value.
MaxInline (see page 2139)	Used to access the MaxInline (see page 2139) column in the Columns metadata collection. The data in this column specifies the maximal number of bytes to write into row. The rest of the data is handled as a blob (Blackfish SQL only).
DbxDataType (see page 2137)	Used to access the DbxDataType (see page 2137) column in the Columns metadata collection. The data in this column specifies the DBX data type.
IsFixedLength (see page 2138)	Used to access the IsFixedLength (see page 2138) column in the EndColumns metadata collection.The data in this column specifies that the column holds fixed length data.
IsUnicode (see page 2139)	Used to access the IsUnicode (see page 2139) column in the Columns metadata collection. The data in this column specifies that the column can hold unicode characters.
IsLong (see page 2138)	Used to access the IsLong (see page 2138) column in the Columns metadata collection. The data in this column specifies that the column is a blob data type.
IsUnsigned (see page 2139)	Used to access the IsUnsigned (see page 2139) column in the Columns metadata collection. The data in this column specifies that the column is an unsigned numeric type.

15.1.3.1.3.1 ColumnsColumns Members

The following tables list the members exposed by ColumnsColumns.

Public Fields

	Name	Description
	CatalogName (see page 2137)	This is CatalogName, a member of class ColumnsColumns.
	ColumnName (see page 2137)	This is ColumnName, a member of class ColumnsColumns.
	DbxDataType (see page 2137)	This is DbxDataType, a member of class ColumnsColumns.
	DefaultValue (see page 2138)	This is DefaultValue, a member of class ColumnsColumns.
	IsAutoIncrement (see page 2138)	This is IsAutoIncrement, a member of class ColumnsColumns.
	IsFixedLength (see page 2138)	This is IsFixedLength, a member of class ColumnsColumns.
	IsLong (see page 2138)	This is IsLong, a member of class ColumnsColumns.
	IsNullable (see page 2138)	This is IsNullable, a member of class ColumnsColumns.
	IsUnicode (see page 2139)	This is IsUnicode, a member of class ColumnsColumns.
	IsUnsigned (see page 2139)	This is IsUnsigned, a member of class ColumnsColumns.
	MaxInline (see page 2139)	This is MaxInline, a member of class ColumnsColumns.
	Ordinal (see page 2139)	This is Ordinal, a member of class ColumnsColumns.
	Precision (see page 2139)	This is Precision, a member of class ColumnsColumns.
	Scale (see page 2140)	This is Scale, a member of class ColumnsColumns.
	SchemaName (see page 2140)	This is SchemaName, a member of class ColumnsColumns.
	TableName (see page 2140)	This is TableName, a member of class ColumnsColumns.
	TypeName (see page 2140)	This is TypeName, a member of class ColumnsColumns.

15.1.3.1.3.2 ColumnsColumns Fields

The fields of the ColumnsColumns class are listed here.

Public Fields

	Name	Description
	CatalogName (see page 2137)	This is CatalogName, a member of class ColumnsColumns.
	ColumnName (see page 2137)	This is ColumnName, a member of class ColumnsColumns.
	DbxDataType (see page 2137)	This is DbxDataType, a member of class ColumnsColumns.
	DefaultValue (see page 2138)	This is DefaultValue, a member of class ColumnsColumns.
	IsAutoIncrement (see page 2138)	This is IsAutoIncrement, a member of class ColumnsColumns.
	IsFixedLength (see page 2138)	This is IsFixedLength, a member of class ColumnsColumns.
	IsLong (see page 2138)	This is IsLong, a member of class ColumnsColumns.
	IsNullable (see page 2138)	This is IsNullable, a member of class ColumnsColumns.
	IsUnicode (see page 2139)	This is IsUnicode, a member of class ColumnsColumns.
	IsUnsigned (see page 2139)	This is IsUnsigned, a member of class ColumnsColumns.
	MaxInline (see page 2139)	This is MaxInline, a member of class ColumnsColumns.
	Ordinal (see page 2139)	This is Ordinal, a member of class ColumnsColumns.
	Precision (see page 2139)	This is Precision, a member of class ColumnsColumns.
	Scale (see page 2140)	This is Scale, a member of class ColumnsColumns.
	SchemaName (see page 2140)	This is SchemaName, a member of class ColumnsColumns.
	TableName (see page 2140)	This is TableName, a member of class ColumnsColumns.
	TypeName (see page 2140)	This is TypeName, a member of class ColumnsColumns.

15.1.3.1.3.2.1 ColumnsColumns.CatalogName Field

Pascal

```
const CatalogName: string = "CatalogName";
```

C++

```
string CatalogName = "CatalogName";
```

Description

This is CatalogName, a member of class ColumnsColumns.

15.1.3.1.3.2.2 ColumnsColumns.ColumnName Field

Pascal

```
const ColumnName: string = "ColumnName";
```

C++

```
string ColumnName = "ColumnName";
```

Description

This is ColumnName, a member of class ColumnsColumns.

15.1.3.1.3.2.3 ColumnsColumns.DbxDataType Field

Pascal

```
const DbxDataType: string = "DbxDataType";
```

C++

```
string DbxDataType = "DbxDataType";
```

Description

This is DbxDataType, a member of class ColumnsColumns.

15.1.3.1.3.2.4 ColumnsColumns.DefaultValue Field

Pascal

```
const DefaultValue: string = "DefaultValue";
```

C++

```
string DefaultValue = "DefaultValue";
```

Description

This is DefaultValue, a member of class ColumnsColumns.

15.1.3.1.3.2.5 ColumnsColumns.IsAutoIncrement Field

Pascal

```
const IsAutoIncrement: string = "IsAutoIncrement";
```

C++

```
string IsAutoIncrement = "IsAutoIncrement";
```

Description

This is IsAutoIncrement, a member of class ColumnsColumns.

15.1.3.1.3.2.6 ColumnsColumns.IsFixedLength Field

Pascal

```
const IsFixedLength: string = "IsFixedLength";
```

C++

```
string IsFixedLength = "IsFixedLength";
```

Description

This is IsFixedLength, a member of class ColumnsColumns.

15.1.3.1.3.2.7 ColumnsColumns.IsLong Field

Pascal

```
const IsLong: string = "IsLong";
```

C++

```
string IsLong = "IsLong";
```

Description

This is IsLong, a member of class ColumnsColumns.

15.1.3.1.3.2.8 ColumnsColumns.IsNullable Field

Pascal

```
const IsNullable: string = "IsNullable";
```

C++

```
string IsNullable = "IsNullable";
```

Description

This is IsNullable, a member of class ColumnsColumns.

15.1.3.1.3.2.9 ColumnsColumns.IsUnicode Field

Pascal

```
const IsUnicode: string = "IsUnicode";
```

C++

```
string IsUnicode = "IsUnicode";
```

Description

This is IsUnicode, a member of class ColumnsColumns.

15.1.3.1.3.2.10 ColumnsColumns.IsUnsigned Field

Pascal

```
const IsUnsigned: string = "IsUnsigned";
```

C++

```
string IsUnsigned = "IsUnsigned";
```

Description

This is IsUnsigned, a member of class ColumnsColumns.

15.1.3.1.3.2.11 ColumnsColumns.MaxInline Field

Pascal

```
const MaxInline: string = "MaxInline";
```

C++

```
string MaxInline = "MaxInline";
```

Description

This is MaxInline, a member of class ColumnsColumns.

15.1.3.1.3.2.12 ColumnsColumns.Ordinal Field

Pascal

```
const Ordinal: string = "Ordinal";
```

C++

```
string Ordinal = "Ordinal";
```

Description

This is Ordinal, a member of class ColumnsColumns.

15.1.3.1.3.2.13 ColumnsColumns.Precision Field

Pascal

```
const Precision: string = "Precision";
```

C++

```
string Precision = "Precision";
```

Description

This is Precision, a member of class ColumnsColumns.

15.1.3.1.3.2.14 ColumnsColumns.Scale Field

Pascal

```
const Scale: string = "Scale";
```

C++

```
string Scale = "Scale";
```

Description

This is Scale, a member of class ColumnsColumns.

15.1.3.1.3.2.15 ColumnsColumns.SchemaName Field

Pascal

```
const SchemaName: string = "SchemaName";
```

C++

```
string SchemaName = "SchemaName";
```

Description

This is SchemaName, a member of class ColumnsColumns.

15.1.3.1.3.2.16 ColumnsColumns.TableName Field

Pascal

```
const TableName: string = "TableName";
```

C++

```
string TableName = "TableName";
```

Description

This is TableName, a member of class ColumnsColumns.

15.1.3.1.3.2.17 ColumnsColumns.TypeName Field

Pascal

```
const TypeName: string = "TypeName";
```

C++

```
string TypeName = "TypeName";
```

Description

This is TypeName, a member of class ColumnsColumns.

15.1.3.1.4 DataTypesColumns Class

Column names for result table from the built-in stored procedure DB_ADMIN.GET_DATATYPES. and DataStoreConnection.GetSchema(MetaDataCollectionName.DataTypes).

Class Hierarchy

Borland.Data.MetaData.DataTypesColumns

Pascal

```
DataTypesColumns = class;
```

C++

```
class DataTypesColumns;
```

File

DataTypesColumns.cs

Description

DataTypesColumns provides the column names for the result table from the built-in stored procedure DB_ADMIN.GET_DATATYPES and DataStoreConnection.GetSchema(MetaDataCollectionName.DataTypes).

Each row in the result table of DB_ADMIN.GET_DATATYPES describes a data type. The columns of the result table are:

Constant	Description
TypeName (see page 2148)	Used to access the TypeName (see page 2148) column in the DataTypes metadata collection. The data in this column specifies the database specific data type name.
DbxDataType (see page 2144)	Used to access the DbxDataType (see page 2144) column in the DataTypes metadata collection. The data in this column specifies the DBX data type.
ColumnSize (see page 2143)	Used to access the ColumnSize (see page 2143) column in the DataTypes metadata collection. The data in this column specifies the length of this type. For a string data type, this is the maximum number of characters. For a floating point number, this is the number of significant bits in the mantissa. For other numeric types, this is the maximum number of significant digits. For a date, time, and timestamp types, this is the length of the string representation.
CreateFormat (see page 2144)	Used to access the CreateFormat (see page 2144) column in the DataTypes metadata collection. The data in this column specifies the create format as used in CREATE TABLE.
CreateParameters (see page 2144)	Used to access the CreateParameters (see page 2144) column in the DataTypes metadata collection. The data in this column specifies the parameters for the create format.
DataType (see page 2144)	Used to access the DataType (see page 2144) column in the DataTypes metadata collection. The data in this column specifies the name of the language type representing this data type.
IsAutoIncrementable (see page 2144)	Used to access the IsAutoIncrementable (see page 2144) column in the DataTypes metadata collection. The data in this column specifies that the data type can be used as for an autoincrement column.
IsBestMatch (see page 2145)	Used to access the IsBestMatch (see page 2145) column in the DataTypes metadata collection. The data in this column specifies that the data type is the best match for the language type.
IsCaseSensitive (see page 2145)	Used to access the IsCaseSensitive (see page 2145) column in the DataTypes metadata collection. The data in this column specifies that the data type is case sensitive.
IsFixedLength (see page 2145)	Used to access the IsFixedLength (see page 2145) column in the DataTypes metadata collection. The data in this column specifies that the data type is fixed length.
IsFixedPrecisionScale (see page 2145)	Used to access the IsFixedPrecisionScale (see page 2145) column in the DataTypes metadata collection. The data in this column specifies that the data type is an exact numeric.
IsLong (see page 2146)	Used to access the IsLong (see page 2146) column in the DataTypes metadata collection. The data in this column specifies that the data type is a blob type.
IsNullable (see page 2146)	Used to access the IsNullable (see page 2146) column in the DataTypes metadata collection. The data in this column specifies that the data type can be assigned a value of NULL.

IsSearchable (see page 2146)	Used to access the IsSearchable (see page 2146) column in the DataTypes metadata collection. The data in this column specifies that the data type can be searched in the SQL database.
IsSearchableWithLike (see page 2146)	Used to access the IsSearchableWithLike (see page 2146) column in the DataTypes metadata collection. The data in this column specifies that the data type can be search with the SQL LIKE operator.
IsUnsigned (see page 2147)	Used to access the IsUnsigned (see page 2147) column in the DataTypes metadata collection. The data in this column specifies that the data type is an unsigned numeric.
MaximumScale (see page 2147)	Used to access the MaximumScale (see page 2147) column in the DataTypes metadata collection. The data in this column specifies the maximum possible scale value.
MinimumScale (see page 2148)	Used to access the MinimumScale (see page 2148) column in the DataTypes metadata collection. The data in this column specifies the minimum possible scale value.
IsConcurrencyType (see page 2145)	Used to access the IsConcurrencyType (see page 2145) column in the DataTypes metadata collection. The data in this column specifies that the data type has special update semantics.
MaximumVersion (see page 2148)	Used to access the MaximumVersion (see page 2148) column in the DataTypes metadata collection. The data in this column specifies the last database product version where this type was avaliable.
MinimumVersion (see page 2148)	Used to access the MinimumVersion (see page 2148) column in the DataTypes metadata collection. The data in this column specifies the first database product version where this type was available.
IsLiteralSupported (see page 2146)	Used to access the IsLiteralSupported (see page 2146) column in the DataTypes metadata collection. The data in this column specifies that the data type can be represented as a SQL literal.
LiteralPrefix (see page 2147)	Used to access the LiteralPrefix (see page 2147) column in the DataTypes metadata collection. The data in this column specifies the prefix of a SQL literal.
LiteralSuffix (see page 2147)	Used to access the LiteralSuffix (see page 2147) column in the DataTypes metadata collection. The data in this column specifies the suffix of a SQL literal.
IsUnicode (see page 2147)	Used to access the IsUnicode (see page 2147) column in the DataTypes metadata collection. The data in this column specifies that the data type can hold unicode character data.
ProviderDbType (see page 2148)	Used to access the ProviderDbType (see page 2148) column in the DataTypes metadata collection. The data in this column specifies a SQLDataStore data type from the constants in Borland.Data.DataStore.JdsType. Reserved for .NET applications.

15.1.3.1.4.1 DataTypesColumns Members

The following tables list the members exposed by DataTypesColumns.

Public Fields

	Name	Description
	ColumnSize (see page 2143)	This is ColumnSize, a member of class DataTypesColumns.
	CreateFormat (see page 2144)	This is CreateFormat, a member of class DataTypesColumns.
	CreateParameters (see page 2144)	This is CreateParameters, a member of class DataTypesColumns.
	DataType (see page 2144)	This is DataType, a member of class DataTypesColumns.
	DbxDataType (see page 2144)	This is DbxDataType, a member of class DataTypesColumns.
	IsAutoIncrementable (see page 2144)	This is IsAutoIncrementable, a member of class DataTypesColumns.
	IsBestMatch (see page 2145)	This is IsBestMatch, a member of class DataTypesColumns.
	IsCaseSensitive (see page 2145)	This is IsCaseSensitive, a member of class DataTypesColumns.
	IsConcurrencyType (see page 2145)	This is IsConcurrencyType, a member of class DataTypesColumns.
	IsFixedLength (see page 2145)	This is IsFixedLength, a member of class DataTypesColumns.
	IsFixedPrecisionScale (see page 2145)	This is IsFixedPrecisionScale, a member of class DataTypesColumns.
	IsLiteralSupported (see page 2146)	This is IsLiteralSupported, a member of class DataTypesColumns.

	IsLong (see page 2146)	This is IsLong, a member of class DataTypesColumns.
	IsNullable (see page 2146)	This is IsNullable, a member of class DataTypesColumns.
	IsSearchable (see page 2146)	This is IsSearchable, a member of class DataTypesColumns.
	IsSearchableWithLike (see page 2146)	This is IsSearchableWithLike, a member of class DataTypesColumns.
	IsUnicode (see page 2147)	This is IsUnicode, a member of class DataTypesColumns.
	IsUnsigned (see page 2147)	This is IsUnsigned, a member of class DataTypesColumns.
	LiteralPrefix (see page 2147)	This is LiteralPrefix, a member of class DataTypesColumns.
	LiteralSuffix (see page 2147)	This is LiteralSuffix, a member of class DataTypesColumns.
	MaximumScale (see page 2147)	This is MaximumScale, a member of class DataTypesColumns.
	MaximumVersion (see page 2148)	This is MaximumVersion, a member of class DataTypesColumns.
	MinimumScale (see page 2148)	This is MinimumScale, a member of class DataTypesColumns.
	MinimumVersion (see page 2148)	This is MinimumVersion, a member of class DataTypesColumns.
	ProviderDbType (see page 2148)	This is ProviderDbType, a member of class DataTypesColumns.
	TypeName (see page 2148)	This is TypeName, a member of class DataTypesColumns.

15.1.3.1.4.2 DataTypesColumns Fields

The fields of the DataTypesColumns class are listed here.

Public Fields

	Name	Description
	ColumnSize (see page 2143)	This is ColumnSize, a member of class DataTypesColumns.
	CreateFormat (see page 2144)	This is CreateFormat, a member of class DataTypesColumns.
	CreateParameters (see page 2144)	This is CreateParameters, a member of class DataTypesColumns.
	DataType (see page 2144)	This is DataType, a member of class DataTypesColumns.
	DbxDataType (see page 2144)	This is DbxDataType, a member of class DataTypesColumns.
	IsAutoIncrementable (see page 2144)	This is IsAutoIncrementable, a member of class DataTypesColumns.
	IsBestMatch (see page 2145)	This is IsBestMatch, a member of class DataTypesColumns.
	IsCaseSensitive (see page 2145)	This is IsCaseSensitive, a member of class DataTypesColumns.
	IsConcurrencyType (see page 2145)	This is IsConcurrencyType, a member of class DataTypesColumns.
	IsFixedLength (see page 2145)	This is IsFixedLength, a member of class DataTypesColumns.
	IsFixedPrecisionScale (see page 2145)	This is IsFixedPrecisionScale, a member of class DataTypesColumns.
	IsLiteralSupported (see page 2146)	This is IsLiteralSupported, a member of class DataTypesColumns.
	IsLong (see page 2146)	This is IsLong, a member of class DataTypesColumns.
	IsNullable (see page 2146)	This is IsNullable, a member of class DataTypesColumns.
	IsSearchable (see page 2146)	This is IsSearchable, a member of class DataTypesColumns.
	IsSearchableWithLike (see page 2146)	This is IsSearchableWithLike, a member of class DataTypesColumns.
	IsUnicode (see page 2147)	This is IsUnicode, a member of class DataTypesColumns.
	IsUnsigned (see page 2147)	This is IsUnsigned, a member of class DataTypesColumns.
	LiteralPrefix (see page 2147)	This is LiteralPrefix, a member of class DataTypesColumns.
	LiteralSuffix (see page 2147)	This is LiteralSuffix, a member of class DataTypesColumns.
	MaximumScale (see page 2147)	This is MaximumScale, a member of class DataTypesColumns.
	MaximumVersion (see page 2148)	This is MaximumVersion, a member of class DataTypesColumns.
	MinimumScale (see page 2148)	This is MinimumScale, a member of class DataTypesColumns.
	MinimumVersion (see page 2148)	This is MinimumVersion, a member of class DataTypesColumns.
	ProviderDbType (see page 2148)	This is ProviderDbType, a member of class DataTypesColumns.
	TypeName (see page 2148)	This is TypeName, a member of class DataTypesColumns.

15.1.3.1.4.2.1 DataTypesColumns.ColumnSize Field

Pascal

```
const ColumnSize: string = "ColumnSize";
```

C++

```
string ColumnSize = "ColumnSize";
```

Description

This is ColumnSize, a member of class DataTypesColumns.

15.1.3.1.4.2.2 DataTypesColumns.CreateFormat Field

Pascal

```
const CreateFormat: string = "CreateFormat";
```

C++

```
string CreateFormat = "CreateFormat";
```

Description

This is CreateFormat, a member of class DataTypesColumns.

15.1.3.1.4.2.3 DataTypesColumns.CreateParameters Field

Pascal

```
const CreateParameters: string = "CreateParameters";
```

C++

```
string CreateParameters = "CreateParameters";
```

Description

This is CreateParameters, a member of class DataTypesColumns.

15.1.3.1.4.2.4 DataTypesColumns.DataType Field

Pascal

```
const DataType: string = "DataType";
```

C++

```
string DataType = "DataType";
```

Description

This is DataType, a member of class DataTypesColumns.

15.1.3.1.4.2.5 DataTypesColumns.DbxDataType Field

Pascal

```
const DbxDataType: string = "DbxDataType";
```

C++

```
string DbxDataType = "DbxDataType";
```

Description

This is DbxDataType, a member of class DataTypesColumns.

15.1.3.1.4.2.6 DataTypesColumns.IsAutoIncrementable Field

Pascal

```
const IsAutoIncrementable: string = "IsAutoIncrementable";
```

C++

```
string IsAutoIncrementable = "IsAutoIncrementable";
```

Description

This is IsAutoIncrementable, a member of class DataTypesColumns.

15.1.3.1.4.2.7 DataTypesColumns.IsBestMatch Field

Pascal

```
const IsBestMatch: string = "IsBestMatch";
```

C++

```
string IsBestMatch = "IsBestMatch";
```

Description

This is IsBestMatch, a member of class DataTypesColumns.

15.1.3.1.4.2.8 DataTypesColumns.IsCaseSensitive Field

Pascal

```
const IsCaseSensitive: string = "IsCaseSensitive";
```

C++

```
string IsCaseSensitive = "IsCaseSensitive";
```

Description

This is IsCaseSensitive, a member of class DataTypesColumns.

15.1.3.1.4.2.9 DataTypesColumns.IsConcurrencyType Field

Pascal

```
const IsConcurrencyType: string = "IsConcurrencyType";
```

C++

```
string IsConcurrencyType = "IsConcurrencyType";
```

Description

This is IsConcurrencyType, a member of class DataTypesColumns.

15.1.3.1.4.2.10 DataTypesColumns.IsFixedLength Field

Pascal

```
const IsFixedLength: string = "IsFixedLength";
```

C++

```
string IsFixedLength = "IsFixedLength";
```

Description

This is IsFixedLength, a member of class DataTypesColumns.

15.1.3.1.4.2.11 DataTypesColumns.IsFixedPrecisionScale Field

Pascal

```
const IsFixedPrecisionScale: string = "IsFixedPrecisionScale";
```

C++

```
string IsFixedPrecisionScale = "IsFixedPrecisionScale";
```

Description

This is IsFixedPrecisionScale, a member of class DataTypesColumns.

15.1.3.1.4.2.12 DataTypesColumns.IsLiteralSupported Field

Pascal

```
const IsLiteralSupported: string = "IsLiteralSupported";
```

C++

```
string IsLiteralSupported = "IsLiteralSupported";
```

Description

This is IsLiteralSupported, a member of class DataTypesColumns.

15.1.3.1.4.2.13 DataTypesColumns.IsLong Field

Pascal

```
const IsLong: string = "IsLong";
```

C++

```
string IsLong = "IsLong";
```

Description

This is IsLong, a member of class DataTypesColumns.

15.1.3.1.4.2.14 DataTypesColumns.IsNullable Field

Pascal

```
const IsNullable: string = "IsNullable";
```

C++

```
string IsNullable = "IsNullable";
```

Description

This is IsNullable, a member of class DataTypesColumns.

15.1.3.1.4.2.15 DataTypesColumns.IsSearchable Field

Pascal

```
const IsSearchable: string = "IsSearchable";
```

C++

```
string IsSearchable = "IsSearchable";
```

Description

This is IsSearchable, a member of class DataTypesColumns.

15.1.3.1.4.2.16 DataTypesColumns.IsSearchableWithLike Field

Pascal

```
const IsSearchableWithLike: string = "IsSearchableWithLike";
```

C++

```
string IsSearchableWithLike = "IsSearchableWithLike";
```

Description

This is IsSearchableWithLike, a member of class DataTypesColumns.

15.1.3.1.4.2.17 DataTypesColumns.IsUnicode Field

Pascal

```
const IsUnicode: string = "IsUnicode";
```

C++

```
string IsUnicode = "IsUnicode";
```

Description

This is IsUnicode, a member of class DataTypesColumns.

15.1.3.1.4.2.18 DataTypesColumns.IsUnsigned Field

Pascal

```
const IsUnsigned: string = "IsUnsigned";
```

C++

```
string IsUnsigned = "IsUnsigned";
```

Description

This is IsUnsigned, a member of class DataTypesColumns.

15.1.3.1.4.2.19 DataTypesColumns.LiteralPrefix Field

Pascal

```
const LiteralPrefix: string = "LiteralPrefix";
```

C++

```
string LiteralPrefix = "LiteralPrefix";
```

Description

This is LiteralPrefix, a member of class DataTypesColumns.

15.1.3.1.4.2.20 DataTypesColumns.LiteralSuffix Field

Pascal

```
const LiteralSuffix: string = "LiteralSuffix";
```

C++

```
string LiteralSuffix = "LiteralSuffix";
```

Description

This is LiteralSuffix, a member of class DataTypesColumns.

15.1.3.1.4.2.21 DataTypesColumns.MaximumScale Field

Pascal

```
const MaximumScale: string = "MaximumScale";
```

C++

```
string MaximumScale = "MaximumScale";
```

Description

This is MaximumScale, a member of class DataTypesColumns.

15.1.3.1.4.2.22 DataTypesColumns.MaximumVersion Field

Pascal

```
const MaximumVersion: string = "MaximumVersion";
```

C++

```
string MaximumVersion = "MaximumVersion";
```

Description

This is MaximumVersion, a member of class DataTypesColumns.

15.1.3.1.4.2.23 DataTypesColumns.MinimumScale Field

Pascal

```
const MinimumScale: string = "MinimumScale";
```

C++

```
string MinimumScale = "MinimumScale";
```

Description

This is MinimumScale, a member of class DataTypesColumns.

15.1.3.1.4.2.24 DataTypesColumns.MinimumVersion Field

Pascal

```
const MinimumVersion: string = "MinimumVersion";
```

C++

```
string MinimumVersion = "MinimumVersion";
```

Description

This is MinimumVersion, a member of class DataTypesColumns.

15.1.3.1.4.2.25 DataTypesColumns.ProviderDbType Field

Pascal

```
const ProviderDbType: string = "ProviderDbType";
```

C++

```
string ProviderDbType = "ProviderDbType";
```

Description

This is ProviderDbType, a member of class DataTypesColumns.

15.1.3.1.4.2.26 DataTypesColumns.TypeName Field

Pascal

```
const TypeName: string = "TypeName";
```

C++

```
string TypeName = "TypeName";
```

Description

This is TypeName, a member of class DataTypesColumns.

15.1.3.1.5 ForeignKeyColumnsColumns Class

Column names for result table from the built-in stored procedure DB_ADMIN.GET_FOREIGN_KEY_COLUMNS and DataStoreConnection.GetSchema(MetaDataCollectionName.ForeignKeyColumns).

Class Hierarchy

Borland.Data.MetaData.ForeignKeyColumnsColumns

Pascal

```
ForeignKeyColumnsColumns = class;
```

C++

```
class ForeignKeyColumnsColumns;
```

File

ForeignKeyColumnsColumns.cs

Description

Column names for result table from the built-in stored procedure DB_ADMIN.GET_FOREIGN_KEY_COLUMNS and DataStoreConnection.GetSchema(MetaDataCollectionName.ForeignKeyColumns).

The columns of the result table are:

Constant	Description
CatalogName (see page 2150)	Used to access the CatalogName (see page 2150) column in the ForeignKeyColumns metadata collection. The data in this column specifies the catalog name of the table with the foreign key.
SchemaName (see page 2152)	Used to access the SchemaName (see page 2152) column in the ForeignKeyColumns metadata collection. The data in this column specifies the schema name of the table with the foreign key.
TableName (see page 2152)	Used to access the TableName (see page 2152) column in the ForeignKeyColumns metadata collection. The data in this column specifies the name of the table with the foreign key.
ForeignKeyName (see page 2151)	Used to access the ForeignKeyName (see page 2151) column in the ForeignKeyColumns metadata collection. The data in this column specifies the foreign key name.
ColumnName (see page 2151)	Used to access the ColumnName (see page 2151) column in the ForeignKeyColumns metadata collection. The data in this column specifies a column which refers to a column of in another table.
PrimaryCatalogName (see page 2151)	Used to access the PrimaryCatalogName (see page 2151) column in the ForeignKeyColumns metadata collection. The data in this column specifies the catalog name of the table being referred to.
PrimarySchemaName (see page 2152)	Used to access the PrimarySchemaName (see page 2152) column in the ForeignKeyColumns metadata collection. The data in this column specifies the schema name of the table being referred to.
PrimaryTableName (see page 2152)	Used to access the PrimaryTableName (see page 2152) column in the ForeignKeyColumns metadata collection. The data in this column specifies the name of the table being referred to.
PrimaryKeyName (see page 2152)	Used to access the PrimaryKeyName (see page 2152) column in the ForeignKeyColumns metadata collection. The data in this column specifies the name of the key being referred to. This is usually the primary key.

PrimaryColumnName (see page 2151)	Used to access the PrimaryColumnName (see page 2151) column in the ForeignKeyColumns metadata collection. The data in this column specifies the column which is being referred to.
Ordinal (see page 2151)	Used to access the Ordinal (see page 2151) column in the ForeignKeyColumns metadata collection. The data in this column specifies the position of the column reference in the foreign key.

15.1.3.1.5.1 ForeignKeyColumnsColumns Members

The following tables list the members exposed by ForeignKeyColumnsColumns.

Public Fields

	Name	Description
	CatalogName (see page 2150)	This is CatalogName, a member of class ForeignKeyColumnsColumns.
	ColumnName (see page 2151)	This is ColumnName, a member of class ForeignKeyColumnsColumns.
	ForeignKeyName (see page 2151)	This is ForeignKeyName, a member of class ForeignKeyColumnsColumns.
	Ordinal (see page 2151)	This is Ordinal, a member of class ForeignKeyColumnsColumns.
	PrimaryCatalogName (see page 2151)	This is PrimaryCatalogName, a member of class ForeignKeyColumnsColumns.
	PrimaryColumnName (see page 2151)	This is PrimaryColumnName, a member of class ForeignKeyColumnsColumns.
	PrimaryKeyName (see page 2152)	This is PrimaryKeyName, a member of class ForeignKeyColumnsColumns.
	PrimarySchemaName (see page 2152)	This is PrimarySchemaName, a member of class ForeignKeyColumnsColumns.
	PrimaryTableName (see page 2152)	This is PrimaryTableName, a member of class ForeignKeyColumnsColumns.
	SchemaName (see page 2152)	This is SchemaName, a member of class ForeignKeyColumnsColumns.
	TableName (see page 2152)	This is TableName, a member of class ForeignKeyColumnsColumns.

15.1.3.1.5.2 ForeignKeyColumnsColumns Fields

The fields of the ForeignKeyColumnsColumns class are listed here.

Public Fields

	Name	Description
	CatalogName (see page 2150)	This is CatalogName, a member of class ForeignKeyColumnsColumns.
	ColumnName (see page 2151)	This is ColumnName, a member of class ForeignKeyColumnsColumns.
	ForeignKeyName (see page 2151)	This is ForeignKeyName, a member of class ForeignKeyColumnsColumns.
	Ordinal (see page 2151)	This is Ordinal, a member of class ForeignKeyColumnsColumns.
	PrimaryCatalogName (see page 2151)	This is PrimaryCatalogName, a member of class ForeignKeyColumnsColumns.
	PrimaryColumnName (see page 2151)	This is PrimaryColumnName, a member of class ForeignKeyColumnsColumns.
	PrimaryKeyName (see page 2152)	This is PrimaryKeyName, a member of class ForeignKeyColumnsColumns.
	PrimarySchemaName (see page 2152)	This is PrimarySchemaName, a member of class ForeignKeyColumnsColumns.
	PrimaryTableName (see page 2152)	This is PrimaryTableName, a member of class ForeignKeyColumnsColumns.
	SchemaName (see page 2152)	This is SchemaName, a member of class ForeignKeyColumnsColumns.
	TableName (see page 2152)	This is TableName, a member of class ForeignKeyColumnsColumns.

15.1.3.1.5.2.1 ForeignKeyColumnsColumns.CatalogName Field

Pascal

```
const CatalogName: string = "CatalogName";
```

C++

```
string CatalogName = "CatalogName";
```

Description

This is CatalogName, a member of class ForeignKeyColumnsColumns.

15.1.3.1.5.2.2 ForeignKeyColumnsColumns.ColumnName Field

Pascal

```
const ColumnName: string = "ColumnName";
```

C++

```
string ColumnName = "ColumnName";
```

Description

This is ColumnName, a member of class ForeignKeyColumnsColumns.

15.1.3.1.5.2.3 ForeignKeyColumnsColumns.ForeignKeyName Field

Pascal

```
const ForeignKeyName: string = "ForeignKeyName";
```

C++

```
string ForeignKeyName = "ForeignKeyName";
```

Description

This is ForeignKeyName, a member of class ForeignKeyColumnsColumns.

15.1.3.1.5.2.4 ForeignKeyColumnsColumns.Ordinal Field

Pascal

```
const Ordinal: string = "Ordinal";
```

C++

```
string Ordinal = "Ordinal";
```

Description

This is Ordinal, a member of class ForeignKeyColumnsColumns.

15.1.3.1.5.2.5 ForeignKeyColumnsColumns.PrimaryCatalogName Field

Pascal

```
const PrimaryCatalogName: string = "PrimaryCatalogName";
```

C++

```
string PrimaryCatalogName = "PrimaryCatalogName";
```

Description

This is PrimaryCatalogName, a member of class ForeignKeyColumnsColumns.

15.1.3.1.5.2.6 ForeignKeyColumnsColumns.PrimaryColumnName Field

Pascal

```
const PrimaryColumnName: string = "PrimaryColumnName";
```

C++

```
string PrimaryColumnName = "PrimaryColumnName";
```

Description

This is PrimaryColumnName, a member of class ForeignKeyColumnsColumns.

15.1.3.1.5.2.7 ForeignKeyColumnsColumns.PrimaryKeyName Field

Pascal

```
const PrimaryKeyName: string = "PrimaryKeyName";
```

C++

```
string PrimaryKeyName = "PrimaryKeyName";
```

Description

This is PrimaryKeyName, a member of class ForeignKeyColumnsColumns.

15.1.3.1.5.2.8 ForeignKeyColumnsColumns.PrimarySchemaName Field

Pascal

```
const PrimarySchemaName: string = "PrimarySchemaName";
```

C++

```
string PrimarySchemaName = "PrimarySchemaName";
```

Description

This is PrimarySchemaName, a member of class ForeignKeyColumnsColumns.

15.1.3.1.5.2.9 ForeignKeyColumnsColumns.PrimaryTableName Field

Pascal

```
const PrimaryTableName: string = "PrimaryTableName";
```

C++

```
string PrimaryTableName = "PrimaryTableName";
```

Description

This is PrimaryTableName, a member of class ForeignKeyColumnsColumns.

15.1.3.1.5.2.10 ForeignKeyColumnsColumns.SchemaName Field

Pascal

```
const SchemaName: string = "SchemaName";
```

C++

```
string SchemaName = "SchemaName";
```

Description

This is SchemaName, a member of class ForeignKeyColumnsColumns.

15.1.3.1.5.2.11 ForeignKeyColumnsColumns.TableName Field

Pascal

```
const TableName: string = "TableName";
```

C++

```
string TableName = "TableName";
```

Description

This is TableName, a member of class ForeignKeyColumnsColumns.

15.1.3.1.6 ForeignKeysColumns Class

Column names for result table from the built-in stored procedure DB_ADMIN.GET_FOREIGN_KEYS and DataStoreConnection.GetSchema(MetaDataCollectionName.ForeignKeys).

Class Hierarchy

Borland.Data.MetaData.ForeignKeysColumns

Pascal

```
ForeignKeysColumns = class;
```

C++

```
class ForeignKeysColumns;
```

File

ForeignKeysColumns.cs

Description

Column names for result table from the built-in stored procedure DB_ADMIN.GET_FOREIGN_KEYS and DataStoreConnection.GetSchema(MetaDataCollectionName.ForeignKeys).

The columns of the result table are:

Constant	Description
CatalogName (see page 2154)	Used to access the CatalogName (see page 2154) column in the ForeignKeys metadata collection. The data in this column specifies the catalog name.
SchemaName (see page 2154)	Used to access the SchemaName (see page 2154) column in the ForeignKeys metadata collection. The data in this column specifies the schema name.
TableName (see page 2154)	Used to access the TableName (see page 2154) column in the ForeignKeys metadata collection. The data in this column specifies the table name.
ForeignKeyName (see page 2154)	Used to access the ForeignKeyName (see page 2154) column in the ForeignKeys metadata collection. The data in this column specifies the foreign key name.

15.1.3.1.6.1 ForeignKeysColumns Members

The following tables list the members exposed by ForeignKeysColumns.

Public Fields

	Name	Description
	CatalogName (see page 2154)	This is CatalogName, a member of class ForeignKeysColumns.
	ForeignKeyName (see page 2154)	This is ForeignKeyName, a member of class ForeignKeysColumns.
	SchemaName (see page 2154)	This is SchemaName, a member of class ForeignKeysColumns.
	TableName (see page 2154)	This is TableName, a member of class ForeignKeysColumns.

15.1.3.1.6.2 ForeignKeysColumns Fields

The fields of the ForeignKeysColumns class are listed here.

Public Fields

	Name	Description
	CatalogName (see page 2154)	This is CatalogName, a member of class ForeignKeysColumns.
	ForeignKeyName (see page 2154)	This is ForeignKeyName, a member of class ForeignKeysColumns.
	SchemaName (see page 2154)	This is SchemaName, a member of class ForeignKeysColumns.
	TableName (see page 2154)	This is TableName, a member of class ForeignKeysColumns.

15.1.3.1.6.2.1 ForeignKeysColumns.CatalogName Field

Pascal

```
const CatalogName: string = "CatalogName";
```

C++

```
string CatalogName = "CatalogName";
```

Description

This is CatalogName, a member of class ForeignKeysColumns.

15.1.3.1.6.2.2 ForeignKeysColumns.ForeignKeyName Field

Pascal

```
const ForeignKeyName: string = "ForeignKeyName";
```

C++

```
string ForeignKeyName = "ForeignKeyName";
```

Description

This is ForeignKeyName, a member of class ForeignKeysColumns.

15.1.3.1.6.2.3 ForeignKeysColumns.SchemaName Field

Pascal

```
const SchemaName: string = "SchemaName";
```

C++

```
string SchemaName = "SchemaName";
```

Description

This is SchemaName, a member of class ForeignKeysColumns.

15.1.3.1.6.2.4 ForeignKeysColumns.TableName Field

Pascal

```
const TableName: string = "TableName";
```

C++

```
string TableName = "TableName";
```

Description

This is TableName, a member of class ForeignKeysColumns.

15.1.3.1.7 IndexColumnsColumns Class

Column names for result table from the built-in stored procedure DB_ADMIN.GET_INDEX_COLUMNS and

DataStoreConnection.GetSchema(MetaDataCollectionName.IndexColumns).

Class Hierarchy

Borland.Data.MetaData.IndexColumnsColumns

Pascal

```
IndexColumnsColumns = class;
```

C++

```
class IndexColumnsColumns;
```

File

IndexColumnsColumns.cs

Description

Column names for result table from the built-in stored procedure DB_ADMIN.GET_INDEX_COLUMNS and DataStoreConnection.GetSchema(MetaDataCollectionName.IndexColumns).

The columns of the result table are:

Constant	Description
CatalogName (see page 2156)	Used to access the CatalogName (see page 2156) column in the IndexColumns metadata collection. The data in this column specifies the catalog name.
SchemaName (see page 2157)	Used to access the SchemaName (see page 2157) column in the IndexColumns metadata collection. The data in this column specifies the schema name.
TableName (see page 2157)	Used to access the TableName (see page 2157) column in the IndexColumns metadata collection. The data in this column specifies the table name.
IndexName (see page 2156)	Used to access the IndexName (see page 2156) column in the IndexColumns metadata collection. data in this column specifies the index name.
ColumnName (see page 2156)	Used to access the ColumnName (see page 2156) column in the IndexColumns metadata collection. The data in this column specifies a column in the index.
Ordinal (see page 2157)	Used to access the Ordinal (see page 2157) column in the IndexColumns metadata collection. The data in this column specifies the position of the column in the index starting with 1.
IsAscending (see page 2157)	Used to access the IsAscending (see page 2157) column in the IndexColumns metadata collection. The data in this column specifies that the index column is a descending index column.

15.1.3.1.7.1 IndexColumnsColumns Members

The following tables list the members exposed by IndexColumnsColumns.

Public Fields

	Name	Description
	CatalogName (see page 2156)	This is CatalogName, a member of class IndexColumnsColumns.

	ColumnName (see page 2156)	This is ColumnName, a member of class IndexColumnsColumns.
	IndexName (see page 2156)	This is IndexName, a member of class IndexColumnsColumns.
	IsAscending (see page 2157)	This is IsAscending, a member of class IndexColumnsColumns.
	Ordinal (see page 2157)	This is Ordinal, a member of class IndexColumnsColumns.
	SchemaName (see page 2157)	This is SchemaName, a member of class IndexColumnsColumns.
	TableName (see page 2157)	This is TableName, a member of class IndexColumnsColumns.

15.1.3.1.7.2 IndexColumnsColumns Fields

The fields of the IndexColumnsColumns class are listed here.

Public Fields

	Name	Description
	CatalogName (see page 2156)	This is CatalogName, a member of class IndexColumnsColumns.
	ColumnName (see page 2156)	This is ColumnName, a member of class IndexColumnsColumns.
	IndexName (see page 2156)	This is IndexName, a member of class IndexColumnsColumns.
	IsAscending (see page 2157)	This is IsAscending, a member of class IndexColumnsColumns.
	Ordinal (see page 2157)	This is Ordinal, a member of class IndexColumnsColumns.
	SchemaName (see page 2157)	This is SchemaName, a member of class IndexColumnsColumns.
	TableName (see page 2157)	This is TableName, a member of class IndexColumnsColumns.

15.1.3.1.7.2.1 IndexColumnsColumns.CatalogName Field

Pascal

```
const CatalogName: string = "CatalogName";
```

C++

```
string CatalogName = "CatalogName";
```

Description

This is CatalogName, a member of class IndexColumnsColumns.

15.1.3.1.7.2.2 IndexColumnsColumns.ColumnName Field

Pascal

```
const ColumnName: string = "ColumnName";
```

C++

```
string ColumnName = "ColumnName";
```

Description

This is ColumnName, a member of class IndexColumnsColumns.

15.1.3.1.7.2.3 IndexColumnsColumns.IndexName Field

Pascal

```
const IndexName: string = "IndexName";
```

C++

```
string IndexName = "IndexName";
```

Description

This is IndexName, a member of class IndexColumnsColumns.

15.1.3.1.7.2.4 IndexColumnsColumns.IsAscending Field

Pascal

```
const IsAscending: string = "IsAscending";
```

C++

```
string IsAscending = "IsAscending";
```

Description

This is IsAscending, a member of class IndexColumnsColumns.

15.1.3.1.7.2.5 IndexColumnsColumns.Ordinal Field

Pascal

```
const Ordinal: string = "Ordinal";
```

C++

```
string Ordinal = "Ordinal";
```

Description

This is Ordinal, a member of class IndexColumnsColumns.

15.1.3.1.7.2.6 IndexColumnsColumns.SchemaName Field

Pascal

```
const SchemaName: string = "SchemaName";
```

C++

```
string SchemaName = "SchemaName";
```

Description

This is SchemaName, a member of class IndexColumnsColumns.

15.1.3.1.7.2.7 IndexColumnsColumns.TableName Field

Pascal

```
const TableName: string = "TableName";
```

C++

```
string TableName = "TableName";
```

Description

This is TableName, a member of class IndexColumnsColumns.

15.1.3.1.8 IndexesColumns Class

Provides the column names for the result table from the built-in stored procedure DB_ADMIN.GET_INDEXES and DataStoreConnection.GetSchema(MetaDataCollectionName.IndexColumns).

Class Hierarchy

Pascal

```
IndexesColumns = class;
```

C++

```
class IndexesColumns;
```

File

IndexesColumns.cs

Description

IndexesColumns provides the column names for the result table from the built-in stored procedure DB_ADMIN.GET_INDEXES and DataStoreConnection.GetSchema(MetaDataCollectionName.IndexColumns). Each row in the result table of DB_ADMIN.GET_INDEXES describes a column in an index in a database.

The columns of the result table are:

Constant	Description
CatalogName (see page 2159)	Used to access the CatalogName (see page 2159) column in the Indexes metadata collection. The data in this column specifies the catalog name.
SchemaName (see page 2160)	Used to access the SchemaName (see page 2160) column in the Indexes metadata collection. The data in this column specifies the schema name.
TableName (see page 2160)	Used to access the TableName (see page 2160) column in the Indexes metadata collection. The data in this column specifies the table name.
IndexName (see page 2159)	Used to access the IndexName (see page 2159) column in the Indexes metadata collection. The data in this column specifies the index name.
ConstraintName (see page 2159)	Used to access the ConstraintName (see page 2159) column in the Indexes metadata collection. The data in this column specifies the constraint name, may be NULL.
IsPrimary (see page 2160)	Used to access the IsPrimary (see page 2160) column in the Indexes metadata collection. The data in this column specifies that the index is the primary key of the table.
IsUnique (see page 2160)	Used to access the IsUnique (see page 2160) column in the Indexes metadata collection. The data in this column specifies that the index is an unique index of the table.
IsAscending (see page 2159)	Used to access the IsAscending (see page 2159) column in the Indexes metadata collection. The data in this column specifies that the index is a descending index (Interbase only).

Blackfish SQL Developer's Guide.

15.1.3.1.8.1 IndexesColumns Members

The following tables list the members exposed by IndexesColumns.

Public Fields

	Name	Description
	CatalogName (see page 2159)	This is CatalogName, a member of class IndexesColumns.
	ConstraintName (see page 2159)	This is ConstraintName, a member of class IndexesColumns.
	IndexName (see page 2159)	This is IndexName, a member of class IndexesColumns.
	IsAscending (see page 2159)	This is IsAscending, a member of class IndexesColumns.
	IsPrimary (see page 2160)	This is IsPrimary, a member of class IndexesColumns.
	IsUnique (see page 2160)	This is IsUnique, a member of class IndexesColumns.
	SchemaName (see page 2160)	This is SchemaName, a member of class IndexesColumns.

	TableName (see page 2160)	This is TableName, a member of class IndexesColumns.

15.1.3.1.8.2 IndexesColumns Fields

The fields of the IndexesColumns class are listed here.

Public Fields

	Name	Description
	CatalogName (see page 2159)	This is CatalogName, a member of class IndexesColumns.
	ConstraintName (see page 2159)	This is ConstraintName, a member of class IndexesColumns.
	IndexName (see page 2159)	This is IndexName, a member of class IndexesColumns.
	IsAscending (see page 2159)	This is IsAscending, a member of class IndexesColumns.
	IsPrimary (see page 2160)	This is IsPrimary, a member of class IndexesColumns.
	IsUnique (see page 2160)	This is IsUnique, a member of class IndexesColumns.
	SchemaName (see page 2160)	This is SchemaName, a member of class IndexesColumns.
	TableName (see page 2160)	This is TableName, a member of class IndexesColumns.

15.1.3.1.8.2.1 IndexesColumns.CatalogName Field

Pascal

```
const CatalogName: string = "CatalogName";
```

C++

```
string CatalogName = "CatalogName";
```

Description

This is CatalogName, a member of class IndexesColumns.

15.1.3.1.8.2.2 IndexesColumns.ConstraintName Field

Pascal

```
const ConstraintName: string = "ConstraintName";
```

C++

```
string ConstraintName = "ConstraintName";
```

Description

This is ConstraintName, a member of class IndexesColumns.

15.1.3.1.8.2.3 IndexesColumns.IndexName Field

Pascal

```
const IndexName: string = "IndexName";
```

C++

```
string IndexName = "IndexName";
```

Description

This is IndexName, a member of class IndexesColumns.

15.1.3.1.8.2.4 IndexesColumns.IsAscending Field

Pascal

```
const IsAscending: string = "IsAscending";
```

C++

```
string IsAscending = "IsAscending";
```

Description

This is IsAscending, a member of class IndexesColumns.

15.1.3.1.8.2.5 IndexesColumns.IsPrimary Field

Pascal

```
const IsPrimary: string = "IsPrimary";
```

C++

```
string IsPrimary = "IsPrimary";
```

Description

This is IsPrimary, a member of class IndexesColumns.

15.1.3.1.8.2.6 IndexesColumns.IsUnique Field

Pascal

```
const IsUnique: string = "IsUnique";
```

C++

```
string IsUnique = "IsUnique";
```

Description

This is IsUnique, a member of class IndexesColumns.

15.1.3.1.8.2.7 IndexesColumns.SchemaName Field

Pascal

```
const SchemaName: string = "SchemaName";
```

C++

```
string SchemaName = "SchemaName";
```

Description

This is SchemaName, a member of class IndexesColumns.

15.1.3.1.8.2.8 IndexesColumns.TableName Field

Pascal

```
const TableName: string = "TableName";
```

C++

```
string TableName = "TableName";
```

Description

This is TableName, a member of class IndexesColumns.

15.1.3.1.9 MetaDataCollectionName Class

Collection names that can be passed to DataStoreConnection.GetSchema to receive metadata collections.

Class Hierarchy

Borland.Data.MetaData.MetaDataCollectionName

Pascal

```
MetaDataCollectionName = class;
```

C++

```
class MetaDataCollectionName;
```

File

MetaDataCollectionName.cs

Description

Collection names that can be passed to DataStoreConnection.GetSchema to receive metadata collections.

The collection names are:

Catalogs (see page 2163)
ColumnConstraints (see page 2163)
Columns (see page 2163)
DataTypes (see page 2164)
ForeignKeyColumns (see page 2165)
ForeignKeys (see page 2166)
IndexColumns (see page 2167)
Indexes (see page 2167)
PackageProcedureParameters (see page 2168)
PackageProcedures (see page 2168)
Packages (see page 2169)
PackageSources (see page 2169)
ProcedureParameters (see page 2170)
Procedures (see page 2171)
ProcedureSources (see page 2171)
ReservedWords (see page 2172)
Roles (see page 2172)
Schemas (see page 2172)
Synonyms (see page 2173)
Tables (see page 2173)
Users (see page 2174)
Views (see page 2174)

15.1.3.1.9.1 MetaDataCollectionName Members

The following tables list the members exposed by MetaDataCollectionName.

Public Fields

	Name	Description
	Catalogs (see page 2163)	This metadata collection represents catalogs in a database.
	ColumnConstraints (see page 2163)	This metadata collection is used internally.
	Columns (see page 2163)	This metadata collection represents table columns in a database.
	DataTypes (see page 2164)	This metadata collection represents data types in a database.
	ForeignKeyColumns (see page 2165)	This metadata collection represents foreign key columns in a database.
	ForeignKeys (see page 2166)	This metadata collection represents foreign keys in a database.
	IndexColumns (see page 2167)	This metadata collection represents index columns in a database.
	Indexes (see page 2167)	This metadata collection represents table indexes in a database.
	PackageProcedureParameters (see page 2168)	This metadata collection represents package procedure parameters in a database.
	PackageProcedures (see page 2168)	This metadata collection represents package procedures in a database.
	Packages (see page 2169)	This metadata collection represents packages in a database.
	PackageSources (see page 2169)	This metadata collection represents package source code in a database.
	ProcedureParameters (see page 2170)	This metadata collection represents procedure parameters in a database.
	Procedures (see page 2171)	This metadata collection represents procedures in a database.
	ProcedureSources (see page 2171)	This metadata collection represents procedure source code in a database.
	ReservedWords (see page 2172)	This metadata collection represents reserved words in a database.
	Roles (see page 2172)	This metadata collection represents roles in a database.
	Schemas (see page 2172)	This metadata collection represents schemas in a database.
	Synonyms (see page 2173)	This metadata collection represents synonyms in a database.
	Tables (see page 2173)	This metadata collection represents tables in a database.
	Users (see page 2174)	This metadata collection represents users in a database.
	Views (see page 2174)	This metadata collection represents views in a database.

15.1.3.1.9.2 MetaDataCollectionName Fields

The fields of the MetaDataCollectionName class are listed here.

Public Fields

	Name	Description
	Catalogs (see page 2163)	This metadata collection represents catalogs in a database.
	ColumnConstraints (see page 2163)	This metadata collection is used internally.
	Columns (see page 2163)	This metadata collection represents table columns in a database.
	DataTypes (see page 2164)	This metadata collection represents data types in a database.
	ForeignKeyColumns (see page 2165)	This metadata collection represents foreign key columns in a database.
	ForeignKeys (see page 2166)	This metadata collection represents foreign keys in a database.
	IndexColumns (see page 2167)	This metadata collection represents index columns in a database.
	Indexes (see page 2167)	This metadata collection represents table indexes in a database.
	PackageProcedureParameters (see page 2168)	This metadata collection represents package procedure parameters in a database.
	PackageProcedures (see page 2168)	This metadata collection represents package procedures in a database.
	Packages (see page 2169)	This metadata collection represents packages in a database.
	PackageSources (see page 2169)	This metadata collection represents package source code in a database.
	ProcedureParameters (see page 2170)	This metadata collection represents procedure parameters in a database.
	Procedures (see page 2171)	This metadata collection represents procedures in a database.
	ProcedureSources (see page 2171)	This metadata collection represents procedure source code in a database.
	ReservedWords (see page 2172)	This metadata collection represents reserved words in a database.
	Roles (see page 2172)	This metadata collection represents roles in a database.
	Schemas (see page 2172)	This metadata collection represents schemas in a database.
	Synonyms (see page 2173)	This metadata collection represents synonyms in a database.
	Tables (see page 2173)	This metadata collection represents tables in a database.
	Users (see page 2174)	This metadata collection represents users in a database.

	Views (see page 2174)	This metadata collection represents views in a database.

15.1.3.1.9.2.1 MetaDataCollectionName.Catalogs Field

This metadata collection represents catalogs in a database.

Pascal

```
const Catalogs: string = "Catalogs";
```

C++

```
string Catalogs = "Catalogs";
```

Description

This metadata collection represents catalogs in a database. The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.2 MetaDataCollectionName.ColumnConstraints Field

This metadata collection is used internally.

Pascal

```
const ColumnConstraints: string = "ColumnConstraints";
```

C++

```
string ColumnConstraints = "ColumnConstraints";
```

Description

This metadata collection represents catalogs in a database is used internally.

The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
SchemaName	String	The schema name.
TableName	String	The table name.
ConstraintName	String	The constraint name.
ColumnName	String	The column name.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.3 MetaDataCollectionName.Columns Field

This metadata collection represents table columns in a database.

Pascal

```
const Columns: string = "Columns";
```

C++

```
string Columns = "Columns";
```

Description

This metadata collection represents table columns in a database. The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
SchemaName	String	The schema name.
TableName	String	The table name.
ColumnName	String	The column name.
TypeName	String	The database specific data type name.
Precision	Int32	The precision of this type. For a string data type, this is the maximum number of characters. For a decimal types, this is the maximum number digits including digits from the scale.
Scale	Int32	The scale of a decimal type.
Ordinal	Int32	The position in the rows of the table starting with 1.
DefaultValue	String	The default value.
IsNullable	Boolean	Can accept NULL values.
IsAutoIncrement	Boolean	Is an autoincrement value.
MaxInline	Int32	The maximal number of bytes to write into row. The rest of the data is handled as a blob (Blackfish SQL only).
DbxDataType	Int32	The DBX data type.
IsFixedLength	Boolean	Holds fixed length data.
IsUnicode	Boolean	Can hold unicode characters.
IsLong	Boolean	Is a blob data type.
IsUnsigned	Boolean	Is an unsigned numeric type.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.4 MetaDataCollectionName.DataTypes Field

This metadata collection represents data types in a database.

Pascal

```
const DataTypes: string = "DataTypes";
```

C++

```
string DataTypes = "DataTypes";
```

Description

This metadata collection represents the data types supported by a database.

The columns are:

Column Name	Data (see page 1762) Type	Description
The database specific data type name.	The DBX data type.	The database specific data type name. The length of this type. For a string data type, this is the maximum number of characters. For a floating point number, this is the number of significant bits in the mantissa. For other numeric types, this is the maximum number of significant digits. For a date, time, and timestamp types, this is the length of the string representation.
CreateFormat	String	The create format as used in CREATE TABLE.
CreateParameters	String	The parameters for the create format.
DataType	String	The name of the language type representing this data type.
IsAutoIncrementable	Boolean	Can be used as for an autoincrement column.
IsBestMatch	Boolean	Is the best match for the language type.
IsCaseSensitive	Boolean	Is case sensitive.
IsFixedLength	Boolean	Is fixed length.
IsFixedPrecisionScale	Boolean	Is an exact numeric.
IsLong	Boolean	Is a blob type.
IsNullable	Boolean	Can be assigned a value of NULL.
IsSearchable	Boolean	Can be searched in the SQL database.
IsSearchableWithLike	Boolean	Can be searched with the SQL LIKE operator.
IsUnsigned	Boolean	Is an unsigned numeric.
MaximumScale	Int16	The maximum possible scale value.
MinimumScale	Int16	The minimum possible scale value.
IsConcurrencyType	Boolean	Has special update semantics .
MaximumVersion	String	The last database product version where this type was available.
MinimumVersion	String	The first database product version where this type was available.
IsLiteralSupported	Boolean	Can be represented as a SQL literal.
LiteralPrefix	String	The prefix of a SQL literal.
LiteralSuffix	String	The suffix of a SQL literal.
IsUnicode	Boolean	Can hold unicode character data.
ProviderDb	Int32	The same as the DbxDataType column. Reserved for .NET applications.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.5 MetaDataCollectionName.ForeignKeyColumns Field

This metadata collection represents foreign key columns in a database.

Pascal

```
const ForeignKeyColumns: string = "ForeignKeyColumns";
```

C++

```
string ForeignKeyColumns = "ForeignKeyColumns";
```

Description

This metadata collection represents foreign key columns in a database.

The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
SchemaName	String	The schema name of the table with the foreign key.
TableName	String	The table name of the table with the foreign key.
ForeignKeyName	String	The foreign key name.
ColumnName	String	A column which refers to a column of in another table.
PrimaryCatalogName	String	The catalog name of the table being referred to.
PrimarySchemaName	String	The schema name of the table being referred to.
PrimaryTableName	String	The name of the table being referred to.
PrimaryKeyName	String	The name of the key being referred to. This is usually the primary key.
PrimaryColumnName	String	The column which is being referred to.
Ordinal	Int32	The position of the column reference in the foreign key.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.6 MetaDataCollectionName.ForeignKeys Field

This metadata collection represents foreign keys in a database.

Pascal

```
const ForeignKeys: string = "ForeignKeys";
```

C++

```
string ForeignKeys = "ForeignKeys";
```

Description

This metadata collection represents foreign keys in a database.

The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
SchemaName	String	The schema name.
TableName	String	The table name.
ForeignKeyName	String	The foreign key name.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.7 MetaDataCollectionName.IndexColumns Field

This metadata collection represents index columns in a database.

Pascal

```
const IndexColumns: string = "IndexColumns";
```

C++

```
string IndexColumns = "IndexColumns";
```

Description

This metadata collection represents index columns in a database.

The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
SchemaName	String	The schema name.
TableName	String	The table name.
IndexName	String	The index name.
ColumnName	String	A column in the index.
Ordinal	Int32	The position of the column in the index starting with 1.
IsAscending	Boolean	A descending index column.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.8 MetaDataCollectionName.Indexes Field

This metadata collection represents table indexes in a database.

Pascal

```
const Indexes: string = "Indexes";
```

C++

```
string Indexes = "Indexes";
```

Description

This metadata collection represents table indexes in a database.

The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
SchemaName	String	The schema name.
TableName	String	The table name.
IndexName	String	The index name.
ConstraintName	String	The constraint name, may be NULL.
IsPrimary	Boolean	The primary index of the table.

IsUnique	Boolean	A unique index of the table.
IsAscending	Boolean	A descending index (Interbase only).

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.9 MetaDataCollectionName.PackageProcedureParameters Field

This metadata collection represents package procedure parameters in a database.

Pascal

```
const PackageProcedureParameters: string = "PackageProcedureParameters";
```

C++

```
string PackageProcedureParameters = "PackageProcedureParameters";
```

Description

This metadata collection represents package procedure parameters in a database.

The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
SchemaName	String	The schema name.
PackageName	String	The package name.
ProcedureName	String	The procedure name from the package.
ParameterName	String	The parameter mode: IN, OUT, INOUT, or RESULT.
TypeName	String	The database specific data type name.
Precision	Int32	The precision of this type. For a string data type, this is the maximum number of characters. For a decimal types, this is the maximum number digits including digits from the scale.
Scale	Int32	The scale of a decimal type.
Ordinal	Int32	The position in the rows of the table starting with 1.
IsNullable	Boolean	Can accept NULL values.
DbxDataType	Int32	The DBX data type.
IsFixedLength	Boolean	Holds fixed length data.
IsUnicode	Boolean	Can hold UNICODE characters.
IsLong	Boolean	Is blob data type.
IsUnsigned	Boolean	Is unsigned numeric type.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.10 MetaDataCollectionName.PackageProcedures Field

This metadata collection represents package procedures in a database.

Pascal

```
const PackageProcedures: string = "PackageProcedures";
```

C++

```
string PackageProcedures = "PackageProcedures";
```

Description

This metadata collection represents package procedures in a database. The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
SchemaName	String	The schema name.
PackageName	String	The package name.
ProcedureName	String	The procedure name from the package.
ProcedureType	String	The procedure type: FUNCTION, PROCEDURE.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.11 MetaDataCollectionName.Packages Field

This metadata collection represents packages in a database.

Pascal

```
const Packages: string = "Packages";
```

C++

```
string Packages = "Packages";
```

Description

This metadata collection represents packages in a database. The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
SchemaName	String	The schema name.
PackageName	String	The package name.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.12 MetaDataCollectionName.PackageSources Field

This metadata collection represents package source code in a database.

Pascal

```
const PackageSources: string = "PackageSources";
```

C++

```
string PackageSources = "PackageSources";
```

Description

This metadata collection represents package source code in a database.

The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
PackageName	String	The package name.
Definition	String	The package source code.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.13 MetaDataCollectionName.ProcedureParameters Field

This metadata collection represents procedure parameters in a database.

Pascal

```
const ProcedureParameters: string = "ProcedureParameters";
```

C++

```
string ProcedureParameters = "ProcedureParameters";
```

Description

This metadata collection represents procedure parameters in a database.

The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
SchemaName	String	The schema name.
ProcedureName	String	The procedure name.
ParameterName	String	The parameter name.
ParameterMode	String	The parameter mode: IN, OUT, INOUT, or RESULT.
TypeName	String	The database specific data type name.
Precision	Int32	The precision of this type. For a string data type, this is the maximum number of characters. For a decimal types, this is the maximum number digits including digits from the scale.
Scale	Int32	The scale of a decimal type.
Ordinal	Int32	The position in the rows of the table starting with 1.
IsNullable	Boolean	Can accept NULL values.
DbxDataType	Int32	The DBX data type.
IsFixedLength	Boolean	Holds fixed length data.
IsUnicode	Boolean	Can hold UNICODE characters.
IsLong	Boolean	Blob data type.

IsUnsigned	Boolean	Unsigned numeric type.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.14 MetaDataCollectionName.Procedures Field

This metadata collection represents procedures in a database.

Pascal

```
const Procedures: string = "Procedures";
```

C++

```
string Procedures = "Procedures";
```

Description

This metadata collection represents procedures in a database.

The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
SchemaName	String	The schema name.
ProcedureName	String	The procedure name.
ProcedureType	String	The procedure type: FUNCTION or PROCEDURE.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.15 MetaDataCollectionName.ProcedureSources Field

This metadata collection represents procedure source code in a database.

Pascal

```
const ProcedureSources: string = "ProcedureSources";
```

C++

```
string ProcedureSources = "ProcedureSources";
```

Description

This metadata collection represents procedure source code in a database. The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
SchemaName	String	The schema name.
ProcedureName	String	The procedure name.
ProcedureType	String	The procedure type: FUNCTION or PROCEDURE.
Definition	String	The source of the SQL procedure.
ExternalDefinition	String	A reference to an procedure external to the database.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.16 MetaDataCollectionName.ReservedWords Field

This metadata collection represents reserved words in a database.

Pascal

```
const ReservedWords: string = "ReservedWords";
```

C++

```
string ReservedWords = "ReservedWords";
```

Description

This metadata collection represents reserved words in a database. The columns are:

Column Name	Data (see page 1762) Type	Description
ReservedWord	String	An identifier reserved for the SQL syntax. These identifiers should not be used as object names such as tables and columns. Some databases allows their use if they are quoted.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.17 MetaDataCollectionName.Roles Field

This metadata collection represents roles in a database.

Pascal

```
const Roles: string = "Roles";
```

C++

```
string Roles = "Roles";
```

Description

This metadata collection represents roles in a database.

The columns are:

Column Name	Data (see page 1762) Type	Description
RoleName	String	A role name.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.18 MetaDataCollectionName.Schemas Field

This metadata collection represents schemas in a database.

Pascal

```
const Schemas: string = "Schemas";
```

C++

```
string Schemas = "Schemas";
```

Description

This metadata collection represents schemas in a database. The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
SchemaName	String	The schema name.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.19 MetaDataCollectionName.Synonyms Field

This metadata collection represents synonyms in a database.

Pascal

```
const Synonyms: string = "Synonyms";
```

C++

```
string Synonyms = "Synonyms";
```

Description

This metadata collection represents synonyms in a database.

The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
SchemaName	String	The schema name.
SynonymName	String	The catalog name of the table to which this synonym refers.
TableCatalogName	String	The catalog name of the table to which this synonym refers.
TableSchemaName	String .	The schema name of the table to which this synonym refers.
TableName	String	The name of the table to which this synonym refers.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.20 MetaDataCollectionName.Tables Field

This metadata collection represents tables in a database.

Pascal

```
const Tables: string = "Tables";
```

C++

```
string Tables = "Tables";
```

Description

This metadata collection represents tables in a database.

The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.
SchemaName	String	The schema name.
TableName	String	The table name.
TableType	String	The table type: TABLE, VIEW, SYNONYM, or SYSTEM_TABLE.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.21 MetaDataCollectionName.Users Field

This metadata collection represents users in a database.

Pascal

```
const Users: string = "Users";
```

C++

```
string Users = "Users";
```

Description

This metadata collection represents users in a database. The columns are:

Column Name	Data (see page 1762) Type	Description
UserName	String	A user name.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.9.2.22 MetaDataCollectionName.Views Field

This metadata collection represents views in a database.

Pascal

```
const Views: string = "Views";
```

C++

```
string Views = "Views";
```

Description

This metadata collection represents views in a database.

The columns are:

Column Name	Data (see page 1762) Type	Description
CatalogName	String	The catalog name.

SchemaName	String	The schema name.
ViewName	String	The view name.
Definition	String	The SQL that was used to create the view.

See Also

MetaDataCollectionName (see page 2160)

15.1.3.1.10 ProcedureParametersColumns Class

Column names for result table from the built-in stored procedure DB_ADMIN.GET_PROCEDURE_COLUMNS and DataStoreConnection.GetSchema(MetaDataCollectionName.ProcedureParameters).

Class Hierarchy

Borland.Data.MetaData.ProcedureParametersColumns

Pascal

```
ProcedureParametersColumns = class;
```

C++

```
class ProcedureParametersColumns;
```

File

ProcedureParametersColumns.cs

Description

Column names for result table from the built-in stored procedure DB_ADMIN.GET_PROCEDURE_COLUMNS and DataStoreConnection.GetSchema(MetaDataCollectionName.ProcedureParameters).

The columns of the result table are:

Constant	Description
CatalogName (see page 2177)	Used to access the CatalogName (see page 2177) column in the ProcedureParameters metadata collection.The data in this column specifies the catalog name.
SchemaName (see page 2179)	Used to access the SchemaName (see page 2179) column in the ProcedureParameters metadata collection. The data in this column specifies the schema name.
ProcedureName (see page 2179)	Used to access the ProcedureName (see page 2179) column in the ProcedureParameters metadata collection. The data in this column specifies the procedure name.
ParameterName (see page 2179)	Used to access the ParameterName (see page 2179) column in the ProcedureParameters metadata collection. The data in this column specifies the parameter name.
ParameterMode (see page 2178)	Used to access the ParameterMode (see page 2178) column in the ProcedureParameters metadata collection. The data in this column specifies the parameter mode: IN, OUT, INOUT, RESULT.
TypeName (see page 2180)	Used to access the TypeName (see page 2180) column in the ProcedureParameters metadata collection. The data in this column specifies the database specific data type name.
Precision (see page 2179)	Used to access the Precision (see page 2179) column in the ProcedureParameters metadata collection. The data in this column specifies the precision of this type. For a string data type, this is the maximum number of characters. For a decimal types, this is the maximum number digits including digits from the scale.

Scale (see page 2179)	Used to access the Scale (see page 2179) column in the ProcedureParameters metadata collection. The data in this column specifies the scale of a decimal type.
Ordinal (see page 2178)	Used to access the Ordinal (see page 2178) column in the ProcedureParameters metadata collection. The data in this column specifies the parameter number starting with 1.
IsNullable (see page 2178)	Used to access the IsNullable (see page 2178) column in the ProcedureParameters metadata collection. The data in this column specifies that the procedure parameter can accept NULL values.
DbxDataType (see page 2177)	Used to access the DbxDataType (see page 2177) column in the ProcedureParameters metadata collection. The data in this column specifies the DBX data type.
IsFixedLength (see page 2177)	Used to access the IsFixedLength (see page 2177) column in the ProcedureParameters metadata collection. The data in this column specifies that the procedure parameter holds fixed length data.
IsUnicode (see page 2178)	Used to access the IsUnicode (see page 2178) column in the ProcedureParameters metadata collection. The data in this column specifies that the procedure parameter can hold unicode characters.
IsLong (see page 2177)	Used to access the IsLong (see page 2177) column in the ProcedureParameters metadata collection. The data in this column specifies that the procedure parameter is blob data type.
IsUnsigned (see page 2178)	Used to access the IsUnsigned (see page 2178) column in the ProcedureParameters metadata collection. The data in this column specifies that the procedure parameter is unsigned numeric type.

15.1.3.1.10.1 ProcedureParametersColumns Members

The following tables list the members exposed by ProcedureParametersColumns.

Public Fields

	Name	Description
	CatalogName (see page 2177)	This is CatalogName, a member of class ProcedureParametersColumns.
	DbxDataType (see page 2177)	This is DbxDataType, a member of class ProcedureParametersColumns.
	IsFixedLength (see page 2177)	This is IsFixedLength, a member of class ProcedureParametersColumns.
	IsLong (see page 2177)	This is IsLong, a member of class ProcedureParametersColumns.
	IsNullable (see page 2178)	This is IsNullable, a member of class ProcedureParametersColumns.
	IsUnicode (see page 2178)	This is IsUnicode, a member of class ProcedureParametersColumns.
	IsUnsigned (see page 2178)	This is IsUnsigned, a member of class ProcedureParametersColumns.
	Ordinal (see page 2178)	This is Ordinal, a member of class ProcedureParametersColumns.
	ParameterMode (see page 2178)	This is ParameterMode, a member of class ProcedureParametersColumns.
	ParameterName (see page 2179)	This is ParameterName, a member of class ProcedureParametersColumns.
	Precision (see page 2179)	This is Precision, a member of class ProcedureParametersColumns.
	ProcedureName (see page 2179)	This is ProcedureName, a member of class ProcedureParametersColumns.
	Scale (see page 2179)	This is Scale, a member of class ProcedureParametersColumns.
	SchemaName (see page 2179)	This is SchemaName, a member of class ProcedureParametersColumns.
	TypeName (see page 2180)	This is TypeName, a member of class ProcedureParametersColumns.

15.1.3.1.10.2 ProcedureParametersColumns Fields

The fields of the ProcedureParametersColumns class are listed here.

Public Fields

	Name	Description
	CatalogName (see page 2177)	This is CatalogName, a member of class ProcedureParametersColumns.

	DbxDataType (see page 2177)	This is DbxDataType, a member of class ProcedureParametersColumns.
	IsFixedLength (see page 2177)	This is IsFixedLength, a member of class ProcedureParametersColumns.
	IsLong (see page 2177)	This is IsLong, a member of class ProcedureParametersColumns.
	IsNullable (see page 2178)	This is IsNullable, a member of class ProcedureParametersColumns.
	IsUnicode (see page 2178)	This is IsUnicode, a member of class ProcedureParametersColumns.
	IsUnsigned (see page 2178)	This is IsUnsigned, a member of class ProcedureParametersColumns.
	Ordinal (see page 2178)	This is Ordinal, a member of class ProcedureParametersColumns.
	ParameterMode (see page 2178)	This is ParameterMode, a member of class ProcedureParametersColumns.
	ParameterName (see page 2179)	This is ParameterName, a member of class ProcedureParametersColumns.
	Precision (see page 2179)	This is Precision, a member of class ProcedureParametersColumns.
	ProcedureName (see page 2179)	This is ProcedureName, a member of class ProcedureParametersColumns.
	Scale (see page 2179)	This is Scale, a member of class ProcedureParametersColumns.
	SchemaName (see page 2179)	This is SchemaName, a member of class ProcedureParametersColumns.
	TypeName (see page 2180)	This is TypeName, a member of class ProcedureParametersColumns.

15.1.3.1.10.2.1 ProcedureParametersColumns.CatalogName Field

Pascal

```
const CatalogName: string = "CatalogName";
```

C++

```
string CatalogName = "CatalogName";
```

Description

This is CatalogName, a member of class ProcedureParametersColumns.

15.1.3.1.10.2.2 ProcedureParametersColumns.DbxDataType Field

Pascal

```
const DbxDataType: string = "DbxDataType";
```

C++

```
string DbxDataType = "DbxDataType";
```

Description

This is DbxDataType, a member of class ProcedureParametersColumns.

15.1.3.1.10.2.3 ProcedureParametersColumns.IsFixedLength Field

Pascal

```
const IsFixedLength: string = "IsFixedLength";
```

C++

```
string IsFixedLength = "IsFixedLength";
```

Description

This is IsFixedLength, a member of class ProcedureParametersColumns.

15.1.3.1.10.2.4 ProcedureParametersColumns.IsLong Field

Pascal

```
const IsLong: string = "IsLong";
```

C++

```
string IsLong = "IsLong";
```

Description

This is IsLong, a member of class ProcedureParametersColumns.

15.1.3.1.10.2.5 ProcedureParametersColumns.IsNullable Field

Pascal

```
const IsNullable: string = "IsNullable";
```

C++

```
string IsNullable = "IsNullable";
```

Description

This is IsNullable, a member of class ProcedureParametersColumns.

15.1.3.1.10.2.6 ProcedureParametersColumns.IsUnicode Field

Pascal

```
const IsUnicode: string = "IsUnicode";
```

C++

```
string IsUnicode = "IsUnicode";
```

Description

This is IsUnicode, a member of class ProcedureParametersColumns.

15.1.3.1.10.2.7 ProcedureParametersColumns.IsUnsigned Field

Pascal

```
const IsUnsigned: string = "IsUnsigned";
```

C++

```
string IsUnsigned = "IsUnsigned";
```

Description

This is IsUnsigned, a member of class ProcedureParametersColumns.

15.1.3.1.10.2.8 ProcedureParametersColumns.Ordinal Field

Pascal

```
const Ordinal: string = "Ordinal";
```

C++

```
string Ordinal = "Ordinal";
```

Description

This is Ordinal, a member of class ProcedureParametersColumns.

15.1.3.1.10.2.9 ProcedureParametersColumns.ParameterMode Field

Pascal

```
const ParameterMode: string = "ParameterMode";
```

C++

```
string ParameterMode = "ParameterMode";
```

Description

This is ParameterMode, a member of class ProcedureParametersColumns.

15.1.3.1.10.2.10 ProcedureParametersColumns.ParameterName Field

Pascal

```
const ParameterName: string = "ParameterName";
```

C++

```
string ParameterName = "ParameterName";
```

Description

This is ParameterName, a member of class ProcedureParametersColumns.

15.1.3.1.10.2.11 ProcedureParametersColumns.Precision Field

Pascal

```
const Precision: string = "Precision";
```

C++

```
string Precision = "Precision";
```

Description

This is Precision, a member of class ProcedureParametersColumns.

15.1.3.1.10.2.12 ProcedureParametersColumns.ProcedureName Field

Pascal

```
const ProcedureName: string = "ProcedureName";
```

C++

```
string ProcedureName = "ProcedureName";
```

Description

This is ProcedureName, a member of class ProcedureParametersColumns.

15.1.3.1.10.2.13 ProcedureParametersColumns.Scale Field

Pascal

```
const Scale: string = "Scale";
```

C++

```
string Scale = "Scale";
```

Description

This is Scale, a member of class ProcedureParametersColumns.

15.1.3.1.10.2.14 ProcedureParametersColumns.SchemaName Field

Pascal

```
const SchemaName: string = "SchemaName";
```

C++

```
string SchemaName = "SchemaName";
```

Description

This is SchemaName, a member of class ProcedureParametersColumns.

15.1.3.1.10.2.15 ProcedureParametersColumns.TypeName Field

Pascal

```
const TypeName: string = "TypeName";
```

C++

```
string TypeName = "TypeName";
```

Description

This is TypeName, a member of class ProcedureParametersColumns.

15.1.3.1.11 ProceduresColumns Class

Provides the column names for the result table from the built-in stored procedure DB_ADMIN.GET_PROCEDURES and DataStoreConnection.GetSchema(MetaDataCollectionName.Procedures).

Class Hierarchy

Pascal

```
ProceduresColumns = class;
```

C++

```
class ProceduresColumns;
```

File

ProceduresColumns.cs

Description

Provides the column names for the result table from the built-in stored procedure DB_ADMIN.GET_PROCEDURES and DataStoreConnection.GetSchema(MetaDataCollectionName.Procedures).

The columns of the result table are:

Constant	Description
CatalogName (see page 2181)	Used to access the CatalogName (see page 2181) column in the Procedures metadata collection. The data in this column specifies the catalog name.
SchemaName (see page 2182)	Used to access the SchemaName (see page 2182) column in the Procedures metadata collection. The data in this column specifies the schema name.
ProcedureName (see page 2181)	Used to access the ProcedureName (see page 2181) column in the Procedures metadata collection. The data in this column specifies the procedure name.
ProcedureType (see page 2181)	Used to access the ProcedureType (see page 2181) column in the Procedures metadata collection. The data in this column specifies the procedure type: FUNCTION or PROCEDURE.

See Also

Blackfish SQL Developer's Guide.

15.1.3.1.11.1 ProceduresColumns Members

The following tables list the members exposed by ProceduresColumns.

Public Fields

	Name	Description
	CatalogName (see page 2181)	This is CatalogName, a member of class ProceduresColumns.
	ProcedureName (see page 2181)	This is ProcedureName, a member of class ProceduresColumns.
	ProcedureType (see page 2181)	This is ProcedureType, a member of class ProceduresColumns.
	SchemaName (see page 2182)	This is SchemaName, a member of class ProceduresColumns.

15.1.3.1.11.2 ProceduresColumns Fields

The fields of the ProceduresColumns class are listed here.

Public Fields

	Name	Description
	CatalogName (see page 2181)	This is CatalogName, a member of class ProceduresColumns.
	ProcedureName (see page 2181)	This is ProcedureName, a member of class ProceduresColumns.
	ProcedureType (see page 2181)	This is ProcedureType, a member of class ProceduresColumns.
	SchemaName (see page 2182)	This is SchemaName, a member of class ProceduresColumns.

15.1.3.1.11.2.1 ProceduresColumns.CatalogName Field

Pascal

```
const CatalogName: string = "CatalogName";
```

C++

```
string CatalogName = "CatalogName";
```

Description

This is CatalogName, a member of class ProceduresColumns.

15.1.3.1.11.2.2 ProceduresColumns.ProcedureName Field

Pascal

```
const ProcedureName: string = "ProcedureName";
```

C++

```
string ProcedureName = "ProcedureName";
```

Description

This is ProcedureName, a member of class ProceduresColumns.

15.1.3.1.11.2.3 ProceduresColumns.ProcedureType Field

Pascal

```
const ProcedureType: string = "ProcedureType";
```

C++

```
string ProcedureType = "ProcedureType";
```

Description

This is ProcedureType, a member of class ProceduresColumns.

15.1.3.1.11.2.4 ProceduresColumns.SchemaName Field

Pascal

```
const SchemaName: string = "SchemaName";
```

C++

```
string SchemaName = "SchemaName";
```

Description

This is SchemaName, a member of class ProceduresColumns.

15.1.3.1.12 ProcedureSourcesColumns Class

Column names for the result table from the built-in stored procedure DB_ADMIN.GET_PROCEDURES and DataStoreConnection.GetSchema(MetaDataCollectionName.ProcedureSources).

Class Hierarchy

Pascal

```
ProcedureSourcesColumns = class;
```

C++

```
class ProcedureSourcesColumns;
```

File

ProcedureSourcesColumns.cs

Description

Column names for the result table from the built-in stored procedure DB_ADMIN.GET_PROCEDURES and DataStoreConnection.GetSchema(MetaDataCollectionName.ProcedureSources).

The columns of the result table are:

Constant	Description
CatalogName (see page 2183)	Used to access the CatalogName (see page 2183) column in the ProcedureSources metadata collection. The data in this column specifies the catalog name.
SchemaName (see page 2184)	Used to access the SchemaName (see page 2184) column in the ProcedureSources metadata collection. The data in this column specifies the schema name.
ProcedureName (see page 2184)	Used to access the ProcedureName (see page 2184) column in the ProcedureSources metadata collection. The data in this column specifies the procedure name.
ProcedureType (see page 2184)	Used to access the ProcedureType (see page 2184) column in the ProcedureSources metadata collection. The data in this column specifies the procedure type: FUNCTION or PROCEDURE.
Definition (see page 2183)	Used to access the Definition (see page 2183) column in the ProcedureSources metadata collection. The data in this column specifies the source of the SQL procedure.

ExternalDefinition (see page 2184)	Used to access the ExternalDefinition (see page 2184) column in the ProcedureSources metadata collection. The data in this column specifies a reference to an procedure external to the database.

See Also

Blackfish SQL Developer's Guide.

15.1.3.1.12.1 ProcedureSourcesColumns Members

The following tables list the members exposed by ProcedureSourcesColumns.

Public Fields

	Name	Description
	CatalogName (see page 2183)	This is CatalogName, a member of class ProcedureSourcesColumns.
	Definition (see page 2183)	This is Definition, a member of class ProcedureSourcesColumns.
	ExternalDefinition (see page 2184)	This is ExternalDefinition, a member of class ProcedureSourcesColumns.
	ProcedureName (see page 2184)	This is ProcedureName, a member of class ProcedureSourcesColumns.
	ProcedureType (see page 2184)	This is ProcedureType, a member of class ProcedureSourcesColumns.
	SchemaName (see page 2184)	This is SchemaName, a member of class ProcedureSourcesColumns.

15.1.3.1.12.2 ProcedureSourcesColumns Fields

The fields of the ProcedureSourcesColumns class are listed here.

Public Fields

	Name	Description
	CatalogName (see page 2183)	This is CatalogName, a member of class ProcedureSourcesColumns.
	Definition (see page 2183)	This is Definition, a member of class ProcedureSourcesColumns.
	ExternalDefinition (see page 2184)	This is ExternalDefinition, a member of class ProcedureSourcesColumns.
	ProcedureName (see page 2184)	This is ProcedureName, a member of class ProcedureSourcesColumns.
	ProcedureType (see page 2184)	This is ProcedureType, a member of class ProcedureSourcesColumns.
	SchemaName (see page 2184)	This is SchemaName, a member of class ProcedureSourcesColumns.

15.1.3.1.12.2.1 ProcedureSourcesColumns.CatalogName Field

Pascal

```
const CatalogName: string = "CatalogName";
```

C++

```
string CatalogName = "CatalogName";
```

Description

This is CatalogName, a member of class ProcedureSourcesColumns.

15.1.3.1.12.2.2 ProcedureSourcesColumns.Definition Field

Pascal

```
const Definition: string = "Definition";
```

C++

```
string Definition = "Definition";
```

Description

This is Definition, a member of class ProcedureSourcesColumns.

15.1.3.1.12.2.3 ProcedureSourcesColumns.ExternalDefinition Field

Pascal

```
const ExternalDefinition: string = "ExternalDefinition";
```

C++

```
string ExternalDefinition = "ExternalDefinition";
```

Description

This is ExternalDefinition, a member of class ProcedureSourcesColumns.

15.1.3.1.12.2.4 ProcedureSourcesColumns.ProcedureName Field

Pascal

```
const ProcedureName: string = "ProcedureName";
```

C++

```
string ProcedureName = "ProcedureName";
```

Description

This is ProcedureName, a member of class ProcedureSourcesColumns.

15.1.3.1.12.2.5 ProcedureSourcesColumns.ProcedureType Field

Pascal

```
const ProcedureType: string = "ProcedureType";
```

C++

```
string ProcedureType = "ProcedureType";
```

Description

This is ProcedureType, a member of class ProcedureSourcesColumns.

15.1.3.1.12.2.6 ProcedureSourcesColumns.SchemaName Field

Pascal

```
const SchemaName: string = "SchemaName";
```

C++

```
string SchemaName = "SchemaName";
```

Description

This is SchemaName, a member of class ProcedureSourcesColumns.

15.1.3.1.13 ReservedWordsColumns Class

Column names for result table from the built-in stored procedure DB_ADMIN.GET_KEYWORDS and DataStoreConnection.GetSchema(MetaDataCollectionName.ReservedWords).

Class Hierarchy

Pascal

```
ReservedWordsColumns = class;
```

C++

```
class ReservedWordsColumns;
```

File

ReservedWordsColumns.cs

Description

Column names for result table from the built-in stored procedure DB_ADMIN.GET_KEYWORDS and DataStoreConnection.GetSchema(MetaDataCollectionName.ReservedWords).

The columns of the result table are:

Constant	Description
ReservedWord (see page 2185)	Used to access the ReservedWord (see page 2185) column in the ReservedWords metadata collection. The data in this column specifies an identifier reserved for the SQL syntax. These identifiers should not be used as object names such as tables and columns. Some databases allow their use if they are quoted.

Blackfish SQL Developer's Guide.

15.1.3.1.13.1 ReservedWordsColumns Members

The following tables list the members exposed by ReservedWordsColumns.

Public Fields

	Name	Description
	ReservedWord (see page 2185)	This is ReservedWord, a member of class ReservedWordsColumns.

15.1.3.1.13.2 ReservedWordsColumns Fields

The fields of the ReservedWordsColumns class are listed here.

Public Fields

	Name	Description
	ReservedWord (see page 2185)	This is ReservedWord, a member of class ReservedWordsColumns.

15.1.3.1.13.2.1 ReservedWordsColumns.ReservedWord Field

Pascal

```
const ReservedWord: string = "ReservedWord";
```

C++

```
string ReservedWord = "ReservedWord";
```

Description

This is ReservedWord, a member of class ReservedWordsColumns.

15.1.3.1.14 RolesColumns Class

Column names for the result table from the built-in stored procedure DB_ADMIN.GET_ROLES and DataStoreConnection.GetSchema(MetaDataCollectionName.Roles).

Class Hierarchy

Borland.Data.MetaData.RolesColumns

Pascal

```
RolesColumns = class;
```

C++

```
class RolesColumns;
```

File

RolesColumns.cs

Description

Column names for the result table from the built-in stored procedure DB_ADMIN.GET_ROLES and DataStoreConnection.GetSchema(MetaDataCollectionName.Roles).

The columns of the result table are:

Constant	Description
RoleName (see page 2186)	Used to access the RoleName (see page 2186) column in the Roles metadata collection. The data in this column specifies a role name.

See Also

Blackfish SQL Developer's Guide.

15.1.3.1.14.1 RolesColumns Members

The following tables list the members exposed by RolesColumns.

Public Fields

	Name	Description
	RoleName (see page 2186)	This is RoleName, a member of class RolesColumns.

15.1.3.1.14.2 RolesColumns Fields

The fields of the RolesColumns class are listed here.

Public Fields

	Name	Description
	RoleName (see page 2186)	This is RoleName, a member of class RolesColumns.

15.1.3.1.14.2.1 RolesColumns.RoleName Field

Pascal

```
const RoleName: string = "RoleName";
```

C++

```
string RoleName = "RoleName";
```

Description

This is RoleName, a member of class RolesColumns.

15.1.3.1.15 SchemasColumns Class

Column names for the result table from the built-in stored procedure DB_ADMIN.GET_SCHEMAS and DataStoreConnection.GetSchema(MetaDataCollectionName.Schemas).

Class Hierarchy

Borland.Data.MetaData.SchemasColumns

Pascal

```
SchemasColumns = class;
```

C++

```
class SchemasColumns;
```

File

SchemasColumns.cs

Description

Column names for the result table from the built-in stored procedure DB_ADMIN.GET_SCHEMAS and DataStoreConnection.GetSchema(MetaDataCollectionName.Schemas).

The columns of the result table are:

Constant	Description
CatalogName (see page 2188)	Used to access the CatalogName (see page 2188) column in the Schemas metadata collection. The data in this column specifies the catalog name.
SchemaName (see page 2188)	Used to access the SchemaName (see page 2188) column in the Schemas metadata collection. The data in this column specifies the schema name.

See Also

Blackfish SQL Developer's Guide.

15.1.3.1.15.1 SchemasColumns Members

The following tables list the members exposed by SchemasColumns.

Public Fields

	Name	Description
	CatalogName (see page 2188)	This is CatalogName, a member of class SchemasColumns.
	SchemaName (see page 2188)	This is SchemaName, a member of class SchemasColumns.

15.1.3.1.15.2 SchemasColumns Fields

The fields of the SchemasColumns class are listed here.

Public Fields

	Name	Description
	CatalogName (see page 2188)	This is CatalogName, a member of class SchemasColumns.
	SchemaName (see page 2188)	This is SchemaName, a member of class SchemasColumns.

15.1.3.1.15.2.1 SchemasColumns.CatalogName Field

Pascal

```
const CatalogName: string = "CatalogName";
```

C++

```
string CatalogName = "CatalogName";
```

Description

This is CatalogName, a member of class SchemasColumns.

15.1.3.1.15.2.2 SchemasColumns.SchemaName Field

Pascal

```
const SchemaName: string = "SchemaName";
```

C++

```
string SchemaName = "SchemaName";
```

Description

This is SchemaName, a member of class SchemasColumns.

15.1.3.1.16 SynonymsColumns Class

Reserved for future use.

Class Hierarchy

Pascal

```
SynonymsColumns = class;
```

C++

```
class SynonymsColumns;
```

File

SynonymsColumns.cs

Description

Reserved for future use.

15.1.3.1.16.1 SynonymsColumns Members

The following tables list the members exposed by SynonymsColumns.

Public Fields

	Name	Description
	CatalogName (see page 2189)	This is CatalogName, a member of class SynonymsColumns.
	SchemaName (see page 2189)	This is SchemaName, a member of class SynonymsColumns.
	SynonymName (see page 2189)	This is SynonymName, a member of class SynonymsColumns.
	TableCatalogName (see page 2189)	This is TableCatalogName, a member of class SynonymsColumns.
	TableName (see page 2190)	This is TableName, a member of class SynonymsColumns.
	TableSchemaName (see page 2190)	This is TableSchemaName, a member of class SynonymsColumns.

15.1.3.1.16.2 SynonymsColumns Fields

The fields of the SynonymsColumns class are listed here.

Public Fields

	Name	Description
	CatalogName (see page 2189)	This is CatalogName, a member of class SynonymsColumns.
	SchemaName (see page 2189)	This is SchemaName, a member of class SynonymsColumns.
	SynonymName (see page 2189)	This is SynonymName, a member of class SynonymsColumns.
	TableCatalogName (see page 2189)	This is TableCatalogName, a member of class SynonymsColumns.
	TableName (see page 2190)	This is TableName, a member of class SynonymsColumns.
	TableSchemaName (see page 2190)	This is TableSchemaName, a member of class SynonymsColumns.

15.1.3.1.16.2.1 SynonymsColumns.CatalogName Field

Pascal

```
const CatalogName: string = "CatalogName";
```

C++

```
string CatalogName = "CatalogName";
```

Description

This is CatalogName, a member of class SynonymsColumns.

15.1.3.1.16.2.2 SynonymsColumns.SchemaName Field

Pascal

```
const SchemaName: string = "SchemaName";
```

C++

```
string SchemaName = "SchemaName";
```

Description

This is SchemaName, a member of class SynonymsColumns.

15.1.3.1.16.2.3 SynonymsColumns.SynonymName Field

Pascal

```
const SynonymName: string = "SynonymName";
```

C++

```
string SynonymName = "SynonymName";
```

Description

This is SynonymName, a member of class SynonymsColumns.

15.1.3.1.16.2.4 SynonymsColumns.TableCatalogName Field

Pascal

```
const TableCatalogName: string = "TableCatalogName";
```

C++

```
string TableCatalogName = "TableCatalogName";
```

Description

This is TableCatalogName, a member of class SynonymsColumns.

15.1.3.1.16.2.5 SynonymsColumns.TableName Field

Pascal

```
const TableName: string = "TableName";
```

C++

```
string TableName = "TableName";
```

Description

This is TableName, a member of class SynonymsColumns.

15.1.3.1.16.2.6 SynonymsColumns.TableSchemaName Field

Pascal

```
const TableSchemaName: string = "TableSchemaName";
```

C++

```
string TableSchemaName = "TableSchemaName";
```

Description

This is TableSchemaName, a member of class SynonymsColumns.

15.1.3.1.17 TablesColumns Class

Column names for the result table from the built-in stored procedure DB_ADMIN.GET_TABLES and DataStoreConnection.GetSchema(MetaDataCollectionName.Tables).

Class Hierarchy

Pascal

```
TablesColumns = class;
```

C++

```
class TablesColumns;
```

File

TablesColumns.cs

Description

Column names for the result table from the built-in stored procedure DB_ADMIN.GET_TABLES and DataStoreConnection.GetSchema(MetaDataCollectionName.Tables).

The columns of the result table are:

Constant	Description
CatalogName (see page 2191)	Used to access the CatalogName (see page 2191) column in the Tables metadata collection. The data in this column specifies the catalog name.

TableName (see page 2192)	Used to access the TableName (see page 2192) column in the Tables metadata collection. The data in this column specifies the table name.
SchemaName (see page 2191)	Used to access the SchemaName (see page 2191) column in the Tables metadata collection. The data in this column specifies the schema name.
TableType (see page 2192)	Used to access the TableType (see page 2192) column in the Tables metadata collection. The data in this column specifies the table type: TABLE, VIEW, SYNONYM, or SYSTEM_TABLE.

See Also

Blackfish SQL Developer's Guide.

15.1.3.1.17.1 TablesColumns Members

The following tables list the members exposed by TablesColumns.

Public Fields

	Name	Description
	CatalogName (see page 2191)	This is CatalogName, a member of class TablesColumns.
	SchemaName (see page 2191)	This is SchemaName, a member of class TablesColumns.
	TableName (see page 2192)	This is TableName, a member of class TablesColumns.
	TableType (see page 2192)	This is TableType, a member of class TablesColumns.

15.1.3.1.17.2 TablesColumns Fields

The fields of the TablesColumns class are listed here.

Public Fields

	Name	Description
	CatalogName (see page 2191)	This is CatalogName, a member of class TablesColumns.
	SchemaName (see page 2191)	This is SchemaName, a member of class TablesColumns.
	TableName (see page 2192)	This is TableName, a member of class TablesColumns.
	TableType (see page 2192)	This is TableType, a member of class TablesColumns.

15.1.3.1.17.2.1 TablesColumns.CatalogName Field

Pascal

```
const CatalogName: string = "CatalogName";
```

C++

```
string CatalogName = "CatalogName";
```

Description

This is CatalogName, a member of class TablesColumns.

15.1.3.1.17.2.2 TablesColumns.SchemaName Field

Pascal

```
const SchemaName: string = "SchemaName";
```

C++

```
string SchemaName = "SchemaName";
```

Description

This is SchemaName, a member of class TablesColumns.

15.1.3.1.17.2.3 TablesColumns.TableName Field

Pascal

```
const TableName: string = "TableName";
```

C++

```
string TableName = "TableName";
```

Description

This is TableName, a member of class TablesColumns.

15.1.3.1.17.2.4 TablesColumns.TableType Field

Pascal

```
const TableType: string = "TableType";
```

C++

```
string TableType = "TableType";
```

Description

This is TableType, a member of class TablesColumns.

15.1.3.1.18 UsersColumns Class

Column names for the result table from the built-in stored procedure DB_ADMIN.GET_USERS and DataStoreConnection.GetSchema(MetaDataCollectionName.Users).

Class Hierarchy

Borland.Data.MetaData.UsersColumns

Pascal

```
UsersColumns = class;
```

C++

```
class UsersColumns;
```

File

UsersColumns.cs

Description

Column names for the result table from the built-in stored procedure DB_ADMIN.GET_USERS and DataStoreConnection.GetSchema(MetaDataCollectionName.Users).

The columns of the result table are:

Constant	Description
UserName (see page 2193)	Used to access the UserName (see page 2193) column in the Users metadata collection. The data in this column specifies a user name.

See Also

Blackfish SQL Developer's Guide.

15.1.3.1.18.1 UsersColumns Members

The following tables list the members exposed by UsersColumns.

Public Fields

	Name	Description
	UserName (see page 2193)	This is UserName, a member of class UsersColumns.

15.1.3.1.18.2 UsersColumns Fields

The fields of the UsersColumns class are listed here.

Public Fields

	Name	Description
	UserName (see page 2193)	This is UserName, a member of class UsersColumns.

15.1.3.1.18.2.1 UsersColumns.UserName Field

Pascal

```
const UserName: string = "UserName";
```

C++

```
string UserName = "UserName";
```

Description

This is UserName, a member of class UsersColumns.

15.1.3.1.19 ViewsColumns Class

Column names for the result table from the built-in stored procedure DB_ADMIN.GET_VIEWS DataStoreConnection.GetSchema(MetaDataCollectionName.Views).

Class Hierarchy

Borland.Data.MetaData.ViewsColumns

Pascal

```
ViewsColumns = class;
```

C++

```
class ViewsColumns;
```

File

ViewsColumns.cs

Description

Column names for the result table from the built-in stored procedure DB_ADMIN.GET_VIEWS DataStoreConnection.GetSchema(MetaDataCollectionName.Views).

The columns of the result table are:

Constant	Description
CatalogName (see page 2194)	Used to access the CatalogName (see page 2194) column in the Views metadata collection. The data in this column specifies the catalog name.
SchemaName (see page 2195)	Used to access the SchemaName (see page 2195) column in the Views metadata collection. The data in this column specifies the schema name.
ViewName (see page 2195)	Used to access the ViewName (see page 2195) column in the Views metadata collection. The data in this column specifies the view name.
Definition (see page 2195)	Used to access the Definition (see page 2195) column in the Views metadata collection. The data in this column specifies the SQL which was used to create the view.

See Also

Blackfish SQL Developer's Guide.

15.1.3.1.19.1 ViewsColumns Members

The following tables list the members exposed by ViewsColumns.

Public Fields

	Name	Description
	CatalogName (see page 2194)	This is CatalogName, a member of class ViewsColumns.
	Definition (see page 2195)	This is Definition, a member of class ViewsColumns.
	SchemaName (see page 2195)	This is SchemaName, a member of class ViewsColumns.
	ViewName (see page 2195)	This is ViewName, a member of class ViewsColumns.

15.1.3.1.19.2 ViewsColumns Fields

The fields of the ViewsColumns class are listed here.

Public Fields

	Name	Description
	CatalogName (see page 2194)	This is CatalogName, a member of class ViewsColumns.
	Definition (see page 2195)	This is Definition, a member of class ViewsColumns.
	SchemaName (see page 2195)	This is SchemaName, a member of class ViewsColumns.
	ViewName (see page 2195)	This is ViewName, a member of class ViewsColumns.

15.1.3.1.19.2.1 ViewsColumns.CatalogName Field

Pascal

```
const CatalogName: string = "CatalogName";
```

C++

```
string CatalogName = "CatalogName";
```

Description

This is CatalogName, a member of class ViewsColumns.

15.1.3.1.19.2.2 ViewsColumns.Definition Field

Pascal

```
const Definition: string = "Definition";
```

C++

```
string Definition = "Definition";
```

Description

This is Definition, a member of class ViewsColumns.

15.1.3.1.19.2.3 ViewsColumns.SchemaName Field

Pascal

```
const SchemaName: string = "SchemaName";
```

C++

```
string SchemaName = "SchemaName";
```

Description

This is SchemaName, a member of class ViewsColumns.

15.1.3.1.19.2.4 ViewsColumns.ViewName Field

Pascal

```
const ViewName: string = "ViewName";
```

C++

```
string ViewName = "ViewName";
```

Description

This is ViewName, a member of class ViewsColumns.

16 ButtonGroup Namespace

This is namespace ButtonGroup.

Topics

Name	Description
Classes (see page 2198)	The following table lists classes in this documentation.
Types (see page 2284)	The following table lists types in this documentation.

Classes

	Name	Description
	TButtonGroup (see page 2198)	TButtonGroup displays a group of buttons in a container.
	TGrpButtonItem (see page 2275)	TGrpButtonItem is an individual button of a TButtonGroup (see page 2198) control.
	TGrpButtonItems (see page 2278)	TGrpButtonItems maintains the collection of buttons that appear in a TButtonGroup (see page 2198) control.

Types

Name	Description
TGrpButtonDrawEvent (see page 2284)	TGrpButtonDrawEvent is the type of Button Group draw event handler.
TGrpButtonDrawIconEvent (see page 2285)	TGrpButtonDrawIconEvent is the type of Button Group OnDrawIcon event handler.
TGrpButtonEvent (see page 2285)	TGrpButtonEvent is a type of Button Group event handler.
TGrpButtonItemClass (see page 2286)	Metaclass of TGrpButtonItem (see page 2275).
TGrpButtonItemsClass (see page 2286)	Metaclass of TGrpButtonItems (see page 2278).
TGrpButtonOptions (see page 2286)	Options for button groups.
TGrpButtonReorderEvent (see page 2287)	TGrpButtonReorderEvent is a type of Button Group reorder event handler.

16.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TButtonGroup (see page 2198)	TButtonGroup displays a group of buttons in a container.
	TGrpButtonItem (see page 2275)	TGrpButtonItem is an individual button of a TButtonGroup (see page 2198) control.
	TGrpButtonItems (see page 2278)	TGrpButtonItems maintains the collection of buttons that appear in a TButtonGroup (see page 2198) control.

16.1.1 TButtonGroup Class

TButtonGroup displays a group of buttons in a container.

Class Hierarchy

Pascal

```
TButtonGroup = class(TCustomControl);
```

C++

```
class TButtonGroup : public TCustomControl;
```

File

ButtonGroup

Description

You can use a TButtonGroup to create a related set of buttons. For example in the RAD Studio IDE, a button group control is used to display **Tool Palette** categories. The button group appears when you click the **Categories** button in the IDE.

16.1.1.1 TButtonGroup Members

The following tables list the members exposed by TButtonGroup.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnResize (see page 5870)	Occurs immediately after the control is resized.

	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
V	CreateButton (see page 2211)	This is CreateButton, a member of class TButtonGroup.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 2211)	Creates underlying screen object.
V	CreateParams (see page 2211)	Initializes a window-creation parameter data structure.

	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
V	DoEndDrag (see page 2212)	OnEndDrag event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoHotButton (see page 2212)	This is DoHotButton, a member of class TButtonGroup.
V	DoItemClicked (see page 2212)	This is DoItemClicked, a member of class TButtonGroup.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
V	DoMouseWheelDown (see page 2213)	OnMouseWheelDown event dispatcher.
V	DoMouseWheelUp (see page 2213)	OnMouseWheelUp event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoReorderButton (see page 2214)	This is DoReorderButton, a member of class TButtonGroup.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 2214)	OnStartDrag event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 2215)	OnDragOver event dispatcher.
V	DrawButton (see page 2215)	This is DrawButton, a member of class TButtonGroup.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.

	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetButtonClass (see page 2215)	This is GetButtonClass, a member of class TButtonGroup.
	GetButtonsClass (see page 2216)	This is GetButtonsClass, a member of class TButtonGroup.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 2216)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 2216)	OnMouseDown event dispatcher.
	MouseMove (see page 2217)	Respond to mouse moving over control area..
	MouseUp (see page 2217)	OnMouseUp event dispatcher.
	Notification (see page 2218)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 2218)	Renders the image of a custom control.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.

	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 2219)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.

	UpdateAllButtons (see page 2220)	This is UpdateAllButtons, a member of class TButtonGroup.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateButton (see page 2220)	This is UpdateButton, a member of class TButtonGroup.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2210)	Assigns values to buttons and categories.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 2209)	Constructor for the object.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2209)	Destructor of the object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
V	DragDrop (see page 2214)	OnDragDrop event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.

	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetButtonRect (see page 2215)	Retrieves the bounding rectangle of a button, given the rectangle's index number.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	IndexOfButtonAt (see page 2216)	Retrieves the index of a button, given x and y coordinates.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveInsertionPoints (see page 2219)	Removes the insertion points added by SetInsertionPoints (see page 2220).
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	ScrollIntoView (see page 2219)	Scrolls buttons to make the the buttons visible in the group container.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetInsertionPoints (see page 2220)	Draws an insert line for inserting at InsertionIndex. You can choose to show or hide insertion points.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	TargetIndexAt (see page 2220)	Provides the target insertion index of a given coordinate (x,y). If the target is somewhere in or above the top half of a button, this method inserts an object above the button. If the target is somewhere in or below the bottom half of a button, the method inserts an object after the button.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	Canvas (see page 2229)	Specifies the TCanvas object that presents a drawing surface for the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.

R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	DragImageList (see page 2232)	DragImageList defines the list of images shown during drag operations.
	DragIndex (see page 2233)	DragIndex defines the index of the button during drag operations.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnAfterDrawButton (see page 2248)	Occurs after a button is drawn.
	OnAlignInsertBefore (see page 2248)	Occurs when an object is aligned.
	OnAlignPosition (see page 2249)	Occurs when a control is aligned to a new position.
	OnBeforeDrawButton (see page 2249)	Occurs just before a button is drawn.
	OnButtonClicked (see page 2249)	Occurs when a button is clicked, if the OnClick (see page 2249) event is not present.

	OnClick (see page 2249)	Occurs when the user clicks the control.
	OnContextPopup (see page 2251)	Occurs when a user right-clicks on the dock site to display the popup menu.
	OnDockDrop (see page 2251)	Occurs when the control is dropped by a release of the mouse button.
	OnDockOver (see page 2251)	Occurs when the control is being moved over another control, but has not yet been docked.
	OnDragDrop (see page 2252)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2254)	Occurs when the user drags an object over a control.
	OnDrawButton (see page 2256)	Occurs when a button is redrawn.
	OnDrawIcon (see page 2256)	Occurs when an icon is redrawn.
	OnEndDock (see page 2257)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 2257)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 2258)	Occurs when the control gets focus.
	OnExit (see page 2258)	Occurs when the control loses focus, typically in tabbing between controls.
	OnHotButton (see page 2258)	Fired when the mouse pointer is over the button.
	OnKeyDown (see page 2259)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 2261)	Occurs when a key is pressed.
	OnKeyUp (see page 2262)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 2264)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2265)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 2267)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2268)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 2268)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2270)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 2273)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 2273)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 2273)	Occurs when the mouse wheel is rotated upward.
	OnReorderButton (see page 2274)	Fired when buttons are reordered in the button group.
	OnStartDock (see page 2274)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 2274)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 2221)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 2225)	Specifies how the control is anchored to its parent.
	BevelEdges (see page 2225)	Specifies which edges of the control are beveled.
	BevelInner (see page 2226)	Specifies the cut of the inner bevel.
	BevelKind (see page 2226)	Specifies the control's bevel style.
	BevelOuter (see page 2227)	Specifies the cut of the outer bevel.
	BevelWidth (see page 2227)	Specifies the width of the inner and outer bevels.
	BorderStyle (see page 2227)	BorderStyle specifies the appearance of the button group border.
	BorderWidth (see page 2228)	Specifies the width of the control's border.
	ButtonHeight (see page 2228)	ButtonHeight specifies the height of the buttons in the group.
	ButtonOptions (see page 2228)	Specifies options for button display and behavior.
	ButtonWidth (see page 2229)	ButtonWidth specifies the width of the buttons in the group.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DockSite (see page 2231)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 2232)	Indicates the image used to represent the mouse pointer when the control is being dragged.

	DragKind (see page 2233)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 2233)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 2235)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 2235)	Controls the attributes of text written on or in the control.
	Height (see page 2237)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Images (see page 2238)	This is Images, a member of class TButtonGroup.
	ItemIndex (see page 2238)	Specifies the index of the currently selected item.
	Items (see page 2238)	Button items in this group.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	PopupMenu (see page 2238)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 2243)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 2244)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 2245)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 2245)	Determines whether the component appears onscreen.
	Width (see page 2247)	Specifies the horizontal size of the control or form in pixels.

16.1.1.2 TButtonGroup.Create Constructor

Constructor for the object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TButtonGroup(TComponent * AOwner);
```

16.1.1.3 TButtonGroup.Destroy Destructor

Destructor of the object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TButtonGroup();
```

Description

Releases memory and performs garbage collection for the object.

16.1.1.4 TButtonGroup Methods

The methods of the TButtonGroup class are listed here.

Protected Methods

	Name	Description
	CreateButton (see page 2211)	This is CreateButton, a member of class TButtonGroup.
	CreateHandle (see page 2211)	Creates underlying screen object.
	CreateParams (see page 2211)	Initializes a window-creation parameter data structure.
	DoEndDrag (see page 2212)	OnEndDrag event dispatcher.
	DoHotButton (see page 2212)	This is DoHotButton, a member of class TButtonGroup.
	DoItemClicked (see page 2212)	This is DoItemClicked, a member of class TButtonGroup.
	DoMouseWheelDown (see page 2213)	OnMouseWheelDown event dispatcher.
	DoMouseWheelUp (see page 2213)	OnMouseWheelUp event dispatcher.
	DoReorderButton (see page 2214)	This is DoReorderButton, a member of class TButtonGroup.
	DoStartDrag (see page 2214)	OnStartDrag event dispatcher.
	DragOver (see page 2215)	OnDragOver event dispatcher.
	DrawButton (see page 2215)	This is DrawButton, a member of class TButtonGroup.
	GetButtonClass (see page 2215)	This is GetButtonClass, a member of class TButtonGroup.
	GetButtonsClass (see page 2216)	This is GetButtonsClass, a member of class TButtonGroup.
	GetDragImages (see page 2216)	Returns the control's image list containing the image to be displayed while dragging.
	MouseDown (see page 2216)	OnMouseDown event dispatcher.
	MouseMove (see page 2217)	Respond to mouse moving over control area..
	MouseUp (see page 2217)	OnMouseUp event dispatcher.
	Notification (see page 2218)	Responds to notifications that components are being created or destroyed.
	Paint (see page 2218)	Renders the image of a custom control.
	Resize (see page 2219)	Respond to control resize.
	UpdateAllButtons (see page 2220)	This is UpdateAllButtons, a member of class TButtonGroup.
	UpdateButton (see page 2220)	This is UpdateButton, a member of class TButtonGroup.

Public Methods

	Name	Description
	Assign (see page 2210)	Assigns values to buttons and categories.
	DragDrop (see page 2214)	OnDragDrop event dispatcher.
	GetButtonRect (see page 2215)	Retrieves the bounding rectangle of a button, given the rectangle's index number.
	IndexOfButtonAt (see page 2216)	Retrieves the index of a button, given x and y coordinates.
	RemoveInsertionPoints (see page 2219)	Removes the insertion points added by SetInsertionPoints (see page 2220).
	ScrollIntoView (see page 2219)	Scrolls buttons to make the the buttons visible in the group container.
	SetInsertionPoints (see page 2220)	Draws an insert line for inserting at InsertionIndex. You can choose to show or hide insertion points.
	TargetIndexAt (see page 2220)	Provides the target insertion index of a given coordinate (x,y). If the target is somewhere in or above the top half of a button, this method inserts an object above the button. If the target is somewhere in or below the bottom half of a button, the method inserts an object after the button.

16.1.1.4.1 TButtonGroup.Assign Method

Assigns values to buttons and categories.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

16.1.1.4.2 TButtonGroup.CreateButton Method

Pascal

```
function CreateButton: TGrpButtonItem; virtual;
```

C++

```
virtual __fastcall TGrpButtonItem CreateButton();
```

Description

This is CreateButton, a member of class TButtonGroup.

16.1.1.4.3 TButtonGroup.CreateHandle Method

Creates underlying screen object.

Pascal

```
procedure CreateHandle; override;
```

C++

```
virtual __fastcall CreateHandle();
```

Description

CreateHandle creates the Microsoft Windows screen object that underlies the control. if it does not already exist. The new window handle becomes the value of the Handle property.

CreateHandle creates or locates the parent control's window before it creates a window for the control itself.

Note: If the Parent property is nil (Delphi) or NULL (C++), CreateHandle raises an exception.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

Handle (see page 6207)

Parent (see page 5832)

16.1.1.4.4 TButtonGroup.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

16.1.1.4.5 TButtonGroup.DoEndDrag Method

OnEndDrag event dispatcher.

Pascal

```
procedure DoEndDrag(Target: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DoEndDrag(TObject * Target, int X, int Y);
```

Description

DoEndDrag calls any event handler attached to the OnEndDrag event. When creating a component that descends from TControl, override DoEndDrag to provide other responses in addition to the inherited event-handler call when the user drops an object or cancels a drag-and-drop operation.

See Also

DoStartDrag (see page 5753)

OnEndDrag (see page 5860)

16.1.1.4.6 TButtonGroup.DoHotButton Method

Pascal

```
procedure DoHotButton; dynamic;
```

C++

```
__fastcall DoHotButton();
```

Description

This is DoHotButton, a member of class TButtonGroup.

16.1.1.4.7 TButtonGroup.DoItemClicked Method

Pascal

```
procedure DoItemClicked(const Index: Integer); virtual;
```

C++

```
virtual __fastcall DoItemClicked(const int Index);
```

Description

This is DoItemClicked, a member of class TButtonGroup.

16.1.1.4.8 TButtonGroup.DoMouseWheelDown Method

OnMouseWheelDown event dispatcher.

Pascal

```
function DoMouseWheelDown(Shift: TShiftState; MousePos: TPoint): Boolean; override;
```

C++

```
virtual __fastcall Boolean DoMouseWheelDown(TShiftState Shift, TPoint MousePos);
```

Description

The DoMouseWheel method calls DoMouseWheelDown to generate an OnMouseWheelDown event.

The Shift parameter indicates the state of the Shift, Alt, and Ctrl keys.

The MousePos parameter indicates the position of the mouse pointer.

DoMouseWheelDown returns true if an event handler indicates that it handled the message, and false otherwise.

Override DoMouseWheelDown to perform class-specific tasks in addition to calling the event handler when the mouse wheel is rotated downward.

See Also

OnMouseWheelDown (see page 5869)

DoMouseWheel (see page 5751)

16.1.1.4.9 TButtonGroup.DoMouseWheelUp Method

OnMouseWheelUp event dispatcher.

Pascal

```
function DoMouseWheelUp(Shift: TShiftState; MousePos: TPoint): Boolean; override;
```

C++

```
virtual __fastcall Boolean DoMouseWheelUp(TShiftState Shift, TPoint MousePos);
```

Description

The DoMouseWheel method calls DoMouseWheelUp to generate an OnMouseWheelUp event.

The Shift parameter indicates the state of the Shift, Alt, and Ctrl keys.

The MousePos parameter indicates the position of the mouse pointer.

DoMouseWheelUp returns true if an event handler indicates that it handled the message, and false otherwise.

Override DoMouseWheelUp to perform class-specific tasks in addition to calling the event handler when the mouse wheel is rotated upward.

See Also

OnMouseWheelUp (see page 5870)

DoMouseWheel (see page 5751)

16.1.1.4.10 TButtonGroup.DoReorderButton Method

Pascal

```
procedure DoReorderButton(const OldIndex: Integer; const NewIndex: Integer);
```

C++

```
__fastcall DoReorderButton(const int OldIndex, const int NewIndex);
```

Description

This is DoReorderButton, a member of class TButtonGroup.

16.1.1.4.11 TButtonGroup.DoStartDrag Method

OnStartDrag event dispatcher.

Pascal

```
procedure DoStartDrag(var DragObject: TDragObject); override;
```

C++

```
virtual __fastcall DoStartDrag(TDragObject DragObject);
```

Description

DoStartDrag calls any event handler attached to the OnStartDrag event. When creating a component that descends from TControl, override DoStartDrag to provide other responses in addition to the inherited event-handler call when the user starts a drag-and-drop operation.

See Also

DoEndDrag (see page 5751)

OnStartDrag (see page 5871)

16.1.1.4.12 TButtonGroup.DragDrop Method

OnDragDrop event dispatcher.

Pascal

```
procedure DragDrop(Source: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DragDrop(TObject * Source, int X, int Y);
```

Description

When creating a component that descends from TControl, override DragDrop to add additional code that executes before the OnDragDrop event handler is called.

The Source parameter is the object that was dropped onto the control. The X and Y parameters are the mouse coordinates where the object was dropped.

See Also

DragCanceled (see page 5754)

OnDragDrop (see page 5855)

16.1.1.4.13 TButtonGroup.DragOver Method

OnDragOver event dispatcher.

Pascal

```
procedure DragOver(Source: TObject; X: Integer; Y: Integer; State: TDragState; var Accept:
Boolean); override;
```

C++

```
virtual __fastcall DragOver(TObject * Source, int X, int Y, TDragState State, Boolean Accept);
```

Description

Override DragOver to add additional code that executes before the OnDragOver event handler is called.

DragOver sets the Accept parameter to true to indicate that the user can drop the dragged object on the control. It sets Accept to false to indicate that the user cannot drop the dragged object on the control.

The Source parameter is the object being dragged. The State parameter indicates how the dragged object is moving in relation to the control. X and Y indicate the current position of the mouse.

See Also

DragDrop (see page 5754)

OnDragOver (see page 5857)

16.1.1.4.14 TButtonGroup.DrawButton Method

Pascal

```
procedure DrawButton(Index: Integer; Canvas: TCanvas; Rect: TRect; State: TButtonDrawState);
virtual;
```

C++

```
virtual __fastcall DrawButton(int Index, TCanvas Canvas, TRect Rect, TButtonDrawState State);
```

Description

This is DrawButton, a member of class TButtonGroup.

16.1.1.4.15 TButtonGroup.GetButtonClass Method

Pascal

```
function GetButtonClass: TGrpButtonItemClass; virtual;
```

C++

```
virtual __fastcall TGrpButtonItemClass GetButtonClass();
```

Description

This is GetButtonClass, a member of class TButtonGroup.

16.1.1.4.16 TButtonGroup.GetButtonRect Method

Retrieves the bounding rectangle of a button, given the rectangle's index number.

Pascal

```
function GetButtonRect(const Index: Integer): TRect;
```

C++

```
__fastcall TRect GetButtonRect(const int Index);
```

16.1.1.4.17 TButtonGroup.GetButtonsClass Method

Pascal

```
function GetButtonsClass: TGrpButtonItemsClass; virtual;
```

C++

```
virtual __fastcall TGrpButtonItemsClass GetButtonsClass();
```

Description

This is GetButtonsClass, a member of class TButtonGroup.

16.1.1.4.18 TButtonGroup.GetDragImages Method

Returns the control's image list containing the image to be displayed while dragging.

Pascal

```
function GetDragImages: TDragImageList; override;
```

C++

```
virtual __fastcall TDragImageList GetDragImages();
```

Description

Override GetDragImages to provide a custom image list for the control. As implemented in TControl, GetDragImages returns nil (Delphi) or NULL (C++).

See Also

DragCursor (see page 5818)

OnStartDrag (see page 5871)

16.1.1.4.19 TButtonGroup.IndexOfButtonAt Method

Retrieves the index of a button, given x and y coordinates.

Pascal

```
function IndexOfButtonAt(const X: Integer; const Y: Integer): Integer;
```

C++

```
__fastcall int IndexOfButtonAt(const int X, const int Y);
```

16.1.1.4.20 TButtonGroup.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

See Also

MouseMove (see page 5773)

MouseUp (see page 5774)

OnMouseDown (see page 5862)

16.1.1.4.21 TButtonGroup.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

See Also

MouseDown (see page 5773)

MouseUp (see page 5774)

OnMouseMove (see page 5865)

16.1.1.4.22 TButtonGroup.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

MouseDown (see page 5773)

MouseMove (see page 5773)

OnMouseUp (see page 5867)

16.1.1.4.23 TButtonGroup.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu (see page 5835)

Notification (see page 2783)

16.1.1.4.24 TButtonGroup.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

See Also

Canvas (see page 5921)

PaintWindow (see page 5920)

GetDeviceContext (see page 6155)

ClipRect (see page 14486)

16.1.1.4.25 TButtonGroup.RemoveInsertionPoints Method

Removes the insertion points added by SetInsertionPoints (see page 2220).

Pascal

```
procedure RemoveInsertionPoints;
```

C++

```
__fastcall RemoveInsertionPoints();
```

16.1.1.4.26 TButtonGroup.Resize Method

Respond to control resize.

Pascal

```
procedure Resize; override;
```

C++

```
virtual __fastcall Resize();
```

Description

Resize is called automatically immediately after the control's dimensions change. As implemented in TControl, Resize calls the control's OnResize event handler if it is assigned.

See Also

OnResize (see page 5870)

16.1.1.4.27 TButtonGroup.ScrollIntoView Method

Scrolls buttons to make the the buttons visible in the group container.

Pascal

```
procedure ScrollIntoView(const Index: Integer);
```

C++

```
__fastcall ScrollIntoView(const int Index);
```

16.1.1.4.28 TButtonGroup.SetInsertionPoints Method

Draws an insert line for inserting at InsertionIndex. You can choose to show or hide insertion points.

Pascal

```
procedure SetInsertionPoints(const InsertionIndex: Integer);
```

C++

```
__fastcall SetInsertionPoints(const int InsertionIndex);
```

16.1.1.4.29 TButtonGroup.TargetIndexAt Method

Provides the target insertion index of a given coordinate (x,y). If the target is somewhere in or above the top half of a button, this method inserts an object above the button. If the target is somewhere in or below the bottom half of a button, the method inserts an object after the button.

Pascal

```
function TargetIndexAt(const X: Integer; const Y: Integer): Integer;
```

C++

```
__fastcall int TargetIndexAt(const int X, const int Y);
```

16.1.1.4.30 TButtonGroup.UpdateAllButtons Method

Pascal

```
procedure UpdateAllButtons;
```

C++

```
__fastcall UpdateAllButtons();
```

Description

This is UpdateAllButtons, a member of class TButtonGroup.

16.1.1.4.31 TButtonGroup.UpdateButton Method

Pascal

```
procedure UpdateButton(const Index: Integer);
```

C++

```
__fastcall UpdateButton(const int Index);
```

Description

This is UpdateButton, a member of class TButtonGroup.

16.1.1.5 TButtonGroup Properties

The properties of the TButtonGroup class are listed here.

Public Properties

	Name	Description
	Canvas (see page 2229)	Specifies the TCanvas object that presents a drawing surface for the control.
R	DragImageList (see page 2232)	DragImageList defines the list of images shown during drag operations.
	DragIndex (see page 2233)	DragIndex defines the index of the button during drag operations.

Published Properties

	Name	Description
	Align (see page 2221)	Determines how the control aligns within its container (parent control).
	Anchors (see page 2225)	Specifies how the control is anchored to its parent.
	BevelEdges (see page 2225)	Specifies which edges of the control are beveled.
	BevelInner (see page 2226)	Specifies the cut of the inner bevel.
	BevelKind (see page 2226)	Specifies the control's bevel style.
	BevelOuter (see page 2227)	Specifies the cut of the outer bevel.
	BevelWidth (see page 2227)	Specifies the width of the inner and outer bevels.
	BorderStyle (see page 2227)	BorderStyle specifies the appearance of the button group border.
	BorderWidth (see page 2228)	Specifies the width of the control's border.
	ButtonHeight (see page 2228)	ButtonHeight specifies the height of the buttons in the group.
	ButtonOptions (see page 2228)	Specifies options for button display and behavior.
	ButtonWidth (see page 2229)	ButtonWidth specifies the width of the buttons in the group.
	DockSite (see page 2231)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 2232)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 2233)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 2233)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 2235)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 2235)	Controls the attributes of text written on or in the control.
	Height (see page 2237)	Specifies the vertical size of the control in pixels.
	Images (see page 2238)	This is Images, a member of class TButtonGroup.
	ItemIndex (see page 2238)	Specifies the index of the currently selected item.
	Items (see page 2238)	Button items in this group.
	PopupMenu (see page 2238)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 2243)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 2244)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 2245)	Determines if the user can tab to a control.
	Visible (see page 2245)	Determines whether the component appears onscreen.
	Width (see page 2247)	Specifies the horizontal size of the control or form in pixels.

16.1.1.5.1 TButtonGroup.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The

value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
```

```
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)

        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
```

```
    Split := TSplitter.Create(Form1);
    Split.Parent := Form1;
    { make sure the splitter is to the right of the directory list box! }
    Split.Left := Dirs.Left + Dirs.Width + 1;
    Split.Align := Dirs.Align; { give it the same alignment as the directory }
    { each pane must be at least one quarter of the form's width }
    Split.MinSize := Form1.ClientWidth div 4;
    { Finally, create the last pane – a file list box }
    Files := TFileListBox.Create(Form1);
    Files.Parent := Form1;
    Files.Align := alClient;
    Dirs.FileList := Files; { link the file list box to the directory list box }
  end;
  {
  Dynamically create a TProgressBar control and align it to
  the bottom of the form.
  }

  var
    I: Integer;

  procedure TForm1.Button1Click(Sender: TObject);

  var
    i: Integer;
  begin
    PageControl1 := TPageControl.Create(Self);
    PageControl1.Parent := Self;
    PageControl1.Align := alClient;
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i]:= TTabSheet.Create(PageControl1);
      with pts[i] do
      begin
        PageControl := PageControl1;
        Name := 'ts' + TabTitles[i];
        Caption := TabTitles[i];
        Brush.Color := colorPalette[i];
     end;
    end;
  end;
```

```
procedure TForm1.FormDestroy(Sender: TObject);
var
  i: Integer;
begin
  for i := Low(TabTitles) to High(TabTitles) do
  begin
    pts[i].Free;
  end;
  PageControl1.Free;
end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

16.1.1.5.2 TButtonGroup.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

16.1.1.5.3 TButtonGroup.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges: TBevelEdges;
```

C++

```
__property TBevelEdges BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties

determine the appearance of the specified edges.

See Also

BevelInner (see page 6193)

BevelOuter (see page 6194)

BevelKind (see page 6193)

16.1.1.5.4 TButtonGroup.BevelInner Property

Specifies the cut of the inner bevel.

Pascal

```
property BevelInner: TBevelCut;
```

C++

```
__property TBevelCut BevelInner;
```

Description

Use BevelInner to specify whether the inner bevel has a raised, lowered, or flat look.

The inner bevel appears immediately inside the outer bevel. If there is no outer bevel (BevelOuter is bvNone), the inner bevel appears immediately inside the border.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelKind (see page 6193)

BevelWidth (see page 6194)

BorderWidth (see page 6195)

16.1.1.5.5 TButtonGroup.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind: TBevelKind;
```

C++

```
__property TBevelKind BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelInner (see page 6193)

BevelWidth (see page 6194)

16.1.1.5.6 TButtonGroup.BevelOuter Property

Specifies the cut of the outer bevel.

Pascal

```
property BevelOuter: TBevelCut;
```

C++

```
__property TBevelCut BevelOuter;
```

Description

Use BevelInner to specify whether the outer bevel has a raised, lowered, or flat look.

The outer bevel appears immediately inside the border and outside the inner bevel.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelWidth (see page 6194)

16.1.1.5.7 TButtonGroup.BevelWidth Property

Specifies the width of the inner and outer bevels.

Pascal

```
property BevelWidth: TBevelWidth;
```

C++

```
__property TBevelWidth BevelWidth;
```

Description

Use BevelWidth to specify the width, in pixels, of the inner and outer bevels.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelOuter (see page 6194)

16.1.1.5.8 TButtonGroup.BorderStyle Property

BorderStyle specifies the appearance of the button group border.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Use BorderStyle to get or set the appearance of the button group border. BorderStyle can be any of the following values:

Value	Meaning
bsNone	Has no border.
bsSingle	Has a border, whose width is defined by BorderWidth (see page 2228).

See Also

BorderWidth (see page 2228)

16.1.1.5.9 TButtonGroup.BorderWidth Property

Specifies the width of the control's border.

Pascal

```
property BorderWidth: TBorderWidth;
```

C++

```
__property TBorderWidth BorderWidth;
```

Description

Use BorderWidth to get or set the width of the control's border. Graphics or text drawn by the control is clipped to the area within the border.

See Also

ClientRect

BevelOuter (see page 6194)

16.1.1.5.10 TButtonGroup.ButtonHeight Property

ButtonHeight specifies the height of the buttons in the group.

Pascal

```
property ButtonHeight: Integer;
```

C++

```
__property int ButtonHeight;
```

Description

Use ButtonHeight to set the height of all of the buttons contained within the button group.

See Also

ButtonWidth (see page 2229)

16.1.1.5.11 TButtonGroup.ButtonOptions Property

Specifies options for button display and behavior.

Pascal

```
property ButtonOptions: TGrpButtonOptions;
```

C++

```
__property TGrpButtonOptions ButtonOptions;
```

Description

Set the following options on your button group:

Option	Description
gboAllowReorder	Allows the user to reorder buttons within the group at runtime.
gboFullSize	Sets the width of the buttons in the group to the maximum size, which is the entire width of the container.
gboGroupStyle	Specifies that the buttons should inherit the group style that is set on the container.
gboShowCaptions	Toggles the captions that you set in the Items (see page 2238) property.

16.1.1.5.12 TButtonGroup.ButtonWidth Property

ButtonWidth specifies the width of the buttons in the group.

Pascal

```
property ButtonWidth: Integer;
```

C++

```
__property int ButtonWidth;
```

Description

Use ButtonWidth to set the width of all of the buttons contained within the button group.

See Also

ButtonHeight (see page 2228)

16.1.1.5.13 TButtonGroup.Canvas Property

Specifies the TCanvas object that presents a drawing surface for the control.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Use the properties of the TCanvas object to draw or paint on the surface of the control. Canvas encapsulates a Windows device context, providing all the tools and methods needed for drawing and painting.

Canvas is a protected property that is usually redeclared as public in descendants of TCustomControl.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
```

```
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  ImageList1->Draw(DrawGrid1->Canvas,Rect.Left,Rect.Top,index);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(index) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}
//---------------------------------------------------------------------------
void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
}
/*
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
*/
{
  TPoint APoint = Point(X, Y);
  int Index = ListBox1->ItemAtPos(APoint, True);
  TStringGrid *myStringGrid;
  TClass ClassRef = ListBox1->Items->Objects[Index]->ClassType();
  if (String(ClassRef->ClassName()) == "TStringGrid")
  {
    myStringGrid = (TStringGrid *)ListBox1->Items->Objects[Index];
    // make sure we are using the TControls canvas and not the from's!
    myStringGrid->Canvas->MoveTo(myStringGrid->ClientRect.Left, myStringGrid->ClientRect.Top);
    myStringGrid->Canvas->LineTo(myStringGrid->ClientRect.Right,
myStringGrid->ClientRect.Bottom);
    myStringGrid = NULL;
  }
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
}
procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clWhite;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
```

```
      DrawGrid1.Canvas.DrawFocusRect(Rect);
      Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
    end;
    ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
  end;

  procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
    var CanSelect: Boolean);
  begin
    CanSelect:= True;
  end;
  {
  The following code uses ClientRect to find and draw a line
  from the top left to the bottom right of the current
  control.  Select a TControl in the ListBox list.  This
  example assumes that the current object is a descendent of
  TControl and has a public Canvas property.
  }
    if (ListBox1.Items.Objects[Index] is TStringGrid) then
    begin
      myStringGrid:= (ListBox1.Items.Objects[Index] as TStringGrid);
      with myStringGrid.ClientRect do
      begin // make sure we are using the TControl's canvas and not the form's!
        myStringGrid.Canvas.MoveTo(Left, Top);
        myStringGrid.Canvas.LineTo(Right, Bottom);
      end;
    myStringGrid:= nil;
    end;

16.1.1.5.14 TButtonGroup.DockSite Property

Specifies whether the control can be the target of drag-and-dock operations.

Pascal

```
property DockSite: Boolean;
```

C++

```
__property Boolean DockSite;
```

Description

Set DockSite to true to allow other controls to be docked to this windowed control.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
```

```
    if (Client->ClassNameIs("TDockableForm"))
      dynamic_cast<TDockableForm *>(Client)->DockSite = True;
    if ((DockClientCount == 2) && (NewTarget != this))        // Self?
      PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
    UpdateCaption(Client);
  }
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
}
procedure TConjoinDockHost.FormUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if Client is TDockableForm then
    TDockableForm(Client).DockSite := True;
  if (DockClientCount = 2) and (NewTarget <> Self) then
    PostMessage(Self.Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
end;
```

16.1.1.5.15 TButtonGroup.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

16.1.1.5.16 TButtonGroup.DragImageList Property

DragImageList defines the list of images shown during drag operations.

Pascal

```
property DragImageList: TDragImageList;
```

C++

```
__property TDragImageList DragImageList;
```

Description

TDragImageList is used to manage images that are displayed during drag and drop or drag and dock operations. Use DragImageList to add images and control attributes.

See Also

TDragImageList (see page 6021)

16.1.1.5.17 TButtonGroup.DragIndex Property

DragIndex defines the index of the button during drag operations.

Pascal

```
property DragIndex: Integer;
```

C++

```
__property int DragIndex;
```

Description

If a drag operation is coming from this control, it is because they are dragging the item at DragIndex. Set DragIndex to control which item is being dragged before manually calling BeginDrag.

See Also

BeginDrag

DragImageList (see page 2232)

16.1.1.5.18 TButtonGroup.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

16.1.1.5.19 TButtonGroup.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
```

```
      else if htNowhere in HT then AttachMode := naAdd
      else if htOnIndent in HT then AttachMode := naInsert;
      TreeView1.Selected.MoveTo(AnItem, AttachMode);
    end;
  end;

  procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TTreeView;
  end;

Arranging the Order of Persistent Columns

16.1.1.5.20 TButtonGroup.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

16.1.1.5.21 TButtonGroup.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do

Displaying and Editing Text in a Memo Control

16.1.1.5.22 TButtonGroup.Height Property

Specifies the vertical size of the control in pixels.

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

Use the Height property to read or change the height of the control.

C++ Examples:

```
/*
This example needs only a blank form.  Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
*/
#include <ComCtrls.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int I = 0; I <= 2; I++)
  {
    TRichEdit *pRich = new TRichEdit(this);
    pRich->Parent = this;
    pRich->Top = pRich->Height * I;
    pRich->Text = "This text will take the focus.";
    pRich->SelStart = 0;
    pRich->SelLength = pRich->Text.Length();
    if (I == 1)
      pRich->HideSelection = false;
  }
}
```

Delphi Examples:

```
{
HideSelection, Height example
This example needs only a blank form. Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
}
uses ComCtrls;

16.1.1.5.23 TButtonGroup.Images Property

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

This is Images, a member of class TButtonGroup.

16.1.1.5.24 TButtonGroup.ItemIndex Property

Specifies the index of the currently selected item.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

16.1.1.5.25 TButtonGroup.Items Property

Button items in this group.

Pascal

```
property Items: TGrpButtonItems;
```

C++

```
__property TGrpButtonItems Items;
```

16.1.1.5.26 TButtonGroup.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
```

```
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/

    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{

16.1.1.5.27 TButtonGroup.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
```

```
      itoa(i, index, 10);
      strcat(string, index);
      ListBox1->Items->Add(string);
    }
    ListBox1->Hint = "Select an item";
    ListBox1->ShowHint = true;
    Application->ShowHint = true;
  }
  /*
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  */
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

Displaying Fly-over Help

16.1.1.5.28 TButtonGroup.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder

value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

16.1.1.5.29 TButtonGroup.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

16.1.1.5.30 TButtonGroup.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false,

the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
```

```
        begin
          Parent := PageControl1.Pages[i];
          Left := Random(PageControl1.ActivePage.ClientWidth - Width);
          Top := Random(PageControl1.ActivePage.ClientHeight - Height);
        end;
      end;
      PageControl1Change(Sender);
  end;
```

16.1.1.5.31 TButtonGroup.Width Property

Specifies the horizontal size of the control or form in pixels.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

Use the Width property to read or change the width of the control.

Note: For tab sheet controls, changing this property at runtime has no effect.

16.1.1.6 TButtonGroup Events

The events of the TButtonGroup class are listed here.

Published Events

	Name	Description
	OnAfterDrawButton (see page 2248)	Occurs after a button is drawn.
	OnAlignInsertBefore (see page 2248)	Occurs when an object is aligned.
	OnAlignPosition (see page 2249)	Occurs when a control is aligned to a new position.
	OnBeforeDrawButton (see page 2249)	Occurs just before a button is drawn.
	OnButtonClicked (see page 2249)	Occurs when a button is clicked, if the OnClick (see page 2249) event is not present.
	OnClick (see page 2249)	Occurs when the user clicks the control.
	OnContextPopup (see page 2251)	Occurs when a user right-clicks on the dock site to display the popup menu.
	OnDockDrop (see page 2251)	Occurs when the control is dropped by a release of the mouse button.
	OnDockOver (see page 2251)	Occurs when the control is being moved over another control, but has not yet been docked.

	OnDragDrop (see page 2252)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 2254)	Occurs when the user drags an object over a control.
	OnDrawButton (see page 2256)	Occurs when a button is redrawn.
	OnDrawIcon (see page 2256)	Occurs when an icon is redrawn.
	OnEndDock (see page 2257)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 2257)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 2258)	Occurs when the control gets focus.
	OnExit (see page 2258)	Occurs when the control loses focus, typically in tabbing between controls.
	OnHotButton (see page 2258)	Fired when the mouse pointer is over the button.
	OnKeyDown (see page 2259)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 2261)	Occurs when a key is pressed.
	OnKeyUp (see page 2262)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 2264)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2265)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 2267)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2268)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 2268)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2270)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 2273)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 2273)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 2273)	Occurs when the mouse wheel is rotated upward.
	OnReorderButton (see page 2274)	Fired when buttons are reordered in the button group.
	OnStartDock (see page 2274)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 2274)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

16.1.1.6.1 TButtonGroup.OnAfterDrawButton Event

Occurs after a button is drawn.

Pascal

```
property OnAfterDrawButton: TGrpButtonDrawEvent;
```

C++

```
__property TGrpButtonDrawEvent OnAfterDrawButton;
```

16.1.1.6.2 TButtonGroup.OnAlignInsertBefore Event

Occurs when an object is aligned.

Pascal

```
property OnAlignInsertBefore: TAlignInsertBeforeEvent;
```

C++

```
__property TAlignInsertBeforeEvent OnAlignInsertBefore;
```

Description

When the object is aligned with other objects, it is inserted before other objects.

16.1.1.6.3 TButtonGroup.OnAlignPosition Event

Occurs when a control is aligned to a new position.

Pascal

```
property OnAlignPosition: TAlignPositionEvent;
```

C++

```
__property TAlignPositionEvent OnAlignPosition;
```

16.1.1.6.4 TButtonGroup.OnBeforeDrawButton Event

Occurs just before a button is drawn.

Pascal

```
property OnBeforeDrawButton: TGrpButtonDrawEvent;
```

C++

```
__property TGrpButtonDrawEvent OnBeforeDrawButton;
```

16.1.1.6.5 TButtonGroup.OnButtonClicked Event

Occurs when a button is clicked, if the OnClick (see page 2249) event is not present.

Pascal

```
property OnButtonClicked: TGrpButtonEvent;
```

C++

```
__property TGrpButtonEvent OnButtonClicked;
```

16.1.1.6.6 TButtonGroup.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B.

However, focus does not move to the control in these instances.

- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
```

```
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

16.1.1.6.7 TButtonGroup.OnContextPopup Event

Occurs when a user right-clicks on the dock site to display the popup menu.

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

Any action you add to this event may occur prior to the popup menu being displayed. You can test this yourself by adding a ShowMessage command to the event handler and running the application.

16.1.1.6.8 TButtonGroup.OnDockDrop Event

Occurs when the control is dropped by a release of the mouse button.

Pascal

```
property OnDockDrop: TDockDropEvent;
```

C++

```
__property TDockDropEvent OnDockDrop;
```

16.1.1.6.9 TButtonGroup.OnDockOver Event

Occurs when the control is being moved over another control, but has not yet been docked.

Pascal

```
property OnDockOver: TDockOverEvent;
```

C++

```
__property TDockOverEvent OnDockOver;
```

16.1.1.6.10 TButtonGroup.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
```

```
end;
```

16.1.1.6.11 TButtonGroup.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
```

```
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
```

```
    ListBox1.Items.Add('Alphabetical');
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

16.1.1.6.12 TButtonGroup.OnDrawButton Event

Occurs when a button is redrawn.

Pascal

```
property OnDrawButton: TGrpButtonDrawEvent;
```

C++

```
__property TGrpButtonDrawEvent OnDrawButton;
```

16.1.1.6.13 TButtonGroup.OnDrawIcon Event

Occurs when an icon is redrawn.

Pascal

```
property OnDrawIcon: TGrpButtonDrawIconEvent;
```

C++

```
__property TGrpButtonDrawIconEvent OnDrawIcon;
```

16.1.1.6.14 TButtonGroup.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
```

```
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

16.1.1.6.16 TButtonGroup.OnEnter Event

Occurs when the control gets focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

16.1.1.6.17 TButtonGroup.OnExit Event

Occurs when the control loses focus, typically in tabbing between controls.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

16.1.1.6.18 TButtonGroup.OnHotButton Event

Fired when the mouse pointer is over the button.

Pascal

```
property OnHotButton: TGrpButtonEvent;
```

C++

```
__property TGrpButtonEvent OnHotButton;
```

16.1.1.6.19 TButtonGroup.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
```

```
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
    else
      ComboBox1.Text := 'KeyUp';
    WriteLn(ComboBox1.Text);
  end;
end;
{
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
}
```

```
uses Printers;

procedure TForm1.Button1Click(Sender: TObject);
var

16.1.1.6.20 TButtonGroup.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

16.1.1.6.21 TButtonGroup.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/

      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
```

```
  event to FormKeyUp.  Set the KeyPreview on the form to True.
  }
  var
    FormColor: TColor;
  procedure TForm1.FormCreate(Sender: TObject);
  begin
    KeyPreview := True;
    FormColor := Form1.Color;
  end;

  procedure TForm1.FormKeyDown(
    Sender: TObject; var Key: Word; Shift: TShiftState);
  begin
    if Key = VK_F1 then
    begin
      Form1.Color := clAqua;
      if (ComboBox1.Text = 'KeyDown') then
        ComboBox1.Text := 'KeyDown2'
      else
        ComboBox1.Text := 'KeyDown';
      WriteLn(ComboBox1.Text);
    end;
  end;

  procedure TForm1.FormKeyUp(
    Sender: TObject; var Key: Word; Shift: TShiftState);
  begin
    if Key = VK_F1 then
    begin
      Form1.Color := FormColor;
      if (ComboBox1.Text = 'KeyUp') then
        ComboBox1.Text := 'KeyUp2'
      else
        ComboBox1.Text := 'KeyUp';
      WriteLn(ComboBox1.Text);
    end;
  end;

16.1.1.6.22 TButtonGroup.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

16.1.1.6.23 TButtonGroup.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
```

```
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,

16.1.1.6.24 TButtonGroup.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

16.1.1.6.25 TButtonGroup.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

16.1.1.6.26 TButtonGroup.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/

{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
```

```
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
      end;
    if X > StartX then
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
      end
    else
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
      end;
  end;
end;
```

OnMouseDown (see page 5862)

OnMouseUp (see page 5867)

MouseCapture (see page 5831)

16.1.1.6.27 TButtonGroup.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,

Responding to a Mouse-up Action

16.1.1.6.28 TButtonGroup.OnMouseWheel Event

Occurs when the mouse wheel is rotated.

Pascal

```
property OnMouseWheel: TMouseWheelEvent;
```

C++

```
__property TMouseWheelEvent OnMouseWheel;
```

Description

Write code in the OnMouseWheel event handler to respond to mouse wheel messages. If there is no OnMouseWheel event handler, or if the mouse wheel message is not handled in the OnMouseWheel event handler, then an OnMouseWheelUp or OnMouseWheelDown event occurs, depending on the direction the mouse wheel was rotated.

See Also

OnMouseWheelDown (see page 5869)

OnMouseWheelUp (see page 5870)

16.1.1.6.29 TButtonGroup.OnMouseWheelDown Event

Occurs when the mouse wheel is rotated downward.

Pascal

```
property OnMouseWheelDown: TMouseWheelUpDownEvent;
```

C++

```
__property TMouseWheelUpDownEvent OnMouseWheelDown;
```

Description

Write code in the OnMouseWheelDown event handler to perform actions when the mouse wheel is rotated downward. OnMouseWheelDown occurs only if the message is not already handled in an OnMouseWheel event handler.

See Also

OnMouseWheel (see page 5869)

OnMouseWheelUp (see page 5870)

16.1.1.6.30 TButtonGroup.OnMouseWheelUp Event

Occurs when the mouse wheel is rotated upward.

Pascal

```
property OnMouseWheelUp: TMouseWheelUpDownEvent;
```

C++

```
__property TMouseWheelUpDownEvent OnMouseWheelUp;
```

Description

Write code in the OnMouseWheelUp event handler to perform actions when the mouse wheel is rotated upward. OnMouseWheelUp occurs only if the message is not already handled in an OnMouseWheel event handler.

See Also

OnMouseWheelDown (see page 5869)

OnMouseWheel (see page 5869)

16.1.1.6.31 TButtonGroup.OnReorderButton Event

Fired when buttons are reordered in the button group.

Pascal

```
property OnReorderButton: TGrpButtonReorderEvent;
```

C++

```
__property TGrpButtonReorderEvent OnReorderButton;
```

16.1.1.6.32 TButtonGroup.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

16.1.1.6.33 TButtonGroup.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

16.1.2 TGrpButtonItem Class

TGrpButtonItem is an individual button of a TButtonGroup (see page 2198) control.

Class Hierarchy

Pascal

```
TGrpButtonItem = class(TBaseButtonItem);
```

C++

```
class TGrpButtonItem : public TBaseButtonItem;
```

File

ButtonGroup

16.1.2.1 TGrpButtonItem Members

The following tables list the members exposed by TGrpButtonItem.

Protected Methods

	Name	Description
	ActionChange (see page 2420)	This is ActionChange, a member of class TBaseButtonItem.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetActionLinkClass (see page 2421)	This is GetActionLinkClass, a member of class TBaseButtonItem.
	GetDisplayName (see page 2421)	Returns the name of the collection item as it appears in the collection editor.
	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
	GetNotifyTarget (see page 2277)	This is GetNotifyTarget, a member of class TGrpButtonItem.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Protected Properties

	Name	Description
	ActionLink (see page 2422)	This is ActionLink, a member of class TBaseButtonItem.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2420)	Copies the contents of another, similar object.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2419)	Creates and initializes a TCollectionItem instance.
	Create (see page 2757)	Creates and initializes a TCollectionItem (see page 2755) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	ScrollIntoView (see page 2278)	Scroll buttons to make the item visible

Public Properties

	Name	Description
	Collection (see page 2278)	The name of the collection that the button group items are contained in.
	Data (see page 2423)	This is Data, a member of class TBaseButtonItem.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Events

	Name	Description
	OnClick (see page 2423)	This is OnClick, a member of class TBaseButtonItem.

Published Properties

	Name	Description
	Action (see page 2422)	Specifies the action the button executes when clicked.
R	ButtonGroup (see page 2278)	The name of the button group that the button item belongs to.
	Caption (see page 2422)	This is Caption, a member of class TBaseButtonItem.
	Hint (see page 2423)	This is Hint, a member of class TBaseButtonItem.
	ImageIndex (see page 2423)	The index of a specified image.

16.1.2.2 TGrpButtonItem Methods

The methods of the TGrpButtonItem class are listed here.

Protected Methods

	Name	Description
V	GetNotifyTarget (see page 2277)	This is GetNotifyTarget, a member of class TGrpButtonItem.

Public Methods

	Name	Description
V	ScrollIntoView (see page 2278)	Scroll buttons to make the item visible

16.1.2.2.1 TGrpButtonItem.GetNotifyTarget Method

Pascal

```
function GetNotifyTarget: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetNotifyTarget();
```

Description

This is GetNotifyTarget, a member of class TGrpButtonItem.

16.1.2.2.2 TGrpButtonItem.ScrollIntoView Method

Scroll buttons to make the item visible

Pascal

```
procedure ScrollIntoView; override;
```

C++

```
virtual __fastcall ScrollIntoView();
```

16.1.2.3 TGrpButtonItem Properties

The properties of the TGrpButtonItem class are listed here.

Public Properties

	Name	Description
	Collection (see page 2278)	The name of the collection that the button group items are contained in.

Published Properties

	Name	Description
R	ButtonGroup (see page 2278)	The name of the button group that the button item belongs to.

16.1.2.3.1 TGrpButtonItem.ButtonGroup Property

The name of the button group that the button item belongs to.

Pascal

```
property ButtonGroup: TButtonGroup;
```

C++

```
__property TButtonGroup ButtonGroup;
```

16.1.2.3.2 TGrpButtonItem.Collection Property

The name of the collection that the button group items are contained in.

Pascal

```
property Collection: TGrpButtonItems;
```

C++

```
__property TGrpButtonItems Collection;
```

16.1.3 TGrpButtonItems Class

TGrpButtonItems maintains the collection of buttons that appear in a TButtonGroup (see page 2198) control.

Class Hierarchy

Pascal

```
TGrpButtonItems = class(TCollection);
```

C++

```
class TGrpButtonItems : public TCollection;
```

File

ButtonGroup

16.1.3.1 TGrpButtonItems Members

The following tables list the members exposed by TGrpButtonItems.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2281)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2282)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 2281)	Adds an item to the button group at the end of the list of buttons.
	AddItem (see page 2281)	Adds a button to the button group at a specified index position.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2281)	Updates the IDs of buttons in the button group when a button is removed, moved, or added.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 2280)	Constructor for the group button items.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2282)	Inserts a button item at a specified index.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ButtonGroup (see page 2283)	The button group that this item belongs to.
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 2283)	Lists the items in the collection.

16.1.3.2 TGrpButtonItems.Create Constructor

Constructor for the group button items.

Pascal

```
constructor Create(const ButtonGroup: TButtonGroup);
```

C++

```
__fastcall TGrpButtonItems(const TButtonGroup ButtonGroup);
```

16.1.3.3 TGrpButtonItems Methods

The methods of the TGrpButtonItems class are listed here.

Protected Methods

	Name	Description
	GetOwner (see page 2281)	Returns the owner of an object.
	Update (see page 2282)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Add (see page 2281)	Adds an item to the button group at the end of the list of buttons.
	AddItem (see page 2281)	Adds a button to the button group at a specified index position.
	BeginUpdate (see page 2281)	Updates the IDs of buttons in the button group when a button is removed, moved, or added.
	Insert (see page 2282)	Inserts a button item at a specified index.

16.1.3.3.1 TGrpButtonItems.Add Method

Adds an item to the button group at the end of the list of buttons.

Pascal

```
function Add: TGrpButtonItem;
```

C++

```
__fastcall TGrpButtonItem Add();
```

16.1.3.3.2 TGrpButtonItems.AddItem Method

Adds a button to the button group at a specified index position.

Pascal

```
function AddItem(Item: TGrpButtonItem; Index: Integer): TGrpButtonItem;
```

C++

```
__fastcall TGrpButtonItem AddItem(TGrpButtonItem Item, int Index);
```

16.1.3.3.3 TGrpButtonItems.BeginUpdate Method

Updates the IDs of buttons in the button group when a button is removed, moved, or added.

Pascal

```
procedure BeginUpdate; override;
```

C++

```
virtual __fastcall BeginUpdate();
```

16.1.3.3.4 TGrpButtonItems.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath (see page 2932)

TCollection (see page 2731)

TComponent (see page 2762)

Owner (see page 2807)

16.1.3.3.5 TGrpButtonItems.Insert Method

Inserts a button item at a specified index.

Pascal

```
function Insert(Index: Integer): TGrpButtonItem;
```

C++

```
__fastcall TGrpButtonItem Insert(int Index);
```

16.1.3.3.6 TGrpButtonItems.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem Item);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

See Also

Changed (see page 2740)

Changed (see page 2758)

16.1.3.4 TGrpButtonItems Properties

The properties of the TGrpButtonItems class are listed here.

Public Properties

	Name	Description
R	ButtonGroup (see page 2283)	The button group that this item belongs to.
	Items (see page 2283)	Lists the items in the collection.

16.1.3.4.1 TGrpButtonItems.ButtonGroup Property

The button group that this item belongs to.

Pascal

```
property ButtonGroup: TButtonGroup;
```

C++

```
__property TButtonGroup ButtonGroup;
```

16.1.3.4.2 TGrpButtonItems.Items Property

Lists the items in the collection.

Pascal

```
property Items [Index: Integer]: TGrpButtonItem;
```

C++

```
__property TGrpButtonItem Items[int Index];
```

Description

Use Items to access individual items in the collection. The value of the Index parameter corresponds to the Index property of TCollectionItem. It represents the position of the item in the collection.

See Also

Count (see page 2749)

ItemClass (see page 2751)

Index (see page 2762)

Add (see page 2736)

Insert (see page 2746)

16.2 Types

The following table lists types in this documentation.

Types

Name	Description
TGrpButtonDrawEvent (see page 2284)	TGrpButtonDrawEvent is the type of Button Group draw event handler.
TGrpButtonDrawIconEvent (see page 2285)	TGrpButtonDrawIconEvent is the type of Button Group OnDrawIcon event handler.
TGrpButtonEvent (see page 2285)	TGrpButtonEvent is a type of Button Group event handler.
TGrpButtonItemClass (see page 2286)	Metaclass of TGrpButtonItem (see page 2275).
TGrpButtonItemsClass (see page 2286)	Metaclass of TGrpButtonItems (see page 2278).
TGrpButtonOptions (see page 2286)	Options for button groups.
TGrpButtonReorderEvent (see page 2287)	TGrpButtonReorderEvent is a type of Button Group reorder event handler.

16.2.1 ButtonGroup.TGrpButtonDrawEvent Type

TGrpButtonDrawEvent is the type of Button Group draw event handler.

Pascal

```
TGrpButtonDrawEvent = procedure (Sender: TObject; Index: Integer; Canvas: TCanvas; Rect:
TRect; State: TButtonDrawState) of object;
```

C++

```
(Sender: TObject; Index: Integer; Canvas: TCanvas; Rect: TRect; State: TButtonDrawState) (
TGrpButtonDrawEvent)();
```

File

ButtonGroup

Description

TGrpButtonDrawEvent defines the type of method procedure that you must define in order to implement the OnAfterDrawButton, OnBeforeDrawButton and OnDrawButton events of the TButtonGroup (see page 2198) class.

Each of these events is invoked once per button in the button group.

Sender is a reference to the TButtonGroup (see page 2198) invoking the event.

Index is the index of the button in the button group.

Canvas is the canvas on which the drawing takes place.

Rect defines the rectangle in which the user drawing must be made.

State defines state of the button to be drawn.

See Also

OnAfterDrawButton (see page 2248)

OnBeforeDrawButton (see page 2249)

OnDrawButton (see page 2256)

TButtonDrawState (see page 2545)

16.2.2 ButtonGroup.TGrpButtonDrawIconEvent Type

TGrpButtonDrawIconEvent is the type of Button Group OnDrawIcon event handler.

Pascal

```
TGrpButtonDrawIconEvent = procedure (Sender: TObject; Index: Integer; Canvas: TCanvas; Rect:
TRect; State: TButtonDrawState; var TextOffset: Integer) of object;
```

C++

```
(Sender: TObject; Index: Integer; Canvas: TCanvas; Rect: TRect; State: TButtonDrawState; var
TextOffset: Integer) ( TGrpButtonDrawIconEvent)();
```

File

ButtonGroup

Description

TGrpButtonDrawEvent (see page 2284) defines the type of method procedure that you must define in order to implement the OnDrawIcon event which is called when a button icon is drawn or redrawn.

This event is invoked once per button icon in the button group.

Sender is a reference to the TButtonGroup (see page 2198) invoking the event.

Index is the index of the button in the button group.

Canvas is the canvas on which the drawing takes place.

State defines state of the button to be drawn.

TextOffset defines the offset of the button text in pixels.

See Also

OnDrawIcon (see page 2256)

TButtonDrawState (see page 2545)

16.2.3 ButtonGroup.TGrpButtonEvent Type

TGrpButtonEvent is a type of Button Group event handler.

Pascal

```
TGrpButtonEvent = procedure (Sender: TObject; Index: Integer) of object;
```

C++

```
(Sender: TObject; Index: Integer) ( TGrpButtonEvent)();
```

File

ButtonGroup

Description

TGrpButtonEvent defines the type of method procedure that you must define in order to implement the OnButtonClicked and

OnHotButton events.

This event is invoked for a button in the button group.

Sender is a reference to the TButtonGroup (see page 2198) invoking the event.

Index is the index of the button in the button group.

See Also

OnButtonClicked (see page 2249)

OnHotButton (see page 2258)

16.2.4 ButtonGroup.TGrpButtonItemClass Type

Metaclass of TGrpButtonItem (see page 2275).

Pascal

```
TGrpButtonItemClass = class of TGrpButtonItem;
```

C++

```
TGrpButtonItem TGrpButtonItemClass;
```

File

ButtonGroup

16.2.5 ButtonGroup.TGrpButtonItemsClass Type

Metaclass of TGrpButtonItems (see page 2278).

Pascal

```
TGrpButtonItemsClass = class of TGrpButtonItems;
```

C++

```
TGrpButtonItems TGrpButtonItemsClass;
```

File

ButtonGroup

16.2.6 ButtonGroup.TGrpButtonOptions Type

Options for button groups.

Pascal

```
TGrpButtonOptions = set of (gboAllowReorder, gboFullSize, gboGroupStyle, gboShowCaptions);
```

C++

```
(gboAllowReorder, gboFullSize, gboGroupStyle, gboShowCaptions) TGrpButtonOptions;
```

File

ButtonGroup

Description

The following options are available:

Option	Description
gboAllowReorder	Allows the user to reorder buttons within the group at runtime by dragging buttons to new locations within the group.
gboFullSize	Resizes the buttons to take up the entire width of the button group container.
gboGroupStyle	Shows selected button as greyed out or darker than unselected buttons.
gboShowCaptions	Displays captions on each button.

16.2.7 ButtonGroup.TGrpButtonReorderEvent Type

TGrpButtonReorderEvent is a type of Button Group reorder event handler.

Pascal

```
TGrpButtonReorderEvent = procedure (Sender: TObject; OldIndex, NewIndex: Integer) of object;
```

C++

```
(Sender: TObject; OldIndex, NewIndex: Integer) ( TGrpButtonReorderEvent)();
```

File

ButtonGroup

Description

TGrpButtonEvent (see page 2285) defines the type of method procedure that you must define in order to implement the OnReorderButton and event.

This event is invoked when buttons are reordered in the button group.

Sender is a reference to the TButtonGroup (see page 2198) invoking the event.

OldIndex is the index of the original button position in the button group.

NewIndex is the index of the relocated button position in the button group.

See Also

OnReorderButton (see page 2274)

17 Buttons Namespace

This is namespace Buttons.

Topics

Name	Description
Classes (see page 2290)	The following table lists classes in this documentation.
Functions (see page 2391)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 2392)	The following table lists structs, records, enums in this documentation.
Types (see page 2396)	The following table lists types in this documentation.

Classes

	Name	Description
	TBitBtn (see page 2290)	TBitBtn is a push button control that can include a bitmap on its face.
	TBitBtnActionLink (see page 2330)	TBitBtnActionLink is an action link designed specifically for button control clients.
	TSpeedButton (see page 2335)	TSpeedButton is a button that is used to execute commands or set modes.
	TSpeedButtonActionLink (see page 2382)	TSpeedButtonActionLink is an action link designed specifically for button control clients.

Functions

	Name	Description
	DrawButtonFace (see page 2391)	Draws a push button.

Structs, Records, Enums

	Name	Description
	TBitBtnKind (see page 2392)	TBitBtnKind identifies the appearance and use of a TBitBtn (see page 2290) control.
	TButtonLayout (see page 2393)	TButtonLayout defines values for the Layout property of buttons.
	TButtonState (see page 2394)	TButtonState describes the current state of a button.
	TButtonStyle (see page 2395)	TButtonStyle specifies the basic look of a TBitBtn (see page 2290) control.

Types

Name	Description
TNumGlyphs (see page 2396)	This is type Buttons.TNumGlyphs.

17.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TBitBtn (see page 2290)	TBitBtn is a push button control that can include a bitmap on its face.
	TBitBtnActionLink (see page 2330)	TBitBtnActionLink is an action link designed specifically for button control clients.
	TSpeedButton (see page 2335)	TSpeedButton is a button that is used to execute commands or set modes.
	TSpeedButtonActionLink (see page 2382)	TSpeedButtonActionLink is an action link designed specifically for button control clients.

17.1.1 TBitBtn Class

TBitBtn is a push button control that can include a bitmap on its face.

Class Hierarchy

Pascal

```
TBitBtn = class(TButton);
```

C++

```
class TBitBtn : public TButton;
```

File

Buttons

Description

Bitmap buttons exhibit the same behavior as button controls. Use them to initiate actions from forms and dialog boxes.

Bitmap buttons implement properties that specify the bitmap images, along with their appearance and placement on the button. You can choose from predefined bitmap buttons styles or use your own customized bitmap for the button. Although the button can be associated with only one bitmap, the bitmap (glyph property) can be subdivided into four equal-sized portions, which are displayed based on the state of the button: up, down, disabled, and clicked.

The Kind (see page 2317) property of TBitBtn provides commonly used buttons, such as OK, Cancel (see page 2312), Help, and so on. These predefined button types have corresponding graphical images and default behaviors, so you can easily add them to your application with little or no coding necessary.

The recommended way to implement the response of other button kinds to user clicks is to assign an action from an action list as the value of the Action (see page 2307) property. By setting the Action (see page 2307) property, you make the button a client of the action, and the action handles updating the button's properties and responding when the user clicks the button.

If you are not using the built-in response to a specific kind of button or an action to respond when the user clicks the button, then you can specify the button's response by writing an OnClick event handler.

TSpeedButton (see page 2335)

Bitmap Buttons

Buttons and Similar Controls

17.1.1.1 TBitBtn Members

The following tables list the members exposed by TBitBtn.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActionChange (see page 2303)	Updates the button control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CopyImage (see page 2304)	This is CopyImage, a member of class TBitBtn.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 2304)	Creates underlying screen object.
V	CreateParams (see page 2304)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CreateWnd (see page 20922)	Creates the underlying window.

	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 2305)	Returns the appropriate action link class that is associated with button controls.
	GetChecked (see page 20993)	Returns whether the button control is checked.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.

	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 2305)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.

	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetButtonStyle (see page 2306)	This is SetButtonStyle, a member of class TBitBtn.
	SetChecked (see page 20994)	Sets the Checked (see page 20995) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.

	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WndProc (see page 20994)	Handles Windows messages.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Checked (see page 20995)	Specifies whether the button control is checked.
	ClicksDisabled (see page 20996)	This is ClicksDisabled, a member of class TButtonControl.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

	WordWrap (see page 20996)	Specifies whether the button text wraps to fit the width of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Click (see page 2303)	Simulates a mouse click, as if the user had clicked the button.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 2302)	Constructs an instance of the button control and initializes its values.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2302)	Destroys the bitmap button object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.

	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
V	UseRightToLeftAlignment (see page 20923)	Specifies whether the control's alignment is in a right-to-left mode.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.

R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnClick (see page 20949)	Occurs when the user clicks the control.
	OnContextPopup (see page 20951)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDragDrop (see page 20951)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 20954)	Occurs when the user drags an object over a control.
	OnEndDock (see page 20956)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 20956)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 2326)	Occurs when a control receives the input focus.
	OnExit (see page 2328)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 20961)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 20964)	Occurs when a key is pressed.
	OnKeyUp (see page 20965)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 20967)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 20968)	Occurs when the user presses a mouse button with the mouse pointer over a control.

	OnMouseEnter (see page 20970)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 20970)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 20971)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 20973)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 20975)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 20976)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Action (see page 2307)	Designates the action associated with the control.
	Align (see page 2307)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 2310)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 2311)	Specifies the bi-directional mode for the control.
	Cancel (see page 2312)	Determines whether the button's OnClick event handler executes when the Escape key is pressed.
	Caption (see page 2312)	Specifies a text string that identifies the control to the user.
	Constraints (see page 2315)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Default (see page 2315)	Determines whether the button's OnClick event handler executes when the Enter key is pressed.
	DragCursor (see page 20933)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 20934)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 20934)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 2316)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 20936)	Controls the attributes of text written on or in the control.
	Glyph (see page 2317)	Specifies the bitmap that appears on the bitmap button.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Kind (see page 2317)	Specifies the kind of bitmap button.
	Layout (see page 2318)	Specifies where the image appears on the bitmap button.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margin (see page 2318)	Specifies the number of pixels between the edge of the image (specified in the Glyph (see page 2317) property) and the edge of the button.
	Margins (see page 5831)	Specifies the margins for the control.
	ModalResult (see page 2319)	Determines whether and how the button closes its (modal) parent form.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NumGlyphs (see page 2320)	Indicates the number of images that are in the graphic specified in the Glyph (see page 2317) property.
	ParentBiDiMode (see page 2320)	Specifies whether the control uses its parent's BiDiMode.
	ParentFont (see page 20938)	Determines where a control looks for its font information.
	ParentShowHint (see page 2320)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 20939)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 2321)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Spacing (see page 2322)	Determines where the image and text appear on a bitmap or speed button.
	Style (see page 2323)	Determines the appearance of a bitmap button.

	TabOrder (see page 2323)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 2324)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 2324)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.
	WordWrap (see page 20948)	Specifies whether the button text wraps to fit the width of the control.

17.1.1.2 TBitBtn.Create Constructor

Constructs an instance of the button control and initializes its values.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TBitBtn(TComponent * AOwner);
```

Description

Use Create to programmatically instantiate a button. Buttons (see page 2289) added using the form designer are created automatically.

The AOwner parameter specifies the component, typically a form, that is responsible for freeing the button.

See Also

Owner (see page 2807)

Destroy (see page 2302)

17.1.1.3 TBitBtn.Destroy Destructor

Destroys the bitmap button object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBitBtn();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the bitmap button is not nil, and only then calls Destroy.

See Also

delete

Free (see page 22300)

17.1.1.4 TBitBtn Methods

The methods of the TBitBtn class are listed here.

Protected Methods

	Name	Description
	ActionChange (see page 2303)	Updates the button control to reflect changes in its associated action.
	CopyImage (see page 2304)	This is CopyImage, a member of class TBitBtn.
	CreateHandle (see page 2304)	Creates underlying screen object.
	CreateParams (see page 2304)	Initializes a window-creation parameter data structure.
	GetActionLinkClass (see page 2305)	Returns the appropriate action link class that is associated with button controls.
	GetPalette (see page 2305)	Returns the handle to a palette for use by the control.
	SetButtonStyle (see page 2306)	This is SetButtonStyle, a member of class TBitBtn.

Public Methods

	Name	Description
	Click (see page 2303)	Simulates a mouse click, as if the user had clicked the button.

17.1.1.4.1 TBitBtn.ActionChange Method

Updates the button control to reflect changes in its associated action.

Pascal

```
procedure ActionChange(Sender: TObject; CheckDefaults: Boolean); override;
```

C++

```
virtual __fastcall ActionChange(TObject * Sender, Boolean CheckDefaults);
```

Description

ActionChange is called automatically when the associated action changes. It updates the button control to reflect the action's current Checked state. Then it calls the inherited method, which checks the associated properties for that client type.

The Sender parameter is the associated action. The CheckDefaults parameter specifies whether properties and event handlers should be changed if they differ from the default values. When CheckDefaults is true, properties and event handlers are only changed when the current values are the default values (that is, when the values have not been previously changed). When CheckDefaults is false, properties and event handlers are changed, regardless of their current values.

See Also

TCustomAction (see page 297)

17.1.1.4.2 TBitBtn.Click Method

Simulates a mouse click, as if the user had clicked the button.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

Use Click to simulate a mouse click. Click performs the following tasks:

1. If the value of the Kind (see page 2317) property is bkClose, Click closes the form. If the value of Kind (see page 2317) is bkHelp, Click displays the Help screen assigned with the HelpContext property.
2. Any associated action fires, or, if there is no associated action, any code attached to the OnClick event is executed.

See Also

Kind (see page 2317)

Action (see page 5797)

OnClick (see page 5851)

17.1.1.4.3 TBitBtn.CopyImage Method

Pascal

```
procedure CopyImage(ImageList: TCustomImageList; Index: Integer);
```

C++

```
__fastcall CopyImage(TCustomImageList ImageList, int Index);
```

Description

This is CopyImage, a member of class TBitBtn.

17.1.1.4.4 TBitBtn.CreateHandle Method

Creates underlying screen object.

Pascal

```
procedure CreateHandle; override;
```

C++

```
virtual __fastcall CreateHandle();
```

Description

CreateHandle creates the Microsoft Windows screen object that underlies the control. if it does not already exist. The new window handle becomes the value of the Handle property.

CreateHandle creates or locates the parent control's window before it creates a window for the control itself.

Note: If the Parent property is nil (Delphi) or NULL (C++), CreateHandle raises an exception.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

Handle (see page 6207)

Parent (see page 5832)

17.1.1.4.5 TBitBtn.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

17.1.1.4.6 TBitBtn.GetActionLinkClass Method

Returns the appropriate action link class that is associated with button controls.

Pascal

```
function GetActionLinkClass: TControlActionLinkClass; override;
```

C++

```
virtual __fastcall TControlActionLinkClass GetActionLinkClass();
```

Description

GetActionLinkClass is used to get the appropriate class type for the action link used with button controls. GetActionLinkClass is used internally to create action link objects for clients when a button control has an associated action. The action link is used to link the action to the button control client. Each Action link class type is designed to link specific actions to clients based upon the types of properties the client supports. For button controls, GetActionLinkClass returns the TButtonActionLink class type.

See Also

TButtonActionLink (see page 20976)

17.1.1.4.7 TBitBtn.GetPalette Method

Returns the handle to a palette for use by the control.

Pascal

```
function GetPalette: HPALETTE; override;
```

C++

```
virtual __fastcall HPALETTE GetPalette();
```

Description

As implemented in TControl, GetPalette returns a null handle, indicating that the control does not have a palette. Override GetPalette to implement derived objects that use a palette. Create a palette handle for the control by a call to the Windows API function CreatePalette. GetPalette should return the palette handle for the control.

Specifying the palette for a control tells the application that the control's palette needs to be realized and designates the palette

to use for realization.

GetPalette is called only if the run-time video mode requires color palette support, for example, in 256-color mode.

See Also

PaletteChanged (see page 5775)

17.1.1.4.8 TBitBtn.SetButtonStyle Method

Pascal

```
procedure SetButtonStyle(ADefault: Boolean); override;
```

C++

```
virtual __fastcall SetButtonStyle(Boolean ADefault);
```

Description

This is SetButtonStyle, a member of class TBitBtn.

17.1.1.5 TBitBtn Properties

The properties of the TBitBtn class are listed here.

Published Properties

	Name	Description
	Action (see page 2307)	Designates the action associated with the control.
	Align (see page 2307)	Determines how the control aligns within its container (parent control).
	Anchors (see page 2310)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 2311)	Specifies the bi-directional mode for the control.
	Cancel (see page 2312)	Determines whether the button's OnClick event handler executes when the Escape key is pressed.
	Caption (see page 2312)	Specifies a text string that identifies the control to the user.
	Constraints (see page 2315)	Specifies the size constraints for the control.
	Default (see page 2315)	Determines whether the button's OnClick event handler executes when the Enter key is pressed.
	Enabled (see page 2316)	Controls whether the control responds to mouse, keyboard, and timer events.
	Glyph (see page 2317)	Specifies the bitmap that appears on the bitmap button.
	Kind (see page 2317)	Specifies the kind of bitmap button.
	Layout (see page 2318)	Specifies where the image appears on the bitmap button.
	Margin (see page 2318)	Specifies the number of pixels between the edge of the image (specified in the Glyph (see page 2317) property) and the edge of the button.
	ModalResult (see page 2319)	Determines whether and how the button closes its (modal) parent form.
	NumGlyphs (see page 2320)	Indicates the number of images that are in the graphic specified in the Glyph (see page 2317) property.
	ParentBiDiMode (see page 2320)	Specifies whether the control uses its parent's BiDiMode.
	ParentShowHint (see page 2320)	Determines where a control looks to find out if its Help Hint should be shown.
	ShowHint (see page 2321)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Spacing (see page 2322)	Determines where the image and text appear on a bitmap or speed button.
	Style (see page 2323)	Determines the appearance of a bitmap button.
	TabOrder (see page 2323)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 2324)	Determines if the user can tab to a control.
	Visible (see page 2324)	Determines whether the component appears onscreen.

17.1.1.5.1 TBitBtn.Action Property

Designates the action associated with the control.

Pascal

```
property Action: TBasicAction;
```

C++

```
__property TBasicAction Action;
```

Description

Action is the action object that is associated with the control. Actions allow an application to centralize the response to user commands. When a control is associated with an action, the action determines the appropriate properties and events of the control (such as whether the control is enabled or how it responds to an OnClick event).

To create actions at design time, place an action list component on a form or data module. Double click the action list to bring up the action list editor. Add actions in the editor using its context menu. Once the actions have been added using the action list editor, they appear in the drop-down list for the Action property in the Object Inspector.

17.1.1.5.2 TBitBtn.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
```

```
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

17.1.1.5.3 TBitBtn.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

17.1.1.5.4 TBitBtn.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

17.1.1.5.5 TBitBtn.Cancel Property

Determines whether the button's OnClick event handler executes when the Escape key is pressed.

Pascal

```
property Cancel: Boolean;
```

C++

```
__property Boolean Cancel;
```

Description

If Cancel is true, the button's OnClick event handler executes when the user presses Esc. Although an application can have more than one Cancel button, the form calls the OnClick event handler only for the first visible button in the tab order.

See Also

Default (see page 20932)

OnClick (see page 5851)

17.1.1.5.6 TBitBtn.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
```

```
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
```

```
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

17.1.1.5.7 TBitBtn.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

17.1.1.5.8 TBitBtn.Default Property

Determines whether the button's OnClick event handler executes when the Enter key is pressed.

Pascal

```
property Default: Boolean;
```

C++

```
__property Boolean Default;
```

Description

If Default is true, the button's OnClick event handler executes when the user presses Enter.

Although an application can have more than one Default button, the form calls the OnClick event handler only for the first visible button in the tab order. Moreover, any button that has focus becomes the Default button temporarily; hence, if the user selects another button before pressing Enter, the selected button's OnClick event handler executes instead.

C++ Examples:

```
/*
This example uses a file list box, a directory list box, a
filter combo box, a drive combo box, a label, an edit box,
and a button on a form. When the user runs the application
```

```
and enters a path or filename in the edit box and presses
the button, all the controls update:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  FileListBox1->FileEdit = Edit1;
  FilterComboBox1->FileList = FileListBox1;
  DirectoryListBox1->FileList = FileListBox1;
  DirectoryListBox1->DirLabel = Label1;
  DriveComboBox1->DirList = DirectoryListBox1;
  Button1->Default = true;
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FileListBox1->ApplyFilePath(Edit1->Text);
}
```

Delphi Examples:

```
{
This example uses a file list box, a directory list box, a
filter combo box, a drive combo box, a label, an edit box,
and a button on a form. When the user runs the application
and enters a path or filename in the edit box and presses
the button, all the controls update:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  FileListBox1.ApplyFilePath(Edit1.Text);
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  FileListBox1.FileEdit := Edit1;
  FilterComboBox1.FileList := FileListBox1;
  DirectoryListBox1.FileList := FileListBox1;
  DirectoryListBox1.DirLabel := Label1;
  DriveComboBox1.DirList := DirectoryListBox1;
  Button1.Default := True;
end;
```

See Also

Cancel (see page 20929)

OnClick (see page 5851)

17.1.1.5.9 TBitBtn.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

17.1.1.5.10 TBitBtn.Glyph Property

Specifies the bitmap that appears on the bitmap button.

Pascal

```
property Glyph: TBitmap;
```

C++

```
__property TBitmap Glyph;
```

Description

Use the Open dialog box that appears as an editor in the Object Inspector to choose a bitmap file (with a .BMP extension) to use on the button, or specify a TBitmap object at runtime.

You can provide up to four images within a single bitmap. All images must be the same size and next to each other in a row. Bit buttons display one of these images depending on their state.

Image position	Button state	Description
First	Up	This image appears when the button is up (unselected). This image is also used when the button has focus (for example, if the user tabs to it); in this case, a focus rectangle is drawn around the button. If no other images exist in the bitmap, bit buttons also use this image for all other states.
Second	Disabled	This image usually appears dimmed to indicate that the button can't be selected.
Third	Clicked	This image appears when the button is clicked. The Up image reappears when the user releases the mouse button.
Fourth	Down	This image appears when the button stays down (indicating that it remains selected).

If only one image is present, bit buttons attempt to represent the other states by altering the image slightly for the different states, although the Down state is always the same as the Up state. If you aren't satisfied with the results, you can provide additional images in the bitmap.

If you have multiple images in a bitmap, you must specify the number of images that are in the bitmap with the Num Glyphs property.

Note: The lower left pixel of the bitmap is reserved for the "transparent" color. Any pixel in the bitmap which matches that lower left pixel will be transparent.

See Also

Kind (see page 2317)

NumGlyphs (see page 2320)

17.1.1.5.11 TBitBtn.Kind Property

Specifies the kind of bitmap button.

Pascal

```
property Kind: TBitBtnKind;
```

C++

```
__property TBitBtnKind Kind;
```

Description

Use Kind to specify the appearance of the TBitBtn (see page 2290) control and its response when the user clicks the button. A standard set of buttons are included and operate as expected without the addition of code. However, you can write additional code in the button events, if you want to. This does not include the Custom button kind, which can be programmed in any way you like.

The images (such as the green check mark on the OK button) appear on the button when using this version of TBitBtn (see page 2290).

See Also

ModalResult (see page 20937)

Glyph (see page 2317)

Style (see page 2323)

17.1.1.5.12 TBitBtn.Layout Property

Specifies where the image appears on the bitmap button.

Pascal

```
property Layout: TButtonLayout;
```

C++

```
__property TButtonLayout Layout;
```

Description

Layout indicates whether the text appears on the left of the button (blGlyphLeft), the right of the button (blGlyphRight), the top (blGlyphTop) or the bottom (blGlyphBottom).

See Also

Glyph (see page 2317)

Kind (see page 2317)

Margin (see page 2318)

17.1.1.5.13 TBitBtn.Margin Property

Specifies the number of pixels between the edge of the image (specified in the Glyph (see page 2317) property) and the edge of the button.

Pascal

```
property Margin: Integer;
```

C++

```
__property int Margin;
```

Description

The margin is the space between the image edge and the button edge. The format of the edges depends on the layout of the image and text (specified in the Layout (see page 2318) property). For example, if Layout (see page 2318) is blGlyphLeft, the margin appears between the left edge of the image and the left edge of the button. If Margin is 3, three pixels separate the image and the button edges. If Margin is 0, there is no space between the image and the button edges.

If Margin is -1 (the default value), the image and text (specified in the Caption (see page 2312) property) are centered. The number of pixels between the image and button edge is equal to the number of pixels between the opposite edge of the button and the text.

See Also

Glyph (see page 2317)

Layout (see page 2318)

Spacing (see page 2322)

Caption (see page 5806)

17.1.1.5.14 TBitBtn.ModalResult Property

Determines whether and how the button closes its (modal) parent form.

Pascal

```
property ModalResult: TModalResult;
```

C++

```
__property TModalResult ModalResult;
```

Description

Setting the TButton component's ModalResult property is an easy way to make clicking the button close a modal form. When a button is clicked, the ModalResult property of its parent form is set to the same value as the button's ModalResult property.

For example, if a dialog box has OK and Cancel buttons, their ModalResult properties could be set at design time to mrOk and mrCancel, respectively. At runtime, clicking the OK button then changes the dialog's ModalResult property to mrOk, and clicking the Cancel button changes the dialog's ModalResult property to mrCancel. Unless further processing is required, no OnClick event handlers are required for the buttons.

The following constants are defined for the ModalResult property:

Constant	Value	Meaning
mrNone	0	None. Used as a default value before the user exits.
mrOk	idOK	The user exited with OK button.
mrCancel	idCancel	The user exited with the CANCEL button.
mrAbort	idAbort	The user exited with the ABORT button.
mrRetry	idRetry	The user exited with the RETRY button.
mrIgnore	idIgnore	The user exited with the IGNORE button.
mrYes	idYes	The user exited with the YES button.
mrNo	idNo	The user exited with the NO button.
mrAll	mrNo + 1	The user exited with the ALL button.
mrNoToAll	mrAll + 1	The user exited with the NO TO ALL button.

mrYesToAll	mrNoToAll + 1	The user exited with the YES TO ALL button.

17.1.1.5.15 TBitBtn.NumGlyphs Property

Indicates the number of images that are in the graphic specified in the Glyph (see page 2317) property.

Pascal

```
property NumGlyphs: TNumGlyphs;
```

C++

```
__property TNumGlyphs NumGlyphs;
```

Description

If you have multiple images in a bitmap, you must specify the number of images that are in the bitmap with the NumGlyphs property. The default value is 1.

See Also

Glyph (see page 2317)

17.1.1.5.16 TBitBtn.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

17.1.1.5.17 TBitBtn.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

17.1.1.5.18 TBitBtn.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;
```

```
    char string[10];
    char index[3];
    for(int i = 1; i <= 10; i++)
    {
      strcpy(string, "Item");
      itoa(i, index, 10);
      strcat(string, index);
      ListBox1->Items->Add(string);
    }
    ListBox1->Hint = "Select an item";
    ListBox1->ShowHint = true;
    Application->ShowHint = true;
  }
  /*
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  */
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

ShowHint (see page 13721)

Displaying Fly-over Help

17.1.1.5.19 TBitBtn.Spacing Property

Determines where the image and text appear on a bitmap or speed button.

Pascal

```
property Spacing: Integer;
```

C++

```
__property int Spacing;
```

Description

Spacing determines the number of pixels between the image (specified in the Glyph (see page 2317) property) and the text (specified in the Caption (see page 2312) property). The default value is 4 pixels.

If Spacing is a positive number, its value is the number of pixels between the image and text. If Spacing is 0, no pixels will be between the image and text. If Spacing is -1, the text appears centered between the image and the button edge. The number of pixels between the image and text is equal to the number of pixels between the text and the button edge opposite the glyph.

See Also

Glyph (see page 2317)

Layout (see page 2318)

Margin (see page 2318)

Caption (see page 5806)

17.1.1.5.20 TBitBtn.Style Property

Determines the appearance of a bitmap button.

Pascal

```
property Style: TButtonStyle;
```

C++

```
__property TButtonStyle Style;
```

Description

Style indicates whether the TBitBtn (see page 2290) control uses the modern button look, or reflects the look of a 16-bit Windows pushbutton.

See Also

Kind (see page 2317)

17.1.1.5.21 TBitBtn.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the

same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

17.1.1.5.22 TBitBtn.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

17.1.1.5.23 TBitBtn.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
```

```
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
```

```
end;
```

17.1.1.6 TBitBtn Events

The events of the TBitBtn class are listed here.

Published Events

	Name	Description
	OnEnter (see page 2326)	Occurs when a control receives the input focus.
	OnExit (see page 2328)	Occurs when the input focus shifts away from one control to another.

17.1.1.6.1 TBitBtn.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
```

```
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
```

```
    FontDialog1.Execute;
  end;

  procedure TForm1.Edit1Enter(Sender: TObject);
  begin
    myActiveControl := ActiveControl;
  end;

  procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
  begin
    if myActiveControl is TEdit then
      with myActiveControl as TEdit do
         Font.Assign(TFontDialog(Sender).Font)
    else if myActiveControl is TRichEdit then
      with myActiveControl as TRichEdit do
        SelAttributes.Assign(TFontDialog(Sender).Font)
    else
      Beep;
  end;
  {
  This example uses an edit box and a memo control on a form.
  When either the edit box or the memo is the active control,
  it is colored yellow. When the active control becomes
  inactive, the color of the control returns to the Windows

17.1.1.6.2 TBitBtn.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
```

```
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

17.1.2 TBitBtnActionLink Class

TBitBtnActionLink is an action link designed specifically for button control clients.

Class Hierarchy

Pascal

```
TBitBtnActionLink = class(TControlActionLink);
```

C++

```
class TBitBtnActionLink : public TControlActionLink;
```

File

Buttons

Description

TBitBtnActionLink is designed to specifically link actions to bit buttton control clients. TBitBtnActionLink overrides methods to determine whether the action and client are linked, and to ensure that action events are appropriate for properties of bit button control clients.

TBitBtnActionLink inherits, from its ancestors, support for linking actions with the properties of components, generic controls, and windowed controls. TBitBtnActionLink adds support for linking the checked property to the appropriate property of a bit button control.

17.1.2.1 TBitBtnActionLink Members

The following tables list the members exposed by TBitBtnActionLink.

Protected Fields

	Name	Description
	FAction (see page 2722)	This is FAction, a member of class TBasicActionLink.
	FClient (see page 2333)	This is FClient, a member of class TBitBtnActionLink.
	FImageIndex (see page 2333)	This is FImageIndex, a member of class TBitBtnActionLink.

Protected Methods

	Name	Description
	AssignClient (see page 2334)	Assigns a client control that is linked to the associated action.
	Change (see page 2723)	This is Change, a member of class TBasicActionLink.
	DoShowHint (see page 5896)	Indicates whether the hint is shown, and modified.
	IsCaptionLinked (see page 268)	Indicates whether the Caption properties for the action and client are linked.
	IsCaptionLinked (see page 5896)	Indicates whether the caption for the action and the client are linked.
	IsCheckedLinked (see page 269)	Indicates whether the Checked properties for the action and client are linked.
	IsDropdownMenuLinked (see page 5896)	This is IsDropdownMenuLinked, a member of class TControlActionLink.
	IsEnabledLinked (see page 269)	Indicates whether the Enabled properties for the action and client are linked.
	IsEnabledLinked (see page 5897)	Indicates whether the enabled state for the action and the client are linked.
	IsEnableDropdownLinked (see page 5897)	This is IsEnableDropdownLinked, a member of class TControlActionLink.
	IsGroupIndexLinked (see page 270)	Indicates whether the GroupIndex property for the action controls client behavior.
	IsHelpContextLinked (see page 270)	Indicates whether the HelpContext properties for the action and client controls are linked.
	IsHelpLinked (see page 271)	Indicates whether the help properties for the action and client are linked.
	IsHelpLinked (see page 5897)	Indicates whether the help properties for the action and the client are linked.
	IsHintLinked (see page 271)	Indicates whether the Hint properties for the action and client are linked.
	IsHintLinked (see page 5898)	Indicates whether the Hint property for the action and the client are linked.
	IsImageIndexLinked (see page 2334)	Indicates whether the image index for the action and the client are linked.
	IsOnExecuteLinked (see page 2723)	This is IsOnExecuteLinked, a member of class TBasicActionLink.
	IsOnExecuteLinked (see page 5898)	Indicates whether the OnExecute event handler for the action and the client are linked.
	IsPopupMenuLinked (see page 5898)	This is IsPopupMenuLinked, a member of class TControlActionLink.
	IsShortCutLinked (see page 272)	Indicates whether the ShortCut properties for the action and client are linked.
	IsVisibleLinked (see page 273)	Indicates whether the Visible properties for the action and client are linked.
	IsVisibleLinked (see page 5899)	Indicates whether the visible state for the action and the client are linked.
	SetAction (see page 2724)	This is SetAction, a member of class TBasicActionLink.
	SetAutoCheck (see page 274)	Introduces an interface for setting the AutoCheck property of a client.
	SetCaption (see page 274)	Introduces an interface for setting the caption on a client.
	SetCaption (see page 5899)	Sets the caption of a control if the client is linked to the action for this event.
	SetChecked (see page 274)	Introduces an interface for setting the checked state of a client.
	SetDropdownMenu (see page 5899)	This is SetDropdownMenu, a member of class TControlActionLink.
	SetEnabled (see page 275)	Introduces an interface for setting the enabled state of a client.
	SetEnabled (see page 5900)	Sets the enabled state of a control if the client is linked to the action for this event.
	SetEnableDropdown (see page 5900)	This is SetEnableDropdown, a member of class TControlActionLink.
	SetGroupIndex (see page 275)	Introduces an interface for setting the GroupIndex property of a client.
	SetHelpContext (see page 276)	Introduces an interface for setting the help context of a client.
	SetHelpContext (see page 5900)	Sets the HelpContext of a control if the client is linked to the action help properties.
	SetHelpKeyword (see page 276)	Introduces an interface for setting the help keyword of a client.
	SetHelpKeyword (see page 5901)	Sets the HelpKeyword of a control if the client is linked to the action help properties.
	SetHelpType (see page 277)	Introduces an interface for setting the HelpType property of a client.
	SetHelpType (see page 5901)	Sets the HelpType of a control if the client is linked to the action help properties.
	SetHint (see page 278)	Introduces an interface for setting the hint for a client.
	SetHint (see page 5901)	Sets the hint of a control if the client is linked to the action for this event.
	SetImageIndex (see page 2335)	Introduces an interface for setting the image index for a client.
	SetOnExecute (see page 2724)	This is SetOnExecute, a member of class TBasicActionLink.

	SetOnExecute (see page 5902)	Sets the execution event handler for a control if the client is linked to the action for this event.
	SetPopupMenu (see page 5902)	This is SetPopupMenu, a member of class TControlActionLink.
	SetShortCut (see page 279)	Introduces an interface for setting the shortcut for a client.
	SetVisible (see page 279)	Introduces an interface for setting the visible state of a client.
	SetVisible (see page 5902)	Sets the visible state of a control if the client is linked to the action for this event.

Public Events

	Name	Description
	OnChange (see page 2725)	Occurs when an OnChange event is triggered on the action.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2332)	Instantiates and initializes a TBasicActionLink object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2722)	Destroys an instance of an action link object.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 2723)	Invokes the action's Execute method.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Update (see page 2724)	Invokes the action's Update method.

Public Properties

	Name	Description
	Action (see page 2725)	Indicates which action the link connects to its client.

17.1.2.2 TBitBtnActionLink.Create Constructor

Instantiates and initializes a TBasicActionLink object.

Pascal

```
constructor Create(AClient: TObject); override;
```

C++

```
virtual __fastcall TBitBtnActionLink(TObject * AClient);
```

Description

Applications do not need to call the constructor directly. Instances of TBasicActionLink are created automatically when you connect an action with a client in the action list editor. The AClient parameter is the client for the link. The link connects this client to its action.

Create ensures that the client is of the appropriate type for the particular type of link. Descendant classes can progressively specify more customized client types. For example, there are action link classes for controls, for windowed controls, and for button controls.

Action (see page 5797)

ActionLink (see page 5798)

17.1.2.3 TBitBtnActionLink Fields

The fields of the TBitBtnActionLink class are listed here.

Protected Fields

	Name	Description
	FClient (see page 2333)	This is FClient, a member of class TBitBtnActionLink.
	FImageIndex (see page 2333)	This is FImageIndex, a member of class TBitBtnActionLink.

17.1.2.3.1 TBitBtnActionLink.FClient Field

Pascal

```
FClient: TBitBtn;
```

C++

```
TBitBtn FClient;
```

Description

This is FClient, a member of class TBitBtnActionLink.

17.1.2.3.2 TBitBtnActionLink.FImageIndex Field

Pascal

```
FImageIndex: Integer;
```

C++

```
int FImageIndex;
```

Description

This is FImageIndex, a member of class TBitBtnActionLink.

17.1.2.4 TBitBtnActionLink Methods

The methods of the TBitBtnActionLink class are listed here.

Protected Methods

	Name	Description
	AssignClient (see page 2334)	Assigns a client control that is linked to the associated action.
	IsImageIndexLinked (see page 2334)	Indicates whether the image index for the action and the client are linked.
	SetImageIndex (see page 2335)	Introduces an interface for setting the image index for a client.

17.1.2.4.1 TBitBtnActionLink.AssignClient Method

Assigns a client control that is linked to the associated action.

Pascal

```
procedure AssignClient(AClient: TObject); override;
```

C++

```
virtual __fastcall AssignClient(TObject * AClient);
```

Description

TControlActionLink overrides AssignClient to ensure that the client for the action descends from TControl. Descendants of TControlActionLink can further limit the type of client associated with the link.

See Also

Action (see page 5797)

17.1.2.4.2 TBitBtnActionLink.IsImageIndexLinked Method

Indicates whether the image index for the action and the client are linked.

Pascal

```
function IsImageIndexLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsImageIndexLinked();
```

Description

TActionLink descendants call IsImageIndexLinked to determine whether they need to propagate changes to the ImageIndex property of the action so that they are reflected by the client object. When IsImageIndexLinked returns true, the action controls the ImageIndex property: Changes to the ImageIndex property of the action are reflected by changes to the corresponding property of the client object. When IsImageIndexLinked returns false, the client object does not reflect the ImageIndex property of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink, IsImageIndexLinked merely checks that the Action property specifies a descendant of TCustomAction (that is, it is an action that has an ImageIndex property). Descendant classes override IsImageIndexLinked to determine whether the ImageIndex property is linked with the appropriate client property.

See Also

ImageIndex (see page 313)

ImageIndex (see page 16148)

SetImageIndex (see page 278)

Action (see page 2725)

17.1.2.4.3 TBitBtnActionLink.SetImageIndex Method

Introduces an interface for setting the image index for a client.

Pascal

```
procedure SetImageIndex(Value: Integer); override;
```

C++

```
virtual __fastcall SetImageIndex(int Value);
```

Description

The associated action calls SetImageIndex when its ImageIndex property changes so that the action link can propagate the new ImageIndex value to the client object.

Value specifies the new value of the ImageIndex property.

As implemented in TActionLink, SetImageIndex does nothing. Descendant classes override SetImageIndex to set the client property that corresponds to the action's ImageIndex property if the IsImageIndexLinked method returns true.

17.1.3 TSpeedButton Class

TSpeedButton is a button that is used to execute commands or set modes.

Class Hierarchy

Pascal

```
TSpeedButton = class(TGraphicControl);
```

C++

```
class TSpeedButton : public TGraphicControl;
```

File

Buttons

Description

Use TSpeedButton to add a button to a group of buttons in a form. TSpeedButton introduces properties that can be used to set graphical images that represent the different button states (selected, unselected, disabled and so on). Use other properties to

specify multiple images or to rearrange the images and text on the button. TSpeedButton also introduces properties that allow speed buttons to work together as a group. Speed buttons are commonly grouped in panels to create specialized tool bars and tool palettes.

The recommended way to implement the response of the button when the user clicks on it is to assign an action from an action list as the value of the Action (see page 2350) property. By setting the Action (see page 2350) property, you make the button a client of the action, and the action handles updating the button's properties and responding when the user clicks the button.

If you are not using an action to respond when the user clicks the button, then you can specify the button's response by writing an OnClick (see page 2372) event handler.

Tip: To create a speed button with a client-aligned glyph that covers the button's edges, add a 1-pixel margin around the button's top and left edges and a 3-pixel margin around its bottom and right edges. Do this by manually editing the bitmap specified by the Glyph (see page 2359) property.

VCL Overview

17.1.3.1 TSpeedButton Members

The following tables list the members exposed by TSpeedButton.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FState (see page 2345)	This is FState, a member of class TSpeedButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActionChange (see page 2345)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.

	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	CopyImage (see page 2346)	This is CopyImage, a member of class TSpeedButton.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
V	GetActionLinkClass (see page 2346)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetPalette (see page 2347)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2347)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
V	MouseDown (see page 2348)	OnMouseDown event dispatcher.
V	MouseMove (see page 2348)	Respond to mouse moving over control area..

	MouseUp (see page 2349)	OnMouseUp event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Paint (see page 2349)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.

	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseInControl (see page 2361)	This is MouseInControl, a member of class TSpeedButton.
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 2346)	Generates an OnClick (see page 2372) event or triggers the associated action.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 2344)	Creates and initializes an instance of TSpeedButton (see page 2335).
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2344)	Destroys an instance of TSpeedButton (see page 2335).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.

	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.

V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnClick (see page 2372)	Occurs when the user clicks the control.
	OnDblClick (see page 2374)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnMouseActivate (see page 2374)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2375)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 2377)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2378)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 2378)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2380)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Published Properties

	Name	Description
	Action (see page 2350)	Designates the action associated with the control.
	Align (see page 2350)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	AllowAllUp (see page 2354)	Specifies whether all speed buttons in the group that contains this speed button can be unselected at the same time.
	Anchors (see page 2355)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 2355)	Specifies the bi-directional mode for the control.
	Caption (see page 2356)	Specifies the caption, or label, that appears on the speed button.
	Constraints (see page 2356)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Down (see page 2357)	Specifies whether the button is selected (down) or unselected (up).
	Enabled (see page 2357)	Controls whether the control responds to mouse, keyboard, and timer events.
	Flat (see page 2357)	Determines whether the button has a 3D border that provides a raised or lowered look.
	Font (see page 2358)	Controls the attributes of text written on or in the control.
	Glyph (see page 2359)	Specifies the bitmap that appears on the speed button.
	GroupIndex (see page 2360)	Allows speed buttons to work together as a group.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Layout (see page 2360)	Determines where the image or text appears on the speed button.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margin (see page 2361)	Specifies the number of pixels between the edge of the button and the image or caption drawn on its surface.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NumGlyphs (see page 2361)	Specifies the number of images included in the Glyph (see page 2359) property.
	ParentBiDiMode (see page 2362)	Specifies whether the control uses its parent's BiDiMode.
	ParentFont (see page 2362)	Determines where a control looks for its font information.
	ParentShowHint (see page 2363)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 2363)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 2368)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

	Spacing (see page 2369)	Determines where the image and text appear on a speed button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Transparent (see page 2370)	Specifies whether the background of the button is transparent.
	Visible (see page 2370)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

17.1.3.2 TSpeedButton.Create Constructor

Creates and initializes an instance of TSpeedButton (see page 2335).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSpeedButton(TComponent * AOwner);
```

Description

Call Create to create a speed button at runtime. Speed buttons placed on forms at design time are created automatically.

AOwner is the component, typically a form, that is responsible for freeing the speed button.

See Also

Owner (see page 2807)

17.1.3.3 TSpeedButton.Destroy Destructor

Destroys an instance of TSpeedButton (see page 2335).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSpeedButton();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the speed button is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

17.1.3.4 TSpeedButton Fields

The fields of the TSpeedButton class are listed here.

Protected Fields

	Name	Description
	FState (see page 2345)	This is FState, a member of class TSpeedButton.

17.1.3.4.1 TSpeedButton.FState Field

Pascal

```
FState: TButtonState;
```

C++

```
TButtonState FState;
```

Description

This is FState, a member of class TSpeedButton.

17.1.3.5 TSpeedButton Methods

The methods of the TSpeedButton class are listed here.

Protected Methods

	Name	Description
	ActionChange (see page 2345)	Responds when the action associated with the control changes.
	CopyImage (see page 2346)	This is CopyImage, a member of class TSpeedButton.
	GetActionLinkClass (see page 2346)	Returns the appropriate action link class that is associated with the control class.
	GetPalette (see page 2347)	Returns the handle to a palette for use by the control.
	Loaded (see page 2347)	Initializes the control after it is loaded from a stream.
	MouseDown (see page 2348)	OnMouseDown event dispatcher.
	MouseMove (see page 2348)	Respond to mouse moving over control area..
	MouseUp (see page 2349)	OnMouseUp event dispatcher.
	Paint (see page 2349)	Render control surface.

Public Methods

	Name	Description
	Click (see page 2346)	Generates an OnClick (see page 2372) event or triggers the associated action.

17.1.3.5.1 TSpeedButton.ActionChange Method

Responds when the action associated with the control changes.

Pascal

```
procedure ActionChange(Sender: TObject; CheckDefaults: Boolean); override;
```

C++

```
virtual __fastcall ActionChange(TObject * Sender, Boolean CheckDefaults);
```

Description

ActionChange is called automatically when the action object specified by the Action property, or any of its properties, changes. By default, the control's action link's OnChange event handler calls ActionChange.

ActionChange updates the control properties that correspond to properties of the associated action. These properties include the Caption, Enabled, Hint, and Visible properties and the OnClick event handler.

The Sender parameter is the action object that changed. The CheckDefaults parameter indicates whether the control's properties should all be updated or only those that have not been explicitly changed from their default values. When CheckDefaults is true, only those properties and event handlers that have not been changed from the default values are updated.

See Also

Action (see page 5797)

OnChange (see page 2725)

17.1.3.5.2 TSpeedButton.Click Method

Generates an OnClick (see page 2372) event or triggers the associated action.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

Call Click to generate an OnClick (see page 2372) event. If the speed button has an OnClick (see page 2372) event handler, or if it is linked to an action, Click allows an application to simulate a click on the button.

See Also

OnClick (see page 5851)

17.1.3.5.3 TSpeedButton.CopyImage Method

Pascal

```
procedure CopyImage(ImageList: TCustomImageList; Index: Integer);
```

C++

```
__fastcall CopyImage(TCustomImageList ImageList, int Index);
```

Description

This is CopyImage, a member of class TSpeedButton.

17.1.3.5.4 TSpeedButton.GetActionLinkClass Method

Returns the appropriate action link class that is associated with the control class.

Pascal

```
function GetActionLinkClass: TControlActionLinkClass; override;
```

C++

```
virtual __fastcall TControlActionLinkClass GetActionLinkClass();
```

Description

GetActionLinkClass returns the appropriate class type for the action link used with a control. This class is used internally to create an action link object for the control when it has an associated action. The action link links the action to the control client. Each Action link class is designed to link specific properties and event handlers of the action to its client, based on the types of properties the client supports.

As implemented in TControl, GetActionLinkClass returns the TControlActionLink class type, which associates the ShowHint, Caption, Enabled and Visible properties and the OnClick event handler. Descendants of TControl override this method to specify a descendant of TControlActionLink that handles their configuration of properties and events.

See Also

TControlActionLink (see page 5892)

ActionLink (see page 5798)

Action (see page 5797)

17.1.3.5.5 TSpeedButton.GetPalette Method

Returns the handle to a palette for use by the control.

Pascal

```
function GetPalette: HPALETTE; override;
```

C++

```
virtual __fastcall HPALETTE GetPalette();
```

Description

As implemented in TControl, GetPalette returns a null handle, indicating that the control does not have a palette. Override GetPalette to implement derived objects that use a palette. Create a palette handle for the control by a call to the Windows API function CreatePalette. GetPalette should return the palette handle for the control.

Specifying the palette for a control tells the application that the control's palette needs to be realized and designates the palette to use for realization.

GetPalette is called only if the run-time video mode requires color palette support, for example, in 256-color mode.

See Also

PaletteChanged (see page 5775)

17.1.3.5.6 TSpeedButton.Loaded Method

Initializes the control after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the control's form is loaded into memory so that the control can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method in order to initialize the control from its associated Action. To change the properties the control copies from its action, override the ActionChange method.

See Also

Loaded (see page 2782)

Action (see page 5797)

ActionChange (see page 5737)

17.1.3.5.7 TSpeedButton.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

See Also

MouseMove (see page 5773)

MouseUp (see page 5774)

OnMouseDown (see page 5862)

17.1.3.5.8 TSpeedButton.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

See Also

MouseDown (see page 5773)

MouseUp (see page 5774)

OnMouseMove (see page 5865)

17.1.3.5.9 TSpeedButton.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

See Also

MouseDown (see page 5773)

MouseMove (see page 5773)

OnMouseUp (see page 5867)

17.1.3.5.10 TSpeedButton.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas (see page 6053)

17.1.3.6 TSpeedButton Properties

The properties of the TSpeedButton class are listed here.

Protected Properties

	Name	Description
R	MouseInControl (see page 2361)	This is MouseInControl, a member of class TSpeedButton.

Published Properties

	Name	Description
	Action (see page 2350)	Designates the action associated with the control.
	Align (see page 2350)	Determines how the control aligns within its container (parent control).
	AllowAllUp (see page 2354)	Specifies whether all speed buttons in the group that contains this speed button can be unselected at the same time.
	Anchors (see page 2355)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 2355)	Specifies the bi-directional mode for the control.
	Caption (see page 2356)	Specifies the caption, or label, that appears on the speed button.
	Constraints (see page 2356)	Specifies the size constraints for the control.
	Down (see page 2357)	Specifies whether the button is selected (down) or unselected (up).
	Enabled (see page 2357)	Controls whether the control responds to mouse, keyboard, and timer events.
	Flat (see page 2357)	Determines whether the button has a 3D border that provides a raised or lowered look.
	Font (see page 2358)	Controls the attributes of text written on or in the control.
	Glyph (see page 2359)	Specifies the bitmap that appears on the speed button.
	GroupIndex (see page 2360)	Allows speed buttons to work together as a group.
	Layout (see page 2360)	Determines where the image or text appears on the speed button.
	Margin (see page 2361)	Specifies the number of pixels between the edge of the button and the image or caption drawn on its surface.
	NumGlyphs (see page 2361)	Specifies the number of images included in the Glyph (see page 2359) property.
	ParentBiDiMode (see page 2362)	Specifies whether the control uses its parent's BiDiMode.
	ParentFont (see page 2362)	Determines where a control looks for its font information.
	ParentShowHint (see page 2363)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 2363)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 2368)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Spacing (see page 2369)	Determines where the image and text appear on a speed button.
	Transparent (see page 2370)	Specifies whether the background of the button is transparent.
	Visible (see page 2370)	Determines whether the component appears onscreen.

17.1.3.6.1 TSpeedButton.Action Property

Designates the action associated with the control.

Pascal

```
property Action: TBasicAction;
```

C++

```
__property TBasicAction Action;
```

Description

Action is the action object that is associated with the control. Actions allow an application to centralize the response to user commands. When a control is associated with an action, the action determines the appropriate properties and events of the control (such as whether the control is enabled or how it responds to an OnClick event).

To create actions at design time, place an action list component on a form or data module. Double click the action list to bring up the action list editor. Add actions in the editor using its context menu. Once the actions have been added using the action list editor, they appear in the drop-down list for the Action property in the Object Inspector.

17.1.3.6.2 TSpeedButton.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;
```

```
  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
```

```
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);

17.1.3.6.3 TSpeedButton.AllowAllUp Property

Specifies whether all speed buttons in the group that contains this speed button can be unselected at the same time.

Pascal

```
property AllowAllUp: Boolean;
```

C++

```
__property Boolean AllowAllUp;
```

Description

Use AllowAllUp with a group of buttons that belong to the same group. Speed buttons belong to the same group if they have the same value on their GroupIndex (see page 2360) property. Buttons (see page 2289) in the same group behave in a mutually exclusive fashion: when one button in the group is selected (down), all other buttons in the group become unselected (up).

If AllowAllUp is true, all of the speed buttons in a group can be unselected at the same time. Clicking the single selected button in the group will deselect that button without selecting another. If AllowAllUp is false, exactly one of the buttons in the group must be selected at any time. Clicking a down button won't return the button to its up state.

Changing the value of the AllowAllUp property for one speed button in a group changes the AllowAllUp value for all buttons in the group.

Note: If GroupIndex (see page 2360) is zero, AllowAllUp has no effect.

Down (see page 2357)

GroupIndex (see page 2360)

17.1.3.6.4 TSpeedButton.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

17.1.3.6.5 TSpeedButton.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

17.1.3.6.6 TSpeedButton.Caption Property

Specifies the caption, or label, that appears on the speed button.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the caption that appears on the speed button. If the speed button is the client of an action, the Caption property can be set by that action.

See Also

Glyph (see page 2359)

Layout (see page 2360)

17.1.3.6.7 TSpeedButton.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

17.1.3.6.8 TSpeedButton.Down Property

Specifies whether the button is selected (down) or unselected (up).

Pascal

```
property Down: Boolean;
```

C++

```
__property Boolean Down;
```

Description

Read Down to determine whether a speed button is selected. The Down property only applies if the GroupIndex (see page 2360) property of the button is nonzero.

When GroupIndex (see page 2360) is greater than 0, set Down to true to select a button. When the user clicks on a button in the unselected (up) state, the button is selected and Down is set to true. When the user clicks on a button in the selected (down) state, if Caption (see page 2356) is true, the button becomes unselected and Down is set to false.

At design time, specify which button in a group is the initially selected button by setting the Down property of the selected button to true.

Note: When GroupIndex (see page 2360) is 0, buttons do not remain in the selected state when clicked.

See Also

Caption (see page 5806)

GroupIndex (see page 2360)

17.1.3.6.9 TSpeedButton.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

EnableControls (see page 6934)

Enabling Mouse

17.1.3.6.10 TSpeedButton.Flat Property

Determines whether the button has a 3D border that provides a raised or lowered look.

Pascal

```
property Flat: Boolean;
```

C++

```
__property Boolean Flat;
```

Description

Set Flat to true to remove the raised border when the button is unselected and the lowered border when the button is clicked or selected. When Flat is true, use separate bitmaps for the different button states to provide visual feedback to the user about the button state.

See Also

Glyph (see page 2359)

NumGlyphs (see page 2361)

17.1.3.6.11 TSpeedButton.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
```

```
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

17.1.3.6.12 TSpeedButton.Glyph Property

Specifies the bitmap that appears on the speed button.

Pascal

```
property Glyph: TBitmap;
```

C++

```
__property TBitmap Glyph;
```

Description

Set Glyph to a bitmap object that contains the image that should appear on the face of the button. Bring up the Open dialog box from the Object Inspector to choose a bitmap file (with a .BMP extension), or specify a bitmap file at runtime.

Glyph can provide up to four images within a single bitmap. All images must be the same size and next to each other in a horizontal row. TSpeedButton (see page 2335) displays one of these images depending on the state of the button.

Image position	Button state	Description
First	Up	This image appears when the button is unselected. If no other images exist in the bitmap, this image is used for all states.
Second	Disabled	This image usually appears dimmed to indicate that the button can't be selected.
Third	Clicked	This image appears when the button is clicked. If GroupIndex (see page 2360) is 0, the Up image reappears when the user releases the mouse button.
Fourth	Down (see page 2357)	This image appears when the button stays down indicating that it remains selected.

If only one image is present, TSpeedButton (see page 2335) attempts to represent the other states by altering the image slightly for each state, although the Down (see page 2357) state is always the same as the Up state.

If the bitmap contains multiple images, specify the number of images in the bitmap with the NumGlyphs (see page 2361) property.

Note: The lower left pixel of the bitmap is reserved for the "transparent" color. Any pixel in the bitmap that matches the lower left pixel will be transparent.

See Also

Down (see page 2357)

GroupIndex (see page 2360)

Layout (see page 2360)

NumGlyphs (see page 2361)

17.1.3.6.13 TSpeedButton.GroupIndex Property

Allows speed buttons to work together as a group.

Pascal

```
property GroupIndex: Integer;
```

C++

```
__property int GroupIndex;
```

Description

Set GroupIndex to determine how the button behaves when clicked.

When GroupIndex is 0, the button behaves independently of all other buttons on the form. When the user clicks such a speed button, the button appears pressed (in its clicked state) and then returns to its normal up state when the user releases the mouse button.

When GroupIndex is greater than 0, the button remains selected (in its down state) when clicked by the user. When the user clicks a selected button, it returns to the up state, unless AllowAllUp (see page 2354) is false. Setting the GroupIndex property of a single speed button to a value greater than 0 causes the button to behave as a two-state button when AllowAllUp (see page 2354) is true.

Speed buttons with the same GroupIndex property value (other than 0), work together as a group. When the user clicks one of these buttons, it remains selected until the user clicks another speed button belonging to the same group. Speed buttons used in this way can present mutually exclusive choices to the user.

See Also

Caption (see page 5806)

Down (see page 2357)

Layout (see page 2360)

17.1.3.6.14 TSpeedButton.Layout Property

Determines where the image or text appears on the speed button.

Pascal

```
property Layout: TButtonLayout;
```

C++

```
__property TButtonLayout Layout;
```

Description

Set Layout to determine the position of the bitmap specified by the Glyph (see page 2359) property or the text specified by the Caption (see page 2356) property.

See Also

Caption (see page 5806)

Glyph (see page 2359)

Margin (see page 2361)

Spacing (see page 2369)

17.1.3.6.15 TSpeedButton.Margin Property

Specifies the number of pixels between the edge of the button and the image or caption drawn on its surface.

Pascal

```
property Margin: Integer;
```

C++

```
__property int Margin;
```

Description

Use Margin to specify the indentation of the image specified by the Glyph (see page 2359) property or the text specified by the Caption (see page 2356) property. The edges that Margin separates depends on the Layout (see page 2360) property. If Layout (see page 2360) is blGlyphLeft, the margin appears between the left edge of the image or caption and the left edge of the button. If Layout (see page 2360) is blGlyphRight, the margin separates the right edges. If Layout (see page 2360) is blGlyphTop, the margin separates the top edges, and if Layout (see page 2360) is blGlyphBottom, the margin separates the bottom edges.

If Margin is –1, the image or text is centered on the button.

See Also

Caption (see page 5806)

Glyph (see page 2359)

Spacing (see page 2369)

17.1.3.6.16 TSpeedButton.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TSpeedButton.

17.1.3.6.17 TSpeedButton.NumGlyphs Property

Specifies the number of images included in the Glyph (see page 2359) property.

Pascal

```
property NumGlyphs: TNumGlyphs;
```

C++

```
__property TNumGlyphs NumGlyphs;
```

Description

Set NumGlyphs to the number of images provided by the bitmap assigned to the Glyph (see page 2359) property. All images must be the same size and next to each other in a row. The Glyph (see page 2359) property can provide up to four images.

See Also

Glyph (see page 2359)

17.1.3.6.18 TSpeedButton.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

17.1.3.6.19 TSpeedButton.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

17.1.3.6.20 TSpeedButton.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

ParentFont (see page 5834)

ShowHint (see page 5840)

17.1.3.6.21 TSpeedButton.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
```

```
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

17.1.3.6.22 TSpeedButton.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
```

```
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

17.1.3.6.23 TSpeedButton.Spacing Property

Determines where the image and text appear on a speed button.

Pascal

```
property Spacing: Integer;
```

C++

```
__property int Spacing;
```

Description

Set Spacing to the number of pixels that should appear between the image specified in the Glyph (see page 2359) property and the text specified in the Caption (see page 2356) property.

If Spacing is a positive number, its value is the number of pixels between the image and text. If Spacing is 0, the image and text appear flush with each other. If Spacing is -1, the text appears centered between the image and the button edge.

See Also

Caption (see page 5806)

Glyph (see page 2359)

Margin (see page 2361)

Layout (see page 2360)

17.1.3.6.24 TSpeedButton.Transparent Property

Specifies whether the background of the button is transparent.

Pascal

```
property Transparent: Boolean;
```

C++

```
__property Boolean Transparent;
```

Description

Use Transparent to specify whether the background of the button is transparent.

See Also

Glyph (see page 2359)

NumGlyphs (see page 2361)

17.1.3.6.25 TSpeedButton.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
```

```
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

17.1.3.7 TSpeedButton Events

The events of the TSpeedButton class are listed here.

Published Events

	Name	Description
	OnClick (see page 2372)	Occurs when the user clicks the control.
	OnDblClick (see page 2374)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnMouseActivate (see page 2374)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 2375)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 2377)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 2378)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 2378)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 2380)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

17.1.3.7.1 TSpeedButton.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
```

```
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
```

```
end;

17.1.3.7.2 TSpeedButton.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

OnClick (see page 5851)

Responding to User Actions at Runtime

17.1.3.7.3 TSpeedButton.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no

control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

17.1.3.7.4 TSpeedButton.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
```

```
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

17.1.3.7.5 TSpeedButton.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

17.1.3.7.6 TSpeedButton.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

17.1.3.7.7 TSpeedButton.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form’s unit
// Use this code as the OnMouseDown event handler of the form:

  StartY = Y;
}
```

```
// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);

  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
```

```
    StatusBar1.Panels[1].Text := '';
    StatusBar1.Panels[2].Text := '';
    StatusBar1.Panels[3].Text := '';
  end;

  procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
  begin
    if ssLeft in Shift then { make sure button is down }
    begin
      if Y > StartY then
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
        end
      else
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

17.1.3.7.8 TSpeedButton.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
```

```
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
```

```
  released the mouse button.  While the user drags the mouse,
  the location of the top, left, bottom, and right sides of
  the rectangle are displayed in the status bar.
  }
  procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
  Y: Integer);
  begin
    StartX := X;
    StartY := Y;
  end;

  procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
  Integer);
  begin
    Form1.Canvas.Rectangle(StartX, StartY, X, Y);
    StatusBar1.Panels[0].Text := '';
    StatusBar1.Panels[1].Text := '';
    StatusBar1.Panels[2].Text := '';
    StatusBar1.Panels[3].Text := '';
  end;

  procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
  begin
    if ssLeft in Shift then { make sure button is down }
    begin
      if Y > StartY then
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
        end
      else
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

17.1.4 TSpeedButtonActionLink Class

TSpeedButtonActionLink is an action link designed specifically for button control clients.

Class Hierarchy

Pascal

```
TSpeedButtonActionLink = class(TControlActionLink);
```

C++

```
class TSpeedButtonActionLink : public TControlActionLink;
```

File

Buttons

Description

TSpeedButtonActionLink is designed to specifically link actions to speed buttton control clients. TSpeedButtonActionLink overrides methods to determine whether the action and client are linked, and to ensure that action events are appropriate for properties of speed button control clients.

TSpeedButtonActionLink inherits, from its ancestors, support for linking actions with the properties of components, generic controls, and windowed controls. TSpeedButtonActionLink adds support for linking the checked property to the appropriate property of a speed button control.

17.1.4.1 TSpeedButtonActionLink Members

The following tables list the members exposed by TSpeedButtonActionLink.

Protected Fields

	Name	Description
	FAction (see page 2722)	This is FAction, a member of class TBasicActionLink.
	FClient (see page 2386)	This is FClient, a member of class TSpeedButtonActionLink.
	FImageIndex (see page 2386)	This is FImageIndex, a member of class TSpeedButtonActionLink.

Protected Methods

	Name	Description
	AssignClient (see page 2386)	Assigns a client control that is linked to the associated action.
	Change (see page 2723)	This is Change, a member of class TBasicActionLink.
	DoShowHint (see page 5896)	Indicates whether the hint is shown, and modified.
	IsCaptionLinked (see page 268)	Indicates whether the Caption properties for the action and client are linked.
	IsCaptionLinked (see page 5896)	Indicates whether the caption for the action and the client are linked.
	IsCheckedLinked (see page 2387)	Indicates whether the Checked properties for the action and client are linked.
	IsDropdownMenuLinked (see page 5896)	This is IsDropdownMenuLinked, a member of class TControlActionLink.
	IsEnabledLinked (see page 269)	Indicates whether the Enabled properties for the action and client are linked.
	IsEnabledLinked (see page 5897)	Indicates whether the enabled state for the action and the client are linked.
	IsEnableDropdownLinked (see page 5897)	This is IsEnableDropdownLinked, a member of class TControlActionLink.
	IsGroupIndexLinked (see page 2387)	Indicates whether the GroupIndex property for the action controls client behavior.
	IsHelpContextLinked (see page 270)	Indicates whether the HelpContext properties for the action and client controls are linked.
	IsHelpLinked (see page 271)	Indicates whether the help properties for the action and client are linked.
	IsHelpLinked (see page 5897)	Indicates whether the help properties for the action and the client are linked.
	IsHintLinked (see page 271)	Indicates whether the Hint properties for the action and client are linked.
	IsHintLinked (see page 5898)	Indicates whether the Hint property for the action and the client are linked.
	IsImageIndexLinked (see page 2388)	Indicates whether the image index for the action and the client are linked.
	IsOnExecuteLinked (see page 2723)	This is IsOnExecuteLinked, a member of class TBasicActionLink.
	IsOnExecuteLinked (see page 5898)	Indicates whether the OnExecute event handler for the action and the client are linked.
	IsPopupMenuLinked (see page 5898)	This is IsPopupMenuLinked, a member of class TControlActionLink.
	IsShortCutLinked (see page 272)	Indicates whether the ShortCut properties for the action and client are linked.

	IsVisibleLinked (see page 273)	Indicates whether the Visible properties for the action and client are linked.
	IsVisibleLinked (see page 5899)	Indicates whether the visible state for the action and the client are linked.
	SetAction (see page 2724)	This is SetAction, a member of class TBasicActionLink.
	SetAutoCheck (see page 274)	Introduces an interface for setting the AutoCheck property of a client.
	SetCaption (see page 274)	Introduces an interface for setting the caption on a client.
	SetCaption (see page 5899)	Sets the caption of a control if the client is linked to the action for this event.
	SetChecked (see page 2388)	Introduces an interface for setting the checked state of a client.
	SetDropdownMenu (see page 5899)	This is SetDropdownMenu, a member of class TControlActionLink.
	SetEnabled (see page 275)	Introduces an interface for setting the enabled state of a client.
	SetEnabled (see page 5900)	Sets the enabled state of a control if the client is linked to the action for this event.
	SetEnableDropdown (see page 5900)	This is SetEnableDropdown, a member of class TControlActionLink.
	SetGroupIndex (see page 2389)	Introduces an interface for setting the GroupIndex property of a client.
	SetHelpContext (see page 276)	Introduces an interface for setting the help context of a client.
	SetHelpContext (see page 5900)	Sets the HelpContext of a control if the client is linked to the action help properties.
	SetHelpKeyword (see page 276)	Introduces an interface for setting the help keyword of a client.
	SetHelpKeyword (see page 5901)	Sets the HelpKeyword of a control if the client is linked to the action help properties.
	SetHelpType (see page 277)	Introduces an interface for setting the HelpType property of a client.
	SetHelpType (see page 5901)	Sets the HelpType of a control if the client is linked to the action help properties.
	SetHint (see page 278)	Introduces an interface for setting the hint for a client.
	SetHint (see page 5901)	Sets the hint of a control if the client is linked to the action for this event.
	SetImageIndex (see page 2389)	Introduces an interface for setting the image index for a client.
	SetOnExecute (see page 2724)	This is SetOnExecute, a member of class TBasicActionLink.
	SetOnExecute (see page 5902)	Sets the execution event handler for a control if the client is linked to the action for this event.
	SetPopupMenu (see page 5902)	This is SetPopupMenu, a member of class TControlActionLink.
	SetShortCut (see page 279)	Introduces an interface for setting the shortcut for a client.
	SetVisible (see page 279)	Introduces an interface for setting the visible state of a client.
	SetVisible (see page 5902)	Sets the visible state of a control if the client is linked to the action for this event.

Public Events

	Name	Description
	OnChange (see page 2725)	Occurs when an OnChange event is triggered on the action.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2385)	Instantiates and initializes a TBasicActionLink object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2722)	Destroys an instance of an action link object.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 2723)	Invokes the action's Execute method.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Update (see page 2724)	Invokes the action's Update method.

Public Properties

	Name	Description
	Action (see page 2725)	Indicates which action the link connects to its client.

17.1.4.2 TSpeedButtonActionLink.Create Constructor

Instantiates and initializes a TBasicActionLink object.

Pascal

```
constructor Create(AClient: TObject); override;
```

C++

```
virtual __fastcall TSpeedButtonActionLink(TObject * AClient);
```

Description

Applications do not need to call the constructor directly. Instances of TBasicActionLink are created automatically when you connect an action with a client in the action list editor. The AClient parameter is the client for the link. The link connects this client to its action.

Create ensures that the client is of the appropriate type for the particular type of link. Descendant classes can progressively specify more customized client types. For example, there are action link classes for controls, for windowed controls, and for button controls.

Action (see page 5797)

ActionLink (see page 5798)

17.1.4.3 TSpeedButtonActionLink Fields

The fields of the TSpeedButtonActionLink class are listed here.

Protected Fields

	Name	Description
	FClient (see page 2386)	This is FClient, a member of class TSpeedButtonActionLink.
	FImageIndex (see page 2386)	This is FImageIndex, a member of class TSpeedButtonActionLink.

17.1.4.3.1 TSpeedButtonActionLink.FClient Field

Pascal

```
FClient: TSpeedButton;
```

C++

```
TSpeedButton FClient;
```

Description

This is FClient, a member of class TSpeedButtonActionLink.

17.1.4.3.2 TSpeedButtonActionLink.FImageIndex Field

Pascal

```
FImageIndex: Integer;
```

C++

```
int FImageIndex;
```

Description

This is FImageIndex, a member of class TSpeedButtonActionLink.

17.1.4.4 TSpeedButtonActionLink Methods

The methods of the TSpeedButtonActionLink class are listed here.

Protected Methods

	Name	Description
	AssignClient (see page 2386)	Assigns a client control that is linked to the associated action.
	IsCheckedLinked (see page 2387)	Indicates whether the Checked properties for the action and client are linked.
	IsGroupIndexLinked (see page 2387)	Indicates whether the GroupIndex property for the action controls client behavior.
	IsImageIndexLinked (see page 2388)	Indicates whether the image index for the action and the client are linked.
	SetChecked (see page 2388)	Introduces an interface for setting the checked state of a client.
	SetGroupIndex (see page 2389)	Introduces an interface for setting the GroupIndex property of a client.
	SetImageIndex (see page 2389)	Introduces an interface for setting the image index for a client.

17.1.4.4.1 TSpeedButtonActionLink.AssignClient Method

Assigns a client control that is linked to the associated action.

Pascal

```
procedure AssignClient(AClient: TObject); override;
```

C++

```
virtual __fastcall AssignClient(TObject * AClient);
```

Description

TControlActionLink overrides AssignClient to ensure that the client for the action descends from TControl. Descendants of TControlActionLink can further limit the type of client associated with the link.

See Also

Action (see page 5797)

17.1.4.4.2 TSpeedButtonActionLink.IsCheckedLinked Method

Indicates whether the Checked properties for the action and client are linked.

Pascal

```
function IsCheckedLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsCheckedLinked();
```

Description

TActionLink descendants call IsCheckedLinked to determine whether they need to propagate changes to the Checked property of the action so that they are reflected by the client object. When IsCheckedLinked returns true, the action controls the Checked property: Changes to the Checked property of the action are reflected by changes to the corresponding property of the client object. When IsCheckedLinked returns false, the client object does not reflect the Checked property of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink, IsCheckedLinked merely checks that the Action property specifies a descendant of TCustomAction (that is, it is an action that has a Checked property). Descendant classes override IsCheckedLinked to determine whether the Checked property is linked with the appropriate client property.

See Also

Checked (see page 308)

SetChecked (see page 274)

Action (see page 2725)

17.1.4.4.3 TSpeedButtonActionLink.IsGroupIndexLinked Method

Indicates whether the GroupIndex property for the action controls client behavior.

Pascal

```
function IsGroupIndexLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsGroupIndexLinked();
```

Description

TActionLink descendants can call IsGroupIndexLinked to determine whether they need to propagate changes to the GroupIndex property of the action so that they are reflected by the client object. When IsGroupIndexLinked returns true, the action controls the GroupIndex property: Changes to the GroupIndex property of the action are reflected in the client object. When IsGroupIndexLinked returns false, the client object is not influenced by the GroupIndex property of its action.

As implemented in TActionLink, IsGroupIndexLinked merely checks that the Action property specifies a descendant of TCustomAction, and if so, returns true.

See Also

GroupIndex (see page 311)

SetGroupIndex (see page 275)

Action (see page 2725)

17.1.4.4.4 TSpeedButtonActionLink.IsImageIndexLinked Method

Indicates whether the image index for the action and the client are linked.

Pascal

```
function IsImageIndexLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsImageIndexLinked();
```

Description

TActionLink descendants call IsImageIndexLinked to determine whether they need to propagate changes to the ImageIndex property of the action so that they are reflected by the client object. When IsImageIndexLinked returns true, the action controls the ImageIndex property: Changes to the ImageIndex property of the action are reflected by changes to the corresponding property of the client object. When IsImageIndexLinked returns false, the client object does not reflect the ImageIndex property of its action, either because it does not have a corresponding property, or, more commonly, because it manages the value of its corresponding property independently.

As implemented in TActionLink, IsImageIndexLinked merely checks that the Action property specifies a descendant of TCustomAction (that is, it is an action that has an ImageIndex property). Descendant classes override IsImageIndexLinked to determine whether the ImageIndex property is linked with the appropriate client property.

See Also

ImageIndex (see page 313)

ImageIndex (see page 16148)

SetImageIndex (see page 278)

Action (see page 2725)

17.1.4.4.5 TSpeedButtonActionLink.SetChecked Method

Introduces an interface for setting the checked state of a client.

Pascal

```
procedure SetChecked(Value: Boolean); override;
```

C++

```
virtual __fastcall SetChecked(Boolean Value);
```

Description

The associated action calls SetChecked when its Checked property changes so that the action link can propagate the new Checked value to the client object.

Value specifies the new value of the Checked property.

As implemented in TActionLink, SetChecked does nothing. Descendant classes override SetChecked to set the client property that corresponds to the action's Checked property if the IsCheckedLinked method returns true.

See Also

Checked (see page 308)

Action (see page 2725)

IsCheckedLinked (see page 269)

17.1.4.4.6 TSpeedButtonActionLink.SetGroupIndex Method

Introduces an interface for setting the GroupIndex property of a client.

Pascal

```
procedure SetGroupIndex(Value: Integer); override;
```

C++

```
virtual __fastcall SetGroupIndex(int Value);
```

Description

The associated action calls SetGroupIndex when its GroupIndex property changes so that the action link can propagate the new GroupIndex value to the client object.

Value specifies the new value of the GroupIndex property.

As implemented in TActionLink, SetGroupIndex does nothing. It is not strictly necessary for descendant classes to override SetGroupIndex to set the client property that corresponds to the action's GroupIndex property, because the action itself implements the GroupIndex feature. That is, when an action's Checked property is set to true, it unchecks other actions in the same action list if they have the same GroupIndex value.

GroupIndex (see page 311)

GroupIndex (see page 16146)

Action (see page 2725)

GroupIndex (see page 2360)

Checked (see page 308)

IsGroupIndexLinked (see page 270)

17.1.4.4.7 TSpeedButtonActionLink.SetImageIndex Method

Introduces an interface for setting the image index for a client.

Pascal

```
procedure SetImageIndex(Value: Integer); override;
```

C++

```
virtual __fastcall SetImageIndex(int Value);
```

Description

The associated action calls SetImageIndex when its ImageIndex property changes so that the action link can propagate the new ImageIndex value to the client object.

Value specifies the new value of the ImageIndex property.

As implemented in TActionLink, SetImageIndex does nothing. Descendant classes override SetImageIndex to set the client property that corresponds to the action's ImageIndex property if the IsImageIndexLinked method returns true.

17.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DrawButtonFace (see page 2391)	Draws a push button.

17.2.1 Buttons.DrawButtonFace Function

Draws a push button.

Pascal

```
function DrawButtonFace(Canvas: TCanvas; const Client: TRect; BevelWidth: Integer; Style:
TButtonStyle; IsRounded: Boolean; IsDown: Boolean; IsFocused: Boolean): TRect;
```

C++

```
TRect DrawButtonFace(TCanvas Canvas, const TRect Client, int BevelWidth, TButtonStyle Style,
Boolean IsRounded, Boolean IsDown, Boolean IsFocused);
```

File

Buttons

Description

Use DrawButtonFace to draw a standard push button. DrawButtonFace draws the borders and background of the button. DrawButtonFace can be used by button controls that do not descend from TButtonControl, which must implement all their own rendering.

Canvas is the drawing surface on which to render the button.

Client indicates the boundaries of the button's client area on Canvas.

BevelWidth is the width of the beveled edge on the outside of the button. This parameter is ignored.

IsDown indicates whether the button is depressed.

IsFocused indicates whether the button has keyboard focus.

Flat indicates whether the button has a beveled border.

FillColor is the color to use for the surface of the button.

FillStyle is the style to use for the brush that paints the surface of the button.

DrawButtonFace returns the dimensions of the remaining usable area on the surface of the button after the edges and bevels have been drawn.

TButtonControl

17.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TBitBtnKind (see page 2392)	TBitBtnKind identifies the appearance and use of a TBitBtn (see page 2290) control.
	TButtonLayout (see page 2393)	TButtonLayout defines values for the Layout property of buttons.
	TButtonState (see page 2394)	TButtonState describes the current state of a button.
	TButtonStyle (see page 2395)	TButtonStyle specifies the basic look of a TBitBtn (see page 2290) control.

17.3.1 Buttons.TBitBtnKind Enumeration

TBitBtnKind identifies the appearance and use of a TBitBtn (see page 2290) control.

Pascal

```
TBitBtnKind = (
  bkCustom,
  bkOK,
  bkCancel,
  bkHelp,
  bkYes,
  bkNo,
  bkClose,
  bkAbort,
  bkRetry,
  bkIgnore,
  bkAll
);
```

C++

```
enum TBitBtnKind {
  bkCustom,
  bkOK,
  bkCancel,
  bkHelp,
  bkYes,
  bkNo,
  bkClose,
  bkAbort,
  bkRetry,
  bkIgnore,
  bkAll
};
```

Buttons

Description

TBitBtnKind specifies how a TBitBtn (see page 2290) control is rendered and how it behaves when clicked. The following table lists the possible values:

Value	Meaning
bkCustom	The button uses the Glyph property to determine the image that appears. There is no associated ModalResult value. Instead, you must explicitly select a ModalResult for the button or supply the code to respond using an action or an OnClick event.
bkOK	The text "OK" appears on the button face (possibly accompanied by a green check mark). The button becomes the default button (the Default property is automatically set to true). When the user chooses the button, the dialog box closes. The resulting ModalResult value of the button is mrOk.
bkCancel	The text "Cancel" appears on the button face (possibly accompanied by a red X). The button becomes the Cancel button (the Cancel property is automatically set to true). When the user chooses the button, the dialog box closes. The resulting ModalResult value of the bitmap button is mrCancel.
bkYes	The text "Yes" appears on the button face (possibly accompanied by a green check mark). The button becomes the default button (the Default property is automatically set to true). When the user chooses the button, any changes the user made in the dialog box are accepted and the dialog box closes. The resulting ModalResult value of the bitmap button is mrYes.
bkNo	The text "No" appears on the button face (possibly accompanied by a red no symbol). The button becomes the Cancel button (the Cancel property is automatically set to true). When the user chooses the button, any changes the user made in the dialog box are canceled and the dialog box closes. The resulting ModalResult value of the bitmap button is mrNo.
bkHelp	The text "Help" appears on the button face (possibly accompanied by a cyan question mark). When the user chooses the button, the help topic associated with the button is automatically displayed.
bkClose	The text "Close" appears on the button face (possibly accompanied by a door with a green exit sign over it). When the user chooses the button, the form closes. The Default property of the button is true.
bkAbort	The text "Abort" appears on the button face (possibly accompanied by a red X).
bkRetry	The text "Retry" appears on the button face (possibly accompanied by a green circular arrow).
bkIgnore	The text "Ignore" appears on the button face (possibly accompanied by a green man walking away). Use it to allow the user to continue after an error has occurred.
bkAll	The text "Yes to All" appears on the button face (possibly accompanied by a double green check mark).

CustomAlignPosition

17.3.2 Buttons.TButtonLayout Enumeration

TButtonLayout defines values for the Layout property of buttons.

Pascal

```
TButtonLayout = (
  blGlyphLeft,
  blGlyphRight,
  blGlyphTop,
  blGlyphBottom
);
```

C++

```
enum TButtonLayout {
  blGlyphLeft,
  blGlyphRight,
  blGlyphTop,
```

```
  blGlyphBottom
};
```

File

Buttons

Description

TButtonLayout defines the location of an image on a button. The following table lists the values for TButtonLayout:

Value	Meaning
blGlyphLeft	The image appears near the left side of the button.
blGlyphRight	The image appears near the right side of the button.
blGlyphTop	The image appears near the top of the button.
blGlyphBottom	The image appears near the bottom of the button.

TBitBtn

TSpeedButton

17.3.3 Buttons.TButtonState Enumeration

TButtonState describes the current state of a button.

Pascal

```
TButtonState = (
  bsUp,
  bsDisabled,
  bsDown,
  bsExclusive
);
```

C++

```
enum TButtonState {
  bsUp,
  bsDisabled,
  bsDown,
  bsExclusive
};
```

File

Buttons

Description

Use TButtonState as an indicator of the state of the button control. The possible values are as follows:

Value	State Description
bsUp	The button control is up, or unselected.
bsDisabled	The button is not enabled, which generally means it is greyed out. It cannot be selected by the user.
bsDown	The button control is down, or selected.

bsExclusive	The button is a "radio button." It is one of a group of buttons, exactly one of which must be selected at any given time. Selecting another button will cause the previously selected button to become deselected.

17.3.4 Buttons.TButtonStyle Enumeration

TButtonStyle specifies the basic look of a TBitBtn (see page 2290) control.

Pascal

```
TButtonStyle = (
  bsAutoDetect,
  bsWin31,
  bsNew
);
```

C++

```
enum TButtonStyle {
  bsAutoDetect,
  bsWin31,
  bsNew
};
```

File

Buttons

Description

The following are possible values of TButtonStyle:

Value	Meaning
bsAutoDetect	When using Windows 3.x, the bitmap button uses the standard Windows 3.x look. When using a later version of Windows, the bitmap button uses a newer look.
bsWin31	Uses the standard Windows 3.1 look, regardless of which version of Windows is running.
bsNew	Uses a new bitmap button look, regardless of which version of Windows is running.

17.4 Types

The following table lists types in this documentation.

Types

Name	Description
TNumGlyphs (see page 2396)	This is type Buttons.TNumGlyphs.

17.4.1 Buttons.TNumGlyphs Type

Pascal

```
TNumGlyphs = 1..4;
```

C++

```
1..4 TNumGlyphs;
```

File

Buttons

Description

This is type Buttons.TNumGlyphs.

18 CaptionedDockTree Namespace

This is namespace CaptionedDockTree.

Topics

Name	Description
Classes (see page 2398)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 2409)	The following table lists structs, records, enums in this documentation.
Types (see page 2411)	The following table lists types in this documentation.
Constants (see page 2413)	The following table lists constants in this documentation.

Classes

	Name	Description
	TCaptionedDockTree (see page 2398)	Defines a new appearance of the docking mechanism for components that can be docked.
	TDockCaptionDrawer (see page 2405)	Creates an instance of the TDockCaptionDrawer.

Constants

Name	Description
dchtCaption (see page 2413)	This is constant CaptionedDockTree.dchtCaption.
dchtClose (see page 2413)	This is constant CaptionedDockTree.dchtClose.
dchtCustom (see page 2414)	This is constant CaptionedDockTree.dchtCustom.
dchtNone (see page 2414)	This is constant CaptionedDockTree.dchtNone.
dchtPin (see page 2414)	This is constant CaptionedDockTree.dchtPin.

Structs, Records, Enums

	Name	Description
	TDockCaptionOrientation (see page 2409)	Defines the values used to determine caption orientation.
	TDockCaptionPinButton (see page 2409)	The pin button styles.
	TParentFormState (see page 2410)	Stores information about the parent dock form for use in drawing the dock site.

Types

Name	Description
TCaptionedDockTreeClass (see page 2411)	This is type CaptionedDockTree.TCaptionedDockTreeClass.
TDockCaptionDrawerClass (see page 2411)	This is type CaptionedDockTree.TDockCaptionDrawerClass.
TDockCaptionHitTest (see page 2411)	Defines the values available for use in a hit test.

18.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCaptionedDockTree (see page 2398)	Defines a new appearance of the docking mechanism for components that can be docked.
	TDockCaptionDrawer (see page 2405)	Creates an instance of the TDockCaptionDrawer.

18.1.1 TCaptionedDockTree Class

Defines a new appearance of the docking mechanism for components that can be docked.

Class Hierarchy

Pascal

```
TCaptionedDockTree = class(TDockTree);
```

C++

```
class TCaptionedDockTree : public TDockTree;
```

File

CaptionedDockTree

Description

Include this class in your project to use the more modern appearance of RAD Studio. If you do not add this class, your docking items will appear as they did in Delphi 7.

18.1.1.1 TCaptionedDockTree Members

The following tables list the members exposed by TCaptionedDockTree.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
V	AdjustCaptionRect (see page 2402)	This is AdjustCaptionRect, a member of class TCaptionedDockTree.

V	AdjustDockRect (see page 2402)	Adjusts the boundaries of the docking zone where a specified control is docked.
V	AdjustFrameRect (see page 5988)	This is AdjustFrameRect, a member of class TDockTree.
	BeginUpdate (see page 5988)	Responds when the docked controls are about to change.
	EndUpdate (see page 5988)	Responds when the docked controls have finished changing.
	FindControlAtPos (see page 5989)	This is FindControlAtPos, a member of class TDockTree.
	GetControlBounds (see page 5989)	Returns the dimensions allotted to a control that is already docked.
V	HitTest (see page 5990)	Indicates which docked control is at a specified mouse position.
V	InsertControl (see page 5990)	Handles the docking of a control into the associated DockSite (see page 5996).
	InternalCaptionHitTest (see page 2403)	This is InternalCaptionHitTest, a member of class TCaptionedDockTree.
V	LoadFromStream (see page 5991)	Creates docking zones for a set of docked controls read from a stream.
V	MouseDown (see page 5991)	This is MouseDown, a member of class TDockTree.
V	MouseMove (see page 5991)	This is MouseMove, a member of class TDockTree.
V	MouseUp (see page 5992)	This is MouseUp, a member of class TDockTree.
V	PaintDockFrame (see page 2404)	Paints the elements of a docking zone that surround a docked control.
V	PositionDockRect (see page 5993)	Computes the dimensions of a new docking zone.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
V	ReferenceFromOrient (see page 5993)	This is ReferenceFromOrient, a member of class TDockTree.
V	RemoveControl (see page 5993)	Handles the undocking of a control from the associated DockSite (see page 5996).
V	ResetBounds (see page 5994)	Recomputes the layout of docked controls.
V	SaveToStream (see page 5994)	Saves a list of the set of docked controls and their positions to a stream.
	SetReplacingControl (see page 5995)	Prepares the dock tree for replacing one docked control with another.
V	ShowHint (see page 5995)	This is ShowHint, a member of class TDockTree.
	UpdateAll (see page 5995)	Makes any internal adjustments to reflect the current state of the docked controls.
V	WndProc (see page 2404)	This is WndProc, a member of class TCaptionedDockTree.
V	ZoneCaptionHitTest (see page 2404)	This is ZoneCaptionHitTest, a member of class TCaptionedDockTree.

Protected Properties

	Name	Description
R	DockCaptionDrawer (see page 2405)	This is DockCaptionDrawer, a member of class TCaptionedDockTree.
R	DockCaptionOrientation (see page 2405)	This is DockCaptionOrientation, a member of class TCaptionedDockTree.
	DockSite (see page 5996)	Specifies the windowed control that uses this dock tree to manage docking operations.
	RelativeSizes (see page 5997)	This is RelativeSizes, a member of class TDockTree.
R	TopZone (see page 5997)	This is TopZone, a member of class TDockTree.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginUpdate (see page 6239)	Responds when the docked controls are about to change.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2400)	This is the overview for the Create constructor overload.

V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2401)	Frees the memory associated with the TDockTree object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 6240)	Responds when the docked controls have finished changing.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetControlBounds (see page 6240)	Returns the dimensions allotted to a control that is already docked.
V	GetDockCaptionDrawer (see page 2403)	This is GetDockCaptionDrawer, a member of class TCaptionedDockTree.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetParentFormState (see page 2403)	Returns the state of the form that contains the control.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertControl (see page 6240)	Handles the docking of a control into the associated container control.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	LoadFromStream (see page 6241)	Lays out a set of docked controls read from a stream.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintSite (see page 6241)	Paints the elements that surround all docked controls.
V	PaintSite (see page 5992)	Paints the elements that surround all docked controls.
	PositionDockRect (see page 6242)	Computes the dimensions of a new docking zone.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RemoveControl (see page 6242)	Handles the undocking of a control from the associated container control.
	ResetBounds (see page 6243)	Recomputes the layout of docked controls.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToStream (see page 6245)	Saves a list of the set of docked controls and their positions to a stream.
	SetReplacingControl (see page 6245)	This is SetReplacingControl, a member of class IDockManager.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

18.1.1.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
V	TCaptionedDockTree.Create (TWinControl) (see page 2401)	Creates and initializes a TDockTree object.
	TCaptionedDockTree.Create (TWinControl, TDockCaptionOrientation) (see page 2401)	This is Create, a member of class TCaptionedDockTree.

18.1.1.2.1 TCaptionedDockTree.Create Constructor (TWinControl)

Creates and initializes a TDockTree object.

Pascal

```
constructor Create(DockSite: TWinControl); override; overload;
```

C++

```
virtual __fastcall TCaptionedDockTree(TWinControl * DockSite);
```

Description

Createinstantiates a new TDockTree object to manage docking operations for the control specified by the DockSite parameter. Typically, applications do not create TDockTree objects. Instead, the windowed control that is the value of the DockSite parameter creates the dock tree when an application sets its UseDockManager property to true.

DockSite is the windowed control that uses the dock tree to manage the docking of child controls. It becomes the value of the DockSite property.

Createinitializes the new dock tree to reflect any controls currently docked in DockSite. It then replaces the WindowProc property of DockSite with a method that handles all docking-related messages, passing any other messages on to DockSite's previous window procedure.

See Also

UseDockManager (see page 6212)

DockManager (see page 6202)

DefaultDockTreeClass (see page 6321)

DockSite (see page 5996)

WindowProc (see page 5872)

18.1.1.2.2 TCaptionedDockTree.Create Constructor (TWinControl, TDockCaptionOrientation)

Pascal

```
constructor Create(DockSite: TWinControl; ADockCaptionOrientation: TDockCaptionOrientation);
overload; reintroduce;
```

C++

```
__fastcall TCaptionedDockTree(TWinControl * DockSite, TDockCaptionOrientation
ADockCaptionOrientation);
```

Description

This is Create, a member of class TCaptionedDockTree.

18.1.1.3 TCaptionedDockTree.Destroy Destructor

Frees the memory associated with the TDockTree object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCaptionedDockTree();
```

Description

Do not explicitly destroy TDockTree objects. As interfaced objects, dock trees are destroyed automatically when the reference count of their IDockManager interface drops to zero.

Destroy detaches the dock tree from the windowed control specified by the DockSite property, restoring its WindowProc property to the value it had when it called the TDockTree constructor.

RefCount (see page 22281)

Create (see page 5985)

DockSite (see page 5996)

WindowProc (see page 5872)

18.1.1.4 TCaptionedDockTree Methods

The methods of the TCaptionedDockTree class are listed here.

Protected Methods

	Name	Description
	AdjustCaptionRect (see page 2402)	This is AdjustCaptionRect, a member of class TCaptionedDockTree.
	AdjustDockRect (see page 2402)	Adjusts the boundaries of the docking zone where a specified control is docked.
	InternalCaptionHitTest (see page 2403)	This is InternalCaptionHitTest, a member of class TCaptionedDockTree.
	PaintDockFrame (see page 2404)	Paints the elements of a docking zone that surround a docked control.
	WndProc (see page 2404)	This is WndProc, a member of class TCaptionedDockTree.
	ZoneCaptionHitTest (see page 2404)	This is ZoneCaptionHitTest, a member of class TCaptionedDockTree.

Public Methods

	Name	Description
	GetDockCaptionDrawer (see page 2403)	This is GetDockCaptionDrawer, a member of class TCaptionedDockTree.
	GetParentFormState (see page 2403)	Returns the state of the form that contains the control.

18.1.1.4.1 TCaptionedDockTree.AdjustCaptionRect Method

Pascal

```
function AdjustCaptionRect(const ARect: TRect): TRect; virtual;
```

C++

```
virtual __fastcall TRect AdjustCaptionRect(const TRect ARect);
```

Description

This is AdjustCaptionRect, a member of class TCaptionedDockTree.

18.1.1.4.2 TCaptionedDockTree.AdjustDockRect Method

Adjusts the boundaries of the docking zone where a specified control is docked.

Pascal

```
procedure AdjustDockRect(Control: TControl; var ARect: TRect); override;
```

C++

```
virtual __fastcall AdjustDockRect(TControl * Control, TRect ARect);
```

Description

Applications can't call the protected AdjustDockRect method. It is called automatically to make any final adjustments to the rectangle where a client control is docked.

Control is the control that is docked.

On entry, ARect indicates the boundaries of Control when it is docked to the windowed control specified by the DockSite property. AdjustDockRect changes this to make any final adjustments to the space in which Control is docked.

In TDockTree, AdjustDockRect expands the ARect parameter to make room for the "grab region" around a docked control. (The grab region is indicated by a double bevel, and is where the user can click with the mouse to start an undocking operation.) AdjustDockRect checks the Align property of the dock site to determine whether the grab region should appear on the side or the top of the docked control.

See Also

Align (see page 5798)

DockSite (see page 5996)

18.1.1.4.3 TCaptionedDockTree.GetDockCaptionDrawer Method

Pascal

```
class function GetDockCaptionDrawer: TDockCaptionDrawerClass; virtual;
```

C++

```
virtual __fastcall TDockCaptionDrawerClass GetDockCaptionDrawer();
```

Description

This is GetDockCaptionDrawer, a member of class TCaptionedDockTree.

18.1.1.4.4 TCaptionedDockTree.GetParentFormState Method

Returns the state of the form that contains the control.

Pascal

```
class function GetParentFormState(const Control: TControl): TParentFormState; virtual;
```

C++

```
virtual __fastcall TParentFormState GetParentFormState(const TControl * Control);
```

18.1.1.4.5 TCaptionedDockTree.InternalCaptionHitTest Method

Pascal

```
function InternalCaptionHitTest(const Zone: TDockZone; const MousePos: TPoint):
TDockCaptionHitTest;
```

C++

```
__fastcall TDockCaptionHitTest InternalCaptionHitTest(const TDockZone Zone, const TPoint
MousePos);
```

Description

This is InternalCaptionHitTest, a member of class TCaptionedDockTree.

18.1.1.4.6 TCaptionedDockTree.PaintDockFrame Method

Paints the elements of a docking zone that surround a docked control.

Pascal

```
procedure PaintDockFrame(Canvas: TCanvas; Control: TControl; const ARect: TRect); override;
```

C++

```
virtual __fastcall PaintDockFrame(TCanvas Canvas, TControl * Control, const TRect ARect);
```

Description

Application's can't call the protected PaintDockFrame method. It is used by the PaintSite method to render the grab lines and close buttons that make up the grab region of a docking zone.

Canvas is the drawing surface on which to paint.

Control is the control that is docked in the zone being rendered.

ARect indicates the boundaries of the entire docking zone.

Note: Descendants classes can override this method to change the way a dock tree paints docking zones. The descendant class should only paint in the portions of ARect that are not occupied by Control.

See Also

PaintSite (see page 5992)

18.1.1.4.7 TCaptionedDockTree.WndProc Method

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

This is WndProc, a member of class TCaptionedDockTree.

18.1.1.4.8 TCaptionedDockTree.ZoneCaptionHitTest Method

Pascal

```
function ZoneCaptionHitTest(const Zone: TDockZone; const MousePos: TPoint; var HTFlag:
Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ZoneCaptionHitTest(const TDockZone Zone, const TPoint MousePos, int
HTFlag);
```

Description

This is ZoneCaptionHitTest, a member of class TCaptionedDockTree.

18.1.1.5 TCaptionedDockTree Properties

The properties of the TCaptionedDockTree class are listed here.

Protected Properties

	Name	Description
R	DockCaptionDrawer (see page 2405)	This is DockCaptionDrawer, a member of class TCaptionedDockTree.
R	DockCaptionOrientation (see page 2405)	This is DockCaptionOrientation, a member of class TCaptionedDockTree.

18.1.1.5.1 TCaptionedDockTree.DockCaptionDrawer Property

Pascal

```
property DockCaptionDrawer: TDockCaptionDrawer;
```

C++

```
__property TDockCaptionDrawer DockCaptionDrawer;
```

Description

This is DockCaptionDrawer, a member of class TCaptionedDockTree.

18.1.1.5.2 TCaptionedDockTree.DockCaptionOrientation Property

Pascal

```
property DockCaptionOrientation: TDockCaptionOrientation;
```

C++

```
__property TDockCaptionOrientation DockCaptionOrientation;
```

Description

This is DockCaptionOrientation, a member of class TCaptionedDockTree.

18.1.2 TDockCaptionDrawer Class

Creates an instance of the TDockCaptionDrawer.

Class Hierarchy

Pascal

```
TDockCaptionDrawer = class(TObject);
```

C++

```
class TDockCaptionDrawer : public TObject;
```

File

CaptionedDockTree

Description

TDockCaptionDrawer is defined as **virtual** so the call to TCaptionedDockTree (see page 2398). GetDockCaptionDrawer.

Create (see page 2406) is called on the correct type.

18.1.2.1 TDockCaptionDrawer Members

The following tables list the members exposed by TDockCaptionDrawer.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2406)	This is Create, a member of class TDockCaptionDrawer.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DockCaptionHitTest (see page 2407)	Indicates which docked control is at a specified mouse position.
	DrawDockCaption (see page 2407)	Draws the caption on the control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	DockCaptionPinButton (see page 2408)	The pin button style to draw, if any.

18.1.2.2 TDockCaptionDrawer.Create Constructor

Pascal

```
constructor Create(DockCaptionOrientation: TDockCaptionOrientation); virtual;
```

C++

```
virtual __fastcall TDockCaptionDrawer(TDockCaptionOrientation DockCaptionOrientation);
```

Description

This is Create, a member of class TDockCaptionDrawer.

18.1.2.3 TDockCaptionDrawer Methods

The methods of the TDockCaptionDrawer class are listed here.

Public Methods

	Name	Description
	DockCaptionHitTest (see page 2407)	Indicates which docked control is at a specified mouse position.
	DrawDockCaption (see page 2407)	Draws the caption on the control.

18.1.2.3.1 TDockCaptionDrawer.DockCaptionHitTest Method

Indicates which docked control is at a specified mouse position.

Pascal

```
function DockCaptionHitTest(const CaptionRect: TRect; const MousePos: TPoint):
TDockCaptionHitTest; virtual;
```

C++

```
virtual __fastcall TDockCaptionHitTest DockCaptionHitTest(const TRect CaptionRect, const
TPoint MousePos);
```

Description

Provides hit tests for the caption. You can return your own hit test results for your own drawer, using custom values.

18.1.2.3.2 TDockCaptionDrawer.DrawDockCaption Method

Draws the caption on the control.

Pascal

```
procedure DrawDockCaption(const Canvas: TCanvas; CaptionRect: TRect; State: TParentFormState);
virtual;
```

C++

```
virtual __fastcall DrawDockCaption(const TCanvas Canvas, TRect CaptionRect, TParentFormState
State);
```

Description

The following parameters are passed in the DrawDockCaption procedure.

Parameter	Description
Canvas	The canvas object upon which to draw the caption.
CaptionRect	The defined rectangle in which the caption is to be drawn.
State	The current state of the parent form.

18.1.2.4 TDockCaptionDrawer Properties

The properties of the TDockCaptionDrawer class are listed here.

Public Properties

	Name	Description
	DockCaptionPinButton (see page 2408)	The pin button style to draw, if any.

18.1.2.4.1 TDockCaptionDrawer.DockCaptionPinButton Property

The pin button style to draw, if any.

Pascal

```
property DockCaptionPinButton: TDockCaptionPinButton;
```

C++

```
__property TDockCaptionPinButton DockCaptionPinButton;
```

Description

The valid values are:

Style	Description
dcpbNone	No style set.
dcpbUp	Shows the push pin in an upward facing direction.
dcpbDown	Shows the push pin in a downward facing direction.

18.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TDockCaptionOrientation (see page 2409)	Defines the values used to determine caption orientation.
	TDockCaptionPinButton (see page 2409)	The pin button styles.

Records

	Name	Description
	TParentFormState (see page 2410)	Stores information about the parent dock form for use in drawing the dock site.

18.2.1 CaptionedDockTree.TDockCaptionOrientation Enumeration

Defines the values used to determine caption orientation.

Pascal

```
TDockCaptionOrientation = (
  dcoHorizontal,
  dcoVertical
);
```

C++

```
enum TDockCaptionOrientation {
  dcoHorizontal,
  dcoVertical
};
```

File

CaptionedDockTree

Description

The following values allow you to set caption orientation:

Value	Description
dcoHorizontal	Positions the caption horizontally.
dcoVertical	Positions the caption vertically.

18.2.2 CaptionedDockTree.TDockCaptionPinButton Enumeration

The pin button styles.

Pascal

```
TDockCaptionPinButton = (
  dcpbNone,
  dcpbUp,
  dcpbDown
);
```

C++

```
enum TDockCaptionPinButton {
  dcpbNone,
  dcpbUp,
  dcpbDown
};
```

File

CaptionedDockTree

Description

The valid values are:

Style	Description
dcpbNone	No style set.
dcpbUp	Shows the push pin in an upward facing direction.
dcpbDown	Shows the push pin in a downward facing direction.

18.2.3 CaptionedDockTree.TParentFormState Record

Stores information about the parent dock form for use in drawing the dock site.

Pascal

```
TParentFormState = record
  Caption: string;
  EndColor: TColor;
  FontColor: TColor;
  StartColor: TColor;
  Focused: Boolean;
  Icon: TIcon;
end;
```

C++

```
struct TParentFormState {
  AnsiString Caption;
  TColor EndColor;
  TColor FontColor;
  TColor StartColor;
  Boolean Focused;
  TIcon Icon;
};
```

File

CaptionedDockTree

18.3 Types

The following table lists types in this documentation.

Types

Name	Description
TCaptionedDockTreeClass (see page 2411)	This is type CaptionedDockTree.TCaptionedDockTreeClass.
TDockCaptionDrawerClass (see page 2411)	This is type CaptionedDockTree.TDockCaptionDrawerClass.
TDockCaptionHitTest (see page 2411)	Defines the values available for use in a hit test.

18.3.1 CaptionedDockTree.TCaptionedDockTreeClass Type

Pascal

```
TCaptionedDockTreeClass = class of TCaptionedDockTree;
```

C++

```
TCaptionedDockTree TCaptionedDockTreeClass;
```

File

CaptionedDockTree

Description

This is type CaptionedDockTree.TCaptionedDockTreeClass.

18.3.2 CaptionedDockTree.TDockCaptionDrawerClass Type

Pascal

```
TDockCaptionDrawerClass = class of TDockCaptionDrawer;
```

C++

```
TDockCaptionDrawer TDockCaptionDrawerClass;
```

File

CaptionedDockTree

Description

This is type CaptionedDockTree.TDockCaptionDrawerClass.

18.3.3 CaptionedDockTree.TDockCaptionHitTest Type

Defines the values available for use in a hit test.

Pascal

```
TDockCaptionHitTest = Cardinal;
```

C++

```
unsigned TDockCaptionHitTest;
```

File

CaptionedDockTree

Description

The following values are used in hit tests:

Constant	Value
dchtNone (see page 2414)	0
dchtCaption (see page 2413)	1
dchtClose (see page 2413)	2
dchtPin (see page 2414)	3
dchtCustom (see page 2414)	10 or above

You can create your own hit tests and use **dchtCustom (see page 2414)** to set values. Values 4 through 9 are reserved. The default value of **dchtCustom (see page 2414)** may change.

18.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
dchtCaption (see page 2413)	This is constant CaptionedDockTree.dchtCaption.
dchtClose (see page 2413)	This is constant CaptionedDockTree.dchtClose.
dchtCustom (see page 2414)	This is constant CaptionedDockTree.dchtCustom.
dchtNone (see page 2414)	This is constant CaptionedDockTree.dchtNone.
dchtPin (see page 2414)	This is constant CaptionedDockTree.dchtPin.

18.4.1 CaptionedDockTree.dchtCaption Constant

Pascal

```
dchtCaption = 1;
```

C++

```
dchtCaption = 1;
```

File

CaptionedDockTree

Description

This is constant CaptionedDockTree.dchtCaption.

18.4.2 CaptionedDockTree.dchtClose Constant

Pascal

```
dchtClose = 2;
```

C++

```
dchtClose = 2;
```

File

CaptionedDockTree

Description

This is constant CaptionedDockTree.dchtClose.

18.4.3 CaptionedDockTree.dchtCustom Constant

Pascal

```
dchtCustom = 10;
```

C++

```
dchtCustom = 10;
```

File

CaptionedDockTree

Description

This is constant CaptionedDockTree.dchtCustom.

18.4.4 CaptionedDockTree.dchtNone Constant

Pascal

```
dchtNone = 0;
```

C++

```
dchtNone = 0;
```

File

CaptionedDockTree

Description

This is constant CaptionedDockTree.dchtNone.

18.4.5 CaptionedDockTree.dchtPin Constant

Pascal

```
dchtPin = 3;
```

C++

```
dchtPin = 3;
```

File

CaptionedDockTree

Description

This is constant CaptionedDockTree.dchtPin.

19 CategoryButtons Namespace

This is namespace CategoryButtons.

Topics

Name	Description
Classes (see page 2417)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 2543)	The following table lists structs, records, enums in this documentation.
Types (see page 2544)	The following table lists types in this documentation.
Constants (see page 2551)	The following table lists constants in this documentation.

Classes

	Name	Description
	TBaseButtonItem (see page 2417)	TBaseButtonItem is the base class for button items used by TButtonGroup and TCategoryButtons (see page 2452).
	TButtonCategories (see page 2424)	TButtonCategories maintains the collection of button categories that appear in a TCategoryButtons (see page 2452) control.
	TButtonCategory (see page 2429)	TButtonCategory is an individual button category of a TCategoryButtons (see page 2452) control.
	TButtonCollection (see page 2436)	Defines a collection of buttons that appear in a TButtonCategory (see page 2429).
	TButtonItem (see page 2441)	An instance of a button in a TCategoryButtons (see page 2452) control.
	TButtonItemActionLink (see page 2445)	TButtonItemActionLink is an action link designed specifically for controls using TButtonItem (see page 2441).
	TCategoryButtons (see page 2452)	Defines a group of categorized buttons.

Constants

Name	Description
crDragCopy (see page 2551)	This is constant CategoryButtons.crDragCopy.

Structs, Records, Enums

	Name	Description
	TCatButtonFlow (see page 2543)	Defines the ordering style of category buttons.

Types

Name	Description
TBaseButtonItemClass (see page 2544)	Defines button items that are to be included in a container, such as in button groups or category buttons.
TButtonCategoriesClass (see page 2544)	Metaclass of the TButtonCategories (see page 2424) class.

TButtonCategoryClass (see page 2545)	Metaclass of TButtonCategory (see page 2429).
TButtonDrawState (see page 2545)	Values indicating the drawing state of buttons.
TButtonItemActionLinkClass (see page 2546)	Metaclass of TButtonItemActionLink (see page 2445).
TButtonItemClass (see page 2546)	Defines the button item class.
TCatButtonCopyEvent (see page 2546)	This is type CategoryButtons.TCatButtonCopyEvent.
TCatButtonDrawEvent (see page 2547)	This is type CategoryButtons.TCatButtonDrawEvent.
TCatButtonDrawIconEvent (see page 2547)	This is type CategoryButtons.TCatButtonDrawIconEvent.
TCatButtonEvent (see page 2547)	This is type CategoryButtons.TCatButtonEvent.
TCatButtonGetHint (see page 2548)	This is type CategoryButtons.TCatButtonGetHint.
TCatButtonOptions (see page 2548)	Defines button options for category buttons.
TCatButtonReorderEvent (see page 2549)	This is type CategoryButtons.TCatButtonReorderEvent.
TCategoryCollapseEvent (see page 2549)	This is type CategoryButtons.TCategoryCollapseEvent.
TCategoryReorderEvent (see page 2549)	This is type CategoryButtons.TCategoryReorderEvent.

19.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TBaseButtonItem (see page 2417)	TBaseButtonItem is the base class for button items used by TButtonGroup and TCategoryButtons (see page 2452).
	TButtonCategories (see page 2424)	TButtonCategories maintains the collection of button categories that appear in a TCategoryButtons (see page 2452) control.
	TButtonCategory (see page 2429)	TButtonCategory is an individual button category of a TCategoryButtons (see page 2452) control.
	TButtonCollection (see page 2436)	Defines a collection of buttons that appear in a TButtonCategory (see page 2429).
	TButtonItem (see page 2441)	An instance of a button in a TCategoryButtons (see page 2452) control.
	TButtonItemActionLink (see page 2445)	TButtonItemActionLink is an action link designed specifically for controls using TButtonItem (see page 2441).
	TCategoryButtons (see page 2452)	Defines a group of categorized buttons.

19.1.1 TBaseButtonItem Class

TBaseButtonItem is the base class for button items used by TButtonGroup and TCategoryButtons (see page 2452).

Class Hierarchy

Pascal

```
TBaseButtonItem = class(TCollectionItem);
```

C++

```
class TBaseButtonItem : public TCollectionItem;
```

File

CategoryButtons

19.1.1.1 TBaseButtonItem Members

The following tables list the members exposed by TBaseButtonItem.

Protected Methods

	Name	Description
	ActionChange (see page 2420)	This is ActionChange, a member of class TBaseButtonItem.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetActionLinkClass (see page 2421)	This is GetActionLinkClass, a member of class TBaseButtonItem.
	GetDisplayName (see page 2421)	Returns the name of the collection item as it appears in the collection editor.

	GetNotifyTarget (see page 2421)	This is GetNotifyTarget, a member of class TBaseButtonItem.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Protected Properties

	Name	Description
	ActionLink (see page 2422)	This is ActionLink, a member of class TBaseButtonItem.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2420)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2419)	Creates and initializes a TCollectionItem instance.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScrollIntoView (see page 2421)	Scrolls a button to make it visible.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	Data (see page 2423)	This is Data, a member of class TBaseButtonItem.

	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Events

	Name	Description
	OnClick (see page 2423)	This is OnClick, a member of class TBaseButtonItem.

Published Properties

	Name	Description
	Action (see page 2422)	Specifies the action the button executes when clicked.
	Caption (see page 2422)	This is Caption, a member of class TBaseButtonItem.
	Hint (see page 2423)	This is Hint, a member of class TBaseButtonItem.
	ImageIndex (see page 2423)	The index of a specified image.

19.1.1.2 TBaseButtonItem.Create Constructor

Creates and initializes a TCollectionItem instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TBaseButtonItem(TCollection Collection);
```

Description

Do not call Create to instantiate a collection item. Instead, call the Add method of the collection to which the item should belong.

Collection identifies the TCollection instance to which the new item belongs.

See Also

Add (see page 2736)

Collection (see page 2761)

19.1.1.3 TBaseButtonItem Methods

The methods of the TBaseButtonItem class are listed here.

Protected Methods

	Name	Description
V	ActionChange (see page 2420)	This is ActionChange, a member of class TBaseButtonItem.
V	GetActionLinkClass (see page 2421)	This is GetActionLinkClass, a member of class TBaseButtonItem.
V	GetDisplayName (see page 2421)	Returns the name of the collection item as it appears in the collection editor.
A	GetNotifyTarget (see page 2421)	This is GetNotifyTarget, a member of class TBaseButtonItem.

Public Methods

	Name	Description
V	Assign (see page 2420)	Copies the contents of another, similar object.
A	ScrollIntoView (see page 2421)	Scrolls a button to make it visible.

19.1.1.3.1 TBaseButtonItem.ActionChange Method

Pascal

```
procedure ActionChange(Sender: TObject; CheckDefaults: Boolean); virtual;
```

C++

```
virtual __fastcall ActionChange(TObject * Sender, Boolean CheckDefaults);
```

Description

This is ActionChange, a member of class TBaseButtonItem.

19.1.1.3.2 TBaseButtonItem.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo (see page 2931)

EConvertError (see page 22724)

19.1.1.3.3 TBaseButtonItem.GetActionLinkClass Method

Pascal

```
function GetActionLinkClass: TButtonItemActionLinkClass; virtual;
```

C++

```
virtual __fastcall TButtonItemActionLinkClass GetActionLinkClass();
```

Description

This is GetActionLinkClass, a member of class TBaseButtonItem.

19.1.1.3.4 TBaseButtonItem.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName (see page 2761)

GetNamePath (see page 2759)

19.1.1.3.5 TBaseButtonItem.GetNotifyTarget Method

Pascal

```
function GetNotifyTarget: TComponent; virtual; abstract;
```

C++

```
virtual __fastcall TComponent * GetNotifyTarget() = 0;
```

Description

This is GetNotifyTarget, a member of class TBaseButtonItem.

19.1.1.3.6 TBaseButtonItem.ScrollIntoView Method

Scrolls a button to make it visible.

Pascal

```
procedure ScrollIntoView; virtual; abstract;
```

C++

```
virtual __fastcall ScrollIntoView() = 0;
```

Description

Supply the following value for this method:

Parameter	Description
Index	An Integer representing the button you want scrolled into view.

19.1.1.4 TBaseButtonItem Properties

The properties of the TBaseButtonItem class are listed here.

Protected Properties

	Name	Description
	ActionLink (see page 2422)	This is ActionLink, a member of class TBaseButtonItem.

Public Properties

	Name	Description
	Data (see page 2423)	This is Data, a member of class TBaseButtonItem.

Published Properties

	Name	Description
	Action (see page 2422)	Specifies the action the button executes when clicked.
	Caption (see page 2422)	This is Caption, a member of class TBaseButtonItem.
	Hint (see page 2423)	This is Hint, a member of class TBaseButtonItem.
	ImageIndex (see page 2423)	The index of a specified image.

19.1.1.4.1 TBaseButtonItem.Action Property

Specifies the action the button executes when clicked.

Pascal

```
property Action: TBasicAction;
```

C++

```
__property TBasicAction Action;
```

19.1.1.4.2 TBaseButtonItem.ActionLink Property

Pascal

```
property ActionLink: TButtonItemActionLink;
```

C++

```
__property TButtonItemActionLink ActionLink;
```

Description

This is ActionLink, a member of class TBaseButtonItem.

19.1.1.4.3 TBaseButtonItem.Caption Property

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

This is Caption, a member of class TBaseButtonItem.

19.1.1.4.4 TBaseButtonItem.Data Property

Pascal

```
property Data: Pointer;
```

C++

```
__property void * Data;
```

Description

This is Data, a member of class TBaseButtonItem.

19.1.1.4.5 TBaseButtonItem.Hint Property

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

This is Hint, a member of class TBaseButtonItem.

19.1.1.4.6 TBaseButtonItem.ImageIndex Property

The index of a specified image.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

19.1.1.5 TBaseButtonItem Events

The events of the TBaseButtonItem class are listed here.

Published Events

	Name	Description
	OnClick (see page 2423)	This is OnClick, a member of class TBaseButtonItem.

19.1.1.5.1 TBaseButtonItem.OnClick Event

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

This is OnClick, a member of class TBaseButtonItem.

19.1.2 TButtonCategories Class

TButtonCategories maintains the collection of button categories that appear in a TCategoryButtons (see page 2452) control.

Class Hierarchy

System::TObject → Classes.TPersistent → Classes.TCollection → CategoryButtons.TButtonCategories

Pascal

```
TButtonCategories = class(TCollection);
```

C++

```
class TButtonCategories : public TCollection;
```

File

CategoryButtons

19.1.2.1 TButtonCategories Members

The following tables list the members exposed by TButtonCategories.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2427)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2428)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 2426)	Adds a new item at the end of the collection.
	AddItem (see page 2426)	Adds an item to the category at the specified index.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2427)	Begins the update procedure to update the button list whenever the categories or buttons within the categories are modified.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 2426)	This is Create, a member of class TButtonCategories.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	IndexOf (see page 2427)	This is IndexOf, a member of class TButtonCategories.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2428)	Inserts a new item at the specified index.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ButtonGroup (see page 2428)	A specified button group within the category button container.
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 2429)	The number of categories in the category button container.

19.1.2.2 TButtonCategories.Create Constructor

Pascal

```
constructor Create(const ButtonGroup: TCategoryButtons);
```

C++

```
__fastcall TButtonCategories(const TCategoryButtons ButtonGroup);
```

Description

This is Create, a member of class TButtonCategories.

19.1.2.3 TButtonCategories Methods

The methods of the TButtonCategories class are listed here.

Protected Methods

	Name	Description
V	GetOwner (see page 2427)	Returns the owner of an object.
V	Update (see page 2428)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Add (see page 2426)	Adds a new item at the end of the collection.
	AddItem (see page 2426)	Adds an item to the category at the specified index.
V	BeginUpdate (see page 2427)	Begins the update procedure to update the button list whenever the categories or buttons within the categories are modified.
	IndexOf (see page 2427)	This is IndexOf, a member of class TButtonCategories.
	Insert (see page 2428)	Inserts a new item at the specified index.

19.1.2.3.1 TButtonCategories.Add Method
