        Name := 'ts' + TabTitles[i];
        Caption := TabTitles[i];
        Brush.Color := colorPalette[i];
     end;
    end;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    i: Integer;
  begin
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i].Free;
    end;
    PageControl1.Free;
```

```
end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

27.1.5.4.3 TAnimate.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

27.1.5.4.4 TAnimate.AutoSize Property

Specifies whether the control sizes itself automatically to fit animation.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

If AutoSize is true (default), loading a new animation file causes the control to resize itself to match the new frame height and width.

See Also

FrameHeight (see page 3451)

FrameWidth (see page 3451)

Height (see page 5825)

Width (see page 5849)

27.1.5.4.5 TAnimate.BorderWidth Property

Specifies the width of the control's border.

Pascal

```
property BorderWidth: TBorderWidth;
```

C++

```
__property TBorderWidth BorderWidth;
```

Description

Use BorderWidth to get or set the width of the control's border. Graphics or text drawn by the control is clipped to the area within the border.

See Also

ClientRect

BevelOuter (see page 6194)

27.1.5.4.6 TAnimate.Center Property

Determines whether the frames of the AVI clip are centered in the animation control.

Pascal

```
property Center: Boolean;
```

C++

```
__property Boolean Center;
```

Description

Use Center to position the frames of the clip in the animation control when FrameHeight (see page 3451) is not the same as ClientHeight or FrameWidth (see page 3451) is not the same as ClientWidth. When Center is true, the frames are centered both horizontally and vertically in the client area of the control. When Center is false, the top left corner of the frames is positioned at the top left corner of the client area.

See Also

AutoSize (see page 5803)

ClientHeight (see page 5808)

ClientWidth (see page 5811)

FrameHeight (see page 3451)

FrameWidth (see page 3451)

27.1.5.4.7 TAnimate.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

27.1.5.4.8 TAnimate.CommonAVI Property

Indicates whether the animation control displays a one of the common Windows AVI clips provided in Shell32.dll.

Pascal

```
property CommonAVI: TCommonAVI;
```

C++

```
__property TCommonAVI CommonAVI;
```

Description

Set CommonAVI to display one of the common Windows AVI clips in the animation control. The common Windows AVI clips appear in the Windows user interface when the user attempts common file actions. CommonAVI is aviNone when the animation control displays an AVI clip that was specified in some other manner.

Setting CommonAVI automatically sets the FileName (see page 3450) property to an empty string, ResHandle (see page

3454) and ResID to 0, and ResName (see page 3455) to an empty string.

Note: CommonAVI cannot be used when running under NT 3.51.

C++ Examples:

```
/*
To run this example, create a new project, place a button on
the form, and insert the example code to the button click
event. Place the button on the bottom of the form to leave
room for the TAnimate component that will be created on the
fly.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TForm *TempForm = new TForm(this);
  TAnimate *pAnimate = new TAnimate(TempForm);
  pAnimate->Parent = TempForm;
  pAnimate->CommonAVI = aviFindFile;
  pAnimate->Active = true;
  TempForm->Show();
  // Simulate a lengthy process.  Alter this value
  // to accommodate your machine speed.
  for (int i = 0; i < 90000000; i++)
    Application->ProcessMessages();
  delete TempForm;
}
```

Delphi Examples:

```
{
To run this example, create a new project, place a button on
the form, and insert the example code to the button click
event. Place the button on the bottom of the form to leave
room for the TAnimate component that will be created on the
fly.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  TempForm: TForm;
  I: Integer;
begin
  TempForm := TForm.Create(Self);
  with TAnimate.Create(TempForm) do
  try
    Parent := TempForm;
    CommonAVI := aviFindFile;
    Active := True;
    TempForm.Show;
    // Simulate a lengthy process.  Alter this value
    // to accommodate your machine speed.
    for I := 0 to 90000000 do Application.ProcessMessages;
  finally
    TempForm.Release;
  end;
end;
```

See Also

FileName (see page 3450)

ResHandle (see page 3454)

ResId (see page 3455)

ResName (see page 3455)

27.1.5.4.9 TAnimate.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

27.1.5.4.10 TAnimate.FileName Property

Specifies file containing animation.

Pascal

```
property FileName: string;
```

C++

```
__property AnsiString FileName;
```

Description

Setting FileName causes the control to load the animation from the specified file. If the control succeeds in loading the animation from the file, it sets the Open (see page 3452) property to true.

FileName must refer to a Windows AVI file. The sound track, if present, is ignored.

Note: Setting FileName automatically sets the CommonAVI (see page 3448) property to aviNone, ResHandle (see page 3454) and ResID to 0, and ResName (see page 3455) to an empty string.

See Also

Open (see page 3452)

CommonAVI (see page 3448)

ResHandle (see page 3454)

ResId (see page 3455)

ResName (see page 3455)

Adding Silent Video Clips to an Application

27.1.5.4.11 TAnimate.FrameCount Property

Indicates the total number of frames in the AVI clip.

Pascal

```
property FrameCount: Integer;
```

C++

```
__property int FrameCount;
```

Description

Read FrameCount to determine the number of frames that can be displayed by the animation control. The animation control can play all the frames in the AVI clip, or run through a subset of those frames.

See Also

Play (see page 3438)

StartFrame (see page 3457)

StopFrame (see page 3458)

27.1.5.4.12 TAnimate.FrameHeight Property

Indicates the height, in pixels, of each image in the animation.

Pascal

```
property FrameHeight: Integer;
```

C++

```
__property int FrameHeight;
```

Description

Read FrameHeight to determine the height required to fully display the frames of the animation. If AutoSize (see page 3446) is true, the animation control automatically sizes itself to the value of FrameHeight.

See Also

AutoSize (see page 5803)

ClientHeight (see page 5808)

FrameWidth (see page 3451)

27.1.5.4.13 TAnimate.FrameWidth Property

Indicates the width, in pixels, of each image in the animation.

Pascal

```
property FrameWidth: Integer;
```

C++

```
__property int FrameWidth;
```

Description

Read FrameWidth to determine the width required to fully display the frames of the animation. If AutoSize (see page 3446) is true, the animation control automatically resizes itself to the value of FrameWidth.

See Also

AutoSize (see page 5803)

ClientWidth (see page 5811)

FrameHeight (see page 3451)

27.1.5.4.14 TAnimate.Open Property

Indicates whether the animation is loaded into memory.

Pascal

```
property Open: Boolean;
```

C++

```
__property Boolean Open;
```

Description

Read Open to determine whether the animation is loaded and ready for playing. When the animation is specified using the CommonAVI (see page 3448), FileName (see page 3450), ResName (see page 3455), or ResID property, the animation control is opened automatically. When Open is true, the animation control displays the frame specified by the StartFrame (see page 3457) property until the clip is played using the Active (see page 3441) property or Play (see page 3438) method.

Set Open to false to free the resources used by the animation. When the animation control is not open, none of the frames can be shown.

Note: When Open is changed from false to true, the StartFrame (see page 3457) property is reset to 1 and the StopFrame (see page 3458) property is reset to FrameCount (see page 3451).

See Also

Active (see page 3441)

CommonAVI (see page 3448)

FileName (see page 3450)

FrameCount (see page 3451)

OnClose (see page 3461)

OnOpen (see page 3461)

Play (see page 3438)

ResHandle (see page 3454)

ResId (see page 3455)

ResName (see page 3455)

StartFrame (see page 3457)

StopFrame (see page 3458)

Adding Silent Video Clips to an Application

27.1.5.4.15 TAnimate.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

27.1.5.4.16 TAnimate.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

27.1.5.4.17 TAnimate.Repetitions Property

Specifies the number of times to repeat the sequence of frames.

Pascal

```
property Repetitions: Integer;
```

C++

```
__property int Repetitions;
```

Description

Set Repetitions to specify the number of times the sequence of frames in the animation is repeated when the Active (see page 3441) property is set to true. After the sequence is repeated by the specified number of times, the value of Active (see page 3441) becomes false again.

To show the sequence a single time, set Repetitions to 1. Set Repetitions to 0 to indicate that the sequence of frames should repeat indefinitely. When Repetitions is 0, use the Active (see page 3441) property or Stop (see page 3440) method to interrupt the animation.

The Play (see page 3438) method overrides Repetitions with the value passed as the Count parameter.

See Also

Active (see page 3441)

Play (see page 3438)

Stop (see page 3440)

Adding Silent Video Clips to an Application

27.1.5.4.18 TAnimate.ResHandle Property

Specifies the Windows handle for the module that contains the AVI clip as a resource.

Pascal

```
property ResHandle: THandle;
```

C++

```
__property THandle ResHandle;
```

Description

Set ResHandle at runtime to the instance handle or module handle of the module that includes the animation resource. After setting ResHandle, set the ResID or ResName (see page 3455) property to specify which resource in the indicated module is the AVI animation that should be displayed by the animation control.

If a value is not specified for ResHandle, the animate control uses the instance of the application's main executable.

Note: Setting ResHandle automatically sets the CommonAVI (see page 3448) property to aviNone and the FileName (see page 3450) property to an empty string.

See Also

CommonAVI (see page 3448)

FileName (see page 3450)

Hinstance

ResId (see page 3455)

ResName (see page 3455)

Adding Silent Video Clips to an Application

27.1.5.4.19 TAnimate.ResId Property

Specifies the resource ID of the animation.

Pascal

```
property ResId: Integer;
```

C++

```
__property int ResId;
```

Description

Set ResId to identify an AVI resource that contains the animation. Use ResHandle (see page 3454) to indicate the module that contains the resource identified by ResId.

If the resource file identifies the animation by name rather than number, use the ResName (see page 3455) property instead.

Note: Setting ResId automatically sets the CommonAVI (see page 3448) property to aviNone, the FileName (see page 3450) property to an empty string, and the ResName (see page 3455) property to an empty string.

See Also

CommonAVI (see page 3448)

FileName (see page 3450)

ResHandle (see page 3454)

ResName (see page 3455)

Adding Silent Video Clips to an Application

27.1.5.4.20 TAnimate.ResName Property

Specifies the resource name of the animation.

Pascal

```
property ResName: string;
```

C++

```
__property AnsiString ResName;
```

Description

Set ResName to identify an AVI resource that contains the animation. Use ResHandle (see page 3454) to indicate the module

that contains the resource identified by ResName.

If the resource file identifies the animation by number rather than number, use the ResID property instead.

Note: Setting ResName automatically sets the CommonAVI (see page 3448) property to aviNone, the FileName (see page 3450) property to an empty string, and the ResID property to 0.

See Also

CommonAVI (see page 3448)

FileName (see page 3450)

ResHandle (see page 3454)

ResId (see page 3455)

Adding Silent Video Clips to an Application

27.1.5.4.21 TAnimate.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
```

```
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

See Also

Hint (see page 5827)

ParentShowHint (see page 5835)

ShowHint (see page 13721)

Displaying Fly-over Help

27.1.5.4.22 TAnimate.StartFrame Property

Specifies the first frame displayed when the animation control is activated.

Pascal

```
property StartFrame: Smallint;
```

C++

```
__property Smallint StartFrame;
```

Description

Set StartFrame to specify the first frame shown when the Active (see page 3441) property is set to true. When StartFrame is 1, the clip is played from the very beginning, when StartFrame is 2, the clip begins with the second frame, and so on. If Repetitions

(see page 3454) is not 1, after the sequence of frames is played, it starts over at the frame specified by StartFrame (which may not be the first frame in the clip).

When the animation control is Open (see page 3452) but not Active (see page 3441), it displays the frame specified by StartFrame.

Note: The Play (see page 3438) method overrides StartFrame with the value passed as the FromFrame parameter.

See Also

Active (see page 3441)

FrameCount (see page 3451)

Play (see page 3438)

Repetitions (see page 3454)

Seek (see page 3439)

StopFrame (see page 3458)

27.1.5.4.23 TAnimate.StopFrame Property

Specifies the last frame displayed when the animation control is activated.

Pascal

```
property StopFrame: Smallint;
```

C++

```
__property Smallint StopFrame;
```

Description

Set StopFrame to specify the last frame shown every time the animation control displays its sequence of frames. When StopFrame is 0, the clip is played to the very end. Otherwise, StopFrame is the number of the frame in the sequence. When the Active (see page 3441) property is set to true, the animation control displays the sequence of frames from StartFrame (see page 3457) to StopFrame, repeating this sequence by the number of iterations specified by the Repetitions (see page 3454) property.

Note: The Play (see page 3438) method overrides StopFrame with the value passed as the ToFrame parameter.

See Also

Active (see page 3441)

FrameCount (see page 3451)

Play (see page 3438)

Repetitions (see page 3454)

StartFrame (see page 3457)

27.1.5.4.24 TAnimate.Timers Property

Specifies whether the frames are displayed using a timer.

Pascal

```
property Timers: Boolean;
```

C++

```
__property Boolean Timers;
```

Description

Set Timers to specify whether the frames in the animation should be changed in response to timer messages, or whether the sequence progresses asynchronously in a separate execution thread. When Timers is true, the frames progress in response to timer messages. This is useful for synchronizing the animation sequence with other actions such as playing a sound track. When Timers is false, the animation is played in a separate thread.

See Also

OnStart (see page 3462)

TMediaPlayer (see page 17167)

Ttimer

27.1.5.4.25 TAnimate.Transparent Property

Specifies whether the background color of the frame matches the Color (see page 3447) property.

Pascal

```
property Transparent: Boolean;
```

C++

```
__property Boolean Transparent;
```

Description

Set Transparent to true to replace the background color stored in the animation with the value of the Color (see page 3447) property, or the parent control's color if the value of ParentColor (see page 3453) is true. Set Transparent to false to display the background color stored in the animation.

See Also

Color (see page 5812)

ParentColor (see page 5834)

27.1.5.4.26 TAnimate.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
```

```
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

27.1.5.5 TAnimate Events

The events of the TAnimate class are listed here.

Published Events

	Name	Description
	OnClose (see page 3461)	Occurs immediately after the animation control is closed.
	OnOpen (see page 3461)	Occurs immediately after the animation control is opened.
	OnStart (see page 3462)	Occurs immediately after the animation control starts playing.
	OnStop (see page 3462)	Occurs when the animation control finishes playing.

27.1.5.5.1 TAnimate.OnClose Event

Occurs immediately after the animation control is closed.

Pascal

```
property OnClose: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClose;
```

Description

Write an OnClose event handler to take specific action when the Open (see page 3452) property is set to false. For example, if the animation control is used to cycle through a series of AVI clips, the clip could be changed in an OnClose event handler.

To respond when the clip stops playing, but the animation control remains open, use the OnStop (see page 3462) event.

See Also

OnOpen (see page 3461)

OnStop (see page 3462)

Open (see page 3452)

27.1.5.5.2 TAnimate.OnOpen Event

Occurs immediately after the animation control is opened.

Pascal

```
property OnOpen: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnOpen;
```

Description

Write an OnOpen event handler to take specific action when the Open (see page 3452) property changes from false to true.

This is a good opportunity to set the Repetitions (see page 3454), StartFrame (see page 3457), and StopFrame (see page 3458) properties before the AVI clip is activated, or to seek to a particular frame.

See Also

Active (see page 3441)

OnClose (see page 3461)

OnStart (see page 3462)

Open (see page 3452)

Repetitions (see page 3454)

Seek (see page 3439)

StartFrame (see page 3457)

StopFrame (see page 3458)

27.1.5.5.3 TAnimate.OnStart Event

Occurs immediately after the animation control starts playing.

Pascal

```
property OnStart: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnStart;
```

Description

Write an OnStart event handler to take specific action when the animation is played. Setting the Active (see page 3441) property to true or calling the Play (see page 3438) method triggers an OnStart event. OnStart is useful for launching other actions that should be synchronized with the playing of the animation sequence.

See Also

Active (see page 3441)

OnOpen (see page 3461)

OnStop (see page 3462)

Play (see page 3438)

Timers (see page 3458)

27.1.5.5.4 TAnimate.OnStop Event

Occurs when the animation control finishes playing.

Pascal

```
property OnStop: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnStop;
```

Description

Write an OnStop event handler to take specific action when the animation finishes playing all its repetitions. For example, use an OnStop event handler to shut down any simultaneous actions that were started in an OnStart (see page 3462) event handler.

See Also

Active (see page 3441)

OnClose (see page 3461)

OnStart (see page 3462)

Repetitions (see page 3454)

Stop (see page 3440)

27.1.6 TComboBoxEx Class

TComboBoxEx represents a combo box that supports extended combo box features such as images on the list entries.

Class Hierarchy

Pascal

```
TComboBoxEx = class(TCustomComboBoxEx);
```

C++

```
class TComboBoxEx : public TCustomComboBoxEx;
```

File

ComCtrls

Description

Add TComboBoxEx to a form when you want to include a combo box that uses the images in an image list or when you want to control how far the items in the drop-down list are indented. TComboBoxEx provides greater support of items than the TComboBox control, but omits certain features as well (owner-drawn items, sorting of list items, and so on).

See Also

TComboBox (see page 21064)

TColorBox (see page 12182)

TDBComboBox (see page 8657)

27.1.6.1 TComboBoxEx Members

The following tables list the members exposed by TComboBoxEx.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnCloseUp (see page 21199)	Occurs when the drop-down list closes up due to some user action.

	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefEditProc (see page 21167)	This is FDefEditProc, a member of class TCustomCombo.
	FDefListProc (see page 21167)	This is FDefListProc, a member of class TCustomCombo.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FDropHandle (see page 21168)	This is FDropHandle, a member of class TCustomCombo.
	FDroppingDown (see page 21168)	This is FDroppingDown, a member of class TCustomCombo.
	FEditHandle (see page 21168)	This is FEditHandle, a member of class TCustomCombo.
	FEditInstance (see page 21168)	This is FEditInstance, a member of class TCustomCombo.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFocusChanged (see page 21168)	This is FFocusChanged, a member of class TCustomCombo.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FIsFocused (see page 21169)	This is FIsFocused, a member of class TCustomCombo.
	FListHandle (see page 21169)	This is FListHandle, a member of class TCustomCombo.
	FListInstance (see page 21169)	This is FListInstance, a member of class TCustomCombo.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FSaveIndex (see page 21169)	This is FSaveIndex, a member of class TCustomCombo.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActionChange (see page 3692)	Responds when the action for which this combo box is a client changes.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustDropDown (see page 21171)	Adjusts the size and position of the drop down list.

	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21171)	Generates an OnChange (see page 21197) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	CloseUp (see page 21172)	Generates an OnCloseUp (see page 21199) event.
	CMColorChanged (see page 3693)	Responds when the Color property changes.
	CMParentColorChanged (see page 3693)	Responds when the ParentColor property changes.
	CNNotify (see page 3693)	Responds to notifications of changes in the combo box.
	ComboExWndProc (see page 3694)	Responds to Windows messages sent to the combo box.
	ComboWndProc (see page 21173)	Responds to Windows messages sent to the edit control or drop-down list.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 3694)	Initializes the window-creation parameter record.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 3694)	Creates the underlying Windows control that implements the extended combo box.
	CreateWnd (see page 6137)	Creates the underlying window.
	CreateWnd (see page 21174)	Creates the Windows control that represents the combo box.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.

V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWindowHandle (see page 21174)	Destroys all of the windows controls that implement the combo box.
V	DestroyWnd (see page 3695)	Destroys the Windows control that represents the combo box.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DropDown (see page 21175)	Generates an OnDropDown (see page 21199) event.
V	EditWndProc (see page 21175)	Responds to Windows messages that are sent to the edit control portion of the combo box.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
V	GetActionLinkClass (see page 3695)	Returns the action link class that is associated with extended combo boxes.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
A	GetCount (see page 5942)	Returns the number of items in the list.
V	GetCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.

V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetDroppedDown (see page 21176)	Returns the value of the DroppedDown (see page 21185) property.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetItemCount (see page 3696)	Returns the number of items in the Items property list.
A	GetItemCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
V	GetItemHt (see page 3696)	Returns the height, in pixels, allocated for each item in the drop-down list.
A	GetItemHt (see page 21177)	Returns the value of the ItemHeight (see page 21186) property.
A	GetItemIndex (see page 5942)	Returns the value of the ItemIndex (see page 5944) property.
V	GetItemIndex (see page 21177)	Returns the value of the ItemIndex property.
V	GetItemsClass (see page 3696)	Returns the class used to implement the Items property.
A	GetItemsClass (see page 21177)	Indicates the class that implements the Items (see page 21187) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSelLength (see page 21178)	Returns the value of the SelLength (see page 21190) property.
	GetSelStart (see page 21178)	Returns the value of the SelStart (see page 21193) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	ListWndProc (see page 21178)	Responds to Windows messages that are sent to the drop-down list portion of the combo box.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 21179)	Initializes the combo box after its form is loaded into memory.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 3697)	Responds to notifications that objects are about to be inserted or removed.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.

	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Select (see page 21179)	Generates an OnSelect (see page 21201) event.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetDropDownCount (see page 3697)	Sets the value of the DropDownCount property.
V	SetDropDownCount (see page 21180)	Sets the value of the DropDownCount (see page 21185) property.
	SetDroppedDown (see page 21180)	Sets the value of the DroppedDown (see page 21185) property.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetItemHeight (see page 21181)	Sets the value of the ItemHeight (see page 21186) property.
A	SetItemIndex (see page 5943)	Sets the value of the ItemIndex (see page 5944) property.
V	SetItemIndex (see page 21181)	Sets the value of the ItemIndex property.
V	SetItems (see page 21181)	Sets the value of the Items (see page 21187) property.
	SetMaxLength (see page 21182)	Sets the value of the MaxLength (see page 21189) property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.

V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelLength (see page 21182)	Sets the value of the SelLength (see page 21190) property.
	SetSelStart (see page 21182)	Sets the value of the SelStart (see page 21193) property.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMHelp (see page 3697)	This is WMHelp, a member of class TCustomComboBoxEx.
	WMLButtonDown (see page 3698)	Responds when the user clicks the left mouse button on the combo box.
V	WndProc (see page 3698)	Processes messages received by the combo box.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WndProc (see page 21183)	Processes messages received by the combo box.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
R	EditHandle (see page 21185)	Returns the window handle for the edit portion of the combo box.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	ItemCount (see page 21186)	Specifies the number of items in the drop-down list.

R	ListHandle (see page 21189)	Provides access to the window handle of the list of items in the combo box.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
A	AddItem (see page 5940)	Adds an item to the list control.
V	AddItem (see page 21170)	Adds an item to the drop-down list of items.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
A	Clear (see page 5940)	Deletes all of the items from the list control.
V	Clear (see page 21172)	Deletes all text from the edit box and all items from the Items (see page 21187) list.
A	ClearSelection (see page 5940)	Removes the selection, leaving all items unselected.
V	ClearSelection (see page 21172)	Deselects any selected items in the drop-down list.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
A	CopySelection (see page 5941)	Copies the selected item or items to another TCustomListControl (see page 5928) descendant.
V	CopySelection (see page 21173)	Copies the selected item in the drop-down list to another list control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 3691)	Creates and initializes a TCustomComboBoxEx (see page 3678) instance.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 21166)	Creates and initializes a TCustomCombo (see page 21154) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.

	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DeleteSelected (see page 5941)	Deletes all the selected items.
	DeleteSelected (see page 21174)	Deletes the selected item from the drop-down list.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 3691)	Destroys the combo box and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
	Destroy (see page 21166)	Destroys the combo box and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 3695)	Indicates whether the combo box has input focus.
	Focused (see page 6150)	Determines whether the control has input focus.
	Focused (see page 21175)	Indicates whether the combo box has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.

	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	MoveSelection (see page 5942)	Moves all selected items to another list control.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
A	SelectAll (see page 5943)	Selects all items or all text in the selected item.
V	SelectAll (see page 21180)	Selects the entire block of text in the edit box.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.

V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 21184)	Provides access to the drawing surface of the combo box.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DroppedDown (see page 21185)	Indicates whether the drop-down list is currently displayed.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.

	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	ItemIndex (see page 5944)	Specifies the index of the selected item.
	Items (see page 21187)	Provides access to the list of items (strings) in the list portion of the combo box.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	SelLength (see page 21190)	Specifies the length, in characters, of the selected text in the edit portion of the combo box.
	SelStart (see page 21193)	Specifies the position of the first selected character in the edit portion of the combo box.
	SelText (see page 3701)	Represents the selected text in the edit region.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnBeginEdit (see page 3504)	Occurs when the user starts editing the text of the combo box.
	OnChange (see page 3504)	Occurs when the user changes the text displayed in the edit region.
	OnClick (see page 3507)	Occurs when the user clicks the control.
	OnContextPopup (see page 3509)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 3509)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 3510)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 3512)	Occurs when the user drags an object over a control.
	OnDropDown (see page 3514)	Occurs when the user opens the drop-down list.
	OnEndDock (see page 3516)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 3516)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEndEdit (see page 3517)	Occurs when the user finishes editing the text of the combo box.
	OnEnter (see page 3517)	Occurs when a control receives the input focus.
	OnExit (see page 3520)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 3521)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 3524)	Occurs when a key is pressed.
	OnKeyUp (see page 3525)	Occurs when the user releases a key that has been pressed.
	OnMouseMove (see page 3527)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnSelect (see page 3529)	Occurs when the user selects a string in the drop-down list.
	OnStartDock (see page 3530)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 3530)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Action (see page 3476)	Designates the action associated with the control.
	Align (see page 3477)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.

	Anchors (see page 3480)	Specifies how the control is anchored to its parent.
	AutoCompleteOptions (see page 3481)	Specifies options that control autocompletion.
	BiDiMode (see page 3481)	Specifies the bi-directional mode for the control.
	Color (see page 3482)	Specifies the background color of the control.
	Constraints (see page 3482)	Specifies the size constraints for the control.
	Ctl3D (see page 3483)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 3483)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 3484)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 3484)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DropDownCount (see page 3486)	Specifies the maximum number of items displayed in the drop-down list.
	Enabled (see page 3486)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 3487)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Images (see page 3488)	Specifies the images that appear next to items in the combo box list.
	ImeMode (see page 3488)	Determines the behavior of the input method editor (IME).
	ImeName (see page 3489)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	ItemHeight (see page 3489)	Specifies the height, in pixels, of the items in the drop-down list.
	ItemsEx (see page 3490)	Lists the items that appear in the list portion of the combo box.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	MaxLength (see page 3490)	Specifies the maximum number of characters the user can type into the edit portion of the combo box.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 3491)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 3491)	Determines where a control looks for its color information.
	ParentCtl3D (see page 3492)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 3492)	Determines where a control looks for its font information.
	ParentShowHint (see page 3492)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 3493)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 3498)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Style (see page 3499)	Determines the display style of the combo box.
	StyleEx (see page 3499)	Determines the appearance and behavior of the items in the list.
	TabOrder (see page 3500)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 3500)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Text (see page 3501)	Contains a text string associated with the control.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 3502)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

27.1.6.2 TComboBoxEx Properties

The properties of the TComboBoxEx class are listed here.

Published Properties

	Name	Description
	Action (see page 3476)	Designates the action associated with the control.
	Align (see page 3477)	Determines how the control aligns within its container (parent control).
	Anchors (see page 3480)	Specifies how the control is anchored to its parent.
	AutoCompleteOptions (see page 3481)	Specifies options that control autocompletion.
	BiDiMode (see page 3481)	Specifies the bi-directional mode for the control.
	Color (see page 3482)	Specifies the background color of the control.
	Constraints (see page 3482)	Specifies the size constraints for the control.
	Ctl3D (see page 3483)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DragCursor (see page 3483)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 3484)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 3484)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DropDownCount (see page 3486)	Specifies the maximum number of items displayed in the drop-down list.
	Enabled (see page 3486)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 3487)	Controls the attributes of text written on or in the control.
	Images (see page 3488)	Specifies the images that appear next to items in the combo box list.
	ImeMode (see page 3488)	Determines the behavior of the input method editor (IME).
	ImeName (see page 3489)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	ItemHeight (see page 3489)	Specifies the height, in pixels, of the items in the drop-down list.
	ItemsEx (see page 3490)	Lists the items that appear in the list portion of the combo box.
	MaxLength (see page 3490)	Specifies the maximum number of characters the user can type into the edit portion of the combo box.
	ParentBiDiMode (see page 3491)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 3491)	Determines where a control looks for its color information.
	ParentCtl3D (see page 3492)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 3492)	Determines where a control looks for its font information.
	ParentShowHint (see page 3492)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 3493)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 3498)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Style (see page 3499)	Determines the display style of the combo box.
	StyleEx (see page 3499)	Determines the appearance and behavior of the items in the list.
	TabOrder (see page 3500)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 3500)	Determines if the user can tab to a control.
	Text (see page 3501)	Contains a text string associated with the control.
	Visible (see page 3502)	Determines whether the component appears onscreen.

27.1.6.2.1 TComboBoxEx.Action Property

Designates the action associated with the control.

Pascal

```
property Action: TBasicAction;
```

C++

```
__property TBasicAction Action;
```

Description

Action is the action object that is associated with the control. Actions allow an application to centralize the response to user commands. When a control is associated with an action, the action determines the appropriate properties and events of the control (such as whether the control is enabled or how it responds to an OnClick event).

To create actions at design time, place an action list component on a form or data module. Double click the action list to bring up the action list editor. Add actions in the editor using its context menu. Once the actions have been added using the action list editor, they appear in the drop-down list for the Action property in the Object Inspector.

27.1.6.2.2 TComboBoxEx.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)

    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
```

```
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

procedure TForm1.Button1Click(Sender: TObject);
var
  ProgressBar: TProgressBar;
begin
  ProgressBar := TProgressBar.Create(Self);
  with ProgressBar do
  begin
    Parent := Self;
    Align := alBottom;
  end;
end;
{
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
```

```
}
var
  PageControl1: TPageControl;
  pts: array[0..3] of TTabSheet;
const
  TabTitles: array[0..3] of ShortString = ('Customer', 'Orders', 'Items', 'Parts' );

procedure TForm1.FormCreate(Sender: TObject);
const
  colorpalette: Array[0..11] of TColor = (
    clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia, clTeal,
    clNavy, clMaroon, clLime, clOlive, clPurple);
var
  i: Integer;
begin
  PageControl1 := TPageControl.Create(Self);
  PageControl1.Parent := Self;
  PageControl1.Align := alClient;
  for i := Low(TabTitles) to High(TabTitles) do
  begin
    pts[i]:= TTabSheet.Create(PageControl1);
    with pts[i] do
    begin
      PageControl := PageControl1;
      Name := 'ts' + TabTitles[i];
      Caption := TabTitles[i];
      Brush.Color := colorPalette[i];
   end;
  end;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  i: Integer;
begin
  for i := Low(TabTitles) to High(TabTitles) do
  begin
    pts[i].Free;
  end;
  PageControl1.Free;
end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

27.1.6.2.3 TComboBoxEx.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control

has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

27.1.6.2.4 TComboBoxEx.AutoCompleteOptions Property

Specifies options that control autocompletion.

Pascal

```
property AutoCompleteOptions: TAutoCompleteOptions;
```

C++

```
__property TAutoCompleteOptions AutoCompleteOptions;
```

Description

AutoCompleteOptions specifies options that control autocompletion.

27.1.6.2.5 TComboBoxEx.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

27.1.6.2.6 TComboBoxEx.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

27.1.6.2.7 TComboBoxEx.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

27.1.6.2.8 TComboBoxEx.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

27.1.6.2.9 TComboBoxEx.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

27.1.6.2.10 TComboBoxEx.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

27.1.6.2.11 TComboBoxEx.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
```

```
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}

Arranging the Order of Persistent Columns

27.1.6.2.12 TComboBoxEx.DropDownCount Property

Specifies the maximum number of items displayed in the drop-down list.

Pascal

```
property DropDownCount: Integer;
```

C++

```
__property int DropDownCount;__property int DropDownCount;
```

Description

By default, the drop-down list is long enough to contain eight items without requiring the user to scroll to see them all. To make the drop-down list smaller or larger, specify a number larger or smaller than eight as the DropDownCount value.

If the DropDownCount value is larger than the number of items in the Items property, the drop-down list will be just large enough to hold all the possible choices and no more. If the DropDownCount value is smaller then the number of item in the Items property, the drop down list will display a scroll bar.

DropDownCount is meaningful only if Style is not csExSimple.

ItemsEx (see page 3700)

Style (see page 3701)

27.1.6.2.13 TComboBoxEx.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

Enabling Mouse

27.1.6.2.14 TComboBoxEx.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

27.1.6.2.15 TComboBoxEx.Images Property

Specifies the images that appear next to items in the combo box list.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Use Images to supply the list of images that appear beside items in the combo box's drop-down list. Each combo box item has an ImageIndex property that identifies an image in this list. In addition, Images can contain images that are used as overlay masks for the item images (to create non-rectangular images) and images that are used only when items are selected. The combo box items reference these images using their OverlayImageIndex and SelectedImageIndex properties.

ImageIndex

ItemsEx (see page 3700)

SelectedImageIndex (see page 3552)

OverlayImageIndex (see page 3551)

27.1.6.2.16 TComboBoxEx.ImeMode Property

Determines the behavior of the input method editor (IME).

Pascal

```
property ImeMode: TImeMode;
```

C++

```
__property TImeMode ImeMode;
```

Description

Set ImeMode to configure the way an IME processes user keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeMode allows a control to influence the type of conversion performed by the IME so that it is appropriate for the input expected by the control. For example, a control that only accepts numeric input might specify an ImeMode of imClose, as no conversion is necessary for numeric input.

Note: The value of ImeMode only takes effect when the control receives focus. To change the value of ImeMode when the control already has input focus, call the SetIme method.

See Also

ImeName (see page 6208)

ResetIme (see page 6174)

ResetImeComposition (see page 6175)

SetIme (see page 6181)

SetImeCompositionWindow (see page 6181)

27.1.6.2.17 TComboBoxEx.ImeName Property

Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.

Pascal

```
property ImeName: TImeName;
```

C++

```
__property TImeName ImeName;
```

Description

Set ImeName to specify which IME to use for converting keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeName must specify one of the IMEs that has been installed through the Windows control panel. The property inspector provides a drop-down list of all currently installed IMEs on the system. At runtime, applications can obtain a list of currently installed IMEs from the global Screen variable.

If ImeName specifies an unavailable IME, the IME that was active when the application started is used instead. No exception is generated.

Note: The value of ImeName only takes effect when the control receives focus. To change the value of ImeName after the control has input focus, call the SetIme method.

See Also

ImeMode (see page 6207)

ResetIme (see page 6174)

SetIme (see page 6181)

DefaultIme (see page 14216)

Imes (see page 14227)

27.1.6.2.18 TComboBoxEx.ItemHeight Property

Specifies the height, in pixels, of the items in the drop-down list.

Pascal

```
property ItemHeight: Integer;
```

C++

```
__property int ItemHeight;
```

Description

Read ItemHeight to determine the height of the items in the drop-down list.

The effect of setting ItemHeight varies, depending on the type of combo box and the style. For example, TComboBox lets you

set the item height only when Style is set to csOwnerDrawFixed or csOwnerDrawVariable. If Style is csOwnerDrawVariable, ItemHeight is the default height for drawing list items, but this value can be overridden by an OnMeasureItem event handler.

TComboBoxEx does not let you change the value of ItemHeight.

Note: Combo boxes that do not support changes to ItemHeight do not raise an exception when you attempt to change ItemHeight; they simply ignore the attempt.

See Also

Items (see page 21187)

OnMeasureItem (see page 21225)

Style (see page 21224)

27.1.6.2.19 TComboBoxEx.ItemsEx Property

Lists the items that appear in the list portion of the combo box.

Pascal

```
property ItemsEx: TComboExItems;
```

C++

```
__property TComboExItems ItemsEx;
```

Description

Read Items to access the list of items that appears in the combo box. ItemsEx is a collection of TComboExItem objects.

Set the value of Items to copy the items from another collection of TComboExItem objects.

Use the methods of Items to add, insert, delete and move items. Use the properties of individual items in the collection to specify the appearance of each item.

Note: To work with only the strings in the combo box, and not the other properties of the items, you can use the Items property instead.

See Also

ItemIndex

TComboExItem (see page 3546)

Items (see page 21187)

27.1.6.2.20 TComboBoxEx.MaxLength Property

Specifies the maximum number of characters the user can type into the edit portion of the combo box.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

Use MaxLength to limit the number of characters that the user can enter into the edit portion of the combo box. A value of 0 indicates that there is no application-defined limit on the length.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the

limit of MaxLength characters.

Note: Even when MaxLength is 0, there may be limitations imposed by the operating system on the number of characters that may be entered into an edit control.

See Also

Text (see page 5842)

27.1.6.2.21 TComboBoxEx.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

27.1.6.2.22 TComboBoxEx.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

27.1.6.2.23 TComboBoxEx.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

27.1.6.2.24 TComboBoxEx.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

27.1.6.2.25 TComboBoxEx.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

27.1.6.2.26 TComboBoxEx.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
```

```
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
```

```
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;
```

```
{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

27.1.6.2.27 TComboBoxEx.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
```

```
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

27.1.6.2.28 TComboBoxEx.Style Property

Determines the display style of the combo box.

Pascal

```
property Style: TComboBoxExStyle;
```

C++

```
__property TComboBoxExStyle Style;
```

Description

Set Style to specify how the list and edit region of the combo box should appear.

See Also

Height (see page 5825)

DropDownCount (see page 3699)

27.1.6.2.29 TComboBoxEx.StyleEx Property

Determines the appearance and behavior of the items in the list.

Pascal

```
property StyleEx: TComboBoxExStyles;
```

C++

```
__property TComboBoxExStyles StyleEx;
```

Description

Set StyleEx to configure how the items in the list look and behave.

27.1.6.2.30 TComboBoxEx.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

27.1.6.2.31 TComboBoxEx.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

27.1.6.2.32 TComboBoxEx.Text Property

Contains a text string associated with the control.

Pascal

```
property Text: TCaption;
```

C++

```
__property TCaption Text;
```

Description

Use the Text property to read the Text of the control or specify a new string for the Text value. By default, Text is the control name. For edit controls and memos, the Text appears within the control. For combo boxes, the Text is the content of the edit control portion of the combo box.

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
This example requires two edit boxes and a button.  This example
copies the text in an edit box into a null-terminated string, and
puts this string in another edit box when the user clicks the
button on the form.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  int Size = Edit1->GetTextLen(); //Get length of string in Edit1
  Size++;                        //Add room for null character
  char *Buffer = new char[Size];  //Creates Buffer dynamic variable
  Edit1->GetTextBuf(Buffer,Size); //Puts Edit1->Text into Buffer
  Edit2->Text = Buffer;
  delete [] Buffer;
}
/*
Note: the same thing could be accomplished more simply as follows:
*/
void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Edit2->Text = Edit1->Text;
}
```

Delphi Examples:

```
{
This example requires two edit boxes and a button.  This example
copies the text in an edit box into a null-terminated string, and
```

```
  puts this string in another edit box when the user clicks the
  button on the form.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  var
    Buffer: PChar;
    Size: Byte;
  begin
    Size := Edit1.GetTextLen;       {Get length of string in Edit1}
    Inc(Size);                      {Add room for null character}
    GetMem(Buffer, Size);           {Creates Buffer dynamic variable}
    Edit1.GetTextBuf(Buffer,Size);  {Puts Edit1.Text into Buffer}
    Edit2.Text := StrPas(Buffer);   {Converts Buffer to a Pascal-style string}
    FreeMem(Buffer, Size);{Frees memory allocated to Buffer}
  end;

  {
  Note: the same thing could be accomplished more simply as follows:
  }
  procedure TForm1.Button2Click(Sender: TObject);
  begin
    Edit2.Text := Edit1.Text;
  end;
```

See Also

Caption (see page 5806)

Lines (see page 21380)

27.1.6.2.33 TComboBoxEx.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

27.1.6.3 TComboBoxEx Events

The events of the TComboBoxEx class are listed here.

Published Events

	Name	Description
	OnBeginEdit (see page 3504)	Occurs when the user starts editing the text of the combo box.
	OnChange (see page 3504)	Occurs when the user changes the text displayed in the edit region.
	OnClick (see page 3507)	Occurs when the user clicks the control.
	OnContextPopup (see page 3509)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 3509)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 3510)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 3512)	Occurs when the user drags an object over a control.
	OnDropDown (see page 3514)	Occurs when the user opens the drop-down list.
	OnEndDock (see page 3516)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 3516)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEndEdit (see page 3517)	Occurs when the user finishes editing the text of the combo box.
	OnEnter (see page 3517)	Occurs when a control receives the input focus.
	OnExit (see page 3520)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 3521)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 3524)	Occurs when a key is pressed.
	OnKeyUp (see page 3525)	Occurs when the user releases a key that has been pressed.
	OnMouseMove (see page 3527)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnSelect (see page 3529)	Occurs when the user selects a string in the drop-down list.
	OnStartDock (see page 3530)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 3530)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

27.1.6.3.1 TComboBoxEx.OnBeginEdit Event

Occurs when the user starts editing the text of the combo box.

Pascal

```
property OnBeginEdit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnBeginEdit;
```

Description

Write an OnBeginEdit event handler to take specific action immediately before the user edits the text in the combo box.

See Also

OnEndEdit (see page 3702)

Text (see page 5842)

27.1.6.3.2 TComboBoxEx.OnChange Event

Occurs when the user changes the text displayed in the edit region.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action immediately after the user edits the text in the edit region or selects an item from the list. The Text property gives the new value in the edit region.

Note: OnChange only occurs in response to user actions. Changing the Text property programmatically does not trigger an OnChange event.

C++ Examples:

```
/*
This example requires a TPageControl already on the form.
Also, you must add pages to the TPageControl by right
clicking and selecting New Page.
The example code will allow the user to select the
ActivePage property through selection of a ComboBox item.
During the form create, the Combo Box control is loaded with
the names of each of the tabs, as well as the instance
pointers to the corresponding tab.  When the user selects
the Combo Box item, the associated TTabSheet object
contained in the Combo Box Objects array is used to set the
ActivePage property.  Select the Lines property of the
TRichEdit to enter a string.  Select the string before
justifying.
*/
void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  TComboBox *pCB = dynamic_cast<TComboBox *>(Sender);
  if (pCB)
    PageControl1->ActivePage = (TTabSheet *)(pCB->Items->Objects[pCB->ItemIndex]);
}

27.1.6.3.3 TComboBoxEx.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
    for (int i = 0; i < 10; i++)
    {
      TTabSheet *pPage = new TTabSheet(this);
      pPage->PageControl = PageControl1;
      pPage->Caption = AnsiString("Page") + IntToStr(i);
      TEdit *pEdit = new TEdit(this);
      pEdit->Parent = pPage;
      pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
      pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
    }
    PageControl1Change(Sender);
  }
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

27.1.6.3.4 TComboBoxEx.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

AutoPopup (see page 16178)

27.1.6.3.5 TComboBoxEx.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

27.1.6.3.6 TComboBoxEx.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
```

```
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;

TDragObject (see page 6031)

27.1.6.3.7 TComboBoxEx.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}
```

```
/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
```

```
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

27.1.6.3.8 TComboBoxEx.OnDropDown Event

Occurs when the user opens the drop-down list.

Pascal

```
property OnDropDown: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDropDown;
```

Description

Write an OnDropDown event handler to implement special processing that needs to occur only when the drop-down list is activated.

C++ Examples:

```
/*
This example fills the list of a combo box with the set of
open forms when the user drops down the list. The list is
regenerated every time the list is dropped down, so if the
application opens or closes forms, the combo box stays current.
*/
#include "Unit2.h"
#include "Unit3.h"

void __fastcall TForm1::ComboBox1DropDown(TObject *Sender)
{
  ComboBox1->Items->BeginUpdate(); // prevent repaints until done
  ComboBox1->Items->Clear(); // empty the list of any old values
  for (int i = 0; i < Screen->CustomFormCount; i++)
  {
    if (((TForm1 *)Screen->CustomForms[i])->Visible)
      ComboBox1->Items->Add(Screen->CustomForms[i]->Caption);  // add form names
  }
  ComboBox1->Items->EndUpdate(); //reenable painting
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ComboBox1->Sorted = True; // make sure the form names are sorted
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Form2->Show();
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Form3->Show();
}
```

Delphi Examples:

```
{
This example fills the list of a combo box with the set of
open forms when the user drops down the list. The list is
regenerated every time the list is dropped down, so if the
application opens or closes forms, the combo box stays current.
}
procedure TForm1.ComboBox1DropDown(Sender: TObject);
var
  I: Integer;
begin
  with ComboBox1 do
  begin
    Items.BeginUpdate; { prevent repaints until done }
    Items.Clear; { empty the list of any old values }
    for I := 0 to Screen.CustomFormCount - 1 do
    begin
      if (Screen.CustomForms[I].Visible) then
        Items.Add(Screen.CustomForms[I].Caption); { add form name }
    end;
    Items.EndUpdate; {reenable painting }
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ComboBox1.Sorted := True; { make sure the form names are sorted }
end;

procedure TForm1.Button1Click(Sender: TObject);
```

```
begin
  Form2.Show;
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  Form3.Show;
end;
```

27.1.6.3.9 TComboBoxEx.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

27.1.6.3.10 TComboBoxEx.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
```

```
    if (Sender->ClassNameIs("TLabel"))
    {
      AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
      if (Target)
        S = S + "accepted!";
      else
        S = S + "rejected.";
      Status->Caption = S;
    }
  }
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

27.1.6.3.11 TComboBoxEx.OnEndEdit Event

Occurs when the user finishes editing the text of the combo box.

Pascal

```
property OnEndEdit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEndEdit;
```

Description

Write an OnEndEdit event handler to take specific action immediately after the user edits the text in the combo box.

See Also

Text (see page 5842)

27.1.6.3.12 TComboBoxEx.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
```

```
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
```

```
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

27.1.6.3.13 TComboBoxEx.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
```

```
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

27.1.6.3.14 TComboBoxEx.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
```

```
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}

27.1.6.3.15 TComboBoxEx.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an

OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

OnKeyUp (see page 6228)

KeyPreview (see page 13918)

27.1.6.3.16 TComboBoxEx.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
```

```
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
    else
      ComboBox1.Text := 'KeyUp';
    WriteLn(ComboBox1.Text);
  end;
end;
```

OnKeyPress (see page 6227)

27.1.6.3.17 TComboBoxEx.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
```

```
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
```

```
    StartY := Y;
  end;

  procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
  Integer);
  begin
    Form1.Canvas.Rectangle(StartX, StartY, X, Y);
    StatusBar1.Panels[0].Text := '';
    StatusBar1.Panels[1].Text := '';
    StatusBar1.Panels[2].Text := '';
    StatusBar1.Panels[3].Text := '';
  end;

  procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
  begin
    if ssLeft in Shift then { make sure button is down }
    begin
      if Y > StartY then
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
        end
      else
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

MouseCapture (see page 5831)

27.1.6.3.18 TComboBoxEx.OnSelect Event

Occurs when the user selects a string in the drop-down list.

Pascal

```
property OnSelect: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSelect;
```

Description

Write an OnSelect event handler to respond when the user changes the selected item in the drop-down list. OnSelect occurs after the selection has changed and the Text property reflects the new item.

See Also

autocomplete (see page 21220)

ItemIndex

Text (see page 5842)

27.1.6.3.19 TComboBoxEx.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

27.1.6.3.20 TComboBoxEx.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

27.1.7 TComboBoxExActionLink Class

Class Hierarchy

Pascal

```
TComboBoxExActionLink = class(TListActionLink);
```

C++

```
class TComboBoxExActionLink : public TListActionLink;
```

File

ComCtrls

Description

This is class ComCtrls.TComboBoxExActionLink.

27.1.7.1 TComboBoxExActionLink Members

The following tables list the members exposed by TComboBoxExActionLink.

Protected Fields

	Name	Description
	FAction (see page 2722)	This is FAction, a member of class TBasicActionLink.
	FClient (see page 5894)	This is FClient, a member of class TControlActionLink.
	FClient (see page 6236)	This is FClient, a member of class TWinControlActionLink.

Protected Methods

	Name	Description
	AddItem (see page 3534)	This is the overview for the AddItem method overload.
	AddItem (see page 15747)	This is the overview for the AddItem method overload.
	AssignClient (see page 2723)	This is AssignClient, a member of class TBasicActionLink.
	AssignClient (see page 5895)	Assigns a client control that is linked to the associated action.
	AssignClient (see page 6236)	Specifies the client control.
	Change (see page 2723)	This is Change, a member of class TBasicActionLink.
	DoShowHint (see page 5896)	Indicates whether the hint is shown, and modified.
	IsActiveLinked (see page 15748)	This is IsActiveLinked, a member of class TListActionLink.
	IsCaptionLinked (see page 268)	Indicates whether the Caption properties for the action and client are linked.
	IsCaptionLinked (see page 5896)	Indicates whether the caption for the action and the client are linked.
	IsCheckedLinked (see page 269)	Indicates whether the Checked properties for the action and client are linked.
	IsDropdownMenuLinked (see page 5896)	This is IsDropdownMenuLinked, a member of class TControlActionLink.
	IsEnabledLinked (see page 269)	Indicates whether the Enabled properties for the action and client are linked.
	IsEnabledLinked (see page 5897)	Indicates whether the enabled state for the action and the client are linked.
	IsEnableDropdownLinked (see page 5897)	This is IsEnableDropdownLinked, a member of class TControlActionLink.
	IsGroupIndexLinked (see page 270)	Indicates whether the GroupIndex property for the action controls client behavior.
	IsHelpContextLinked (see page 270)	Indicates whether the HelpContext properties for the action and client controls are linked.
	IsHelpContextLinked (see page 6236)	Indicates whether the Help context for the action and the client are linked.
	IsHelpLinked (see page 271)	Indicates whether the help properties for the action and client are linked.
	IsHelpLinked (see page 5897)	Indicates whether the help properties for the action and the client are linked.
	IsHintLinked (see page 271)	Indicates whether the Hint properties for the action and client are linked.
	IsHintLinked (see page 5898)	Indicates whether the Hint property for the action and the client are linked.
	IsImageIndexLinked (see page 272)	Indicates whether the image index for the action and the client are linked.
	IsImagesLinked (see page 15748)	This is IsImagesLinked, a member of class TListActionLink.
	IsOnExecuteLinked (see page 2723)	This is IsOnExecuteLinked, a member of class TBasicActionLink.
	IsOnExecuteLinked (see page 5898)	Indicates whether the OnExecute event handler for the action and the client are linked.
	IsPopupMenuLinked (see page 5898)	This is IsPopupMenuLinked, a member of class TControlActionLink.
	IsShortCutLinked (see page 272)	Indicates whether the ShortCut properties for the action and client are linked.
	IsVisibleLinked (see page 273)	Indicates whether the Visible properties for the action and client are linked.
	IsVisibleLinked (see page 5899)	Indicates whether the visible state for the action and the client are linked.
	RefreshControl (see page 15748)	This is RefreshControl, a member of class TListActionLink.
	SetAction (see page 2724)	This is SetAction, a member of class TBasicActionLink.
	SetAction (see page 15749)	This is SetAction, a member of class TListActionLink.
	SetActive (see page 15749)	This is SetActive, a member of class TListActionLink.
	SetAutoCheck (see page 274)	Introduces an interface for setting the AutoCheck property of a client.
	SetCaption (see page 274)	Introduces an interface for setting the caption on a client.
	SetCaption (see page 5899)	Sets the caption of a control if the client is linked to the action for this event.
	SetChecked (see page 274)	Introduces an interface for setting the checked state of a client.
	SetDropdownMenu (see page 5899)	This is SetDropdownMenu, a member of class TControlActionLink.
	SetEnabled (see page 275)	Introduces an interface for setting the enabled state of a client.
	SetEnabled (see page 5900)	Sets the enabled state of a control if the client is linked to the action for this event.
	SetEnableDropdown (see page 5900)	This is SetEnableDropdown, a member of class TControlActionLink.
	SetGroupIndex (see page 275)	Introduces an interface for setting the GroupIndex property of a client.
	SetHelpContext (see page 276)	Introduces an interface for setting the help context of a client.
	SetHelpContext (see page 5900)	Sets the HelpContext of a control if the client is linked to the action help properties.
	SetHelpContext (see page 6237)	Sets the Help context of a windowed control if the client is linked to the action for this event.
	SetHelpKeyword (see page 276)	Introduces an interface for setting the help keyword of a client.
	SetHelpKeyword (see page 5901)	Sets the HelpKeyword of a control if the client is linked to the action help properties.

	SetHelpType (see page 277)	Introduces an interface for setting the HelpType property of a client.
	SetHelpType (see page 5901)	Sets the HelpType of a control if the client is linked to the action help properties.
	SetHint (see page 278)	Introduces an interface for setting the hint for a client.
	SetHint (see page 5901)	Sets the hint of a control if the client is linked to the action for this event.
	SetImageIndex (see page 278)	Introduces an interface for setting the image index for a client.
	SetImages (see page 15749)	This is SetImages, a member of class TListActionLink.
	SetItemIndex (see page 15749)	This is SetItemIndex, a member of class TListActionLink.
	SetOnExecute (see page 2724)	This is SetOnExecute, a member of class TBasicActionLink.
	SetOnExecute (see page 5902)	Sets the execution event handler for a control if the client is linked to the action for this event.
	SetPopupMenu (see page 5902)	This is SetPopupMenu, a member of class TControlActionLink.
	SetShortCut (see page 279)	Introduces an interface for setting the shortcut for a client.
	SetVisible (see page 279)	Introduces an interface for setting the visible state of a client.
	SetVisible (see page 5902)	Sets the visible state of a control if the client is linked to the action for this event.

Public Events

	Name	Description
	OnChange (see page 2725)	Occurs when an OnChange event is triggered on the action.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2721)	Instantiates and initializes a TBasicActionLink (see page 2720) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2722)	Destroys an instance of an action link object.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 2723)	Invokes the action's Execute method.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Update (see page 2724)	Invokes the action's Update method.

Public Properties

	Name	Description
	Action (see page 2725)	Indicates which action the link connects to its client.

27.1.7.2 TComboBoxExActionLink Methods

The methods of the TComboBoxExActionLink class are listed here.

Protected Methods

	Name	Description
	AddItem (see page 3534)	This is the overview for the AddItem method overload.

27.1.7.2.1 AddItem Method

This is the overview for the AddItem method overload.

Overload List

	Name	Description
	TComboBoxExActionLink.AddItem (String, Integer, Pointer) (see page 3534)	This is AddItem, a member of class TComboBoxExActionLink.
	TComboBoxExActionLink.AddItem (TListControlItem) (see page 3534)	This is AddItem, a member of class TComboBoxExActionLink.

27.1.7.2.1.1 TComboBoxExActionLink.AddItem Method (String, Integer, Pointer)

Pascal

```
procedure AddItem(ACaption: String; AImageIndex: Integer; DataPtr: Pointer); override;
```

C++

```
virtual __fastcall AddItem(AnsiString ACaption, int AImageIndex, void * DataPtr);
```

Description

This is AddItem, a member of class TComboBoxExActionLink.

27.1.7.2.1.2 TComboBoxExActionLink.AddItem Method (TListControlItem)

Pascal

```
procedure AddItem(AnItem: TListControlItem); override;
```

C++

```
virtual __fastcall AddItem(TListControlItem AnItem);
```

Description

This is AddItem, a member of class TComboBoxExActionLink.

27.1.8 TComboBoxExStrings Class

Class Hierarchy

System::TObject → Classes.TPersistent → Classes.TStrings → StdCtrls.TCustomComboBoxStrings → ComCtrls.TComboBoxExStrings

Pascal

```
TComboBoxExStrings = class(TCustomComboBoxStrings);
```

C++

```
class TComboBoxExStrings : public TCustomComboBoxStrings;
```

File

ComCtrls

Description

This is class ComCtrls.TComboBoxExStrings.

27.1.8.1 TComboBoxExStrings Members

The following tables list the members exposed by TComboBoxExStrings.

Protected Methods

	Name	Description
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	CompareStrings (see page 3048)	Compares two strings.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 3049)	Reads and writes the Strings (see page 3080) property as if it were published.
	Error (see page 3052)	This is the overview for the Error method overload.
	ExtractName (see page 3053)	Returns the name portion of a string that is a name value pair.
V	GetItemClass (see page 3542)	This is GetItemClass, a member of class TComboBoxExStrings.
V	GetItemsClass (see page 3542)	This is GetItemsClass, a member of class TComboBoxExStrings.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetTextStr (see page 3056)	Returns the value of the Text (see page 3084) property.
V	Put (see page 3064)	Changes the value of the string with a specified index.
V	PutObject (see page 3544)	Changes the object associated with the string at a specified index.
V	SetCapacity (see page 3068)	Changes the amount of memory allocated to hold strings in the list.
V	SetTextStr (see page 3069)	Sets the Text (see page 3084) property.
V	SetUpdateState (see page 3545)	Performs internal adjustments before or after a series of updates.

Protected Properties

	Name	Description
	ComboBox (see page 21232)	Identifies the combo box whose items this object represents.
R	UpdateCount (see page 3085)	Indicates the number of calls to BeginUpdate (see page 3045) that have not been matched by a call to EndUpdate (see page 3050).

Public Methods

	Name	Description
V	Add (see page 3538)	This is Add, a member of class TComboBoxExStrings.
	AddItem (see page 3539)	This is AddItem, a member of class TComboBoxExStrings.

	AddObject (see page 3539)	This is AddObject, a member of class TComboBoxExStrings.
	AddStrings (see page 3039)	Adds a group of strings to the list.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 3041)	Adds a string to the list.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 3043)	Sets the strings in the list, and possibly associated objects, from a source object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginUpdate (see page 3045)	Enables the TStrings (see page 3029) object to track when the list of strings is changing.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 3539)	Deletes all the strings from the list.
	Create (see page 3537)	This is Create, a member of class TComboBoxExStrings.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 3539)	Removes the item specified by the Index parameter.
	Destroy (see page 3537)	Destroys the TPersistent instance and frees its memory.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 3050)	Enables the TStrings (see page 3029) object to keep track of when the list of strings has finished changing.
	Equals (see page 3051)	Compares the list of strings to the list from another TStrings (see page 3029) object and returns true if the two lists match.
	Exchange (see page 3540)	Swaps the position of two strings in the list.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	Get (see page 3540)	Returns a string given its index.
	GetCapacity (see page 3541)	Returns the currently allocated size of the list of strings.
	GetCount (see page 3541)	Returns the number of strings in the list
	GetEnumerator (see page 3054)	Returns a TStrings (see page 3029) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetObject (see page 3542)	Returns the object associated with the item at a specified index.
	GetText (see page 3055)	Allocates a text buffer and fills it with the value of the Text (see page 3084) property.
	IndexOf (see page 3542)	This is IndexOf, a member of class TComboBoxExStrings.
	IndexOfName (see page 3543)	This is IndexOfName, a member of class TComboBoxExStrings.
	IndexOfObject (see page 3059)	Returns the index of the first string in the list associated with a given object.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 3543)	This is Insert, a member of class TComboBoxExStrings.
	InsertObject (see page 3060)	Inserts a string into the list at the specified position, and associates it with an object.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	LoadFromFile (see page 3061)	Fills the list with the lines of text in a specified file.
	LoadFromStream (see page 3062)	Fills the list with lines of text read from a stream.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	Move (see page 3543)	Changes the position of a string in the list.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SaveToFile (see page 3065)	Saves the strings in the list to the specified file.
V	SaveToStream (see page 3067)	Writes the value of the Text (see page 3084) property to a stream object.
V	SetText (see page 3068)	Sets the Text (see page 3084) property.

Public Properties

	Name	Description
	Capacity (see page 3070)	Indicates the number of strings the TStrings (see page 3029) object can hold.
	CommaText (see page 3070)	Lists the strings in the TStrings (see page 3029) object in system data format (SDF).
R	Count (see page 3071)	Introduces an abstract property to represent the number of strings in the list.
	DelimitedText (see page 3074)	Represents all the strings in the TStrings (see page 3029) object as a single delimited string.
	Delimiter (see page 3074)	Specifies the delimiter used by the DelimitedText (see page 3074) property.
	ItemsEx (see page 3545)	This is ItemsEx, a member of class TComboBoxExStrings.
	LineBreak (see page 3075)	Defines the line break character(s).
R	Names (see page 3075)	Indicates the name part of strings that are name-value pairs.
	NameValueSeparator (see page 3077)	Indicates the character used to separate names from values.
	Objects (see page 3077)	Represents a set of objects that are associated one with each of the strings in the Strings (see page 3080) property.
	QuoteChar (see page 3080)	Specifies the quote character used by the DelimitedText (see page 3074) property.
	SortType (see page 3545)	This is SortType, a member of class TComboBoxExStrings.
	StrictDelimiter (see page 3080)	Determines how the Delimiter (see page 3074) property is used.
	Strings (see page 3080)	References the strings in the list by their positions.
	StringsAdapter (see page 3084)	Implements an IStringsAdapter (see page 3208) interface for the TStrings (see page 3029) object.
	Text (see page 3084)	Lists the strings in the TStrings (see page 3029) object as a single string with the individual strings delimited by carriage returns and line feeds.
	ValueFromIndex (see page 3085)	Represents the value part of a string with a given index, on strings that are name-value pairs.
	Values (see page 3086)	Represents the value part of a string associated with a given name, on strings that are name-value pairs.

27.1.8.2 TComboBoxExStrings.Create Constructor

Pascal

```
constructor Create(Owner: TCustomComboBoxEx);
```

C++

```
__fastcall TComboBoxExStrings(TCustomComboBoxEx Owner);
```

Description

This is Create, a member of class TComboBoxExStrings.

27.1.8.3 TComboBoxExStrings.Destroy Destructor

Destroys the TPersistent instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TComboBoxExStrings();
```

Description

Do not call Destroy directly. Call Free instead. Free checks that the object reference is not nil before calling Destroy.

See Also

Free (see page 22300)

Destroy (see page 22287)

27.1.8.4 TComboBoxExStrings Methods

The methods of the TComboBoxExStrings class are listed here.

Protected Methods

	Name	Description
	GetItemClass (see page 3542)	This is GetItemClass, a member of class TComboBoxExStrings.
	GetItemsClass (see page 3542)	This is GetItemsClass, a member of class TComboBoxExStrings.
	PutObject (see page 3544)	Changes the object associated with the string at a specified index.
	SetUpdateState (see page 3545)	Performs internal adjustments before or after a series of updates.

Public Methods

	Name	Description
	Add (see page 3538)	This is Add, a member of class TComboBoxExStrings.
	AddItem (see page 3539)	This is AddItem, a member of class TComboBoxExStrings.
	AddObject (see page 3539)	This is AddObject, a member of class TComboBoxExStrings.
	Clear (see page 3539)	Deletes all the strings from the list.
	Delete (see page 3539)	Removes the item specified by the Index parameter.
	Exchange (see page 3540)	Swaps the position of two strings in the list.
	Get (see page 3540)	Returns a string given its index.
	GetCapacity (see page 3541)	Returns the currently allocated size of the list of strings.
	GetCount (see page 3541)	Returns the number of strings in the list
	GetObject (see page 3542)	Returns the object associated with the item at a specified index.
	IndexOf (see page 3542)	This is IndexOf, a member of class TComboBoxExStrings.
	IndexOfName (see page 3543)	This is IndexOfName, a member of class TComboBoxExStrings.
	Insert (see page 3543)	This is Insert, a member of class TComboBoxExStrings.
	Move (see page 3543)	Changes the position of a string in the list.

27.1.8.4.1 TComboBoxExStrings.Add Method

Pascal

```
function Add(const S: String): Integer; override;
```

C++

```
virtual __fastcall int Add(const AnsiString S);
```

Description

This is Add, a member of class TComboBoxExStrings.

27.1.8.4.2 TComboBoxExStrings.AddItem Method

Pascal

```
function AddItem(const Caption: String; const ImageIndex: Integer; const SelectedImageIndex:
Integer; const OverlayImageIndex: Integer; const Indent: Integer; Data: Pointer): TComboExItem;
```

C++

```
__fastcall TComboExItem AddItem(const AnsiString Caption, const int ImageIndex, const int
SelectedImageIndex, const int OverlayImageIndex, const int Indent, void * Data);
```

Description

This is AddItem, a member of class TComboBoxExStrings.

27.1.8.4.3 TComboBoxExStrings.AddObject Method

Pascal

```
function AddObject(const S: String; AObject: TObject): Integer; override;
```

C++

```
virtual __fastcall int AddObject(const AnsiString S, TObject * AObject);
```

Description

This is AddObject, a member of class TComboBoxExStrings.

27.1.8.4.4 TComboBoxExStrings.Clear Method

Deletes all the strings from the list.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Call clear to empty the drop-down list of the combo box. All references to associated objects are also removed. However, the objects themselves are not freed.

See Also

Delete (see page 21229)

Objects

Strings

27.1.8.4.5 TComboBoxExStrings.Delete Method

Removes the item specified by the Index parameter.

Pascal

```
procedure Delete(Index: Integer); override;
```

C++

```
virtual __fastcall Delete(int Index);
```

Description

Call Delete to remove a single item from the list. If an object is associated with the string, the reference to the object is removed as well. Index gives the position of the string in the drop-down list, where 0 is the first string, 1 is the second string, and so on.

See Also

Add (see page 3033)

AddObject (see page 3036)

Clear (see page 21228)

IndexOf (see page 21230)

InsertObject (see page 3060)

Objects

Strings

27.1.8.4.6 TComboBoxExStrings.Exchange Method

Swaps the position of two strings in the list.

Pascal

```
procedure Exchange(Index1: Integer; Index2: Integer); override;
```

C++

```
virtual __fastcall Exchange(int Index1, int Index2);
```

Description

Call Exchange to rearrange the strings in the list. The strings are specified by their index values in the Index1 and Index2 parameters. Indexes are zero-based, so the first string in the list has an index value of 0, the second has an index value of 1, and so on.

If either string has an associated object, Exchange changes the position of the object as well.

See Also

Move (see page 3063)

Objects (see page 3077)

Strings (see page 3080)

27.1.8.4.7 TComboBoxExStrings.Get Method

Returns a string given its index.

Pascal

```
function Get(Index: Integer): String; override;
```

C++

```
virtual __fastcall AnsiString Get(int Index);
```

Description

Get is the protected read implementation of the Strings property. It fetches the specified string from the combo box identified by the ComboBox property.

Index identifies the string to return, where 0 is the index of the first string, 1 is the index of the second string, and so on.

See Also

Strings

IndexOf (see page 21230)

ComboBox (see page 21232)

27.1.8.4.8 TComboBoxExStrings.GetCapacity Method

Returns the currently allocated size of the list of strings.

Pascal

```
function GetCapacity: Integer; override;
```

C++

```
virtual __fastcall int GetCapacity();
```

Description

GetCapacity is the protected read implementation of the Capacity property. In TStrings, GetCapacity returns the value of the Count property. Descendants of TStrings can override this property to let a string list allocate memory for entries that have not been added to the list.

See Also

Capacity (see page 3070)

Count (see page 3071)

27.1.8.4.9 TComboBoxExStrings.GetCount Method

Returns the number of strings in the list

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

GetCount is the protected read implementation of the Count property. It fetches the number of items from the combo box identified by the ComboBox property.

See Also

Count

ComboBox (see page 21232)

27.1.8.4.10 TComboBoxExStrings.GetItemClass Method

Pascal

```
function GetItemClass: TComboExItemClass; virtual;
```

C++

```
virtual __fastcall TComboExItemClass GetItemClass();
```

Description

This is GetItemClass, a member of class TComboBoxExStrings.

27.1.8.4.11 TComboBoxExStrings.GetItemsClass Method

Pascal

```
function GetItemsClass: TComboExItemsClass; virtual;
```

C++

```
virtual __fastcall TComboExItemsClass GetItemsClass();
```

Description

This is GetItemsClass, a member of class TComboBoxExStrings.

27.1.8.4.12 TComboBoxExStrings.GetObject Method

Returns the object associated with the item at a specified index.

Pascal

```
function GetObject(Index: Integer): TObject; override;
```

C++

```
virtual __fastcall TObject * GetObject(int Index);
```

Description

GetObject is the protected read implementation of the Objects property. It fetches the associated object for the identified item from the combo box identified by the ComboBox property.

Index is the index of the item with which the object is associated.

See Also

Objects

ComboBox (see page 21232)

27.1.8.4.13 TComboBoxExStrings.IndexOf Method

Pascal

```
function IndexOf(const S: String): Integer; override;
```

C++

```
virtual __fastcall int IndexOf(const AnsiString S);
```

Description

This is IndexOf, a member of class TComboBoxExStrings.

27.1.8.4.14 TComboBoxExStrings.IndexOfName Method

Pascal

```
function IndexOfName(const Name: String): Integer; override;
```

C++

```
virtual __fastcall int IndexOfName(const AnsiString Name);
```

Description

This is IndexOfName, a member of class TComboBoxExStrings.

27.1.8.4.15 TComboBoxExStrings.Insert Method

Pascal

```
procedure Insert(Index: Integer; const S: String); override;
```

C++

```
virtual __fastcall Insert(int Index, const AnsiString S);
```

Description

This is Insert, a member of class TComboBoxExStrings.

27.1.8.4.16 TComboBoxExStrings.Move Method

Changes the position of a string in the list.

Pascal

```
procedure Move(CurIndex: Integer; NewIndex: Integer); override;
```

C++

```
virtual __fastcall Move(int CurIndex, int NewIndex);
```

Description

Use Move to move the string at position CurIndex so that it occupies the position NewIndex. The positions are specified as 0-based indexes. For example, the following lines of code move the string in the first position to the last position.

```
MyStringsObject.Move(0, MyStringsObject.Count
MyStringsObject->Move(0, MyStringsObject->Count - 1);
```

If the string has an associated object, the object remains associated with the string in its new position.

C++ Examples:

```
/*
This example uses a list box and a button on a form. The
list box contains items when the form appears. When the user
clicks the button, the selected item in the list box is
moved to the top of the list box:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->MultiSelect = false;
  Button1->Caption = "Move to Top";
  for (int i = 1; i <= 10; i++)
    ListBox1->Items->Add("Item " + IntToStr(i));
}
```

```
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ListBox1->ItemIndex >= 0 && ListBox1->ItemIndex <= 9)
    ListBox1->Items->Move(ListBox1->ItemIndex, 0);
}
```

Delphi Examples:

```
{
This example uses a list box and a button on a form. The
list box contains items when the form appears. When the user
clicks the button, the selected item in the list box is
moved to the top of the list box:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if (ListBox1.ItemIndex in [0..9]) then
    ListBox1.Items.Move(ListBox1.ItemIndex, 0);
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  ListBox1.MultiSelect := False;
  Button1.Caption := 'Move to Top';
  for I := 1 to 10 do
    ListBox1.Items.Add('Item ' + IntToStr(I));
end;
```

See Also

Count (see page 3071)

Objects (see page 3077)

Strings (see page 3080)

27.1.8.4.17 TComboBoxExStrings.PutObject Method

Changes the object associated with the string at a specified index.

Pascal

```
procedure PutObject(Index: Integer; AObject: TObject); override;
```

C++

```
virtual __fastcall PutObject(int Index, TObject * AObject);
```

Description

PutObject is the protected write implementation of the Objects property. It associates the object specified by AObject with the item identified by Index.

Index identifies an item in the drop-down list of the combo box, where 0 is the index of the first item, 1 is the index of the second item, and so on.

AObject is the object to associated with the specified item.

See Also

Objects

27.1.8.4.18 TComboBoxExStrings.SetUpdateState Method

Performs internal adjustments before or after a series of updates.

Pascal

```
procedure SetUpdateState(Updating: Boolean); override;
```

C++

```
virtual __fastcall SetUpdateState(Boolean Updating);
```

Description

SetUpdateState is called at the beginning or end of a series of updates. When the BeginUpdate method is first called and the TCustomComboBoxStrings object is not already in the middle of an update, SetUpdateState is called with Updating set to true. When the EndUpdate method is called and it cancels out the last unmatched call to BeginUpdate, SetUpdateState is called with Updating set to false.

SetUpdateState refreshes the combo box when Updating is false, so that the combo box reflects the new set of strings.

See Also

BeginUpdate (see page 3045)

EndUpdate (see page 3050)

27.1.8.5 TComboBoxExStrings Properties

The properties of the TComboBoxExStrings class are listed here.

Public Properties

	Name	Description
	ItemsEx (see page 3545)	This is ItemsEx, a member of class TComboBoxExStrings.
	SortType (see page 3545)	This is SortType, a member of class TComboBoxExStrings.

27.1.8.5.1 TComboBoxExStrings.ItemsEx Property

Pascal

```
property ItemsEx: TComboExItems;
```

C++

```
__property TComboExItems ItemsEx;
```

Description

This is ItemsEx, a member of class TComboBoxExStrings.

27.1.8.5.2 TComboBoxExStrings.SortType Property

Pascal

```
property SortType: TListItemsSortType;
```

C++

```
__property TListItemsSortType SortType;
```

Description

This is SortType, a member of class TComboBoxExStrings.

27.1.9 TComboExItem Class

TComboExItem represents an item in an extended combo box.

Class Hierarchy

Pascal

```
TComboExItem = class(TListControlItem);
```

C++

```
class TComboExItem : public TListControlItem;
```

File

ComCtrls

Description

TComboExItem represents a single item in the drop-down list of a TComboBoxEx (see page 3463) object. Each TComboBoxEx (see page 3463) item publishes a set of properties that determine its appearance in the list of the combo box. These include

Caption, which is the text that appears in the combo box list.

ImageIndex, which identifies an image to appear beside the caption.

SelectedImageIndex (see page 3552), which identifies an image to appear beside the caption when the item is selected.

OverlayImageIndex (see page 3551), which identifies an overlay bitmap that can mask out portions of the image (or selected image), allowing the background of the item to show through.

Indent (see page 3551), which indicates the number of pixels by which the item is indented in the list.

See Also

TComboExItems (see page 3552)

TComboBoxEx (see page 3463)

27.1.9.1 TComboExItem Members

The following tables list the members exposed by TComboExItem.

Protected Fields

	Name	Description
	FCaption (see page 15752)	This is FCaption, a member of class TListControlItem.
	FData (see page 15752)	This is FData, a member of class TListControlItem.
	FImageIndex (see page 15753)	This is FImageIndex, a member of class TListControlItem.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	Changed (see page 15754)	Responds when any of the item's properties changes.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
	GetDisplayName (see page 15754)	Specifies the name of the item as it appears in the Object Inspector.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCaption (see page 3549)	Sets the value of the Caption property.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetData (see page 3549)	Sets the value of the Data property.
	SetDisplayName (see page 3549)	This is SetDisplayName, a member of class TComboExItem.
	SetImageIndex (see page 3550)	Sets the value of the ImageIndex property.
	SetIndex (see page 3550)	Moves the collection item to a specified position in the parent collection.
	SetOverlayImageIndex (see page 3550)	This is SetOverlayImageIndex, a member of class TComboExItem.
	SetSelectedImageIndex (see page 3551)	This is SetSelectedImageIndex, a member of class TComboExItem.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 3548)	Copies the properties of another TComboExItem (see page 3546) object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2757)	Creates and initializes a TCollectionItem (see page 2755) instance.
	Create (see page 15752)	Creates and initializes a TListControlItem (see page 15750) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	Data (see page 15756)	Points to user-defined data associated with the control.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Properties

	Name	Description
	Caption (see page 15756)	Specifies the text value of the item.
	ImageIndex (see page 15757)	Identifies the image associated with this item.
	Indent (see page 3551)	Indicate the number of pixels by which the item appears indented in the combo box list.
	OverlayImageIndex (see page 3551)	Identifies an overlay mask that is used to mask out portions of the image and selected image.
	SelectedImageIndex (see page 3552)	Identifies the image associated with this item when it is selected.

27.1.9.2 TComboExItem Methods

The methods of the TComboExItem class are listed here.

Protected Methods

	Name	Description
V	SetCaption (see page 3549)	Sets the value of the Caption property.
V	SetData (see page 3549)	Sets the value of the Data property.
V	SetDisplayName (see page 3549)	This is SetDisplayName, a member of class TComboExItem.
V	SetImageIndex (see page 3550)	Sets the value of the ImageIndex property.
V	SetIndex (see page 3550)	Moves the collection item to a specified position in the parent collection.
V	SetOverlayImageIndex (see page 3550)	This is SetOverlayImageIndex, a member of class TComboExItem.
V	SetSelectedImageIndex (see page 3551)	This is SetSelectedImageIndex, a member of class TComboExItem.

Public Methods

	Name	Description
V	Assign (see page 3548)	Copies the properties of another TComboExItem (see page 3546) object.

27.1.9.2.1 TComboExItem.Assign Method

Copies the properties of another TComboExItem (see page 3546) object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to assign the properties of another combo box item to this one. If the Source parameter is another TComboExItem (

see page 3546) object, Assign copies the values of its Caption, ImageIndex, SelectedImageIndex (see page 3552), OverlayImageIndex (see page 3551), and Indent (see page 3551) properties. Otherwise, Assign calls the inherited method, which copies the properties from any object that has an AssignTo method that can copy to a TComboExItem (see page 3546) object.

See Also

AssignTo (see page 2931)

27.1.9.2.2 TComboExItem.SetCaption Method

Sets the value of the Caption property.

Pascal

```
procedure SetCaption(const Value: String); override;
```

C++

```
virtual __fastcall SetCaption(const AnsiString Value);
```

Description

SetCaption is the protected write implementation of the Caption property. It sets the Caption property to Value, and then calls the Changed method so that the collection can update itself.

See Also

Caption (see page 15756)

Changed (see page 15754)

27.1.9.2.3 TComboExItem.SetData Method

Sets the value of the Data property.

Pascal

```
procedure SetData(const Value: Pointer); override;
```

C++

```
virtual __fastcall SetData(const void * Value);
```

Description

SetData is the protected write implementation of the Data property. It sets the Data property to Value, and then calls the Changed method so that the collection can update itself.

See Also

Data (see page 15756)

Changed (see page 15754)

27.1.9.2.4 TComboExItem.SetDisplayName Method

Pascal

```
procedure SetDisplayName(const Value: String); override;
```

C++

```
virtual __fastcall SetDisplayName(const AnsiString Value);
```

Description

This is SetDisplayName, a member of class TComboExItem.

27.1.9.2.5 TComboExItem.SetImageIndex Method

Sets the value of the ImageIndex property.

Pascal

```
procedure SetImageIndex(const Value: TImageIndex); override;
```

C++

```
virtual __fastcall SetImageIndex(const TImageIndex Value);
```

Description

SetImageIndex is the protected write implementation of the ImageIndex property. It sets the ImageIndex property to Value, and then calls the Changed method so that the collection can update itself.

See Also

ImageIndex (see page 15757)

Changed (see page 15754)

27.1.9.2.6 TComboExItem.SetIndex Method

Moves the collection item to a specified position in the parent collection.

Pascal

```
procedure SetIndex(Value: Integer); override;
```

C++

```
virtual __fastcall SetIndex(int Value);
```

Description

SetIndex is the protected write implementation of the Index property. The Value parameter specifies the new (0-based) position for the item in its parent collection.

See Also

Index (see page 2762)

27.1.9.2.7 TComboExItem.SetOverlayImageIndex Method

Pascal

```
procedure SetOverlayImageIndex(const Value: TImageIndex); virtual;
```

C++

```
virtual __fastcall SetOverlayImageIndex(const TImageIndex Value);
```

Description

This is SetOverlayImageIndex, a member of class TComboExItem.

27.1.9.2.8 TComboExItem.SetSelectedImageIndex Method

Pascal

```
procedure SetSelectedImageIndex(const Value: TImageIndex); virtual;
```

C++

```
virtual __fastcall SetSelectedImageIndex(const TImageIndex Value);
```

Description

This is SetSelectedImageIndex, a member of class TComboExItem.

27.1.9.3 TComboExItem Properties

The properties of the TComboExItem class are listed here.

Published Properties

	Name	Description
	Indent (see page 3551)	Indicate the number of pixels by which the item appears indented in the combo box list.
	OverlayImageIndex (see page 3551)	Identifies an overlay mask that is used to mask out portions of the image and selected image.
	SelectedImageIndex (see page 3552)	Identifies the image associated with this item when it is selected.

27.1.9.3.1 TComboExItem.Indent Property

Indicate the number of pixels by which the item appears indented in the combo box list.

Pascal

```
property Indent: Integer;
```

C++

```
__property int Indent;
```

Description

Use Indent to cause the item to appear indented in the list portion of the combo box. If Indent is –1, the item does not appear indented. If Indent is non-negative, it indicates the number of pixels by which to indent the item.

27.1.9.3.2 TComboExItem.OverlayImageIndex Property

Identifies an overlay mask that is used to mask out portions of the image and selected image.

Pascal

```
property OverlayImageIndex: TImageIndex;
```

C++

```
__property TImageIndex OverlayImageIndex;
```

Description

Set OverlayImageIndex to use an overlay mask with the images that the ImageIndex and SelectedImageIndex (see page 3552) properties identify. An overlay mask is a black-and-white bitmap that is combined with another image so that every place the overlay mask is white appears transparent in the other image.

OverlayImageIndex is an index into the Images property of the combo box. If OverlayImageIndex is -1, this item does not use an

overlay mask.

See Also

Images (see page 3700)

OverlayImageIndex

ImageIndex

27.1.9.3.3 TComboExItem.SelectedImageIndex Property

Identifies the image associated with this item when it is selected.

Pascal

```
property SelectedImageIndex: TImageIndex;
```

C++

```
__property TImageIndex SelectedImageIndex;
```

Description

Set SelectedImageIndex to specify the image that appears beside this item's text when it is selected. SelectedImageIndex is an index into the Images property of the combo box.

When the item is not selected, the combo box displays the image specified by the ImageIndex property instead. If SelectedImageIndex is –1, the combo box also displays the image identified by the ImageIndex property when the item is selected.

Note: To mask out portions of the image that SelectedImageIndex specifies, you can identify an overlay mask using the OverlayImageIndex (see page 3551) property.

See Also

Images (see page 3700)

OverlayImageIndex (see page 3551)

ImageIndex

27.1.10 TComboExItems Class

TComboExItems manages a collection of TComboExItem (see page 3546) objects.

Class Hierarchy

Pascal

```
TComboExItems = class(TListControlItems);
```

C++

```
class TComboExItems : public TListControlItems;
```

File

ComCtrls

Description

TComboExItems manages the collection of items that appear in an extended combo box (TComboBoxEx (see page 3463)).

Use the properties and methods of TComboExItems to:

Access a specific item.

Add (see page 3555) or delete items from the collection.

Find out how many items are in the collection.

Sort the items in the collection.

See Also

TComboExItem (see page 3546)

TComboBoxEx (see page 3463)

27.1.10.1 TComboExItems Members

The following tables list the members exposed by TComboExItems.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	CompareItems (see page 15761)	Returns the relative order of two items in the collection.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 3557)	Responds when items are added to or removed from the collection.
V	SetItem (see page 3557)	This is SetItem, a member of class TComboExItems.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 3555)	Adds a new item to the collection.
	AddItem (see page 3556)	Adds a new item to the collection and initializes its properties.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 2734)	Creates and initializes a collection.
	Create (see page 2914)	Creates and initializes a TOwnedCollection (see page 2912) instance.
	Create (see page 15760)	Creates and initializes a TOwnedCollection instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CustomSort (see page 15761)	Sorts the items in the collection using a specified comparison function.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 3556)	Inserts a new item at a specified position.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Sort (see page 15762)	Sorts the items in the collection.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	ComboItems (see page 3557)	Lists the items in the collection.
R	Count (see page 2749)	Returns the number of items in the collection.

R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 2751)	Lists the items in the collection.
R	Items (see page 15763)	Lists the items in the collection.

Published Events

	Name	Description
	OnCompare (see page 15764)	Occurs to when two items need to be compared for sorting the collection.

Published Properties

	Name	Description
	CaseSensitive (see page 15762)	Controls (see page 5711) whether items are sorted in a case-sensitive or case-insensitive manner.
	SortType (see page 15764)	Indicates how the items should be sorted.

27.1.10.2 TComboExItems Methods

The methods of the TComboExItems class are listed here.

Protected Methods

	Name	Description
V	Notify (see page 3557)	Responds when items are added to or removed from the collection.
V	SetItem (see page 3557)	This is SetItem, a member of class TComboExItems.

Public Methods

	Name	Description
	Add (see page 3555)	Adds a new item to the collection.
	AddItem (see page 3556)	Adds a new item to the collection and initializes its properties.
	Insert (see page 3556)	Inserts a new item at a specified position.

27.1.10.2.1 TComboExItems.Add Method

Adds a new item to the collection.

Pascal

```
function Add: TComboExItem;
```

C++

```
__fastcall TComboExItem Add();
```

Description

Call Add to add a new item to the collection. Add instantiates an object of the type that was specified when the TListControlItems instance was created. It returns the newly created object so that you can specify its properties.

See Also

ComboItems (see page 3557)

Delete (see page 2741)

AddItem (see page 3556)

Insert (see page 3556)

27.1.10.2.2 TComboExItems.AddItem Method

Adds a new item to the collection and initializes its properties.

Pascal

```
function AddItem(const Caption: String; const ImageIndex: Integer; const SelectedImageIndex:
Integer; const OverlayImageIndex: Integer; const Indent: Integer; Data: Pointer): TComboExItem;
```

C++

```
__fastcall TComboExItem AddItem(const AnsiString Caption, const int ImageIndex, const int
SelectedImageIndex, const int OverlayImageIndex, const int Indent, void * Data);
```

Description

Call AddItem to add a new item to the collection. Add (see page 3555) instantiates an object of the type that was specified when the TListControlItems instance was created. It then assigns the values of the Caption, ImageIndex, SelectedImageIndex, OverlayImageIndex, Indent, and Data parameters to the TComboExItem (see page 3546) properties of the same names.

See Also

ComboItems (see page 3557)

Delete (see page 2741)

Create

Add (see page 3555)

Caption

Data

ImageIndex

OverlayImageIndex (see page 3551)

SelectedImageIndex (see page 3552)

Indent (see page 3551)

27.1.10.2.3 TComboExItems.Insert Method

Inserts a new item at a specified position.

Pascal

```
function Insert(Index: Integer): TComboExItem;
```

C++

```
__fastcall TComboExItem Insert(int Index);
```

Description

Call Insert to insert a new item into the collection at a specified position.

Insert instantiates an object of the type that was specified when the TListControlItems instance was created and inserts it into the collection at the position specified by Index. An index of 0 specifies the first position, 1 specifies the second position, and so on.

Insert returns the newly created object so that you can specify its properties.

See Also

ComboItems (see page 3557)

Delete (see page 2741)

Create

Add (see page 3555)

27.1.10.2.4 TComboExItems.Notify Method

Responds when items are added to or removed from the collection.

Pascal

```
procedure Notify(Item: TCollectionItem; Action: TCollectionNotification); override;
```

C++

```
virtual __fastcall Notify(TCollectionItem Item, TCollectionNotification Action);
```

Description

Notify is called automatically when the items in the collection change.

Item is the item that was just added to or that is about to be removed from the collection.

Action indicates whether item was added, is about to be removed, or is about to be deleted:

As implemented in TCollection, Notify calls Added when Action is cnAdded and calls Deleting when Action is cnDeleting. TCollection ignores the cnExtracting action. Descendant classes can override Notify to modify this behavior.

See Also

Added (see page 2736)

Deleting (see page 2741)

27.1.10.2.5 TComboExItems.SetItem Method

Pascal

```
procedure SetItem(const Index: Integer); virtual;
```

C++

```
virtual __fastcall SetItem(const int Index);
```

Description

This is SetItem, a member of class TComboExItems.

27.1.10.3 TComboExItems Properties

The properties of the TComboExItems class are listed here.

Public Properties

	Name	Description
R	ComboItems (see page 3557)	Lists the items in the collection.

27.1.10.3.1 TComboExItems.ComboItems Property

Lists the items in the collection.

Pascal

```
property ComboItems [const Index: Integer]: TComboExItem;
```

C++

```
__property TComboExItem ComboItems[int const Index];
```

Description

Use ComboItems to access the items in this collection.

Index indicates the item to access, where 0 is the index of the first item, 1 is the index of the second item, and so on. The Count property indicates the maximum number of items.

Note: ComboItems is the same as the Items property, except that the type of the property is TComboExItem (see page 3546) instead of TListControlItem, which is the base class for TComboExItem (see page 3546).

See Also

Items (see page 15763)

Count (see page 2749)

27.1.11 TCommonCalendar Class

TCommonCalendar is the base class for the controls TDateTimePicker (see page 4049) and TMonthCalendar (see page 4397).

Class Hierarchy

Pascal

```
TCommonCalendar = class(TWinControl);
```

C++

```
class TCommonCalendar : public TWinControl;
```

File

ComCtrls

Description

Use TCommonCalendar as a base class when creating custom controls that represent dates in a calendar-like format. Do not create instances of TCommonCalendar. Instead, to put a calendar control on a form, use a TCommonCalendar descendant such as TDateTimePicker (see page 4049) or TMonthCalendar (see page 4397).

Note: The VCL includes another calendar control that does not descend from TCommonCalendar. This is TCalendar, which is offered as a sample.

27.1.11.1 TCommonCalendar Members

The following tables list the members exposed by TCommonCalendar.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetMonthInfo (see page 3581)	Called whenever a new month is displayed in the calendar.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.

	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
V	CheckEmptyDate (see page 3571)	Clears the check box associated with the calendar.
V	CheckValidDate (see page 3571)	Confirms that a date falls between MinDate (see page 3579) and MaxDate (see page 3578).
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 3572)	Creates the windows control for the calendar.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.

V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
A	GetCalendarHandle (see page 3572)	Returns the calendar control's window handle.
V	GetCalStyles (see page 3573)	Returns the style flags that are used when creating the calendar's window.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.

	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	MsgSetCalColors (see page 3573)	Sets the calendar's colors.
	MsgSetDateTime (see page 3574)	Sets the calendar's date/time.
	MsgSetRange (see page 3574)	Implements the MinDate (see page 3579) and MaxDate (see page 3578) properties.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.

	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	CalColors (see page 3575)	Contains the colors used for each part of the calendar.
R	CalendarHandle (see page 3576)	Indicates the calendar control's window handle.
	CalExceptionClass (see page 3576)	Specifies the calendar's exception class.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Date (see page 3576)	Indicates the date that is marked on the calendar.
	DateTime (see page 3577)	Indicates the date that is marked on the calendar.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EndDate (see page 3577)	Indicates the last date that in the range of selected dates.
	FirstDayOfWeek (see page 3578)	Specifies the left-most day on the calendar.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MaxDate (see page 3578)	Indicates the maximum date to which users can scroll the calendar.
	MaxSelectRange (see page 3579)	Specifies the maximum number of days that can be selected.
	MinDate (see page 3579)	Indicates the minimum date that can be selected.
	MonthDelta (see page 3579)	Specifies how many months that the calendar scrolls.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	MultiSelect (see page 3580)	Specifies whether multiple dates can be selected on the calendar.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.

	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	ShowToday (see page 3580)	Specifies whether today's date is shown below the calendar.
	ShowTodayCircle (see page 3580)	Specifies whether today's date is circled on the calendar.
	Text (see page 5842)	Contains a text string associated with the control.
	WeekNumbers (see page 3581)	Specifies whether week numbers are shown to the left of the calendar.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BoldDays (see page 3570)	Encodes a set of dates for use in the OnGetMonthInfo (see page 3581) event handler.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 3569)	Creates an instance of TCommonCalendar (see page 3558).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 3570)	Destroys the TCommonCalendar (see page 3558) instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.

	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.

	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.

	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

27.1.11.2 TCommonCalendar.Create Constructor

Creates an instance of TCommonCalendar (see page 3558).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCommonCalendar(TComponent * AOwner);
```

Description

Call Create to construct and initialize an instance of TCommonCalendar (see page 3558). The AOwner parameter assigns a value to the Owner property, which is responsible for freeing the calendar control.

Create performs the following tasks:

Calls the inherited constructor.

Sets ShowToday (see page 3580) and ShowTodayCircle (see page 3580) to true.

Sets ControlStyle to [csOpaque, csClickEvents, csDoubleClicks].

Sets DateTime (see page 3577) to Now.

Sets FirstDayOfWeek (see page 3578) to dowLocaleDefault.

Sets MaxSelectRange (see page 3579) to 31.

Sets MonthDelta (see page 3579) to 1.

See Also

ShowToday (see page 3580)

ShowTodayCircle (see page 3580)

DateTime (see page 3577)

Now (see page 22930)

FirstDayOfWeek (see page 3578)

MaxSelectRange (see page 3579)

MonthDelta (see page 3579)

ControlStyle (see page 5814)

27.1.11.3 TCommonCalendar.Destroy Destructor

Destroys the TCommonCalendar (see page 3558) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCommonCalendar();
```

Description

Do not call the TCommonCalendar (see page 3558) destructor directly in an application. Instead, call Free, which checks that the calendar reference is not nil before calling Destroy.

Applications do not need to explicitly destroy calendar controls unless they were created without assigning an Owner.

See Also

Free (see page 22300)

27.1.11.4 TCommonCalendar Methods

The methods of the TCommonCalendar class are listed here.

Protected Methods

	Name	Description
	CheckEmptyDate (see page 3571)	Clears the check box associated with the calendar.
	CheckValidDate (see page 3571)	Confirms that a date falls between MinDate (see page 3579) and MaxDate (see page 3578).
	CreateWnd (see page 3572)	Creates the windows control for the calendar.
	GetCalendarHandle (see page 3572)	Returns the calendar control's window handle.
	GetCalStyles (see page 3573)	Returns the style flags that are used when creating the calendar's window.
	MsgSetCalColors (see page 3573)	Sets the calendar's colors.
	MsgSetDateTime (see page 3574)	Sets the calendar's date/time.
	MsgSetRange (see page 3574)	Implements the MinDate (see page 3579) and MaxDate (see page 3578) properties.

Public Methods

	Name	Description
	BoldDays (see page 3570)	Encodes a set of dates for use in the OnGetMonthInfo (see page 3581) event handler.

27.1.11.4.1 TCommonCalendar.BoldDays Method

Encodes a set of dates for use in the OnGetMonthInfo (see page 3581) event handler.

Pascal

```
procedure BoldDays(Days: array of LongWord; var MonthBoldInfo: LongWord);
```

C++

```
__fastcall BoldDays(array of LongWord Days, LongWord MonthBoldInfo);
```

Description

Use BoldDays to encode the days of the current month that should appear in bold. The value returned by BoldDays can be assigned to the MonthBoldInfo parameter of an OnGetMonthInfo (see page 3581) event handler.

Days is an array of unsigned integers corresponding to the days that should be bold.

MonthBoldInfo returns the encoding of the values that were passed in the Days array. This value can be assigned to the MonthBoldInfo parameter of the OnGetMonthInfo (see page 3581) event handler. (or the MonthBoldInfo parameter can be passed in for this argument). You shouldn't work with the MonthBoldInfo variable directly.

For example, to encode the first and eighth days of a month, call

```
BoldDays([1,8], MonthBoldInfo);
unsigned bolddays[2] = {1,2};
BoldDays(bolddays, MonthBoldInfo);
```

See Also

OnGetMonthInfo (see page 3581)

27.1.11.4.2 TCommonCalendar.CheckEmptyDate Method

Clears the check box associated with the calendar.

Pascal

```
procedure CheckEmptyDate; virtual;
```

C++

```
virtual __fastcall CheckEmptyDate();
```

Description

CheckEmptyDate is called automatically when DateTime (see page 3577) is assigned a value that represents a time and not a date value (or Date (see page 3576) is assigned a value of 0). As implemented in TCommonCalendar (see page 3558), CheckEmptyDate does nothing.

TDateTimePicker (see page 4049) overrides CheckEmptyDate to clear the check box associated with the calendar, or raise an EDateTimeError (see page 3421) if the ShowCheckbox property is false. This allows TDateTimePicker (see page 4049) to represent time values that do not include a date portion. (When a TDateTime value represents a time and not a date, the date portion is 0).

See Also

Checked (see page 4073)

ShowCheckbox (see page 4091)

Date (see page 3576)

DateTime (see page 3577)

27.1.11.4.3 TCommonCalendar.CheckValidDate Method

Confirms that a date falls between MinDate (see page 3579) and MaxDate (see page 3578).

Pascal

```
procedure CheckValidDate(Value: TDate); virtual;
```

C++

```
virtual __fastcall CheckValidDate(TDate Value);
```

Description

Calendar controls call CheckValidDate to confirm that a date falls between MinDate (see page 3579) and MaxDate (see page 3578).

Value is the date to check.

If Value is outside MinDate (see page 3579) and MaxDate (see page 3578), an exception of the type specified in the CalExceptionClass (see page 3576) property is raised.

See Also

MinDate (see page 3579)

MaxDate (see page 3578)

CalExceptionClass (see page 3576)

27.1.11.4.4 TCommonCalendar.CreateWnd Method

Creates the windows control for the calendar.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the windowed control is first created or when the window must be destroyed and recreated to reflect property changes. Override CreateWnd to pass additional initialization messages to the window when it is first created.

CreateWnd calls the TWinControl CreateWnd method to generate the window, and then sends messages to initialize the control so that it reflects the current property settings.

See Also

CreateWnd (see page 6137)

27.1.11.4.5 TCommonCalendar.GetCalendarHandle Method

Returns the calendar control's window handle.

Pascal

```
function GetCalendarHandle: HWND; virtual; abstract;
```

C++

```
virtual __fastcall HWND GetCalendarHandle() = 0;
```

Description

GetCalendarHandle is the protected read implementation of the CalendarHandle (see page 3576) property. For

TCommonCalendar (see page 3558), this is an abstract method. It must be implemented in descendant classes.

See Also

CalendarHandle (see page 3576)

27.1.11.4.6 TCommonCalendar.GetCalStyles Method

Returns the style flags that are used when creating the calendar's window.

Pascal

```
function GetCalStyles: DWORD; virtual;
```

C++

```
virtual __fastcall DWORD GetCalStyles();
```

Description

GetCalStyles is used internally to create the style flags that reflect the current property settings of the calendar control.

See Also

CreateWnd (see page 3572)

TCreateParams (see page 6280)

CreateParams (see page 6135)

27.1.11.4.7 TCommonCalendar.MsgSetCalColors Method

Sets the calendar's colors.

Pascal

```
function MsgSetCalColors(ColorIndex: Integer; ColorValue: TColor): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean MsgSetCalColors(int ColorIndex, TColor ColorValue) = 0;
```

Description

MsgSetCalColors implements the CalColors (see page 3575) property by sending a message to the calendar window handle. MsgSetCalColors is an abstract method, and must be overridden in descendant objects to send the appropriate message.

The ColorIndex parameter indicates which of the TMonthCalColors (see page 4392) properties is being set. It is one of the following values:

Value	Property
0	BackColor
1	TextColor
2	TitleBackColor
3	TitleTextColor
4	MonthBackColor
5	TrailingTextColor

The ColorValue parameter is the value that should be set.

MsgSetCalColors returns true if the color is set by the method.

See Also

CalColors (see page 3575)

CalendarHandle (see page 3576)

TextColor (see page 4395)

BackColor (see page 4395)

TitleBackColor (see page 4396)

TitleTextColor (see page 4396)

MonthBackColor (see page 4395)

TrailingTextColor (see page 4396)

27.1.11.4.8 TCommonCalendar.MsgSetDateTime Method

Sets the calendar's date/time.

Pascal

```
function MsgSetDateTime(Value: TSystemTime): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean MsgSetDateTime(TSystemTime Value) = 0;
```

Description

MsgSetDateTime implements the DateTime (see page 3577) property by sending a message to the calendar window handle. MsgSetDateTime is an abstract method, and must be overridden in descendant objects to send the appropriate message.

The Value parameter indicates the value of DateTime (see page 3577) as a TSystemTime value. This can be obtained from the DateTime (see page 3577) property value by calling DateTimeToSystemTime.

MsgSetDateTime returns true if the date/time value is set by the method.

See Also

DateTime (see page 3577)

CalendarHandle (see page 3576)

DateTimeToSystemTime (see page 22825)

SystemTimeToDateTime (see page 22974)

27.1.11.4.9 TCommonCalendar.MsgSetRange Method

Implements the MinDate (see page 3579) and MaxDate (see page 3578) properties.

Pascal

```
function MsgSetRange(Flags: Integer; SysTime: PSystemTime): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean MsgSetRange(int Flags, PSystemTime SysTime) = 0;
```

Description

MsgSetRange implements the MinDate (see page 3579) and MaxDate (see page 3578) properties by sending a message to the calendar window handle. MsgSetRange is an abstract method, and must be overridden in descendant objects to send the

appropriate message.

The Flags parameter indicates what type of information is included in the SysTime array. It includes the GDTR_MIN flag if a minimum date is supplied and GDTR_MAX if a maximum date is supplied.

The SysTime parameter is a two-element array containing the minimum date as the first element and the maximum date as the second element. These values can be obtained from the MinDate (see page 3579) and MaxDate (see page 3578) properties by calling DateTimeToSystemTime.

MsgSetRange returns true if the range is set by the method.

See Also

MinDate (see page 3579)

MaxDate (see page 3578)

CalendarHandle (see page 3576)

DateTimeToSystemTime (see page 22825)

SystemTimeToDateTime (see page 22974)

27.1.11.5 TCommonCalendar Properties

The properties of the TCommonCalendar class are listed here.

Protected Properties

	Name	Description
	CalColors (see page 3575)	Contains the colors used for each part of the calendar.
R	CalendarHandle (see page 3576)	Indicates the calendar control's window handle.
	CalExceptionClass (see page 3576)	Specifies the calendar's exception class.
	Date (see page 3576)	Indicates the date that is marked on the calendar.
	DateTime (see page 3577)	Indicates the date that is marked on the calendar.
	EndDate (see page 3577)	Indicates the last date that in the range of selected dates.
	FirstDayOfWeek (see page 3578)	Specifies the left-most day on the calendar.
	MaxDate (see page 3578)	Indicates the maximum date to which users can scroll the calendar.
	MaxSelectRange (see page 3579)	Specifies the maximum number of days that can be selected.
	MinDate (see page 3579)	Indicates the minimum date that can be selected.
	MonthDelta (see page 3579)	Specifies how many months that the calendar scrolls.
	MultiSelect (see page 3580)	Specifies whether multiple dates can be selected on the calendar.
	ShowToday (see page 3580)	Specifies whether today's date is shown below the calendar.
	ShowTodayCircle (see page 3580)	Specifies whether today's date is circled on the calendar.
	WeekNumbers (see page 3581)	Specifies whether week numbers are shown to the left of the calendar.

27.1.11.5.1 TCommonCalendar.CalColors Property

Contains the colors used for each part of the calendar.

Pascal

```
property CalColors: TMonthCalColors;
```

C++

```
__property TMonthCalColors CalColors;
```

Description

Use the CalColors property to get or set the calendar's background color, month background color, text color, title background

color, title text color, and trailing text color.

See Also

BoldDays (see page 3570)

MsgSetCalColors (see page 3573)

27.1.11.5.2 TCommonCalendar.CalendarHandle Property

Indicates the calendar control's window handle.

Pascal

```
property CalendarHandle: HWND;
```

C++

```
__property HWND CalendarHandle;
```

Description

Use the CalendarHandle property to get the calendar control's window handle.

The CalendarHandle property is declared but not implemented in TCommonCalendar (see page 3558).

For descendants that use only one window, such as TMonthCalendar (see page 4397), CalendarHandle is the same as the Handle property. However, some TCommonCalendar (see page 3558) descendants such as TDateTimePicker (see page 4049) are implemented using more than one window. In these classes, CalendarHandle is the window handle for the portion of the control that displays date values.

See Also

Handle (see page 6207)

27.1.11.5.3 TCommonCalendar.CalExceptionClass Property

Specifies the calendar's exception class.

Pascal

```
property CalExceptionClass: ExceptClass;
```

C++

```
__property ExceptClass CalExceptionClass;
```

Description

Use CalExceptionClass in a derived class determine the class used for exceptions raised by the calendar control. Descendants of TCommonCalendar (see page 3558) initialize this value in the constructor so that when TCommonCalendar (see page 3558) encounters an unexpected condition, it can raise the appropriate type of exception.

See Also

EMonthCalError (see page 3421)

EDateTimeError (see page 3421)

27.1.11.5.4 TCommonCalendar.Date Property

Indicates the date that is marked on the calendar.

Pascal

```
property Date: TDate;
```

C++

```
__property TDate Date;
```

Description

Use Date to get or set the date that is marked on the calendar. The value of Date must lie within the range specified by the MaxDate (see page 3578) and MinDate (see page 3579) properties.

If MultiSelect (see page 3580) is true, the selected range of dates goes from Date to EndDate (see page 3577).

Note: You can also set the marked date with the DateTime (see page 3577) property.

See Also

DateTime (see page 3577)

EndDate (see page 3577)

MaxDate (see page 3578)

MinDate (see page 3579)

MultiSelect (see page 3580)

27.1.11.5.5 TCommonCalendar.DateTime Property

Indicates the date that is marked on the calendar.

Pascal

```
property DateTime: TDateTime;
```

C++

```
__property TDateTime DateTime;
```

Description

Use DateTime to get or set the date (and, if relevant, time) that is marked on the calendar control. The value of DateTime must lie within the range specified by the MaxDate (see page 3578) and MinDate (see page 3579) properties.

If MultiSelect (see page 3580) is true, the selected range of dates goes from DateTime to EndDate (see page 3577).

Note: You can also set the marked date with the Date (see page 3576) property.

See Also

Date (see page 3576)

EndDate (see page 3577)

MaxDate (see page 3578)

MinDate (see page 3579)

Time (see page 4094)

MultiSelect (see page 3580)

27.1.11.5.6 TCommonCalendar.EndDate Property

Indicates the last date that in the range of selected dates.

Pascal

```
property EndDate: TDate;
```

C++

```
__property TDate EndDate;
```

Description

Use EndDate to get or set the last selected date that is marked on the calendar. The first selected date is given by the Date (see page 3576) property.

Before you can set the EndDate property, you must set the MultiSelect (see page 3580) property to true.

See Also

Date (see page 3576)

MultiSelect (see page 3580)

27.1.11.5.7 TCommonCalendar.FirstDayOfWeek Property

Specifies the left-most day on the calendar.

Pascal

```
property FirstDayOfWeek: TCalDayOfWeek;
```

C++

```
__property TCalDayOfWeek FirstDayOfWeek;
```

Description

Use FirstDayOfWeek to get or set the left-most day on the calendar.

To make the left-most day adjust for the locale, set FirstDayOfWeek to dowLocaleDefault.

See Also

DayOfWeek (see page 22827)

WeekNumbers (see page 3581)

27.1.11.5.8 TCommonCalendar.MaxDate Property

Indicates the maximum date to which users can scroll the calendar.

Pascal

```
property MaxDate: TDate;
```

C++

```
__property TDate MaxDate;
```

Description

Use MaxDate to get or set the maximum date to which users can scroll the calendar. The values of the Date (see page 3576) and EndDate (see page 3577) properties cannot exceed MaxDate.

See Also

Date (see page 3576)

MinDate (see page 3579)

EndDate (see page 3577)

MaxSelectRange (see page 3579)

27.1.11.5.9 TCommonCalendar.MaxSelectRange Property

Specifies the maximum number of days that can be selected.

Pascal

```
property MaxSelectRange: Integer;
```

C++

```
__property int MaxSelectRange;
```

Description

Use MaxSelectRange to limit the number of days that can be selected when MultiSelect (see page 3580) is true. To limit ranges so that they fall between specific date values, use the MaxDate (see page 3578) and MinDate (see page 3579) properties instead.

See Also

Date (see page 3576)

MinDate (see page 3579)

MultiSelect (see page 3580)

EndDate (see page 3577)

MaxDate (see page 3578)

27.1.11.5.10 TCommonCalendar.MinDate Property

Indicates the minimum date that can be selected.

Pascal

```
property MinDate: TDate;
```

C++

```
__property TDate MinDate;
```

Description

Use MinDate to get or set the minimum date that can be selected.

See Also

Date (see page 3576)

MaxDate (see page 3578)

EndDate (see page 3577)

MaxSelectRange (see page 3579)

27.1.11.5.11 TCommonCalendar.MonthDelta Property

Specifies how many months that the calendar scrolls.

Pascal

```
property MonthDelta: Integer;
```

C++

```
__property int MonthDelta;
```

Description

Use MonthDelta to get or set the number of months that the calendar scrolls when the back and forward buttons are clicked.

27.1.11.5.12 TCommonCalendar.MultiSelect Property

Specifies whether multiple dates can be selected on the calendar.

Pascal

```
property MultiSelect: Boolean;
```

C++

```
__property Boolean MultiSelect;
```

Description

Use MultiSelect to specify whether the calendar represents a single date or a range of dates. When MultiSelect is true, the calendar represents the range of dates from Date (see page 3576) to EndDate (see page 3577). When MultiSelect is false, the calendar represents only the value of Date (see page 3576).

See Also

Date (see page 3576)

EndDate (see page 3577)

27.1.11.5.13 TCommonCalendar.ShowToday Property

Specifies whether today's date is shown below the calendar.

Pascal

```
property ShowToday: Boolean;
```

C++

```
__property Boolean ShowToday;
```

Description

Use ShowToday to specify whether today's date (according to the system clock) is shown below the calendar.

See Also

Date (see page 3576)

ShowTodayCircle (see page 3580)

27.1.11.5.14 TCommonCalendar.ShowTodayCircle Property

Specifies whether today's date is circled on the calendar.

Pascal

```
property ShowTodayCircle: Boolean;
```

C++

```
__property Boolean ShowTodayCircle;
```

Description

Use ShowTodayCircle to specify whether today's date (according to the system clock) is circled on the calendar.

See Also

Date (see page 3576)

ShowToday (see page 3580)

27.1.11.5.15 TCommonCalendar.WeekNumbers Property

Specifies whether week numbers are shown to the left of the calendar.

Pascal

```
property WeekNumbers: Boolean;
```

C++

```
__property Boolean WeekNumbers;
```

Description

Use WeekNumbers to indicate whether week numbers are shown to the left of the calendar. The week numbers correspond to the number of the week in the current year.

See Also

FirstDayOfWeek (see page 3578)

27.1.11.6 TCommonCalendar Events

The events of the TCommonCalendar class are listed here.

Protected Events

	Name	Description
	OnGetMonthInfo (see page 3581)	Called whenever a new month is displayed in the calendar.

27.1.11.6.1 TCommonCalendar.OnGetMonthInfo Event

Called whenever a new month is displayed in the calendar.

Pascal

```
property OnGetMonthInfo: TOnGetMonthInfoEvent;
```

C++

```
__property TOnGetMonthInfoEvent OnGetMonthInfo;
```

Description

Use the OnGetMonthInfo event to initialize the display properties of a month. In particular, OnGetMonthInfo allows applications to bold individual days in the calendar (such as holidays).

To specify that specific dates are to be bolded, use the BoldDays (see page 3570) method to obtain a value that can be returned as the MonthBoldInfo parameter. For example, to bold the first and eighth days of every month that is displayed, call

```
BoldDays([1,8], MonthBoldInfo);
```

```
unsigned bolddays[2] = {1,2};
BoldDays(bolddays, MonthBoldInfo);
```

from the OnGetMonthInfo event handler.

See Also

BoldDays (see page 3570)

27.1.12 TConversion Class

TConversion converts rich text data from one encoding format to another.

Class Hierarchy

Pascal

```
TConversion = class(TObject);
```

C++

```
class TConversion : public TObject;
```

File

ComCtrls

Description

Use TConversion as the base class for an object that converts rich data from one encoding system to another. TConversion, by itself, does not perform any conversions. It simply reads from or writes to a stream. TConversion provides an interface that can be overridden by derived classes that convert streamed text from one format to another.

Descendants of TCustomRichEdit (see page 3854) use TConversion when streaming text to and from files, when the files contain plain ANSI text or text in rich text format (RTF). To allow rich text edit controls to read from and write to files that use another format, derive a class from TConversion which converts between that format and RTF. Rich text edit controls can use the new class by registering it through their RegisterConversionFormat method, or by making it the default converter.

See Also

TCustomRichEdit (see page 3854)

TCustomRichEdit (see page 3854)

TFileStream (see page 2841)

TStream (see page 2973)

27.1.12.1 TConversion Members

The following tables list the members exposed by TConversion.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	ConvertReadStream (see page 3583)	Reads BufSize bytes from Stream into the memory buffer pointed to by Buffer.
V	ConvertWriteStream (see page 3584)	Writes BufSize bytes to Stream from the memory buffer pointed to by Buffer.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

27.1.12.2 TConversion Methods

The methods of the TConversion class are listed here.

Public Methods

	Name	Description
V	ConvertReadStream (see page 3583)	Reads BufSize bytes from Stream into the memory buffer pointed to by Buffer.
V	ConvertWriteStream (see page 3584)	Writes BufSize bytes to Stream from the memory buffer pointed to by Buffer.

27.1.12.2.1 TConversion.ConvertReadStream Method

Reads BufSize bytes from Stream into the memory buffer pointed to by Buffer.

Pascal

```
function ConvertReadStream(Stream: TStream; Buffer: PChar; BufSize: Integer): Integer; virtual;
```

C++

```
virtual __fastcall int ConvertReadStream(TStream Stream, const char * Buffer, int BufSize);
```

Description

To convert text between two formats, override this method in a descendant class and convert the text in the buffer. To create a descendant class that TCustomRichEdit (see page 3854) can use, convert the text to RTF format.

Note: ConvertReadStream should reverse the conversion that ConvertWriteStream (see page 3584) makes.

See Also

ConvertWriteStream (see page 3584)

27.1.12.2.2 TConversion.ConvertWriteStream Method

Writes BufSize bytes to Stream from the memory buffer pointed to by Buffer.

Pascal

```
function ConvertWriteStream(Stream: TStream; Buffer: PChar; BufSize: Integer): Integer;
virtual;
```

C++

```
virtual __fastcall int ConvertWriteStream(TStream Stream, const char * Buffer, int BufSize);
```

Description

To convert text between two formats, override this method in a descendant class and convert the text in the buffer. To create a descendant class that TCustomRichEdit (see page 3854) can use, convert the text from RTF format.

Note: ConvertWriteStream should reverse the conversion that ConvertReadStream (see page 3583) makes.

See Also

ConvertReadStream (see page 3583)

27.1.13 TCoolBand Class

TCoolBand represents a band within a TCoolBar (see page 3603).

Class Hierarchy

Pascal

```
TCoolBand = class(TCollectionItem);
```

C++

```
class TCoolBand : public TCollectionItem;
```

File

ComCtrls

Description

Use TCoolBand to access one of the resizable bands in a cool bar object. Each TCoolBar (see page 3603) uses a TCoolBands (see page 3596) to maintain a collection of TCoolBand objects.

See Also

TCollection (see page 2731)

TCollectionItem (see page 2755)

TCoolBands (see page 3596)

TCoolBar (see page 3603)

TCoolBar (see page 3603)

27.1.13.1 TCoolBand Members

The following tables list the members exposed by TCoolBand.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 3587)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	ParentBitmapChanged (see page 3588)	This is ParentBitmapChanged, a member of class TCoolBand.
	ParentColorChanged (see page 3588)	This is ParentColorChanged, a member of class TCoolBand.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 3587)	Copies the properties of one band to another.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3586)	Creates and initializes a TCoolBand (see page 3584) instance.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 3586)	Destroys the TCoolBand (see page 3584) and frees its memory.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	Height (see page 3591)	Returns the height of the cool band.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Properties

	Name	Description
	Bitmap (see page 3589)	Specifies the background image displayed on the band.
	BorderStyle (see page 3589)	Specifies the border style for the band.
	Break (see page 3590)	Causes the band to start on a new line.
	Color (see page 3590)	Specifies the color of the band.
	Control (see page 3590)	Specifies the control that appears on the band.
	FixedBackground (see page 3591)	Determines whether the background is realigned within the band.
	FixedSize (see page 3591)	Determines whether the band can be resized at runtime.
	HorizontalOnly (see page 3592)	Determines whether the band is displayed when the TCoolBar (see page 3603) is arranged vertically.
	ImageIndex (see page 3592)	Determines the image that appears on the band.
	MinHeight (see page 3592)	Determines the minimum height for the band.
	MinWidth (see page 3593)	Determines the minimum width for the band.
	ParentBitmap (see page 3593)	Determines whether the band uses the Bitmap (see page 3589) image of the TCoolBar (see page 3603) that owns it.
	ParentColor (see page 3593)	Determines whether the band uses the color of the TCoolBar (see page 3603) that owns it.
	Text (see page 3594)	Specifies the text string that appears on the band and identifies it in the Bands editor.
	Visible (see page 3595)	Determines whether the band appears at runtime.
	Width (see page 3596)	Specifies the width of the band.

27.1.13.2 TCoolBand.Create Constructor

Creates and initializes a TCoolBand (see page 3584) instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TCoolBand(TCollection Collection);
```

Description

Create generates a TCoolBand (see page 3584) and initializes its properties.

27.1.13.3 TCoolBand.Destroy Destructor

Destroys the TCoolBand (see page 3584) and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCoolBand();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the band is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

27.1.13.4 TCoolBand Methods

The methods of the TCoolBand class are listed here.

Protected Methods

	Name	Description
	GetDisplayName (see page 3587)	Returns the name of the collection item as it appears in the collection editor.
	ParentBitmapChanged (see page 3588)	This is ParentBitmapChanged, a member of class TCoolBand.
	ParentColorChanged (see page 3588)	This is ParentColorChanged, a member of class TCoolBand.

Public Methods

	Name	Description
	Assign (see page 3587)	Copies the properties of one band to another.

27.1.13.4.1 TCoolBand.Assign Method

Copies the properties of one band to another.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Assign copies the properties of Source.

See Also

Text (see page 3594)

Assign (see page 2930)

Width (see page 3596)

27.1.13.4.2 TCoolBand.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName (see page 2761)

GetNamePath (see page 2759)

27.1.13.4.3 TCoolBand.ParentBitmapChanged Method

Pascal

```
procedure ParentBitmapChanged; dynamic;
```

C++

```
__fastcall ParentBitmapChanged();
```

Description

This is ParentBitmapChanged, a member of class TCoolBand.

27.1.13.4.4 TCoolBand.ParentColorChanged Method

Pascal

```
procedure ParentColorChanged; dynamic;
```

C++

```
__fastcall ParentColorChanged();
```

Description

This is ParentColorChanged, a member of class TCoolBand.

27.1.13.5 TCoolBand Properties

The properties of the TCoolBand class are listed here.

Public Properties

	Name	Description
R	Height (see page 3591)	Returns the height of the cool band.

Published Properties

	Name	Description
	Bitmap (see page 3589)	Specifies the background image displayed on the band.
	BorderStyle (see page 3589)	Specifies the border style for the band.
	Break (see page 3590)	Causes the band to start on a new line.
	Color (see page 3590)	Specifies the color of the band.
	Control (see page 3590)	Specifies the control that appears on the band.
	FixedBackground (see page 3591)	Determines whether the background is realigned within the band.
	FixedSize (see page 3591)	Determines whether the band can be resized at runtime.
	HorizontalOnly (see page 3592)	Determines whether the band is displayed when the TCoolBar (see page 3603) is arranged vertically.
	ImageIndex (see page 3592)	Determines the image that appears on the band.
	MinHeight (see page 3592)	Determines the minimum height for the band.
	MinWidth (see page 3593)	Determines the minimum width for the band.

	ParentBitmap (see page 3593)	Determines whether the band uses the Bitmap (see page 3589) image of the TCoolBar (see page 3603) that owns it.
	ParentColor (see page 3593)	Determines whether the band uses the color of the TCoolBar (see page 3603) that owns it.
	Text (see page 3594)	Specifies the text string that appears on the band and identifies it in the Bands editor.
	Visible (see page 3595)	Determines whether the band appears at runtime.
	Width (see page 3596)	Specifies the width of the band.

27.1.13.5.1 TCoolBand.Bitmap Property

Specifies the background image displayed on the band.

Pascal

```
property Bitmap: TBitmap;
```

C++

```
__property TBitmap Bitmap;
```

Description

Use the Bitmap property to select the image that appears on the band. The image is tiled, if necessary, to cover the entire band.

Setting the Bitmap property automatically sets ParentBitmap (see page 3593) to false.

See Also

FixedBackground (see page 3591)

ImageIndex (see page 3592)

ParentBitmap (see page 3593)

TBitmap (see page 14396)

Bitmap (see page 3630)

27.1.13.5.2 TCoolBand.BorderStyle Property

Specifies the border style for the band.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

If BorderStyle is set to bsSingle, the band has a single-line border. If BorderStyle is set to bsNone, no border appears around the band.

Note: If the CoolBand resides in a CoolBar control, the CoolBar's BandBorderStyle property takes precedence over BorderStyle.

See Also

BandBorderStyle (see page 3627)

27.1.13.5.3 TCoolBand.Break Property

Causes the band to start on a new line.

Pascal

```
property Break: Boolean;
```

C++

```
__property Boolean Break;
```

Description

If Break is true (the default), the band starts a new line at the left side of the TCoolBar (see page 3603) control. If Break is false, the band continues on the same line as its predecessor.

27.1.13.5.4 TCoolBand.Color Property

Specifies the color of the band.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use the Color property to select the color of the band. Setting Color automatically sets ParentColor (see page 3593) to false.

See Also

Bitmap (see page 3589)

FixedBackground (see page 3591)

ParentBitmap (see page 3593)

ParentColor (see page 3593)

Bitmap (see page 3630)

27.1.13.5.5 TCoolBand.Control Property

Specifies the control that appears on the band.

Pascal

```
property Control: TWinControl;
```

C++

```
__property TWinControl * Control;
```

Description

The Control property indicates the windowed control that appears on the band. If Control is unassigned, there is no control associated with the band.

27.1.13.5.6 TCoolBand.FixedBackground Property

Determines whether the background is realigned within the band.

Pascal

```
property FixedBackground: Boolean;
```

C++

```
__property Boolean FixedBackground;
```

Description

If ParentBitmap (see page 3593) is true, the band displays the same background as the TCoolBar (see page 3603) that owns it. Ordinarily, when FixedBackground is true, that background is continuous over the entire TCoolBar (see page 3603). Setting FixedBackground to false realigns the background within the individual band, so that the TCoolBar (see page 3603)'s Bitmap (see page 3589) image is positioned relative to the upper left corner of the band.

See Also

Bitmap (see page 3589)

ParentBitmap (see page 3593)

Bitmap (see page 3630)

27.1.13.5.7 TCoolBand.FixedSize Property

Determines whether the band can be resized at runtime.

Pascal

```
property FixedSize: Boolean;
```

C++

```
__property Boolean FixedSize;
```

Description

Setting FixedSize to true prevents the user from resizing the band.

See Also

MinHeight (see page 3592)

MinWidth (see page 3593)

27.1.13.5.8 TCoolBand.Height Property

Returns the height of the cool band.

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

Use Height to get the height of the CoolBand

27.1.13.5.9 TCoolBand.HorizontalOnly Property

Determines whether the band is displayed when the TCoolBar (see page 3603) is arranged vertically.

Pascal

```
property HorizontalOnly: Boolean;
```

C++

```
__property Boolean HorizontalOnly;
```

Description

If the Vertical property of the container CoolBar is true, setting HorizontalOnly to true hides the band. If the Vertical property of the container CoolBar is false, HorizontalOnly has no effect.

See Also

Vertical (see page 3647)

Visible (see page 3595)

27.1.13.5.10 TCoolBand.ImageIndex Property

Determines the image that appears on the band.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

The Images property of TCoolBar (see page 3603) contains a list of bitmaps that can appear to the left of any band in the TCoolBar (see page 3603). To select a bitmap from the list, assign a value to the band's ImageIndex property.

See Also

Bitmap (see page 3589)

Images (see page 3639)

27.1.13.5.11 TCoolBand.MinHeight Property

Determines the minimum height for the band.

Pascal

```
property MinHeight: Integer;
```

C++

```
__property int MinHeight;
```

Description

The MinHeight property determines the smallest height to which the band can be resized at runtime.

See Also

FixedSize (see page 3591)

MinWidth (see page 3593)

27.1.13.5.12 TCoolBand.MinWidth Property

Determines the minimum width for the band.

Pascal

```
property MinWidth: Integer;
```

C++

```
__property int MinWidth;
```

Description

The MinWidth property determines the smallest width to which the band can be resized at runtime.

See Also

FixedSize (see page 3591)

MinHeight (see page 3592)

Width (see page 3596)

27.1.13.5.13 TCoolBand.ParentBitmap Property

Determines whether the band uses the Bitmap (see page 3589) image of the TCoolBar (see page 3603) that owns it.

Pascal

```
property ParentBitmap: Boolean;
```

C++

```
__property Boolean ParentBitmap;
```

Description

If ParentBitmap is set to true, the band displays the same background image as the CoolBar it belongs to. Setting the band's Bitmap (see page 3589) property automatically sets ParentBitmap to false.

See Also

Bitmap (see page 3589)

FixedBackground (see page 3591)

ParentColor (see page 3593)

Bitmap (see page 3630)

27.1.13.5.14 TCoolBand.ParentColor Property

Determines whether the band uses the color of the TCoolBar (see page 3603) that owns it.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

If ParentColor is true, the band has the same color as the CoolBar it belongs to. Setting the Color (see page 3590) property automatically sets ParentColor to false.

See Also

Bitmap (see page 3589)

Color (see page 3590)

ParentBitmap (see page 3593)

Color (see page 5812)

ParentColor (see page 5834)

27.1.13.5.15 TCoolBand.Text Property

Specifies the text string that appears on the band and identifies it in the Bands editor.

Pascal

```
property Text: string;
```

C++

```
__property AnsiString Text;
```

Description

Assign (see page 3587) a value to Text to create text that appears on the band on the left of the band.

C++ Examples:

```
/*
To run this example, add the example code to a new project.
The example code dynamically creates a TCoolbar and three
TCoolBand objects populated with a windowed control in each
TCoolBand.
*/
void AddBands(TCoolBar *CoolBar, TList *Objects)
{
  TControl *pCurrent;
  for (int i = 0; i < Objects->Count; i++)
  {
    pCurrent = (TControl *)Objects->Items[i];
    // only add windowed controls to the coolbar
    if (dynamic_cast<TWinControl *>(pCurrent) != NULL)
    {
      // Placing the control onto the CoolBar
      // causes the TCoolBar object to create a TCoolBand
      // and place the control within the band.
      pCurrent->Parent = CoolBar;   // This statement increments CoolBar->Bands->Count.
      // Get the reference of the TCoolBand just created and assign text.
      String S = pCurrent->ClassName(pCurrent->ClassType());
      CoolBar->Bands->Items[CoolBar->Bands->Count - 1]->Text = S;
    }
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TCoolBar *CoolBar = new TCoolBar(this);
  TList *List;
  CoolBar->Parent = this;
  CoolBar->Align = alTop;
  List = new TList();
  try
  {
    TControl *Control;
```

```
    Control = new TButton(CoolBar);
    List->Add(Control);
    Control = new TCheckBox(CoolBar);
    List->Add(Control);
    Control = new TEdit(CoolBar);
    List->Add(Control);
    AddBands(CoolBar, List);
  }
  catch (...)
  {
    ShowMessage("Some objects could not be added to Coolband");
  }
  delete List;
}
```

Delphi Examples:

```
{
To run this example, add the example code to a new project.
The example code dynamically creates a TCoolBar and three
TCoolBand objects populated with a windowed control in each
TCoolBand.
}
procedure AddBand(CoolBar: TCoolBar; Const ControlClasses: array of TControlClass);
var
  CurrentControl: TControl;
  I: Integer;
begin
  for I := 0 to High(ControlClasses) do
    begin
      CurrentControl := ControlClasses[i].Create(CoolBar);
      if (CurrentControl is TWinControl) then
      begin
        { Placing the control onto the CoolBar causes the TCoolBar object to create a
TCoolBand and place the control within the band. }
        CurrentControl.Parent := Coolbar;
        { Get the reference of the last TCoolBand created and assign text. }
        with CoolBar.Bands do
          Items[count - 1].Text := CurrentControl.ClassName;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  CoolBar: TCoolBar;
begin
  CoolBar := TCoolBar.Create(Self);
  CoolBar.Parent := Self;
  CoolBar.Align := alClient;
  AddBand(CoolBar, [TCheckBox, TEdit, TButton]);
end;
```

See Also

Control (see page 3590)

27.1.13.5.16 TCoolBand.Visible Property

Determines whether the band appears at runtime.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the band at runtime. If Visible is true, the band appears on the form; if Visible is false, it does not.

27.1.13.5.17 TCoolBand.Width Property

Specifies the width of the band.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

The Width property indicates the width of the band, in pixels.

See Also

MinWidth (see page 3593)

27.1.14 TCoolBands Class

TCoolBands is a container for TCoolBand (see page 3584) objects.

Class Hierarchy

Pascal

```
TCoolBands = class(TCollection);
```

C++

```
class TCoolBands : public TCollection;
```

File

ComCtrls

Description

Each TCoolBands holds a collection of TCoolBand (see page 3584) objects in a TCoolBar (see page 3603). TCoolBands maintains an index of the TCoolBand (see page 3584) objects in its Items (see page 3601) array. The Count property contains the number of bands in the collection.

See Also

TCollection (see page 2731)

TCollectionItem (see page 2755)

TCoolBand (see page 3584)

TCoolBar (see page 3603)

TCoolBar (see page 3603)

27.1.14.1 TCoolBands Members

The following tables list the members exposed by TCoolBands.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 3599)	Returns the owner of an object.
	HaveGraphic (see page 3600)	This is HaveGraphic, a member of class TCoolBands.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 3600)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 3599)	Adds a cool band to the collection.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 3598)	Creates and initializes a TCoolBands (see page 3596) instance.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.

V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindBand (see page 3599)	Returns the band that contains a specified control.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	CoolBar (see page 3601)	Provides access to the TCoolBar (see page 3603) component that owns the TCoolBands (see page 3596).
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 3601)	Lists the bands in the TCoolBands (see page 3596).

27.1.14.2 TCoolBands.Create Constructor

Creates and initializes a TCoolBands (see page 3596) instance.

Pascal

```
constructor Create(CoolBar: TCoolBar);
```

C++

```
__fastcall TCoolBands(TCoolBar CoolBar);
```

Description

Create generates a TCoolBands (see page 3596) instance and initializes its properties.

Typically, applications have no need to instantiate TCoolBands (see page 3596). Instead, this object is created by the TCoolBar (see page 3603) object that uses it to manage its bands.

CoolBar (see page 3601) is the object that owns the TCoolBands (see page 3596) object and uses it to manage its bands.

27.1.14.3 TCoolBands Methods

The methods of the TCoolBands class are listed here.

Protected Methods

	Name	Description
	GetOwner (see page 3599)	Returns the owner of an object.
	HaveGraphic (see page 3600)	This is HaveGraphic, a member of class TCoolBands.
	Update (see page 3600)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Add (see page 3599)	Adds a cool band to the collection.
	FindBand (see page 3599)	Returns the band that contains a specified control.

27.1.14.3.1 TCoolBands.Add Method

Adds a cool band to the collection.

Pascal

```
function Add: TCoolBand;
```

C++

```
__fastcall TCoolBand Add();
```

Description

Call Add to create an CoolBand in the collection. The new item is placed at the end of the Items (see page 3601) array.

Add returns the new TCoolBand (see page 3584) object.

See Also

Items (see page 3601)

27.1.14.3.2 TCoolBands.FindBand Method

Returns the band that contains a specified control.

Pascal

```
function FindBand(AControl: TControl): TCoolBand;
```

C++

```
__fastcall TCoolBand FindBand(TControl * AControl);
```

Description

Call FindBand to obtain the band containing the specified control.

27.1.14.3.3 TCoolBands.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath (see page 2932)

TCollection (see page 2731)

TComponent (see page 2762)

Owner (see page 2807)

27.1.14.3.4 TCoolBands.HaveGraphic Method

Pascal

```
function HaveGraphic: Boolean;
```

C++

```
__fastcall Boolean HaveGraphic();
```

Description

This is HaveGraphic, a member of class TCoolBands.

27.1.14.3.5 TCoolBands.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem Item);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

See Also

Changed (see page 2740)

Changed (see page 2758)

27.1.14.4 TCoolBands Properties

The properties of the TCoolBands class are listed here.

Public Properties

	Name	Description
R	CoolBar (see page 3601)	Provides access to the TCoolBar (see page 3603) component that owns the TCoolBands (see page 3596).
	Items (see page 3601)	Lists the bands in the TCoolBands (see page 3596).

27.1.14.4.1 TCoolBands.CoolBar Property

Provides access to the TCoolBar (see page 3603) component that owns the TCoolBands (see page 3596).

Pascal

```
property CoolBar: TCoolBar;
```

C++

```
__property TCoolBar CoolBar;
```

Description

CoolBar is the TCoolBar (see page 3603) instance to which the TCoolBands (see page 3596) belongs.

See Also

Bands (see page 3628)

27.1.14.4.2 TCoolBands.Items Property

Lists the bands in the TCoolBands (see page 3596).

Pascal

```
property Items [Index: Integer]: TCoolBand;
```

C++

```
__property TCoolBand Items[int Index];
```

Description

Use Items to access individual cool bands. The value of the Index parameter corresponds to the Index property of TCoolBand (see page 3584). It represents the position of the band in the TCoolBands (see page 3596) collection.

C++ Examples:

```
/*
To run this example, add the example code to a new project.
The example code dynamically creates a TCoolbar and three
TCoolBand objects populated with a windowed control in each
TCoolBand.
*/
void AddBands(TCoolBar *CoolBar, TList *Objects)
{
  TControl *pCurrent;
  for (int i = 0; i < Objects->Count; i++)
  {
    pCurrent = (TControl *)Objects->Items[i];
    // only add windowed controls to the coolbar
    if (dynamic_cast<TWinControl *>(pCurrent) != NULL)
```

```
      {
        // Placing the control onto the CoolBar
        // causes the TCoolBar object to create a TCoolBand
        // and place the control within the band.
        pCurrent->Parent = CoolBar;   // This statement increments CoolBar->Bands->Count.
        // Get the reference of the TCoolBand just created and assign text.
        String S = pCurrent->ClassName(pCurrent->ClassType());
        CoolBar->Bands->Items[CoolBar->Bands->Count - 1]->Text = S;
      }
    }
  }

  void __fastcall TForm1::FormCreate(TObject *Sender)
  {
    TCoolBar *CoolBar = new TCoolBar(this);
    TList *List;
    CoolBar->Parent = this;
    CoolBar->Align = alTop;
    List = new TList();
    try
    {
      TControl *Control;
      Control = new TButton(CoolBar);
      List->Add(Control);
      Control = new TCheckBox(CoolBar);
      List->Add(Control);
      Control = new TEdit(CoolBar);
      List->Add(Control);
      AddBands(CoolBar, List);
    }
    catch (...)
    {
      ShowMessage("Some objects could not be added to Coolband");
    }
    delete List;
  }
```

Delphi Examples:

```
{
To run this example, add the example code to a new project.
The example code dynamically creates a TCoolBar and three
TCoolBand objects populated with a windowed control in each
TCoolBand.
}
procedure AddBand(CoolBar: TCoolBar; Const ControlClasses: array of TControlClass);
var
  CurrentControl: TControl;
  I: Integer;
begin
  for I := 0 to High(ControlClasses) do
    begin
      CurrentControl := ControlClasses[i].Create(CoolBar);
      if (CurrentControl is TWinControl) then
      begin
        { Placing the control onto the CoolBar causes the TCoolBar object to create a
TCoolBand and place the control within the band. }
        CurrentControl.Parent := Coolbar;
        { Get the reference of the last TCoolBand created and assign text. }
        with CoolBar.Bands do
          Items[count - 1].Text := CurrentControl.ClassName;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
```

```
  CoolBar: TCoolBar;
begin
  CoolBar := TCoolBar.Create(Self);
  CoolBar.Parent := Self;
  CoolBar.Align := alClient;
  AddBand(CoolBar, [TCheckBox, TEdit, TButton]);
end;
```

27.1.15 TCoolBar Class

TCoolBar displays a collection of windowed controls within movable, resizable bands.

Class Hierarchy

Pascal

```
TCoolBar = class(TToolWindow);
```

C++

```
class TCoolBar : public TToolWindow;
```

File

ComCtrls

Description

TCoolBar is a wrapper class for a Windows rebar control, more commonly known as a CoolBar. A CoolBar contains child controls that can be moved and resized independently. Each control resides on an individual band, represented by a TCoolBand (see page 3584) object listed in the Bands (see page 3628) property. The user positions the controls by dragging the sizing grip to the left of each band.

If its FixedSize (see page 3638) property is true, a CoolBar can contain any kind control. If FixedSize (see page 3638) is false, only wrapper controls (instances of TWinControl descendants) can appear on the CoolBar.

To create a bar that acts as a docking site for tool bars and other controls, use TControlBar instead.

Note: TCoolBar requires version 4.70 or later of COMCTL32.DLL. This file, which usually resides in the WINDOWS\SYSTEM or WINDOWS\SYSTEM32 directory, is required at both design time and runtime. Contact Microsoft for information about deploying COMCTL32.DLL.

27.1.15.1 TCoolBar Members

The following tables list the members exposed by TCoolBar.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.

	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 3616)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 3617)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 3617)	This is Change, a member of class TCoolBar.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	CMBorderChanged (see page 23285)	This is CMBorderChanged, a member of class TToolWindow.
	CMCtl3DChanged (see page 23286)	This is CMCtl3DChanged, a member of class TToolWindow.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 3617)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 3618)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.

	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.

	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 3619)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HitTest (see page 3619)	This is HitTest, a member of class TCoolBar.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 3619)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	NCPaint (see page 23286)	This is NCPaint, a member of class TToolWindow.
	Notification (see page 3620)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 3620)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.

	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMNCCalcSize (see page 23286)	This is WMNCCalcSize, a member of class TToolWindow.
	WMNCPaint (see page 23286)	This is WMNCPaint, a member of class TToolWindow.
V	WndProc (see page 3621)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 3614)	Creates and initializes a TCoolBar (see page 3603) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 3615)	Destroys the TCoolBar (see page 3603) instance and frees its memory.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
V	FlipChildren (see page 3618)	Flips the control's children.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.

	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.

V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.

	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnChange (see page 3650)	Occurs when the position or size of a band changes.
	OnClick (see page 3650)	Occurs when the user clicks the control.
	OnContextPopup (see page 3652)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 3653)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 3653)	Occurs when another control is docked to the control.
	OnDockOver (see page 3655)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 3657)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 3660)	Occurs when the user drags an object over a control.
	OnEndDock (see page 3662)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 3662)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnGetSiteInfo (see page 3663)	Returns the control's docking information.
	OnMouseActivate (see page 3665)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 3666)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 3669)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 3669)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 3669)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 3672)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnResize (see page 3674)	Occurs immediately after the control is resized.
	OnStartDock (see page 3674)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 3675)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 3676)	Occurs when the application tries to undock a control that is docked to the windowed control.

Published Properties

	Name	Description
	Align (see page 3626)	Determines the alignment of the TCoolBar (see page 3603) component.
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 3626)	Specifies how the control is anchored to its parent.
	AutoSize (see page 3627)	Specifies whether the control sizes itself automatically to accommodate its contents.

	BandBorderStyle (see page 3627)	Determines the border style of the bands in the TCoolBar (see page 3603).
	BandMaximize (see page 3628)	Specifies the conditions under which a TCoolBand (see page 3584) is maximized.
	Bands (see page 3628)	Lists the bands (TCoolBands (see page 3596)) of the coolbar.
	Bitmap (see page 3630)	Specifies the image that appears behind the bands in the TCoolBar (see page 3603).
	BorderWidth (see page 3630)	Specifies the width of the control's border.
	Color (see page 3631)	Specifies the background color of the control.
	Constraints (see page 3631)	Specifies the size constraints for the control.
	Ctl3D (see page 3632)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DockSite (see page 3632)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 3633)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 3634)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 3634)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EdgeBorders (see page 3636)	Determines which sides of the control have visible borders.
	EdgeInner (see page 3636)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 3637)	Determines the border style for the control's outer edge.
	Enabled (see page 3637)	Controls whether the control responds to mouse, keyboard, and timer events.
	FixedOrder (see page 3637)	Determines whether the user can reorder the bands in the TCoolBar (see page 3603).
	FixedSize (see page 3638)	Determines whether the bands automatically maintain a uniform height (or width).
	Font (see page 3638)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Images (see page 3639)	Lists images available for bands in the TCoolBar (see page 3603).
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentColor (see page 3640)	Determines where a control looks for its color information.
	ParentFont (see page 3640)	Determines where a control looks for its font information.
	ParentShowHint (see page 3641)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 3641)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 3646)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	ShowText (see page 3647)	Determines whether text is displayed on the bands.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Vertical (see page 3647)	Determines whether the bands are arranged vertically or horizontally.
	Visible (see page 3648)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

27.1.15.2 TCoolBar.Create Constructor

Creates and initializes a TCoolBar (see page 3603) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCoolBar(TComponent * AOwner);
```

Description

Call Create to create a cool bar at runtime. Cool bars added at design time are created automatically.

AOwner is the component that is responsible for freeing the cool bar instance. Typically, this is the form. It becomes the value of the Owner property.

Create generates a TCoolBar (see page 3603) object and initializes its properties. If COMCTL32.DLL cannot be found, Create raises the EComponentError exception.

Delphi Examples:

```
{
To run this example, add the example code to a new project.
The example code dynamically creates a TCoolBar and three
TCoolBand objects populated with a windowed control in each
TCoolBand.
}
procedure AddBand(CoolBar: TCoolBar; Const ControlClasses: array of TControlClass);
var
  CurrentControl: TControl;
  I: Integer;
begin
  for I := 0 to High(ControlClasses) do
    begin
      CurrentControl := ControlClasses[i].Create(CoolBar);
      if (CurrentControl is TWinControl) then
      begin
        { Placing the control onto the CoolBar causes the TCoolBar object to create a
TCoolBand and place the control within the band. }
        CurrentControl.Parent := Coolbar;
        { Get the reference of the last TCoolBand created and assign text. }
        with CoolBar.Bands do
          Items[count - 1].Text := CurrentControl.ClassName;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  CoolBar: TCoolBar;
begin
  CoolBar := TCoolBar.Create(Self);
  CoolBar.Parent := Self;
  CoolBar.Align := alClient;
  AddBand(CoolBar, [TCheckBox, TEdit, TButton]);
end;
```

See Also

Owner (see page 2807)

EComponentError (see page 2694)

27.1.15.3 TCoolBar.Destroy Destructor

Destroys the TCoolBar (see page 3603) instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCoolBar();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the coolbar reference is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

27.1.15.4 TCoolBar Methods

The methods of the TCoolBar class are listed here.

Protected Methods

	Name	Description
	AlignControls (see page 3616)	Aligns any controls for which the control is the parent within a specified area of the control.
	CanAutoSize (see page 3617)	Indicates how the control can be resized.
	Change (see page 3617)	This is Change, a member of class TCoolBar.
	CreateParams (see page 3617)	Initializes a window-creation parameter data structure.
	CreateWnd (see page 3618)	Creates the underlying window.
	GetPalette (see page 3619)	Returns the handle to a palette for use by the control.
	HitTest (see page 3619)	This is HitTest, a member of class TCoolBar.
	Loaded (see page 3619)	Initializes the control after it is loaded from a stream.
	Notification (see page 3620)	Responds to notifications that components are being created or destroyed.
	PaintWindow (see page 3620)	Renders the image of a windowed control.
	WndProc (see page 3621)	Provides specific message responses for the control.

Public Methods

	Name	Description
	FlipChildren (see page 3618)	Flips the control's children.

27.1.15.4.1 TCoolBar.AlignControls Method

Aligns any controls for which the control is the parent within a specified area of the control.

Pascal

```
procedure AlignControls(AControl: TControl; var Rect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect Rect);
```

Description

Use AlignControls to align all controls within an area of a form, panel, group box, scroll box, or any container control. Specify the area in which to align the controls as the value of the Rect parameter.

AlignControls uses the Align property value for each child control to determine how to align it. The AControl parameter can be nil (Delphi) or NULL (C++). If you specify a control in AControl, that control takes precedence in alignment over other, similarly-aligned controls.

See Also

Align (see page 5798)

27.1.15.4.2 TCoolBar.CanAutoSize Method

Indicates how the control can be resized.

Pascal

```
function CanAutoSize(var NewWidth: Integer; var NewHeight: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanAutoSize(int NewWidth, int NewHeight);
```

Description

CanAutoSize is called automatically when the AutoSize property is true and an attempt is made to resize the control. It allows controls to implement the AutoSize property before the resize sequence that begins with the OnCanResize and OnConstrainedResize events and ends with the OnResize event.

When CanAutoSize is called, the NewWidth and NewHeight parameters indicate the proposed new dimensions of the control. CanAutoSize adjusts these values so that the control's size adjusts to its contents. If the adjustment results in values of NewWidth and NewHeight that differ from the control's current width and height, CanAutoSize returns true, indicating that the resize sequence should proceed. If, after adjustment, NewWidth and NewHeight equal Width and Height, CanAutoSize returns false, and the resize sequence is aborted.

As implemented in TWinControl, CanAutoSize returns true, adjusting NewWidth and NewHeight so that all the control's children fit.

See Also

Constraints (see page 5812)

ConstrainedResize (see page 6133)

AdjustSize (see page 6129)

27.1.15.4.3 TCoolBar.Change Method

Pascal

```
procedure Change; dynamic;
```

C++

```
__fastcall Change();
```

Description

This is Change, a member of class TCoolBar.

27.1.15.4.4 TCoolBar.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

27.1.15.4.5 TCoolBar.CreateWnd Method

Creates the underlying window.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the control is first created or when the underlying screen object must be destroyed and recreated to reflect property changes. Override CreateWnd to pass additional initialization messages to the screen object when it is created.

See Also

CreateParams (see page 6135)

CreateWindowHandle (see page 6137)

Perform (see page 5776)

DestroyWnd (see page 6141)

27.1.15.4.6 TCoolBar.FlipChildren Method

Flips the control's children.

Pascal

```
procedure FlipChildren(AllLevels: Boolean); override;
```

C++

```
virtual __fastcall FlipChildren(Boolean AllLevels);
```

Description

FlipChildren overrides the inherited method in order to prevent the flipping of the control bar's children.

Applications call FlipChildren to flip the control's children; that is, to move children on the left side of the control to the right side and vice versa. If an application calls the FlipChildren method of the cool bar's parent, passing in true for the AllLevels parameter, then the cool bar's FlipChildren method is called along with the FlipChildren method of any sibling controls. Because of their special nature, cool bar controls do not respond to the FlipChildren command.

Note: FlipChildren does the same thing as the Flip Children command on the context menu in the IDE.

See Also

FlipChildren (see page 6150)

27.1.15.4.7 TCoolBar.GetPalette Method

Returns the handle to a palette for use by the control.

Pascal

```
function GetPalette: HPALETTE; override;
```

C++

```
virtual __fastcall HPALETTE GetPalette();
```

Description

As implemented in TControl, GetPalette returns a null handle, indicating that the control does not have a palette. Override GetPalette to implement derived objects that use a palette. Create a palette handle for the control by a call to the Windows API function CreatePalette. GetPalette should return the palette handle for the control.

Specifying the palette for a control tells the application that the control's palette needs to be realized and designates the palette to use for realization.

GetPalette is called only if the run-time video mode requires color palette support, for example, in 256-color mode.

See Also

PaletteChanged (see page 5775)

27.1.15.4.8 TCoolBar.HitTest Method

Pascal

```
function HitTest(const Pos: TPoint): TCoolBand;
```

C++

```
__fastcall TCoolBand HitTest(const TPoint Pos);
```

Description

This is HitTest, a member of class TCoolBar.

27.1.15.4.9 TCoolBar.Loaded Method

Initializes the control after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the control's form is loaded into memory so that the control can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method in order to initialize the control from its associated Action. To change the properties the control copies from its action, override the ActionChange method.

See Also

Loaded (see page 2782)

Action (see page 5797)

ActionChange (see page 5737)

27.1.15.4.10 TCoolBar.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu (see page 5835)

Notification (see page 2783)

27.1.15.4.11 TCoolBar.PaintWindow Method

Renders the image of a windowed control.

Pascal

```
procedure PaintWindow(DC: HDC); override;
```

C++

```
virtual __fastcall PaintWindow(HDC DC);
```

Description

Call PaintWindow to repaint the control. PaintWindow sends a WM_PAINT message to the windowed control's DefaultHandler method, setting the message record's WParam field to the value passed in DC and the other parameter and result fields to zeros.

See Also

DefaultHandler (see page 6139)

PaintTo (see page 6167)

DoubleBuffered (see page 6205)

27.1.15.4.12 TCoolBar.WndProc Method

Provides specific message responses for the control.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

Override WndProc to change the initial Windows message handler for the control. The WindowProc property is initialized to point to the WndProc method.

WndProc for TWinControl overrides the inherited method to define responses for focus, mouse, and keyboard messages. It sends all others to its inherited WndProc.

When overriding WndProc to provide specialized responses to messages, call the inherited WndProc at the end to dispatch any unhandled messages.

C++ Examples:

```
/*
This example shows how to use the WndProc method and the
WindowProc property to subclass a custom control's window
procedure.  This example subclasses the window procedure of
a TListBox descendant to respond to a user-defined message
called WM_STYLEMESSAGE. The subclassed window procedure can
be turned on or off by pressing a radio button.
*/
class TMyListBoxDescendant : public TListBox
{
__published:    // IDE-managed Components
    void __fastcall SubClassWndProc(Messages::TMessage &Message);
    void __fastcall ToggleSubClass(bool On);
    void __fastcall OnDrawItemProc(
      TWinControl *Control, int Index, const TRect &Rect,
      TOwnerDrawState State);
private:    // User declarations
public:     // User declarations
    __fastcall TMyListBoxDescendant(TComponent* Owner);
};

TForm1 *Form1;
TMyListBoxDescendant *MyListBoxDescendant1;
Graphics::TBitmap *bitmap0;

const WM_STYLEMESSAGE = WM_USER + 2000;

__fastcall TForm1::TForm1(TComponent* Owner)
    : TForm(Owner)
{
}
```

```
__fastcall TMyListBoxDescendant::TMyListBoxDescendant(TComponent* Owner)
    : TListBox(Owner)
{
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PostMessage(
    MyListBoxDescendant1->Handle,
    WM_STYLEMESSAGE,
    Integer(lbOwnerDrawFixed),
    0);
}

27.1.15.5 TCoolBar Properties

The properties of the TCoolBar class are listed here.

Published Properties

	Name	Description
	Align (see page 3626)	Determines the alignment of the TCoolBar (see page 3603) component.
	Anchors (see page 3626)	Specifies how the control is anchored to its parent.
	AutoSize (see page 3627)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BandBorderStyle (see page 3627)	Determines the border style of the bands in the TCoolBar (see page 3603).
	BandMaximize (see page 3628)	Specifies the conditions under which a TCoolBand (see page 3584) is maximized.
	Bands (see page 3628)	Lists the bands (TCoolBands (see page 3596)) of the coolbar.
	Bitmap (see page 3630)	Specifies the image that appears behind the bands in the TCoolBar (see page 3603).
	BorderWidth (see page 3630)	Specifies the width of the control's border.
	Color (see page 3631)	Specifies the background color of the control.
	Constraints (see page 3631)	Specifies the size constraints for the control.
	Ctl3D (see page 3632)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DockSite (see page 3632)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 3633)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 3634)	Specifies whether the control is being dragged normally or for docking.

	DragMode (see page 3634)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EdgeBorders (see page 3636)	Determines which sides of the control have visible borders.
	EdgeInner (see page 3636)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 3637)	Determines the border style for the control's outer edge.
	Enabled (see page 3637)	Controls whether the control responds to mouse, keyboard, and timer events.
	FixedOrder (see page 3637)	Determines whether the user can reorder the bands in the TCoolBar (see page 3603).
	FixedSize (see page 3638)	Determines whether the bands automatically maintain a uniform height (or width).
	Font (see page 3638)	Controls the attributes of text written on or in the control.
	Images (see page 3639)	Lists images available for bands in the TCoolBar (see page 3603).
	ParentColor (see page 3640)	Determines where a control looks for its color information.
	ParentFont (see page 3640)	Determines where a control looks for its font information.
	ParentShowHint (see page 3641)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 3641)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 3646)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	ShowText (see page 3647)	Determines whether text is displayed on the bands.
	Vertical (see page 3647)	Determines whether the bands are arranged vertically or horizontally.
	Visible (see page 3648)	Determines whether the component appears onscreen.

27.1.15.5.1 TCoolBar.Align Property

Determines the alignment of the TCoolBar (see page 3603) component.

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align the CoolBar to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the cool bar changes.

Setting Align to alLeft or alRight automatically sets Vertical (see page 3647) to true (causing bands to be arranged vertically). Setting Align to alTop, alBottom, alClient, or alNone automatically sets Vertical (see page 3647) to false.

See Also

Align (see page 5798)

Vertical (see page 3647)

Anchors (see page 5802)

27.1.15.5.2 TCoolBar.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized.

When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

27.1.15.5.3 TCoolBar.AutoSize Property

Specifies whether the control sizes itself automatically to accommodate its contents.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

Use AutoSize to specify whether the control sizes itself automatically. When AutoSize is true, the control resizes automatically when its contents change.

By default, AutoSize is false.

See Also

Constraints (see page 5812)

CanAutoSize (see page 5741)

27.1.15.5.4 TCoolBar.BandBorderStyle Property

Determines the border style of the bands in the TCoolBar (see page 3603).

Pascal

```
property BandBorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BandBorderStyle;
```

Description

If BandBorderStyle is bsSingle, each band in the TCoolBar (see page 3603) has a single line around it. If BandBorderStyle is bsNone, the bands have no borders.

Note: BandBorderStyle takes precedence over the BorderStyle property on individual cool bands. Thus, when a CoolBand resides in a cool bar control, its BorderStyle property has no effect.

See Also

BorderStyle (see page 3589)

27.1.15.5.5 TCoolBar.BandMaximize Property

Specifies the conditions under which a TCoolBand (see page 3584) is maximized.

Pascal

```
property BandMaximize: TCoolBandMaximize;
```

C++

```
__property TCoolBandMaximize BandMaximize;
```

Description

Use BandMaximize to determine the user actions that maximize individual bands. When a band is maximized, it takes up as much space as possible in its row or column.

Note: Users can't maximize fixed-size bands.

See Also

OnChange (see page 3650)

FixedSize (see page 3591)

27.1.15.5.6 TCoolBar.Bands Property

Lists the bands (TCoolBands (see page 3596)) of the coolbar.

Pascal

```
property Bands: TCoolBands;
```

C++

```
__property TCoolBands Bands;
```

Description

The Bands property holds a TCoolBands (see page 3596) collection. At design time, you can add, remove, or modify bands with the Bands editor. To open the Bands editor, select the Bands property in the Object Inspector, then double-click in the Value column to the right or click the ellipsis (...) button.

You can also create bands simply by adding new wrapper controls from the palette. When any TWinControl descendant is placed on the form as a child of the TCoolBar (see page 3603), a new band is created for it.

C++ Examples:

```
/*
To run this example, add the example code to a new project.
The example code dynamically creates a TCoolbar and three
TCoolBand objects populated with a windowed control in each
TCoolBand.
*/
void AddBands(TCoolBar *CoolBar, TList *Objects)
{
  TControl *pCurrent;
  for (int i = 0; i < Objects->Count; i++)
  {
    pCurrent = (TControl *)Objects->Items[i];
    // only add windowed controls to the coolbar
```

```
    if (dynamic_cast<TWinControl *>(pCurrent) != NULL)
    {
      // Placing the control onto the CoolBar
      // causes the TCoolBar object to create a TCoolBand
      // and place the control within the band.
      pCurrent->Parent = CoolBar;   // This statement increments CoolBar->Bands->Count.
      // Get the reference of the TCoolBand just created and assign text.
      String S = pCurrent->ClassName(pCurrent->ClassType());
      CoolBar->Bands->Items[CoolBar->Bands->Count - 1]->Text = S;
    }
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TCoolBar *CoolBar = new TCoolBar(this);
  TList *List;
  CoolBar->Parent = this;
  CoolBar->Align = alTop;
  List = new TList();
  try
  {
    TControl *Control;
    Control = new TButton(CoolBar);
    List->Add(Control);
    Control = new TCheckBox(CoolBar);
    List->Add(Control);
    Control = new TEdit(CoolBar);
    List->Add(Control);
    AddBands(CoolBar, List);
  }
  catch (...)
  {
    ShowMessage("Some objects could not be added to Coolband");
  }
  delete List;
}
```

Delphi Examples:

```
{
To run this example, add the example code to a new project.
The example code dynamically creates a TCoolBar and three
TCoolBand objects populated with a windowed control in each
TCoolBand.
}
procedure AddBand(CoolBar: TCoolBar; Const ControlClasses: array of TControlClass);
var
  CurrentControl: TControl;
  I: Integer;
begin
  for I := 0 to High(ControlClasses) do
    begin
      CurrentControl := ControlClasses[i].Create(CoolBar);
      if (CurrentControl is TWinControl) then
      begin
        { Placing the control onto the CoolBar causes the TCoolBar object to create a
TCoolBand and place the control within the band. }
        CurrentControl.Parent := Coolbar;
        { Get the reference of the last TCoolBand created and assign text. }
        with CoolBar.Bands do
          Items[count - 1].Text := CurrentControl.ClassName;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
```

```
var
  CoolBar: TCoolBar;
begin
  CoolBar := TCoolBar.Create(Self);
  CoolBar.Parent := Self;
  CoolBar.Align := alClient;
  AddBand(CoolBar, [TCheckBox, TEdit, TButton]);
end;
```

See Also

TCoolBand (see page 3584)

27.1.15.5.7 TCoolBar.Bitmap Property

Specifies the image that appears behind the bands in the TCoolBar (see page 3603).

Pascal

```
property Bitmap: TBitmap;
```

C++

```
__property TBitmap Bitmap;
```

Description

Bitmap specifies an image that appears behind the bands in the TCoolBar (see page 3603).

By default, the Bitmap image is positioned relative to the upper left corner of the TCoolBar (see page 3603) and covers the client area, and is visible through transparent CoolBands. Setting the FixedBackground, Bitmap, or ParentBitmap properties of the CoolBands can modify this appearance.

See Also

Bitmap (see page 3589)

FixedBackground (see page 3591)

ParentBitmap (see page 3593)

27.1.15.5.8 TCoolBar.BorderWidth Property

Specifies the width of the control's border.

Pascal

```
property BorderWidth: TBorderWidth;
```

C++

```
__property TBorderWidth BorderWidth;
```

Description

Use BorderWidth to get or set the width of the control's border. Graphics or text drawn by the control is clipped to the area within the border.

See Also

ClientRect

BevelOuter (see page 6194)

27.1.15.5.9 TCoolBar.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

27.1.15.5.10 TCoolBar.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

27.1.15.5.11 TCoolBar.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

27.1.15.5.12 TCoolBar.DockSite Property

Specifies whether the control can be the target of drag-and-dock operations.

Pascal

```
property DockSite: Boolean;
```

C++

```
__property Boolean DockSite;
```

Description

Set DockSite to true to allow other controls to be docked to this windowed control.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
}
procedure TConjoinDockHost.FormUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if Client is TDockableForm then
    TDockableForm(Client).DockSite := True;
  if (DockClientCount = 2) and (NewTarget <> Self) then
    PostMessage(Self.Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
end;
```

27.1.15.5.13 TCoolBar.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

27.1.15.5.14 TCoolBar.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

27.1.15.5.15 TCoolBar.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
```

```
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

OnStartDrag (see page 5871)

DragKind (see page 5819)

Arranging the Order of Persistent Columns

27.1.15.5.16 TCoolBar.EdgeBorders Property

Determines which sides of the control have visible borders.

Pascal

```
property EdgeBorders: TEdgeBorders;
```

C++

```
__property TEdgeBorders EdgeBorders;
```

Description

Use the EdgeBorders property to add or remove borders. The appearance of the borders can be set with the EdgeInner and EdgeOuter properties.

See Also

EdgeInner (see page 23287)

EdgeOuter (see page 23288)

27.1.15.5.17 TCoolBar.EdgeInner Property

Determines the border style for the control's inner edge.

Pascal

```
property EdgeInner: TEdgeStyle;
```

C++

```
__property TEdgeStyle EdgeInner;
```

Description

Use EdgeInner to provide the tool window with a three-dimensional beveled look. A tool window has two borders on each side, an outer border drawn next to the outer edge, and an inner border drawn inside the outer border. EdgeInner specifies the appearance of the inner border. It can be raised (esRaised), lowered (esLowered), or left off altogether (esNone).

Note: The EdgeInner property has an effect only on the sides specified by the EdgeBorders property.

Use EdgeInner with EdgeOuter to give the component a three-dimensional look.

See Also

EdgeBorders (see page 23287)

EdgeOuter (see page 23288)

27.1.15.5.18 TCoolBar.EdgeOuter Property

Determines the border style for the control's outer edge.

Pascal

```
property EdgeOuter: TEdgeStyle;
```

C++

```
__property TEdgeStyle EdgeOuter;
```

Description

Use EdgeOuter to provide the tool window with a three-dimensional beveled look. A tool window has two borders on each side, an outer border drawn next to the outer edge, and an inner border drawn inside the outer border. EdgeOuter specifies the appearance of the outer border. It can be raised (esRaised), lowered (esLowered), or left off altogether (esNone).

Note: The EdgeInner property has an effect only on the sides specified by the EdgeBorders property.

Use EdgeOuter with EdgeInner to give the component a three-dimensional look.

See Also

EdgeBorders (see page 23287)

EdgeInner (see page 23287)

27.1.15.5.19 TCoolBar.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

27.1.15.5.20 TCoolBar.FixedOrder Property

Determines whether the user can reorder the bands in the TCoolBar (see page 3603).

Pascal

```
property FixedOrder: Boolean;
```

C++

```
__property Boolean FixedOrder;
```

Description

If FixedOrder is set to true, the user can reposition the bands by dragging them with the mouse, but cannot change their order. Bands (see page 3628) can still be reordered from the Collection editor at design time, or by changing their Index properties in program code.

See Also

Index (see page 2762)

27.1.15.5.21 TCoolBar.FixedSize Property

Determines whether the bands automatically maintain a uniform height (or width).

Pascal

```
property FixedSize: Boolean;
```

C++

```
__property Boolean FixedSize;
```

Description

Ordinarily, when Vertical (see page 3647) and FixedSize are both false, the height of each TCoolBand (see page 3584) is determined by the height of its controls or text. When FixedSize is true, the bands are resized so that they all have the same height; increasing the height of the tallest visible band automatically increases the height of all the other bands.

When Vertical (see page 3647) is true, these dependencies are switched. As long as FixedSize is false, the width of each band is determined the width of its controls and text. If FixedSize and Vertical (see page 3647) are both set to true, the bands maintain the same width; increasing the width of the widest visible band automatically increases the width of all the other bands.

See Also

TCoolBand (see page 3584)

Text (see page 3594)

Vertical (see page 3647)

27.1.15.5.22 TCoolBar.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
```

```
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

See Also

DesktopFont (see page 5818)

ParentFont (see page 5834)

Displaying and Editing Text in a Memo Control

27.1.15.5.23 TCoolBar.Images Property

Lists images available for bands in the TCoolBar (see page 3603).

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Images is a list of bitmaps that can be displayed to the left of any band in the TCoolBar (see page 3603). Each band can specify an image from this list by setting its ImageIndex property.

See Also

ImageIndex (see page 3592)

27.1.15.5.24 TCoolBar.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

27.1.15.5.25 TCoolBar.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

27.1.15.5.26 TCoolBar.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

27.1.15.5.27 TCoolBar.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
```

```
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
```

```
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
```

```
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

type
  TForm1 = class(TForm)
    AddButton: TButton;
    EditButton: TButton;
    DestroyButton: TButton;
    PopupMenu1: TPopupMenu;
```

```
    procedure AddButtonClick(Sender: TObject);
    procedure EditButtonClick(Sender: TObject);
    procedure DestroyButtonClick(Sender: TObject);
    procedure FormDestroy(Sender: TObject);

27.1.15.5.28 TCoolBar.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
```

```
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

Displaying Fly-over Help

27.1.15.5.29 TCoolBar.ShowText Property

Determines whether text is displayed on the bands.

Pascal

```
property ShowText: Boolean;
```

C++

```
__property Boolean ShowText;
```

Description

If ShowText is true, the Text string of each TCoolBand (see page 3584) is displayed on the band at runtime. If ShowText is false, only the TWinControl linked to the band is displayed.

See Also

Text (see page 3594)

27.1.15.5.30 TCoolBar.Vertical Property

Determines whether the bands are arranged vertically or horizontally.

Pascal

```
property Vertical: Boolean;
```

C++

```
__property Boolean Vertical;
```

Description

If Vertical is false (the default), the bands in the TCoolBar (see page 3603) are oriented horizontally, from left to right and top to bottom. If Vertical is true, the bands are oriented vertically, from top to bottom and left to right.

See Also

Align (see page 3626)

AutoSize (see page 5803)

FixedSize (see page 3638)

27.1.15.5.31 TCoolBar.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
```

```
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

27.1.15.6 TCoolBar Events

The events of the TCoolBar class are listed here.

Published Events

	Name	Description
	OnChange (see page 3650)	Occurs when the position or size of a band changes.
	OnClick (see page 3650)	Occurs when the user clicks the control.

	OnContextPopup (see page 3652)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 3653)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 3653)	Occurs when another control is docked to the control.
	OnDockOver (see page 3655)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 3657)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 3660)	Occurs when the user drags an object over a control.
	OnEndDock (see page 3662)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 3662)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnGetSiteInfo (see page 3663)	Returns the control's docking information.
	OnMouseActivate (see page 3665)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 3666)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 3669)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 3669)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 3669)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 3672)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnResize (see page 3674)	Occurs immediately after the control is resized.
	OnStartDock (see page 3674)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 3675)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 3676)	Occurs when the application tries to undock a control that is docked to the windowed control.

27.1.15.6.1 TCoolBar.OnChange Event

Occurs when the position or size of a band changes.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

The OnChange event occurs whenever a TCoolBand (see page 3584)'s Break, Index, or Width property is modified at runtime. An OnChange event handler can be used, for example, to record the positions and sizes of the bands in the Windows registry.

See Also

Break (see page 3590)

Index (see page 2762)

Width (see page 3596)

27.1.15.6.2 TCoolBar.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

27.1.15.6.3 TCoolBar.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The

OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

TPopupMenu (see page 16169)

PopupMenu (see page 5835)

AutoPopup (see page 16178)

27.1.15.6.4 TCoolBar.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

OnClick (see page 5851)

Responding to User Actions at Runtime

27.1.15.6.5 TCoolBar.OnDockDrop Event

Occurs when another control is docked to the control.

Pascal

```
property OnDockDrop: TDockDropEvent;
```

C++

```
__property TDockDropEvent OnDockDrop;
```

Description

Write code in the OnDockDrop event to perform actions when another control is docked on the control.

OnDockDrop can only occur if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
```

```
    //OnDockDrop gets called AFTER the client has actually docked,
    //so we check for DockClientCount = 1 before making the dock panel visible.
    if (Sender as TPanel).DockClientCount = 1 then
      ShowDockPanel(Sender as TPanel, True, nil);
    (Sender as TPanel).DockManager.ResetBounds(True);
    //Make DockManager repaints it's clients.
  end;

  procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
    Source: TDragDockObject; X, Y: Integer; State: TDragState;
    var Accept: Boolean);
  var
    ARect: TRect;
  begin
    Accept := Source.Control is TDockableForm;
    if Accept then
    begin
      //Modify the DockRect to preview dock area.
      ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
      ARect.BottomRight := LeftDockPanel.ClientToScreen(
        Point(Self.ClientWidth div 3, LeftDockPanel.Height));
      Source.DockRect := ARect;
    end;
  end;

  procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
    NewTarget: TWinControl; var Allow: Boolean);
  begin
    //OnUnDock gets called BEFORE the client is undocked, in order to optionally
    //disallow the undock. DockClientCount is never 0 when called from this event.
    if (Sender as TPanel).DockClientCount = 1 then
      ShowDockPanel(Sender as TPanel, False, nil);
  end;

  procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
    DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
    var CanDock: Boolean);
  begin
    //if CanDock is true, the panel will not automatically draw the preview rect.
    CanDock := DockClient is TDockableForm;
  end;
```

See Also

DockSite (see page 6204)

OnDockOver (see page 6216)

27.1.15.6.6 TCoolBar.OnDockOver Event

Occurs when another control is dragged over the control.

Pascal

```
property OnDockOver: TDockOverEvent;
```

C++

```
__property TDockOverEvent OnDockOver;
```

Description

Write code in the OnDockOver event to indicate whether a dockable control that is dragged over the windowed control can be accepted as a dock client. OnDockOver occurs after the TDragDockObject has been initialized by an OnGetSiteInfo event.

OnDockOver occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);

27.1.15.6.7 TCoolBar.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the

OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;
```

```
procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

27.1.15.6.8 TCoolBar.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
```

```
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
```

```
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

27.1.15.6.9 TCoolBar.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

27.1.15.6.10 TCoolBar.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

27.1.15.6.11 TCoolBar.OnGetSiteInfo Event

Returns the control's docking information.

Pascal

```
property OnGetSiteInfo: TGetSiteInfoEvent;
```

C++

```
__property TGetSiteInfoEvent OnGetSiteInfo;
```

Description

Write code in the OnGetSiteInfo event handler to initialize a TDragDockObject with information about where a dragged object can be docked, if at all. OnGetSiteInfo occurs before the OnDockOver event.

OnGetSiteInfo occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
```

```
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

27.1.15.6.12 TCoolBar.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

MouseCapture (see page 5831)

27.1.15.6.13 TCoolBar.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
```

```
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
      end;
    if X > StartX then
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
      end
    else
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
      end;
  end;
```

```
end;

27.1.15.6.14 TCoolBar.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

27.1.15.6.15 TCoolBar.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

27.1.15.6.16 TCoolBar.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

27.1.15.6.17 TCoolBar.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.

Responding to a Mouse-up Action

27.1.15.6.18 TCoolBar.OnResize Event

Occurs immediately after the control is resized.

Pascal

```
property OnResize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnResize;
```

Description

Use OnResize to make any final adjustments after a control is resized.

To modify the way a control responds when an attempt is made to resize it, use OnCanResize or OnConstrainedResize.

Note: Some controls call this event handler when the control is first created.

Delphi Examples:

```
{
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
}
procedure TForm1.FormResize(Sender: TObject);
begin
  Button1.Left := Form1.ClientWidth-Button1.Width;
end;
```

OnConstrainedResize (see page 5853)

27.1.15.6.19 TCoolBar.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

27.1.15.6.20 TCoolBar.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

27.1.15.6.21 TCoolBar.OnUnDock Event

Occurs when the application tries to undock a control that is docked to the windowed control.

Pascal

```
property OnUnDock: TUnDockEvent;
```

C++

```
__property TUnDockEvent OnUnDock;
```

Description

Write an OnUnDock event handler to adjust the windowed control when a dock client is undocked. The OnUnDock event handler can make any necessary adjustments, or it can block the undock attempt by setting the Allow parameter to false.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
```

```
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

27.1.16 TCustomComboBoxEx Class

TCustomComboBoxEx is the base class for combo box components that support extended combo box features such as images on the list entries.

Class Hierarchy

Pascal

```
TCustomComboBoxEx = class(TCustomCombo);
```

C++

```
class TCustomComboBoxEx : public TCustomCombo;
```

File

ComCtrls

Description

Use TCustomComboBoxEx as a base class when defining a control that represents a Windows extended combo box (ComboBoxEx). An extended combo box is an edit box with a scrollable list attached to it that provides native support for item images. Users can select an item from the list or type directly into the edit box. Extended combo boxes can present the list as a drop-down list or as a list box that is always visible.

Note: To create a combo box class that does not use the extended combo box features such as images associated with entries, use the TCustomComboBox class instead.

Do not create instances of TCustomComboBoxEx. To put an extended combo box in a form, use a descendant of TCustomComboBoxEx, such as TComboBoxEx (see page 3463).

27.1.16.1 TCustomComboBoxEx Members

The following tables list the members exposed by TCustomComboBoxEx.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnChange (see page 21197)	Occurs when the user changes the text displayed in the edit region.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnCloseUp (see page 21199)	Occurs when the drop-down list closes up due to some user action.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.

	OnDropDown (see page 21199)	Occurs when the user opens the drop-down list.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnSelect (see page 21201)	Occurs when the user selects a string in the drop-down list.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefEditProc (see page 21167)	This is FDefEditProc, a member of class TCustomCombo.
	FDefListProc (see page 21167)	This is FDefListProc, a member of class TCustomCombo.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FDropHandle (see page 21168)	This is FDropHandle, a member of class TCustomCombo.
	FDroppingDown (see page 21168)	This is FDroppingDown, a member of class TCustomCombo.
	FEditHandle (see page 21168)	This is FEditHandle, a member of class TCustomCombo.
	FEditInstance (see page 21168)	This is FEditInstance, a member of class TCustomCombo.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFocusChanged (see page 21168)	This is FFocusChanged, a member of class TCustomCombo.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FIsFocused (see page 21169)	This is FIsFocused, a member of class TCustomCombo.
	FListHandle (see page 21169)	This is FListHandle, a member of class TCustomCombo.
	FListInstance (see page 21169)	This is FListInstance, a member of class TCustomCombo.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

	FSaveIndex (see page 21169)	This is FSaveIndex, a member of class TCustomCombo.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActionChange (see page 3692)	Responds when the action for which this combo box is a client changes.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustDropDown (see page 21171)	Adjusts the size and position of the drop down list.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21171)	Generates an OnChange (see page 21197) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	CloseUp (see page 21172)	Generates an OnCloseUp (see page 21199) event.
	CMColorChanged (see page 3693)	Responds when the Color property changes.
	CMParentColorChanged (see page 3693)	Responds when the ParentColor property changes.
	CNNotify (see page 3693)	Responds to notifications of changes in the combo box.
	ComboExWndProc (see page 3694)	Responds to Windows messages sent to the combo box.
V	ComboWndProc (see page 21173)	Responds to Windows messages sent to the edit control or drop-down list.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 3694)	Initializes the window-creation parameter record.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 3694)	Creates the underlying Windows control that implements the extended combo box.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWindowHandle (see page 21174)	Destroys all of the windows controls that implement the combo box.
	DestroyWnd (see page 3695)	Destroys the Windows control that represents the combo box.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DropDown (see page 21175)	Generates an OnDropDown (see page 21199) event.
	EditWndProc (see page 21175)	Responds to Windows messages that are sent to the edit control portion of the combo box.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 3695)	Returns the action link class that is associated with extended combo boxes.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.

	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetCount (see page 5942)	Returns the number of items in the list.
	GetCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetDroppedDown (see page 21176)	Returns the value of the DroppedDown (see page 21185) property.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetItemCount (see page 3696)	Returns the number of items in the Items property list.
	GetItemHt (see page 3696)	Returns the height, in pixels, allocated for each item in the drop-down list.
	GetItemIndex (see page 5942)	Returns the value of the ItemIndex (see page 5944) property.
	GetItemIndex (see page 21177)	Returns the value of the ItemIndex property.
	GetItemsClass (see page 3696)	Returns the class used to implement the Items property.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSelLength (see page 21178)	Returns the value of the SelLength (see page 21190) property.
	GetSelStart (see page 21178)	Returns the value of the SelStart (see page 21193) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	ListWndProc (see page 21178)	Responds to Windows messages that are sent to the drop-down list portion of the combo box.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	Loaded (see page 21179)	Initializes the combo box after its form is loaded into memory.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 3697)	Responds to notifications that objects are about to be inserted or removed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.

	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Select (see page 21179)	Generates an OnSelect (see page 21201) event.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropDownCount (see page 3697)	Sets the value of the DropDownCount property.
	SetDroppedDown (see page 21180)	Sets the value of the DroppedDown (see page 21185) property.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetItemHeight (see page 21181)	Sets the value of the ItemHeight (see page 21186) property.
	SetItemIndex (see page 5943)	Sets the value of the ItemIndex (see page 5944) property.
	SetItemIndex (see page 21181)	Sets the value of the ItemIndex property.
	SetItems (see page 21181)	Sets the value of the Items (see page 21187) property.
	SetMaxLength (see page 21182)	Sets the value of the MaxLength (see page 21189) property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).

	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelLength (see page 21182)	Sets the value of the SelLength (see page 21190) property.
	SetSelStart (see page 21182)	Sets the value of the SelStart (see page 21193) property.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMHelp (see page 3697)	This is WMHelp, a member of class TCustomComboBoxEx.
	WMLButtonDown (see page 3698)	Responds when the user clicks the left mouse button on the combo box.
V	WndProc (see page 3698)	Processes messages received by the combo box.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
R	EditHandle (see page 21185)	Returns the window handle for the edit portion of the combo box.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.

	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	ItemCount (see page 21186)	Specifies the number of items in the drop-down list.
	ItemHeight (see page 21186)	Specifies the height, in pixels, of the items in the drop-down list.
R	ListHandle (see page 21189)	Provides access to the window handle of the list of items in the combo box.
	MaxLength (see page 21189)	Specifies the maximum number of characters the user can type into the edit portion of the combo box.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentColor (see page 21190)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnBeginEdit (see page 3702)	Occurs when the user starts editing the text of the combo box.
	OnEndEdit (see page 3702)	Occurs when the user finishes editing the text of the combo box.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
A	AddItem (see page 5940)	Adds an item to the list control.
V	AddItem (see page 21170)	Adds an item to the drop-down list of items.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
A	Clear (see page 5940)	Deletes all of the items from the list control.
V	Clear (see page 21172)	Deletes all text from the edit box and all items from the Items (see page 21187) list.

	ClearSelection (see page 5940)	Removes the selection, leaving all items unselected.
	ClearSelection (see page 21172)	Deselects any selected items in the drop-down list.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	CopySelection (see page 5941)	Copies the selected item or items to another TCustomListControl (see page 5928) descendant.
	CopySelection (see page 21173)	Copies the selected item in the drop-down list to another list control.
	Create (see page 3691)	Creates and initializes a TCustomComboBoxEx (see page 3678) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DeleteSelected (see page 5941)	Deletes all the selected items.
	DeleteSelected (see page 21174)	Deletes the selected item from the drop-down list.
	Destroy (see page 3691)	Destroys the combo box and frees its memory.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 3695)	Indicates whether the combo box has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.

	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	MoveSelection (see page 5942)	Moves all selected items to another list control.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
A	SelectAll (see page 5943)	Selects all items or all text in the selected item.
V	SelectAll (see page 21180)	Selects the entire block of text in the edit box.

	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AutoCompleteOptions (see page 3699)	Specifies options that control autocompletion.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 21184)	Provides access to the drawing surface of the combo box.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.

	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DropDownCount (see page 3699)	Specifies the maximum number of items displayed in the drop-down list.
	DroppedDown (see page 21185)	Indicates whether the drop-down list is currently displayed.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	Images (see page 3700)	Specifies the images that appear next to items in the combo box list.
	ItemIndex (see page 5944)	Specifies the index of the selected item.
	Items (see page 21187)	Provides access to the list of items (strings) in the list portion of the combo box.
	ItemsEx (see page 3700)	Lists the items that appear in the list portion of the combo box.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	SelLength (see page 21190)	Specifies the length, in characters, of the selected text in the edit portion of the combo box.
	SelStart (see page 21193)	Specifies the position of the first selected character in the edit portion of the combo box.
	SelText (see page 3701)	Represents the selected text in the edit region.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	Style (see page 3701)	Determines the display style of the combo box.
	StyleEx (see page 3701)	Determines the appearance and behavior of the items in the list.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TabStop (see page 21196)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic

	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

27.1.16.2 TCustomComboBoxEx.Create Constructor

Creates and initializes a TCustomComboBoxEx (see page 3678) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomComboBoxEx(TComponent * AOwner);
```

Description

Call Create to generate an extended combo box at runtime. Combo boxes placed on forms at design time are created automatically.

AOwner is a component, typically the form, that is responsible for freeing the combo box instance.

See Also

Owner (see page 2807)

27.1.16.3 TCustomComboBoxEx.Destroy Destructor

Destroys the combo box and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomComboBoxEx();
```

Description

Do not call Destroy directly in an application. Call Free instead. Free verifies that the combo box is not nil, and only then calls Destroy.

Free (see page 22300)

27.1.16.4 TCustomComboBoxEx Methods

The methods of the TCustomComboBoxEx class are listed here.

Protected Methods

	Name	Description
	ActionChange (see page 3692)	Responds when the action for which this combo box is a client changes.
	CMColorChanged (see page 3693)	Responds when the Color property changes.
	CMParentColorChanged (see page 3693)	Responds when the ParentColor property changes.
	CNNotify (see page 3693)	Responds to notifications of changes in the combo box.
	ComboExWndProc (see page 3694)	Responds to Windows messages sent to the combo box.
	CreateParams (see page 3694)	Initializes the window-creation parameter record.
	CreateWnd (see page 3694)	Creates the underlying Windows control that implements the extended combo box.
	DestroyWnd (see page 3695)	Destroys the Windows control that represents the combo box.
	GetActionLinkClass (see page 3695)	Returns the action link class that is associated with extended combo boxes.
	GetItemCount (see page 3696)	Returns the number of items in the Items property list.
	GetItemHt (see page 3696)	Returns the height, in pixels, allocated for each item in the drop-down list.
	GetItemsClass (see page 3696)	Returns the class used to implement the Items property.
	Notification (see page 3697)	Responds to notifications that objects are about to be inserted or removed.
	SetDropDownCount (see page 3697)	Sets the value of the DropDownCount property.
	WMHelp (see page 3697)	This is WMHelp, a member of class TCustomComboBoxEx.
	WMLButtonDown (see page 3698)	Responds when the user clicks the left mouse button on the combo box.
	WndProc (see page 3698)	Processes messages received by the combo box.

Public Methods

	Name	Description
	Focused (see page 3695)	Indicates whether the combo box has input focus.

27.1.16.4.1 TCustomComboBoxEx.ActionChange Method

Responds when the action for which this combo box is a client changes.

Pascal

```
procedure ActionChange(Sender: TObject; CheckDefaults: Boolean); override;
```

C++

```
virtual __fastcall ActionChange(TObject * Sender, Boolean CheckDefaults);
```

Description

ActionChange is called automatically when the action object specified by the Action property, or any of its properties, changes.

In TCustomComboBoxEx (see page 3678), ActionChange checks whether the action is a TActionList object, and if so, updates its Images (see page 3700) and ItemIndex properties, as appropriate. It then calls the inherited method, which updates the Caption, Enabled, Hint, and Visible properties and the OnClick event handler.

The Sender parameter is the action object that changed. The CheckDefaults parameter indicates whether the control's properties should all be updated or only those that have not been explicitly changed from their default values. When CheckDefaults is true, only those properties and event handlers that have not been changed from the default values are updated.

See Also

OnChange (see page 2725)

Action (see page 5797)

TActionList (see page 280)

27.1.16.4.2 TCustomComboBoxEx.CMColorChanged Method

Responds when the Color property changes.

Pascal

```
procedure CMColorChanged(var Message: TMessage); message CM_COLORCHANGED;
```

C++

```
__fastcall CMColorChanged(TMessage Message);
```

Description

CMColorChanged is called automatically when the Color property changes. It forces a repaint to reflect the new color.

Message represents the parameters of the Windows message that informs the combo box of the color change.

See Also

Color (see page 5812)

27.1.16.4.3 TCustomComboBoxEx.CMParentColorChanged Method

Responds when the ParentColor property changes.

Pascal

```
procedure CMParentColorChanged(var Message: TMessage); message CM_PARENTCOLORCHANGED;
```

C++

```
__fastcall CMParentColorChanged(TMessage Message);
```

Description

CMParentColorChanged is called automatically when the ParentColor property changes. It forces a repaint to reflect the new color.

Message represents the parameters of the Windows message that informs the combo box of the property change.

See Also

ParentColor (see page 5834)

27.1.16.4.4 TCustomComboBoxEx.CNNotify Method

Responds to notifications of changes in the combo box.

Pascal

```
procedure CNNotify(var Message: TWMNotify); message CN_NOTIFY;
```

C++

```
__fastcall CNNotify(TWMNotify Message);
```

Description

CNNotify is called automatically in response to notification messages from Windows that there has been a change in the combo box. It checks the notification code, and if it is a notification that the user started or stopped editing, generates an OnBeginEdit (see page 3702) or OnEndEdit (see page 3702) event, as appropriate.

Message represents the parameters of the Windows message that informs the combo box of the change.

See Also

OnBeginEdit (see page 3702)

OnEndEdit (see page 3702)

27.1.16.4.5 TCustomComboBoxEx.ComboExWndProc Method

Responds to Windows messages sent to the combo box.

Pascal

```
procedure ComboExWndProc(var Message: TMessage);
```

C++

```
__fastcall ComboExWndProc(TMessage Message);
```

Description

ComboExWndProc is the window procedure of the internal combo box Ex control that is part of the extended combo box. It forwards all messages directed at that control to the ComboWndProc method.

Message represents the parameters of the Windows message.

27.1.16.4.6 TCustomComboBoxEx.CreateParams Method

Initializes the window-creation parameter record.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd (see page 3694) method calls CreateParams to initialize the parameters it uses to create the window for the combo box. CreateParams overrides the inherited method to implement the Style (see page 3701) property.

See Also

CreateWnd (see page 3694)

Style (see page 3701)

27.1.16.4.7 TCustomComboBoxEx.CreateWnd Method

Creates the underlying Windows control that implements the extended combo box.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

The CreateHandle method calls CreateWnd to perform the task of creating the underlying Windows control.

The Windows control for the combo box can be temporarily destroyed and recreated in order to set properties that require

changing the window creation parameters. Thus, CreateWnd may be called several times during the lifetime of the TCustomComboBoxEx (see page 3678) instance.

See Also

CreateHandle (see page 6135)

27.1.16.4.8 TCustomComboBoxEx.DestroyWnd Method

Destroys the Windows control that represents the combo box.

Pascal

```
procedure DestroyWnd; override;
```

C++

```
virtual __fastcall DestroyWnd();
```

Description

DestroyWnd is called when the underlying Windows control needs to be destroyed. In addition to freeing this control when the TCustomComboBoxEx (see page 3678) object is destroyed, it can be temporarily destroyed and recreated in order to set properties that require changing the window creation parameters.

DestroyWnd saves the contents of Items list before calling the inherited DestroyWnd method. The saved list is used if the window is recreated.

See Also

DestroyWnd (see page 6141)

CreateWnd (see page 3694)

27.1.16.4.9 TCustomComboBoxEx.Focused Method

Indicates whether the combo box has input focus.

Pascal

```
function Focused: Boolean; override;
```

C++

```
virtual __fastcall Boolean Focused();
```

Description

Call Focused to determine whether the combo box is currently the recipient of keyboard input. When Focused returns true, the combo box is the active control and keystroke messages are sent to it. When Focused is false, the combo box is not active (although it may be selected).

See Also

ActiveControl (see page 13896)

27.1.16.4.10 TCustomComboBoxEx.GetActionLinkClass Method

Returns the action link class that is associated with extended combo boxes.

Pascal

```
function GetActionLinkClass: TControlActionLinkClass; override;
```

C++

```
virtual __fastcall TControlActionLinkClass GetActionLinkClass();
```

Description

GetActionLinkClass returns the class type for the action link that manages communication between the combo box and the action specified by the Action property. Each Action link class is designed to link specific properties and event handlers of the action to its client, based on the types of properties the client supports.

See Also

Action (see page 5797)

27.1.16.4.11 TCustomComboBoxEx.GetItemCount Method

Returns the number of items in the Items property list.

Pascal

```
function GetItemCount: Integer; override;
```

C++

```
virtual __fastcall int GetItemCount();
```

Description

GetItemCount is used internally to quickly determine the number of items in the drop-down list of the combo box.

See Also

Items (see page 21187)

ItemsEx (see page 3700)

27.1.16.4.12 TCustomComboBoxEx.GetItemHt Method

Returns the height, in pixels, allocated for each item in the drop-down list.

Pascal

```
function GetItemHt: Integer; override;
```

C++

```
virtual __fastcall int GetItemHt();
```

Description

Extended combo boxes do not support variable-height items. For this reason, TCustomComboBoxEx (see page 3678) overrides the GetItemHt method so that it always returns 16.

See Also

ItemHeight

27.1.16.4.13 TCustomComboBoxEx.GetItemsClass Method

Returns the class used to implement the Items property.

Pascal

```
function GetItemsClass: TCustomComboBoxStringsClass; override;
```

C++

```
virtual __fastcall TCustomComboBoxStringsClass GetItemsClass();
```

Description

Combo box controls use GetItemsClass internally to determine what class to use when implementing the Items property. TCustomComboBoxEx (see page 3678) overrides the inherited method to specify a class that can maintain the relationship between the Items property and the ItemsEx (see page 3700) property.

See Also

Items (see page 21187)

ItemsEx (see page 3700)

27.1.16.4.14 TCustomComboBoxEx.Notification Method

Responds to notifications that objects are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called when the component specified by AComponent is about to be inserted or removed, as specified by Operation. TCustomComboBoxEx (see page 3678) overrides this method to respond to notifications that the image list assigned to the Images (see page 3700) property is going away.

See Also

Images (see page 3700)

27.1.16.4.15 TCustomComboBoxEx.SetDropDownCount Method

Sets the value of the DropDownCount property.

Pascal

```
procedure SetDropDownCount(const Value: Integer); override;
```

C++

```
virtual __fastcall SetDropDownCount(const int Value);
```

Description

SetDropDownCount is the protected write implementation of the DropDownCount property.

See Also

DropDownCount (see page 21185)

27.1.16.4.16 TCustomComboBoxEx.WMHelp Method

Pascal

```
procedure WMHelp(var Message: TWMHelp); message WM_HELP;
```

C++

```
__fastcall WMHelp(TWMHelp Message);
```

Description

This is WMHelp, a member of class TCustomComboBoxEx.

27.1.16.4.17 TCustomComboBoxEx.WMLButtonDown Method

Responds when the user clicks the left mouse button on the combo box.

Pascal

```
procedure WMLButtonDown(var Message: TWMLButtonDown); message WM_LBUTTONDOWN;
```

C++

```
__fastcall WMLButtonDown(TWMLButtonDown Message);
```

Description

WMLButtonDown is called automatically in response to Windows messages that the user clicked the left mouse button over the combo box. This method handles the details of starting drag operations when the DragMode property is dmAutomatic.

Message represents the parameters of the Windows message that informs the combo box of the left mouse click.

See Also

DragMode (see page 5819)

27.1.16.4.18 TCustomComboBoxEx.WndProc Method

Processes messages received by the combo box.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

WndProc is the first method to received Windows messages that are sent to the combo box. Messages (see page 16211) sent to the child windows of the combo box (for the edit region and the list portion) go to the EditWndProc or ListWndProc method instead. WndProc handles messages about changes to the system colors defined in the Windows control panel, and closes up the drop-down list when the Enter key or the Escape key is pressed. All other messages are passed to Dispatch for default processing.

See Also

ComboExWndProc (see page 3694)

Dispatch

WndProc (see page 6187)

EditWndProc (see page 21175)

ListWndProc (see page 21178)

27.1.16.5 TCustomComboBoxEx Properties

The properties of the TCustomComboBoxEx class are listed here.

Public Properties

	Name	Description
	AutoCompleteOptions (see page 3699)	Specifies options that control autocompletion.
	DropDownCount (see page 3699)	Specifies the maximum number of items displayed in the drop-down list.
	Images (see page 3700)	Specifies the images that appear next to items in the combo box list.
	ItemsEx (see page 3700)	Lists the items that appear in the list portion of the combo box.
	SelText (see page 3701)	Represents the selected text in the edit region.
	Style (see page 3701)	Determines the display style of the combo box.
	StyleEx (see page 3701)	Determines the appearance and behavior of the items in the list.

27.1.16.5.1 TCustomComboBoxEx.AutoCompleteOptions Property

Specifies options that control autocompletion.

Pascal

```
property AutoCompleteOptions: TAutoCompleteOptions;
```

C++

```
__property TAutoCompleteOptions AutoCompleteOptions;
```

Description

AutoCompleteOptions specifies options that control autocompletion.

27.1.16.5.2 TCustomComboBoxEx.DropDownCount Property

Specifies the maximum number of items displayed in the drop-down list.

Pascal

```
property DropDownCount: Integer;
```

C++

```
__property int DropDownCount;
```

Description

By default, the drop-down list is long enough to contain eight items without requiring the user to scroll to see them all. To make the drop-down list smaller or larger, specify a number larger or smaller than eight as the DropDownCount value.

If the DropDownCount value is larger than the number of items in the Items property, the drop-down list will be just large enough to hold all the possible choices and no more. If the DropDownCount value is smaller then the number of item in the Items property, the drop down list will display a scroll bar.

DropDownCount is meaningful only if Style (see page 3701) is not csExSimple.

See Also

ItemsEx (see page 3700)

Style (see page 3701)

27.1.16.5.3 TCustomComboBoxEx.Images Property

Specifies the images that appear next to items in the combo box list.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Use Images to supply the list of images that appear beside items in the combo box's drop-down list. Each combo box item has an ImageIndex property that identifies an image in this list. In addition, Images can contain images that are used as overlay masks for the item images (to create non-rectangular images) and images that are used only when items are selected. The combo box items reference these images using their OverlayImageIndex and SelectedImageIndex properties.

See Also

ImageIndex

ItemsEx (see page 3700)

SelectedImageIndex (see page 3552)

OverlayImageIndex (see page 3551)

27.1.16.5.4 TCustomComboBoxEx.ItemsEx Property

Lists the items that appear in the list portion of the combo box.

Pascal

```
property ItemsEx: TComboExItems;
```

C++

```
__property TComboExItems ItemsEx;
```

Description

Read Items to access the list of items that appears in the combo box. ItemsEx is a collection of TComboExItem (see page 3546) objects.

Set the value of Items to copy the items from another collection of TComboExItem (see page 3546) objects.

Use the methods of Items to add, insert, delete and move items. Use the properties of individual items in the collection to specify the appearance of each item.

Note: To work with only the strings in the combo box, and not the other properties of the items, you can use the Items property instead.

See Also

ItemIndex

TComboExItem (see page 3546)

Items (see page 21187)

27.1.16.5.5 TCustomComboBoxEx.SelText Property

Represents the selected text in the edit region.

Pascal

```
property SelText: string;
```

C++

```
__property AnsiString SelText;
```

Description

Read SelText to obtain the text that is selected in the edit region of the combo box. When the combo box is the active control, SelText appears highlighted. Set SelText to replace the current selection with a different substring. If no text is selected when a value is assigned to SelText, the SelText string is inserted in the text at the cursor.

See Also

SelLength (see page 21190)

SelStart (see page 21193)

27.1.16.5.6 TCustomComboBoxEx.Style Property

Determines the display style of the combo box.

Pascal

```
property Style: TComboBoxExStyle;
```

C++

```
__property TComboBoxExStyle Style;
```

Description

Set Style to specify how the list and edit region of the combo box should appear.

See Also

Height (see page 5825)

DropDownCount (see page 3699)

27.1.16.5.7 TCustomComboBoxEx.StyleEx Property

Determines the appearance and behavior of the items in the list.

Pascal

```
property StyleEx: TComboBoxExStyles;
```

C++

```
__property TComboBoxExStyles StyleEx;
```

Description

Set StyleEx to configure how the items in the list look and behave.

See Also

Indent

ImageIndex

ItemsEx (see page 3700)

27.1.16.6 TCustomComboBoxEx Events

The events of the TCustomComboBoxEx class are listed here.

Public Events

	Name	Description
	OnBeginEdit (see page 3702)	Occurs when the user starts editing the text of the combo box.
	OnEndEdit (see page 3702)	Occurs when the user finishes editing the text of the combo box.

27.1.16.6.1 TCustomComboBoxEx.OnBeginEdit Event

Occurs when the user starts editing the text of the combo box.

Pascal

```
property OnBeginEdit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnBeginEdit;
```

Description

Write an OnBeginEdit event handler to take specific action immediately before the user edits the text in the combo box.

See Also

OnEndEdit (see page 3702)

Text (see page 5842)

27.1.16.6.2 TCustomComboBoxEx.OnEndEdit Event

Occurs when the user finishes editing the text of the combo box.

Pascal

```
property OnEndEdit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEndEdit;
```

Description

Write an OnEndEdit event handler to take specific action immediately after the user edits the text in the combo box.

See Also

OnBeginEdit (see page 3702)

Text (see page 5842)

27.1.17 TCustomHeaderControl Class

TCustomHeaderControl represents a spreadsheet-style header.

Class Hierarchy

Pascal

```
TCustomHeaderControl = class(TWinControl);
```

C++

```
class TCustomHeaderControl : public TWinControl;
```

File

ComCtrls

Description

TCustomHeaderControl is an abstract base class for control classes that provide column and row headers for spreadsheet-style controls. Use TCustomHeaderControl to create new kinds of header controls.

Do not create instances of TCustomHeaderControl. THeaderControl (see page 4118) provides a minimal implementation of TCustomHeaderControl. Use THeaderControl (see page 4118) or create your own descendant classes that represent spreadsheet-style headers.

See Also

TListColumn (see page 4236)

TListItem (see page 4250)

TListView (see page 4285)

THeaderControl (see page 4118)

27.1.17.1 TCustomHeaderControl Members

The following tables list the members exposed by TCustomHeaderControl.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.

	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 3715)	Initializes a window-creation parameter data structure.
	CreateSection (see page 3715)	This is CreateSection, a member of class TCustomHeaderControl.
	CreateSections (see page 3715)	This is CreateSections, a member of class TCustomHeaderControl.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 3716)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 3716)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.

	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawSection (see page 3716)	This is DrawSection, a member of class TCustomHeaderControl.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 3717)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SectionClick (see page 3717)	This is SectionClick, a member of class TCustomHeaderControl.
	SectionDrag (see page 3717)	This is SectionDrag, a member of class TCustomHeaderControl.
	SectionEndDrag (see page 3718)	This is SectionEndDrag, a member of class TCustomHeaderControl.
	SectionResize (see page 3718)	This is SectionResize, a member of class TCustomHeaderControl.
	SectionTrack (see page 3718)	This is SectionTrack, a member of class TCustomHeaderControl.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetImages (see page 3718)	This is SetImages, a member of class TCustomHeaderControl.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 3719)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.

	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 3714)	Instantiate a TCustomHeaderControl (see page 3702) object.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.

	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 3714)	Destroy.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
V	FlipChildren (see page 3717)	Reverses the order in which sections are displayed.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 3728)	Provides runtime access to the header control's drawing surface.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.

	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnCreateSectionClass (see page 3736)	Runtime specification of section object class.
	OnDrawSection (see page 3737)	Draw header section.
	OnSectionClick (see page 3737)	Respond to mouse clicks on header section.
	OnSectionDrag (see page 3737)	Respond to section drag.
	OnSectionEndDrag (see page 3738)	Respond to moved sections
	OnSectionResize (see page 3738)	Respond to section resizing.
	OnSectionTrack (see page 3738)	Occurs as one of the header control's sections is being resized.

Published Properties

	Name	Description
	Align (see page 3723)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 3727)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 3728)	Specifies the bi-directional mode for the control.
	BorderWidth (see page 3728)	Specifies the width of the control's border.
	Constraints (see page 3730)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 3730)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 3731)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 3731)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DragReorder (see page 3733)	Make header reorderable.
	Enabled (see page 3733)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 3733)	Controls the attributes of text written on or in the control.
	FullDrag (see page 3735)	Specifies whether headers are repainted when they are dragged.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	HotTrack (see page 3735)	Highlights the header sections as the mouse passes over them.
	Images (see page 3735)	Specifies header images
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Sections (see page 3735)	Specifies header sections.
	Style (see page 3736)	Specifies the header control's style.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

27.1.17.2 TCustomHeaderControl.Create Constructor

Instantiate a TCustomHeaderControl (see page 3702) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomHeaderControl(TComponent * AOwner);
```

Description

TCustomHeaderControl (see page 3702) is an abstract class and should not be instantiated in application code. Concrete subclasses, such as THeaderControl (see page 4118), call the TCustomHeaderControl (see page 3702) constructor in their own constructors.

27.1.17.3 TCustomHeaderControl.Destroy Destructor

Destroy.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomHeaderControl();
```

Description

Do not call Destroy directly in an application. Call Free instead. Free verifies that the object variable is not nil, and only then calls Destroy.

27.1.17.4 TCustomHeaderControl Methods

The methods of the TCustomHeaderControl class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 3715)	Initializes a window-creation parameter data structure.
	CreateSection (see page 3715)	This is CreateSection, a member of class TCustomHeaderControl.
	CreateSections (see page 3715)	This is CreateSections, a member of class TCustomHeaderControl.
	CreateWnd (see page 3716)	Creates the underlying window.
	DestroyWnd (see page 3716)	Destroys the control's window.
	DrawSection (see page 3716)	This is DrawSection, a member of class TCustomHeaderControl.
	Notification (see page 3717)	Responds to notifications that components are being created or destroyed.
	SectionClick (see page 3717)	This is SectionClick, a member of class TCustomHeaderControl.
	SectionDrag (see page 3717)	This is SectionDrag, a member of class TCustomHeaderControl.
	SectionEndDrag (see page 3718)	This is SectionEndDrag, a member of class TCustomHeaderControl.
	SectionResize (see page 3718)	This is SectionResize, a member of class TCustomHeaderControl.
	SectionTrack (see page 3718)	This is SectionTrack, a member of class TCustomHeaderControl.
	SetImages (see page 3718)	This is SetImages, a member of class TCustomHeaderControl.
	WndProc (see page 3719)	Provides specific message responses for the control.

Public Methods

	Name	Description
	FlipChildren (see page 3717)	Reverses the order in which sections are displayed.

27.1.17.4.1 TCustomHeaderControl.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

27.1.17.4.2 TCustomHeaderControl.CreateSection Method

Pascal

```
function CreateSection: THeaderSection; virtual;
```

C++

```
virtual __fastcall THeaderSection CreateSection();
```

Description

This is CreateSection, a member of class TCustomHeaderControl.

27.1.17.4.3 TCustomHeaderControl.CreateSections Method

Pascal

```
function CreateSections: THeaderSections; virtual;
```

C++

```
virtual __fastcall THeaderSections CreateSections();
```

Description

This is CreateSections, a member of class TCustomHeaderControl.

27.1.17.4.4 TCustomHeaderControl.CreateWnd Method

Creates the underlying window.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the control is first created or when the underlying screen object must be destroyed and recreated to reflect property changes. Override CreateWnd to pass additional initialization messages to the screen object when it is created.

See Also

CreateParams (see page 6135)

CreateWindowHandle (see page 6137)

Perform (see page 5776)

DestroyWnd (see page 6141)

27.1.17.4.5 TCustomHeaderControl.DestroyWnd Method

Destroys the control's window.

Pascal

```
procedure DestroyWnd; override;
```

C++

```
virtual __fastcall DestroyWnd();
```

Description

DestroyWnd is called when the control needs to replace its window. For example, changing properties that are implemented by window parameter settings require the control to be destroyed and then recreated using the CreateWnd method.

Before the window is destroyed, DestroyWnd saves a copy of the control's text in memory, frees any device contexts, and finally calls DestroyWindowHandle. When the window is recreated, the stored copy of the control's text is assigned to the new window.

See Also

DestroyWindowHandle (see page 6140)

RecreateWnd (see page 6171)

27.1.17.4.6 TCustomHeaderControl.DrawSection Method

Pascal

```
procedure DrawSection(Section: THeaderSection; const Rect: TRect; Pressed: Boolean); dynamic;
```

C++

```
__fastcall DrawSection(THeaderSection Section, const TRect Rect, Boolean Pressed);
```

Description

This is DrawSection, a member of class TCustomHeaderControl.

27.1.17.4.7 TCustomHeaderControl.FlipChildren Method

Reverses the order in which sections are displayed.

Pascal

```
procedure FlipChildren(AllLevels: Boolean); override;
```

C++

```
virtual __fastcall FlipChildren(Boolean AllLevels);
```

Description

FlipChildren flips the order of the header control's sections; then calls the inherited FlipChildren method to reverse the order of any other child controls.

27.1.17.4.8 TCustomHeaderControl.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

TCustomHeaderControl (see page 3702) overrides Notification in order to call ImageListChanged when the image list is removed.

See Also

Notification (see page 2783)

27.1.17.4.9 TCustomHeaderControl.SectionClick Method

Pascal

```
procedure SectionClick(Section: THeaderSection); dynamic;
```

C++

```
__fastcall SectionClick(THeaderSection Section);
```

Description

This is SectionClick, a member of class TCustomHeaderControl.

27.1.17.4.10 TCustomHeaderControl.SectionDrag Method

Pascal

```
procedure SectionDrag(FromSection: THeaderSection; ToSection: THeaderSection; var AllowDrag:
Boolean); dynamic;
```

C++

```
__fastcall SectionDrag(THeaderSection FromSection, THeaderSection ToSection, Boolean
AllowDrag);
```

Description

This is SectionDrag, a member of class TCustomHeaderControl.

27.1.17.4.11 TCustomHeaderControl.SectionEndDrag Method

Pascal

```
procedure SectionEndDrag; dynamic;
```

C++

```
__fastcall SectionEndDrag();
```

Description

This is SectionEndDrag, a member of class TCustomHeaderControl.

27.1.17.4.12 TCustomHeaderControl.SectionResize Method

Pascal

```
procedure SectionResize(Section: THeaderSection); dynamic;
```

C++

```
__fastcall SectionResize(THeaderSection Section);
```

Description

This is SectionResize, a member of class TCustomHeaderControl.

27.1.17.4.13 TCustomHeaderControl.SectionTrack Method

Pascal

```
procedure SectionTrack(Section: THeaderSection; Width: Integer; State: TSectionTrackState);
dynamic;
```

C++

```
__fastcall SectionTrack(THeaderSection Section, int Width, TSectionTrackState State);
```

Description

This is SectionTrack, a member of class TCustomHeaderControl.

27.1.17.4.14 TCustomHeaderControl.SetImages Method

Pascal

```
procedure SetImages(Value: TCustomImageList); virtual;
```

C++

```
virtual __fastcall SetImages(TCustomImageList Value);
```

Description

This is SetImages, a member of class TCustomHeaderControl.

27.1.17.4.15 TCustomHeaderControl.WndProc Method

Provides specific message responses for the control.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

Override WndProc to change the initial Windows message handler for the control. The WindowProc property is initialized to point to the WndProc method.

WndProc for TWinControl overrides the inherited method to define responses for focus, mouse, and keyboard messages. It sends all others to its inherited WndProc.

When overriding WndProc to provide specialized responses to messages, call the inherited WndProc at the end to dispatch any unhandled messages.

C++ Examples:

```
/*
This example shows how to use the WndProc method and the
WindowProc property to subclass a custom control's window
procedure.  This example subclasses the window procedure of
a TListBox descendant to respond to a user-defined message
called WM_STYLEMESSAGE. The subclassed window procedure can
be turned on or off by pressing a radio button.
*/
class TMyListBoxDescendant : public TListBox
{
__published:    // IDE-managed Components
    void __fastcall SubClassWndProc(Messages::TMessage &Message);
    void __fastcall ToggleSubClass(bool On);
    void __fastcall OnDrawItemProc(
      TWinControl *Control, int Index, const TRect &Rect,
      TOwnerDrawState State);
private:    // User declarations
public:     // User declarations
    __fastcall TMyListBoxDescendant(TComponent* Owner);
};

TForm1 *Form1;
TMyListBoxDescendant *MyListBoxDescendant1;
Graphics::TBitmap *bitmap0;

const WM_STYLEMESSAGE = WM_USER + 2000;

__fastcall TForm1::TForm1(TComponent* Owner)
    : TForm(Owner)
{
}

__fastcall TMyListBoxDescendant::TMyListBoxDescendant(TComponent* Owner)
    : TListBox(Owner)
{
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PostMessage(
    MyListBoxDescendant1->Handle,
```

```
    WM_STYLEMESSAGE,
    Integer(lbOwnerDrawFixed),
    0);
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  PostMessage(
    MyListBoxDescendant1->Handle,
    WM_STYLEMESSAGE,
    Integer(lbStandard),
    0);
}

void __fastcall TForm1::SubClassRadioGroup1Click(TObject *Sender)
{

27.1.17.5 TCustomHeaderControl Properties

The properties of the TCustomHeaderControl class are listed here.

Public Properties

	Name	Description
R	Canvas (see page 3728)	Provides runtime access to the header control's drawing surface.

Published Properties

	Name	Description
	Align (see page 3723)	Determines how the control aligns within its container (parent control).
	Anchors (see page 3727)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 3728)	Specifies the bi-directional mode for the control.
	BorderWidth (see page 3728)	Specifies the width of the control's border.
	Constraints (see page 3730)	Specifies the size constraints for the control.
	DragCursor (see page 3730)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 3731)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 3731)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DragReorder (see page 3733)	Make header reorderable.
	Enabled (see page 3733)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 3733)	Controls the attributes of text written on or in the control.
	FullDrag (see page 3735)	Specifies whether headers are repainted when they are dragged.
	HotTrack (see page 3735)	Highlights the header sections as the mouse passes over them.
	Images (see page 3735)	Specifies header images
	Sections (see page 3735)	Specifies header sections.
	Style (see page 3736)	Specifies the header control's style.

27.1.17.5.1 TCustomHeaderControl.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;
```

```
  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };

      pts[i].Free;
    end;
    PageControl1.Free;
  end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

27.1.17.5.2 TCustomHeaderControl.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

27.1.17.5.3 TCustomHeaderControl.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

27.1.17.5.4 TCustomHeaderControl.BorderWidth Property

Specifies the width of the control's border.

Pascal

```
property BorderWidth: TBorderWidth;
```

C++

```
__property TBorderWidth BorderWidth;
```

Description

Use BorderWidth to get or set the width of the control's border. Graphics or text drawn by the control is clipped to the area within the border.

See Also

ClientRect

BevelOuter (see page 6194)

27.1.17.5.5 TCustomHeaderControl.Canvas Property

Provides runtime access to the header control's drawing surface.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

The read-only Canvas property provides access to the header control's drawing surface that can be used when implementing a handler for the OnDrawSection (see page 3737) event.

C++ Examples:

```
/*
Add a THeaderControl to the form and call
HeaderControl1DrawSection for the OnDrawSection event.
*/
void __fastcall TForm1::HeaderControl1DrawSection(THeaderControl *HeaderControl,
      THeaderSection *Section, const TRect &Rect, bool Pressed)
{
  if (Pressed)
    HeaderControl->Canvas->Font->Color = clRed;
  else
    HeaderControl->Canvas->Font->Color = clBlue;
  HeaderControl->Canvas->TextOut(Rect.Left + HeaderControl->Canvas->Font->Size, Rect.Top + 2,
"Custom " + IntToStr(Section->Index));
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  THeaderSection *Section;
  for (int i = 0; i <= 4; i++)
  {
    Section = HeaderControl1->Sections->Add();
    Section->Text = "Section " + IntToStr(i);
    Section->MinWidth =
      (Section->Text).Length() *
      HeaderControl1->Font->Size;
    // Owner draw every other section
    if (i % 2 == 0)
      Section->Style = hsOwnerDraw;
    else
      Section->Style = hsText;
  }
}
```

Delphi Examples:

```
{
Add a THeaderControl to the form and call
HeaderControl1DrawSection for the OnDrawSection event.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  HeaderSection: THeaderSection;
  I: Integer;
begin
  for I := 0 to 4 do
  begin
    HeaderSection := HeaderControl1.Sections.Add;
    HeaderSection.Text := 'Text Section ' + IntToStr(I);
    HeaderSection.MinWidth := length(HeaderSection.Text) * Font.Size;
    // Owner draw every other section
    if (I mod 2 = 0) then
      HeaderSection.Style := hsOwnerDraw
    else
      HeaderSection.Style := hsText;
  end;
end;
```

```
procedure TForm1.HeaderControl1DrawSection(HeaderControl: THeaderControl;
  Section: THeaderSection; const Rect: TRect; Pressed: Boolean);
begin
  with HeaderControl.Canvas do
  begin
    // highlight pressed sections
    if Pressed then
      Font.Color := clRed
    else
      Font.Color := clBlue;
    TextOut(Rect.Left + Font.Size, Rect.Top + 2, 'Owner Drawn text');
  end;
end;
```

See Also

OnDrawSection (see page 3737)

27.1.17.5.6 TCustomHeaderControl.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

27.1.17.5.7 TCustomHeaderControl.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

27.1.17.5.8 TCustomHeaderControl.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

27.1.17.5.9 TCustomHeaderControl.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
```

```
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

DragKind (see page 5819)

Arranging the Order of Persistent Columns

27.1.17.5.10 TCustomHeaderControl.DragReorder Property

Make header reorderable.

Pascal

```
property DragReorder: Boolean;
```

C++

```
__property Boolean DragReorder;
```

Description

If DragReorder is true (default is false), the user can rearrange headers by dragging them.

See Also

OnSectionDrag (see page 3737)

OnSectionEndDrag (see page 3738)

27.1.17.5.11 TCustomHeaderControl.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

Enabling Mouse

27.1.17.5.12 TCustomHeaderControl.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Pascal

```
property FullDrag: Boolean;
```

C++

```
__property Boolean FullDrag;
```

Description

Use FullDrag to specify whether headers are repainted while they are dragged.

See Also

OnSectionDrag (see page 3737)

27.1.17.5.14 TCustomHeaderControl.HotTrack Property

Highlights the header sections as the mouse passes over them.

Pascal

```
property HotTrack: Boolean;
```

C++

```
__property Boolean HotTrack;
```

Description

If HotTrack is set to true, the text on each header section appears highlighted when the mouse passes over it at runtime.

See Also

Text (see page 4183)

27.1.17.5.15 TCustomHeaderControl.Images Property

Specifies header images

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Images contains a list of images that can be used as icons. Each section's ImageIndex property determines the specific image displayed on it. If Images is unassigned, items are displayed as captions with no icons.

See Also

ImageIndex

27.1.17.5.16 TCustomHeaderControl.Sections Property

Specifies header sections.

Pascal

```
property Sections: THeaderSections;
```

C++

```
__property THeaderSections Sections;
```

Description

The Sections property refers to the THeaderSections (see page 4185) object that contains the header sections.. This protected property is only useful for creating new control classes derived from TCustomHeaderControl (see page 3702).

27.1.17.5.17 TCustomHeaderControl.Style Property

Specifies the header control's style.

Pascal

```
property Style: THeaderStyle;
```

C++

```
__property THeaderStyle Style;
```

Description

Use Style to determine the appearance of the header sections.

27.1.17.6 TCustomHeaderControl Events

The events of the TCustomHeaderControl class are listed here.

Published Events

	Name	Description
	OnCreateSectionClass (see page 3736)	Runtime specification of section object class.
	OnDrawSection (see page 3737)	Draw header section.
	OnSectionClick (see page 3737)	Respond to mouse clicks on header section.
	OnSectionDrag (see page 3737)	Respond to section drag.
	OnSectionEndDrag (see page 3738)	Respond to moved sections
	OnSectionResize (see page 3738)	Respond to section resizing.
	OnSectionTrack (see page 3738)	Occurs as one of the header control's sections is being resized.

27.1.17.6.1 TCustomHeaderControl.OnCreateSectionClass Event

Runtime specification of section object class.

Pascal

```
property OnCreateSectionClass: TCustomHCCreateSectionClassEvent;
```

C++

```
__property TCustomHCCreateSectionClassEvent OnCreateSectionClass;
```

Description

The OnCreateSectionClass event occurs when a new header section object is about to be created. If the event handler exists, it is called with SectionClass set to THeaderSection (see page 4173). The event handler can modify this value to any descendant of THeaderSection (see page 4173), which will then be used to create the header section object.

27.1.17.6.2 TCustomHeaderControl.OnDrawSection Event

Draw header section.

Pascal

```
property OnDrawSection: TCustomDrawSectionEvent;
```

C++

```
__property TCustomDrawSectionEvent OnDrawSection;
```

Description

Use the OnDrawSection to define custom section drawing code. The event handler takes the following parameters.

Section is the header section that is being redrawn.

Rect is the display rectangle for the header section.

Pressed is true if the section is being displayed as a button, and that button is currently in its depressed state.

27.1.17.6.3 TCustomHeaderControl.OnSectionClick Event

Respond to mouse clicks on header section.

Pascal

```
property OnSectionClick: TCustomSectionNotifyEvent;
```

C++

```
__property TCustomSectionNotifyEvent OnSectionClick;
```

Description

The OnSectionClick event occurs when the user clicks on a header section.

27.1.17.6.4 TCustomHeaderControl.OnSectionDrag Event

Respond to section drag.

Pascal

```
property OnSectionDrag: TSectionDragEvent;
```

C++

```
__property TSectionDragEvent OnSectionDrag;
```

Description

The OnSectionDrag event occurs when the user attempts to rearrange header sections by dragging a section to a new position. This event can only occur when the DragReorder (see page 3733) property is true. The event handler is passed the following parameters.

FromSection is the section being dragged.

ToSection is the section currently occupying the position FromSection was dragged to. If the operation is successful, FromSection will move to this position, and other sections, including ToSection shifted right or left to make room. Note that FromSection and ToSection can be the same section if FromSection was not dragged far enough to trigger a re-arrangement.

AllowDrag is passed a value of true. Change AllowDrag to false to cancel the operation.

See Also

OnSectionEndDrag (see page 3738)

DragReorder (see page 3733)

27.1.17.6.5 TCustomHeaderControl.OnSectionEndDrag Event

Respond to moved sections

Pascal

```
property OnSectionEndDrag: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSectionEndDrag;
```

Description

The OnSectionEndDrag event occurs after the user moves a header section to a new position.

See Also

OnSectionDrag (see page 3737)

27.1.17.6.6 TCustomHeaderControl.OnSectionResize Event

Respond to section resizing.

Pascal

```
property OnSectionResize: TCustomSectionNotifyEvent;
```

C++

```
__property TCustomSectionNotifyEvent OnSectionResize;
```

Description

The OnSectionResize event occurs when the user resizes a header section. If the Tracking property is true (default), a series of OnSectionResize events occur while the user is manipulating the section. Otherwise, OnSectionResize occurs only when the user releases the mouse button.

27.1.17.6.7 TCustomHeaderControl.OnSectionTrack Event

Occurs as one of the header control's sections is being resized.

Pascal

```
property OnSectionTrack: TCustomSectionTrackEvent;
```

C++

```
__property TCustomSectionTrackEvent OnSectionTrack;
```

Description

The OnSectionTrack event tracks the dragging of a header section's border as it happens. OnSectionTrack occurs when the mouse pointer is positioned between two header sections and the left mouse button is depressed.

OnSectionTrack is of type TCustomSectionTrackEvent (see page 5485), whose Width and State parameters indicate the size of the header section (in pixels) and the status of the event. The State property can take three values:

Value	Meaning
tsTrackBegin	The border has not yet been dragged.
tsTrackMove	The border is being dragged.
tsTrackEnd	The border is no longer being dragged.

See Also

OnSectionResize (see page 3738)

27.1.18 TCustomHotKey Class

TCustomHotKey is the base class for objects that wrap the Windows accelerator key Common Control.

Class Hierarchy

Pascal

```
TCustomHotKey = class(TWinControl);
```

C++

```
class TCustomHotKey : public TWinControl;
```

File

ComCtrls

Description

TCustomHotKey is an abstract class that encapsulates behavior of an object that is used to set a shortcut property at runtime. Accelerator key objects are used to perform an action quickly by enabling users to link the accelerator key to a combination of keystrokes that will execute the action. TCustomHotKey introduces properties to:

Associate the accelerator key with keystrokes to perform an action

Select a key combination at design time

Invalidate specific modifier keys

To change the key combination at runtime hold down the Alt, Ctrl or Shift keys or combinations of them and type a letter or number. The accelerator key property can then be assigned to the shortcut property of a menu item, for example.

Hot key classes that descend from TCustomHotKey inherit the basic functionality of TCustomHotKey. Use TCustomHotKey as a base class for deriving specialized accelerator key objects.

See Also

THotKey (see page 4190)

27.1.18.1 TCustomHotKey Members

The following tables list the members exposed by TCustomHotKey.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnChange (see page 3757)	Occurs when the properties of the accelerator key change.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.

	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	CNCommand (see page 3750)	This is CNCommand, a member of class TCustomHotKey.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 3751)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 3751)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.

	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.

	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.

	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 3752)	This is SetAutoSize, a member of class TCustomHotKey.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.

	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 3752)	Determines whether the accelerator key automatically changes its height to accommodate the font size.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	HotKey (see page 3752)	Contains the current key combination of the accelerator key control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	InvalidKeys (see page 3753)	Allows you to specify that one or more modifier keys should be considered invalid.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	Modifiers (see page 3755)	Specifies the key or keys that are used in combination with a non-modifier key.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	TabStop (see page 3756)	Determines if the user can tab to a control.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 3750)	Instantiates an accelerator key control.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.

	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.

	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.

R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.

	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

27.1.18.2 TCustomHotKey.Create Constructor

Instantiates an accelerator key control.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomHotKey(TComponent * AOwner);
```

Description

Call Create to instantiate an accelerator key control at runtime. For accelerator key controls added at design time, Create is called automatically.

AOwner is the component, typically the form, that is responsible for freeing the hotkey instance. It becomes the value of the Owner property.

See Also

Create (see page 6123)

Owner (see page 2807)

27.1.18.3 TCustomHotKey Methods

The methods of the TCustomHotKey class are listed here.

Protected Methods

	Name	Description
	CNCommand (see page 3750)	This is CNCommand, a member of class TCustomHotKey.
V	CreateParams (see page 3751)	Initializes a window-creation parameter data structure.
V	CreateWnd (see page 3751)	Creates the underlying window.
V	SetAutoSize (see page 3752)	This is SetAutoSize, a member of class TCustomHotKey.

27.1.18.3.1 TCustomHotKey.CNCommand Method

Pascal

```
procedure CNCommand(var Message: TWMCommand); message CN_COMMAND;
```

C++

```
__fastcall CNCommand(TWMCommand Message);
```

Description

This is CNCommand, a member of class TCustomHotKey.

27.1.18.3.2 TCustomHotKey.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

27.1.18.3.3 TCustomHotKey.CreateWnd Method

Creates the underlying window.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the control is first created or when the underlying screen object must be destroyed and recreated to reflect property changes. Override CreateWnd to pass additional initialization messages to the screen object when it is created.

See Also

CreateParams (see page 6135)

CreateWindowHandle (see page 6137)

Perform (see page 5776)

DestroyWnd (see page 6141)

27.1.18.3.4 TCustomHotKey.SetAutoSize Method

Pascal

```
procedure SetAutoSize(Value: Boolean); override;
```

C++

```
virtual __fastcall SetAutoSize(Boolean Value);
```

Description

This is SetAutoSize, a member of class TCustomHotKey.

27.1.18.4 TCustomHotKey Properties

The properties of the TCustomHotKey class are listed here.

Protected Properties

	Name	Description
	AutoSize (see page 3752)	Determines whether the accelerator key automatically changes its height to accommodate the font size.
	HotKey (see page 3752)	Contains the current key combination of the accelerator key control.
	InvalidKeys (see page 3753)	Allows you to specify that one or more modifier keys should be considered invalid.
	Modifiers (see page 3755)	Specifies the key or keys that are used in combination with a non-modifier key.
	TabStop (see page 3756)	Determines if the user can tab to a control.

27.1.18.4.1 TCustomHotKey.AutoSize Property

Determines whether the accelerator key automatically changes its height to accommodate the font size.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

Use AutoSize to fully display the font on the accelerator key control. When AutoSize is true, the height of the accelerator key changes to display the key combinations typed in it. When AutoSize is false, the accelerator key remains the same height, regardless of any font changes. The default value is true.

27.1.18.4.2 TCustomHotKey.HotKey Property

Contains the current key combination of the accelerator key control.

Pascal

```
property HotKey: TShortCut;
```

C++

```
__property TShortCut HotKey;
```

Description

Use HotKey to set or change the key combination associated with the accelerator key. Alt+A is the default. To modify the value of HotKey either edit it directly or set the value of the Modifiers (see page 3755) property. At runtime, HotKey is reset when the

accelerator key has focus and the user presses valid key combinations.

C++ Examples:

```
/*
To use this example, create a form with a main menu
component and a HotKey component.  At design time, use the
Menu designer to add menu items, including a "File" menu
with subitems that includes a "New" menu item.  Add the
following code to the OnCreate method of the form and the
OnClick event of the File menu item.
*/
void __fastcall TForm1::File1Click(TObject *Sender)
{
  // Assign HotKey to the menu's File "New" item.
  New1->ShortCut = HotKey1->HotKey;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  // Default to "Ctrl + A"
  HotKey1->Modifiers.Clear();
  HotKey1->Modifiers << hkCtrl;
  // Don't allow shift or alt
  HotKey1->InvalidKeys.Clear();
  (HotKey1->InvalidKeys << hcShift) << hcAlt;
//  HotKey1->Visible = false;
}
```

Delphi Examples:

```
{
To use this example, create a form with a main menu
component and a HotKey component.  At design time, use the
Menu designer to add menu items, including a "File" menu
with subitems that includes a "New" menu item.  Add the
following code to the OnCreate method of the form and the
OnClick event of the File menu item.
}
procedure TForm1.File1Click(Sender: TObject);
begin
  // Assign hotkey to the menu's File "New" item.
  New1.ShortCut := HotKey1.HotKey;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  // Default to "Ctrl + A"
  HotKey1.Modifiers := [hkCtrl];
  // Don't allow shift or alt
  HotKey1.InvalidKeys := [hcShift, hcAlt];
end;
```

See Also

Modifiers (see page 3755)

27.1.18.4.3 TCustomHotKey.InvalidKeys Property

Allows you to specify that one or more modifier keys should be considered invalid.

Pascal

```
property InvalidKeys: THKInvalidKeys;
```

C++

```
__property THKInvalidKeys InvalidKeys;
```

Description

Use InvalidKeys to select which modifier keys are not allowed. If this property is set, a default modifier should also be specified in the Modifiers (see page 3755) property. When the invalid key is selected, the default modifier is displayed in its place.

THKInvalidKey (see page 5451) is the type of the InvalidKeys property. These are the possible values:

Value	Meaning
hcNone	Unmodified keys are invalid.
hcShift	The Shift key is invalid as a modifier.
hcCtrl	The Ctrl key is invalid as a modifier.
hcAlt	The Alt key is invalid as a modifier.
hcShiftCtrl	The Shift+Ctrl key combination is invalid as a modifier.
hcShiftAlt	The Shift+Alt key combinations invalid as a modifier.
hcCtrlAlt	The Ctrl+Alt key combination is invalid as a modifier.
hcShiftCtrlAlt	The Shift+Ctrl+Alt key combination is invalid as a modifier.

The default values are hcNone and hcShift.

C++ Examples:

```
/*
To use this example, create a form with a main menu
component and a HotKey component.  At design time, use the
Menu designer to add menu items, including a "File" menu
with subitems that includes a "New" menu item.  Add the
following code to the OnCreate method of the form and the
OnClick event of the File menu item.
*/
void __fastcall TForm1::File1Click(TObject *Sender)
{
  // Assign HotKey to the menu's File "New" item.
  New1->ShortCut = HotKey1->HotKey;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  // Default to "Ctrl + A"
  HotKey1->Modifiers.Clear();
  HotKey1->Modifiers << hkCtrl;
  // Don't allow shift or alt
  HotKey1->InvalidKeys.Clear();
  (HotKey1->InvalidKeys << hcShift) << hcAlt;
//  HotKey1->Visible = false;
}
```

Delphi Examples:

```
{
To use this example, create a form with a main menu
component and a HotKey component.  At design time, use the
Menu designer to add menu items, including a "File" menu
with subitems that includes a "New" menu item.  Add the
following code to the OnCreate method of the form and the
OnClick event of the File menu item.
}
procedure TForm1.File1Click(Sender: TObject);
```

```
begin
  // Assign hotkey to the menu's File "New" item.
  New1.ShortCut := HotKey1.HotKey;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  // Default to "Ctrl + A"
  HotKey1.Modifiers := [hkCtrl];
  // Don't allow shift or alt
  HotKey1.InvalidKeys := [hcShift, hcAlt];
end;
```

See Also

Modifiers (see page 3755)

27.1.18.4.4 TCustomHotKey.Modifiers Property

Specifies the key or keys that are used in combination with a non-modifier key.

Pascal

```
property Modifiers: THKModifiers;
```

C++

```
__property THKModifiers Modifiers;
```

Description

Use Modifiers to select a modifier key such as Ctrl, Alt, or Shift for the hot key. These are the possible values:

Value	Meaning
hkShift	The Shift key is used as a modifier.
hkCtrl	The Ctrl key is used as a modifier.
hkAlt	The Alt key is used as a modifier.
hkExt	The Extra key is used as a modifier.

The default value is hkAlt.

Modifier keys are used with other non-modifier keys such as character and function keys, arrow keys, and so on. More than one modifier key can be used.

C++ Examples:

```
/*
To use this example, create a form with a main menu
component and a HotKey component.  At design time, use the
Menu designer to add menu items, including a "File" menu
with subitems that includes a "New" menu item.  Add the
following code to the OnCreate method of the form and the
OnClick event of the File menu item.
*/
void __fastcall TForm1::File1Click(TObject *Sender)
{
  // Assign HotKey to the menu's File "New" item.
  New1->ShortCut = HotKey1->HotKey;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  // Default to "Ctrl + A"
```

```
  HotKey1->Modifiers.Clear();
  HotKey1->Modifiers << hkCtrl;
  // Don't allow shift or alt
  HotKey1->InvalidKeys.Clear();
  (HotKey1->InvalidKeys << hcShift) << hcAlt;
//  HotKey1->Visible = false;
}
```

Delphi Examples:

```
{
To use this example, create a form with a main menu
component and a HotKey component.  At design time, use the
Menu designer to add menu items, including a "File" menu
with subitems that includes a "New" menu item.  Add the
following code to the OnCreate method of the form and the
OnClick event of the File menu item.
}
procedure TForm1.File1Click(Sender: TObject);
begin
  // Assign hotkey to the menu's File "New" item.
  New1.ShortCut := HotKey1.HotKey;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  // Default to "Ctrl + A"
  HotKey1.Modifiers := [hkCtrl];
  // Don't allow shift or alt
  HotKey1.InvalidKeys := [hcShift, hcAlt];
end;
```

27.1.18.4.5 TCustomHotKey.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

27.1.18.5 TCustomHotKey Events

The events of the TCustomHotKey class are listed here.

Protected Events

	Name	Description
	OnChange (see page 3757)	Occurs when the properties of the accelerator key change.

27.1.18.5.1 TCustomHotKey.OnChange Event

Occurs when the properties of the accelerator key change.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to respond when the accelerator key changes to represent a different combination of keys. OnChange occurs after the TCustomHotKey (see page 3739) properties have been updated to reflect the change.

27.1.19 TCustomListView Class

TCustomListView is the base type for all list view components, including TListView (see page 4285).

Class Hierarchy

Pascal

```
TCustomListView = class(TCustomMultiSelectListControl);
```

C++

```
class TCustomListView : public TCustomMultiSelectListControl;
```

File

ComCtrls

Description

Use TCustomListView as a base class when defining a control that displays a list of items. TCustomListView allows a list of items to be displayed in columns with column headers and sub-items, or vertically or horizontally, with small or large icons.

Do not create instances of TCustomListView. To put a list view on a form, use a descendant of TCustomListView, such as TListView (see page 4285).

See Also

TListColumn (see page 4236)

TListItem (see page 4250)

TListView (see page 4285)

TCustomHeaderControl (see page 3702)

27.1.19.1 TCustomListView Members

The following tables list the members exposed by TCustomListView.

Protected Events

	Name	Description
	OnAdvancedCustomDraw (see page 3834)	Occurs at discrete points during the rendering of the list view.
	OnAdvancedCustomDrawItem (see page 3835)	Occurs at discrete stages during the painting of an item in an owner-draw list view.
	OnAdvancedCustomDrawSubItem (see page 3835)	Occurs at discrete stages during the painting of a subitem in an owner-drawn list view.
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnChange (see page 3836)	Occurs immediately after an item in the list changes.
	OnChanging (see page 3837)	Occurs when an item in the list is about to change.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnColumnClick (see page 3837)	Occurs when the user clicks on a column header in a list view.
	OnColumnDragged (see page 3840)	Occurs when a column is dragged to a new position.
	OnColumnRightClick (see page 3841)	Occurs when the user right clicks on a column header in a list view.
	OnCompare (see page 3841)	Occurs to when two items need to be compared during a sort of the list.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnCreateItemClass (see page 3844)	Occurs when a list item object is about to be created.
	OnCustomDraw (see page 3844)	Occurs when an owner-draw list view must be rendered.
	OnCustomDrawItem (see page 3845)	Occurs when an item in an owner-draw list view must be rendered.
	OnCustomDrawSubItem (see page 3846)	Occurs when a subitem must be rendered in an owner-draw list view.
	OnData (see page 3846)	Occurs immediately before an item is displayed in the list view control.
	OnDataFind (see page 3847)	Occurs when the list view control receives a search request, such as when the FindData (see page 3789) and FindCaption (see page 3788) methods are called.
	OnDataHint (see page 3847)	Occurs when the contents of the list view change, such as when the user scrolls the list view.
	OnDataStateChange (see page 3848)	Occurs when a range of items change states.
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDeletion (see page 3848)	Occurs when an item in the list view is about to be deleted.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnDrawItem (see page 3848)	Occurs when an item should be drawn in the list view.
	OnEdited (see page 3849)	Occurs immediately after the user edits an item's Caption property.
	OnEditing (see page 3850)	Occurs when the user starts to edit a list item's Caption property.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetImageIndex (see page 3850)	Occurs when an item is about to be displayed in the list view control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnGetSubItemImage (see page 3850)	Occurs when a subitem is about to be displayed in the column of a list view control.
	OnInfoTip (see page 3851)	Occurs when the user pauses the mouse over an item in the list view.
	OnInsert (see page 3851)	Occurs immediately after a new item is inserted into the list view.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.

	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnSelectItem (see page 3852)	Occurs when an item is selected in the list view control.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FMultiSelect (see page 5956)	This is FMultiSelect, a member of class TCustomMultiSelectListControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 3773)	Responds when the action for which this list view is a client changes.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.

	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanChange (see page 3777)	Specifies whether the properties of a list item can be changed.
	CanEdit (see page 3778)	Specifies whether the text of a list item can be changed by the user.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 3778)	Generates an OnChange (see page 3836) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 3778)	Rescaling event dispatcher
	Click (see page 5743)	Respond to user click.
	ColClick (see page 3780)	Column (see page 3806) click event dispatcher.
	ColRightClick (see page 3780)	Column (see page 3806) right-click event dispatcher.
	ColumnsShowing (see page 3780)	Indicates whether the ViewStyle (see page 3829) property is vsReport.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateListItem (see page 3781)	Creates a list item for the collection specified by the Items (see page 3814) property.
	CreateListItems (see page 3782)	Creates the TListItems (see page 4270) object that implements the Items (see page 3814) property.
	CreateParams (see page 3782)	Initializes the window-creation parameter record.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 3782)	Creates the window used by the list view.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	CustomDraw (see page 3783)	Custom draw event dispatcher.
	CustomDrawItem (see page 3783)	Custom draw item event dispatcher.
	CustomDrawSubItem (see page 3783)	Custom draw subitem event dispatcher.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	Delete (see page 3785)	Removes an item from the list view and frees the associated memory.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 3786)	Destroys the window referenced by the list view's window handle.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.

	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
V	DoEndDrag (see page 3787)	Drag end event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
V	DoInfoTip (see page 3787)	InfoTip event dispatcher.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 3787)	Start drag event dispatcher..
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
V	DrawItem (see page 3788)	Draw item event dispatcher.
	Edit (see page 3788)	Edit event dispatcher.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
V	GetActionLinkClass (see page 3789)	Returns the action link class that is associated with list view controls.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetCount (see page 3789)	Returns the number of items in the list.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 3790)	Returns a drag cursor if a list item is being dragged.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetItemIndex (see page 3791)	This is the overview for the GetItemIndex method overload.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.

	GetSelCount (see page 3794)	Returns the value of the SelCount (see page 3822) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InsertItem (see page 3794)	Generates an OnInsert (see page 3851) event.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsCustomDrawn (see page 3794)	Determines when custom draw event handlers are called.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 3795)	Mouse button up event dispatcher.
	Notification (see page 3796)	Responds to notifications that components are about to be created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	OwnerDataFetch (see page 3796)	Customizes a list view item before it is displayed.
	OwnerDataFind (see page 3797)	Searches for an item in the list view control.
	OwnerDataHint (see page 3797)	Specifies a range of items that might be fetched.
	OwnerDataStateChange (see page 3798)	Specifies items that have changed states.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.

	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetItemIndex (see page 3799)	Sets the value of the ItemIndex property.
V	SetMultiSelect (see page 3800)	Sets the value of the MultiSelect (see page 3820) property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetViewStyle (see page 3800)	Sets the value of the ViewStyle (see page 3829) property.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateColumn (see page 3801)	Individual column update event dispatcher.
	UpdateColumns (see page 3801)	General column update event dispatcher.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.

	WndProc (see page 3802)	Provides specific message responses for the list view.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AllocBy (see page 3803)	Indicates the number of items the list view can store in memory.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderStyle (see page 3803)	Determines whether the list view displays a single line border.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	ColumnClick (see page 3808)	Determines whether the column header behaves like a button.
	Columns (see page 3808)	Describes the properties of the columns in the list view.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	HideSelection (see page 3812)	Determines whether the list view gives a visual indication of which item is selected when focus shifts to another control.
	HoverTime (see page 3813)	Specifies how long the user must pause with the mouse before an item is selected.
	IconOptions (see page 3813)	Determines how icons displayed in the list view are arranged.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	Items (see page 3814)	Contains the list of items displayed by the list view.
	LargeImages (see page 3817)	Provides a list of icon images to display for each item in the list when ViewStyle (see page 3829) is vsIcon.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	MultiSelect (see page 3820)	Determines whether the user can select more than one list item at a time.
	OwnerData (see page 3820)	Specifies whether the list view control is virtual.
	OwnerDraw (see page 3821)	Specifies whether the list view receives an OnDrawItem (see page 3848) event.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 3821)	Determines whether the user can change the contents of the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.

	ShowColumnHeaders (see page 3824)	Determines whether the column headers are displayed.
	ShowWorkAreas (see page 3824)	Determines whether the visual properties of work areas are displayed.
	SmallImages (see page 3825)	Provides a list of icon images to display for each item in the list when ViewStyle (see page 3829) is not vsIcon.
	SortType (see page 3827)	Determines if and how the items in the list are automatically sorted.
	StateImages (see page 3828)	Specifies additional icon images to display next to each item in the list view.
	Text (see page 5842)	Contains a text string associated with the control.
	ViewStyle (see page 3829)	Determines how the list items are displayed.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AddItem (see page 3773)	Adds an item to the list control.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AlphaSort (see page 3774)	Sorts the items in the list view.
	Arrange (see page 3777)	Arranges icons in a list view that has a ViewStyle (see page 3829) of vsIcon or vsSmallIcon.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 3779)	Deletes all of the items from the list control.
V	ClearSelection (see page 3779)	Removes the selection, leaving all items unselected.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	CopySelection (see page 3781)	Copies the selected item or items to another TCustomListControl descendant.
V	Create (see page 3770)	Creates and initializes an instance of TCustomListView (see page 3757).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	CustomSort (see page 3784)	Sorts the items in the list using the specified ordering function.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	DeleteSelected (see page 3786)	Deletes all the selected items.

	Destroy (see page 3771)	Destroys an instance of TCustomListView (see page 3757).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindCaption (see page 3788)	Returns a list view item, if any, with the specified caption.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindData (see page 3789)	Returns a list view item, if any, associated with the specified data.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHitTestInfoAt (see page 3790)	Returns information about the specified point in the list view's client area.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItemAt (see page 3790)	Returns the list item at the specified position.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNearestItem (see page 3791)	Returns the list item nearest a specified point, in a particular direction.
	GetNextItem (see page 3792)	Returns the next list item after the StartItem in the specified direction.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetSearchString (see page 3793)	Returns the incremental search string of a list view control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsEditing (see page 3795)	Indicates whether any item in the list view is being edited.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	MoveSelection (see page 5942)	Moves all selected items to another list control.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	Scroll (see page 3798)	Scrolls the content of a list view by the indicated amount.
	ScrollBy (see page 6176)	Scroll control contents.
V	SelectAll (see page 3799)	Selects all items or all text in the selected item.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.

	StringWidth (see page 3800)	Returns the width of a string, using the list view's current font.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UpdateItems (see page 3801)	Redraws a range of items, starting at FirstIndex and ending at LastIndex.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
R	BoundingRect (see page 3804)	Denotes the bounding rectangle for the items in the list view.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 3804)	Gives access to the list view's canvas.
	Checkboxes (see page 3805)	Specifies whether check boxes appear next to the items in the list view.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	Column (see page 3806)	Describes the column specified by the Index parameter.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DropTarget (see page 3810)	Specifies which item in the list is the target of a drag and drop operation.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.

R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
	FlatScrollBars (see page 3810)	Specifies whether the list view's scroll bars are flat.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	FullDrag (see page 3811)	Specifies whether headers are repainted when they are dragged.
	GridLines (see page 3811)	Determines whether lines are drawn separating items in the list.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	HotTrack (see page 3812)	Specifies whether list items are highlighted when the mouse passes over them.
	HotTrackStyles (see page 3812)	Specifies the hot tracking styles.
	ItemFocused (see page 3813)	Indicates which item, if any, has focus.
	ItemIndex (see page 5944)	Specifies the index of the selected item.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	RowSelect (see page 3821)	Determines whether an entire row in the list view can be selected.
R	SelCount (see page 3822)	Specifies the number of selected items in the list view.
	Selected (see page 3822)	Indicates the first selected item in the list view.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
R	TopItem (see page 3828)	Indicates the topmost visible item in the list view.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	ViewOrigin (see page 3829)	Designates the coordinates of the upper left corner of the list, relative to the visible area of the list view control.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.
R	VisibleRowCount (see page 3832)	Indicates number of items that can fit vertically in the visible area of a list view.
R	WorkAreas (see page 3833)	Defines separate working areas that divide the list view's client area.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.

	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

27.1.19.2 TCustomListView.Create Constructor

Creates and initializes an instance of TCustomListView (see page 3757).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomListView(TComponent * AOwner);
```

Description

Call Create to instantiate a list view at runtime. List view controls placed on forms at design time are created automatically.

C++ Examples:

```
/*
This example requires only a blank form.  All other objects:
TListView, TListColumns, TListItems, are created dynamically.
You must add comctrls to the uses defs file.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  const char Names[6][2][10] =
   {{"Rubble","Barny"},
    {"Michael", "Johnson"},
    {"Bunny", "Bugs"},
    {"Silver", "HiHo"},
    {"Simpson", "Bart"},
    {"Squirrel", "Rocky"}};

  TListColumn  *NewColumn;
  TListItem  *ListItem;
  TListView   *ListView = new TListView(this);

  ListView->Parent = this;
  ListView->Align = alClient;
  ListView->ViewStyle = vsReport;
  NewColumn = ListView->Columns->Add();
  NewColumn->Caption = "Last";
  NewColumn = ListView->Columns->Add();
  NewColumn->Caption = "First";
  for (int i = 0; i < 6; i++)
  {
    ListItem = ListView->Items->Add();
    ListItem->Caption = Names[i][0];
    ListItem->SubItems->Add(Names[i][1]);
  }
}
```

Delphi Examples:

```
{
This example requires only a blank form.  All other objects:
TListView, TListColumns, TListItems, are created dynamically.
You must add comctrls to the uses clause of the unit file.
```

```
}
procedure TForm1.FormCreate(Sender: TObject);
const
  Names: array[0..5, 0..1] of string = (
    ('Rubble', 'Barney'),
    ('Michael', 'Johnson'),
    ('Bunny', 'Bugs'),
    ('Silver', 'HiHo'),
    ('Simpson', 'Bart'),
    ('Squirrel', 'Rocky')
    );

var
  I: Integer;
  NewColumn: TListColumn;
  ListItem: TListItem;
  ListView: TListView;
begin
  ListView := TListView.Create(Self);
  with ListView do
  begin
    Parent := Self;
    Align := alClient;
    ViewStyle := vsReport;

    NewColumn := Columns.Add;
    NewColumn.Caption := 'Last';
    NewColumn := Columns.Add;
    NewColumn.Caption := 'First';

    for I := Low(Names) to High(Names) do
    begin
      ListItem := Items.Add;
      ListItem.Caption := Names[I][0];
      ListItem.SubItems.Add(Names[I][1]);
    end;
  end;
end;
```

See Also

Owner (see page 2807)

Create (see page 6123)

ParentWindow (see page 6210)

27.1.19.3 TCustomListView.Destroy Destructor

Destroys an instance of TCustomListView (see page 3757).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomListView();
```

Description

Do not call Destroy directly. Instead, call Free, which checks that the list item is not nil before calling Destroy

See Also

Free (see page 22300)

27.1.19.4 TCustomListView Methods

The methods of the TCustomListView class are listed here.

Protected Methods

	Name	Description
	ActionChange (see page 3773)	Responds when the action for which this list view is a client changes.
	CanChange (see page 3777)	Specifies whether the properties of a list item can be changed.
	CanEdit (see page 3778)	Specifies whether the text of a list item can be changed by the user.
	Change (see page 3778)	Generates an OnChange (see page 3836) event.
	ChangeScale (see page 3778)	Rescaling event dispatcher
	ColClick (see page 3780)	Column (see page 3806) click event dispatcher.
	ColRightClick (see page 3780)	Column (see page 3806) right-click event dispatcher.
	ColumnsShowing (see page 3780)	Indicates whether the ViewStyle (see page 3829) property is vsReport.
	CreateListItem (see page 3781)	Creates a list item for the collection specified by the Items (see page 3814) property.
	CreateListItems (see page 3782)	Creates the TListItems (see page 4270) object that implements the Items (see page 3814) property.
	CreateParams (see page 3782)	Initializes the window-creation parameter record.
	CreateWnd (see page 3782)	Creates the window used by the list view.
	CustomDraw (see page 3783)	Custom draw event dispatcher.
	CustomDrawItem (see page 3783)	Custom draw item event dispatcher.
	CustomDrawSubItem (see page 3783)	Custom draw subitem event dispatcher.
	Delete (see page 3785)	Removes an item from the list view and frees the associated memory.
	DestroyWnd (see page 3786)	Destroys the window referenced by the list view's window handle.
	DoEndDrag (see page 3787)	Drag end event dispatcher.
	DoInfoTip (see page 3787)	InfoTip event dispatcher.
	DoStartDrag (see page 3787)	Start drag event dispatcher..
	DrawItem (see page 3788)	Draw item event dispatcher.
	Edit (see page 3788)	Edit event dispatcher.
	GetActionLinkClass (see page 3789)	Returns the action link class that is associated with list view controls.
	GetCount (see page 3789)	Returns the number of items in the list.
	GetDragImages (see page 3790)	Returns a drag cursor if a list item is being dragged.
	GetItemIndex (see page 3791)	This is the overview for the GetItemIndex method overload.
	GetSelCount (see page 3794)	Returns the value of the SelCount (see page 3822) property.
	InsertItem (see page 3794)	Generates an OnInsert (see page 3851) event.
	IsCustomDrawn (see page 3794)	Determines when custom draw event handlers are called.
	MouseUp (see page 3795)	Mouse button up event dispatcher.
	Notification (see page 3796)	Responds to notifications that components are about to be created or destroyed.
	OwnerDataFetch (see page 3796)	Customizes a list view item before it is displayed.
	OwnerDataFind (see page 3797)	Searches for an item in the list view control.
	OwnerDataHint (see page 3797)	Specifies a range of items that might be fetched.
	OwnerDataStateChange (see page 3798)	Specifies items that have changed states.
	SetItemIndex (see page 3799)	Sets the value of the ItemIndex property.
	SetMultiSelect (see page 3800)	Sets the value of the MultiSelect (see page 3820) property.
	SetViewStyle (see page 3800)	Sets the value of the ViewStyle (see page 3829) property.
	UpdateColumn (see page 3801)	Individual column update event dispatcher.
	UpdateColumns (see page 3801)	General column update event dispatcher.
	WndProc (see page 3802)	Provides specific message responses for the list view.

Public Methods

	Name	Description
	AddItem (see page 3773)	Adds an item to the list control.

	AlphaSort (see page 3774)	Sorts the items in the list view.
	Arrange (see page 3777)	Arranges icons in a list view that has a ViewStyle (see page 3829) of vsIcon or vsSmallIcon.
V	Clear (see page 3779)	Deletes all of the items from the list control.
V	ClearSelection (see page 3779)	Removes the selection, leaving all items unselected.
V	CopySelection (see page 3781)	Copies the selected item or items to another TCustomListControl descendant.
	CustomSort (see page 3784)	Sorts the items in the list using the specified ordering function.
V	DeleteSelected (see page 3786)	Deletes all the selected items.
	FindCaption (see page 3788)	Returns a list view item, if any, with the specified caption.
	FindData (see page 3789)	Returns a list view item, if any, associated with the specified data.
	GetHitTestInfoAt (see page 3790)	Returns information about the specified point in the list view's client area.
	GetItemAt (see page 3790)	Returns the list item at the specified position.
	GetNearestItem (see page 3791)	Returns the list item nearest a specified point, in a particular direction.
	GetNextItem (see page 3792)	Returns the next list item after the StartItem in the specified direction.
	GetSearchString (see page 3793)	Returns the incremental search string of a list view control.
	IsEditing (see page 3795)	Indicates whether any item in the list view is being edited.
	Scroll (see page 3798)	Scrolls the content of a list view by the indicated amount.
V	SelectAll (see page 3799)	Selects all items or all text in the selected item.
	StringWidth (see page 3800)	Returns the width of a string, using the list view's current font.
	UpdateItems (see page 3801)	Redraws a range of items, starting at FirstIndex and ending at LastIndex.

27.1.19.4.1 TCustomListView.ActionChange Method

Responds when the action for which this list view is a client changes.

Pascal

```
procedure ActionChange(Sender: TObject; CheckDefaults: Boolean); override;
```

C++

```
virtual __fastcall ActionChange(TObject * Sender, Boolean CheckDefaults);
```

Description

ActionChange is called automatically when the action object specified by the Action property, or any of its properties, changes.

In TCustomListView (see page 3757), ActionChangechecks whether the action is a TStaticActionList object, and if so, updates the action's SmallImages (see page 3825) and ItemIndex properties, as appropriate. It then calls the inherited method, which updates the Caption, Enabled, Hint, and Visible properties and the OnClick event handler.

The Sender parameter is the action object that changed. The CheckDefaults parameter indicates whether the control's properties should all be updated or only those that have not been explicitly changed from their default values. When CheckDefaults is true, only those properties and event handlers that have not been changed from the default values are updated.

See Also

OnChange (see page 2725)

Action (see page 5797)

27.1.19.4.2 TCustomListView.AddItem Method

Adds an item to the list control.

Pascal

```
procedure AddItem(Item: String; AObject: TObject); override;
```

C++

```
virtual __fastcall AddItem(AnsiString Item, TObject * AObject);
```

Description

AddItem adds an item to the end of the list view, possibly associating it with a specified object.

Item is the caption of the item in the list view. that is the item's value. This becomes the value of the new TListItem (see page 4250) object's Caption property.

AObject is an object that you can associated with the item. It becomes the value of the new TListItem (see page 4250) object's Data property.

See Also

Caption (see page 4258)

Data (see page 4259)

Items (see page 3814)

27.1.19.4.3 TCustomListView.AlphaSort Method

Sorts the items in the list view.

Pascal

```
function AlphaSort: Boolean;
```

C++

```
__fastcall Boolean AlphaSort();
```

Description

Call AlphaSort to sort the items in the manner maintained automatically when the SortType (see page 3827) property is not stNone. If an OnCompare (see page 3841) event handler is assigned, AlphaSort uses that event handler to define the sort order. Otherwise, AlphaSort sorts all list items alphabetically in ascending order. If successful, the method returns true.

C++ Examples:

```
/*
This example shows how to use the OnColumnClick and
OnCompare events of a list view to let users sort the
columns in a report-style list view by clicking on the
column headers. This requires a global variable to keep
track of the column that was clicked.  The OnColumnClick
event handler sets the global variable to indicate the
column to sort and calls AlphaSort:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {
    "C++ Image", "Borland Image", "Delphi Image"};
  const char Col2Array[3][40] = {
    "Documentation for the C++ icon.",
    "Borland icon.", "Delphi icon."
    };
  // Create a ListView item for each image in the ImageList
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
```

```
    Item = ListView1->Items->Add();
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 1";
  Column->Width = 200;
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 2";
  Column->Width = 200;
  ListView1->ViewStyle = vsReport;
}

int ColumnToSort = 0;

/*
The OnColumnClick event handler sets the global variable to
indicate the column to sort and calls AlphaSort:
*/

void __fastcall TForm1::ListView1ColumnClick(TObject *Sender,
      TListColumn *Column)
{
  ColumnToSort = Column->Index;
  ((TCustomListView *)Sender)->AlphaSort();
}

/*
The OnCompare event handler causes the list view to sort on
the selected column:
*/

void __fastcall TForm1::ListView1Compare(TObject *Sender, TListItem *Item1,
      TListItem *Item2, int Data, int &Compare)
{
  if (ColumnToSort == 0)
    Compare = CompareText(Item1->Caption,Item2->Caption);
  else
  {
    int ix = ColumnToSort - 1;
    Compare =
      CompareText(Item1->SubItems->Strings[ix], Item2->SubItems->Strings[ix]);
  }
}
```

Delphi Examples:

```
{
This example shows how to use the OnColumnClick and
OnCompare events of a list view to let users sort the
columns in a report-style list view by clicking on the
column headers. This requires a global variable to keep
track of the column that was clicked.  The OnColumnClick
event handler sets the global variable to indicate the
column to sort and calls AlphaSort:
}
var ColumnToSort: Integer;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
  ListItem: TListItem;
  NewColumn: TListColumn;
const
  imagenames: Array[0..2] of string = ('C++ Image', 'Borland Image', 'Delphi Image');
```

```
begin
  Col2Array[0]:= 'Documentation for the C++ icon.';
  Col2Array[1]:= 'Borland icon.';
  Col2Array[2]:= 'Delphi icon.';
  // Create a ListView item for each image in the ImageList
  with ListView1 do
  begin
    SmallImages := ImageList1;
    LargeImages := ImageList1;
    for I := 0 to ImageList1.Count - 1 do
    begin
      ListItem := Items.Add;
      Listitem.Caption := imagenames[I];
      ListItem.ImageIndex := I;
      Listitem.SubItems.Add(Col2Array[I]);
    end;
    // Create two columns to show during viewing as vsReport
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 1';
    NewColumn.Width := 200;
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 2';
    NewColumn.Width := 200;
    ListView1.ViewStyle := vsReport;
  end;
end;

procedure TForm1.ListView1ColumnClick(Sender: TObject; Column: TListColumn);
begin
  ColumnToSort := Column.Index;
  (Sender as TCustomListView).AlphaSort;
end;

{
The OnCompare event handler causes the list view to sort on
the selected column:
}
procedure TForm1.ListView1Compare(Sender: TObject; Item1, Item2: TListItem; Data: Integer; var
Compare: Integer);
var
  ix: Integer;
begin
  if ColumnToSort = 0 then
    Compare := CompareText(Item1.Caption,Item2.Caption)
  else begin
   ix := ColumnToSort - 1;
   Compare := CompareText(Item1.SubItems[ix],Item2.SubItems[ix]);
  end;
end;
{
Note:   This OnCompare event handler uses the global
CompareText function. An application may want to use
AnsiCompareText, CompareStr, or AnsiCompareStr instead,
depending on whether the comparison should be case-sensitive
and whether the locale should be considered.
}
```

CustomSort (see page 3784)

OnCompare (see page 3841)

SortType (see page 3827)

27.1.19.4.4 TCustomListView.Arrange Method

Arranges icons in a list view that has a ViewStyle (see page 3829) of vslcon or vsSmallIcon.

Pascal

```
procedure Arrange(Code: TListArrangement);
```

C++

```
__fastcall Arrange(TListArrangement Code);
```

Description

Call Arrange to clean up the arrangement of the icons when the ViewStyle (see page 3829) property is vslcon or vsSmallIcon. The Code parameter specifies how to arrange the icons. These are the possible values for the Code parameter:

Value	Meaning
arAlignBottom	Aligns items along the bottom edge of the list view.
arAlignLeft	Aligns items along the left edge of the window.
arAlignRight	Aligns items along the right edge of the window.
arAlignTop	Aligns items along the top edge of the window.
arDefault	Aligns items according to the style associated with the list view when the window was created. For TCustomListView (see page 3757), this is aligned along the top.
arSnapToGrid	Snaps all icons to the nearest grid position. This value is not supported if the application is running in virtual mode.

See Also

ViewStyle (see page 3829)

27.1.19.4.5 TCustomListView.CanChange Method

Specifies whether the properties of a list item can be changed.

Pascal

```
function CanChange(Item: TListItem; Change: Integer): Boolean; dynamic;
```

C++

```
__fastcall Boolean CanChange(TListItem Item, int Change);
```

Description

CanChange is called automatically when an attempt is made to change the item specified by the Item parameter. The Change (see page 3778) parameter is a Windows-defined constant that specifies the type of change that was attempted. CanChange generates an OnChanging (see page 3837) event to determine whether the change should be permitted. CanChange returns true if the change can proceed. CanChange returns false if the change should be blocked. CanChange always returns true if there is no OnChanging (see page 3837) event handler.

Override CanChange to add additional logic to determine whether a change should proceed or to block the OnChanging (see page 3837) event.

See Also

OnChanging (see page 3837)

27.1.19.4.6 TCustomListView.CanEdit Method

Specifies whether the text of a list item can be changed by the user.

Pascal

```
function CanEdit(Item: TListItem): Boolean; dynamic;
```

C++

```
__fastcall Boolean CanEdit(TListItem Item);
```

Description

CanEdit is called automatically when the user attempts to edit the text of the list item specified by the Item parameter. CanEdit generates an OnEditing (see page 3850) event to determine whether to allow the user to edit the item. CanEdit returns true if the user can proceed. CanEdit returns false if the user should be blocked from editing the item. CanEdit always returns true if there is no OnEditing (see page 3850) event handler.

Override CanEdit to add additional logic to determine whether an item can be edited or to block the OnEditing (see page 3850) event.

See Also

OnEditing (see page 3850)

27.1.19.4.7 TCustomListView.Change Method

Generates an OnChange (see page 3836) event.

Pascal

```
procedure Change(Item: TListItem; Change: Integer); dynamic;
```

C++

```
__fastcall Change(TListItem Item, int Change);
```

Description

Change is called automatically after the properties of the item specified by the Item parameter change. The Change parameter is a Windows-defined constant that specifies the type of change that occurred.

Override Change to perform other actions when the list items change or to block the OnChange (see page 3836) event.

See Also

OnChange (see page 3836)

27.1.19.4.8 TCustomListView.ChangeScale Method

Rescaling event dispatcher

Pascal

```
procedure ChangeScale(M: Integer; D: Integer); override;
```

C++

```
virtual __fastcall ChangeScale(int M, int D);
```

Description

TCustomListView (see page 3757) redefines ChangeScale in order to implement item rescaling.

See Also

ChangeScale (see page 5743)

Height (see page 5825)

Left (see page 5830)

Top (see page 5844)

Width (see page 5849)

27.1.19.4.9 TCustomListView.Clear Method

Deletes all of the items from the list control.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Clear empties the list control so that it contains no items.

See Also

DeleteSelected (see page 3786)

Clear (see page 5940)

27.1.19.4.10 TCustomListView.ClearSelection Method

Removes the selection, leaving all items unselected.

Pascal

```
procedure ClearSelection; override;
```

C++

```
virtual __fastcall ClearSelection();
```

Description

Call ClearSelection to deselect any selected items in the list control. ClearSelection removes the selection, but leaves the items in the list.

See Also

Clear (see page 3779)

CopySelection (see page 3781)

DeleteSelected (see page 3786)

MoveSelection (see page 5942)

SelectAll (see page 3799)

ItemIndex

ClearSelection (see page 5940)

27.1.19.4.11 TCustomListView.ColClick Method

Column (see page 3806) click event dispatcher.

Pascal

```
procedure ColClick(Column: TListColumn); dynamic;
```

C++

```
__fastcall ColClick(TListColumn Column);
```

Description

ColClick is called automatically when the user clicks on a column header if the ColumnClick (see page 3808) and ShowColumnHeaders (see page 3824) properties are true and the ViewStyle (see page 3829) property is vsReport. Override ColClick to take additional action when the user clicks on a column header or to conditionally block the OnColumnClick (see page 3837) event.

See Also

ColumnClick (see page 3808)

OnColumnClick (see page 3837)

ShowColumnHeaders (see page 3824)

ViewStyle (see page 3829)

27.1.19.4.12 TCustomListView.ColRightClick Method

Column (see page 3806) right-click event dispatcher.

Pascal

```
procedure ColRightClick(Column: TListColumn; Point: TPoint); dynamic;
```

C++

```
__fastcall ColRightClick(TListColumn Column, TPoint Point);
```

Description

ColRightClick is called automatically when the user clicks on a column header with the right mouse button if the ShowColumnHeaders (see page 3824) properties is true and the ViewStyle (see page 3829) property is vsReport. Override ColRightClick to take additional action when the user right clicks on a column header or to conditionally block the OnColumnRightClick (see page 3841) event.

See Also

OnColumnRightClick (see page 3841)

ShowColumnHeaders (see page 3824)

ViewStyle (see page 3829)

27.1.19.4.13 TCustomListView.ColumnsShowing Method

Indicates whether the ViewStyle (see page 3829) property is vsReport.

Pascal

```
function ColumnsShowing: Boolean;
```

C++

```
__fastcall Boolean ColumnsShowing();
```

Description

Call ColumnsShowing to determine whether the list view displays its items in columns. ColumnsShowing returns true if the value of ViewStyle (see page 3829) is vsReport, false otherwise.

See Also

ViewStyle (see page 3829)

27.1.19.4.14 TCustomListView.CopySelection Method

Copies the selected item or items to another TCustomListControl descendant.

Pascal

```
procedure CopySelection(Destination: TCustomListControl); override;
```

C++

```
virtual __fastcall CopySelection(TCustomListControl Destination);
```

Description

CopySelection adds all selected items to another TCustomListControl descendant.

Destination is the list control that receives the items.

See Also

ClearSelection (see page 3779)

DeleteSelected (see page 3786)

MoveSelection (see page 5942)

SelectAll (see page 3799)

ItemIndex

27.1.19.4.15 TCustomListView.CreateListItem Method

Creates a list item for the collection specified by the Items (see page 3814) property.

Pascal

```
function CreateListItem: TListItem; virtual;
```

C++

```
virtual __fastcall TListItem CreateListItem();
```

Description

Call CreateListItem to create a TListItem (see page 4250) object that will be added to the Items (see page 3814) collection. CreateListItem creates the list item but does not insert it into the collection.

See Also

Items (see page 3814)

27.1.19.4.16 TCustomListView.CreateListItems Method

Creates the TListItems (see page 4270) object that implements the Items (see page 3814) property.

Pascal

```
function CreateListItems: TListItems; virtual;
```

C++

```
virtual __fastcall TListItems CreateListItems();
```

Description

TCustomListView (see page 3757) calls CreateListItems internally to create the object that implements the Items (see page 3814) property. As implemented in TCustomListView (see page 3757), CreateListItems creates and returns a TListItems (see page 4270) instance. Override this method to use a specialized TListItems (see page 4270) descendant instead.

See Also

Items (see page 3814)

27.1.19.4.17 TCustomListView.CreateParams Method

Initializes the window-creation parameter record.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

CreateParams is called automatically to initialize the window-creation parameters when the list view needs to create its window. CreateParams overrides the inherited method to specify a list view window that implements the property settings of the list view control.

When overriding the CreateParams method, be sure to call the inherited method before changing any of the values in the Params parameter.

See Also

CreateParams (see page 6135)

27.1.19.4.18 TCustomListView.CreateWnd Method

Creates the window used by the list view.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd creates the list view's window, based on the parameter values provided by the CreateParams (see page 3782) method. CreateWnd then sends messages to the newly created window so that it reflects the current property settings of the list view object.

See Also

CreateParams (see page 3782)

27.1.19.4.19 TCustomListView.CustomDraw Method

Custom draw event dispatcher.

Pascal

```
function CustomDraw(const ARect: TRect; Stage: TCustomDrawStage): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CustomDraw(const TRect ARect, TCustomDrawStage Stage);
```

Description

CustomDraw generates an OnCustomDraw (see page 3844) or OnAdvancedCustomDraw (see page 3834) event (depending on the drawing stage and the existence of the event handler). It returns a value indicating whether the list view should continue with the default drawing behavior (true) or not (false).

See Also

OnCustomDraw (see page 3844)

IsCustomDrawn (see page 3794)

OnAdvancedCustomDraw (see page 3834)

27.1.19.4.20 TCustomListView.CustomDrawItem Method

Custom draw item event dispatcher.

Pascal

```
function CustomDrawItem(Item: TListItem; State: TCustomDrawState; Stage: TCustomDrawStage):
Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CustomDrawItem(TListItem Item, TCustomDrawState State,
TCustomDrawStage Stage);
```

Description

CustomDraw (see page 3783) generates an OnCustomDrawItem (see page 3845) or OnAdvancedCustomDrawItem (see page 3835) event (depending on the drawing stage and the existence of the event handler) It returns a value indicating whether the list view should continue by drawing the text of the item (true) or not (false).

See Also

OnCustomDrawItem (see page 3845)

IsCustomDrawn (see page 3794)

OnAdvancedCustomDrawItem (see page 3835)

27.1.19.4.21 TCustomListView.CustomDrawSubItem Method

Custom draw subitem event dispatcher.

Pascal

```
function CustomDrawSubItem(Item: TListItem; SubItem: Integer; State: TCustomDrawState; Stage:
TCustomDrawStage): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CustomDrawSubItem(TListItem Item, int SubItem, TCustomDrawState
State, TCustomDrawStage Stage);
```

Description

CustomDrawSubItem generates an OnCustomDrawSubItem (see page 3846) or OnAdvancedCustomDrawSubItem (see page 3835) event, depending on the current painting stage and the existence of an event handler. It returns a value indicating whether the list view should continue by drawing the text of the subitem (true) or not (false).

See Also

OnCustomDrawSubItem (see page 3846)

OnAdvancedCustomDrawSubItem (see page 3835)

27.1.19.4.22 TCustomListView.CustomSort Method

Sorts the items in the list using the specified ordering function.

Pascal

```
function CustomSort(SortProc: TLVCompare; lParam: Longint): Boolean;
```

C++

```
__fastcall Boolean CustomSort(TLVCompare SortProc, Longint lParam);
```

Description

Call CustomSort to sort the items in the list using the ordering function defined by the SortProc parameter. The SortProc parameter specifies an ordering function that compares the list items passed as lParam1 and lParam2. The ordering function returns an integer that indicates whether lParam1 is the same as lParam2 (return value is 0), lParam1 is greater than lParam2 (return value is greater than 0), or lParam1 is less than lParam2 (return value is less than 0). The lParam parameter of CustomSort is an optional value that is passed as the third parameter to the ordering function.

If the SortProc parameter is nil (Delphi) or NULL (C++), CustomSort compares the list items by generating an OnCompare (see page 3841) event. This allows the OnCompare (see page 3841) event handler to provide different ordering criteria (such as ascending vs. descending order), based on the value of the lParam parameter.

If the ordering function is not provided and there is no OnCompare (see page 3841) event handler, CustomSort sorts items alphabetically by their Caption values.

CustomSort returns true if the list is successfully sorted.

Warning: CustomSort does not work if the application is running in virtual mode.

C++ Examples:

```
/*
The following code orders a list view in reverse
alphabetical order on the click of a button. The callback
function CustomSortProc calls the global CompareText
function and negates its return value.
*/
int __stdcall CustomSortProc(long Item1, long Item2, long ParamSort)
{
```

```
  return -CompareText(((TListItem *)Item1)->Caption,
                      ((TListItem *)Item2)->Caption);
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  ListView1->CustomSort(CustomSortProc, 0);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *ListItem;
  ListView1->ViewStyle = vsList;
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Apples";
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Oranges";
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Pears";
}
```

Delphi Examples:

```
{
The following code orders a list view in reverse
alphabetical order on the click of a button. The callback
function CustomSortProc calls the global CompareText
function and negates its return value.
}
function CustomSortProc(Item1, Item2: TListItem; ParamSort: integer): integer; stdcall;
begin
  Result := -CompareText(Item1.Caption,Item2.Caption);
end;
procedure TForm1.Button1Click(Sender: TObject);
begin
  ListView1.CustomSort(@CustomSortProc, 0);
end;

procedure TForm1.FormCreate(Sender: TObject);
var ListItem : TListItem;
begin
  ListView1.ViewStyle := vsList;
  ListItem := ListView1.Items.Add;
  ListItem.Caption := 'Apples';
  ListItem := ListView1.Items.Add;
  ListItem.Caption := 'Oranges';
  ListItem := ListView1.Items.Add;
  ListItem.Caption := 'Pears';
end;
```

See Also

AlphaSort (see page 3774)

OnCompare (see page 3841)

27.1.19.4.23 TCustomListView.Delete Method

Removes an item from the list view and frees the associated memory.

Pascal

```
procedure Delete(Item: TListItem); dynamic;
```

C++

```
__fastcall Delete(TListItem Item);
```

Description

Call Delete to remove an item from the list view. Delete generates an OnDeletion (see page 3848) event before freeing the list item.

See Also

OnDeletion (see page 3848)

27.1.19.4.24 TCustomListView.DeleteSelected Method

Deletes all the selected items.

Pascal

```
procedure DeleteSelected; override;
```

C++

```
virtual __fastcall DeleteSelected();
```

Description

Call DeleteSelected to remove all selected items from the list control. DeleteSelected deletes only the item or items that are selected.

See Also

Clear (see page 3779)

CopySelection (see page 3781)

ClearSelection (see page 3779)

MoveSelection (see page 5942)

SelectAll (see page 3799)

ItemIndex

DeleteSelected (see page 5941)

27.1.19.4.25 TCustomListView.DestroyWnd Method

Destroys the window referenced by the list view's window handle.

Pascal

```
procedure DestroyWnd; override;
```

C++

```
virtual __fastcall DestroyWnd();
```

Description

Before the window is destroyed, DestroyWnd saves a copy of the list view in internal storage. The inherited method then frees any device contexts, and destroys the window.

See Also

CreateWnd (see page 3782)

DestroyWnd (see page 6141)

27.1.19.4.26 TCustomListView.DoEndDrag Method

Drag end event dispatcher.

Pascal

```
procedure DoEndDrag(Target: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DoEndDrag(TObject * Target, int X, int Y);
```

Description

After generating an OnEndDrag event, DoEndDrag clears the internal variables used to track which item is the drop target.

See Also

DoStartDrag (see page 3787)

DropTarget (see page 3810)

OnEndDrag (see page 5860)

27.1.19.4.27 TCustomListView.DoInfoTip Method

InfoTip event dispatcher.

Pascal

```
procedure DoInfoTip(Item: TListItem; var InfoTip: string); virtual;
```

C++

```
virtual __fastcall DoInfoTip(TListItem Item, AnsiString InfoTip);
```

Description

DoInfoTip is called automatically when the mouse pauses over the list item specified by the Item parameter. It generates an OnInfoTip (see page 3851) event, allowing the event handler to change the value of the InfoTip parameter.

See Also

OnInfoTip (see page 3851)

27.1.19.4.28 TCustomListView.DoStartDrag Method

Start drag event dispatcher..

Pascal

```
procedure DoStartDrag(var DragObject: TDragObject); override;
```

C++

```
virtual __fastcall DoStartDrag(TDragObject DragObject);
```

Description

DoStartDrag is called automatically when the user starts dragging a list item with the mouse. After generating an OnStartDrag event, DoStartDrag generates a drag image and begins calculating drop target positions.

See Also

DoEndDrag (see page 3787)

DropTarget (see page 3810)

OnStartDrag (see page 5871)

27.1.19.4.29 TCustomListView.DrawItem Method

Draw item event dispatcher.

Pascal

```
procedure DrawItem(Item: TListItem; Rect: TRect; State: TOwnerDrawState); virtual;
```

C++

```
virtual __fastcall DrawItem(TListItem Item, TRect Rect, TOwnerDrawState State);
```

Description

DrawItem generates an OnDrawItem (see page 3848) event if there is an OnDrawItem (see page 3848) event handler. Otherwise, it paints the text of the list view item. This method is only called if the OwnerDraw (see page 3821) property is true.

See Also

OnDrawItem (see page 3848)

OwnerDraw (see page 3821)

27.1.19.4.30 TCustomListView.Edit Method

Edit event dispatcher.

Pascal

```
procedure Edit(const Item: TLVItem); dynamic;
```

C++

```
__fastcall Edit(const TLVItem Item);
```

Description

Edit is called automatically when the user finishes editing the label of a list item. Edit obtains the newly edited value from the Windows list item and generates an OnEdited (see page 3849) event. After allowing the OnEdited (see page 3849) event handler to change the value supplied by the user, Edit sets the Caption property of the list item.

See Also

OnEdited (see page 3849)

Caption (see page 4258)

27.1.19.4.31 TCustomListView.FindCaption Method

Returns a list view item, if any, with the specified caption.

Pascal

```
function FindCaption(StartIndex: Integer; Value: string; Partial: Boolean; Inclusive: Boolean;
Wrap: Boolean): TListItem;
```

C++

```
__fastcall TListItem FindCaption(int StartIndex, AnsiString Value, Boolean Partial, Boolean
Inclusive, Boolean Wrap);
```

Description

Call FindCaption to search for a list view item labeled by the string specified as the Value parameter. If the Inclusive parameter is

true, the list item specified by StartIndex is the first item checked. Otherwise, the search starts on the next item. If the Wrap parameter is true, the search continues at the top of the list if a match has not been found before reaching the bottom. FindCaption returns the first item with the Caption property equal to Value. If the Partial parameter is true, a Caption matches if it starts with the substring Value. If Partial is false, the Caption must match Value exactly. If no item is found, FindCaption returns nil (Delphi) or NULL (C++).

See Also

FindData (see page 3789)

Caption (see page 4258)

27.1.19.4.32 TCustomListView.FindData Method

Returns a list view item, if any, associated with the specified data.

Pascal

```
function FindData(StartIndex: Integer; Value: Pointer; Inclusive: Boolean; Wrap: Boolean):
TListItem;
```

C++

```
__fastcall TListItem FindData(int StartIndex, void * Value, Boolean Inclusive, Boolean Wrap);
```

Description

Call FindData to locate a list view item with its Data property equal to the Value parameter. If the Inclusive parameter is true, the list item specified by StartIndex is the first item checked. Otherwise, the search starts on the next item. If the Wrap parameter is true, the search continues at the top of the list if a match has not been found before reaching the bottom. FindData returns the first item with a Data property equal to the Value parameter. If no item is found, FindData returns nil (Delphi) or NULL (C++).

See Also

FindCaption (see page 3788)

Data (see page 4259)

27.1.19.4.33 TCustomListView.GetActionLinkClass Method

Returns the action link class that is associated with list view controls.

Pascal

```
function GetActionLinkClass: TControlActionLinkClass; override;
```

C++

```
virtual __fastcall TControlActionLinkClass GetActionLinkClass();
```

Description

GetActionLinkClass returns the class type for the action link that manages communication between the list view and the action specified by the Action property. Each Action link class is designed to link specific properties and event handlers of the action to its client, based on the types of properties the client supports.

See Also

Action (see page 5797)

27.1.19.4.34 TCustomListView.GetCount Method

Returns the number of items in the list.

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

Call GetCount to determine the number of items in the list control.

27.1.19.4.35 TCustomListView.GetDragImages Method

Returns a drag cursor if a list item is being dragged.

Pascal

```
function GetDragImages: TDragImageList; override;
```

C++

```
virtual __fastcall TDragImageList GetDragImages();
```

Description

GetDragImages is called automatically to obtain a list of drag images when the user drags the mouse with the button held down. If the user is dragging a list item, GetDragImages returns the drag image list that is created when the user starts dragging a list item. If the user did not start dragging the mouse over a list item, GetDragImages returns nil (Delphi) or NULL (C++).

See Also

DoStartDrag (see page 3787)

27.1.19.4.36 TCustomListView.GetHitTestInfoAt Method

Returns information about the specified point in the list view's client area.

Pascal

```
function GetHitTestInfoAt(X: Integer; Y: Integer): THitTests;
```

C++

```
__fastcall THitTests GetHitTestInfoAt(int X, int Y);
```

Description

Use GetHitTestInfoAt to determine what elements of the list view lie under the point specified by the X and Y parameters.

X is the x-coordinate of the point.

Y is the y-coordinate of the point.

See Also

GetItemAt (see page 3790)

27.1.19.4.37 TCustomListView.GetItemAt Method

Returns the list item at the specified position.

Pascal

```
function GetItemAt(X: Integer; Y: Integer): TListItem;
```

C++

```
__fastcall TListItem GetItemAt(int X, int Y);
```

Description

Call GetItemAt to obtain the TListItem (see page 4250) object for the list item found at the position specified by the X and Y parameters. X and Y specify the coordinates of the position, in pixels, relative to the top left corner of the list view. If there is no item at the location, GetItemAt returns nil (Delphi) or NULL (C++).

See Also

GetNearestItem (see page 3791)

Items (see page 3814)

27.1.19.4.38 GetItemIndex Method

This is the overview for the GetItemIndex method overload.

Overload List

	Name	Description
	TCustomListView.GetItemIndex () (see page 3791)	Returns the index of the specified item in the Items (see page 3814) property array.
	TCustomListView.GetItemIndex (TListItem) (see page 3791)	Returns the index of the specified item in the Items (see page 3814) property array.

27.1.19.4.38.1 TCustomListView.GetItemIndex Method ()

Returns the index of the specified item in the Items (see page 3814) property array.

Pascal

```
function GetItemIndex(Value: TListItem): Integer; overload; reintroduce;
function GetItemIndex: Integer; override; overload; reintroduce;
```

C++

```
__fastcall int GetItemIndex(TListItem Value);
virtual __fastcall int GetItemIndex();
```

Description

Call GetItemIndex to determine the position of a list item, where 0 is the index of the first item, 1 is the index of the second item, and so on. If the item specified by the Value parameter is not in the list view, GetItemIndex returns -1. If the Value parameter is omitted, the index of the Selected (see page 3822) item is returned.

See Also

Items (see page 3814)

GetItemIndex (see page 5942)

Selected (see page 3822)

27.1.19.4.39 TCustomListView.GetNearestItem Method

Returns the list item nearest a specified point, in a particular direction.

Pascal

```
function GetNearestItem(Point: TPoint; Direction: TSearchDirection): TListItem;
```

C++

```
__fastcall TListItem GetNearestItem(TPoint Point, TSearchDirection Direction);
```

Description

Call GetNearestItem to locate a list item from a position specified in pixel coordinates relative to the top left corner of the list view. GetNearestItem starts looking at the position specified by the Point parameter, and moves in the direction indicated by the Direction parameter until it locates a list item.

If no item is found, GetNearestItem returns nil (Delphi) or NULL (C++).

See Also

GetItemAt (see page 3790)

GetNextItem (see page 3792)

Items (see page 3814)

27.1.19.4.40 TCustomListView.GetNextItem Method

Returns the next list item after the StartItem in the specified direction.

Pascal

```
function GetNextItem(StartItem: TListItem; Direction: TSearchDirection; States: TItemStates):
TListItem;
```

C++

```
__fastcall TListItem GetNextItem(TListItem StartItem, TSearchDirection Direction, TItemStates
States);
```

Description

Call GetNextItem to find the next list item after StartItem in the direction given by the Direction parameter. Only items in the state indicated by the States parameter are considered.

C++ Examples:

```
/*
This example demonstrates how to retrieve all selected items
in a ListView component and add the Caption of the selected
ListItems to a ListBox component.
Add a button, a listview, and a listbox to the form.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *ListItem;
  ListView1->ViewStyle = vsList;
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Apples";
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Oranges";
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Pears";
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
   TItemStates selected = TItemStates() << isSelected;
   TListItem *Item = ListView1->Selected;
```

```
    while (Item){
       ListBox1->Items->Add(Item->Caption);
       Item = ListView1->GetNextItem(Item, sdAll, selected);
    }
}
```

Delphi Examples:

```
{
This example demonstrates how to retrieve all selected items
in a ListView component and add the Caption of the selected
ListItems to a ListBox component.
Add a button, a listview, and a listbox to the form.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  Item: TListItem;
begin
  Item := ListView1.Selected;
  while Item <> nil do
  begin
    ListBox1.Items.Add(Item.Caption);
    Item := ListView1.GetNextItem(Item, sdAll, [isSelected]);
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
var ListItem : TListItem;
begin
  ListView1.ViewStyle := vsList;
  ListItem := ListView1.Items.Add;
  ListItem.Caption := 'Apples';
  ListItem := ListView1.Items.Add;
  ListItem.Caption := 'Oranges';
  ListItem := ListView1.Items.Add;
  ListItem.Caption := 'Pears';
end;
```

See Also

DropTarget (see page 3810)

GetNearestItem (see page 3791)

ItemFocused (see page 3813)

Selected (see page 3822)

27.1.19.4.41 TCustomListView.GetSearchString Method

Returns the incremental search string of a list view control.

Pascal

```
function GetSearchString: string;
```

C++

```
__fastcall AnsiString GetSearchString();
```

Description

Call GetSearchString to obtain the character sequence typed by the user while the list view has input focus. Each time the user types a character, the list view appends the character to the search string and searches for a matching item. A timeout period of less than a second is associated with each character that the user types. If the timeout period elapses before the user types another character, the incremental search string is reset. If the system finds a match, it selects the item and, if necessary, scrolls

it into view.

See Also

Selected (see page 3822)

Caption (see page 4258)

27.1.19.4.42 TCustomListView.GetSelCount Method

Returns the value of the SelCount (see page 3822) property.

Pascal

```
function GetSelCount: Integer; override;
```

C++

```
virtual __fastcall int GetSelCount();
```

Description

Override GetSelCount to provide the read implementation for the SelCount (see page 3822) property. GetSelCount returns the number of items that are currently selected.

See Also

SelCount (see page 3822)

27.1.19.4.43 TCustomListView.InsertItem Method

Generates an OnInsert (see page 3851) event.

Pascal

```
procedure InsertItem(Item: TListItem); dynamic;
```

C++

```
__fastcall InsertItem(TListItem Item);
```

Description

List view objects call InsertItem internally when new items are added to the Items (see page 3814) property list. Override the InsertItem method to cause descendant classes to take specific action in addition to this event when new items are inserted, or to block the OnInsert (see page 3851) event from occurring.

See Also

Items (see page 3814)

OnInsert (see page 3851)

27.1.19.4.44 TCustomListView.IsCustomDrawn Method

Determines when custom draw event handlers are called.

Pascal

```
function IsCustomDrawn(Target: TCustomDrawTarget; Stage: TCustomDrawStage): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsCustomDrawn(TCustomDrawTarget Target, TCustomDrawStage Stage);
```

Description

TCustomListView (see page 3757) checks IsCustomDrawn to determine when to generate the OnCustomDraw (see page 3844), OnAdvancedCustomDraw (see page 3834), OnCustomDrawItem (see page 3845), OnAdvancedCustomDrawItem (see page 3835), OnCustomDrawSubItem (see page 3846), and OnAdvancedCustomDrawSubItem (see page 3835) events. IsCustomDrawn returns true when the list view should generate an event.

The Target parameter indicates whether the list view is about to draw the entire control, an item, or a subitem. IsCustomDrawn does not return true unless the list view has an appropriate event handler for the target.

The Stage parameter indicates the current stage in the process of painting the list view. IsCustomDrawn returns true if the stage is cdPrePaint or if there is an Advanced custom draw event handler for the Target.

See Also

OnCustomDraw (see page 3844)

OnCustomDrawItem (see page 3845)

OnCustomDrawSubItem (see page 3846)

OnAdvancedCustomDraw (see page 3834)

OnAdvancedCustomDrawItem (see page 3835)

OnAdvancedCustomDrawSubItem (see page 3835)

27.1.19.4.45 TCustomListView.IsEditing Method

Indicates whether any item in the list view is being edited.

Pascal

```
function IsEditing: Boolean;
```

C++

```
__fastcall Boolean IsEditing();
```

Description

Call IsEditing to determine whether the user is editing the caption of any of the items in the list. IsEditing returns true if the user is editing an item, false otherwise.

See Also

OnEdited (see page 3849)

OnEditing (see page 3850)

Caption (see page 4258)

27.1.19.4.46 TCustomListView.MouseUp Method

Mouse button up event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

TCustomListView (see page 3757) overrides the protected MouseUp method to suppress the OnMouseUp event when a click is not on a list item.

MouseUp is called internally in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter depends on which of the Windows messages triggered the event.

See Also

MouseUp (see page 5774)

OnMouseUp (see page 5867)

27.1.19.4.47 TCustomListView.Notification Method

Responds to notifications that components are about to be created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

After calling the inherited method, Notification checks whether the image list specified by the LargeImages (see page 3817), SmallImages (see page 3825), or StateImages (see page 3828) property is about to be destroyed. If so, Notification sets the appropriate property to nil (Delphi) or NULL (C++).

See Also

LargeImages (see page 3817)

SmallImages (see page 3825)

StateImages (see page 3828)

27.1.19.4.48 TCustomListView.OwnerDataFetch Method

Customizes a list view item before it is displayed.

Pascal

```
function OwnerDataFetch(Item: TListItem; Request: TItemRequest): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean OwnerDataFetch(TListItem Item, TItemRequest Request);
```

Description

OwnerDataFetch initializes an item before it is drawn in a list view control. The Item parameter specifies the item that is about to be drawn. The Request parameter indicates the type of information that should be initialized. OwnerDataFetch returns true if the specified item should be displayed, and false if the item should not be drawn.

As implemented in TCustomListView (see page 3757), OwnerDataFetch generates an OnData (see page 3846) event, passing the Item parameter to the event handler and ignoring the Request parameter.

OwnerDataFetch is called only if OwnerData (see page 3820) is true.

See Also

OnData (see page 3846)

OwnerData (see page 3820)

OwnerDataFetch

27.1.19.4.49 TCustomListView.OwnerDataFind Method

Searches for an item in the list view control.

Pascal

```
function OwnerDataFind(Find: TItemFind; const FindString: string; const FindPosition: TPoint;
FindData: Pointer; StartIndex: Integer; Direction: TSearchDirection; Wrap: Boolean): Integer;
virtual;
```

C++

```
virtual __fastcall int OwnerDataFind(TItemFind Find, const AnsiString FindString, const TPoint
FindPosition, void * FindData, int StartIndex, TSearchDirection Direction, Boolean Wrap);
```

Description

Override OwnerDataFind in a descendant class to implement the searching capabilities of a virtual list view control (that is, when OwnerData (see page 3820) is true).

OwnerDataFind is called when the virtual list view must find an item; for example, OwnerDataFind is called when a user attempts an incremental search.

Find specifies the type of search to perform (any of ifData, ifPartialString, ifExactString, ifNearest).

FindString specifies the item text to search for. FindString is ignored unless Find contains ifPartialString or ifExactString.

FindPosition specifies the point from which to start the search. FindPosition is ignored unless Find contains ifNearest

FindData (see page 3789) specifies the item data to search for. FindData (see page 3789) is ignored unless Find contains ifData.

StartIndex specifies the index of the item from which the search should start.

Direction specifies the direction for the search (sdLeft, sdRight, sdAbove, sdBelow, or sdAll).

Wrap specifies whether the search should continue from the start of the list view control if no match is found.

OwnerDataFind should return the index of the found item. If no item is found, OwnerDataFind should return -1.

See Also

OnDataFind (see page 3847)

OwnerData (see page 3820)

27.1.19.4.50 TCustomListView.OwnerDataHint Method

Specifies a range of items that might be fetched.

Pascal

```
function OwnerDataHint(StartIndex: Integer; EndIndex: Integer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean OwnerDataHint(int StartIndex, int EndIndex);
```

Description

Override OwnerDataHint in a derived class to customize a range of items before OwnerDataFetch (see page 3796) is called on them.

This method of customizing items is more efficient than individually updating items in the OwnerDataFetch (see page 3796) method. However, the range of items does not always match what is handled by the OwnerDataFetch (see page 3796) method; therefore, you must be prepared to update individual items in the OwnerDataFetch (see page 3796) method as well.

StartIndex is the index of the first item that might be fetched.

EndIndex is the index of the last item that might be fetched.

OwnerDataHint is called only if OwnerData (see page 3820) is true.

See Also

OnDataHint (see page 4357)

OwnerDataFetch

OwnerData (see page 4325)

27.1.19.4.51 TCustomListView.OwnerDataStateChange Method

Specifies items that have changed states.

Pascal

```
function OwnerDataStateChange(StartIndex: Integer; EndIndex: Integer; OldState: TItemStates;
NewState: TItemStates): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean OwnerDataStateChange(int StartIndex, int EndIndex, TItemStates
OldState, TItemStates NewState);
```

Description

Override OwnerDataStateChange in a derived class to update items in a virtual list view control with their new states.

StartIndex is the index of the first item that has changed.

EndIndex is the index of the last item that has changed.

OldState is the old state of the items.

NewState is the new state of the items.

OwnerDataStateChange is called only if OwnerDataFetch (see page 3796) is true.

See Also

OnDataStateChange (see page 3848)

27.1.19.4.52 TCustomListView.Scroll Method

Scrolls the content of a list view by the indicated amount.

Pascal

```
procedure Scroll(DX: Integer; DY: Integer);
```

C++

```
__fastcall Scroll(int DX, int DY);
```

Description

Call Scroll to scroll the content of a list view by DX pixels horizontally and DY pixels vertically.

See Also

TopItem (see page 3828)

ViewOrigin (see page 3829)

27.1.19.4.53 TCustomListView.SelectAll Method

Selects all items or all text in the selected item.

Pascal

```
procedure SelectAll; override;
```

C++

```
virtual __fastcall SelectAll();
```

Description

SelectAll selects all items in the view.

See Also

Clear (see page 3779)

CopySelection (see page 3781)

ClearSelection (see page 3779)

DeleteSelected (see page 3786)

MoveSelection (see page 5942)

ItemIndex

SelectAll (see page 5943)

27.1.19.4.54 TCustomListView.SetItemIndex Method

Sets the value of the ItemIndex property.

Pascal

```
procedure SetItemIndex(const Value: Integer); override;
```

C++

```
virtual __fastcall SetItemIndex(const int Value);
```

Description

Override SetItemIndex to provide the write implementation for the ItemIndex property.

Value represents the index of the item to select, where the first item in the list has index 0, the second item has index 1, and so on. If Value is -1, SetItemIndex deselects all items (the same as the ClearSelection (see page 3779) method).

See Also

ItemIndex

GetItemIndex (see page 3791)

ClearSelection (see page 3779)

27.1.19.4.55 TCustomListView.SetMultiSelect Method

Sets the value of the MultiSelect (see page 3820) property.

Pascal

```
procedure SetMultiSelect(Value: Boolean); override;
```

C++

```
virtual __fastcall SetMultiSelect(Boolean Value);
```

Description

Override SetMultiSelect to provide the write implementation for the MultiSelect (see page 3820) property.

Value is true if the control should allow the user to select more than one item at a time, false if the control should support at most one selected item.

See Also

MultiSelect (see page 3820)

27.1.19.4.56 TCustomListView.SetViewStyle Method

Sets the value of the ViewStyle (see page 3829) property.

Pascal

```
procedure SetViewStyle(Value: TViewStyle); virtual;
```

C++

```
virtual __fastcall SetViewStyle(TViewStyle Value);
```

Description

Override SetViewStyle to provide a different write implementation for the ViewStyle (see page 3829) property.

Value indicates the new value of ViewStyle (see page 3829), which controls how the list view displays its items.

See Also

ViewStyle (see page 3829)

27.1.19.4.57 TCustomListView.StringWidth Method

Returns the width of a string, using the list view's current font.

Pascal

```
function StringWidth(S: string): Integer;
```

C++

```
__fastcall int StringWidth(AnsiString S);
```

Description

Call StringWidth to determine the space, in pixels, required to display a string using the list view's current font.

See Also

Font (see page 5823)

27.1.19.4.58 TCustomListView.UpdateColumn Method

Individual column update event dispatcher.

Pascal

```
procedure UpdateColumn(AnIndex: Integer);
```

C++

```
__fastcall UpdateColumn(int AnIndex);
```

Description

UpdateColumn is called automatically when the display properties of a column in the list view change. UpdateColumn adjusts the image of the column to match the properties of the TListColumn (see page 4236) object indexed by the AnIndex parameter in the Columns (see page 3808) property.

UpdateColumn does nothing if ColumnsShowing (see page 3780) returns false.

See Also

Columns (see page 3808)

ColumnsShowing (see page 3780)

TListColumn (see page 4236)

UpdateColumns (see page 3801)

27.1.19.4.59 TCustomListView.UpdateColumns Method

General column update event dispatcher.

Pascal

```
procedure UpdateColumns;
```

C++

```
__fastcall UpdateColumns();
```

Description

UpdateColumns is called automatically when the properties of several columns in the list view change. UpdateColumn (see page 3801) adjusts the image of every column to match the properties of the corresponding TListColumn (see page 4236) object listed in the Columns (see page 3808) property.

UpdateColumns does nothing if ColumnsShowing (see page 3780) returns false.

See Also

Columns (see page 3808)

ColumnsShowing (see page 3780)

TListColumn (see page 4236)

UpdateColumn (see page 3801)

27.1.19.4.60 TCustomListView.UpdateItems Method

Redraws a range of items, starting at FirstIndex and ending at LastIndex.

Pascal

```
procedure UpdateItems(FirstIndex: Integer; LastIndex: Integer);
```

C++

```
__fastcall UpdateItems(int FirstIndex, int LastIndex);
```

Description

Call UpdateItems after making changes that affect the display image of the list items in the specified range.

See Also

Items (see page 3814)

27.1.19.4.61 TCustomListView.WndProc Method

Provides specific message responses for the list view.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

WndProc overrides the inherited method to prevent the list view from redrawing while the items are being updated.

See Also

WndProc (see page 6187)

27.1.19.5 TCustomListView Properties

The properties of the TCustomListView class are listed here.

Protected Properties

	Name	Description
	AllocBy (see page 3803)	Indicates the number of items the list view can store in memory.
	BorderStyle (see page 3803)	Determines whether the list view displays a single line border.
	ColumnClick (see page 3808)	Determines whether the column header behaves like a button.
	Columns (see page 3808)	Describes the properties of the columns in the list view.
	HideSelection (see page 3812)	Determines whether the list view gives a visual indication of which item is selected when focus shifts to another control.
	HoverTime (see page 3813)	Specifies how long the user must pause with the mouse before an item is selected.
	IconOptions (see page 3813)	Determines how icons displayed in the list view are arranged.
	Items (see page 3814)	Contains the list of items displayed by the list view.
	LargeImages (see page 3817)	Provides a list of icon images to display for each item in the list when ViewStyle (see page 3829) is vsIcon.
	MultiSelect (see page 3820)	Determines whether the user can select more than one list item at a time.
	OwnerData (see page 3820)	Specifies whether the list view control is virtual.
	OwnerDraw (see page 3821)	Specifies whether the list view receives an OnDrawItem (see page 3848) event.
	ReadOnly (see page 3821)	Determines whether the user can change the contents of the control.
	ShowColumnHeaders (see page 3824)	Determines whether the column headers are displayed.
	ShowWorkAreas (see page 3824)	Determines whether the visual properties of work areas are displayed.

	SmallImages (see page 3825)	Provides a list of icon images to display for each item in the list when ViewStyle (see page 3829) is not vsIcon.
	SortType (see page 3827)	Determines if and how the items in the list are automatically sorted.
	StateImages (see page 3828)	Specifies additional icon images to display next to each item in the list view.
	ViewStyle (see page 3829)	Determines how the list items are displayed.

Public Properties

	Name	Description
R	BoundingRect (see page 3804)	Denotes the bounding rectangle for the items in the list view.
R	Canvas (see page 3804)	Gives access to the list view's canvas.
	Checkboxes (see page 3805)	Specifies whether check boxes appear next to the items in the list view.
R	Column (see page 3806)	Describes the column specified by the Index parameter.
	DropTarget (see page 3810)	Specifies which item in the list is the target of a drag and drop operation.
	FlatScrollBars (see page 3810)	Specifies whether the list view's scroll bars are flat.
	FullDrag (see page 3811)	Specifies whether headers are repainted when they are dragged.
	GridLines (see page 3811)	Determines whether lines are drawn separating items in the list.
	HotTrack (see page 3812)	Specifies whether list items are highlighted when the mouse passes over them.
	HotTrackStyles (see page 3812)	Specifies the hot tracking styles.
	ItemFocused (see page 3813)	Indicates which item, if any, has focus.
	RowSelect (see page 3821)	Determines whether an entire row in the list view can be selected.
R	SelCount (see page 3822)	Specifies the number of selected items in the list view.
	Selected (see page 3822)	Indicates the first selected item in the list view.
R	TopItem (see page 3828)	Indicates the topmost visible item in the list view.
R	ViewOrigin (see page 3829)	Designates the coordinates of the upper left corner of the list, relative to the visible area of the list view control.
R	VisibleRowCount (see page 3832)	Indicates number of items that can fit vertically in the visible area of a list view.
R	WorkAreas (see page 3833)	Defines separate working areas that divide the list view's client area.

27.1.19.5.1 TCustomListView.AllocBy Property

Indicates the number of items the list view can store in memory.

Pascal

```
property AllocBy: Integer;
```

C++

```
__property int AllocBy;
```

Description

Set AllocBy to the total number of items in the list before adding a large number of items to the list view. AllocBy allows the list view to allocate the memory for items in a single block at once rather than bit by bit as items are added.

See Also

Items (see page 3814)

27.1.19.5.2 TCustomListView.BorderStyle Property

Determines whether the list view displays a single line border.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Use BorderStyle to affect the sharpness with which the list view control stands out on a form. BorderStyle can have a value of either bsSingle or bsNone. If BorderStyle is bsSingle, the list view is drawn with a single-line border. If BorderStyle is bsNone, there will be no border.

27.1.19.5.3 TCustomListView.BoundingRect Property

Denotes the bounding rectangle for the items in the list view.

Pascal

```
property BoundingRect: TRect;
```

C++

```
__property TRect BoundingRect;
```

Description

Read BoundingRect to obtain the screen coordinates of a rectangle that encloses all the items in the list view. BoundingRect allows an application to adjust the size of the control to fit the items or to determine whether the mouse is over any of the list items.

Note: To use BoundingRect, the list view's ViewStyle (see page 3829) property must be either vsIcon or vsSmallIcon.

See Also

ViewStyle (see page 3829)

27.1.19.5.4 TCustomListView.Canvas Property

Gives access to the list view's canvas.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Use the Canvas property to paint to the list view's canvas during custom draw events such as OnDrawItem (see page 3848), OnCustomDraw (see page 3844), OnCustomDrawItem (see page 3845), OnCustomDrawSubItem (see page 3846), OnAdvancedCustomDraw (see page 3834), OnAdvancedCustomDrawItem (see page 3835), and OnAdvancedCustomDrawSubItem (see page 3835).

C++ Examples:

```
/*
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
*/
{
  TPoint APoint = Point(X, Y);
  int Index = ListBox1->ItemAtPos(APoint, True);
  TListView *myListView;
  TClass ClassRef = ListBox1->Items->Objects[Index]->ClassType();
  if (String(ClassRef->ClassName()) == "TListView")
```

```
    {
      myListView = (TListView *)ListBox1->Items->Objects[Index];
      // make sure we are using the TControls canvas and not the from's!
      myListView->Canvas->MoveTo(myListView->ClientRect.Left, myListView->ClientRect.Top);
      myListView->Canvas->LineTo(myListView->ClientRect.Right, myListView->ClientRect.Bottom);
      myListView = NULL;
    }
  }
```

Delphi Examples:

```
{
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
}
  if (ListBox1.Items.Objects[Index] is TListView) then
  begin
    myListView:= (ListBox1.Items.Objects[Index] as TListView);
    with myListView.ClientRect do
    begin // make sure we are using the TControl's canvas and not the form's!
      myListView.Canvas.MoveTo(Left, Top);
      myListView.Canvas.LineTo(Right, Bottom);
    end;
  myListView:= nil;
  end;
```

27.1.19.5.5 TCustomListView.Checkboxes Property

Specifies whether check boxes appear next to the items in the list view.

Pascal

```
property Checkboxes: Boolean;
```

C++

```
__property Boolean Checkboxes;
```

Description

Set Checkboxes to true to make check boxes appear next to the list items when ViewStyle (see page 3829) is vsList or vsReport. Each line in the list displays a single check box.

See Also

Checked (see page 4258)

ViewStyle (see page 3829)

27.1.19.5.6 TCustomListView.Column Property

Describes the column specified by the Index parameter.

Pascal

```
property Column [Index: Integer]: TListColumn;
```

C++

```
__property TListColumn Column[int Index];
```

Description

Read Column to access the TListColumn (see page 4236) object that describes the column attributes of a column in a report style list view. The Index parameter is the index of the column in the Columns (see page 3808) property array.

Note: Column is only relevant when the value of the ViewStyle (see page 3829) property is vsReport.

C++ Examples:

```
/*
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {"C++ Image", "Borland Image", "Delphi Image"};
  const char Col2Array[3][40] = {"Documentation for the C++ icon.", "Borland icon.", "Delphi
icon."};
  // Create a ListView item for each image in the ImageList
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
    Item = ListView1->Items->Add();
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 1";
  Column->Width = 200;
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 2";
  Column->Width = 200;
  // Add View styles and constants to the Combo Box
  ComboBox1->Items->AddObject("vsIcon", (TObject *)vsIcon);
```

```
  ComboBox1->Items->AddObject("vsList", (TObject *)vsList);
  ComboBox1->Items->AddObject("vsReport", (TObject *)vsReport);
  ComboBox1->Items->AddObject("vsSmallIcon", (TObject *)vsSmallIcon);
  // Display first item in the Combo Box
  ComboBox1->ItemIndex = 0;
}

void __fastcall TForm1::ComboBox1Click(TObject *Sender)
{
  ListView1->ViewStyle = (TViewStyle) ComboBox1->Items->Objects[ComboBox1->ItemIndex];
}
```

Delphi Examples:

```
{
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. You can use *.bmp or *.ico files from the
\Images\Icons directory. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
}

procedure TComboForm.FormCreate(Sender: TObject);
var
  I: Integer;
  ListItem: TListItem;
  NewColumn: TListColumn;
begin
  Col2Array[0]:= 'Documentation for Image0.';
  Col2Array[1]:= 'Documentation for Image1.';
  Col2Array[2]:= 'Documentation for Image2.';
  // Create a ListView item for each image in the ImageList
  with ListView1 do
  begin
    SmallImages := ImageList1;
    LargeImages := ImageList1;
    for I := 0 to ImageList1.Count - 1 do
    begin
      ListItem := Items.Add;
      Listitem.Caption := 'Image' + IntToStr(I);
      ListItem.ImageIndex := I;
      Listitem.SubItems.Add(Col2Array[I]);
    end;
    // Create two columns to show during viewing as vsReport
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 1';
    NewColumn.Width := 200;
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 2';
    NewColumn.Width := 200;
    // Add View styles and constants to the Combo Box
    ComboBox1.Items.AddObject('vsIcon', TObject(vsIcon));
    ComboBox1.Items.AddObject('vsList', TObject(vsList));
    ComboBox1.Items.AddObject('vsReport', TObject(vsReport));
    ComboBox1.Items.AddObject(
      'vsSmallIcon', TObject(vsSmallIcon));
    // Display first item in the Combo Box
    ComboBox1.ItemIndex := 0;
```

```
    end;
  end;

  procedure TComboForm.ComboBox1Click(Sender: TObject);
  begin
    with ComboBox1 do
      ListView1.ViewStyle := TViewStyle(Items.Objects[ItemIndex]);

  end;
```

See Also

Columns (see page 3808)

ViewStyle (see page 3829)

27.1.19.5.7 TCustomListView.ColumnClick Property

Determines whether the column header behaves like a button.

Pascal

```
property ColumnClick: Boolean;
```

C++

```
__property Boolean ColumnClick;
```

Description

Use ColumnClick to specify whether the OnColumnClick (see page 3837) event should occur when the user clicks on the column header. When ColumnClick is true, the OnColumnClick (see page 3837) occurs when the column header is clicked with the mouse. When ColumnClick is false, the OnColumnClick (see page 3837) event never occurs.

Note: For column clicks to work, the column headers must be displayed. To display the headers, set the ShowColumnHeaders (see page 3824) property to true and the ViewStyle (see page 3829) property to vsReport.

See Also

OnColumnClick (see page 3837)

ShowColumnHeaders (see page 3824)

ViewStyle (see page 3829)

27.1.19.5.8 TCustomListView.Columns Property

Describes the properties of the columns in the list view.

Pascal

```
property Columns: TListColumns;
```

C++

```
__property TListColumns Columns;
```

Description

Use Columns to add or delete columns in the list view, or to edit their display properties. When setting Columns at design time a ListView Columns Editor dialog appears. This dialog allows columns to be added or deleted, and the display properties of individual columns to be changed. At runtime, use the Caption, Alignment, and Width properties of the TListColumn (see page 4236) objects accessed by the Columns property to change the appearance of the column headers.

Note: To display the columns, set the ViewStyle (see page 3829) property to vsReport and the ShowColumnHeaders (see

page 3824) property to true.

C++ Examples:

```
/*
This example requires only a blank form.  All other objects:
TListView, TListColumns, TListItems, are created dynamically.
You must add comctrls to the uses defs file.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  const char Names[6][2][10] =
   {{"Rubble","Barny"},
    {"Michael", "Johnson"},
    {"Bunny", "Bugs"},
    {"Silver", "HiHo"},
    {"Simpson", "Bart"},
    {"Squirrel", "Rocky"}};

  TListColumn  *NewColumn;
  TListItem  *ListItem;
  TListView   *ListView = new TListView(this);

  ListView->Parent = this;
  ListView->Align = alClient;
  ListView->ViewStyle = vsReport;
  NewColumn = ListView->Columns->Add();
  NewColumn->Caption = "Last";
  NewColumn = ListView->Columns->Add();
  NewColumn->Caption = "First";
  for (int i = 0; i < 6; i++)
  {
    ListItem = ListView->Items->Add();
    ListItem->Caption = Names[i][0];
    ListItem->SubItems->Add(Names[i][1]);
  }
}
```

Delphi Examples:

```
{
This example requires only a blank form.  All other objects:
TListView, TListColumns, TListItems, are created dynamically.
You must add comctrls to the uses clause of the unit file.
}
procedure TForm1.FormCreate(Sender: TObject);
const
  Names: array[0..5, 0..1] of string = (
    ('Rubble', 'Barney'),
    ('Michael', 'Johnson'),
    ('Bunny', 'Bugs'),
    ('Silver', 'HiHo'),
    ('Simpson', 'Bart'),
    ('Squirrel', 'Rocky')
    );

var
  I: Integer;
  NewColumn: TListColumn;
  ListItem: TListItem;
  ListView: TListView;
begin
  ListView := TListView.Create(Self);
  with ListView do
  begin
```

```
      Parent := Self;
      Align := alClient;
      ViewStyle := vsReport;

      NewColumn := Columns.Add;
      NewColumn.Caption := 'Last';
      NewColumn := Columns.Add;
      NewColumn.Caption := 'First';

      for I := Low(Names) to High(Names) do
      begin
        ListItem := Items.Add;
        ListItem.Caption := Names[I][0];
        ListItem.SubItems.Add(Names[I][1]);
      end;
    end;
  end;
```

See Also

ShowColumnHeaders (see page 3824)

TListColumns (see page 4245)

TListColumn (see page 4236)

ViewStyle (see page 3829)

27.1.19.5.9 TCustomListView.DropTarget Property

Specifies which item in the list is the target of a drag and drop operation.

Pascal

```
property DropTarget: TListItem;
```

C++

```
__property TListItem DropTarget;
```

Description

Read DropTarget to determine whether an item in the list is the target of a drag and drop operation. Set DropTarget to change whether a particular item in the list can be the drop target of a dragged item.

Note: DropTarget only indicates the list item that appears to the user as a drop target. The application must still implement the drag-and-drop behavior for the item.

See Also

OnDragDrop (see page 5855)

TListItem (see page 4250)

DropTarget (see page 4260)

DragKind (see page 5819)

OnDragOver (see page 5857)

27.1.19.5.10 TCustomListView.FlatScrollBars Property

Specifies whether the list view's scroll bars are flat.

Pascal

```
property FlatScrollBars: Boolean;
```

C++

```
__property Boolean FlatScrollBars;
```

Description

Use FlatScrollBars to get or set whether the list view's scroll bars are flat. Flat scroll bars do not have the beveled borders used for the three-dimensional effect.

Note: List views only support flat scroll bars if the system has version 472 or later of comctl32.dll.

27.1.19.5.11 TCustomListView.FullDrag Property

Specifies whether headers are repainted when they are dragged.

Pascal

```
property FullDrag: Boolean;
```

C++

```
__property Boolean FullDrag;
```

Description

Use FullDrag to get or set whether headers are repainted when they are dragged.

Note: To display the column headers, set the ViewStyle (see page 3829) property to vsReport and the ShowColumnHeaders (see page 3824) property to true.

See Also

ViewStyle (see page 3829)

Columns (see page 3808)

ShowColumnHeaders (see page 3824)

OnColumnDragged (see page 3840)

27.1.19.5.12 TCustomListView.GridLines Property

Determines whether lines are drawn separating items in the list.

Pascal

```
property GridLines: Boolean;
```

C++

```
__property Boolean GridLines;
```

Description

Set GridLines to true to add lines that separate the items in the list view. The value of GridLines is ignored unless ViewStyle (see page 3829) is vsReport.

See Also

ViewStyle (see page 3829)

27.1.19.5.13 TCustomListView.HideSelection Property

Determines whether the list view gives a visual indication of which item is selected when focus shifts to another control.

Pascal

```
property HideSelection: Boolean;
```

C++

```
__property Boolean HideSelection;
```

Description

Set HideSelection to false to provide visual feedback of the selected item in the list even when the list view does not have focus. Set HideSelection to true to show the selection only when the list view has focus. HideSelection does not affect the actual value of the selection, only the visual indication. Always setting HideSelection to false can make forms with many list views look too busy.

See Also

ItemFocused (see page 3813)

MultiSelect (see page 3820)

SelCount (see page 3822)

Selected (see page 3822)

27.1.19.5.14 TCustomListView.HotTrack Property

Specifies whether list items are highlighted when the mouse passes over them.

Pascal

```
property HotTrack: Boolean;
```

C++

```
__property Boolean HotTrack;
```

Description

Set HotTrack to true to provide visual feedback about which item is under the mouse. When HotTrack is true, the HoverTime (see page 3813) property controls whether pausing the mouse over an item causes it to be selected. When HotTrack is false, there is no visual feedback when the mouse passes over items and users can't select items by pausing the mouse.

To specify hot tracking styles, use the HotTrackStyles (see page 3812) property.

See Also

HideSelection (see page 3812)

HotTrackStyles (see page 3812)

HoverTime (see page 3813)

27.1.19.5.15 TCustomListView.HotTrackStyles Property

Specifies the hot tracking styles.

Pascal

```
property HotTrackStyles: TListHotTrackStyles;
```

C++

```
__property TListHotTrackStyles HotTrackStyles;
```

Description

Use HotTrackStyles to specify the hot tracking styles. The hot tracking style indicates the type of feedback that the list view gives when the mouse passes over list items. This feedback can be a change of the mouse cursor or underline of the list items.

To turn hot tracking on, set HotTrack (see page 3812) to true.

See Also

HotTrack (see page 3812)

27.1.19.5.16 TCustomListView.HoverTime Property

Specifies how long the user must pause with the mouse before an item is selected.

Pascal

```
property HoverTime: Integer;
```

C++

```
__property int HoverTime;
```

Description

Use HoverTime to indicate how long (in milliseconds) the user must pause with the mouse before an item is selected. If HoverTime is -1 (the default value), a default time period must elapse.

HoverTime has no effect unless the HotTrack (see page 3812) property is true.

See Also

HotTrack (see page 3812)

27.1.19.5.17 TCustomListView.IconOptions Property

Determines how icons displayed in the list view are arranged.

Pascal

```
property IconOptions: TIconOptions;
```

C++

```
__property TIconOptions IconOptions;
```

Description

Set the properties of the TIconOptions (see page 4233) object that is the value of IconOptions to specify how the icons in the list view should be arranged. The ViewStyle (see page 3829) of the list view must be set to either vsIcon or vsSmallIcons for these options to affect the control.

See Also

TIconOptions (see page 4233)

ViewStyle (see page 3829)

27.1.19.5.18 TCustomListView.ItemFocused Property

Indicates which item, if any, has focus.

Pascal

```
property ItemFocused: TListItem;
```

C++

```
__property TListItem ItemFocused;
```

Description

Read ItemFocused to determine which item, if any, can be edited by the user. Set ItemFocused to set focus to an item in the list. When an item has focus, it appears surrounded by a standard focus rectangle. If no item has focus, ItemFocused returns nil (Delphi) or NULL (C++). Only one item can have focus at a time.

See Also

Selected (see page 3822)

27.1.19.5.19 TCustomListView.Items Property

Contains the list of items displayed by the list view.

Pascal

```
property Items: TListItems;
```

C++

```
__property TListItems Items;
```

Description

Use Items to directly access the TListItem (see page 4250) objects that represent the items in the list. Setting this property at design time brings up the ListView Items Editor. Use this dialog to add or delete items or subitems, and to edit their display properties. At runtime, use each item's Caption, ImageIndex, and StateIndex properties to change the appearance of the list items.

Warning: Items is read-only if the application is running in virtual mode.

C++ Examples:

```
/*
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {"C++ Image", "Borland Image", "Delphi Image"};
  const char Col2Array[3][40] = {"Documentation for the C++ icon.", "Borland icon.", "Delphi
icon."};
  // Create a ListView item for each image in the ImageList
```

```
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
    Item = ListView1->Items->Add();
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();

27.1.19.5.20 TCustomListView.LargeImages Property

Provides a list of icon images to display for each item in the list when ViewStyle (see page 3829) is vsIcon.

Pascal

```
property LargeImages: TCustomImageList;
```

C++

```
__property TCustomImageList LargeImages;
```

Description

Set LargeImages to specify the bitmaps that should be displayed next to items in the list when ViewStyle (see page 3829) is vsIcon. Each item in the Items (see page 3814) list can be associated with a bitmap in this image list by setting its ImageIndex property.

C++ Examples:

```
/*
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {"C++ Image", "Borland Image", "Delphi Image"};
  const char Col2Array[3][40] = {"Documentation for the C++ icon.", "Borland icon.", "Delphi
icon."};
  // Create a ListView item for each image in the ImageList
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
    Item = ListView1->Items->Add();
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 1";
  Column->Width = 200;
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 2";
  Column->Width = 200;
  // Add View styles and constants to the Combo Box
  ComboBox1->Items->AddObject("vsIcon", (TObject *)vsIcon);
  ComboBox1->Items->AddObject("vsList", (TObject *)vsList);
  ComboBox1->Items->AddObject("vsReport", (TObject *)vsReport);
  ComboBox1->Items->AddObject("vsSmallIcon", (TObject *)vsSmallIcon);
  // Display first item in the Combo Box
  ComboBox1->ItemIndex = 0;
}

void __fastcall TForm1::ComboBox1Click(TObject *Sender)
{
  ListView1->ViewStyle = (TViewStyle) ComboBox1->Items->Objects[ComboBox1->ItemIndex];
}
```

Delphi Examples:

```
{
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. You can use *.bmp or *.ico files from the
\Images\Icons directory. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
```

```
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
}

procedure TComboForm.FormCreate(Sender: TObject);
var
  I: Integer;
  ListItem: TListItem;
  NewColumn: TListColumn;
begin
  Col2Array[0]:= 'Documentation for Image0.';
  Col2Array[1]:= 'Documentation for Image1.';
  Col2Array[2]:= 'Documentation for Image2.';
  // Create a ListView item for each image in the ImageList
  with ListView1 do
  begin
    SmallImages := ImageList1;
    LargeImages := ImageList1;
    for I := 0 to ImageList1.Count - 1 do
    begin
      ListItem := Items.Add;
      Listitem.Caption := 'Image' + IntToStr(I);
      ListItem.ImageIndex := I;
      Listitem.SubItems.Add(Col2Array[I]);
    end;
    // Create two columns to show during viewing as vsReport
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 1';
    NewColumn.Width := 200;
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 2';
    NewColumn.Width := 200;
    // Add View styles and constants to the Combo Box
    ComboBox1.Items.AddObject('vsIcon', TObject(vsIcon));
    ComboBox1.Items.AddObject('vsList', TObject(vsList));
    ComboBox1.Items.AddObject('vsReport', TObject(vsReport));
    ComboBox1.Items.AddObject(
      'vsSmallIcon', TObject(vsSmallIcon));
    // Display first item in the Combo Box
    ComboBox1.ItemIndex := 0;
  end;
end;

procedure TComboForm.ComboBox1Click(Sender: TObject);
begin
  with ComboBox1 do
    ListView1.ViewStyle := TViewStyle(Items.Objects[ItemIndex]);

end;
```

27.1.19.5.21 TCustomListView.MultiSelect Property

Determines whether the user can select more than one list item at a time.

Pascal

```
property MultiSelect: Boolean;
```

C++

```
__property Boolean MultiSelect;
```

Description

Set MultiSelect to specify whether users can select multiple items in the list. If MultiSelect is true, the user can select multiple items. If MultiSelect if false, only one item can be selected at a time.

See Also

SelCount (see page 3822)

Selected (see page 3822)

27.1.19.5.22 TCustomListView.OwnerData Property

Specifies whether the list view control is virtual.

Pascal

```
property OwnerData: Boolean;
```

C++

```
__property Boolean OwnerData;
```

Description

Set OwnerData to true to specify that the list view is virtual. A virtual list view can contain a huge number of items (specifically, up to a DWORD). However, you must manage the items of a virtual list view using the OnData (see page 3846), OnDataFind (see page 3847), OnDataHint (see page 3847), and OnDataStateChange (see page 3848) event handlers. For example, you must explicitly provide a value to a list item's StateIndex property if it is to display a check box.

When creating a virtual list view, you must set the Count property for the Items (see page 3814) to the number of items in the virtual list.

The only information contained in a virtual list view control is the selection and focus information.

To improve the performance of a virtual list view control, cache items for quick retrieval. The OnDataHint (see page 3847) event can help optimize retrieval from the cache.

Note: Virtual list views need not be owner-drawn. The OnData (see page 3846), OnDataFind (see page 3847), OnDataHint (see page 3847), and OnDataStateChange (see page 3848) events enable the list view's default drawing, if desired.

See Also

OnData (see page 3846)

OnDataFind (see page 3847)

OnDataHint (see page 3847)

OnDataStateChange (see page 3848)

OwnerDraw (see page 3821)

Count (see page 4281)

27.1.19.5.23 TCustomListView.OwnerDraw Property

Specifies whether the list view receives an OnDrawItem (see page 3848) event.

Pascal

```
property OwnerDraw: Boolean;
```

C++

```
__property Boolean OwnerDraw;
```

Description

Set OwnerDraw to true to allow the list view to receive the OnDrawItem (see page 3848) event instead of the default rendering of list items.

Note: This property is independent of the custom draw events such as OnCustomDraw (see page 3844), OnCustomDrawItem (see page 3845), OnAdvancedCustomDraw (see page 3834), and so on. The custom draw events always occur.

See Also

OnDrawItem (see page 3848)

Canvas (see page 3804)

IsCustomDrawn (see page 3794)

27.1.19.5.24 TCustomListView.ReadOnly Property

Determines whether the user can change the contents of the control.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to determine whether the list view can be used to enter data. If ReadOnly is true, the list view displays values that the user can't edit. If ReadOnly is false, the user can modify the contents. If ReadOnly is false, the OnEditing (see page 3850) and OnEdited (see page 3849) events occur when the user begins and finishes editing the list item, respectively.

See Also

OnEdited (see page 3849)

OnEditing (see page 3850)

27.1.19.5.25 TCustomListView.RowSelect Property

Determines whether an entire row in the list view can be selected.

Pascal

```
property RowSelect: Boolean;
```

C++

```
__property Boolean RowSelect;
```

Description

Set RowSelect to true to allow entire rows to be selected when the ViewStyle (see page 3829) property is vsReport. To allow multiple rows to be selected, use the MultiSelect (see page 3820) property.

See Also

MultiSelect (see page 3820)

Selected (see page 4267)

ViewStyle (see page 3829)

27.1.19.5.26 TCustomListView.SelCount Property

Specifies the number of selected items in the list view.

Pascal

```
property SelCount: Integer;
```

C++

```
__property int SelCount;
```

Description

Read SelCount to determine the number of items that are currently selected. When SelCount is 1, use the Selected (see page 3822) property to access the selected item. To locate the selected items when SelCount is greater than one, check the Selected (see page 3822) property of the list items, beginning with the item specified by the Selected (see page 3822) property.

Note: SelCount can only exceed 1 if the MultiSelect (see page 3820) property is true.

See Also

Items (see page 3814)

MultiSelect (see page 3820)

Selected (see page 3822)

Selected (see page 4267)

27.1.19.5.27 TCustomListView.Selected Property

Indicates the first selected item in the list view.

Pascal

```
property Selected: TListItem;
```

C++

```
__property TListItem Selected;
```

Description

Read Selected to access the properties of the first selected item in the list. If SelCount (see page 3822) is 0, Selected is nil (Delphi) or NULL (C++). If SelCount (see page 3822) is greater than 1, subsequent selected items can be located by checking the Selected property of the items found using the GetNextItem (see page 3792) method.

Set the Selected property to select an item in the list. If MultiSelect (see page 3820) is true, setting Selected adds an item to the selection. If MultiSelect (see page 3820) is false, setting Selected changes the selection. Setting Selected to nil (Delphi) or NULL (C++) deselects all items in the list.

When an item is selected, the OnChanging (see page 3837) and OnChange (see page 3836) events are generated.

C++ Examples:

```
/*
The following example inserts a list item after the selected
item in the list view.  Place a TButton, a TEdit and a
TListView in the form.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TListItem *InsertItem;
  if (ListView1->Selected == NULL) return;
  InsertItem =
    ListView1->Items->Insert(ListView1->Selected->Index);
  InsertItem->Caption = Edit1->Text;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *ListItem;
  ListView1->ViewStyle = vsList;
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Apples";
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Oranges";
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Pears";
}
```

Delphi Examples:

```
{
The following example inserts a list item after the selected
item in the list view.  Place a TButton, a TEdit and a
TListView in the form.
}
procedure TForm1.Button1Click(Sender: TObject);
var InsertItem : TListItem;
begin
  with ListView1 do
  begin
    if (Selected = nil) then exit;
    InsertItem := Items.Insert(Selected.Index);
  end;
  InsertItem.Caption := Edit1.Text;
end;

procedure TForm1.FormCreate(Sender: TObject);
var ListItem : TListItem;
begin
  ListView1.ViewStyle := vsList;
  ListItem := ListView1.Items.Add;
  ListItem.Caption := 'Apples';
  ListItem := ListView1.Items.Add;
  ListItem.Caption := 'Oranges';
  ListItem := ListView1.Items.Add;
  ListItem.Caption := 'Pears';
end;
```

See Also

GetNextItem (see page 3792)

MultiSelect (see page 3820)

OnChange (see page 3836)

OnChanging (see page 3837)

SelCount (see page 3822)

27.1.19.5.28 TCustomListView.ShowColumnHeaders Property

Determines whether the column headers are displayed.

Pascal

```
property ShowColumnHeaders: Boolean;
```

C++

```
__property Boolean ShowColumnHeaders;
```

Description

Set ShowColumnHeaders to specify whether the columns in the list view should display column headers. A column header is a panel with a caption that identifies the category of items in the column of the list view. Headers are useful for labeling columns of subitems that provide additional information in a list view. Use the Columns (see page 3808) property to create or add headers.

Note: To use columns in a list view, the ViewStyle (see page 3829) property must be set to vsReport.

See Also

ColumnClick (see page 3808)

Columns (see page 3808)

ViewStyle (see page 3829)

FullDrag (see page 3811)

27.1.19.5.29 TCustomListView.ShowWorkAreas Property

Determines whether the visual properties of work areas are displayed.

Pascal

```
property ShowWorkAreas: Boolean;
```

C++

```
__property Boolean ShowWorkAreas;
```

Description

Set ShowWorkAreas to specify whether the list view should paint each work area in its own color and labeled by its display name. If the list view's WorkAreas (see page 3833) property includes any work areas, the icons in the list view are always grouped visually by these work areas. ShowWorkAreas determines whether the properties of individual work area components are used to make each area stand out visually.

When ShowWorkAreas is true, each work area is painted in the color specified by its Color property and labeled by the string in its DisplayName property. When ShowWorkAreas is false, icons appear grouped by work areas, but there is no other visual indication.

Note: To use work areas in a list view, the ViewStyle (see page 3829) property must be set to vsIcon or vsSmallIcon.

Warning: Work areas are not supported if the OwnerData (see page 3820) property is true.

See Also

Color (see page 5428)

DisplayName (see page 2761)

ViewStyle (see page 3829)

WorkAreas (see page 3833)

OwnerData (see page 3820)

27.1.19.5.30 TCustomListView.SmallImages Property

Provides a list of icon images to display for each item in the list when ViewStyle (see page 3829) is not vsIcon.

Pascal

```
property SmallImages: TCustomImageList;
```

C++

```
__property TCustomImageList SmallImages;
```

Description

Set SmallImages to specify the icons that should be displayed next to items in the list when ViewStyle (see page 3829) is vsSmallIcon, vsList, or vsReport. Each item in the Items (see page 3814) list can be associated with an icon in this image list by setting its ImageIndex property.

C++ Examples:

```
/*
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {"C++ Image", "Borland Image", "Delphi Image"};
  const char Col2Array[3][40] = {"Documentation for the C++ icon.", "Borland icon.", "Delphi
icon."};
  // Create a ListView item for each image in the ImageList
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
    Item = ListView1->Items->Add();
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();
```

```
  Column->Caption = "Column 1";
  Column->Width = 200;
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 2";
  Column->Width = 200;
  // Add View styles and constants to the Combo Box
  ComboBox1->Items->AddObject("vsIcon", (TObject *)vsIcon);
  ComboBox1->Items->AddObject("vsList", (TObject *)vsList);
  ComboBox1->Items->AddObject("vsReport", (TObject *)vsReport);
  ComboBox1->Items->AddObject("vsSmallIcon", (TObject *)vsSmallIcon);
  // Display first item in the Combo Box
  ComboBox1->ItemIndex = 0;
}

void __fastcall TForm1::ComboBox1Click(TObject *Sender)
{
  ListView1->ViewStyle = (TViewStyle) ComboBox1->Items->Objects[ComboBox1->ItemIndex];
}
```

Delphi Examples:

```
{
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. You can use *.bmp or *.ico files from the
\Images\Icons directory. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
}

procedure TComboForm.FormCreate(Sender: TObject);
var
  I: Integer;
  ListItem: TListItem;
  NewColumn: TListColumn;
begin
  Col2Array[0]:= 'Documentation for Image0.';
  Col2Array[1]:= 'Documentation for Image1.';
  Col2Array[2]:= 'Documentation for Image2.';
  // Create a ListView item for each image in the ImageList
  with ListView1 do
  begin
    SmallImages := ImageList1;
    LargeImages := ImageList1;
    for I := 0 to ImageList1.Count - 1 do
    begin
      ListItem := Items.Add;
      Listitem.Caption := 'Image' + IntToStr(I);
      ListItem.ImageIndex := I;
      Listitem.SubItems.Add(Col2Array[I]);
    end;
    // Create two columns to show during viewing as vsReport
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 1';
    NewColumn.Width := 200;
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 2';
    NewColumn.Width := 200;
    // Add View styles and constants to the Combo Box
```

```
      ComboBox1.Items.AddObject('vsIcon', TObject(vsIcon));
      ComboBox1.Items.AddObject('vsList', TObject(vsList));
      ComboBox1.Items.AddObject('vsReport', TObject(vsReport));
      ComboBox1.Items.AddObject(
        'vsSmallIcon', TObject(vsSmallIcon));
      // Display first item in the Combo Box
      ComboBox1.ItemIndex := 0;
    end;
  end;

  procedure TComboForm.ComboBox1Click(Sender: TObject);
  begin
    with ComboBox1 do
      ListView1.ViewStyle := TViewStyle(Items.Objects[ItemIndex]);

  end;
```

StateImages (see page 3828)

TImageList (see page 6078)

ViewStyle (see page 3829)

27.1.19.5.31 TCustomListView.SortType Property

Determines if and how the items in the list are automatically sorted.

Pascal

```
property SortType: TSortType;
```

C++

```
__property TSortType SortType;
```

Description

Set SortType to specify the order of items in the list. If SortType is not stNone, the list items in the Items (see page 3814) property are automatically sorted. Once a list view is sorted, the original order is lost. That is, setting the SortType back to stNone will not restore the original order of items.

Note: If SortType is stData or stBoth, provide an OnCompare (see page 3841) event handler to compare data values.

Note: If the list view uses work areas, sorting items only compares each item to the other items in its work area.

See Also

Items (see page 3814)

OnCompare (see page 3841)

Caption (see page 4258)

Data (see page 4259)

WorkAreas (see page 3833)

27.1.19.5.32 TCustomListView.StateImages Property

Specifies additional icon images to display next to each item in the list view.

Pascal

```
property StateImages: TCustomImageList;
```

C++

```
__property TCustomImageList StateImages;
```

Description

Set StateImages to specify the icons that should be displayed next to items in the list. Each item in the Items (see page 3814) list can be associated with an icon in this image list by setting its StateIndex property.

See Also

Items (see page 3814)

LargeImages (see page 3817)

SmallImages (see page 3825)

TImageList (see page 6078)

ViewStyle (see page 3829)

StateIndex (see page 4267)

27.1.19.5.33 TCustomListView.TopItem Property

Indicates the topmost visible item in the list view.

Pascal

```
property TopItem: TListItem;
```

C++

```
__property TListItem TopItem;
```

Description

Read TopItem to determine the first item in the list view that the user can see. TopItem reflects how far the list view has been scrolled. The TopItem property is read-only.

You can scroll the list view with the Scroll (see page 3798) or ScrollBy methods. You can't scroll by setting TopItem, since it is read-only.

TopItem is only implemented when ViewStyle (see page 3829) is vsReport or vsList. For vsIcon and vsSmallIcon view styles, use the ViewOrigin (see page 3829) property to determine the scroll position.

See Also

Scroll (see page 3798)

ScrollBy (see page 6176)

ViewOrigin (see page 3829)

ViewStyle (see page 3829)

27.1.19.5.34 TCustomListView.ViewOrigin Property

Designates the coordinates of the upper left corner of the list, relative to the visible area of the list view control.

Pascal

```
property ViewOrigin: TPoint;
```

C++

```
__property TPoint ViewOrigin;
```

Description

Read ViewOrigin to determine the logical origin of the list image. When the list view is not scrolled, ViewOrigin is (0,0). Otherwise, use the x coordinate to determine the number of pixels the view is scrolled horizontally, and the y coordinate to determine the number of pixels the view is scrolled vertically.

ViewOrigin is only implemented when ViewStyle (see page 3829) is vsIcon or vsSmallIcon. For vsReport or vsList, use the TopItem (see page 3828) property instead.

See Also

TopItem (see page 3828)

ViewStyle (see page 3829)

27.1.19.5.35 TCustomListView.ViewStyle Property

Determines how the list items are displayed.

Pascal

```
property ViewStyle: TViewStyle;
```

C++

```
__property TViewStyle ViewStyle;
```

Description

Set ViewStyle to control the visual display of items in a list view. The items can be displayed as a set of movable icons, or as columns of text.

C++ Examples:

```
/*
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {"C++ Image", "Borland Image", "Delphi Image"};
```

```
  const char Col2Array[3][40] = {"Documentation for the C++ icon.", "Borland icon.", "Delphi
icon."};
  // Create a ListView item for each image in the ImageList
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
    Item = ListView1->Items->Add();
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 1";
  Column->Width = 200;
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 2";
  Column->Width = 200;
  // Add View styles and constants to the Combo Box
  ComboBox1->Items->AddObject("vsIcon", (TObject *)vsIcon);
  ComboBox1->Items->AddObject("vsList", (TObject *)vsList);
  ComboBox1->Items->AddObject("vsReport", (TObject *)vsReport);
  ComboBox1->Items->AddObject("vsSmallIcon", (TObject *)vsSmallIcon);
  // Display first item in the Combo Box
  ComboBox1->ItemIndex = 0;
}

void __fastcall TForm1::ComboBox1Click(TObject *Sender)
{
  ListView1->ViewStyle = (TViewStyle) ComboBox1->Items->Objects[ComboBox1->ItemIndex];
}
/*
This example requires only a blank form.  All other objects:
TListView, TListColumns, TListItems, are created dynamically.
You must add comctrls to the uses defs file.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  const char Names[6][2][10] =
   {{"Rubble","Barny"},
    {"Michael", "Johnson"},
    {"Bunny", "Bugs"},
    {"Silver", "HiHo"},
    {"Simpson", "Bart"},
    {"Squirrel", "Rocky"}};

  TListColumn  *NewColumn;
  TListItem  *ListItem;
  TListView   *ListView = new TListView(this);

  ListView->Parent = this;
  ListView->Align = alClient;
  ListView->ViewStyle = vsReport;
  NewColumn = ListView->Columns->Add();
  NewColumn->Caption = "Last";
  NewColumn = ListView->Columns->Add();
  NewColumn->Caption = "First";
  for (int i = 0; i < 6; i++)
  {
    ListItem = ListView->Items->Add();
    ListItem->Caption = Names[i][0];
    ListItem->SubItems->Add(Names[i][1]);
  }
}
```

Delphi Examples:

```
{
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. You can use *.bmp or *.ico files from the
\Images\Icons directory. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
}

procedure TComboForm.FormCreate(Sender: TObject);
var
  I: Integer;
  ListItem: TListItem;
  NewColumn: TListColumn;
begin
  Col2Array[0]:= 'Documentation for Image0.';
  Col2Array[1]:= 'Documentation for Image1.';
  Col2Array[2]:= 'Documentation for Image2.';
  // Create a ListView item for each image in the ImageList
  with ListView1 do
  begin
    SmallImages := ImageList1;
    LargeImages := ImageList1;
    for I := 0 to ImageList1.Count - 1 do
    begin
      ListItem := Items.Add;
      Listitem.Caption := 'Image' + IntToStr(I);
      ListItem.ImageIndex := I;
      Listitem.SubItems.Add(Col2Array[I]);
    end;
    // Create two columns to show during viewing as vsReport
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 1';
    NewColumn.Width := 200;
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 2';
    NewColumn.Width := 200;
    // Add View styles and constants to the Combo Box
    ComboBox1.Items.AddObject('vsIcon', TObject(vsIcon));
    ComboBox1.Items.AddObject('vsList', TObject(vsList));
    ComboBox1.Items.AddObject('vsReport', TObject(vsReport));
    ComboBox1.Items.AddObject(
      'vsSmallIcon', TObject(vsSmallIcon));
    // Display first item in the Combo Box
    ComboBox1.ItemIndex := 0;
  end;
end;

procedure TComboForm.ComboBox1Click(Sender: TObject);
begin
  with ComboBox1 do
    ListView1.ViewStyle := TViewStyle(Items.Objects[ItemIndex]);

end;
{
This example requires only a blank form.  All other objects:
TListView, TListColumns, TListItems, are created dynamically.
You must add comctrls to the uses clause of the unit file.
```

```
}
procedure TForm1.FormCreate(Sender: TObject);
const
  Names: array[0..5, 0..1] of string = (
    ('Rubble', 'Barney'),
    ('Michael', 'Johnson'),
    ('Bunny', 'Bugs'),
    ('Silver', 'HiHo'),
    ('Simpson', 'Bart'),
    ('Squirrel', 'Rocky')
    );

var
  I: Integer;
  NewColumn: TListColumn;
  ListItem: TListItem;
  ListView: TListView;
begin
  ListView := TListView.Create(Self);
  with ListView do
  begin
    Parent := Self;
    Align := alClient;
    ViewStyle := vsReport;

    NewColumn := Columns.Add;
    NewColumn.Caption := 'Last';
    NewColumn := Columns.Add;
    NewColumn.Caption := 'First';

    for I := Low(Names) to High(Names) do
    begin
      ListItem := Items.Add;
      ListItem.Caption := Names[I][0];
      ListItem.SubItems.Add(Names[I][1]);
    end;
  end;
end;
```

SmallImages (see page 3825)

StateImages (see page 3828)

27.1.19.5.36 TCustomListView.VisibleRowCount Property

Indicates number of items that can fit vertically in the visible area of a list view.

Pascal

```
property VisibleRowCount: Integer;
```

C++

```
__property int VisibleRowCount;
```

Description

Read VisibleRowCount to determine the number of items from a single column that can appear in the visible area of a list view when the ViewStyle (see page 3829) is either vsList or vsReport. Only fully visible items are counted. If VisibleRowCount is

less than the total number of items in a column, use the TopItem (see page 3828) property to determine if the list view is scrolled.

See Also

TopItem (see page 3828)

ViewStyle (see page 3829)

27.1.19.5.37 TCustomListView.WorkAreas Property

Defines separate working areas that divide the list view's client area.

Pascal

```
property WorkAreas: TWorkAreas;
```

C++

```
__property TWorkAreas WorkAreas;
```

Description

Use WorkAreas to define separate work areas that divide the client area of the list view when the ViewStyle (see page 3829) property is vsIcon or vsSmallIcon. Work areas are rectangular regions that the list view uses to arrange its icons. Each icon falls into a single work area, which is specified by its WorkArea property. Within each work area, icons are arranged in rows (or columns), wrapping at the right (or bottom) edge of the work area. If a work area is larger than the client area of the list view, the list view adds a scroll bar.

If WorkAreas contains no TWorkArea (see page 5425) objects, the list view arranges icons based on its client area.

Note: It is possible to create overlapping work areas, but this is not recommended. Icons that fall in the intersection of two or more work areas become members of the work area with the lowest index.

Warning:Work areas are not supported if the application is running in virtual mode.

27.1.19.6 TCustomListView Events

The events of the TCustomListView class are listed here.

Protected Events

	Name	Description
	OnAdvancedCustomDraw (see page 3834)	Occurs at discrete points during the rendering of the list view.
	OnAdvancedCustomDrawItem (see page 3835)	Occurs at discrete stages during the painting of an item in an owner-draw list view.
	OnAdvancedCustomDrawSubItem (see page 3835)	Occurs at discrete stages during the painting of a subitem in an owner-drawn list view.
	OnChange (see page 3836)	Occurs immediately after an item in the list changes.
	OnChanging (see page 3837)	Occurs when an item in the list is about to change.

	OnColumnClick (see page 3837)	Occurs when the user clicks on a column header in a list view.
	OnColumnDragged (see page 3840)	Occurs when a column is dragged to a new position.
	OnColumnRightClick (see page 3841)	Occurs when the user right clicks on a column header in a list view.
	OnCompare (see page 3841)	Occurs to when two items need to be compared during a sort of the list.
	OnCreateItemClass (see page 3844)	Occurs when a list item object is about to be created.
	OnCustomDraw (see page 3844)	Occurs when an owner-draw list view must be rendered.
	OnCustomDrawItem (see page 3845)	Occurs when an item in an owner-draw list view must be rendered.
	OnCustomDrawSubItem (see page 3846)	Occurs when a subitem must be rendered in an owner-draw list view.
	OnData (see page 3846)	Occurs immediately before an item is displayed in the list view control.
	OnDataFind (see page 3847)	Occurs when the list view control receives a search request, such as when the FindData (see page 3789) and FindCaption (see page 3788) methods are called.
	OnDataHint (see page 3847)	Occurs when the contents of the list view change, such as when the user scrolls the list view.
	OnDataStateChange (see page 3848)	Occurs when a range of items change states.
	OnDeletion (see page 3848)	Occurs when an item in the list view is about to be deleted.
	OnDrawItem (see page 3848)	Occurs when an item should be drawn in the list view.
	OnEdited (see page 3849)	Occurs immediately after the user edits an item's Caption property.
	OnEditing (see page 3850)	Occurs when the user starts to edit a list item's Caption property.
	OnGetImageIndex (see page 3850)	Occurs when an item is about to be displayed in the list view control.
	OnGetSubItemImage (see page 3850)	Occurs when a subitem is about to be displayed in the column of a list view control.
	OnInfoTip (see page 3851)	Occurs when the user pauses the mouse over an item in the list view.
	OnInsert (see page 3851)	Occurs immediately after a new item is inserted into the list view.
	OnSelectItem (see page 3852)	Occurs when an item is selected in the list view control.

27.1.19.6.1 TCustomListView.OnAdvancedCustomDraw Event

Occurs at discrete points during the rendering of the list view.

Pascal

```
property OnAdvancedCustomDraw: TLVAdvancedCustomDrawEvent;
```

C++

```
__property TLVAdvancedCustomDrawEvent OnAdvancedCustomDraw;
```

Description

Write an OnAdvancedCustomDraw event handler to customize the painting of the list view at various stages before its items are drawn. Unlike the OnDrawItem (see page 3848) event, the list view receives this event even if the OwnerDraw (see page 3821) property is false.

Sender is the list view that is about to be painted.

ARect indicates the dimensions of the list view on its Canvas (see page 3804).

Stage indicates the current stage in the drawing process. Note that the cdPreErase and cdPostErase stages do not receive event notification. The background must be drawn when the item is rendered.

DefaultDraw is used only when Stage is cdPrePaint. It indicates whether the list view should continue with the default painting after the event handler exits. Set DefaultDraw to false to prevent the drawing of the list view after event handler exits. If DefaultDraw remains set to true, the list view continues with the default painting process.

Note: OnAdvancedCustomDraw occurs at various stages during the paint process. If you are only writing code to execute immediately prior to rendering the list view, it is more efficient to use the OnCustomDraw (see page 3844) event.

OnAdvancedCustomDrawItem (see page 3835)

OnAdvancedCustomDrawSubItem (see page 3835)

Canvas (see page 3804)

OwnerDraw (see page 3821)

OnCustomDraw (see page 3844)

27.1.19.6.2 TCustomListView.OnAdvancedCustomDrawItem Event

Occurs at discrete stages during the painting of an item in an owner-draw list view.

Pascal

```
property OnAdvancedCustomDrawItem: TLVAdvancedCustomDrawItemEvent;
```

C++

```
__property TLVAdvancedCustomDrawItemEvent OnAdvancedCustomDrawItem;
```

Description

Write an OnAdvancedCustomDrawItem event handler to customize the drawing of individual items on the list view's canvas (using the Canvas (see page 3804) property). OnAdvancedCustomDrawItem occurs at various stages in the rendering of a list item.

Unlike the OnDrawItem (see page 3848) event, the list view receives this event even if the OwnerDraw (see page 3821) property is false. The OnAdvancedCustomDrawItem event handler provides slightly different state information than the OnDrawItem (see page 3848) event and occurs after the default rendering as well as before.

Sender is the list view whose item is drawn.

Item is the item that is currently being painted.

State indicates the state of the item, so that the event handler can adjust the image to reflect whether the item is selected, disabled, hot, and so on.

Stage indicates the current stage in drawing the list item. Note that the cdPreErase and cdPostErase stages do not receive event notification. The background must be drawn when the item is rendered.

DefaultDraw is used only when Stage is cdPrePaint. Set DefaultDraw to false if you don't want the control to paint the item's text after the event handler exits. If DefaultDraw remains true, the list view adds the item's text to the image on the canvas.

Note: OnAdvancedCustomDrawItem occurs at various stages during the paint process. If you are only writing code to execute immediately prior to rendering the list item, it is more efficient to use the OnCustomDrawItem (see page 3845) event.

OnAdvancedCustomDraw (see page 3834)

OnAdvancedCustomDrawSubItem (see page 3835)

Canvas (see page 3804)

OwnerDraw (see page 3821)

OnCustomDrawItem (see page 3845)

27.1.19.6.3 TCustomListView.OnAdvancedCustomDrawSubItem Event

Occurs at discrete stages during the painting of a subitem in an owner-drawn list view.

Pascal

```
property OnAdvancedCustomDrawSubItem: TLVAdvancedCustomDrawSubItemEvent;
```

C++

```
__property TLVAdvancedCustomDrawSubItemEvent OnAdvancedCustomDrawSubItem;
```

Description

Write an OnCustomDrawSubItem (see page 3846) event handler to customize the drawing of subitems that appear in additional columns to the right of each item when ViewStyle (see page 3829) is vsReport. Use the list view's Canvas (see page 3804) property as a drawing surface. OnAdvancedCustomDrawItem (see page 3835) occurs at various stages in the rendering of a subitems. Unlike the OnDrawItem (see page 3848) event, the list view receives this event even if the OwnerDraw (see page 3821) property is false.

The Sender Parameter specifies the list view that owns the subitems.

The Item parameter is the current Item being drawn.

The SubItem parameter is the index of the subitem of that list item in its SubItems property.

The State property indicates various attributes that can affect the way the subitem is drawn.

The Stage property indicates the current stage in the painting process. Note that the cdPreErase and cdPostErase stages do not receive event notification. The background must be drawn when the item is rendered.

DefaultDraw is only used when Stage is cdPrepaint. Set DefaultDraw to false to prevent the list view from adding the subitem's text after the event handler exits.

Note: OnAdvancedCustomDrawSubItem occurs at various stages during the paint process. If you are only writing code to execute immediately prior to rendering the subitem, it is more efficient to use the OnCustomDrawSubItem (see page 3846) event.

ViewStyle (see page 3829)

Canvas (see page 3804)

OwnerDraw (see page 3821)

OnAdvancedCustomDrawSubItem

27.1.19.6.4 TCustomListView.OnChange Event

Occurs immediately after an item in the list changes.

Pascal

```
property OnChange: TLVChangeEvent;
```

C++

```
__property TLVChangeEvent OnChange;
```

Description

Write an OnChange event handler to respond to changes in the list items. OnChange allows a response once the list has been successfully changed.

The Item parameter is the list item that just changed. The Change (see page 3778) parameter indicates the type of change

that just occurred. Change (see page 3778) is ctText if the Caption property of the item changed. Change (see page 3778) is ctImage if the ImageIndex property of the item changed or the appropriate image list changed in the list view. Change (see page 3778) is ctState if the Cut, Focused, or Selected (see page 3822) property of the item changed.

See Also

LargeImages (see page 3817)

OnChanging (see page 3837)

SmallImages (see page 3825)

Cut (see page 4259)

Focused (see page 4260)

Caption (see page 4258)

Selected (see page 4267)

ImageIndex (see page 4261)

27.1.19.6.5 TCustomListView.OnChanging Event

Occurs when an item in the list is about to change.

Pascal

```
property OnChanging: TLVChangingEvent;
```

C++

```
__property TLVChangingEvent OnChanging;
```

Description

Write an OnChanging event handler to conditionally block changes to an item in the list. Set the AllowChange parameter to false to prevent the change from taking place. The Item parameter is the list item that is about to change. The Change (see page 3778) parameter indicates the type of change that is about to happen.

See Also

OnChange (see page 3836)

TListItem (see page 4250)

27.1.19.6.6 TCustomListView.OnColumnClick Event

Occurs when the user clicks on a column header in a list view.

Pascal

```
property OnColumnClick: TLVColumnClickEvent;
```

C++

```
__property TLVColumnClickEvent OnColumnClick;
```

Description

Write an OnColumnClick event handler to respond to clicks made in the column header when ViewStyle (see page 3829) is vsReport. The Column (see page 3806) parameter is the TListColumn (see page 4236) object from the Columns (see page 3808) property that describes the column that was clicked.

OnColumnClick only occurs when ViewStyle (see page 3829) is vsReport and ShowColumnHeaders (see page 3824) is

true.

C++ Examples:

```
/*
This example shows how to use the OnColumnClick and
OnCompare events of a list view to let users sort the
columns in a report-style list view by clicking on the
column headers. This requires a global variable to keep
track of the column that was clicked.  The OnColumnClick
event handler sets the global variable to indicate the
column to sort and calls AlphaSort:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {
    "C++ Image", "Borland Image", "Delphi Image"};
  const char Col2Array[3][40] = {
    "Documentation for the C++ icon.",
    "Borland icon.", "Delphi icon."
    };
  // Create a ListView item for each image in the ImageList
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
    Item = ListView1->Items->Add();
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 1";
  Column->Width = 200;
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 2";
  Column->Width = 200;
  ListView1->ViewStyle = vsReport;
}

int ColumnToSort = 0;

/*
The OnColumnClick event handler sets the global variable to
indicate the column to sort and calls AlphaSort:
*/

void __fastcall TForm1::ListView1ColumnClick(TObject *Sender,
      TListColumn *Column)
{
  ColumnToSort = Column->Index;
  ((TCustomListView *)Sender)->AlphaSort();
}

/*
The OnCompare event handler causes the list view to sort on
the selected column:
*/

void __fastcall TForm1::ListView1Compare(TObject *Sender, TListItem *Item1,
      TListItem *Item2, int Data, int &Compare)
{
  if (ColumnToSort == 0)
```

```
    Compare = CompareText(Item1->Caption,Item2->Caption);
  else
  {
    int ix = ColumnToSort - 1;
    Compare =
      CompareText(Item1->SubItems->Strings[ix], Item2->SubItems->Strings[ix]);
  }
}
```

Delphi Examples:

```
{
This example shows how to use the OnColumnClick and
OnCompare events of a list view to let users sort the
columns in a report-style list view by clicking on the
column headers. This requires a global variable to keep
track of the column that was clicked.  The OnColumnClick
event handler sets the global variable to indicate the
column to sort and calls AlphaSort:
}
var ColumnToSort: Integer;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
  ListItem: TListItem;
  NewColumn: TListColumn;
const
  imagenames: Array[0..2] of string = ('C++ Image', 'Borland Image', 'Delphi Image');
begin
  Col2Array[0]:= 'Documentation for the C++ icon.';
  Col2Array[1]:= 'Borland icon.';
  Col2Array[2]:= 'Delphi icon.';
  // Create a ListView item for each image in the ImageList
  with ListView1 do
  begin
    SmallImages := ImageList1;
    LargeImages := ImageList1;
    for I := 0 to ImageList1.Count - 1 do
    begin
      ListItem := Items.Add;
      Listitem.Caption := imagenames[I];
      ListItem.ImageIndex := I;
      Listitem.SubItems.Add(Col2Array[I]);
    end;
    // Create two columns to show during viewing as vsReport
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 1';
    NewColumn.Width := 200;
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 2';
    NewColumn.Width := 200;
    ListView1.ViewStyle := vsReport;
  end;
end;

procedure TForm1.ListView1ColumnClick(Sender: TObject; Column: TListColumn);
begin
  ColumnToSort := Column.Index;
  (Sender as TCustomListView).AlphaSort;
end;

{
The OnCompare event handler causes the list view to sort on
the selected column:
}
procedure TForm1.ListView1Compare(Sender: TObject; Item1, Item2: TListItem; Data: Integer; var
```

```
  Compare: Integer);
  var
    ix: Integer;
  begin
    if ColumnToSort = 0 then
      Compare := CompareText(Item1.Caption,Item2.Caption)
    else begin
     ix := ColumnToSort - 1;
     Compare := CompareText(Item1.SubItems[ix],Item2.SubItems[ix]);
    end;
  end;
  {
  Note:   This OnCompare event handler uses the global
  CompareText function. An application may want to use
  AnsiCompareText, CompareStr, or AnsiCompareStr instead,
  depending on whether the comparison should be case-sensitive
  and whether the locale should be considered.
  }
```

ColumnClick (see page 3808)

Columns (see page 3808)

ShowColumnHeaders (see page 3824)

TListColumn (see page 4236)

ViewStyle (see page 3829)

OnColumnRightClick (see page 3841)

27.1.19.6.7 TCustomListView.OnColumnDragged Event

Occurs when a column is dragged to a new position.

Pascal

```
property OnColumnDragged: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnColumnDragged;
```

Description

Write an OnColumnDragged event handler to respond when the user drags a column to a new position. OnColumnDragged occurs after all columns are in their new positions but before the list view repaints to reflect the change.

OnColumnClick (see page 3837) only occurs when ViewStyle (see page 3829) is vsReport and ShowColumnHeaders (see page 3824) is true.

Tip: To uniquely identify columns so that you can recognize them after they are repositioned, use the list column's Tag property.

See Also

ViewStyle (see page 3829)

ShowColumnHeaders (see page 3824)

Tag (see page 4244)

Columns (see page 3808)

OnColumnClick (see page 3837)

27.1.19.6.8 TCustomListView.OnColumnRightClick Event

Occurs when the user right clicks on a column header in a list view.

Pascal

```
property OnColumnRightClick: TLVColumnRClickEvent;
```

C++

```
__property TLVColumnRClickEvent OnColumnRightClick;
```

Description

Write an OnColumnRightClick event handler to respond to right clicks made in the column header when ViewStyle (see page 3829) is vsReport.

The Sender parameter is the list view that the user clicked.

The Column (see page 3806) parameter is the TListColumn (see page 4236) object from the Columns (see page 3808) property for the column that was clicked.

The point parameter indicates where the user clicked the mouse, in client coordinates.

OnColumnRightClick only occurs when ViewStyle (see page 3829) is vsReport, and ShowColumnHeaders (see page 3824) is true, and ColumnRightClick is true.

See Also

Columns (see page 3808)

ShowColumnHeaders (see page 3824)

TListColumn (see page 4236)

ViewStyle (see page 3829)

OnContextPopup (see page 5854)

27.1.19.6.9 TCustomListView.OnCompare Event

Occurs to when two items need to be compared during a sort of the list.

Pascal

```
property OnCompare: TLVCompareEvent;
```

C++

```
__property TLVCompareEvent OnCompare;
```

Description

Write an OnCompare event handler to implement a sort order for the list. An OnCompare event handler is called when the SortType (see page 3827) property is stData or stBoth, when the AlphaSort (see page 3774) method is called, or when the CustomSort (see page 3784) method is called without a SortProc parameter.

The OnCompare event handler compares the list items passed as the Item1 and Item2 parameters. If Item1 is the same as Item2 in the sort order, set the Compare parameter to 0. If Item1 is less than Item2, set the Compare parameter to a value less than 0. If Item1 is greater than Item2, set the Compare parameter to a value greater than 0.

The Data parameter is 0 when the event handler is called to maintain the sort order of a list view with a SortType (see page 3827) of stData or stBoth. Similarly, when OnCompare occurs in response to the AlphaSort (see page 3774) method, the Data parameter is 0. When OnCompare occurs in response to the CustomSort (see page 3784) method, the Data parameter is the

value of the LParam parameter of CustomSort (see page 3784).

C++ Examples:

```
/*
This example shows how to use the OnColumnClick and
OnCompare events of a list view to let users sort the
columns in a report-style list view by clicking on the
column headers. This requires a global variable to keep
track of the column that was clicked.  The OnColumnClick
event handler sets the global variable to indicate the
column to sort and calls AlphaSort:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {
    "C++ Image", "Borland Image", "Delphi Image"};
  const char Col2Array[3][40] = {
    "Documentation for the C++ icon.",
    "Borland icon.", "Delphi icon."
    };
  // Create a ListView item for each image in the ImageList
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
    Item = ListView1->Items->Add();
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 1";
  Column->Width = 200;
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 2";
  Column->Width = 200;
  ListView1->ViewStyle = vsReport;
}

int ColumnToSort = 0;

/*
The OnColumnClick event handler sets the global variable to
indicate the column to sort and calls AlphaSort:
*/

void __fastcall TForm1::ListView1ColumnClick(TObject *Sender,
      TListColumn *Column)
{
  ColumnToSort = Column->Index;
  ((TCustomListView *)Sender)->AlphaSort();
}

/*
The OnCompare event handler causes the list view to sort on
the selected column:
*/

void __fastcall TForm1::ListView1Compare(TObject *Sender, TListItem *Item1,
      TListItem *Item2, int Data, int &Compare)
{
  if (ColumnToSort == 0)
```

```
    Compare = CompareText(Item1->Caption,Item2->Caption);
  else
  {
    int ix = ColumnToSort - 1;
    Compare =
      CompareText(Item1->SubItems->Strings[ix], Item2->SubItems->Strings[ix]);
  }
}
```

Delphi Examples:

```
{
This example shows how to use the OnColumnClick and
OnCompare events of a list view to let users sort the
columns in a report-style list view by clicking on the
column headers. This requires a global variable to keep
track of the column that was clicked.  The OnColumnClick
event handler sets the global variable to indicate the
column to sort and calls AlphaSort:
}
var ColumnToSort: Integer;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
  ListItem: TListItem;
  NewColumn: TListColumn;
const
  imagenames: Array[0..2] of string = ('C++ Image', 'Borland Image', 'Delphi Image');
begin
  Col2Array[0]:= 'Documentation for the C++ icon.';
  Col2Array[1]:= 'Borland icon.';
  Col2Array[2]:= 'Delphi icon.';
  // Create a ListView item for each image in the ImageList
  with ListView1 do
  begin
    SmallImages := ImageList1;
    LargeImages := ImageList1;
    for I := 0 to ImageList1.Count - 1 do
    begin
      ListItem := Items.Add;
      Listitem.Caption := imagenames[I];
      ListItem.ImageIndex := I;
      Listitem.SubItems.Add(Col2Array[I]);
    end;
    // Create two columns to show during viewing as vsReport
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 1';
    NewColumn.Width := 200;
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 2';
    NewColumn.Width := 200;
    ListView1.ViewStyle := vsReport;
  end;
end;

procedure TForm1.ListView1ColumnClick(Sender: TObject; Column: TListColumn);
begin
  ColumnToSort := Column.Index;
  (Sender as TCustomListView).AlphaSort;
end;

{
The OnCompare event handler causes the list view to sort on
the selected column:
}
procedure TForm1.ListView1Compare(Sender: TObject; Item1, Item2: TListItem; Data: Integer; var
```

```
  Compare: Integer);
  var
    ix: Integer;
  begin
    if ColumnToSort = 0 then
      Compare := CompareText(Item1.Caption,Item2.Caption)
    else begin
     ix := ColumnToSort - 1;
     Compare := CompareText(Item1.SubItems[ix],Item2.SubItems[ix]);
    end;
  end;
  {
  Note:   This OnCompare event handler uses the global
  CompareText function. An application may want to use
  AnsiCompareText, CompareStr, or AnsiCompareStr instead,
  depending on whether the comparison should be case-sensitive
  and whether the locale should be considered.
  }
```

CustomSort (see page 3784)

SortType (see page 3827)

27.1.19.6.10 TCustomListView.OnCreateItemClass Event

Occurs when a list item object is about to be created.

Pascal

```
property OnCreateItemClass: TLVCreateItemClassEvent;
```

C++

```
__property TLVCreateItemClassEvent OnCreateItemClass;
```

Description

OnCreateItemClass occurs when a new item object is about to be created.

Sender is the list view object that needs to add a new panel.

Item class returns a class reference that is instantiated to create a new item object.

27.1.19.6.11 TCustomListView.OnCustomDraw Event

Occurs when an owner-draw list view must be rendered.

Pascal

```
property OnCustomDraw: TLVCustomDrawEvent;
```

C++

```
__property TLVCustomDrawEvent OnCustomDraw;
```

Description

Write an OnCustomDraw event handler to draw to the list view's Canvas (see page 3804) before its items are painted. Unlike the OnDrawItem (see page 3848) event, the list view receives this event even if the OwnerDraw (see page 3821) property is false.

Sender is the list view that is about to be painted.

ARect indicates the dimensions of the list view on its Canvas (see page 3804).

DefaultDraw indicates whether the list view should continue with the default painting after the event handler exits. Set DefaultDraw to false to prevent the drawing of the list view after event handler exits. If DefaultDraw remains set to true, the list view continues with the default painting process.

Note: OnCustomDraw occurs immediately prior to the rendering of the list view control. To augment the default drawing process at other stages (such as when the background is erased or after the list view is drawn), use the OnAdvancedCustomDraw (see page 3834) event instead.

See Also

OnCustomDrawItem (see page 3845)

OnCustomDrawSubItem (see page 3846)

Canvas (see page 3804)

OwnerDraw (see page 3821)

OnAdvancedCustomDraw (see page 3834)

27.1.19.6.12 TCustomListView.OnCustomDrawItem Event

Occurs when an item in an owner-draw list view must be rendered.

Pascal

```
property OnCustomDrawItem: TLVCustomDrawItemEvent;
```

C++

```
__property TLVCustomDrawItemEvent OnCustomDrawItem;
```

Description

Write code in an OnCustomDrawItem handler to draw individual items on the list view's canvas (using the Canvas (see page 3804) property) before an item is painted.

Unlike the OnDrawItem (see page 3848) event, the list view receives this event even if the OwnerDraw (see page 3821) property is false. The OnCustomDrawItem event handler provides slightly different state information than the OnDrawItem (see page 3848) event.

Sender is the list view whose item is to be drawn.

Item is the item that should be rendered.

State indicates the state of the item, so that the event handler can adjust the image to reflect whether the item is selected, disabled, hot, and so on.

Set DefaultDraw to false if you don't want the control to paint the item's text after the event handler exits. If DefaultDraw remains true, the list view adds the item's text to the image on the canvas.

Note: OnCustomDrawItem occurs immediately prior to the rendering of each list item. To augment the default drawing process at other stages (such as after the list item is drawn), use the OnAdvancedCustomDrawItem (see page 3835) event instead.

OnCustomDraw (see page 3844)

OnCustomDrawSubItem (see page 3846)

Canvas (see page 3804)

OwnerDraw (see page 3821)

OnDrawItem (see page 3848)

OnAdvancedCustomDrawItem (see page 3835)

27.1.19.6.13 TCustomListView.OnCustomDrawSubItem Event

Occurs when a subitem must be rendered in an owner-draw list view.

Pascal

```
property OnCustomDrawSubItem: TLVCustomDrawSubItemEvent;
```

C++

```
__property TLVCustomDrawSubItemEvent OnCustomDrawSubItem;
```

Description

Write code in an OnCustomDrawSubItem handler to draw to the subitems that appear in additional columns to the right of each item when ViewStyle (see page 3829) is vsReport. Use the list view's Canvas (see page 3804) property as a drawing surface. Unlike the OnDrawItem (see page 3848) event, the list view receives this event even if the OwnerDraw (see page 3821) property is false.

The Sender Parameter specifies the list view that owns the subitems. The Item parameter is the current Item being drawn. The SubItem parameter is the index of the subitem of that list item in its SubItems property. The State property indicates various attributes that can affect the way the subitem is drawn. Set DefaultDraw to False to prevent the list view from adding the subitem's text after the event handler exits.

Note: OnCustomDrawSubItem occurs immediately prior to the rendering of each subitem. To augment the default drawing process at other stages (such as after the subitem is drawn), use the OnAdvancedCustomDrawSubItem (see page 3835) event instead.

See Also

OnCustomDrawItem (see page 3845)

SubItems (see page 4268)

ViewStyle (see page 3829)

Canvas (see page 3804)

OwnerDraw (see page 3821)

OnAdvancedCustomDrawSubItem (see page 3835)

27.1.19.6.14 TCustomListView.OnData Event

Occurs immediately before an item is displayed in the list view control.

Pascal

```
property OnData: TLVOwnerDataEvent;
```

C++

```
__property TLVOwnerDataEvent OnData;
```

Description

Use OnData to customize an item before it is displayed in the list view control. Set the properties of the list item in the event handler so that they appear correctly when the item is drawn.

OnData occurs only if OwnerData (see page 3820) is true.

See Also

OwnerData (see page 3820)

OnDataFind (see page 3847)

OnDataHint (see page 3847)

OnDataStateChange (see page 3848)

27.1.19.6.15 TCustomListView.OnDataFind Event

Occurs when the list view control receives a search request, such as when the FindData (see page 3789) and FindCaption (see page 3788) methods are called.

Pascal

```
property OnDataFind: TLVOwnerDataFindEvent;
```

C++

```
__property TLVOwnerDataFindEvent OnDataFind;
```

Description

Use OnDataFind to locate an item and return custom data associated with it.

OnDataFind occurs only if OwnerData (see page 3820) is true.

See Also

OwnerData (see page 3820)

OnData (see page 3846)

OnDataHint (see page 3847)

OnDataStateChange (see page 3848)

27.1.19.6.16 TCustomListView.OnDataHint Event

Occurs when the contents of the list view change, such as when the user scrolls the list view.

Pascal

```
property OnDataHint: TLVOwnerDataHintEvent;
```

C++

```
__property TLVOwnerDataHintEvent OnDataHint;
```

Description

Use OnDataHint to update a range of items before the OnData (see page 3846) event occurs. This method of updating items is more efficient than individually updating items in the OnData (see page 3846) event handler. The range of items specified in the OnDataHint does not always match the range of items for which the OnData (see page 3846) event handler is called; therefore, you must be prepared to update individual items in the OnData (see page 3846) event handler as well.

OnDataHint occurs only if OwnerData (see page 3820) is true.

See Also

OwnerData (see page 3820)

OnDataFind (see page 3847)

OnData (see page 3846)

OnDataStateChange (see page 3848)

27.1.19.6.17 TCustomListView.OnDataStateChange Event

Occurs when a range of items change states.

Pascal

```
property OnDataStateChange: TLVOwnerDataStateChangeEvent;
```

C++

```
__property TLVOwnerDataStateChangeEvent OnDataStateChange;
```

Description

Use OnDataStateChange to respond when an item's state changes.

OnDataStateChange occurs only if OwnerData (see page 3820) is true.

See Also

OwnerData (see page 3820)

OnDataFind (see page 3847)

OnDataHint (see page 3847)

OnData (see page 3846)

27.1.19.6.18 TCustomListView.OnDeletion Event

Occurs when an item in the list view is about to be deleted.

Pascal

```
property OnDeletion: TLVDeletedEvent;
```

C++

```
__property TLVDeletedEvent OnDeletion;
```

Description

Write an OnDeletion event handler to respond when an item in the list is about to be deleted. The Item parameter is the TListItem (see page 4250) object from the Items (see page 3814) property that is about to be deleted.

See Also

Items (see page 3814)

OnInsert (see page 3851)

TListItem (see page 4250)

27.1.19.6.19 TCustomListView.OnDrawItem Event

Occurs when an item should be drawn in the list view.

Pascal

```
property OnDrawItem: TLVDrawItemEvent;
```

C++

```
__property TLVDrawItemEvent OnDrawItem;
```

Description

Write code in an OnDrawItem handler to manually draw items in the list view. This event occurs only if OwnerDraw (see page 3821) is true.

Note: List views receive several other custom draw events, including OnCustomDraw (see page 3844), OnCustomDrawItem (see page 3845), OnCustomDrawSubItem (see page 3846), OnAdvancedCustomDraw (see page 3834), OnAdvancedCustomDrawItem (see page 3835), and OnAdvancedCustomDrawSubItem (see page 3835). These other events, unlike OnDrawItem, occur regardless of the value of the OwnerDraw (see page 3821) property. They provide slightly different information about the state of the item to be drawn, and the OnAdvancedXXX events occur at more points during the paint process.

See Also

OnCustomDraw (see page 3844)

OnCustomDrawSubItem (see page 3846)

Canvas (see page 3804)

OwnerDraw (see page 3821)

OnCustomDrawItem (see page 3845)

OnAdvancedCustomDraw (see page 3834)

OnAdvancedCustomDrawItem (see page 3835)

OnAdvancedCustomDrawSubItem (see page 3835)

27.1.19.6.20 TCustomListView.OnEdited Event

Occurs immediately after the user edits an item's Caption property.

Pascal

```
property OnEdited: TLVEditedEvent;
```

C++

```
__property TLVEditedEvent OnEdited;
```

Description

Write an OnEdited event to take specific action when a user has finished editing the text of a list item. An OnEdited event handler can respond to the value the user typed, or change the value that is assigned to the list item's Caption property. For example, if an OnEdited event handler can check the validity of the string typed by the user, and only allow the Caption property to be changed if the new value is valid.

The Item parameter is the list item that was just edited. The S parameter is the new value the user typed for the item's Caption property. Change (see page 3778) the value of S to override the value the user typed. When OnEdited occurs, the item's Caption property has not yet been changed, so S can still be compared to the original value of Caption.

This event can occur only if ReadOnly (see page 3821) is set to false.

See Also

OnEditing (see page 3850)

ReadOnly (see page 3821)

Caption (see page 4258)

27.1.19.6.21 TCustomListView.OnEditing Event

Occurs when the user starts to edit a list item's Caption property.

Pascal

```
property OnEditing: TLVEditingEvent;
```

C++

```
__property TLVEditingEvent OnEditing;
```

Description

Write an OnEditing event handler to take specific action just before a user edits a list item's Caption property. To prevent the user from editing the item specified by the ListItem parameter, set the AllowEdit parameter to false.

This event can occur only if the ReadOnly (see page 3821) property is set to false.

See Also

OnEdited (see page 3849)

ReadOnly (see page 3821)

Caption (see page 4258)

27.1.19.6.22 TCustomListView.OnGetImageIndex Event

Occurs when an item is about to be displayed in the list view control.

Pascal

```
property OnGetImageIndex: TLVNotifyEvent;
```

C++

```
__property TLVNotifyEvent OnGetImageIndex;
```

Description

Use OnGetImageIndex to dynamically assign an ImageIndex to the item before it is displayed in the list view control.

See Also

OnGetSubItemImage (see page 3850)

ImageIndex (see page 4261)

27.1.19.6.23 TCustomListView.OnGetSubItemImage Event

Occurs when a subitem is about to be displayed in the column of a list view control.

Pascal

```
property OnGetSubItemImage: TLVSubItemImageEvent;
```

C++

```
__property TLVSubItemImageEvent OnGetSubItemImage;
```

Description

Use OnGetSubItemImage to dynamically assign an image to a subitem before it is displayed in the column of a list view control.

This event overrides the value specified by the list item's SubItemImages property.

The Sender parameter is the list view that is being painted.

The Item parameter is the item whose subitem is being painted.

The SubItem parameter identifies the subitem from the list item's SubItems property.

The ImageIndex parameter is an index into the list view's SmallImages (see page 3825) property. On entry to the event handler, ImageIndex is initialized to the value specified by the list item's SubItemImages property for the subitem. Use this event handler to change that value or to suppress the image by setting ImageIndex to –1.

Note: OnGetSubItemImage only occurs if the list view's ViewStyle (see page 3829) property is vsReport and the current list item's SubItems property contains subitems.

See Also

OnGetImageIndex (see page 3850)

SubItemImages (see page 4268)

SmallImages (see page 3825)

27.1.19.6.24 TCustomListView.OnInfoTip Event

Occurs when the user pauses the mouse over an item in the list view.

Pascal

```
property OnInfoTip: TLVInfoTipEvent;
```

C++

```
__property TLVInfoTipEvent OnInfoTip;
```

Description

Use OnInfoTip to provide help hints that are specific to individual items in the list view.

By default, when Help hints are enabled (that is, when ShowHint is true), the list view displays the hint specified by its Hint property. OnInfoTip allows the list view to override this value to specify a hint that is specific to the item under the mouse.

The Sender parameter is the list view under the mouse.

The Item parameter is the list item under the mouse.

The InfoTip parameter returns a string that appears in a help hint window. On entry to the event handler, InfoTip is the item's Caption. If the event handler assigns an empty string, no hint is displayed. Otherwise, a hint window appears that displays the value of InfoTip.

See Also

Hint (see page 5827)

Caption (see page 4258)

ShowHint (see page 5840)

27.1.19.6.25 TCustomListView.OnInsert Event

Occurs immediately after a new item is inserted into the list view.

Pascal

```
property OnInsert: TLVDeletedEvent;
```

C++

```
__property TLVDeletedEvent OnInsert;
```

Description

Write an OnInsert event handler to respond when an item has just been added to the list. The Item parameter is the TListItem (see page 4250) object that was added to the Items (see page 3814) property.

See Also

Items (see page 3814)

OnDeletion (see page 3848)

TListItem (see page 4250)

27.1.19.6.26 TCustomListView.OnSelectItem Event

Occurs when an item is selected in the list view control.

Pascal

```
property OnSelectItem: TLVSelectItemEvent;
```

C++

```
__property TLVSelectItemEvent OnSelectItem;
```

Description

Use OnSelectItem to perform actions when an item is selected.

C++ Examples:

```
/*
This code resizes the active control to twice as wide and
half as high:
*/
void __fastcall TForm1::ButtonTSClick(TObject *Sender)
{
  TRect MyRect;
  if (myActiveControl == NULL) exit;
  MyRect = myActiveControl->BoundsRect;
  MyRect.Right = MyRect.Left + (MyRect.Right - MyRect.Left) / 2;
  MyRect.Bottom = MyRect.Top + 2 * (MyRect.Bottom - MyRect.Top);
  myActiveControl->BoundsRect = MyRect;
}
void __fastcall TForm1::ButtonSFClick(TObject *Sender)
{
  TRect MyRect;
  if (myActiveControl == NULL) exit;
  MyRect = myActiveControl->BoundsRect;
  MyRect.Right = MyRect.Left + 2 * (MyRect.Right - MyRect.Left);
  MyRect.Bottom = MyRect.Top + (MyRect.Bottom - MyRect.Top) / 2;
  myActiveControl->BoundsRect = MyRect;
}
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TComponent *Temp;
  TListItem *ListItem;
  ListView1->ViewStyle = vsList;
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Components: ";
  for (int I = ComponentCount - 1; I >= 0; I--)
  {
    Temp = Components[I];
```

```
    ListItem = ListView1->Items->Add();
    ListItem->Caption = Temp->Name;
  }
}
void __fastcall TForm1::ListView1SelectItem(TObject *Sender, TListItem *Item,
      bool Selected)
{
  TComponent *comp = FindComponent(Item->Caption);
  if (dynamic_cast<TWinControl *>(comp) != NULL)
    myActiveControl = (TWinControl *)comp;
}
```

Delphi Examples:

```
{
This code resizes the active control to twice as wide and
half as high:
}
procedure TForm1.ButtonSFClick(Sender: TObject);
var
  MyRect: TRect;
begin
  if (myActiveControl = nil) then exit;
  MyRect := myActiveControl.BoundsRect;
  MyRect.Right := MyRect.Left + (MyRect.Right - MyRect.Left) * 2;
  MyRect.Bottom := MyRect.Top + (MyRect.Bottom - MyRect.Top) div 2;
  myActiveControl.BoundsRect := MyRect;
end;

procedure TForm1.ButtonTSClick(Sender: TObject);
var
  MyRect: TRect;
begin
  if (myActiveControl = nil) then exit;
  MyRect := myActiveControl.BoundsRect;
  MyRect.Right := MyRect.Left + (MyRect.Right - MyRect.Left) div 2;
  MyRect.Bottom := MyRect.Top + (MyRect.Bottom - MyRect.Top) * 2;
  myActiveControl.BoundsRect := MyRect;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
  Temp: TComponent;
  ListItem: TListItem;
begin
  ListView1.ViewStyle := vsList;
  ListItem := ListView1.Items.Add;
  ListItem.Caption := 'Components: ';
  for I := ComponentCount - 1 downto 0 do
  begin
    Temp := Components[I];
    begin
      ListItem := ListView1.Items.Add;
      ListItem.Caption := Temp.Name;
    end;
  end;
end;

procedure TForm1.ListView1SelectItem(Sender: TObject; Item: TListItem;
  Selected: Boolean);
var comp: TComponent;
begin
  comp := FindComponent(Item.Caption);
  if comp is TWinControl then
    myActiveControl := TWinControl(comp);
end;
```

27.1.20 TCustomRichEdit Class

TCustomRichEdit is the base type for rich edit controls such as TRichEdit (see page 4685).

Class Hierarchy

Pascal

```
TCustomRichEdit = class(TCustomMemo);
```

C++

```
class TCustomRichEdit : public TCustomMemo;
```

File

ComCtrls

Description

TCustomRichEdit introduces new properties and methods to expand the capabilities of TCustomMemo for rich text.

Do not create instances of TCustomRichEdit. Use TCustomRichEdit as a base class when declaring control objects that implement rich text capabilities in an edit control. Properties and methods of TCustomRichEdit provide basic behavior that descendant classes inherit as well as behavior that components can override to customize their behavior.

See Also

TConversion (see page 3582)

TParaAttributes (see page 4606)

TRichEdit (see page 4685)

TTextAttributes (see page 4982)

27.1.20.1 TCustomRichEdit Members

The following tables list the members exposed by TCustomRichEdit.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnChange (see page 21275)	Occurs when the text for the edit control may have changed.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnProtectChange (see page 3888)	Occurs when a user attempts to modify text that is marked as protected.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnResizeRequest (see page 3889)	Occurs when the text has grown either smaller or larger than the control's window size.
	OnSaveClipboard (see page 3890)	Occurs when the window of the edit control is about to be destroyed and the edit control has delayed rendering of text copied to the clipboard..
	OnSelectionChange (see page 3890)	Occurs when the current selection changes.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21245)	Generates an OnChange (see page 21275) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 3868)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWindowHandle (see page 21248)	Creates a Windows control to represent the control.
V	CreateWindowHandle (see page 21376)	Creates a window based on the window-creation parameter record.
V	CreateWnd (see page 3868)	Creates a Windows control corresponding to the edit control.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.

	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 3868)	Destroys the rich edit control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoSetMaxLength (see page 3869)	Sets the MaxLength property.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetCaretPos (see page 3871)	Returns the cursor position.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.

	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSelLength (see page 3871)	Returns the SelLength property.
	GetSelStart (see page 3872)	Returns the SelStart property.
	GetSelText (see page 3872)	Returns the SelText property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyPress (see page 21377)	Ensures that return characters are not entered into the text when WantReturns (see page 21384) is false.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	Loaded (see page 21377)	Initializes the memo control when it is first loaded into memory.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.

	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	RequestSize (see page 3874)	Resize request event dispatcher.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectionChange (see page 3875)	Selection change event dispatcher.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAlignment (see page 21377)	Sets the Alignment (see page 21379) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetAutoSize (see page 21257)	Sets the AutoSize (see page 21260) property.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetCaretPos (see page 3875)	Sets the cursor position in the text.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetLines (see page 21378)	Sets the Lines (see page 21380) property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetScrollBars (see page 21378)	Sets the ScrollBars (see page 21381) property.
	SetSelLength (see page 3876)	Sets the SelLength property.
	SetSelStart (see page 3876)	Returns the SelStart property.
	SetWordWrap (see page 21379)	Sets the WordWrap (see page 21384) property.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.

	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	Alignment (see page 21379)	Determines how the text is aligned within the memo control.
	AutoSelect (see page 21260)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	AutoSize (see page 21260)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderStyle (see page 21261)	Determines whether the edit control has a single line border around the client area.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	CharCase (see page 21262)	Determines the case of the text within the edit control.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	HideScrollBars (see page 3879)	Determines whether the scroll bars disappear when not needed.
	HideSelection (see page 3881)	Determines whether the visual indication of the selected text remains when focus shifts to another control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	Lines (see page 3882)	Contains the individual lines of text in the rich text edit control.

	MaxLength (see page 21263)	Specifies the maximum number of characters the user can enter into the edit control.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	OEMConvert (see page 21264)	Determines whether characters typed in the edit control are converted from ANSI to OEM and then back to ANSI.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentColor (see page 21264)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PasswordChar (see page 21265)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PlainText (see page 3886)	Controls (see page 5711) whether the rich edit control treats the text as plain text or rich text when streaming to or from a file.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	ScrollBars (see page 21381)	Determines whether the memo control has scroll bars.
	Text (see page 5842)	Contains a text string associated with the control.
	WantReturns (see page 21384)	Determines whether the user can insert return characters into the text.
	WantTabs (see page 21384)	Determines whether the user can insert tab characters into the text.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.
	WordWrap (see page 21384)	Determines whether the edit control inserts soft carriage returns so text wraps at the right margin.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 3867)	Deletes all text from the rich edit control.
	ClearSelection (see page 21245)	Removes the selected text from the edit control.
	ClearUndo (see page 21246)	Clears the undo buffer so that no changes to the text can be backed out.

	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	CopyToClipboard (see page 21246)	Copies the selected text in the edit control to the Clipboard in CF_TEXT format.
V	Create (see page 3866)	Creates an instance of TCustomRichEdit (see page 3854).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	CutToClipboard (see page 21249)	Copies the selected text to the Clipboard in CF_TEXT format and then deletes the selection.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 21250)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 3866)	Destroys an instance of TCustomRichEdit (see page 3854).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindText (see page 3869)	Searches a given range in the text for a target string.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
V	GetControlsAlignment (see page 21376)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.

	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetSelTextBuf (see page 3872)	Copies the selected text into a buffer and returns the number of characters copied.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	PasteFromClipboard (see page 21254)	Pastes the contents of the Clipboard into edit control, replacing the current selection.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	Print (see page 3873)	Formats and prints the contents of the rich edit control.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RegisterConversionFormat (see page 3874)	Registers an association between a file extension and a TConversion (see page 3582) object that can convert between the native file format and rich text format (RTF).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.

	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SelectAll (see page 21255)	Selects all text in the edit control.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSelTextBuf (see page 21258)	Replaces the selected text with a null-terminated string.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Undo (see page 21259)	Backs out all changes in the undo buffer.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	CanUndo (see page 21262)	Indicates whether the edit control contains changes that can be backed out.
	CaretPos (see page 21380)	Indicates the position of the caret in the client area of the memo.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DefAttributes (see page 3877)	Describes the rich text characteristics of the default font for the rich edit control

	DefaultConverter (see page 3878)	Specifies the class of the TConversion (see page 3582) object that is used to convert between native file format and the internal format of a rich text control when working with files that do not have a registered extension.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Modified (see page 21263)	Indicates whether the user edited the text of the edit control.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	PageRect (see page 3884)	Specifies the dimensions, in pixels, of the logical page size used when printing the contents of a rich text edit control.
R	Paragraph (see page 3884)	Specifies the formatting information for the current paragraphs.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ReadOnly (see page 21265)	Determines whether the user can change the text of the edit control.
	SelAttributes (see page 3887)	Describes the rich text characteristics of the selected text in the rich edit control.
	SelLength (see page 21265)	Specifies the number of characters (bytes) that are selected.
	SelStart (see page 21269)	Specifies the position of the first selected character in the text.
	SelText (see page 21272)	Specifies the selected portion of the edit control's text.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	Text (see page 21273)	Contains a text string associated with the control.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.

	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	TabStop (see page 21273)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

27.1.20.2 TCustomRichEdit.Create Constructor

Creates an instance of TCustomRichEdit (see page 3854).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRichEdit(TComponent * AOwner);
```

Description

Call Create to create an instance of TCustomRichEdit (see page 3854) at runtime. Rich edit controls added to forms at design time are created automatically.

AOwner is a component, typically the form, that becomes the value of the Owner property.

See Also

Owner (see page 2807)

ParentWindow (see page 6210)

27.1.20.3 TCustomRichEdit.Destroy Destructor

Destroys an instance of TCustomRichEdit (see page 3854).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomRichEdit();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TCustomRichEdit (see page 3854) reference is not nil and only then calls Destroy.

Destroy overrides the inherited method to destroy all the helper objects that were allocated to manage the rich text, before calling

the inherited destructor.

See Also

Free (see page 22300)

27.1.20.4 TCustomRichEdit Methods

The methods of the TCustomRichEdit class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 3868)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateWnd (see page 3868)	Creates a Windows control corresponding to the edit control.
	DestroyWnd (see page 3868)	Destroys the rich edit control's window.
	DoSetMaxLength (see page 3869)	Sets the MaxLength property.
	GetCaretPos (see page 3871)	Returns the cursor position.
	GetSelLength (see page 3871)	Returns the SelLength property.
	GetSelStart (see page 3872)	Returns the SelStart property.
	GetSelText (see page 3872)	Returns the SelText property.
	RequestSize (see page 3874)	Resize request event dispatcher.
	SelectionChange (see page 3875)	Selection change event dispatcher.
	SetCaretPos (see page 3875)	Sets the cursor position in the text.
	SetSelLength (see page 3876)	Sets the SelLength property.
	SetSelStart (see page 3876)	Returns the SelStart property.

Public Methods

	Name	Description
	Clear (see page 3867)	Deletes all text from the rich edit control.
	FindText (see page 3869)	Searches a given range in the text for a target string.
	GetSelTextBuf (see page 3872)	Copies the selected text into a buffer and returns the number of characters copied.
	Print (see page 3873)	Formats and prints the contents of the rich edit control.
	RegisterConversionFormat (see page 3874)	Registers an association between a file extension and a TConversion (see page 3582) object that can convert between the native file format and rich text format (RTF).

27.1.20.4.1 TCustomRichEdit.Clear Method

Deletes all text from the rich edit control.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Use Clear to replace the Text property with an empty string. Clear removes all text, not just the selected text. To remove just the selected text, use ClearSelection.

See Also

ClearSelection (see page 21245)

Text (see page 5842)

27.1.20.4.2 TCustomRichEdit.CreateParams Method

Initializes a window-creation parameter record passed in the Params parameter.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd (see page 3868) method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. TCustomRichEdit (see page 3854) overrides the inherited method to specify a Windows rich edit control.

See Also

CreateWindowHandle (see page 21376)

CreateWnd (see page 3868)

27.1.20.4.3 TCustomRichEdit.CreateWnd Method

Creates a Windows control corresponding to the edit control.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

The CreateWnd method is called when the rich edit control is created, and whenever a change to the rich edit control requires the window to be recreated. CreateWnd first calls the inherited CreateWnd, and then sends the newly created window messages to request notification of Windows events, and, if the window is being recreated, reloads the rich text from a memory stream.

See Also

CreateParams (see page 3868)

CreateWindowHandle (see page 21376)

DestroyWnd (see page 3868)

CreateWnd (see page 6137)

27.1.20.4.4 TCustomRichEdit.DestroyWnd Method

Destroys the rich edit control's window.

Pascal

```
procedure DestroyWnd; override;
```

C++

```
virtual __fastcall DestroyWnd();
```

Description

DestroyWnd is called automatically when the rich edit control is destroyed or when its window must be temporarily destroyed and

recreated to implement a property change. Before the window is destroyed, DestroyWnd saves a copy of the control's text in a memory stream, frees any device contexts, and finally calls DestroyWindowHandle.

See Also

CreateWnd (see page 3868)

DestroyWindowHandle (see page 6140)

27.1.20.4.5 TCustomRichEdit.DoSetMaxLength Method

Sets the MaxLength property.

Pascal

```
procedure DoSetMaxLength(Value: Integer); override;
```

C++

```
virtual __fastcall DoSetMaxLength(int Value);
```

Description

DoSetMaxLength overrides the inherited method to implement the MaxLength property for a rich edit window. DoSetMaxLength sends an EM_EXLIMITTEXT message to the window of the rich edit control.

See Also

MaxLength (see page 21263)

27.1.20.4.6 TCustomRichEdit.FindText Method

Searches a given range in the text for a target string.

Pascal

```
function FindText(const SearchStr: string; StartPos: Integer; Length: Integer; Options:
TSearchTypes): Integer;
```

C++

```
__fastcall int FindText(const AnsiString SearchStr, int StartPos, int Length, TSearchTypes
Options);
```

Description

Use FindText to search a range of text in a rich edit control for the string specified by the SearchStr parameter. Only the text in the range starting at the position StartPos and continuing through the next Length positions will be searched. Use Options to specify whether the search should match whole words only and whether the search should be case sensitive. FindText returns the position of the search string, where 0 is the position of the first character in the rich edit control (as opposed to the first position in the search range). If the search string does not appear in the indicated range, FindText returns -1.

Use FindText rather than programmatically searching through the text of the control, to keep from being thrown off by the encoding of rich text characteristics.

C++ Examples:

```
/*
This example requires a TRichEdit, a TButton, and a
TFindDialog.  Clicking the button click will display a Find
Dialog to the right of the edit control.  Filling in the
"Find what" text and pressing the Find Next button will
select the first matching string in the Rich Edit control
that follows the previous selection.
*/
```

```
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FindDialog1->Position = Point(RichEdit1->Left + RichEdit1->Width, RichEdit1->Top);
  FindDialog1->Execute();
}

void __fastcall TForm1::FindDialog1Find(TObject *Sender)
{
  int FoundAt, StartPos, ToEnd;
  TSearchTypes mySearchTypes;
  // begin the search after the current selection
  // if there is one
  // otherwise, begin at the start of the text
  if (FindDialog1->Options.Contains(frMatchCase))
    mySearchTypes << stMatchCase;
  if (FindDialog1->Options.Contains(frWholeWord))
    mySearchTypes << stWholeWord;
  if (RichEdit1->SelLength)
    StartPos = RichEdit1->SelStart + RichEdit1->SelLength;
  else
    StartPos = 0;
  // ToEnd is the length from StartPos
  // to the end of the text in the rich edit control
  ToEnd = RichEdit1->Text.Length() - StartPos;
  FoundAt = RichEdit1->FindText(FindDialog1->FindText, StartPos, ToEnd, mySearchTypes);
  if (FoundAt != -1)
  {
    RichEdit1->SetFocus();
    RichEdit1->SelStart = FoundAt;
    RichEdit1->SelLength = FindDialog1->FindText.Length();
  }
  else Beep();
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  RichEdit1->PlainText = False;
  RichEdit1->Lines->LoadFromFile("../Overview.RTF");  // starts in Debug
  RichEdit1->ScrollBars = ssVertical;
}
```

Delphi Examples:

```
{
This example requires a TRichEdit, a TButton, and a
TFindDialog.  Clicking the button click will display a Find
Dialog to the right of the edit control.  Filling in the
"Find what" text and pressing the Find Next button will
select the first matching string in the Rich Edit control
that follows the previous selection.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  FindDialog1.Position :=
    Point(RichEdit1.Left + RichEdit1.Width, RichEdit1.Top);
  FindDialog1.Execute;
end;

procedure TForm1.FindDialog1Find(Sender: TObject);
var
  FoundAt: LongInt;
  StartPos, ToEnd: Integer;
  mySearchTypes : TSearchTypes;
  myFindOptions : TFindOptions;
begin
  with RichEdit1 do
  begin
```

```
      if frMatchCase in FindDialog1.Options then
         mySearchTypes := mySearchTypes + [stMatchCase];
      if frWholeWord in FindDialog1.Options then
         mySearchTypes := mySearchTypes + [stWholeWord];
      { begin the search after the current selection if there is one }
      { otherwise, begin at the start of the text }
      if SelLength <> 0 then
        StartPos := SelStart + SelLength
      else
        StartPos := 0;
      { ToEnd is the length from StartPos to the end of the
        text in the rich edit control }
      ToEnd := Length(Text) - StartPos;
      FoundAt :=
        FindText(FindDialog1.FindText, StartPos, ToEnd, mySearchTypes);
      if FoundAt <> -1 then
      begin
        SetFocus;
        SelStart := FoundAt;
        SelLength := Length(FindDialog1.FindText);
      end
      else Beep;
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  const Path = 'OverView.RTF';
  begin
    RichEdit1.PlainText := False;
    RichEdit1.Lines.LoadFromFile(Path);
    RichEdit1.ScrollBars := ssVertical;
  end;
```

27.1.20.4.7 TCustomRichEdit.GetCaretPos Method

Returns the cursor position.

Pascal

```
function GetCaretPos: TPoint; override;
```

C++

```
virtual __fastcall TPoint GetCaretPos();
```

Description

GetCaretPos is the read implementation of the CaretPos property.

See Also

CaretPos (see page 21380)

27.1.20.4.8 TCustomRichEdit.GetSelLength Method

Returns the SelLength property.

Pascal

```
function GetSelLength: Integer; override;
```

C++

```
virtual __fastcall int GetSelLength();
```

Description

GetSelLength overrides the inherited method to implement the SelLength property for a rich edit window. GetSelLength sends an EM_EXGETSEL message to the window of the edit control and returns the difference between the starting position and the ending position.

See Also

SelLength

SetSelLength (see page 3876)

27.1.20.4.9 TCustomRichEdit.GetSelStart Method

Returns the SelStart property.

Pascal

```
function GetSelStart: Integer; override;
```

C++

```
virtual __fastcall int GetSelStart();
```

Description

GetSelStart overrides the inherited method to implement the SelStart property for a rich edit window. GetSelLength (see page 3871) sends an EM_EXGETSEL message to the window of the edit control and returns the starting position.

See Also

SelStart

SetSelStart (see page 3876)

27.1.20.4.10 TCustomRichEdit.GetSelText Method

Returns the SelText property.

Pascal

```
function GetSelText: string; override;
```

C++

```
virtual __fastcall AnsiString GetSelText();
```

Description

GetSelText overrides the inherited method to implement the SelText property for a rich edit window. GetSelText sends an EM_GETSELTEXT message to the window of the rich edit control.

See Also

SelText

27.1.20.4.11 TCustomRichEdit.GetSelTextBuf Method

Copies the selected text into a buffer and returns the number of characters copied.

Pascal

```
function GetSelTextBuf(Buffer: PChar; BufSize: Integer): Integer; override;
```

C++

```
virtual __fastcall int GetSelTextBuf(const char * Buffer, int BufSize);
```

Description

Use GetSelTextBuf to copy the selected text into a character buffer. If there is no selection, the buffer receives an empty string. If the selection contains more than (BufSize - 1) characters, only the first (BufSize - 1) characters are copied. GetSelTextBuf returns the number of characters that were actually copied into the buffer.

See Also

CopyToClipboard (see page 21246)

GetTextBuf (see page 5766)

SelLength

SetSelTextBuf (see page 21258)

27.1.20.4.12 TCustomRichEdit.Print Method

Formats and prints the contents of the rich edit control.

Pascal

```
procedure Print(const Caption: string); virtual;
```

C++

```
virtual __fastcall Print(const AnsiString Caption);
```

Description

Use Print to print the contents of a rich edit control. The Caption parameter specifies the title that appears in the print manager and on network title pages.

C++ Examples:

```
/*
Place a button and a richedit on the form.  No print dialog
appears.  The contents of the richedit is printed to the
currently configured printer.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
// you may need to change this path to suit your environment
  char const *Path = "..\\OVERVIEW.RTF";
  RichEdit1->Lines->LoadFromFile(Path);
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
// The parameter string shows in the print queue under "Document   // name".
  RichEdit1->Print("My Document Name");
}
```

Delphi Examples:

```
{
Place a button and a richedit on the form.  No print dialog
appears.  The contents of the richedit is printed to the
```

```
currently configured printer.
}
procedure TForm1.FormCreate(Sender: TObject);
const
  // The path may need to be changed to accommodate
  // locations of files on your system.
  Path = 'OVERVIEW.RTF';
begin
   RichEdit1.Lines.LoadFromFile(Path);
end;

procedure TForm1.Button1Click(Sender: TObject);
begin
  // The parameter string shows in the print queue
  // under "Document/name".
  RichEdit1.Print('My Document Name');
end;
```

See Also

PageRect (see page 3884)

27.1.20.4.13 TCustomRichEdit.RegisterConversionFormat Method

Registers an association between a file extension and a TConversion (see page 3582) object that can convert between the native file format and rich text format (RTF).

Pascal

```
class procedure RegisterConversionFormat(const AExtension: string; AConversionClass:
TConversionClass);
```

C++

```
__fastcall RegisterConversionFormat(const AnsiString AExtension, TConversionClass
AConversionClass);
```

Description

Rich edit controls encode text attributes in RTF format. To read from or write to files that encode text attributes in some other format, a converter is required. The converter is a descendant of TConversion (see page 3582) that translates between the native file format and RTF when the text is streamed in or out. RegisterConversionFormat sets up an association between a file extension and a converter, so that all attempts to stream between a file with that extension and a rich edit control automatically invoke the appropriate converter.

Note: Use the Lines (see page 3882) property to stream the text to or from a file.

See Also

DefaultConverter (see page 3878)

Lines (see page 3882)

PlainText (see page 3886)

27.1.20.4.14 TCustomRichEdit.RequestSize Method

Resize request event dispatcher.

Pascal

```
procedure RequestSize(const Rect: TRect); virtual;
```

C++

```
virtual __fastcall RequestSize(const TRect Rect);
```

Description

RequestSize merely calls the OnResizeRequest (see page 3889) event handler. RequestSize is exposed as a protected method so that derived classes can change the response to Windows messages about an impending window resize. When overriding RequestSize, include a call to the OnResizeRequest (see page 3889) event handler.

See Also

BoundsRect (see page 5803)

ClientRect

OnResizeRequest (see page 3889)

Text (see page 5842)

27.1.20.4.15 TCustomRichEdit.SelectionChange Method

Selection change event dispatcher.

Pascal

```
procedure SelectionChange; dynamic;
```

C++

```
__fastcall SelectionChange();
```

Description

SelectionChange merely calls the OnSelectionChange (see page 3890) event handler. SelectionChange is exposed as a protected method so that derived classes can change the response to Windows messages about selection changes. When overriding SelectionChange, include a call to the OnSelectionChange (see page 3890) event handler.

SetSelTextBuf (see page 21258)

27.1.20.4.16 TCustomRichEdit.SetCaretPos Method

Sets the cursor position in the text.

Pascal

```
procedure SetCaretPos(const Value: TPoint); override;
```

C++

```
virtual __fastcall SetCaretPos(const TPoint Value);
```

Description

SetCaretPos is the write implementation of the CaretPos property.

Value is the new position of the text cursor.

See Also

CaretPos (see page 21380)

27.1.20.4.17 TCustomRichEdit.SetSelLength Method

Sets the SelLength property.

Pascal

```
procedure SetSelLength(Value: Integer); override;
```

C++

```
virtual __fastcall SetSelLength(int Value);
```

Description

SetSelLength overrides the inherited method to implement the SelLength property for a rich edit window. SetSelLength sends an EM_EXSETSEL message to the window of the edit control, specifying a selection that begins at SelStart and ends at SelStart + Value.

See Also

GetSelLength (see page 3871)

SelLength

SelStart

27.1.20.4.18 TCustomRichEdit.SetSelStart Method

Returns the SelStart property.

Pascal

```
procedure SetSelStart(Value: Integer); override;
```

C++

```
virtual __fastcall SetSelStart(int Value);
```

Description

SetSelStart overrides the inherited method to implement the SelStart property for a rich edit window. SetSelLength (see page 3876) sends an EM_EXSETSEL message to the window of the edit control to position the cursor on the position indicated by Value.

See Also

GetSelStart (see page 3872)

SelStart

27.1.20.5 TCustomRichEdit Properties

The properties of the TCustomRichEdit class are listed here.

Protected Properties

	Name	Description
	HideScrollBars (see page 3879)	Determines whether the scroll bars disappear when not needed.
	HideSelection (see page 3881)	Determines whether the visual indication of the selected text remains when focus shifts to another control.
	Lines (see page 3882)	Contains the individual lines of text in the rich text edit control.
	PlainText (see page 3886)	Controls (see page 5711) whether the rich edit control treats the text as plain text or rich text when streaming to or from a file.

Public Properties

	Name	Description
	DefAttributes (see page 3877)	Describes the rich text characteristics of the default font for the rich edit control
	DefaultConverter (see page 3878)	Specifies the class of the TConversion (see page 3582) object that is used to convert between native file format and the internal format of a rich text control when working with files that do not have a registered extension.
	PageRect (see page 3884)	Specifies the dimensions, in pixels, of the logical page size used when printing the contents of a rich text edit control.
R	Paragraph (see page 3884)	Specifies the formatting information for the current paragraphs.
	SelAttributes (see page 3887)	Describes the rich text characteristics of the selected text in the rich edit control.

27.1.20.5.1 TCustomRichEdit.DefAttributes Property

Describes the rich text characteristics of the default font for the rich edit control

Pascal

```
property DefAttributes: TTextAttributes;
```

C++

```
__property TTextAttributes DefAttributes;
```

Description

Use DefAttributes to discover or set the default font characteristics that the rich edit control uses for newly inserted text. These are the characteristics of the text before any special attributes have been applied. Once any special attributes are applied to a portion of text, no text from that point on is considered to have the default attributes, even if the attributes match the DefAttributes.

For example, if a rich edit control has had no attributes applied, the entire text has the default attributes. Selecting a portion of text in the middle and applying a specific attribute (such as a font change) results in three sections: a first section with the default attributes, a middle section with the applied attribute, and a final section with a non-default set of attributes that match the default attributes. Changing the DefAttributes property affects only the first section.

When inserting new text, the font characteristics of the new text will match the font characteristics at the cursor position, or, if the typing replaces a selection, the font characteristics of the selected text. New text will only have the default attributes when typed into the section of text that has the default attributes.

Note: DefAttributes is available only at runtime.

C++ Examples:

```
/*
```

```
This example requires a TRichEdit and two TButtons. Leave
the default text, usually "RichEdit1", in the lines
property. The DefAttributes will apply to this text.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  RichEdit1->SelAttributes->Color = clRed;
  RichEdit1->SelAttributes->Height += 5;
  RichEdit1->Lines->Add("This line of text will be red. ");
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  RichEdit1->DefAttributes->Color = clBlue;
  RichEdit1->DefAttributes->Style =
    RichEdit1->DefAttributes->Style << fsBold << fsItalic;
}
```

Delphi Examples:

```
{
This example requires a TRichEdit and two TButtons. Leave
the default text, usually "RichEdit1", in the lines
property. The DefAttributes will apply to this text.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  with RichEdit1.SelAttributes do
  begin
    Color := clRed;
    Height := Height + 5;
  end;
  RichEdit1.Lines.Add('This line of text will be red.');
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  RichEdit1.DefAttributes.Color := clBlue;
  RichEdit1.DefAttributes.Style := [fsBold, fsItalic];
end;
```

See Also

PlainText (see page 3886)

SelAttributes (see page 3887)

27.1.20.5.2 TCustomRichEdit.DefaultConverter Property

Specifies the class of the TConversion (see page 3582) object that is used to convert between native file format and the internal format of a rich text control when working with files that do not have a registered extension.

Pascal

```
property DefaultConverter: TConversionClass;
```

C++

```
__property TConversionClass DefaultConverter;
```

Description

Use DefaultConverter to specify the type of conversion to use when streaming text to or from files that do not have a registered extension. If DefaultConverter is not set, TCustomRichEdit (see page 3854) uses TConversion (see page 3582), which performs no actual conversion. TCustomRichEdit (see page 3854) encodes text attributes in rich-text format (RTF). Thus,

unrecognized file extensions lead to no conversion, which works for files that contain plain text or any subset of RTF format.

To support streaming to or from files that encode rich text characteristics in some other format, register a conversion format with the file extension used by those files. Use DefaultConverter only to change the conversion that is used for unrecognized file extensions.

Note: Use the Lines (see page 3882) property to stream the text to or from a file.

See Also

Lines (see page 3882)

PlainText (see page 3886)

RegisterConversionFormat (see page 3874)

TConversion (see page 3582)

27.1.20.5.3 TCustomRichEdit.HideScrollBars Property

Determines whether the scroll bars disappear when not needed.

Pascal

```
property HideScrollBars: Boolean;
```

C++

```
__property Boolean HideScrollBars;
```

Description

Use HideScrollBars to determine whether the scroll bars disappear from the edit control when the text appears completely within the edit window. Set HideScrollBars to false to prevent the scroll bars from flashing on and off when the contents of the rich edit control change.

HideScrollBars does nothing when the ScrollBars property is set to ssNone (The default for TRichEdit (see page 4685)).

C++ Examples:

```
/*
This example requires: TRichEdit, TRadioGroup, TCheckBox,
TButton. Clicking the Radio Group control sets the ScrollBar
style of the RichEdit. Toggling the Check Box turns
HideScrollBars on and off.  Clicking the button loads the
Rich Edit with a large amount of contiguous text.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  RichEdit1->Lines->Clear();
  for (int i = 0; i < 500; i++)
  {
    RichEdit1->Text = RichEdit1->Text + AnsiString("This is sentence ") + IntToStr(i) + ".  ";
    if ((i % 2) == 0) {
      RichEdit1->Text = RichEdit1->Text + AnsiString("\n");
    }
  }
  RichEdit1->SelStart = 0; // move text cursor to top of edit
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  RichEdit1->HideScrollBars = CheckBox1->Checked;
}

void __fastcall TForm1::RadioGroup1Click(TObject *Sender)
```

```
{
  TScrollStyle ScrollBarA[4] = {ssBoth, ssHorizontal, ssNone, ssVertical };
  RichEdit1->ScrollBars = ScrollBarA[RadioGroup1->ItemIndex];
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  RadioGroup1->Caption = "Scroll Bars";
  RadioGroup1->Items->Clear();
  RadioGroup1->Items->Add("ssBoth");
  RadioGroup1->Items->Add("ssHorizontal");
  RadioGroup1->Items->Add("ssNone");
  RadioGroup1->Items->Add("ssVertical");
  CheckBox1->Caption = "Hide Scroll Bars";
  CheckBox1->Checked = true;
  Button1->Caption = "Load Text";
  RichEdit1->Text = "Just a little text.";
  RichEdit1->WordWrap = False;
}
```

Delphi Examples:

```
{
This example requires: TRichEdit, TRadioGroup, TCheckBox,
TButton. Clicking the Radio Group control sets the ScrollBar
style of the RichEdit. Toggling the Check Box turns
HideScrollBars on and off.  Clicking the button loads the
Rich Edit with a large amount of contiguous text.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  RichEdit1.Lines.Clear;
  for I := 0 to 500 do
  begin
    RichEdit1.Text :=
      RichEdit1.Text + 'test line ' + IntToStr(I) + ' ';
    if (i mod 4 = 0) then
      RichEdit1.Text := RichEdit1.Text + Chr(13);
  end;
  // move text cursor to top of editend;
  RichEdit1.SelStart := 0;
end;

procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  RichEdit1.HideScrollbars := CheckBox1.Checked;
end;

procedure TForm1.RadioGroup1Click(Sender: TObject);
const
  ScrollBarA: array[0..3] of TScrollStyle = (
    ssBoth,
    ssHorizontal,
    ssNone,
    ssVertical);
begin
  RichEdit1.ScrollBars :=
    ScrollBarA[RadioGroup1.ItemIndex];
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  with RadioGroup1, Items do
  begin
    Caption := 'Scroll Bars';
```

```
      Clear;
      Add('ssBoth');
      Add('ssHorizontal');
      Add('ssNone');
      Add('ssVertical');
    end;
    with CheckBox1 do
    begin
      Caption := 'HideScrollBars';
      Checked := True;
    end;
    Button1.Caption := 'Loaded';
    RichEdit1.Text := 'Just a little text.';
    RichEdit1.WordWrap := False;
  end;
```

See Also

ScrollBars (see page 21381)

27.1.20.5.4 TCustomRichEdit.HideSelection Property

Determines whether the visual indication of the selected text remains when focus shifts to another control.

Pascal

```
property HideSelection: Boolean;
```

C++

```
__property Boolean HideSelection;
```

Description

Set HideSelection to false when it is important to provide visual feedback of the selected portion of the text even when the edit control does not have focus. Set HideSelection to true to make the visual indication of selection appear only when the edit control has focus. HideSelection does not affect the actual value of the selection, only the visual indication. Always setting HideSelection to false can make forms containing many edit controls look busy.

C++ Examples:

```
/*
This example needs only a blank form.  Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
*/
#include <ComCtrls.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int I = 0; I <= 2; I++)
  {
    TRichEdit *pRich = new TRichEdit(this);
    pRich->Parent = this;
    pRich->Top = pRich->Height * I;
    pRich->Text = "This text will take the focus.";
    pRich->SelStart = 0;
    pRich->SelLength = pRich->Text.Length();
    if (I == 1)
      pRich->HideSelection = false;
  }
}
```

Delphi Examples:

```
{
HideSelection, Height example
This example needs only a blank form. Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
}
uses ComCtrls;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to 2 do
    with TRichEdit.Create(Self) do
    begin
      Parent := Self;
      Top := Height * I;
      Text := 'This text will take the focus.';
      SelStart := 0;
      SelLength := Length(Text);
      if (I = 1) then
        HideSelection := False;
    end;
end;
```

SelLength

SelStart

SelText

SetSelTextBuf (see page 21258)

27.1.20.5.5 TCustomRichEdit.Lines Property

Contains the individual lines of text in the rich text edit control.

Pascal

```
property Lines: TStrings;
```

C++

```
__property TStrings Lines;
```

Description

Use Lines to manipulate the text in the rich text edit control on a line by line basis. Lines is a TStrings object, so TStrings methods may be used for Lines to perform manipulations such as counting the lines of text, adding lines, deleting lines, or replacing the text in lines.

To work with the text as one chunk, use the Text property. To manipulate individual lines of text, the Lines property works better.

Warning: If you paste formatted text into the Lines property at design time, the formatting is lost when the form is saved (it does not appear at runtime). To set the value of a rich edit control at design time, you must save the formatted text in some other manner and use the LoadFromStream or LoadFromFile method of the Lines property to load the value in the OnShow method of the parent form.

C++ Examples:

```
/*
This example requires only a form.  A Rich Edit control is
created on the form and aligned to take the entire client
area of the form.  A series of lines are written to the Rich
Edit control's Lines property, and the Paragraph property
manipulated such that the first items displayed are bulleted,
a second group of lines are unbulleted and centered, and the
last group is left justified and indented.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TRichEdit *pRich = new TRichEdit(this);
  pRich->Parent = this;
  pRich->Align = alClient;
  pRich->Lines->Clear();
  // set numbering style
  pRich->Paragraph->Numbering = nsBullet;
  pRich->Lines->Add("Introduction");
  pRich->Lines->Add("New members to our team");
  pRich->Lines->Add("New Budget discussion");
  pRich->Lines->Add("Facilities");
  pRich->Lines->Add("Q & A");
  pRich->Paragraph->Numbering = nsNone;
  pRich->Paragraph->Alignment = taCenter;
  pRich->Lines->Add("");
  pRich->Lines->Add("Suggested Topics: ");
  pRich->Lines->Add("");
  pRich->Paragraph->Alignment = taLeftJustify;
  pRich->Paragraph->FirstIndent = 10;
  pRich->Lines->Add("");
  pRich->Lines->Add("Parking lot repair");
  pRich->Lines->Add("Cost overruns");
}
```

Delphi Examples:

```
{
This example requires only a form.  A Rich Edit control is
created on the form and aligned to take the entire client
area of the form.  A series of lines are written to the Rich
Edit control's Lines property, and the Paragraph property
manipulated such that the first items displayed are bulleted,
a second group of lines are unbulleted and centered, and the
last group is left justified and indented.
}
uses ComCtrls;

procedure TForm1.FormCreate(Sender: TObject);
begin
  with TRichEdit.Create(Self) do
  begin
    Parent := Self;
    Align := alClient;
    Lines.Clear;
    // set numbering style
    Paragraph.Numbering := nsBullet;
    Lines.Add('Introduction');
    Lines.Add('New members to our team');
    Lines.Add('New Budget discussion');
    Lines.Add('Facilities');
    Lines.Add('Q & A');
    Paragraph.Numbering := nsNone;
    Paragraph.Alignment := taCenter;
    Lines.Add('');
    Lines.Add('Suggested Topics:');
    Lines.Add('');
    Paragraph.Alignment := taLeftJustify;
```

```
      Paragraph.FirstIndent := 10;
      Lines.Add('');
      Lines.Add('Parking lot repair');
      Lines.Add('Cost overruns');
    end;
  end;
```

WordWrap (see page 21384)

LoadFromFile (see page 3061)

LoadFromStream (see page 3062)

27.1.20.5.6 TCustomRichEdit.PageRect Property

Specifies the dimensions, in pixels, of the logical page size used when printing the contents of a rich text edit control.

Pascal

```
property PageRect: TRect;
```

C++

```
__property TRect PageRect;
```

Description

Use PageRect to specify the logical page size used when formatting the contents of the rich edit control for printing. Specify the dimensions in pixels.

See Also

Print (see page 3873)

27.1.20.5.7 TCustomRichEdit.Paragraph Property

Specifies the formatting information for the current paragraphs.

Pascal

```
property Paragraph: TParaAttributes;
```

C++

```
__property TParaAttributes Paragraph;
```

Description

Read Paragraph to get the TParaAttributes (see page 4606) object used by the rich edit control to specify paragraph formatting information. Use the TParaAttributes (see page 4606) object to read or write the paragraph formatting information for the current paragraphs. Paragraph formatting information includes alignment, indentation, numbering, and tabs.

Paragraph is a read-only property, because a TCustomRichEdit (see page 3854) object has only one TParaAttributes (see page 4606) object, which cannot be changed. The attributes of the current paragraphs, however, can be changed, by setting the properties of the TParaAttributes (see page 4606) object.

The current paragraphs are the paragraphs that contain the selected text. If no text is selected, the current paragraph is the one containing the cursor.

Note: Paragraph is available only at runtime.

C++ Examples:

```
/*
This example requires only a form.  A Rich Edit control is
created on the form and aligned to take the entire client
area of the form.  A series of lines are written to the Rich
Edit control's Lines property, and the Paragraph property
manipulated such that the first items displayed are bulleted,
a second group of lines are unbulleted and centered, and the
last group is left justified and indented.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TRichEdit *pRich = new TRichEdit(this);
  pRich->Parent = this;
  pRich->Align = alClient;
  pRich->Lines->Clear();
  // set numbering style
  pRich->Paragraph->Numbering = nsBullet;
  pRich->Lines->Add("Introduction");
  pRich->Lines->Add("New members to our team");
  pRich->Lines->Add("New Budget discussion");
  pRich->Lines->Add("Facilities");
  pRich->Lines->Add("Q & A");
  pRich->Paragraph->Numbering = nsNone;
  pRich->Paragraph->Alignment = taCenter;
  pRich->Lines->Add("");
  pRich->Lines->Add("Suggested Topics: ");
  pRich->Lines->Add("");
  pRich->Paragraph->Alignment = taLeftJustify;
  pRich->Paragraph->FirstIndent = 10;
  pRich->Lines->Add("");
  pRich->Lines->Add("Parking lot repair");
  pRich->Lines->Add("Cost overruns");
}
```

Delphi Examples:

```
{
This example requires only a form.  A Rich Edit control is
created on the form and aligned to take the entire client
area of the form.  A series of lines are written to the Rich
Edit control's Lines property, and the Paragraph property
manipulated such that the first items displayed are bulleted,
a second group of lines are unbulleted and centered, and the
last group is left justified and indented.
}
uses ComCtrls;

procedure TForm1.FormCreate(Sender: TObject);
begin
  with TRichEdit.Create(Self) do
  begin
    Parent := Self;
    Align := alClient;
    Lines.Clear;
    // set numbering style
    Paragraph.Numbering := nsBullet;
    Lines.Add('Introduction');
    Lines.Add('New members to our team');
    Lines.Add('New Budget discussion');
    Lines.Add('Facilities');
    Lines.Add('Q & A');
    Paragraph.Numbering := nsNone;
    Paragraph.Alignment := taCenter;
```

```
      Lines.Add('');
      Lines.Add('Suggested Topics:');
      Lines.Add('');
      Paragraph.Alignment := taLeftJustify;
      Paragraph.FirstIndent := 10;
      Lines.Add('');
      Lines.Add('Parking lot repair');
      Lines.Add('Cost overruns');
    end;
  end;
```

SelStart

SelText

TParaAttributes (see page 4606)

27.1.20.5.8 TCustomRichEdit.PlainText Property

Controls (see page 5711) whether the rich edit control treats the text as plain text or rich text when streaming to or from a file.

Pascal

```
property PlainText: Boolean;
```

C++

```
__property Boolean PlainText;
```

Description

To write the rich text in the control to a plain text file, set PlainText to true before streaming the text to a file. To ignore the rich text information encoded in a file, set PlainText to true before streaming the text to the control. To stream in the rich text attributes encoded in a file, or save the encoding of the rich text attributes to a file, set PlainText to false.

If the rich text attributes of a file are encoded in some format other than rich text format (RTF), it is necessary to use a converter on the text, even when PlainText is true.

Note: Rich edit controls do not directly support streaming. Use the Lines (see page 3882) property to stream to or from a file.

C++ Examples:

```
/*
This example requires two TRichEdit controls placed on the
form.  When the form becomes visible, the first Rich Edit
control will display the rich text in its raw form, including
formatting characters. The second will show the rich text in
its intended format.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
// you may need to change this path to suit your environment
  char const *Path = "..\\OVERVIEW.RTF";
  RichEdit1->PlainText = true;
  RichEdit1->Lines->LoadFromFile(Path);
  RichEdit2->PlainText = false;
  RichEdit2->Lines->LoadFromFile(Path);
}
```

Delphi Examples:

```
{
This example requires two TRichEdit controls placed on the
form.  When the form becomes visible, the first Rich Edit
control will display the rich text in its raw form, including
formatting characters. The second will show the rich text in
its intended format.
}

procedure TForm1.FormCreate(Sender: TObject);
const
  // you may need to change this path to suit your environment
  Path = 'OverView.RTF';
begin
  RichEdit1.PlainText := True;
  RichEdit1.Lines.LoadFromFile(Path);
  RichEdit1.ScrollBars := ssVertical;
  RichEdit2.PlainText := False;
  RichEdit2.Lines.LoadFromFile(Path);
  RichEdit2.ScrollBars := ssVertical;
end;
```

DefaultConverter (see page 3878)

Lines (see page 3882)

RegisterConversionFormat (see page 3874)

27.1.20.5.9 TCustomRichEdit.SelAttributes Property

Describes the rich text characteristics of the selected text in the rich edit control.

Pascal

```
property SelAttributes: TTextAttributes;
```

C++

```
__property TTextAttributes SelAttributes;
```

Description

Use SelAttributes to discover or set the font characteristics of the currently selected text. SelAttributes specifies characteristics such as font face, color, size, style, and pitch. To change a single attribute of the currently selected text, read SelAttributes, and set one of its properties. To change all of the attributes of the currently selected text, set SelAttributes to a TTextAttributes (see page 4982) object that represents the desired configuration of attributes. If no text is selected, SelAttributes represents the attributes of the cursor position.

When inserting new text, the font characteristics of the new text will match SelAttributes.

Note: SelAttributes is available only at runtime.

C++ Examples:

```
/*
This example requires a TRichEdit and two TButtons. Leave
the default text, usually "RichEdit1", in the lines
property. The DefAttributes will apply to this text.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
```

```
  RichEdit1->SelAttributes->Color = clRed;
  RichEdit1->SelAttributes->Height += 5;
  RichEdit1->Lines->Add("This line of text will be red. ");
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  RichEdit1->DefAttributes->Color = clBlue;
  RichEdit1->DefAttributes->Style =
    RichEdit1->DefAttributes->Style << fsBold << fsItalic;
}
```

Delphi Examples:

```
{
This example requires a TRichEdit and two TButtons. Leave
the default text, usually "RichEdit1", in the lines
property. The DefAttributes will apply to this text.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  with RichEdit1.SelAttributes do
  begin
    Color := clRed;
    Height := Height + 5;
  end;
  RichEdit1.Lines.Add('This line of text will be red.');
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  RichEdit1.DefAttributes.Color := clBlue;
  RichEdit1.DefAttributes.Style := [fsBold, fsItalic];
end;
```

OnProtectChange (see page 3888)

PlainText (see page 3886)

27.1.20.6 TCustomRichEdit Events

The events of the TCustomRichEdit class are listed here.

Protected Events

	Name	Description
	OnProtectChange (see page 3888)	Occurs when a user attempts to modify text that is marked as protected.
	OnResizeRequest (see page 3889)	Occurs when the text has grown either smaller or larger than the control's window size.
	OnSaveClipboard (see page 3890)	Occurs when the window of the edit control is about to be destroyed and the edit control has delayed rendering of text copied to the clipboard..
	OnSelectionChange (see page 3890)	Occurs when the current selection changes.

27.1.20.6.1 TCustomRichEdit.OnProtectChange Event

Occurs when a user attempts to modify text that is marked as protected.

Pascal

```
property OnProtectChange: TRichEditProtectChange;
```

C++

```
__property TRichEditProtectChange OnProtectChange;
```

Description

Write an OnProtectChange event handler to allow modification of text with the protected attribute. The StartPos and EndPos parameters indicate the beginning and end of the range of text that would be affected by the modification, where 0 is the first character in the text. To allow modification of protected text, set AllowChange to true.

To set or unset the protected attribute for a section of text, select the text and use the Protected property of the rich edit control's SelAttributes (see page 3887) property. To cause text to have the protected attribute by default, use the Protected property of the rich edit object's DefAttributes (see page 3877) property.

DefAttributes (see page 3877)

SelAttributes (see page 3887)

SelLength

SelStart

27.1.20.6.2 TCustomRichEdit.OnResizeRequest Event

Occurs when the text has grown either smaller or larger than the control's window size.

Pascal

```
property OnResizeRequest: TRichEditResizeEvent;
```

C++

```
__property TRichEditResizeEvent OnResizeRequest;
```

Description

Write an OnResizeRequest event handler to respond to notifications that the edit control is trying to resize due to changes in the text. The Rect parameter gives the desired bounding rectangle that will display all the text, in screen coordinates.

C++ Examples:

```
/*
The following code resizes the rich edit control to
accommodate growing or shrinking lines of text.  This
example requires a button, a TEdit and a TRichEdit.
Double click on the TRichEdit OnResizeRequest event
to create the event handler.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  RichEdit1->Lines->Add(Edit1->Text);
}

void __fastcall TForm1::RichEdit1ResizeRequest(TObject *Sender, TRect &Rect)
{
  ((TRichEdit *)Sender)->BoundsRect = Rect;
}
```

Delphi Examples:

```
{
```

```
The following code resizes the rich edit control to
accommodate growing or shrinking lines of text.  This
example requires a button, a TEdit and a TRichEdit.
Double click on the TRichEdit OnResizeRequest event
to create the event handler.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  RichEdit1.Lines.Add(Edit1.Text);
end;

procedure TForm1.RichEdit1ResizeRequest(Sender: TObject; Rect: TRect);
begin
  (Sender as TRichEdit).BoundsRect := Rect;
end;
```

See Also

BoundsRect (see page 5803)

ClientRect

Text (see page 5842)

27.1.20.6.3 TCustomRichEdit.OnSaveClipboard Event

Occurs when the window of the edit control is about to be destroyed and the edit control has delayed rendering of text copied to the clipboard..

Pascal

```
property OnSaveClipboard: TRichEditSaveClipboard;
```

C++

```
__property TRichEditSaveClipboard OnSaveClipboard;
```

Description

Write an OnSaveClipboard event handler to respond to notifications that the window of the edit control is about to be destroyed and the Clipboard needs information from the edit control. The parameter NumObjects is the number of objects on the Clipboard, and NumChars is the number of characters on the Clipboard. To clear all information about the edit control from the Clipboard, set SaveClipboard to false.

See Also

CopyToClipboard (see page 21246)

CutToClipboard (see page 21249)

27.1.20.6.4 TCustomRichEdit.OnSelectionChange Event

Occurs when the current selection changes.

Pascal

```
property OnSelectionChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSelectionChange;
```

Description

Write an OnSelectionChange event handler to respond to changes in the selected text. Changes in selection can occur when the user changes the selection using the mouse or keyboard, or when the selection is changed through the SelText property.

Portions of the selection can be changed through the Lines (see page 3882) property.

C++ Examples:

```
/*
This example requires a TStatusBar and a TRichEdit.  The
code within the form's OnCreate will take care of sizing the
Rich Edit and setting the OnSelectionChange event to be
handled by RichEdit1SelectionChange (or you can paste the
code directly into the OnSelectionChange event handler.)  As
you type in the Rich Edit control, the current character
location the selection begin and end will display in the
status bar control.
*/
void __fastcall TForm1::RichEdit1SelectionChange(TObject *Sender)
{
  StatusBar1->SimpleText = "  Selection Start: " + IntToStr(RichEdit1->SelStart) +
      "  Selection End: " + IntToStr(RichEdit1->SelStart + RichEdit1->SelLength);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  char const *Path = "..\\OVERVIEW.RTF";
  RichEdit1->Lines->LoadFromFile(Path);
  RichEdit1->Align = alClient;
  RichEdit1->OnSelectionChange = RichEdit1SelectionChange;
  StatusBar1->SimplePanel = True;
}
```

Delphi Examples:

```
{
This example requires a TStatusBar and a TRichEdit.  The
code within the form's OnCreate will take care of sizing the
Rich Edit and setting the OnSelectionChange event to be
handled by RichEdit1SelectionChange (or you can paste the
code directly into the OnSelectionChange event handler.)  As
you type in the Rich Edit control, the current character
location the selection begin and end will display in the
status bar control.
}
procedure TForm1.RichEdit1SelectionChange(Sender: TObject);
begin
  with RichEdit1 do
    begin
    StatusBar1.SimpleText := '  Selection Start: ' + IntToStr(SelStart) +
      '  Selection End: ' + IntToStr(SelStart + SelLength);
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
const
  Path = 'OVERVIEW.RTF';
begin
  with RichEdit1 do
  begin
    Lines.LoadFromFile(Path);
    Align := alClient;
    OnSelectionChange := RichEdit1SelectionChange;
  end;
  StatusBar1.SimplePanel := True;
end;
```

27.1.21 TCustomStatusBar Class

TCustomStatusBar is the base class for objects that represent status bars.

Class Hierarchy

Pascal

```
TCustomStatusBar = class(TWinControl);
```

C++

```
class TCustomStatusBar : public TWinControl;
```

File

ComCtrls

Description

TCustomStatusBar component is the base class for status bar controls. Status bars consist of a row of panels, usually aligned at the bottom of a form, that display information about an application as it runs. Each panel is represented by a TStatusPanel (see page 4825) object listed in the Panels (see page 3912) property.

TCustomStatusBar is intended only as a base class. To add a status bar to a form, use a TCustomStatusBar descendant such as TStatusBar (see page 4769).

See Also

TStatusBar (see page 4769)

TStatusPanel (see page 4825)

TStatusPanels (see page 4834)

27.1.21.1 TCustomStatusBar Members

The following tables list the members exposed by TCustomStatusBar.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.

	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	ChangeScale (see page 3904)	Repositions and resizes the status bar by a specified ratio.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreatePanel (see page 3905)	Creates a new panel that can be added to the Panels (see page 3912) property.
V	CreatePanels (see page 3905)	Creates the TStatusPanels (see page 4834) object that implements the Panels (see page 3912) property.
V	CreateParams (see page 3905)	Initializes the window-creation parameter record when the status bar window is created.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 3906)	Creates the Windows control that represents the status bar.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.

	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoHint (see page 3906)	Generates an OnHint (see page 3920) event.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawPanel (see page 3907)	Draws an owner-drawn panel.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.

	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPanelClass (see page 3908)	Returns the class to use for implementing the panels of the status bar.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsFontStored (see page 3908)	Indicates whether the value of the Font property should be saved in the form file.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.

	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 3909)	Sets the value of the Parent property.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnCreatePanelClass (see page 3919)	Occurs when a status panel needs to be created.
	OnDrawPanel (see page 3919)	Occurs when a status panel needs to be redrawn.

	OnHint (see page 3920)	Occurs when the AutoHint (see page 3910) property is true and the status bar receives a hint action.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 3903)	Creates and initializes a TCustomStatusBar (see page 3892) component.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 3903)	Destroys TCustomStatusBar (see page 3892) and frees its memory.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
V	ExecuteAction (see page 3907)	Processes actions for the status bar.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.

	FlipChildren (see page 3908)	Reverses the positions of the status bar's panels.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.

	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 3909)	Sets the Left, Top, Width, and Height properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AutoHint (see page 3910)	Specifies whether the status bar's text is set automatically to the current hint.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 3910)	Provides runtime access to the status bar's drawing surface.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.

R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Panels (see page 3912)	Lists the panels (TStatusPanel (see page 4825) objects) in the status bar.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	SimplePanel (see page 3915)	Determines whether the status bar displays a single panel or multiple panels.
	SimpleText (see page 3916)	Contains the string that is displayed in the status bar when SimplePanel (see page 3915) is set to true.
	SizeGrip (see page 3918)	Determines whether the status bar is resizable at runtime.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	UseSystemFont (see page 3918)	Specifies whether the status bar uses the system font.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.

	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

27.1.21.2 TCustomStatusBar.Create Constructor

Creates and initializes a TCustomStatusBar (see page 3892) component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomStatusBar(TComponent * AOwner);
```

Description

The Create method creates a status bar along with its canvas and status panels.

AOwner is a component, typically the form, that becomes the value of the Owner property.

See Also

TCanvas (see page 14441)

TStatusPanels (see page 4834)

Owner (see page 2807)

27.1.21.3 TCustomStatusBar.Destroy Destructor

Destroys TCustomStatusBar (see page 3892) and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomStatusBar();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks for a nil object before calling Destroy.

The Destroy method destroys the status bar along with its canvas and status panels.

See Also

TCanvas (see page 14441)

TStatusPanels (see page 4834)

Free (see page 22300)

27.1.21.4 TCustomStatusBar Methods

The methods of the TCustomStatusBar class are listed here.

Protected Methods

	Name	Description
	ChangeScale (see page 3904)	Repositions and resizes the status bar by a specified ratio.
	CreatePanel (see page 3905)	Creates a new panel that can be added to the Panels (see page 3912) property.
	CreatePanels (see page 3905)	Creates the TStatusPanels (see page 4834) object that implements the Panels (see page 3912) property.
	CreateParams (see page 3905)	Initializes the window-creation parameter record when the status bar window is created.
	CreateWnd (see page 3906)	Creates the Windows control that represents the status bar.
	DoHint (see page 3906)	Generates an OnHint (see page 3920) event.
	DrawPanel (see page 3907)	Draws an owner-drawn panel.
	GetPanelClass (see page 3908)	Returns the class to use for implementing the panels of the status bar.
	IsFontStored (see page 3908)	Indicates whether the value of the Font property should be saved in the form file.
	SetParent (see page 3909)	Sets the value of the Parent property.

Public Methods

	Name	Description
	ExecuteAction (see page 3907)	Processes actions for the status bar.
	FlipChildren (see page 3908)	Reverses the positions of the status bar's panels.
	SetBounds (see page 3909)	Sets the Left, Top, Width, and Height properties all at once.

27.1.21.4.1 TCustomStatusBar.ChangeScale Method

Repositions and resizes the status bar by a specified ratio.

Pascal

```
procedure ChangeScale(M: Integer; D: Integer); override;
```

C++

```
virtual __fastcall ChangeScale(int M, int D);
```

Description

ChangeScale is called automatically when the form that contains the status bar is rescaled. ChangeScale modifies the position as well as the size of a control. Thus, ChangeScale modifies the control's Top, Left, Width, and Height properties.

The M and D parameters define a fraction by which to scale the control. The M parameter is the multiplier and the D parameter is the divisor. For example, to make a control 75% of its original size, specify the value of M as 75, and the value of D as 100 (75/100). Alternately, the same results are achieved by specifying the value of M as 3, and the value of D as 4 (3/4). Both fractions are equal and result in the control being scaled by the same amount, 75%.

TCustomStatusBar (see page 3892) overrides the inherited method to ensure that the new size of the status bar matches the system font if the UseSystemFont (see page 3918) property is true.

See Also

UseSystemFont (see page 3918)

27.1.21.4.2 TCustomStatusBar.CreatePanel Method

Creates a new panel that can be added to the Panels (see page 3912) property.

Pascal

```
function CreatePanel: TStatusPanel; virtual;
```

C++

```
virtual __fastcall TStatusPanel CreatePanel();
```

Description

The TStatusPanels (see page 4834) object that implements the Panels (see page 3912) property calls CreatePanel when it needs to add a new panel. CreatePanel generates an OnCreatePanelClass (see page 3919) event to determine the class of the new TStatusPanel (see page 4825) object, and then creates an instance of that class. CreatePanel returns the new status panel instance.

See Also

OnCreatePanelClass (see page 3919)

Panels (see page 3912)

AddItem (see page 4838)

27.1.21.4.3 TCustomStatusBar.CreatePanels Method

Creates the TStatusPanels (see page 4834) object that implements the Panels (see page 3912) property.

Pascal

```
function CreatePanels: TStatusPanels; virtual;
```

C++

```
virtual __fastcall TStatusPanels CreatePanels();
```

Description

TCustomStatusBar (see page 3892) calls CreatePanels internally generate the implementation object for the Panels (see page 3912) property.

Override this method to substitute a TStatusPanels (see page 4834) descendant as the implementation of the Panels (see page 3912) property or to provide special initializations to the TStatusPanels (see page 4834) instance.

See Also

Panels (see page 3912)

27.1.21.4.4 TCustomStatusBar.CreateParams Method

Initializes the window-creation parameter record when the status bar window is created.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd (see page 3906) method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. TCustomStatusBar (see page 3892) overrides CreateParams to customize the parameters to specify a status bar control that reflects the properties of TCustomStatusBar (see page 3892).

The fields of the Params parameter become the parameters to a call to the CreateWindowEx API function.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 3906)

27.1.21.4.5 TCustomStatusBar.CreateWnd Method

Creates the Windows control that represents the status bar.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

The CreateHandle method calls CreateWnd to handle the particulars of creating the status bar window. TCustomStatusBar (see page 3892) overrides the inherited method to ensure that the newly-created window and the TCustomStatusBar (see page 3892) properties correctly reflect each other.

The Windows control for the status bar can be temporarily destroyed and recreated in order to set properties that require changing the window creation parameters. Thus, CreateWnd may be called more than once during the lifetime of the TCustomStatusBar (see page 3892) instance.

See Also

CreateHandle (see page 6135)

27.1.21.4.6 TCustomStatusBar.DoHint Method

Generates an OnHint (see page 3920) event.

Pascal

```
function DoHint: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean DoHint();
```

Description

DoHint is called automatically when the value of AutoHint (see page 3910) is true and the status bar receives notification that it should display a hint.

If there is an OnHint (see page 3920) event handler, DoHint calls the event handler and returns true. If no OnHint (see page 3920) event handler is assigned, DoHint returns false.

See Also

OnHint (see page 3920)

AutoHint (see page 3910)

27.1.21.4.7 TCustomStatusBar.DrawPanel Method

Draws an owner-drawn panel.

Pascal

```
procedure DrawPanel(Panel: TStatusPanel; const Rect: TRect); dynamic;
```

C++

```
__fastcall DrawPanel(TStatusPanel Panel, const TRect Rect);
```

Description

DrawPanel is called automatically for each status panel that has a Style of psOwnerDraw. If there is an event handler for the OnDrawPanel (see page 3919) event, DrawPanel calls the OnDrawPanel (see page 3919) event handler. Otherwise, it fills the panel background using the color specified by the Color property.

Panel is the owner drawn status panel that needs to be drawn.

Rect indicates the dimensions of that panel on the status bar's canvas.

See Also

Style (see page 4830)

OnDrawPanel (see page 3919)

Color (see page 5812)

Canvas (see page 3910)

27.1.21.4.8 TCustomStatusBar.ExecuteAction Method

Processes actions for the status bar.

Pascal

```
function ExecuteAction(Action: TBasicAction): Boolean; override;
```

C++

```
virtual __fastcall Boolean ExecuteAction(TBasicAction Action);
```

Description

When an action executes, the application makes a series of calls to respond to that action. If, in the course of that processing, the application identifies the status bar as a potential target of the action, it calls the status bar's ExecuteAction method.

If the action in a hint action (THintAction), ExecuteAction checks the AutoHint (see page 3910) property, and if it is true, displays the hint and returns true. Otherwise, it allows the inherited method to respond to any other actions.

The Action parameter specifies the action that was invoked.

ExecuteAction returns true if the action was successfully dispatched, and false if the component could not handle the action.

See Also

AutoHint (see page 3910)

Execute (see page 2712)

THintAction (see page 20707)

27.1.21.4.9 TCustomStatusBar.FlipChildren Method

Reverses the positions of the status bar's panels.

Pascal

```
procedure FlipChildren(AllLevels: Boolean); override;
```

C++

```
virtual __fastcall FlipChildren(Boolean AllLevels);
```

Description

FlipChildren iterates through the panels of the status bar, reversing their order but otherwise leaving their properties intact.

AllLevels specifies whether FlipChildren should be called recursively on the control's children. TCustomStatusBar (see page 3892) ignores this parameter when reversing the panels.

See Also

BiDiMode (see page 5803)

Panels (see page 3912)

27.1.21.4.10 TCustomStatusBar.GetPanelClass Method

Returns the class to use for implementing the panels of the status bar.

Pascal

```
function GetPanelClass: TStatusPanelClass; virtual;
```

C++

```
virtual __fastcall TStatusPanelClass GetPanelClass();
```

Description

The CreatePanel (see page 3905) method calls GetPanelClass to determine the default class to use when creating new panels for the status bar. This class can then be changed by an OnCreatePanelClass (see page 3919) event handler.

TCustomStatusBar (see page 3892) returns TStatusPanel (see page 4825) as the default class for status bar panels. Descendants that use a TStatusPanel (see page 4825) descendant by default can override this method to indicate a different default class.

See Also

OnCreatePanelClass (see page 3919)

CreatePanel (see page 3905)

27.1.21.4.11 TCustomStatusBar.IsFontStored Method

Indicates whether the value of the Font property should be saved in the form file.

Pascal

```
function IsFontStored: Boolean;
```

C++

```
__fastcall Boolean IsFontStored();
```

Description

TCustomStatusBar (see page 3892) uses IsFontStored internally to determine whether the value of the Font property should be stored in a form file with the other properties of the status bar object. IsFontStored checks the UseSystemFont (see page 3918), ParentFont, and DesktopFont properties. If any of these is true, the status bar gets its font from an external source, and the value of the Font property does not need to be saved.

See Also

UseSystemFont (see page 3918)

ParentFont (see page 5834)

DesktopFont (see page 5818)

27.1.21.4.12 TCustomStatusBar.SetBounds Method

Sets the Left, Top, Width, and Height properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

TCustomStatusBar (see page 3892) overrides SetBounds in order to update the size grip.

ALeft, ATop, AWidth, and AHeight specify the new values for the Left, Top, Width, and Height properties, respectively.

See Also

SetBounds (see page 5783)

SizeGrip (see page 3918)

27.1.21.4.13 TCustomStatusBar.SetParent Method

Sets the value of the Parent property.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected write implementation of the Parent property.

AParent is the new parent of the status bar.

See Also

Parent

27.1.21.5 TCustomStatusBar Properties

The properties of the TCustomStatusBar class are listed here.

Public Properties

	Name	Description
	AutoHint (see page 3910)	Specifies whether the status bar's text is set automatically to the current hint.
R	Canvas (see page 3910)	Provides runtime access to the status bar's drawing surface.
	Panels (see page 3912)	Lists the panels (TStatusPanel (see page 4825) objects) in the status bar.
	SimplePanel (see page 3915)	Determines whether the status bar displays a single panel or multiple panels.
	SimpleText (see page 3916)	Contains the string that is displayed in the status bar when SimplePanel (see page 3915) is set to true.
	SizeGrip (see page 3918)	Determines whether the status bar is resizable at runtime.
	UseSystemFont (see page 3918)	Specifies whether the status bar uses the system font.

27.1.21.5.1 TCustomStatusBar.AutoHint Property

Specifies whether the status bar's text is set automatically to the current hint.

Pascal

```
property AutoHint: Boolean;
```

C++

```
__property Boolean AutoHint;
```

Description

Use AutoHint to specify whether the status bar's text is set automatically to the current hint. When AutoHint is true, the status bar automatically responds to hint actions by displaying the long version of the hint's text in the first panel.

See Also

Hint (see page 13712)

Hint (see page 5827)

ShowHint (see page 13721)

THintAction (see page 20707)

OnHint (see page 3920)

27.1.21.5.2 TCustomStatusBar.Canvas Property

Provides runtime access to the status bar's drawing surface.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

The read-only Canvas property provides access to the status bar's drawing surface that you can use when implementing a handler for the OnDrawPanel (see page 3919) event.

C++ Examples:

```
/*
The following code is the OnDrawPanel event handler of a
status bar.  It draws each panel of the status bar, adding
text and icons stored in ImageList1. The image list contains
as many icons as there are header sections.  This example
requires a populated image list and a statusbar with several
panels added to the Panels property.  Select each panel and
set the Style property to psOwnerDraw.
*/
void __fastcall TForm1::StatusBar1DrawPanel(TStatusBar *StatusBar,
        TStatusPanel *Panel, const TRect &Rect)
{
  TCanvas *canvas = StatusBar->Canvas;
  canvas->Brush->Color = clRed;
  canvas->FillRect(Rect);
  canvas->Font->Color = clYellow;
  ImageList1->Draw(canvas,Rect.Left,Rect.Top, Panel->Index, true);
  canvas->TextOut(Rect.left + 30, Rect.top + 2, "Panel" + IntToStr(Panel->Index));
}
/*
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
*/
{
  TPoint APoint = Point(X, Y);
  int Index = ListBox1->ItemAtPos(APoint, True);
  TStatusBar *myStatusBar;
  TClass ClassRef = ListBox1->Items->Objects[Index]->ClassType();
  if (String(ClassRef->ClassName()) == "TStatusBar")
  {
    myStatusBar = (TStatusBar *)ListBox1->Items->Objects[Index];
    // make sure we are using the TControls canvas and not the from's!
    myStatusBar->Canvas->MoveTo(myStatusBar->ClientRect.Left, myStatusBar->ClientRect.Top);
    myStatusBar->Canvas->LineTo(myStatusBar->ClientRect.Right, myStatusBar->ClientRect.Bottom);
    myStatusBar = NULL;
  }
}
```

Delphi Examples:

```
{
The following code is the OnDrawPanel event handler of a
status bar.  It draws each panel of the status bar, adding
text and icons stored in ImageList1. The image list contains
as many icons as there are header sections.  This example
requires a populated image list and a statusbar with several
panels added to the Panels property.  Select each panel and
set the Style property to psOwnerDraw.
}
procedure TForm1.StatusBar1DrawPanel(StatusBar: TStatusBar;
  Panel: TStatusPanel; const Rect: TRect);
begin
with StatusBar1.Canvas do
  begin
    Brush.Color := clRed;
    FillRect(Rect);
    Font.Color := clYellow;
    ImageList1.Draw(StatusBar1.Canvas,Rect.Left,Rect.Top,Panel.Index);
    TextOut(Rect.left + 30, Rect.top + 2, 'Panel' + IntToStr(Panel.Index));
  end;
end;
{
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
```

```
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
}
  if (ListBox1.Items.Objects[Index] is TStatusBar) then
  begin
    myStatusBar:= (ListBox1.Items.Objects[Index] as TStatusBar);
    with myStatusBar.ClientRect do
    begin // make sure we are using the TControl's canvas and not the form's!
      myStatusBar.Canvas.MoveTo(Left, Top);
      myStatusBar.Canvas.LineTo(Right, Bottom);
    end;
  myStatusBar:= nil;
  end;
```

27.1.21.5.3 TCustomStatusBar.Panels Property

Lists the panels (TStatusPanel (see page 4825) objects) in the status bar.

Pascal

```
property Panels: TStatusPanels;
```

C++

```
__property TStatusPanels Panels;
```

Description

The Panels property holds a TStatusPanels (see page 4834)—that is, a collection of TStatusPanel (see page 4825) objects. At design time, you can add, remove, or modify panels with the Panels editor. To open the Panels editor, select the Panels property in the Object Inspector, then double-click in the Value column to the right or click the ellipsis (...) button.

C++ Examples:

```
/*
The following code is the OnDrawPanel event handler of a
status bar.  It draws each panel of the status bar, adding
text and icons stored in ImageList1. The image list contains
as many icons as there are header sections.  This example
requires a populated image list and a statusbar with several
panels added to the Panels property.  Select each panel and
set the Style property to psOwnerDraw.
*/
void __fastcall TForm1::StatusBar1DrawPanel(TStatusBar *StatusBar,
        TStatusPanel *Panel, const TRect &Rect)
{
  TCanvas *canvas = StatusBar->Canvas;
  canvas->Brush->Color = clRed;
  canvas->FillRect(Rect);
  canvas->Font->Color = clYellow;
  ImageList1->Draw(canvas,Rect.Left,Rect.Top, Panel->Index, true);
  canvas->TextOut(Rect.left + 30, Rect.top + 2, "Panel" + IntToStr(Panel->Index));
}
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
```

```
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:

TStatusPanel (see page 4825)

27.1.21.5.4 TCustomStatusBar.SimplePanel Property

Determines whether the status bar displays a single panel or multiple panels.

Pascal

```
property SimplePanel: Boolean;
```

C++

```
__property Boolean SimplePanel;
```

Description

If SimplePanel is set to true, the status bar consists of a single panel displaying the text in SimpleText (see page 3916). If SimplePanel is set to false, the status bar displays a separate panel for each item in its Panels (see page 3912) property.

Note: When SimplePanel is false, you can't use the SimpleText (see page 3916) property to display text in the status bar. Instead, you must set the Text property on one of the panel objects.

C++ Examples:

```
/*
This example adds text to a TRichEdit and to a StatusBar.
This example requires no additional controls. All controls are
created dynamically within the form's OnCreate event handler.
Note: Be sure to add ComCtrls to your uses clause to support
TRichEdit.
*/
#include <ComCtrls.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TStatusBar *status = new TStatusBar(this);
  // Display the StatusBar control on the surface
  // of the form.
  status->Parent = this;
  // Allow a single line of text -- no panels.
  status->SimplePanel = true;
  // Provide sample text.
  // Create a new instance of TRichEdit, set its
  // properties, and display on the form.
  TRichEdit *rich = new TRichEdit(this);
  // Display the RichEdit control on the surface
  // of the form.
  rich->Parent = this;
  // The RichText control takes all space left
  // over from the StatusBar.
  rich->Align = alClient;
  // Add 50 lines to the RichText
  for (int i = 1; i <= 50; i++)
    rich->Lines->Add(AnsiString("This is line ") + IntToStr(i));
  rich->SelStart = 0; // set text cursor to first character
  status->SimpleText = IntToStr(rich->Lines->Count) + " Lines loaded";
}
```

Delphi Examples:

```
{
This example adds text to a TRichEdit and to a StatusBar.
```

```
This example requires no additional controls. All controls are
created dynamically within the form's OnCreate event handler.
Note: Be sure to add ComCtrls to your uses clause to support
TRichEdit.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  with TStatusBar.Create(Self) do
  begin
    // Display the StatusBar control on the surface
    // of the form.
    Parent := Self;
    // Allow a single line of text -- no panels.
    SimplePanel := True;
    // Provide sample text.
    // Create a new instance of TRichEdit, set its
    // properties, and display on the form.
    with TRichEdit.Create(Self) do
    begin
      // Display the RichEdit control on the surface
      // of the form.
      Parent := Self;
      // The RichText control takes all space left
      // over from the StatusBar.
      Align := alClient;
      // Add 50 lines to the RichText
      for i := 1 to 50 do
        Lines.Add('Adding line ' + IntToStr(i));
      SelStart := 0; // set text cursor to first character
      SimpleText := 'Number of Lines loaded to RichText: ' +
        IntToStr(Lines.Count);
    end;
  end;
end;

SimpleText (see page 3916)

Panels (see page 3912)

27.1.21.5.5 TCustomStatusBar.SimpleText Property

Contains the string that is displayed in the status bar when SimplePanel (see page 3915) is set to true.

Pascal

```
property SimpleText: string;
```

C++

```
__property AnsiString SimpleText;
```

Description

SimpleText contains a text string to be displayed in the status panel when SimplePanel (see page 3915) is true.

C++ Examples:

```
/*
This example adds text to a TRichEdit and to a StatusBar.
This example requires no additional controls. All controls are
created dynamically within the form's OnCreate event handler.
Note: Be sure to add ComCtrls to your uses clause to support
TRichEdit.
```

```
*/
#include <ComCtrls.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TStatusBar *status = new TStatusBar(this);
  // Display the StatusBar control on the surface
  // of the form.
  status->Parent = this;
  // Allow a single line of text -- no panels.
  status->SimplePanel = true;
  // Provide sample text.
  // Create a new instance of TRichEdit, set its
  // properties, and display on the form.
  TRichEdit *rich = new TRichEdit(this);
  // Display the RichEdit control on the surface
  // of the form.
  rich->Parent = this;
  // The RichText control takes all space left
  // over from the StatusBar.
  rich->Align = alClient;
  // Add 50 lines to the RichText
  for (int i = 1; i <= 50; i++)
    rich->Lines->Add(AnsiString("This is line ") + IntToStr(i));
  rich->SelStart = 0; // set text cursor to first character
  status->SimpleText = IntToStr(rich->Lines->Count) + " Lines loaded";
}
```

Delphi Examples:

```
{
This example adds text to a TRichEdit and to a StatusBar.
This example requires no additional controls. All controls are
created dynamically within the form's OnCreate event handler.
Note: Be sure to add ComCtrls to your uses clause to support
TRichEdit.

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  with TStatusBar.Create(Self) do
  begin
    // Display the StatusBar control on the surface
    // of the form.
    Parent := Self;
    // Allow a single line of text -- no panels.
    SimplePanel := True;
    // Provide sample text.
    // Create a new instance of TRichEdit, set its
    // properties, and display on the form.
    with TRichEdit.Create(Self) do
    begin
      // Display the RichEdit control on the surface
      // of the form.
      Parent := Self;
      // The RichText control takes all space left
      // over from the StatusBar.
      Align := alClient;
      // Add 50 lines to the RichText
      for i := 1 to 50 do
        Lines.Add('Adding line ' + IntToStr(i));
      SelStart := 0; // set text cursor to first character
      SimpleText := 'Number of Lines loaded to RichText: ' +
        IntToStr(Lines.Count);
    end;
  end;
```

```
end;
```

See Also

SimplePanel (see page 3915)

27.1.21.5.6 TCustomStatusBar.SizeGrip Property

Determines whether the status bar is resizable at runtime.

Pascal

```
property SizeGrip: Boolean;
```

C++

```
__property Boolean SizeGrip;
```

Description

If SizeGrip is set to true, the status bar has a triangular grip on the lower right corner. The user can resize the status bar by dragging the grip with the mouse.

A size grip will not be drawn unless the Parent property refers to the child of a TCustomForm descendant with a BorderStyle of bsSizeable or bsSizeToolWin.

Note: If Align is set to alBottom, alRight, or alClient, the sizing grip will not work. If the Alignment property of the last panel in the status bar is set to taRightJustify, the sizing grip will truncate the panel's text.

See Also

Align (see page 5798)

Alignment (see page 4829)

Parent

BorderStyle (see page 13900)

27.1.21.5.7 TCustomStatusBar.UseSystemFont Property

Specifies whether the status bar uses the system font.

Pascal

```
property UseSystemFont: Boolean;
```

C++

```
__property Boolean UseSystemFont;
```

Description

UseSystemFont specifies whether the status bar uses the system font. To change fonts, use the Font property.

See Also

Font (see page 5823)

ParentFont (see page 5834)

DesktopFont (see page 5818)

27.1.21.6 TCustomStatusBar Events

The events of the TCustomStatusBar class are listed here.

Public Events

	Name	Description
	OnCreatePanelClass (see page 3919)	Occurs when a status panel needs to be created.
	OnDrawPanel (see page 3919)	Occurs when a status panel needs to be redrawn.
	OnHint (see page 3920)	Occurs when the AutoHint (see page 3910) property is true and the status bar receives a hint action.

27.1.21.6.1 TCustomStatusBar.OnCreatePanelClass Event

Occurs when a status panel needs to be created.

Pascal

```
property OnCreatePanelClass: TSBCreatePanelClassEvent;
```

C++

```
__property TSBCreatePanelClassEvent OnCreatePanelClass;
```

Description

Write an OnCreatePanelClass event handler to specify a custom TStatusPanel (see page 4825) descendant that the status bar should use to implement its panels.

See Also

Panels (see page 3912)

TStatusPanel (see page 4825)

27.1.21.6.2 TCustomStatusBar.OnDrawPanel Event

Occurs when a status panel needs to be redrawn.

Pascal

```
property OnDrawPanel: TCustomDrawPanelEvent;
```

C++

```
__property TCustomDrawPanelEvent OnDrawPanel;
```

Description

The OnDrawPanel event occurs when a status panel needs to be redisplayed—for example, when the user resizes the status bar. OnDrawPanel occurs only if the status panel's Style property is set to psOwnerDraw.

C++ Examples:

```
/*
The following code is the OnDrawPanel event handler of a
status bar.  It draws each panel of the status bar, adding
text and icons stored in ImageList1. The image list contains
as many icons as there are header sections.  This example
requires a populated image list and a statusbar with several
panels added to the Panels property.  Select each panel and
set the Style property to psOwnerDraw.
*/
void __fastcall TForm1::StatusBar1DrawPanel(TStatusBar *StatusBar,
```

```
        TStatusPanel *Panel, const TRect &Rect)
{
  TCanvas *canvas = StatusBar->Canvas;
  canvas->Brush->Color = clRed;
  canvas->FillRect(Rect);
  canvas->Font->Color = clYellow;
  ImageList1->Draw(canvas,Rect.Left,Rect.Top, Panel->Index, true);
  canvas->TextOut(Rect.left + 30, Rect.top + 2, "Panel" + IntToStr(Panel->Index));
}
```

Delphi Examples:

```
{
The following code is the OnDrawPanel event handler of a
status bar.  It draws each panel of the status bar, adding
text and icons stored in ImageList1. The image list contains
as many icons as there are header sections.  This example
requires a populated image list and a statusbar with several
panels added to the Panels property.  Select each panel and
set the Style property to psOwnerDraw.
}
procedure TForm1.StatusBar1DrawPanel(StatusBar: TStatusBar;
  Panel: TStatusPanel; const Rect: TRect);
begin
with StatusBar1.Canvas do
  begin
    Brush.Color := clRed;
    FillRect(Rect);
    Font.Color := clYellow;
    ImageList1.Draw(StatusBar1.Canvas,Rect.Left,Rect.Top,Panel.Index);
    TextOut(Rect.left + 30, Rect.top + 2, 'Panel' + IntToStr(Panel.Index));
  end;
end;
```

See Also

Style (see page 4830)

27.1.21.6.3 TCustomStatusBar.OnHint Event

Occurs when the AutoHint (see page 3910) property is true and the status bar receives a hint action.

Pascal

```
property OnHint: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnHint;
```

Description

Write an OnHint event handler to customize the way the status bar displays hints when the AutoHint (see page 3910) property is true. When AutoHint (see page 3910) is true and the status bar needs to display a hint, it generates an OnHint event. If the status bar has an OnHint event handler, then the status bar assumes that the event handler displays the hint and does not set the panel text to the value of the application's current hint. If there is no OnHint event handler (and AutoHint (see page 3910) is true), the status bar displays the text of the hint in the first panel.

OnHint does not occur if the AutoHint (see page 3910) property is false.

27.1.22 TCustomTabControl Class

TCustomTabControl is the base type for tab control components such as TTabControl (see page 4841) and TPageControl (see page 4459).

Class Hierarchy

Pascal

```
TCustomTabControl = class(TWinControl);
```

C++

```
class TCustomTabControl : public TWinControl;
```

File

ComCtrls

Description

Use TCustomTabControl as a base class when defining a control that includes a set of notebook style tabs across the top. TCustomTabControl introduces many properties, methods, and events to manage appearance and behavior of the tabs, and to respond when the user selects one of the tabs.

Note: When using one of the page controls, if you want to restrict a user from switching to a tab, you cannot set TTabSheet.Enabled to **false** to accomplish that restriction. Instead, use the OnChanging (see page 3955) event to prevent the user from selecting a tab.

See Also

TPageControl (see page 4459)

TTabControl (see page 4841)

27.1.22.1 TCustomTabControl Members

The following tables list the members exposed by TCustomTabControl.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnChange (see page 3952)	Occurs after a new tab is selected.
	OnChanging (see page 3955)	Occurs immediately before a new tab is selected.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnDrawTab (see page 3956)	Occurs when a tab is about to be drawn.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetImageIndex (see page 3956)	Occurs when a tab is about to display its associated image.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.

	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
	AdjustClientRect (see page 3933)	Calculates the control's display area given a rectangle.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanChange (see page 3933)	Change (see page 3934) permission event dispatcher.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	CanShowTab (see page 3934)	Selection permission event dispatcher.
	Change (see page 3934)	Pending tab change event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 3935)	Sets up the window-creation parameters for the tab control.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 3935)	Creates the window for a tab control.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.

	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawTab (see page 3935)	Tab drawing event dispatcher.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetImageIndex (see page 3936)	Generates an OnGetImageIndex (see page 3956) event
	GetOwner (see page 2778)	Returns the owner of a component.

	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 3937)	Form load event dispatcher.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 3937)	Event dispatcher for creation and destruction of child objects.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.

	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetTabIndex (see page 3938)	This is SetTabIndex, a member of class TCustomTabControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateTabImages (see page 3939)	Updates the tab images.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
R	DisplayRect (see page 3941)	Specifies the bounding rectangle of a tab control client area.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	HotTrack (see page 3941)	Determines whether labels on the tab under the mouse are automatically highlighted.
	Images (see page 3941)	Specifies the images drawn in tabs.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	MultiLine (see page 3942)	Determines whether the tabs can appear on more than one row.
	MultiSelect (see page 3943)	Specifies whether multiple tabs can be selected.
	OwnerDraw (see page 3944)	Specifies whether the tab control handles its own painting.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	RaggedRight (see page 3944)	Specifies whether rows of tabs stretch to fill the width of the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	ScrollOpposite (see page 3944)	Determines how the rows of tabs are scrolled in a multi-line tab control.
	Style (see page 3945)	Specifies the style of the tab control.
	TabHeight (see page 3945)	Specifies the height, in pixels, of the tabs in the tab control.
	TabIndex (see page 3946)	Identifies the selected tab on a tab control.
	TabPosition (see page 3948)	Determines whether tabs appear at the top or bottom.
	Tabs (see page 3948)	Contains the list of text strings that label the tabs of the tab control.
	TabWidth (see page 3950)	Specifies the horizontal size, in pixels, of the tabs in the tab control.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 3932)	Creates and initializes an instance of TCustomTabControl (see page 3921).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 3932)	Destroys an instance of TCustomTabControl (see page 3921).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.

	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHitTestInfoAt (see page 3936)	Returns information about the location of a point relative to the client area of the tab control.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	IndexOfTabAt (see page 3936)	Indicates the index of the tab at a specified point.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	RowCount (see page 3938)	Sets TabIndex (see page 3946) property.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	ScrollTabs (see page 3938)	Scrolls the tabs that are visible when the tab control is not multi-line.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	TabRect (see page 3939)	Returns the bounding rectangle for a specified tab.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 3940)	Gives access to the tab control's canvas.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 3950)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.

	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

27.1.22.2 TCustomTabControl.Create Constructor

Creates and initializes an instance of TCustomTabControl (see page 3921).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomTabControl(TComponent * AOwner);
```

Description

Call Create to instantiate a tab control at runtime. Tab controls placed on forms at design time are created automatically. Create calls the inherited Create method and sets the initial values for the tab control, including the creation of a tab list that contains the text strings for the tabs.

AOwner is a component, typically the form, that is responsible for freeing the tab control. It becomes the value of the Owner property.

See Also

Create (see page 6123)

Owner (see page 2807)

27.1.22.3 TCustomTabControl.Destroy Destructor

Destroys an instance of TCustomTabControl (see page 3921).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomTabControl();
```

Description

Do not call Destroy directly in an application. Instead, use Free. Free checks that the tab control is not nil, and only then calls Destroy. Destroy frees the tab list that holds the list of text strings for the tabs and calls the inherited destructor.

See Also

Free (see page 22300)

27.1.22.4 TCustomTabControl Methods

The methods of the TCustomTabControl class are listed here.

Protected Methods

	Name	Description
	AdjustClientRect (see page 3933)	Calculates the control's display area given a rectangle.
	CanChange (see page 3933)	Change (see page 3934) permission event dispatcher.
	CanShowTab (see page 3934)	Selection permission event dispatcher.
	Change (see page 3934)	Pending tab change event dispatcher.
	CreateParams (see page 3935)	Sets up the window-creation parameters for the tab control.
	CreateWnd (see page 3935)	Creates the window for a tab control.
	DrawTab (see page 3935)	Tab drawing event dispatcher.
	GetImageIndex (see page 3936)	Generates an OnGetImageIndex (see page 3956) event
	Loaded (see page 3937)	Form load event dispatcher.
	Notification (see page 3937)	Event dispatcher for creation and destruction of child objects.
	SetTabIndex (see page 3938)	This is SetTabIndex, a member of class TCustomTabControl.
	UpdateTabImages (see page 3939)	Updates the tab images.

Public Methods

	Name	Description
	GetHitTestInfoAt (see page 3936)	Returns information about the location of a point relative to the client area of the tab control.
	IndexOfTabAt (see page 3936)	Indicates the index of the tab at a specified point.
	RowCount (see page 3938)	Sets TabIndex (see page 3946) property.
	ScrollTabs (see page 3938)	Scrolls the tabs that are visible when the tab control is not multi-line.
	TabRect (see page 3939)	Returns the bounding rectangle for a specified tab.

27.1.22.4.1 TCustomTabControl.AdjustClientRect Method

Calculates the control's display area given a rectangle.

Pascal

```
procedure AdjustClientRect(var Rect: TRect); override;
```

C++

```
virtual __fastcall AdjustClientRect(TRect Rect);
```

Description

AdjustClientRect is called internally when the tab control needs accurate information on where to place child controls within the client area. As implemented in TCustomTabControl (see page 3921), returns the DisplayRect (see page 3941) property as the Rect parameter.

See Also

DisplayRect (see page 3941)

27.1.22.4.2 TCustomTabControl.CanChange Method

Change (see page 3934) permission event dispatcher.

Pascal

```
function CanChange: Boolean; dynamic;
```

C++

```
__fastcall Boolean CanChange();
```

Description

CanChange is called automatically when an attempt is made to change the selected tab. CanChange generates an OnChanging (see page 3955) event so that an OnChanging (see page 3955) event handler can prevent the selection from changing. If there is no OnChanging (see page 3955) event handler, CanChange returns true, allowing the change.

Override CanChange to specify additional processing before the OnChanging (see page 3955) event handler executes or to block the OnChanging (see page 3955) event.

See Also

OnChanging (see page 3955)

27.1.22.4.3 TCustomTabControl.CanShowTab Method

Selection permission event dispatcher.

Pascal

```
function CanShowTab(TabIndex: Integer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CanShowTab(int TabIndex);
```

Description

CanShowTab is called automatically when an attempt is made to show a tab. CanShowTab is exposed as a protected method so that descendants can override this method to provide application-specific criteria that determines whether a tab is accessible.

TabIndex (see page 3946) is the index of the tab in the list of labels maintained by the Tabs (see page 3948) property.

CanShowTab returns a Boolean value that indicates whether the tab specified in TabIndex (see page 3946) can be accessed.

Tip: CanShowTab can be used with such methods as CanFocus (TWinControl) to determine whether the tab can both be accessed and can receive focus. Criteria for an overridden CanShowTab might include checking whether the tab is enabled.

See Also

CanFocus (see page 6131)

Tabs (see page 3948)

27.1.22.4.4 TCustomTabControl.Change Method

Pending tab change event dispatcher.

Pascal

```
procedure Change; dynamic;
```

C++

```
__fastcall Change();
```

Description

Change is called automatically when the selected tab changes. Override Change to specify additional processing before the OnChange (see page 3952) event handler executes, or to block the OnChange (see page 3952) event.

See Also

OnChange (see page 3952)

27.1.22.4.5 TCustomTabControl.CreateParams Method

Sets up the window-creation parameters for the tab control.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

Tab controls call CreateParams internally when the window for the tab control must be generated. CreateParams overrides the inherited method to specify a tab control window with the current property settings.

See Also

CreateWnd (see page 3935)

27.1.22.4.6 TCustomTabControl.CreateWnd Method

Creates the window for a tab control.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the tab control's window is recreated. CreateWnd calls the inherited method, before assigning any saved tab text strings in internal storage.

See Also

DestroyWnd (see page 6141)

27.1.22.4.7 TCustomTabControl.DrawTab Method

Tab drawing event dispatcher.

Pascal

```
procedure DrawTab(TabIndex: Integer; const Rect: TRect; Active: Boolean); virtual;
```

C++

```
virtual __fastcall DrawTab(int TabIndex, const TRect Rect, Boolean Active);
```

Description

Override DrawTab in a derived class to control the painting of tabs.

TabIndex (see page 3946) is the index of the tab that requires painting.

Rect is the area in which the tab should be painted.

Active is whether the tab is active.

Use the Canvas (see page 3940) property to paint the tab.

See Also

OnDrawTab (see page 3956)

27.1.22.4.8 TCustomTabControl.GetHitTestInfoAt Method

Returns information about the location of a point relative to the client area of the tab control.

Pascal

```
function GetHitTestInfoAt(X: Integer; Y: Integer): THitTests;
```

C++

```
__fastcall THitTests GetHitTestInfoAt(int X, int Y);
```

Description

Call GetHitTestInfoAt to determine what portion of the tab control, if any, sits under the point specified by the X and Y parameters.

GetHitTestInfo returns a THitTests (see page 5488) type. This set describes the possible elements under the mouse. When interpreting these values, each tab can be considered an "item" of the tab control.

See Also

IndexOfTabAt (see page 3936)

27.1.22.4.9 TCustomTabControl.GetImageIndex Method

Generates an OnGetImageIndex (see page 3956) event

Pascal

```
function GetImageIndex(TabIndex: Integer): Integer; virtual;
```

C++

```
virtual __fastcall int GetImageIndex(int TabIndex);
```

Description

Override GetImageIndex in a derived class to specify the index of the image to display for a particular tab.

TabIndex (see page 3946) is the index of the tab that is about to be displayed.

Integer is the index of the image in the Images (see page 3941) property that will be displayed in the tab.

See Also

OnGetImageIndex (see page 3956)

27.1.22.4.10 TCustomTabControl.IndexOfTabAt Method

Indicates the index of the tab at a specified point.

Pascal

```
function IndexOfTabAt(X: Integer; Y: Integer): Integer;
```

C++

```
__fastcall int IndexOfTabAt(int X, int Y);
```

Description

Use IndexOfTabAt to locate which tab is at the point specified by X and Y. If the point with X-coordinate X and Y-coordinate Y is over a tab, IndexOfTabAt returns the 0-offset index of that tab in the Tabs (see page 3948) property (TTabControl (see page 4841)) or in the Pages property (TPageControl (see page 4459)). If the point defined by X and Y is not over a tab, IndexOfTabAt returns –1.

See Also

GetHitTestInfoAt (see page 3936)

Tabs (see page 3948)

Pages (see page 4498)

DisplayRect (see page 3941)

27.1.22.4.11 TCustomTabControl.Loaded Method

Form load event dispatcher.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

The protected Loaded method is called automatically when the form that contains the tab control is loaded into memory. It provides an opportunity for the tab control to perform any initializations after the control and all other components in the form are loaded into memory, but before the first paint operation.

In TCustomTabControl (see page 3921), Loaded ensures that the layout of the tabs accommodate the images specified by the Images (see page 3941) property.

See Also

Images (see page 3941)

27.1.22.4.12 TCustomTabControl.Notification Method

Event dispatcher for creation and destruction of child objects.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification checks whether the notification indicates that the component that implements the Images (see page 3941) property is about to be destroyed, and if so, sets that property to nil (Delphi) or NULL (C++).

See Also

Images (see page 3941)

27.1.22.4.13 TCustomTabControl.RowCount Method

Sets TabIndex (see page 3946) property.

Pascal

```
function RowCount: Integer;
```

C++

```
__fastcall int RowCount();
```

Description

RowCount is called to change the value of the TabIndex (see page 3946) property. Descendant classes should override RowCount to provide special implementations of this property.

See Also

TabIndex (see page 3946)

27.1.22.4.14 TCustomTabControl.ScrollTabs Method

Scrolls the tabs that are visible when the tab control is not multi-line.

Pascal

```
procedure ScrollTabs(Delta: Integer);
```

C++

```
__fastcall ScrollTabs(int Delta);
```

Description

Call ScrollTabs to change the tabs that are visible in the tab control. When Delta is positive, Delta additional tabs to the right are scrolled into view. When Delta is negative, the tabs to the left are scrolled into view, with the absolute value of Delta indicating how many tabs are scrolled. If there are fewer than the absolute value of Delta tabs in the indicated direction, ScrollTabs scrolls as far as possible.

ScrollTabs has no effect if there are no scrolled tabs, either because the control is wide enough to display all tabs or because the MultiLine (see page 3942) property is true.

Note: ScrollTabs scrolls the visible tabs. It does not change the current selection. Calling ScrollTabs may scroll the selected tab out of view.

See Also

Tabs (see page 3948)

MultiLine (see page 3942)

27.1.22.4.15 TCustomTabControl.SetTabIndex Method

Pascal

```
procedure SetTabIndex(Value: Integer); virtual;
```

C++

```
virtual __fastcall SetTabIndex(int Value);
```

Description

This is SetTabIndex, a member of class TCustomTabControl.

27.1.22.4.16 TCustomTabControl.TabRect Method

Returns the bounding rectangle for a specified tab.

Pascal

```
function TabRect(Index: Integer): TRect;
```

C++

```
__fastcall TRect TabRect(int Index);
```

Description

Use TabRect to determine the current position of the tab with the specified index. Index is the 0-offset index of a tab in the Tabs (see page 3948) property (TTabControl (see page 4841)) or in the Pages property (TPageControl (see page 4459)). TabRect returns the bounding rectangle (in client coordinates) of the specified tab.

See Also

Tabs (see page 3948)

Pages (see page 4498)

27.1.22.4.17 TCustomTabControl.UpdateTabImages Method

Updates the tab images.

Pascal

```
procedure UpdateTabImages;
```

C++

```
__fastcall UpdateTabImages();
```

Description

UpdateTabImages is called automatically to update the tab images after streaming in the control.

See Also

Images (see page 3941)

27.1.22.5 TCustomTabControl Properties

The properties of the TCustomTabControl class are listed here.

Protected Properties

	Name	Description
R	DisplayRect (see page 3941)	Specifies the bounding rectangle of a tab control client area.
	HotTrack (see page 3941)	Determines whether labels on the tab under the mouse are automatically highlighted.
	Images (see page 3941)	Specifies the images drawn in tabs.
	MultiLine (see page 3942)	Determines whether the tabs can appear on more than one row.
	MultiSelect (see page 3943)	Specifies whether multiple tabs can be selected.
	OwnerDraw (see page 3944)	Specifies whether the tab control handles its own painting.
	RaggedRight (see page 3944)	Specifies whether rows of tabs stretch to fill the width of the control.
	ScrollOpposite (see page 3944)	Determines how the rows of tabs are scrolled in a multi-line tab control.
	Style (see page 3945)	Specifies the style of the tab control.
	TabHeight (see page 3945)	Specifies the height, in pixels, of the tabs in the tab control.

	TabIndex (see page 3946)	Identifies the selected tab on a tab control.
	TabPosition (see page 3948)	Determines whether tabs appear at the top or bottom.
	Tabs (see page 3948)	Contains the list of text strings that label the tabs of the tab control.
	TabWidth (see page 3950)	Specifies the horizontal size, in pixels, of the tabs in the tab control.

Public Properties

	Name	Description
R	Canvas (see page 3940)	Gives access to the tab control's canvas.
	TabStop (see page 3950)	Determines if the user can tab to a control.

27.1.22.5.1 TCustomTabControl.Canvas Property

Gives access to the tab control's canvas.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Use Canvas to paint to the tab control's canvas during the OnDrawTab (see page 3956) event.

C++ Examples:

```
/*
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
*/
{
  TPoint APoint = Point(X, Y);
  int Index = ListBox1->ItemAtPos(APoint, True);
  TPageControl *myPageControl;
  TClass ClassRef = ListBox1->Items->Objects[Index]->ClassType();
  if (String(ClassRef->ClassName()) == "TPageControl")
  {
    myPageControl = (TPageControl *)ListBox1->Items->Objects[Index];
    // make sure we are using the TControls canvas and not the from's!
    myPageControl->Canvas->MoveTo(myPageControl->ClientRect.Left,
myPageControl->ClientRect.Top);
    myPageControl->Canvas->LineTo(myPageControl->ClientRect.Right,
myPageControl->ClientRect.Bottom);
    myPageControl = NULL;
  }
}
```

Delphi Examples:

```
{
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
}
  if (ListBox1.Items.Objects[Index] is TPageControl) then
  begin
    myPageControl:= (ListBox1.Items.Objects[Index] as TPageControl);
    with myPageControl.ClientRect do
```

```
    begin // make sure we are using the TControl's canvas and not the form's!
      myPageControl.Canvas.MoveTo(Left, Top);
      myPageControl.Canvas.LineTo(Right, Bottom);
    end;
  myPageControl:= nil;
  end;
```

See Also

OwnerDraw (see page 3944)

OnDrawTab (see page 3956)

27.1.22.5.2 TCustomTabControl.DisplayRect Property

Specifies the bounding rectangle of a tab control client area.

Pascal

```
property DisplayRect: TRect;
```

C++

```
__property TRect DisplayRect;
```

Description

Use DisplayRect to obtain the coordinates, in pixels, of the portion of the tab control that represents the contents of the tab pages. The appearance of this portion of the tab control does not change when different tabs are selected.

Use DisplayRect rather than the ClientRect property to determine the portion of the tab control that can contain other objects.

See Also

ClientRect

AdjustClientRect (see page 3933)

27.1.22.5.3 TCustomTabControl.HotTrack Property

Determines whether labels on the tab under the mouse are automatically highlighted.

Pascal

```
property HotTrack: Boolean;
```

C++

```
__property Boolean HotTrack;
```

Description

Set HotTrack to true to provide visual feedback to the user about which tab would be selected if the mouse button is clicked. HotTrack is especially useful when the tab control contains multiple rows of tabs.

See Also

MultiLine (see page 3942)

HotImages

27.1.22.5.4 TCustomTabControl.Images Property

Specifies the images drawn in tabs.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Images specifies the images that are drawn in tabs. If DisabledImages is defined, those images are used instead for disabled tabs; otherwise, grayed versions of the images are used.

In the implementation of TCustomTabControl (see page 3921), the order of images in image list properties directly corresponds to the associated tabs in the control. In the descendant class, TPageControl (see page 4459), this behavior is replaced by support for individual TTabSheet (see page 4919) objects, each with an ImageIndex property. In any case, the application programmer can define customized image displays by defining an OnGetImageIndex (see page 3956) event handler.

See Also

OnGetImageIndex (see page 3956)

Pages (see page 4498)

ImageIndex (see page 4943)

DisabledImages

27.1.22.5.5 TCustomTabControl.MultiLine Property

Determines whether the tabs can appear on more than one row.

Pascal

```
property MultiLine: Boolean;
```

C++

```
__property Boolean MultiLine;
```

Description

Use MultiLine to determine how the tabs are displayed. If MultiLine is true, the tabs are displayed on more than one row when the number of tabs exceeds the number that fits across the top of the tab control. How many rows is determined by how many tabs are in the tab control. If MultiLine is false, the tabs are displayed on one row only, and the user must scroll the displayed scroll arrows to view all the tabs.

C++ Examples:

```
/*
This example requires a PageControl with no pages created,
and a TCheckBox. During the form create, a series of tabs
will be created on the Page Control that exceed the Page
Control's width.  When the Check Box control is clicked, the
setting of the MultiLine property is toggled, alternately
stacking the tabs vertically, or along a single line
horizontally.
*/

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->MultiLine = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
```

```
{
  CheckBox1->Caption = "Stack Tabs?";
  for (int i = 0; i < 20; i++)
  {
    TTabSheet *pPage = new TTabSheet(PageControl1);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
  }
}
```

Delphi Examples:

```
{
This example requires a PageControl with no pages created,
and a TCheckBox. During the form create, a series of tabs
will be created on the Page Control that exceed the Page
Control's width.  When the Check Box control is clicked, the
setting of the MultiLine property is toggled, alternately
stacking the tabs vertically, or along a single line
horizontally.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.MultiLine := CheckBox1.Checked;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Checkbox1.Caption := 'Stack Tabs?';
  for i := 0 to 20 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'Tab #' + IntToStr(i);
    end;
end;
```

See Also

ScrollOpposite (see page 3944)

27.1.22.5.6 TCustomTabControl.MultiSelect Property

Specifies whether multiple tabs can be selected.

Pascal

```
property MultiSelect: Boolean;
```

C++

```
__property Boolean MultiSelect;
```

Description

Use MultiSelect to get or set whether multiple tabs can be selected.

MultiSelect can only be true if Style (see page 3945) is tsFlatButtons or tsButtons.

See Also

ScrollOpposite (see page 3944)

27.1.22.5.7 TCustomTabControl.OwnerDraw Property

Specifies whether the tab control handles its own painting.

Pascal

```
property OwnerDraw: Boolean;
```

C++

```
__property Boolean OwnerDraw;
```

Description

Set OwnerDraw to true to override any default painting behavior.

See Also

Canvas (see page 3940)

OnDrawTab (see page 3956)

27.1.22.5.8 TCustomTabControl.RaggedRight Property

Specifies whether rows of tabs stretch to fill the width of the control.

Pascal

```
property RaggedRight: Boolean;
```

C++

```
__property Boolean RaggedRight;
```

Description

Use RaggedRight to get or set whether rows of tabs stretch to fill the width of the control.

27.1.22.5.9 TCustomTabControl.ScrollOpposite Property

Determines how the rows of tabs are scrolled in a multi-line tab control.

Pascal

```
property ScrollOpposite: Boolean;
```

C++

```
__property Boolean ScrollOpposite;
```

Description

Set ScrollOpposite to determine where previous rows of tabs in a multi-line tab control move when the user selects a tab in another row. When ScrollOpposite is true, previous rows of tabs are moved to the bottom of the tab control if TabPosition (see page 3948) is tpTop, or to the top if TabPosition (see page 3948) is tpBottom. When ScrollOpposite is false, previous rows of tabs are moved to the back of all other rows of tabs.

For example, in a tab control with three rows of tabs at the top, if the user selects a tab in the second row, ScrollOpposite determines where the first row moves. If ScrollOpposite is true, the second row now appears at the front (bottom) row on top of the tab control, followed by the third row behind (above) it. The first row moves to the bottom of the tab control. If ScrollOpposite is false, the first row moves to the back (top), so that the tab control displays the second row in front (at the bottom of the tab region), followed by the third row (now in the middle), followed by the first row.

Note: Setting ScrollOpposite to true automatically sets the MultiLine (see page 3942) property to true.

See Also

MultiLine (see page 3942)

TabPosition (see page 3948)

27.1.22.5.10 TCustomTabControl.Style Property

Specifies the style of the tab control.

Pascal

```
property Style: TTabStyle;
```

C++

```
__property TTabStyle Style;
```

Description

Use Style to determine the appearance of the tabs. These can appear as notebook tabs or as buttons.

27.1.22.5.11 TCustomTabControl.TabHeight Property

Specifies the height, in pixels, of the tabs in the tab control.

Pascal

```
property TabHeight: Smallint;
```

C++

```
__property Smallint TabHeight;
```

Description

Set TabHeight to control the height of the tabs that appear above the client region of the tab control. The TabHeight property is the vertical size in pixels of the individual tabs. If TabHeight is set to 0, the tabs automatically size themselves to fit their text.

C++ Examples:

```
/*
This project requires a TPageControl and several TTabPages.
To add new pages, right-click the TPageControl and select
New Page.  During the form creation the width and height of
all tabs on the Page Control becomes double the largest
previous value. So if there are three tabs with captions that
are 12, 23, and 19 characters long, the TabWidth would be the
number of pixels required to fit 46 characters.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < PageControl1->PageCount; i++)
  {
     AnsiString s = PageControl1->Pages[i]->Caption;
     if (Canvas->TextWidth(s) * 2 > PageControl1->TabWidth)
        PageControl1->TabWidth = Canvas->TextWidth(s) * 2;
      if (Canvas->TextHeight(s) * 2 > PageControl1->TabHeight)
        PageControl1->TabHeight = Canvas->TextHeight(s) * 2;
  }
}
```

Delphi Examples:

```
{
This project requires a TPageControl and several TTabPages.
```

```
  To add new pages, right-click the TPageControl and select
  New Page.  During the form creation the width and height of
  all tabs on the Page Control becomes double the largest
  previous value. So if there are three tabs with captions that
  are 12, 23, and 19 characters long, the TabWidth would be the
  number of pixels required to fit 46 characters.
  }
  procedure TForm1.FormCreate(Sender: TObject);
  var
    i: Integer;
  begin
    with PageControl1 do
    begin
      for i := 0 to PageCount - 1 do
      begin
        if (Canvas.TextWidth(Pages[i].Caption) * 2) > TabWidth then
          TabWidth := Canvas.TextWidth(Pages[i].Caption) * 2;
        if (Canvas.TextHeight(Pages[i].Caption) * 2) > TabHeight then
          TabHeight := Canvas.TextHeight(Pages[i].Caption) * 2;
      end;
    end;
  end;
```

See Also

DisplayRect (see page 3941)

Tabs (see page 3948)

TabWidth (see page 3950)

27.1.22.5.12 TCustomTabControl.TabIndex Property

Identifies the selected tab on a tab control.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Read TabIndex to determine which tab was selected by the user. TabIndex is the index of the tab in the list of labels maintained by the Tabs (see page 3948) property. The first (leftmost) tab has a TabIndex of 0, the next has 1, and so on. If no tabs are selected, TabIndex has a value of -1.

Set TabIndex to programmatically change the selected tab in the tab control.

C++ Examples:

```
/*
This example uses a tab control to display the contents of
several files. To run the example, place a tab control on a
form and add a memo control that fits into its client area.
Be sure to leave enough room for the tabs when they appear.
Then add an OpenDialog and a button to the form.  The
"Add a file" button adds a single file to the tabcontrol.
The "Assign files" button removes previous files and can be
used to assign multiple files.  To assign multiple files,
use CNTL Select or SHIFT Select to select files in the
OpenDialog.
*/
void __fastcall TForm1::Add_a_fileClick(TObject *Sender)
{
```

```
  OpenDialog1->Options << ofAllowMultiSelect << ofFileMustExist << ofHideReadOnly;
  if (OpenDialog1->Execute())
  {
    int index = TabControl1->Tabs->Add(OpenDialog1->FileName);
    Memo1->Lines->LoadFromFile(TabControl1->Tabs->Strings[index]);
  }
}

void __fastcall TForm1::Assign_filesClick(TObject *Sender)
{
  OpenDialog1->Options << ofAllowMultiSelect << ofFileMustExist << ofHideReadOnly;
  if (OpenDialog1->Execute())
  {
    TabControl1->Tabs->Assign(OpenDialog1->Files);
    Memo1->Lines->LoadFromFile(TabControl1->Tabs->Strings[TabControl1->TabIndex]);
  }
}
/*
Place the following code in the tab control's OnChange event
handler:
*/
void __fastcall TForm1::TabControl1Change(TObject *Sender)
{
    Memo1->Lines->LoadFromFile(
      TabControl1->Tabs->Strings[TabControl1->TabIndex]);
}
```

Delphi Examples:

```
{
This example uses a tab control to display the contents of
several files. To run the example, place a tab control on a
form and add a memo control that fits into its client area.
Be sure to leave enough room for the tabs when they appear.
Then add an OpenDialog and a button to the form.  The
"Add a file" button adds a single file to the tabcontrol.
The "Assign files" button removes previous files and can be
used to assign multiple files.  To assign multiple files,
use CNTL Select or SHIFT Select to select files in the
OpenDialog.
}
procedure TForm1.Add_a_fileClick(Sender: TObject);
var index : integer;
begin
  OpenDialog1.Options :=
    [ofAllowMultiSelect, ofFileMustExist, ofHideReadOnly];
  if OpenDialog1.Execute then
  begin
    index:= TabControl1.Tabs.Add(OpenDialog1.FileName);
    Memo1.Lines.LoadFromFile(TabControl1.Tabs[index]);
  end;
end;

procedure TForm1.Assign_filesClick(Sender: TObject);
var index : integer;
begin
  OpenDialog1.Options :=
    [ofAllowMultiSelect, ofFileMustExist, ofHideReadOnly];
  if OpenDialog1.Execute then
  begin
    TabControl1.Tabs.Assign(OpenDialog1.Files);
    Memo1.Lines.LoadFromFile(
      TabControl1.Tabs[TabControl1.TabIndex]);
  end;
end;

{
```

```
Place the following code in the tab control's OnChange event
handler:
}
procedure TForm1.TabControl1Change(Sender: TObject);
begin
  with TabControl1 do
    Memo1.Lines.LoadFromFile(Tabs[TabIndex]);
end;
```

See Also

Tabs (see page 3948)

27.1.22.5.13 TCustomTabControl.TabPosition Property

Determines whether tabs appear at the top or bottom.

Pascal

```
property TabPosition: TTabPosition;
```

C++

```
__property TTabPosition TabPosition;
```

Description

Set TabPosition to tpTop to display the tabs at the top of the tab control. Set TabPosition to tpBottom to display the tabs at the bottom. If the ScrollOpposite (see page 3944) property is true, tabs can appear at both top and bottom, with the row containing the current tab and all subsequent rows on the side indicated by TabPosition.

Due to a limitation in the windows common control, if TabPosition is tpLeft or tpRight, Font must be a True Type font. Otherwise, tab text may paint incorrectly.

See Also

ScrollOpposite (see page 3944)

27.1.22.5.14 TCustomTabControl.Tabs Property

Contains the list of text strings that label the tabs of the tab control.

Pascal

```
property Tabs: TStrings;
```

C++

```
__property TStrings Tabs;
```

Description

Tabs contains a list of strings that label the tabs in the tab control. Tabs can also contain objects associated with the labels, using the TStrings Objects property. Add new strings to the Tabs property to add new tabs to the tab control. Rearrange the list to rearrange the tabs.

C++ Examples:

```
/*
This example uses a tab control to display the contents of
several files. To run the example, place a tab control on a
form and add a memo control that fits into its client area.
Be sure to leave enough room for the tabs when they appear.
Then add an OpenDialog and a button to the form.  The
"Add a file" button adds a single file to the tabcontrol.
The "Assign files" button removes previous files and can be
```

```
used to assign multiple files.  To assign multiple files,
use CNTL Select or SHIFT Select to select files in the
OpenDialog.
*/
void __fastcall TForm1::Add_a_fileClick(TObject *Sender)
{
  OpenDialog1->Options << ofAllowMultiSelect << ofFileMustExist << ofHideReadOnly;
  if (OpenDialog1->Execute())
  {
    int index = TabControl1->Tabs->Add(OpenDialog1->FileName);
    Memo1->Lines->LoadFromFile(TabControl1->Tabs->Strings[index]);
  }
}

void __fastcall TForm1::Assign_filesClick(TObject *Sender)
{
  OpenDialog1->Options << ofAllowMultiSelect << ofFileMustExist << ofHideReadOnly;
  if (OpenDialog1->Execute())
  {
    TabControl1->Tabs->Assign(OpenDialog1->Files);
    Memo1->Lines->LoadFromFile(TabControl1->Tabs->Strings[TabControl1->TabIndex]);
  }
}
/*
Place the following code in the tab control's OnChange event
handler:
*/
void __fastcall TForm1::TabControl1Change(TObject *Sender)
{
    Memo1->Lines->LoadFromFile(
      TabControl1->Tabs->Strings[TabControl1->TabIndex]);
}
```

Delphi Examples:

```
{
This example uses a tab control to display the contents of
several files. To run the example, place a tab control on a
form and add a memo control that fits into its client area.
Be sure to leave enough room for the tabs when they appear.
Then add an OpenDialog and a button to the form.  The
"Add a file" button adds a single file to the tabcontrol.
The "Assign files" button removes previous files and can be
used to assign multiple files.  To assign multiple files,
use CNTL Select or SHIFT Select to select files in the
OpenDialog.
}
procedure TForm1.Add_a_fileClick(Sender: TObject);
var index : integer;
begin
  OpenDialog1.Options :=
    [ofAllowMultiSelect, ofFileMustExist, ofHideReadOnly];
  if OpenDialog1.Execute then
  begin
    index:= TabControl1.Tabs.Add(OpenDialog1.FileName);
    Memo1.Lines.LoadFromFile(TabControl1.Tabs[index]);
  end;
end;

procedure TForm1.Assign_filesClick(Sender: TObject);
var index : integer;
begin
  OpenDialog1.Options :=
    [ofAllowMultiSelect, ofFileMustExist, ofHideReadOnly];
  if OpenDialog1.Execute then
  begin
    TabControl1.Tabs.Assign(OpenDialog1.Files);
```

```
      Memo1.Lines.LoadFromFile(
        TabControl1.Tabs[TabControl1.TabIndex]);
    end;
  end;

  {
  Place the following code in the tab control's OnChange event
  handler:
  }
  procedure TForm1.TabControl1Change(Sender: TObject);
  begin
    with TabControl1 do
      Memo1.Lines.LoadFromFile(Tabs[TabIndex]);
  end;
```

See Also

TabIndex (see page 3946)

Objects (see page 3077)

TTabControl (see page 4841)

27.1.22.5.15 TCustomTabControl.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

27.1.22.5.16 TCustomTabControl.TabWidth Property

Specifies the horizontal size, in pixels, of the tabs in the tab control.

Pascal

```
property TabWidth: Smallint;
```

C++

```
__property Smallint TabWidth;
```

Description

TabWidth specifies a fixed width for all tabs. If TabWidth is 0, then each tab is automatically made wide enough to show its caption.

C++ Examples:

```
/*
This project requires a TPageControl and several TTabPages.
To add new pages, right-click the TPageControl and select
New Page.  During the form creation the width and height of
all tabs on the Page Control becomes double the largest
previous value. So if there are three tabs with captions that
are 12, 23, and 19 characters long, the TabWidth would be the
number of pixels required to fit 46 characters.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < PageControl1->PageCount; i++)
  {
     AnsiString s = PageControl1->Pages[i]->Caption;
     if (Canvas->TextWidth(s) * 2 > PageControl1->TabWidth)
        PageControl1->TabWidth = Canvas->TextWidth(s) * 2;
      if (Canvas->TextHeight(s) * 2 > PageControl1->TabHeight)
        PageControl1->TabHeight = Canvas->TextHeight(s) * 2;
  }
}
```

Delphi Examples:

```
{
This project requires a TPageControl and several TTabPages.
To add new pages, right-click the TPageControl and select
New Page.  During the form creation the width and height of
all tabs on the Page Control becomes double the largest
previous value. So if there are three tabs with captions that
are 12, 23, and 19 characters long, the TabWidth would be the
number of pixels required to fit 46 characters.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  with PageControl1 do
  begin
    for i := 0 to PageCount - 1 do
    begin
      if (Canvas.TextWidth(Pages[i].Caption) * 2) > TabWidth then
        TabWidth := Canvas.TextWidth(Pages[i].Caption) * 2;
      if (Canvas.TextHeight(Pages[i].Caption) * 2) > TabHeight then
        TabHeight := Canvas.TextHeight(Pages[i].Caption) * 2;
    end;
  end;
end;
```

27.1.22.6 TCustomTabControl Events

The events of the TCustomTabControl class are listed here.

Protected Events

	Name	Description
	OnChange (see page 3952)	Occurs after a new tab is selected.
	OnChanging (see page 3955)	Occurs immediately before a new tab is selected.
	OnDrawTab (see page 3956)	Occurs when a tab is about to be drawn.

	OnGetImageIndex (see page 3956)	Occurs when a tab is about to display its associated image.

27.1.22.6.1 TCustomTabControl.OnChange Event

Occurs after a new tab is selected.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action immediately after the selected tab changes. Use the TabIndex (see page 3946) property to determine which tab is now selected. This is the opportunity to make any changes to the control that reflect the new state implied by the selected tag.

Before the value of TabIndex (see page 3946) changes, an OnChanging (see page 3955) event occurs.

C++ Examples:

```
/*
This project requires a Page Control.  You will need to
populate the Page Control by right clicking and selecting
New Page from the context menu. As the tabs are selected by
the user, the Page Control OnChange event fires, which
causes the form caption to display the captions of each of
the TTabSheets attached to the Page Control.
Note the use of the Form's OnShow event handler to set the
caption when the form first appears.  This occurs before
any changes trigger the OnChange event of the Page Control.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  Caption = AnsiString("Now working on tab: " + PageControl1->ActivePage->Caption);
}

void __fastcall TForm1::FormShow(TObject *Sender)
{
  PageControl1Change(Sender);
}
/*
This example uses a tab control to display the contents of
several files. To run the example, place a tab control on a
form and add a memo control that fits into its client area.
Be sure to leave enough room for the tabs when they appear.
Then add an OpenDialog and a button to the form.  The
"Add a file" button adds a single file to the tabcontrol.
The "Assign files" button removes previous files and can be
used to assign multiple files.  To assign multiple files,
use CNTL Select or SHIFT Select to select files in the
OpenDialog.
*/
void __fastcall TForm1::Add_a_fileClick(TObject *Sender)
{
  OpenDialog1->Options << ofAllowMultiSelect << ofFileMustExist << ofHideReadOnly;
  if (OpenDialog1->Execute())
  {
    int index = TabControl1->Tabs->Add(OpenDialog1->FileName);
    Memo1->Lines->LoadFromFile(TabControl1->Tabs->Strings[index]);
  }
}
```

```
void __fastcall TForm1::Assign_filesClick(TObject *Sender)
{
  OpenDialog1->Options << ofAllowMultiSelect << ofFileMustExist << ofHideReadOnly;
  if (OpenDialog1->Execute())
  {
    TabControl1->Tabs->Assign(OpenDialog1->Files);
    Memo1->Lines->LoadFromFile(TabControl1->Tabs->Strings[TabControl1->TabIndex]);
  }
}
/*
Place the following code in the tab control's OnChange event
handler:
*/
void __fastcall TForm1::TabControl1Change(TObject *Sender)
{
    Memo1->Lines->LoadFromFile(
      TabControl1->Tabs->Strings[TabControl1->TabIndex]);
}
/*
This example requires a new TPageControl, with no new pages
created at design time.  The form OnCreate event handler
adds several new TabSheet controls to the Page Control.  The
Page Control's OnChange event handler displays a message
dialog when the user changes tabs.  The message dialog
contains the captions for the tabs immediately before and
after the active tab.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(PageControl1);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    pPage->Name = AnsiString("ts") + pPage->Caption;
  }
}

void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  AnsiString PrevCaption, NextCaption;
  TPageControl *pPC = (TPageControl *)Sender;
  PrevCaption = pPC->FindNextPage(pPC->ActivePage, false, false)->Caption;
  NextCaption = pPC->FindNextPage(pPC->ActivePage, true, false)->Caption;
  ShowMessage(AnsiString("Previous tab caption: '") + PrevCaption + AnsiString("'  Next tab
Caption: '") + NextCaption + AnsiString("'"));
}
```

Delphi Examples:

```
{
This project requires a Page Control.  You will need to
populate the Page Control by right clicking and selecting
New Page from the context menu. As the tabs are selected by
the user, the Page Control OnChange event fires, which
causes the form caption to display the captions of each of
the TTabSheets attached to the Page Control.
Note the use of the Form's OnShow event handler to set the
caption when the form first appears.  This occurs before
any changes trigger the OnChange event of the Page Control.
}
procedure TForm1.PageControl1Change(Sender: TObject);
begin
  Caption := ' Now working on tab:  ' + PageControl1.ActivePage.Caption;
end;

procedure TForm1.FormShow(Sender: TObject);
```

```
begin
  PageControl1Change(Sender);
end;
{
This example uses a tab control to display the contents of
several files. To run the example, place a tab control on a
form and add a memo control that fits into its client area.
Be sure to leave enough room for the tabs when they appear.
Then add an OpenDialog and a button to the form.  The
"Add a file" button adds a single file to the tabcontrol.
The "Assign files" button removes previous files and can be
used to assign multiple files.  To assign multiple files,
use CNTL Select or SHIFT Select to select files in the
OpenDialog.
}
procedure TForm1.Add_a_fileClick(Sender: TObject);
var index : integer;
begin
  OpenDialog1.Options :=
    [ofAllowMultiSelect, ofFileMustExist, ofHideReadOnly];
  if OpenDialog1.Execute then
  begin
    index:= TabControl1.Tabs.Add(OpenDialog1.FileName);
    Memo1.Lines.LoadFromFile(TabControl1.Tabs[index]);
  end;
end;

procedure TForm1.Assign_filesClick(Sender: TObject);
var index : integer;
begin
  OpenDialog1.Options :=
    [ofAllowMultiSelect, ofFileMustExist, ofHideReadOnly];
  if OpenDialog1.Execute then
  begin
    TabControl1.Tabs.Assign(OpenDialog1.Files);
    Memo1.Lines.LoadFromFile(
      TabControl1.Tabs[TabControl1.TabIndex]);
  end;
end;

{
Place the following code in the tab control’s OnChange event
handler:
}
procedure TForm1.TabControl1Change(Sender: TObject);
begin
  with TabControl1 do
    Memo1.Lines.LoadFromFile(Tabs[TabIndex]);
end;
{
This example requires a new TPageControl, with no new pages
created at design time.  The form OnCreate event handler
adds several new TabSheet controls to the Page Control.  The
Page Control’s OnChange event handler displays a message
dialog when the user changes tabs.  The message dialog
contains the captions for the tabs immediately before and
after the active tab.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
```

```
      Caption := 'TabSheet #' + IntToStr(i);
    end;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
var
  PrevCaption, NextCaption: ShortString;
begin
  with (Sender as TPageControl) do
  begin
    PrevCaption :=
      FindNextPage(ActivePage, False, False).Caption;
    NextCaption :=
      FindNextPage(ActivePage, True, False).Caption;
  end;
  ShowMessage('Previous tab caption: "' + PrevCaption +
    '"    Next tab Caption: "' + NextCaption + '"');
end;
```

OnChanging (see page 3955)

TabIndex (see page 3946)

27.1.22.6.2 TCustomTabControl.OnChanging Event

Occurs immediately before a new tab is selected.

Pascal

```
property OnChanging: TTabChangingEvent;
```

C++

```
__property TTabChangingEvent OnChanging;
```

Description

Write an OnChanging event handler to take specific action immediately before the selected tab changes. Set the AllowChange parameter to false to prevent the change.

Use an OnChanging event handler to prevent the user from leaving a tab setting until certain conditions have been met. An OnChanging event handler can also be used to save information about the current state of the tab control before it is changed by a new tab selection.

Note: The event is not called if you change the active page in code, for example, by setting the value of TPageControl (see page 4459). ActivePage.

C++ Examples:

```
/*
This project requires a TPageControl, several TTabSheets (to
add sheets, right click the Page Control and select "New
Page" from the context menu), and a TEdit control on the
first tab sheet.  The user is not allowed to change to a new
page if the active page is "TabSheet1" and there is no text
in the Edit Control.
*/
void __fastcall TForm1::PageControl1Changing(TObject *Sender, bool &AllowChange)
{
  if (((TPageControl *)Sender)->ActivePage == TabSheet1)
    AllowChange = (!Edit1->Text.IsEmpty());
  else
```

```
    AllowChange = true;
  if (AllowChange == false)
  {
    MessageBeep(0);
    Edit1->SetFocus();
  }
}
```

Delphi Examples:

```
{
This project requires a TPageControl, several TTabSheets (to
add sheets, right click the Page Control and select "New
Page" from the context menu), and a TEdit control on the
first tab sheet.  The user is not allowed to change to a new
page if the active page is "TabSheet1" and there is no text
in the Edit Control.
}
procedure TForm1.PageControl1Changing(Sender: TObject; var AllowChange: Boolean);
begin
  if ((Sender as TPageControl).ActivePage = TabSheet1) then
    AllowChange := (Edit1.Text <> '')
  else
    AllowChange := True;
end;
```

See Also

OnChange (see page 3952)

TabIndex (see page 3946)

27.1.22.6.3 TCustomTabControl.OnDrawTab Event

Occurs when a tab is about to be drawn.

Pascal

```
property OnDrawTab: TDrawTabEvent;
```

C++

```
__property TDrawTabEvent OnDrawTab;
```

Description

Use OnDrawTab to customize the painting of tabs.

You can paint the tab using the Canvas (see page 3940) property.

See Also

Canvas (see page 3940)

OwnerDraw (see page 3944)

27.1.22.6.4 TCustomTabControl.OnGetImageIndex Event

Occurs when a tab is about to display its associated image.

Pascal

```
property OnGetImageIndex: TTabGetImageEvent;
```

C++

```
__property TTabGetImageEvent OnGetImageIndex;
```

Description

Write an OnGetImageIndex event handler to specify the ImageIndex for a given TabIndex (see page 3946).

On entry to the event handler, the ImageIndex parameter is the same as the TabIndex (see page 3946) parameter, where TabIndex (see page 3946) is the index of the tab which is about to display its image. Change (see page 3934) the ImageIndex parameter to specify the index into the Images (see page 3941) property that specifies the image that should be painted.

Images (see page 3941)

TabIndex (see page 3946)

27.1.23 TCustomTreeView Class

TCustomTreeView is the base type for tree-view components such as TTreeView (see page 5293).

Class Hierarchy

Pascal

```
TCustomTreeView = class(TWinControl);
```

C++

```
class TCustomTreeView : public TWinControl;
```

File

ComCtrls

Description

Use TCustomTreeView as a base class when defining controls that present information in a hierarchical structure with nodes that can be expanded or collapsed. Most of the properties defined in TCustomTreeView are protected so that you can choose whether to publish them in your own tree view components.

Do not create instances of TCustomTreeView. Use the generic descendant TTreeView (see page 5293), or create your own descendant class.

See Also

TTreeNode (see page 5230)

TTreeNodes (see page 5266)

TTreeView (see page 5293)

27.1.23.1 TCustomTreeView Members

The following tables list the members exposed by TCustomTreeView.

Protected Events

	Name	Description
	OnAddition (see page 4016)	Occurs when new node is added.
	OnAdvancedCustomDraw (see page 4016)	Occurs at discrete stages during the painting of the tree view control.
	OnAdvancedCustomDrawItem (see page 4016)	Occurs at discrete stages during the painting of tree view nodes.
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCancelEdit (see page 4017)	Occurs when user cancels editing of a node's Caption.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnChange (see page 4017)	Occurs whenever the selection has changed from one node to another.
	OnChanging (see page 4018)	Occurs when the selection is about to change from one node to another.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnCollapsed (see page 4018)	Occurs after a node has been collapsed.
	OnCollapsing (see page 4018)	Occurs when a node is about to be collapsed.
	OnCompare (see page 4019)	Occurs when two nodes must be compared during a sort of the nodes in the tree view.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnCreateNodeClass (see page 4019)	Occurs when a node in the treeview is about to be created.
	OnCustomDraw (see page 4019)	Occurs immediately prior to painting the tree view control.
	OnCustomDrawItem (see page 4021)	Occurs immediately prior to painting a node in a tree view control.
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDeletion (see page 4024)	Occurs when a node in the tree view is deleted.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEdited (see page 4024)	Occurs after the user edits the Text property of a node.
	OnEditing (see page 4024)	Occurs when the user starts to edit the Text property of a node.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnExpanded (see page 4025)	Occurs after a node is expanded.
	OnExpanding (see page 4025)	Occurs when a node is about to be expanded.
	OnGetImageIndex (see page 4026)	Occurs when the tree view looks up the ImageIndex of a node.
	OnGetSelectedIndex (see page 4026)	Occurs when the tree view looks up the SelectedIndex of a node.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.

	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FChangeTimer (see page 3970)	This is FChangeTimer, a member of class TCustomTreeView.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
	Added (see page 3972)	This is Added, a member of class TCustomTreeView.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanChange (see page 3972)	Pending node change event dispatcher.
	CanCollapse (see page 3973)	Pending node collapse event dispatcher.
	CanEdit (see page 3973)	Node editing event dispatcher.
	CanExpand (see page 3974)	Node expand event dispatcher.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.

	Change (see page 3974)	Completed node change event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	Collapse (see page 3975)	Completed node collapse event dispatcher.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateNode (see page 3975)	Creates a new TTreeNode (see page 5230) instance with the TTreeNodes (see page 5266) specified by Items (see page 4004) as its Owner.
V	CreateNodes (see page 3976)	This is CreateNodes, a member of class TCustomTreeView.
V	CreateParams (see page 3976)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 3976)	Creates the window used by the tree view component.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
V	CustomDraw (see page 3977)	Generates an OnCustomDraw (see page 4019) or OnAdvancedCustomDraw (see page 4016) event.
V	CustomDrawItem (see page 3977)	Generates an OnCustomDrawItem (see page 4021) or OnAdvancedCustomDrawItem (see page 4016) event.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	Delete (see page 3979)	Generates an OnDeletion (see page 4024) event.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 3980)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
V	DoEndDrag (see page 3981)	End drag event dispatcher.
V	DoEnter (see page 3981)	Respond to receiving input focus.
V	DoExit (see page 3981)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.

	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 3982)	Drag start event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	Edit (see page 3982)	Edited event dispatcher.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	Expand (see page 3983)	Completed node expansion event dispatcher.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 3984)	Returns the image list to be displayed during drag operations.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetImageIndex (see page 3986)	Obtain image index.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSelectedIndex (see page 3988)	Obtain selection index.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	InvalidateSelectionsRects (see page 3989)	This is InvalidateSelectionsRects, a member of class TCustomTreeView.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
V	IsCustomDrawn (see page 3989)	Specifies when the control should generate custom draw events.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 3990)	Initializes the tree view after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
V	MouseDown (see page 3991)	OnMouseDown event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 3992)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 3994)	Sets the drag mode for the tree view.

	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateSelection (see page 3995)	This is ValidateSelection, a member of class TCustomTreeView.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 3995)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoExpand (see page 3996)	Specifies whether the nodes in the tree view automatically expand and collapse depending on the selection.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderStyle (see page 3997)	Determines whether the tree view control has a border.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.

	ChangeDelay (see page 3999)	Specifies the delay between when a node is selected and when the OnChange (see page 4017) event occurs.
	Color (see page 5812)	Specifies the background color of the control.
	CreateWndRestores (see page 4000)	This is CreateWndRestores, a member of class TCustomTreeView.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	HideSelection (see page 4000)	Determines whether a selected node appears selected when the focus shifts to another control.
	HotTrack (see page 4001)	Specifies whether list items are highlighted when the mouse passes over them.
	Images (see page 4001)	Determines which image list is associated with the tree view.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	Indent (see page 4001)	Specifies the amount of indentation in pixels when a list of child nodes is expanded.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	Items (see page 4004)	Lists the individual nodes that appear in the tree view control.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	MultiSelect (see page 4005)	Determines whether the user can select more than one tree node at a time.
	MultiSelectStyle (see page 4005)	Determines how multiple node selections work.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 4006)	Determines whether the user can edit the node labels.
	RightClickSelect (see page 4006)	Determines whether the Selected (see page 4007) property returns nodes that are selected using the right mouse button.
	RowSelect (see page 4007)	Specifies whether the entire row of the selected item is highlighted.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	ShowButtons (see page 4013)	Specifies whether to display plus (+) and minus (-) buttons to the left side of each parent item.
	ShowLines (see page 4013)	Specifies whether to display the lines that link child nodes to their corresponding parent nodes.
	ShowRoot (see page 4013)	Specifies whether lines connecting top-level nodes are displayed.
	SortType (see page 4014)	Determines if and how the nodes in a tree view are automatically sorted.
	StateImages (see page 4014)	Determines which image list to use for state images.
	Text (see page 5842)	Contains a text string associated with the control.
	ToolTips (see page 4014)	Specifies whether the items in the tree view have tool tips.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AlphaSort (see page 3972)	Sort tree nodes.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	ClearSelection (see page 3974)	Deselect (see page 3980) all selected nodes, optionally excluding primary selection.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 3969)	Creates an instance of a TTreeView (see page 5293) control.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	CustomSort (see page 3978)	Sorts the nodes in the tree view into a customized sort order.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Deselect (see page 3980)	Deselects a specified node.
V	Destroy (see page 3970)	Destroys the tree view control and is called by the Delete (see page 3979) method.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
V	FindNextToSelect (see page 3983)	Returns next selectable node.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	FullCollapse (see page 3983)	Collapses all the nodes within a tree view control.
	FullExpand (see page 3984)	Expands all nodes within the tree view control.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHitTestInfoAt (see page 3985)	Returns information about the location of a point relative to the client area of the tree view control.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNodeAt (see page 3987)	Returns the node that is found at the specified position.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetSelections (see page 3989)	Obtain selections list.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsEditing (see page 3990)	Indicates whether a node is currently being edited by the user.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	LoadFromFile (see page 3990)	Reads the file specified in FileName and loads the data into the tree view.
	LoadFromStream (see page 3991)	Reads tree view data from a stream and stores the contents in the tree view.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 3992)	Saves a the tree view to the file specified in FileName.
	SaveToStream (see page 3993)	Writes the data in the tree view to the stream passed as the Stream parameter.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
V	Select (see page 3993)	This is the overview for the Select method overload.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Subselect (see page 3994)	Toggle node selection.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.

	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 3997)	Provides access to the canvas.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DropTarget (see page 4000)	Specifies which item in the tree view appears as the target of a drag and drop operation.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	Selected (see page 4007)	Specifies the selected node in the tree view.
R	SelectionCount (see page 4012)	Returns number of nodes selected.
R	Selections (see page 4012)	Returns nodes selected.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.

R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TopItem (see page 4015)	Specifies the topmost node that appears in the tree view.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

27.1.23.2 TCustomTreeView.Create Constructor

Creates an instance of a TTreeView (see page 5293) control.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomTreeView(TComponent * AOwner);
```

Description

Call Create to instantiate a tree view at runtime. Tree view controls placed on forms at design time are created automatically. After calling the inherited constructor, Create initializes many properties the control, including setting BorderStyle (see page 3997) to bsSingle and setting ShowButtons (see page 4013), ShowRoot (see page 4013), and ShowLines (see page 4013), and HideSelection (see page 4000) to true.

See Also

BorderStyle (see page 3997)

HideSelection (see page 4000)

ShowButtons (see page 4013)

ShowLines (see page 4013)

ShowRoot (see page 4013)

27.1.23.3 TCustomTreeView.Destroy Destructor

Destroys the tree view control and is called by the Delete (see page 3979) method.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomTreeView();
```

Description

Do not call the destructor directly in an application. Instead, use the Free method. Free checks that the tree view is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

27.1.23.4 TCustomTreeView Fields

The fields of the TCustomTreeView class are listed here.

Protected Fields

	Name	Description
	FChangeTimer (see page 3970)	This is FChangeTimer, a member of class TCustomTreeView.

27.1.23.4.1 TCustomTreeView.FChangeTimer Field

Pascal

```
FChangeTimer: TTimer;
```

C++

```
TTimer FChangeTimer;
```

Description

This is FChangeTimer, a member of class TCustomTreeView.

27.1.23.5 TCustomTreeView Methods

The methods of the TCustomTreeView class are listed here.

Protected Methods

	Name	Description
	Added (see page 3972)	This is Added, a member of class TCustomTreeView.
	CanChange (see page 3972)	Pending node change event dispatcher.
	CanCollapse (see page 3973)	Pending node collapse event dispatcher.
	CanEdit (see page 3973)	Node editing event dispatcher.
	CanExpand (see page 3974)	Node expand event dispatcher.

	Change (see page 3974)	Completed node change event dispatcher.
	Collapse (see page 3975)	Completed node collapse event dispatcher.
V	CreateNode (see page 3975)	Creates a new TTreeNode (see page 5230) instance with the TTreeNodes (see page 5266) specified by Items (see page 4004) as its Owner.
V	CreateNodes (see page 3976)	This is CreateNodes, a member of class TCustomTreeView.
V	CreateParams (see page 3976)	Initializes a window-creation parameter data structure.
V	CreateWnd (see page 3976)	Creates the window used by the tree view component.
V	CustomDraw (see page 3977)	Generates an OnCustomDraw (see page 4019) or OnAdvancedCustomDraw (see page 4016) event.
V	CustomDrawItem (see page 3977)	Generates an OnCustomDrawItem (see page 4021) or OnAdvancedCustomDrawItem (see page 4016) event.
	Delete (see page 3979)	Generates an OnDeletion (see page 4024) event.
V	DestroyWnd (see page 3980)	Destroys the control's window.
V	DoEndDrag (see page 3981)	End drag event dispatcher.
V	DoEnter (see page 3981)	Respond to receiving input focus.
V	DoExit (see page 3981)	Respond to losing input focus
V	DoStartDrag (see page 3982)	Drag start event dispatcher.
	Edit (see page 3982)	Edited event dispatcher.
	Expand (see page 3983)	Completed node expansion event dispatcher.
V	GetDragImages (see page 3984)	Returns the image list to be displayed during drag operations.
V	GetImageIndex (see page 3986)	Obtain image index.
V	GetSelectedIndex (see page 3988)	Obtain selection index.
	InvalidateSelectionsRects (see page 3989)	This is InvalidateSelectionsRects, a member of class TCustomTreeView.
V	IsCustomDrawn (see page 3989)	Specifies when the control should generate custom draw events.
V	Loaded (see page 3990)	Initializes the tree view after it is loaded from a stream.
V	MouseDown (see page 3991)	OnMouseDown event dispatcher.
V	Notification (see page 3992)	Responds to notifications that components are being created or destroyed.
V	SetDragMode (see page 3994)	Sets the drag mode for the tree view.
	ValidateSelection (see page 3995)	This is ValidateSelection, a member of class TCustomTreeView.
V	WndProc (see page 3995)	Provides specific message responses for the control.

Public Methods

	Name	Description
	AlphaSort (see page 3972)	Sort tree nodes.
V	ClearSelection (see page 3974)	Deselect (see page 3980) all selected nodes, optionally excluding primary selection.
	CustomSort (see page 3978)	Sorts the nodes in the tree view into a customized sort order.
V	Deselect (see page 3980)	Deselects a specified node.
V	FindNextToSelect (see page 3983)	Returns next selectable node.
	FullCollapse (see page 3983)	Collapses all the nodes within a tree view control.
	FullExpand (see page 3984)	Expands all nodes within the tree view control.
	GetHitTestInfoAt (see page 3985)	Returns information about the location of a point relative to the client area of the tree view control.
	GetNodeAt (see page 3987)	Returns the node that is found at the specified position.
	GetSelections (see page 3989)	Obtain selections list.
	IsEditing (see page 3990)	Indicates whether a node is currently being edited by the user.
	LoadFromFile (see page 3990)	Reads the file specified in FileName and loads the data into the tree view.
	LoadFromStream (see page 3991)	Reads tree view data from a stream and stores the contents in the tree view.
	SaveToFile (see page 3992)	Saves a the tree view to the file specified in FileName.
	SaveToStream (see page 3993)	Writes the data in the tree view to the stream passed as the Stream parameter.
V	Select (see page 3993)	This is the overview for the Select method overload.
V	Subselect (see page 3994)	Toggle node selection.

27.1.23.5.1 TCustomTreeView.Added Method

Pascal

```
procedure Added(Node: TTreeNode); dynamic;
```

C++

```
__fastcall Added(TTreeNode Node);
```

Description

This is Added, a member of class TCustomTreeView.

27.1.23.5.2 TCustomTreeView.AlphaSort Method

Sort tree nodes.

Pascal

```
function AlphaSort(ARecurse: Boolean = True): Boolean;
```

C++

```
__fastcall Boolean AlphaSort(Boolean ARecurse = True);
```

Description

AlphaSort triggers node sorting or resorting. If an OnCompare (see page 4019) event handler is defined, that routine determines sort order. If no OnCompare (see page 4019) handler is defined, nodes are sorted by a simple case-sensitive compare of their captions.

The optional ARecurse parameter (default true) specifies that sorting should recursively descend the node tree and sort each subtree in turn.

Calling AlphaSort is equivalent to calling CustomSort (see page 3978) with a nil (Delphi) or NULL (C++) procedure parameter and a data parameter of 0.

Calling AlphaSort has the same effect as calling the same method for the Items (see page 4004) property, except that in TTreeNodes (see page 5266), AlphaSort is not recursive by default.

To sort a subtree, use the AlphaSort method in TTreeNodes (see page 5266).

See Also

CustomSort (see page 3978)

SortType (see page 4014)

AlphaSort (see page 5234)

AlphaSort (see page 5279)

27.1.23.5.3 TCustomTreeView.CanChange Method

Pending node change event dispatcher.

Pascal

```
function CanChange(Node: TTreeNode): Boolean; dynamic;
```

C++

```
__fastcall Boolean CanChange(TTreeNode Node);
```

Description

CanChange is called automatically whenever an attempt is made to change the selected node. The Node parameter indicates the currently selected node. CanChange returns true if selection can move away from the specified node, false otherwise.

If there is no OnChanging (see page 4018) event handler, CanChange returns true.

Override this method to make additional, class-specific responses in addition to the OnChanging (see page 4018) event or to suppress the OnChanging (see page 4018) event.

See Also

OnChanging (see page 4018)

27.1.23.5.4 TCustomTreeView.CanCollapse Method

Pending node collapse event dispatcher.

Pascal

```
function CanCollapse(Node: TTreeNode): Boolean; dynamic;
```

C++

```
__fastcall Boolean CanCollapse(TTreeNode Node);
```

Description

CanCollapse is called automatically whenever an attempt is made to collapse the node specified by the Node parameter. CanCollapse returns true if node can be collapsed, false otherwise.

If there is no OnCollapsing (see page 4018) event handler, CanCollapse returns true.

Override this method to make additional, class-specific responses in addition to the OnCollapsing (see page 4018) event or to suppress the OnCollapsing (see page 4018) event.

See Also

OnCollapsing (see page 4018)

27.1.23.5.5 TCustomTreeView.CanEdit Method

Node editing event dispatcher.

Pascal

```
function CanEdit(Node: TTreeNode): Boolean; dynamic;
```

C++

```
__fastcall Boolean CanEdit(TTreeNode Node);
```

Description

CanEdit is called automatically whenever an attempt is made to edit the node specified by the Node parameter. CanEdit returns true if the user can edit the specified node, false otherwise.

If there is no OnEditing (see page 4024) event handler, CanEdit returns true.

Override this method to make additional, class-specific responses in addition to the OnEditing (see page 4024) event or to suppress the OnEditing (see page 4024) event.

See Also

OnEditing (see page 4024)

27.1.23.5.6 TCustomTreeView.CanExpand Method

Node expand event dispatcher.

Pascal

```
function CanExpand(Node: TTreeNode): Boolean; dynamic;
```

C++

```
__fastcall Boolean CanExpand(TTreeNode Node);
```

Description

CanExpand is called automatically whenever an attempt is made to expand the node specified by the Node parameter. CanExpand returns true if node can be expanded, false otherwise.

If there is no OnExpanding (see page 4025) event handler, CanExpand returns true.

Override this method to make additional, class-specific responses in addition to the OnExpanding (see page 4025) event or to suppress the OnExpanding (see page 4025) event.

See Also

OnExpanding (see page 4025)

27.1.23.5.7 TCustomTreeView.Change Method

Completed node change event dispatcher.

Pascal

```
procedure Change(Node: TTreeNode); dynamic;
```

C++

```
__fastcall Change(TTreeNode Node);
```

Description

Change is called automatically whenever the selected node changes. The Node parameter indicates the newly selected node.

Override this method to make additional, class-specific responses in addition to the OnChange (see page 4017) event or to suppress the OnChange (see page 4017) event.

See Also

OnChanging (see page 4018)

ChangeDelay (see page 3999)

27.1.23.5.8 TCustomTreeView.ClearSelection Method

Deselect (see page 3980) all selected nodes, optionally excluding primary selection.

Pascal

```
procedure ClearSelection(KeepPrimary: Boolean = False); virtual;
```

C++

```
virtual __fastcall ClearSelection(Boolean KeepPrimary = False);
```

Description

ClearSelection deselects all selected nodes. If the KeepPrimary parameter is true, the primary selection (in the first element of

the Selections (see page 4012) property) is not toggled.

See Also

Selections (see page 4012)

27.1.23.5.9 TCustomTreeView.Collapse Method

Completed node collapse event dispatcher.

Pascal

```
procedure Collapse(Node: TTreeNode); dynamic;
```

C++

```
__fastcall Collapse(TTreeNode Node);
```

Description

Collapse is called automatically after the node specified by the Node parameter collapses.

Override this method to make additional, class-specific responses in addition to the OnCollapsed (see page 4018) event or to suppress the OnCollapsed (see page 4018) event.

See Also

OnChanging (see page 4018)

ChangeDelay (see page 3999)

27.1.23.5.10 TCustomTreeView.CreateNode Method

Creates a new TTreeNode (see page 5230) instance with the TTreeNodes (see page 5266) specified by Items (see page 4004) as its Owner.

Pascal

```
function CreateNode: TTreeNode; virtual;
```

C++

```
virtual __fastcall TTreeNode CreateNode();
```

Description

Do not call CreateNode in application code. The TTreeNodes (see page 5266) object specified by the Items (see page 4004) property uses this method in the implementation of its Add, AddFirst, AddChild, AddChildFirst, AddObject, AddObjectFirst, AddChildObject, and AddChildObjectFirst methods. To create a new node for the tree view, use one of these methods instead. These methods ensure that the node is inserted properly and its properties reflect its position in the tree view.

See Also

Create (see page 5232)

Add (see page 5270)

AddFirst (see page 5275)

AddChild (see page 5271)

AddChildFirst (see page 5273)

AddObject (see page 5276)

AddObjectFirst (see page 5279)

AddChildObject (see page 5273)

AddChildObjectFirst (see page 5274)

Items (see page 4004)

27.1.23.5.11 TCustomTreeView.CreateNodes Method

Pascal

```
function CreateNodes: TTreeNodes; virtual;
```

C++

```
virtual __fastcall TTreeNodes CreateNodes();
```

Description

This is CreateNodes, a member of class TCustomTreeView.

27.1.23.5.12 TCustomTreeView.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd (see page 3976) method calls CreateParams to initialize the parameters it passes to CreateWindowHandle.

CreateParams fills in the data structure that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

CreateParams sets the value of the Params parameter to reflect the current property settings of the tree view.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 3976)

AddBiDiModeExStyle (see page 6128)

27.1.23.5.13 TCustomTreeView.CreateWnd Method

Creates the window used by the tree view component.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the tree view is first created or when the window must be destroyed and recreated to reflect property changes.

CreateWnd first calls the CreateParams (see page 3976) method to initialize the window-creation parameters, then calls CreateWindowHandle to create the window for the control. If the tree view's window was temporarily destroyed and recreated, CreateWnd reads various property settings from an in-memory cache where they were stored while there was no window. CreateWnd then sends a series of Windows messages to the newly-created tree view control to initialize its property settings.

See Also

CreateParams (see page 3976)

CreateWindowHandle (see page 6137)

Perform (see page 5776)

DestroyWnd (see page 3980)

27.1.23.5.14 TCustomTreeView.CustomDraw Method

Generates an OnCustomDraw (see page 4019) or OnAdvancedCustomDraw (see page 4016) event.

Pascal

```
function CustomDraw(const ARect: TRect; Stage: TCustomDrawStage): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CustomDraw(const TRect ARect, TCustomDrawStage Stage);
```

Description

CustomDraw is called automatically at discrete stages in the painting process. It determines what event handlers, if any, are appropriate for the current drawing stage, and generates the appropriate events.

ARect is the boundaries of the tree view in the coordinates of the Canvas (see page 3997) property.

Stage is the current stage of the painting process.

CustomDraw returns true if the tree view should continue with the default painting process, false if the method has completely rendered the tree view and there is no more painting to be done.

OnCustomDraw (see page 4019)

Canvas (see page 3997)

OnAdvancedCustomDraw (see page 4016)

27.1.23.5.15 TCustomTreeView.CustomDrawItem Method

Generates an OnCustomDrawItem (see page 4021) or OnAdvancedCustomDrawItem (see page 4016) event.

Pascal

```
function CustomDrawItem(Node: TTreeNode; State: TCustomDrawState; Stage: TCustomDrawStage; var
PaintImages: Boolean): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CustomDrawItem(TTreeNode Node, TCustomDrawState State,
TCustomDrawStage Stage, Boolean PaintImages);
```

Description

CustomDrawItem is called automatically at discrete stages during the painting of tree nodes. It determines what event handlers, if any, are appropriate for the current drawing stage, and generates the appropriate events.

Node is the item that is about to be painted.

State is the item's current state: one or more of cdsSelected, cdsGrayed, cdsDisabled, cdsChecked, cdsFocused, cdsDefault, cdsHot, cdsMarked, cdsIndeterminate.

Stage is the current stage of the painting process.

PaintImages returns a value that indicates whether the tree view should paint the images associated with the current node. This value is only meaningful when Stage is csPrePaint.

CustomDrawItem returns true if the tree view should continue with the default rendering of the item, false if the method completely handled painting the item and there is nothing left to paint.

OnCustomDrawItem (see page 4021)

Canvas (see page 3997)

27.1.23.5.16 TCustomTreeView.CustomSort Method

Sorts the nodes in the tree view into a customized sort order.

Pascal

```
function CustomSort(SortProc: TTVCompare; Data: Longint; ARecurse: Boolean = True): Boolean;
```

C++

```
__fastcall Boolean CustomSort(TTVCompare SortProc, Longint Data, Boolean ARecurse = True);
```

Description

CustomSort triggers node sorting or resorting, using a comparison routine indicated by the SortProc parameter. The Data parameter is passed to the comparison routine. The optional ARecurse parameter (default true) specifies that sorting should recursively descend the node tree and sort each subtree in turn.

If SortProc is nil (Delphi) or NULL (C++), a default comparison routine is used. The default routine uses the OnCompare (see page 4019) event handler, if defined. If the OnCompare (see page 4019) event handler is not defined, the default routine uses a simple case-sensitive compare of node captions.

In the comparison routine, the lParam1 and lParam2 parameters refer to two nodes when cast to TTreeNode (see page 5230). The lParamSort parameter is the value previously passed to the Data parameter of CustomSort. The return value of the comparison routine indicates the relative sort order of lParam1 and lParam2:

Return ValueMeaning

< 0lParam1 comes before lParam2

0lParam1 and lParam2 are equivalent

> 0lParam2 comes before lParam1

Calling CustomSort has the same effect as calling the same method for the Items (see page 4004) property, except that in TTreeNodes (see page 5266), CustomSort is not recursive by default.

To sort a subtree, call the CustomSort method of the Items (see page 4004) property.

C++ Examples:

```
/*
This example shows how to use the CustomSort method to order
a tree view in case-insensitive alphabetical order (either
forward or backward). The application must provide a
callback function such as CompareFunc below, which calls the
```

```
global AnsiStrIComp function to perform the actual
comparison.  This example requires a button and a populated
TreeView.
*/
int CALLBACK CompareFunc(long lParam1, long lParam2, long Reverse)
{
  TTreeNode *Node1 = ((TTreeNode *)lParam1);
  TTreeNode *Node2 = ((TTreeNode *)lParam2);
  if ((Node1 == NULL) || (Node2 == NULL)) return 0;
  int GT = AnsiStrIComp(Node1->Text.c_str(), Node2->Text.c_str());
  if (Reverse)
    return -GT;
  return GT;
}

/*
This procedure can then be used as a parameter to CustomSort
to sort the nodes of the tree view.  To sort in ascending
order, call:
*/

#include <CommCtrl.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TreeView1->CustomSort(CompareFunc, 0);
}
```

Delphi Examples:

```
{
This example shows how to use the CustomSort method to order
a tree view in case-insensitive alphabetical order (either
forward or backward). The application must provide a
callback function such as CompareFunc below, which calls the
global AnsiStrIComp function to perform the actual
comparison.  This example requires a button and a populated
TreeView.
}
function CustomSortProc(Node1, Node2: TTreeNode; Data: Integer): Integer; stdcall;
begin
  Result := -AnsiStrIComp(PChar(Node1.Text), PChar(Node2.Text));
end;

procedure TForm1.Button1Click(Sender: TObject);
begin
  TreeView1.CustomSort(@CustomSortProc, 0);
end;
```

See Also

AlphaSort (see page 3972)

OnCompare (see page 4019)

SortType (see page 4014)

27.1.23.5.17 TCustomTreeView.Delete Method

Generates an OnDeletion (see page 4024) event.

Pascal

```
procedure Delete(Node: TTreeNode); dynamic;
```

C++

```
__fastcall Delete(TTreeNode Node);
```

Description

Delete is called automatically immediately before the node specified by the Node parameter is deleted.

Override this method to make additional, class-specific responses in addition to the OnDeletion (see page 4024) event or to suppress the OnDeletion (see page 4024) event.

See Also

Items (see page 4004)

OnDeletion (see page 4024)

27.1.23.5.18 TCustomTreeView.Deselect Method

Deselects a specified node.

Pascal

```
procedure Deselect(Node: TTreeNode); virtual;
```

C++

```
virtual __fastcall Deselect(TTreeNode Node);
```

Description

Deselect removes the selection from Node. This method has no effect unless MultiSelect (see page 4005) is true and MultiSelectStyle (see page 4005) includes msControlSelect.

See Also

Items (see page 4004)

OnDeletion (see page 4024)

MultiSelect (see page 4005)

MultiSelectStyle (see page 4005)

27.1.23.5.19 TCustomTreeView.DestroyWnd Method

Destroys the control's window.

Pascal

```
procedure DestroyWnd; override;
```

C++

```
virtual __fastcall DestroyWnd();
```

Description

DestroyWnd is called when the tree view needs to replace its window. For example, changing properties that are implemented by window parameter settings require the tree view to be destroyed and then recreated using the CreateWnd (see page 3976) method.

Before the window is destroyed, DestroyWnd saves information about the tree view's items in memory, frees any device contexts, and finally calls DestroyWindowHandle. When the window is recreated, the stored items are added to the new window.

See Also

DestroyWindowHandle (see page 6140)

RecreateWnd (see page 6171)

CreateWnd (see page 3976)

Items (see page 4004)

27.1.23.5.20 TCustomTreeView.DoEndDrag Method

End drag event dispatcher.

Pascal

```
procedure DoEndDrag(Target: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DoEndDrag(TObject * Target, int X, int Y);
```

Description

DoEndDrag is called automatically when the user stops dragging the tree view or one of its items. The drag operation may end either because the tree view was dropped on the object specified by Target, or because the user canceled the drag operation (if Target is nil (Delphi) or NULL (C++)).

Override DoEndDrag to perform any additional adjustments when the user stops dragging the tree view.

See Also

OnEndDrag (see page 5860)

27.1.23.5.21 TCustomTreeView.DoEnter Method

Respond to receiving input focus.

Pascal

```
procedure DoEnter; override;
```

C++

```
virtual __fastcall DoEnter();
```

Description

DoEnter is called automatically when the control receives the input focus. As implemented in TWinControl, DoEnter calls the OnEnter event handler, if defined.

Descendant classes that override DoEnter should always call the inherited method.

See Also

DoExit (see page 6144)

OnEnter (see page 6219)

27.1.23.5.22 TCustomTreeView.DoExit Method

Respond to losing input focus

Pascal

```
procedure DoExit; override;
```

C++

```
virtual __fastcall DoExit();
```

Description

DoExit is called automatically when the control receives the input focus. As implemented in TWinControl, DoExit calls the OnExit event handler, if defined.

Descendant classes that override DoExit should always call the inherited method.

See Also

DoEnter (see page 6144)

OnExit (see page 6221)

27.1.23.5.23 TCustomTreeView.DoStartDrag Method

Drag start event dispatcher.

Pascal

```
procedure DoStartDrag(var DragObject: TDragObject); override;
```

C++

```
virtual __fastcall DoStartDrag(TDragObject DragObject);
```

Description

DoStartDrag is called automatically when the user starts dragging the tree view or one of its items. It generates an OnStartDrag event, and then identifies the node (if any) that is being dragged. If the user is dragging a node (as opposed to the entire tree view), DoStartDrag generates an image for the node drag.

Override DoStartDrag to perform any additional adjustments when the user starts a drag-and-drop operation.

See Also

OnStartDrag (see page 5871)

GetDragImages (see page 3984)

27.1.23.5.24 TCustomTreeView.Edit Method

Edited event dispatcher.

Pascal

```
procedure Edit(const Item: TTVItem); dynamic;
```

C++

```
__fastcall Edit(const TTVItem Item);
```

Description

Edit is called automatically when the user edits the text of a tree view node. The Item parameter is the data structure supplied by the Windows control that identifies the node that was edited and the new value of its text. Edit unpacks this information into the parameters of an OnEdited (see page 4024) event handler, and allows the event handler to change the value of the node's text.

See Also

OnEdited (see page 4024)

Text (see page 5265)

27.1.23.5.25 TCustomTreeView.Expand Method

Completed node expansion event dispatcher.

Pascal

```
procedure Expand(Node: TTreeNode); dynamic;
```

C++

```
__fastcall Expand(TTreeNode Node);
```

Description

Expand is called automatically after the node specified by the Node parameter expands.

Override this method to make additional, class-specific responses in addition to the OnExpanded (see page 4025) event or to suppress the OnExpanded (see page 4025) event.

See Also

OnEdited (see page 4024)

Text (see page 5265)

27.1.23.5.26 TCustomTreeView.FindNextToSelect Method

Returns next selectable node.

Pascal

```
function FindNextToSelect: TTreeNode; virtual;
```

C++

```
virtual __fastcall TTreeNode FindNextToSelect();
```

Description

Starting with the node indicated by the Selected (see page 4007) property, FindNextToSelect searches for a deselected node, with preference given to subsequent siblings. If the Selected (see page 4007) node and all its siblings are selected, the search proceeds to the parent node and its siblings, and so on up the tree. If the top level is reached without finding a deselected node, nil is returned.

Note that the Selected (see page 4007) property can refer to a deselected node when MultiSelect (see page 4005) is true. In this case, FindNextToSelect returns that node.

See Also

Selected (see page 4007)

MultiSelect (see page 4005)

27.1.23.5.27 TCustomTreeView.FullCollapse Method

Collapses all the nodes within a tree view control.

Pascal

```
procedure FullCollapse;
```

C++

```
__fastcall FullCollapse();
```

Description

Call FullCollapse to hide all the nodes in the tree view except those at the first level.

See Also

OnCollapsing (see page 4018)

OnCollapsed (see page 4018)

Collapse (see page 5235)

27.1.23.5.28 TCustomTreeView.FullExpand Method

Expands all nodes within the tree view control.

Pascal

```
procedure FullExpand;
```

C++

```
__fastcall FullExpand();
```

Description

Call FullExpand to display all the nodes in the tree view. If ShowButtons (see page 4013) is true, all buttons will change from '+' to '-'.

See Also

OnExpanded (see page 4025)

OnExpanding (see page 4025)

ShowButtons (see page 4013)

Expand (see page 5242)

27.1.23.5.29 TCustomTreeView.GetDragImages Method

Returns the image list to be displayed during drag operations.

Pascal

```
function GetDragImages: TDragImageList; override;
```

C++

```
virtual __fastcall TDragImageList GetDragImages();
```

Description

GetDragImages is called automatically during drag-and-drop operations to allow the tree view to supply an image that is displayed while the tree view or one of its items is dragged. If an item (and not the entire tree view) is being dragged, GetDragImages returns the image for the node that was generated by the DoStartDrag (see page 3982) method.

See Also

DoStartDrag (see page 3982)

27.1.23.5.30 TCustomTreeView.GetHitTestInfoAt Method

Returns information about the location of a point relative to the client area of the tree view control.

Pascal

```
function GetHitTestInfoAt(X: Integer; Y: Integer): THitTests;
```

C++

```
__fastcall THitTests GetHitTestInfoAt(int X, int Y);
```

Description

Call GetHitTestInfoAt to determine what portion of the tree view, if any, sits under the point specified by the X and Y parameters. For example, use GetHitTestInfoAt to provide feedback about how to expand or collapse nodes when the mouse is over the relevant portions of the tree view.

GetHitTestInfo returns a THitTests (see page 5488) type. This set describes the possible tree view elements under the mouse.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code checks a list of htHitTest types and adds
the ones that occur when the mouse was pressed while on the
tree view.
}
procedure TForm1.TVMouseDown(Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X, Y: Integer);
var
  MyHitTest : THitTests;
```

```
begin
  MyHitTest := TV.GetHitTestInfoAt(X,Y);
  if htNowhere in MyHitTest then
    ListBox1.Items.Add('NoWhere');
  if htOnItem in MyHitTest then
    ListBox1.Items.Add('OnItem');
  if htOnButton in MyHitTest then
    ListBox1.Items.Add('OnButton');
  if htOnIndent in MyHitTest then
    ListBox1.Items.Add('OnIndent');
  if htOnLabel in MyHitTest then
    ListBox1.Items.Add('OnLabel');
  if htOnRight in MyHitTest then
    ListBox1.Items.Add('OnRight');
end;
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

See Also

GetNodeAt (see page 3987)

27.1.23.5.31 TCustomTreeView.GetImageIndex Method

Obtain image index.

Pascal

```
procedure GetImageIndex(Node: TTreeNode); virtual;
```

C++

```
virtual __fastcall GetImageIndex(TTreeNode Node);
```

Description

Call GetImageIndex to set the image index of a tree node. GetImageIndex as implemented in TCustomTreeView (see page

3957) does nothing except invoke the handler for the OnGetImageIndex (see page 4026) event, if one is assigned.

Descendants can override GetImageIndex to provide a class-specific implementation for setting the tree node's image index.

Node is the tree node in which the image index is set.

See Also

OnGetImageIndex (see page 4026)

Items (see page 4004)

TTreeNode (see page 5230)

ImageIndex (see page 5259)

TImageList (see page 6078)

27.1.23.5.32 TCustomTreeView.GetNodeAt Method

Returns the node that is found at the specified position.

Pascal

```
function GetNodeAt(X: Integer; Y: Integer): TTreeNode;
```

C++

```
__fastcall TTreeNode GetNodeAt(int X, int Y);
```

Description

Call GetNodeAt to access the node at the position specified by the X and Y parameters. X and Y specify the position in pixels relative to the top left corner of the tree view. If there is no node at the location, GetNodeAt returns nil (Delphi) or NULL (C++).

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
```

```
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

See Also

Items (see page 4004)

27.1.23.5.33 TCustomTreeView.GetSelectedIndex Method

Obtain selection index.

Pascal

```
procedure GetSelectedIndex(Node: TTreeNode); virtual;
```

C++

```
virtual __fastcall GetSelectedIndex(TTreeNode Node);
```

Description

Call GetSelectedIndex to set the image index of a tree node when the tree node is selected. GetSelectedIndex invokes the handler for the OnGetSelectedIndex (see page 4026) event, if one is assigned.

Descendants can override GetSelectedIndex to implement a class-specific method of setting the selected tree node's image index.

Node is the tree node in which the image index is set.

See Also

OnGetSelectedIndex (see page 4026)

Items (see page 4004)

TTreeNode (see page 5230)

SelectedIndex (see page 5265)

TImageList (see page 6078)

27.1.23.5.34 TCustomTreeView.GetSelections Method

Obtain selections list.

Pascal

```
function GetSelections(AList: TList): TTreeNode;
```

C++

```
__fastcall TTreeNode GetSelections(TList AList);
```

Description

GetSelections clears AList and copies all selected node objects to it. The return value is the Selected (see page 4007) property.

See Also

Selected (see page 4007)

27.1.23.5.35 TCustomTreeView.InvalidateSelectionsRects Method

Pascal

```
procedure InvalidateSelectionsRects;
```

C++

```
__fastcall InvalidateSelectionsRects();
```

Description

This is InvalidateSelectionsRects, a member of class TCustomTreeView.

27.1.23.5.36 TCustomTreeView.IsCustomDrawn Method

Specifies when the control should generate custom draw events.

Pascal

```
function IsCustomDrawn(Target: TCustomDrawTarget; Stage: TCustomDrawStage): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsCustomDrawn(TCustomDrawTarget Target, TCustomDrawStage Stage);
```

Description

TCustomTreeView (see page 3957) checks IsCustomDrawn to determine when to generate an OnCustomDraw (see page 4019), OnAdvancedCustomDraw (see page 4016), OnCustomDrawItem (see page 4021), or OnAdvancedCustomDrawItem (see page 4016) event. IsCustomDrawn returns true when the tree view should generate an event.

The Target parameter indicates whether the tree view is about to draw the entire tree or about to draw a node. IsCustomDrawn does not return true unless the tree view has an appropriate event handler for the target.

The Stage parameter indicates the current stage in the process of painting the tree view. IsCustomDrawn returns true if the

stage is cdPrePaint or if there is an advanced custom draw event handler for the target.

See Also

OnCustomDraw (see page 4019)

OnCustomDrawItem (see page 4021)

27.1.23.5.37 TCustomTreeView.IsEditing Method

Indicates whether a node is currently being edited by the user.

Pascal

```
function IsEditing: Boolean;
```

C++

```
__fastcall Boolean IsEditing();
```

Description

IsEditing returns true if any node label in the tree view is being edited.

See Also

Items (see page 4004)

27.1.23.5.38 TCustomTreeView.Loaded Method

Initializes the tree view after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the tree view's form is loaded into memory so that the tree view can complete any initializations that depend on other objects in the form.

Loaded ensures that the tree view appears fully expanded when it is first loaded into the designer.

See Also

FullExpand (see page 3984)

Loaded (see page 2782)

27.1.23.5.39 TCustomTreeView.LoadFromFile Method

Reads the file specified in FileName and loads the data into the tree view.

Pascal

```
procedure LoadFromFile(const FileName: string);
```

C++

```
__fastcall LoadFromFile(const AnsiString FileName);
```

Description

Use the LoadFromFile method to retrieve tree view nodes from a file and add them to the tree view. FileName should reference a file that was saved using the SaveToFile (see page 3992) method. Tree view files are text files that list the Text property of each node in a tree view, one node per line. Each node text value is preceded by spaces to indicate the depth of nesting.

Note: Tree view files contain only the text of the tree view nodes. They do not contain any data associated with the nodes.

See Also

LoadFromStream (see page 3991)

SaveToFile (see page 3992)

Text (see page 5265)

27.1.23.5.40 TCustomTreeView.LoadFromStream Method

Reads tree view data from a stream and stores the contents in the tree view.

Pascal

```
procedure LoadFromStream(Stream: TStream);
```

C++

```
__fastcall LoadFromStream(TStream Stream);
```

Description

Use LoadFromStream to read the nodes of the tree view from the specified stream. LoadFromStream adds the nodes in the stream data to the tree view.

The format for tree view data used by the SaveToStream (see page 3993) and LoadFromStream methods lists the Text property for each node. Data associated with the nodes is not saved or loaded.

For example, an application can save the information displayed in a tree view as the data in a Binary Large Object (BLOB) field of a dataset using the SaveToStream (see page 3993) method. LoadFromStream can later retrieve the data using a BLOB stream.

See Also

LoadFromFile (see page 3990)

SaveToStream (see page 3993)

CreateBlobStream (see page 6922)

Text (see page 5265)

27.1.23.5.41 TCustomTreeView.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

MouseMove (see page 5773)

MouseUp (see page 5774)

OnMouseDown (see page 5862)

27.1.23.5.42 TCustomTreeView.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu (see page 5835)

Notification (see page 2783)

27.1.23.5.43 TCustomTreeView.SaveToFile Method

Saves a the tree view to the file specified in FileName.

Pascal

```
procedure SaveToFile(const FileName: string);
```

C++

```
__fastcall SaveToFile(const AnsiString FileName);
```

Description

Use the SaveToFile method to store tree view data to a text file. The nodes can later be reloaded from the file into a new tree view object using the LoadFromFile (see page 3990) method.

Tree view files are text files that list the Text property of each node in a tree view, one node per line. Each node text value is preceded by spaces to indicate the depth of nesting.

Note: Tree view files contain only the text of the tree view nodes. They do not contain any data associated with the nodes.

See Also

LoadFromFile (see page 3990)

SaveToStream (see page 3993)

27.1.23.5.44 TCustomTreeView.SaveToStream Method

Writes the data in the tree view to the stream passed as the Stream parameter.

Pascal

```
procedure SaveToStream(Stream: TStream);
```

C++

```
__fastcall SaveToStream(TStream Stream);
```

Description

Use the SaveToStream method to stream out the nodes in a tree view. It can be streamed back in to another tree view object using the LoadFromStream (see page 3991) method.

The format for tree view data used by the SaveToStream and LoadFromStream (see page 3991) methods lists the Text property for each node. Data associated with the nodes is not saved or loaded.

See Also

LoadFromStream (see page 3991)

SaveToFile (see page 3992)

27.1.23.5.45 Select Method

This is the overview for the Select method overload.

Overload List

	Name	Description
	TCustomTreeView.Select (array of TTreeNode) (see page 3994)	Select specified nodes.
	TCustomTreeView.Select (TList) (see page 3994)	Select specified nodes.
	TCustomTreeView.Select (TTreeNode, TShiftState) (see page 3994)	Select specified nodes.

27.1.23.5.45.1 TCustomTreeView.Select Method (TList)

Select specified nodes.

Pascal

```
procedure Select(Node: TTreeNode; ShiftState: TShiftState = []); virtual; overload;
procedure Select(const Nodes: array of TTreeNode); virtual; overload;
procedure Select(Nodes: TList); virtual; overload;
```

C++

```
virtual __fastcall Select(TTreeNode Node, TShiftState ShiftState = []);
virtual __fastcall Select(const array of TTreeNode Nodes);
virtual __fastcall Select(TList Nodes);
```

Description

The select method selects one or more tree nodes.

In the first two forms, all nodes in the Nodes parameter are selected. Any other selected nodes are deselected.

In the third form, Node is selected as if clicked with the mouse. To achieve the effect of using the Control key, the Shift key, or the right mouse button, include ssCtrl, ssShift, or ssRight in the ShiftState parameter.

27.1.23.5.46 TCustomTreeView.SetDragMode Method

Sets the drag mode for the tree view.

Pascal

```
procedure SetDragMode(Value: TDragMode); override;
```

C++

```
virtual __fastcall SetDragMode(TDragMode Value);
```

Description

SetDragMode is the protected write implementation for the DragMode property. It sends a message to the tree view window to suppress automatic drag behavior when DragMode is set to dmManual.

See Also

DragMode

27.1.23.5.47 TCustomTreeView.Subselect Method

Toggle node selection.

Pascal

```
procedure Subselect(Node: TTreeNode; Validate: Boolean = False); virtual;
```

C++

```
virtual __fastcall Subselect(TTreeNode Node, Boolean Validate = False);
```

Description

Subselect toggles the selection state of Node. If Validate is true, Subselect ensures that the selection state information in view, list, and node objects are consistent, and that only those nodes allowed by MultiSelectStyle (see page 4005) are actually selected.

If Subselect is called when MultiSelect (see page 4005) is false, ETreeViewError (see page 3422) is raised.

See Also

ETreeViewError (see page 3422)

27.1.23.5.48 TCustomTreeView.ValidateSelection Method

Pascal

```
procedure ValidateSelection;
```

C++

```
__fastcall ValidateSelection();
```

Description

This is ValidateSelection, a member of class TCustomTreeView.

27.1.23.5.49 TCustomTreeView.WndProc Method

Provides specific message responses for the control.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

WndProc is the initial Windows message handler for the control. The WindowProc property is initialized to point to the WndProc method.

WndProc adjusts for some Windows message idiosyncrasies before calling the WndProc method inherited from TWinControl.

See Also

WindowProc (see page 5872)

DefWndProc (see page 6199)

MainWndProc (see page 6165)

WndProc (see page 6187)

27.1.23.6 TCustomTreeView Properties

The properties of the TCustomTreeView class are listed here.

Protected Properties

	Name	Description
	AutoExpand (see page 3996)	Specifies whether the nodes in the tree view automatically expand and collapse depending on the selection.
	BorderStyle (see page 3997)	Determines whether the tree view control has a border.
	ChangeDelay (see page 3999)	Specifies the delay between when a node is selected and when the OnChange (see page 4017) event occurs.
	CreateWndRestores (see page 4000)	This is CreateWndRestores, a member of class TCustomTreeView.
	HideSelection (see page 4000)	Determines whether a selected node appears selected when the focus shifts to another control.
	HotTrack (see page 4001)	Specifies whether list items are highlighted when the mouse passes over them.

	Images (see page 4001)	Determines which image list is associated with the tree view.
	Indent (see page 4001)	Specifies the amount of indentation in pixels when a list of child nodes is expanded.
	Items (see page 4004)	Lists the individual nodes that appear in the tree view control.
	MultiSelect (see page 4005)	Determines whether the user can select more than one tree node at a time.
	MultiSelectStyle (see page 4005)	Determines how multiple node selections work.
	ReadOnly (see page 4006)	Determines whether the user can edit the node labels.
	RightClickSelect (see page 4006)	Determines whether the Selected (see page 4007) property returns nodes that are selected using the right mouse button.
	RowSelect (see page 4007)	Specifies whether the entire row of the selected item is highlighted.
	ShowButtons (see page 4013)	Specifies whether to display plus (+) and minus (-) buttons to the left side of each parent item.
	ShowLines (see page 4013)	Specifies whether to display the lines that link child nodes to their corresponding parent nodes.
	ShowRoot (see page 4013)	Specifies whether lines connecting top-level nodes are displayed.
	SortType (see page 4014)	Determines if and how the nodes in a tree view are automatically sorted.
	StateImages (see page 4014)	Determines which image list to use for state images.
	ToolTips (see page 4014)	Specifies whether the items in the tree view have tool tips.

Public Properties

	Name	Description
R	Canvas (see page 3997)	Provides access to the canvas.
	DropTarget (see page 4000)	Specifies which item in the tree view appears as the target of a drag and drop operation.
	Selected (see page 4007)	Specifies the selected node in the tree view.
R	SelectionCount (see page 4012)	Returns number of nodes selected.
R	Selections (see page 4012)	Returns nodes selected.
	TopItem (see page 4015)	Specifies the topmost node that appears in the tree view.

27.1.23.6.1 TCustomTreeView.AutoExpand Property

Specifies whether the nodes in the tree view automatically expand and collapse depending on the selection.

Pascal

```
property AutoExpand: Boolean;
```

C++

```
__property Boolean AutoExpand;
```

Description

Set AutoExpand to true to cause the selected item to expand and the unselected items to collapse.

See Also

Selected (see page 4007)

Expanded (see page 5257)

Selected (see page 5264)

Expand (see page 5242)

Collapse (see page 5235)

OnExpanded (see page 4025)

OnExpanding (see page 4025)

OnCollapsed (see page 4018)

OnCollapsing (see page 4018)

27.1.23.6.2 TCustomTreeView.BorderStyle Property

Determines whether the tree view control has a border.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Set BorderStyle to specify whether the tree view control should be outlined with a single-line border. These are the possible values:

Value	Meaning
bsNone	No visible border
bsSingle	Single-line border

See Also

BoundsRect (see page 5803)

27.1.23.6.3 TCustomTreeView.Canvas Property

Provides access to the canvas.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Use the Canvas property to paint to the canvas from the OnCustomDraw (see page 4019) and OnCustomDrawItem (see page 4021) event handlers.

C++ Examples:

```
/*
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
*/
{
  TPoint APoint = Point(X, Y);
  int Index = ListBox1->ItemAtPos(APoint, True);
  TTreeView *myTreeView;
  TClass ClassRef = ListBox1->Items->Objects[Index]->ClassType();
  if (String(ClassRef->ClassName()) == "TTreeView")
  {
    myTreeView = (TTreeView *)ListBox1->Items->Objects[Index];
    // make sure we are using the TControls canvas and not the from's!
    myTreeView->Canvas->MoveTo(myTreeView->ClientRect.Left, myTreeView->ClientRect.Top);
    myTreeView->Canvas->LineTo(myTreeView->ClientRect.Right, myTreeView->ClientRect.Bottom);
```

```
    myTreeView = NULL;
  }
}
/*
The following example is taken from the custom draw demo. It
shows how the OnCustomDraw event handler draws the
background for the tree view before the items and lines are
drawn.
*/
void __fastcall TCustomDrawForm::TVCustomDraw(TCustomTreeView *Sender,
      const TRect &ARect, bool &DefaultDraw)
{
/*
This event should be used to draw any background colors or
images.  ARect represents the entire client area of the TreeView.
Use the TreeView's canvas to do the drawing.
Note that drawing a background bitmap is not really
supported by CustomDraw, so scrolling can get messy. Best to
subclass the TreeView and handle scrolling messages.
*/
  if (None1 != NULL)
  {
    if (None1->Checked) //no picture
    {
      TV->Canvas->Brush->Color = BkgColorDialog->Color;
      TV->Canvas->Brush->Style = FBrushStyle;
      TV->Canvas->FillRect(ARect);
    }
    else if (Tile1->Checked) //tile bitmap
    {
      TV->Canvas->Brush->Bitmap = Image1->Picture->Bitmap;
      TV->Canvas->FillRect(ARect);
    }
    else //Stretch across the canvas.
      TV->Canvas->StretchDraw(ARect, Image1->Picture->Bitmap);
  };
  DefaultDraw = FDefaultDraw;
  // Setting DefaultDraw to false here prevents all calls to
  // OnCustomDrawItem.
}
```

Delphi Examples:

```
{
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
}
  if (ListBox1.Items.Objects[Index] is TTreeView) then
  begin
    myTreeView:= (ListBox1.Items.Objects[Index] as TTreeView);
    with myTreeView.ClientRect do
    begin // make sure we are using the TControl's canvas and not the form's!
      myTreeView.Canvas.MoveTo(Left, Top);
      myTreeView.Canvas.LineTo(Right, Bottom);
    end;
  myTreeView:= nil;
  end;
{
The following example is taken from the custom draw demo. It
shows how the OnCustomDraw event handler draws the
background for the tree view before the items and lines are
drawn.
}
procedure TCustomDrawForm.TVCustomDraw(Sender: TCustomTreeView; const ARect: TRect;
```

```
    var DefaultDraw: Boolean);
  begin
  {
  This event should be used to draw any background colors or
  images.  ARect represents the entire client area of the TreeView.
  Use the TreeView's canvas to do the drawing.
  Note that drawing a background bitmap is not really
  supported by CustomDraw, so scrolling can get messy. Best to
  subclass the TreeView and handle scrolling messages.
  }
    with TV.Canvas do
    begin
      if None1 <> nil then
      begin
        if None1.Checked then //no picture
        begin
          Brush.Color := BkgColorDialog.Color;
          Brush.Style := FBrushStyle;
          FillRect(ARect);
        end else
          if Tile1.Checked then //tile bitmap
          begin
            Brush.Bitmap := Image1.Picture.Bitmap;
              FillRect(ARect);
            end else //Stretch across the canvas.
                StretchDraw(ARect, Image1.Picture.Bitmap);
      end;
    end;
    DefaultDraw := FDefaultDraw;
    // Setting DefaultDraw to false here prevents all calls to
    // OnCustomDrawItem.
  end;
```

See Also

OnCustomDraw (see page 4019)

OnCustomDrawItem (see page 4021)

27.1.23.6.4 TCustomTreeView.ChangeDelay Property

Specifies the delay between when a node is selected and when the OnChange (see page 4017) event occurs.

Pascal

```
property ChangeDelay: Integer;
```

C++

```
__property int ChangeDelay;
```

Description

Use ChangeDelay to get or set the delay, in milliseconds, between when a node is selected and when the OnChange (see page 4017) event occurs.

Set the ChangeDelay to 50 milliseconds to emulate the behavior of the tree-view control used in Windows Explorer.

See Also

Selected (see page 4007)

OnChange (see page 4017)

27.1.23.6.5 TCustomTreeView.CreateWndRestores Property

Pascal

```
property CreateWndRestores: Boolean;
```

C++

```
__property Boolean CreateWndRestores;
```

Description

This is CreateWndRestores, a member of class TCustomTreeView.

27.1.23.6.6 TCustomTreeView.DropTarget Property

Specifies which item in the tree view appears as the target of a drag and drop operation.

Pascal

```
property DropTarget: TTreeNode;
```

C++

```
__property TTreeNode DropTarget;
```

Description

Read DropTarget to determine whether a node in the tree view is drawn as the target of a drag and drop operation. Set DropTarget when specifying a particular node in the tree view as the drop target of a dragged item.

Note: When DropTarget is set, the application must still handle the actual logic of accepting the dragged object by the indicated node.

See Also

EndDrag (see page 5757)

DropTarget (see page 5257)

27.1.23.6.7 TCustomTreeView.HideSelection Property

Determines whether a selected node appears selected when the focus shifts to another control.

Pascal

```
property HideSelection: Boolean;
```

C++

```
__property Boolean HideSelection;
```

Description

Use HideSelection to specify whether the user is given visual feedback about the current selection in the tree view when it does not have focus. If true, the selected node is not visually distinct from other nodes until focus returns to the control. If false, the node always appears selected.

See Also

Selected (see page 4007)

27.1.23.6.8 TCustomTreeView.HotTrack Property

Specifies whether list items are highlighted when the mouse passes over them.

Pascal

```
property HotTrack: Boolean;
```

C++

```
__property Boolean HotTrack;
```

Description

Set HotTrack to true to provide visual feedback about which item is under the mouse. Set HotTrack to false to suppress the visual feedback about which item is under the mouse.

See Also

HideSelection (see page 4000)

RowSelect (see page 4007)

27.1.23.6.9 TCustomTreeView.Images Property

Determines which image list is associated with the tree view.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Use Images to provide a customized list of bitmaps that can be displayed to the left of a node's label. Individual nodes specify the image from this list that should appear by setting their ImageIndex property.

See Also

OnGetImageIndex (see page 4026)

StateImages (see page 4014)

ImageIndex (see page 5259)

SelectedIndex (see page 5265)

27.1.23.6.10 TCustomTreeView.Indent Property

Specifies the amount of indentation in pixels when a list of child nodes is expanded.

Pascal

```
property Indent: Integer;
```

C++

```
__property int Indent;
```

Description

Use Indent to determine how far child nodes are indented from their parent nodes when the parent is expanded.

C++ Examples:

```
/*
The following example shows how the OnCustomDrawItem event
handler draws items and lines of the tree view after the
OnCustomDraw event handler has filled in the background.
*/
void __fastcall TCustomDrawForm::TVCustomDrawItem(TCustomTreeView *Sender,
      TTreeNode *Node, TCustomDrawState State, bool &DefaultDraw)
{
  TRect NodeRect;
/*
    If DefaultDraw it is true, any of the node's font
    properties can be changed. Note also that when
    DefaultDraw = True, Windows draws the buttons and
    ignores our font background colors, using instead the
    TreeView's Color property.
*/
    if (State.Contains(cdsSelected))
    {
      TV->Canvas->Font->Assign(SelectedFontDialog->Font);
      TV->Canvas->Brush->Color = SelBkgColorDialog->Color;
    };

    DefaultDraw = FDefaultDrawItem;
/*
    DefaultDraw = False means you have to handle all the
    item drawing yourself, including the buttons, lines,
    images, and text.
*/
    if (!DefaultDraw)
    {
      //draw the selection rect.
      if (State.Contains(cdsSelected))
      {
        NodeRect = Node->DisplayRect(True);
        TV->Canvas->FillRect(NodeRect);
      };
      NodeRect = Node->DisplayRect(False);

      if (None1->Checked)
      //no bitmap, so paint in the background color.
      {
        TV->Canvas->Brush->Color = BkgColorDialog->Color;
        TV->Canvas->Brush->Style = FBrushStyle;
        TV->Canvas->FillRect(NodeRect);
      }
      else
        //don't paint over the background bitmap.
        TV->Canvas->Brush->Style = bsClear;

      NodeRect.Left = NodeRect.Left + (Node->Level * TV->Indent);
      // NodeRect.Left now represents the left-most portion
      // of the expand button
      DrawButton(&NodeRect, Node); // See the CustomDraw demo

      NodeRect.Left = NodeRect.Left + TV->Indent + FButtonSize;
      //NodeRect->Left is now the leftmost portion of the image.
      DrawImage(&NodeRect, Node->ImageIndex); // See the CustomDraw demo

      NodeRect.Left = NodeRect.Left + ImageList->Width;
      //Now we are finally in a position to draw the text.

      TV->Canvas->TextOut(NodeRect.Left, NodeRect.Top, Node->Text);
    };
}
```

Delphi Examples:

```
{
The following example shows how the OnCustomDrawItem event
handler draws items and lines of the tree view after the
OnCustomDraw event handler has filled in the background.
}
procedure TCustomDrawForm.TVCustomDrawItem(Sender: TCustomTreeView; Node: TTreeNode;
  State: TCustomDrawState; var DefaultDraw: Boolean);
var
  NodeRect: TRect;
begin
  with TV.Canvas do
  begin
{
    If DefaultDraw it is true, any of the node's font
    properties can be changed. Note also that when
    DefaultDraw = True, Windows draws the buttons and
    ignores our font background colors, using instead the
    TreeView's Color property.
}
    if cdsSelected in State then
    begin
      Font.Assign(SelectedFontDialog.Font);
      Brush.Color := SelBkgColorDialog.Color;
    end;

    DefaultDraw := False; // FDefaultDrawItem;
{
    DefaultDraw = False means you have to handle all the
    item drawing yourself, including the buttons, lines,
    images, and text.
}
    if not DefaultDraw then
    begin
      //draw the selection rect.
      if cdsSelected in State then
      begin
        NodeRect := Node.DisplayRect(True);
        FillRect(NodeRect);
      end;
      NodeRect := Node.DisplayRect(False);

      if None1.Checked then
      //no bitmap, so paint in the background color.
      begin
        Brush.Color := BkgColorDialog.Color;
        Brush.Style := FBrushStyle;
        FillRect(NodeRect)
      end
      else
        //don't paint over the background bitmap.
        Brush.Style := bsClear;

      NodeRect.Left := NodeRect.Left + (Node.Level * TV.Indent);
      // NodeRect.Left now represents the left-most portion
      // of the expand button
      DrawButton(NodeRect, Node); // See the CustomDraw demo

      NodeRect.Left := NodeRect.Left + TV.Indent + FButtonSize;
      //NodeRect.Left is now the leftmost portion of the image.
      DrawImage(NodeRect, Node.ImageIndex); // See the CustomDraw demo

      NodeRect.Left := NodeRect.Left + ImageList.Width;
      //Now we are finally in a position to draw the text.
```

```
      TextOut(NodeRect.Left, NodeRect.Top, Node.Text);
    end;
  end;
end;
```

See Also

FullExpand (see page 3984)

27.1.23.6.11 TCustomTreeView.Items Property

Lists the individual nodes that appear in the tree view control.

Pascal

```
property Items: TTreeNodes;
```

C++

```
__property TTreeNodes Items;
```

Description

Individual nodes in a tree view are TTreeNode (see page 5230) objects. These individual nodes can be accessed by using the Items property along with the item's index into the tree view. For example, to access the second item in the tree view, you could use the following code.

```
MyTreeNode := TreeView1.Items[1];
MyTreeNode = TreeView1->Items[1];
```

When setting this property at design-time in the Object Inspector the Tree View Items Editor appears. Use the New Item and New SubItem buttons to add items to the tree view. Use the Text property to modify what text is displayed in the label of the item.

At run-time nodes can be added and inserted by using the TTreeNodes (see page 5266) methods AddChildFirst, AddChild, AddChildObjectFirst, AddChildObject, AddFirst, Add, AddObjectFirst, AddObject, and Insert.

Note: Accessing tree view items by index can be time-intensive, particularly when the tree view contains many items. For optimal performance, try to design your application so that it has as few dependencies on the tree view's item index as possible.

C++ Examples:

```
/*
The following example deletes an item in the tree view when
the user clicks on it, and if the checkbox is checked. This example
requires a populated TreeView.
*/
void __fastcall TForm1::TVMouseDown(TObject *Sender, TMouseButton Button,
      TShiftState Shift, int X, int Y)
{
  THitTests HT;
  if (CheckBox1->Checked && Sender->ClassNameIs("TTreeView"))
  {
    TTreeView *pTV = (TTreeView *)Sender;
    HT = pTV->GetHitTestInfoAt(X,Y);
    if (HT.Contains(htOnItem))
      pTV->Items->Delete(pTV->GetNodeAt(X,Y));
  }
}
```

Delphi Examples:

```
{
The following example deletes an item in the tree view when
the user clicks on it, and if the checkbox is checked. This example
requires a populated TreeView.
```

```
}
procedure TForm1.TVMouseDown(Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X, Y: Integer);
var
  HT : THitTests;
begin
if (CheckBox1.Checked) and (Sender is TTreeView) then
  begin
  with Sender as TTreeView do
    begin
    HT := GetHitTestInfoAt(X,Y);
    if (htOnItem in HT) then
      Items.Delete(GetNodeAt(X,Y));
    end;
  end;
end;
```

AddChild (see page 5271)

AddChildObject (see page 5273)

AddChildObjectFirst (see page 5274)

Add (see page 5270)

AddObject (see page 5276)

AddObjectFirst (see page 5279)

AddFirst (see page 5275)

27.1.23.6.12 TCustomTreeView.MultiSelect Property

Determines whether the user can select more than one tree node at a time.

Pascal

```
property MultiSelect: Boolean;
```

C++

```
__property Boolean MultiSelect;
```

Description

Set MultiSelect to specify whether users can select multiple nodes using the Control and Shift keys. A selection style must also be chosen in MultiSelectStyle (see page 4005).

See Also

MultiSelectStyle (see page 4005)

27.1.23.6.13 TCustomTreeView.MultiSelectStyle Property

Determines how multiple node selections work.

Pascal

```
property MultiSelectStyle: TMultiSelectStyle;
```

C++

```
__property TMultiSelectStyle MultiSelectStyle;
```

Description

MultiSelectStyle determines how multiple selections are made when MultiSelect (see page 4005) is true. MultiSelectStyle must include at least one of the following values.

Value	Meaning
msControlSelect	Clicking on any node with the Control key pressed toggles the selection of that node.
msShiftSelect	Clicking on any node with the Shift key pressed selects that node, the last single node selected, and the nodes in between. All other nodes are deselected.
msVisibleOnly	Multiple selections with the Shift key do not include child nodes of collapsed nodes.
msSiblingOnly	Selected (see page 4007) nodes are restricted to a single set of siblings.

If msControlSelect or msShiftSelect are in effect, the last singly-selected node becomes the primary selection, referenced by Selections (see page 4012)[0]. The primary selection is the anchor for extended selections using the Shift key.

See Also

Selections (see page 4012)

27.1.23.6.14 TCustomTreeView.ReadOnly Property

Determines whether the user can edit the node labels.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to specify whether the user can edit the nodes of the tree view. If ReadOnly is true, the user can expand and collapse nodes, but can't edit their labels. If ReadOnly is false, the user can edit the labels as well. The default value is false.

See Also

Text (see page 5265)

27.1.23.6.15 TCustomTreeView.RightClickSelect Property

Determines whether the Selected (see page 4007) property returns nodes that are selected using the right mouse button.

Pascal

```
property RightClickSelect: Boolean;
```

C++

```
__property Boolean RightClickSelect;
```

Description

Use RightClickSelect to allow the Selected (see page 4007) property to indicate nodes the user clicks with the right mouse button. If RightClickSelect is true, the value of Selected (see page 4007) is the value of the node last clicked with either the right or left mouse button. If RightClickSelect is false, the value of Selected (see page 4007) is the node last clicked using the left mouse button.

RightClickSelect affects only the value of the Selected (see page 4007) property. It does not cause the tree view to highlight a new node if the node is selected using the right mouse button.

Note: RightClickSelect must be set to true before the user right-clicks the tree view for it to affect the value of the Selected (see page 4007) property.

See Also

Selected (see page 4007)

OnMouseDown (see page 5862)

27.1.23.6.16 TCustomTreeView.RowSelect Property

Specifies whether the entire row of the selected item is highlighted.

Pascal

```
property RowSelect: Boolean;
```

C++

```
__property Boolean RowSelect;
```

Description

Set RowSelect to true to cause the entire row of the selected item to be highlighted.

RowSelect is ignored if ShowLines (see page 4013) is true.

See Also

Selected (see page 4007)

ShowLines (see page 4013)

27.1.23.6.17 TCustomTreeView.Selected Property

Specifies the selected node in the tree view.

Pascal

```
property Selected: TTreeNode;
```

C++

```
__property TTreeNode Selected;
```

Description

Read Selected to access the selected node of the tree view. If there is no selected node, the value of Selected is nil (Delphi) or NULL (C++).

Set Selected to set a node in the tree view. When a node becomes selected, the tree view's OnChanging (see page 4018) and OnChange (see page 4017) events occur. Also, if the specified node is the child of a collapsed parent item, the parent's list of child items is expanded to reveal the specified node. In this case, the tree view's OnExpanded (see page 4025) and OnExpanding (see page 4025) events occur as well.

If the RightClickSelect (see page 4006) property is true, the value of Selected is the last node that was clicked in the tree view, even if it was clicked with the right mouse button. This may differ from the node that is highlighted to indicate selection.

If the MultiSelect (see page 4005) property is true and the MultiSelectStyle (see page 4005) property includes msControlSelect, then Selected returns the last node clicked on, even if that click deselected the node. For a current selection status when MultiSelect (see page 4005) is true, refer to the Selections (see page 4012) property.

C++ Examples:

```
/*
This example requires two buttons, three TEdits, a label and
a populated TreeView.  The following code defines a record
type of TMyRec and a record pointer type of PMyRec.
*/
typedef struct MyRec
{
  AnsiString FName, LName;
} TMyRec;

typedef TMyRec* PMyRec;
/*
Assuming these types are used, the following code adds a
node to TreeView1 as the last sibling of the node specified
by the Index.  A TMyRec record is associated with the added
item. The FName and LName fields are obtained from edit
boxes Edit1 and Edit2. The Index parameter is obtained from
edit box Edit3.  The item is added only if the Index is a
valid value.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PMyRec  MyRecPtr;
  int TreeViewIndex;
  TTreeNodes* items;

  MyRecPtr = new TMyRec;
  MyRecPtr->FName = Edit1->Text;
  MyRecPtr->LName = Edit2->Text;
  TreeViewIndex = StrToInt(Edit3->Text);
  items = TreeView1->Items;
  if (items->Count == 0)
    items->AddObject(NULL, "Item" + IntToStr(TreeViewIndex), MyRecPtr);
  else if ((TreeViewIndex < items->Count) && (TreeViewIndex >= 0))
    items->AddObject(items->Item[TreeViewIndex], "Item" + IntToStr(TreeViewIndex) + "after" +
items->Item[TreeViewIndex]->Text, MyRecPtr);
}
/*
After an item containing a TMyRec record has been added, the
following code retrieves the FName and LName values
associated with the item and displays the values in a label.
*/
void __fastcall TForm1::Button2Click(TObject *Sender)
{
  if (TreeView1->Selected->Data != NULL)
    Label1->Caption = PMyRec(TreeView1->Selected->Data)->FName + " " +
                  PMyRec(TreeView1->Selected->Data)->LName;
}
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
```

```
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
/*
The following code uses Item to add the labels of all child
nodes of the selected node to a list box when a button is
clicked.  This example requires a button, a listbox, and a
populated treeview.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < TreeView1->Selected->Count; i++)
    ListBox1->Items->Add(TreeView1->Selected->Item[i]->Text);
}
```

Delphi Examples:

```
{
This example is an event handler for a popup menu item. The
handler enables editing of the current item in a TListView
control. The example would also work with a TTreeView
control, or with any instance of a control class derived
from TCustomViewControl.
}
procedure TForm1.EditItem1Click(Sender: TObject);
begin
  TreeView1.Selected.EditText;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  MyTreeNode1, MyTreeNode2: TTreeNode;
begin
  with TreeView1.Items do
  begin
    Clear; { remove any existing nodes }
    MyTreeNode1 := Add(nil, 'RootTreeNode1'); { Add a root node }
    { Add a child node to the node just added }
    AddChild(MyTreeNode1,'ChildNode1');

    {Add another root node}
    MyTreeNode2 := Add(MyTreeNode1, 'RootTreeNode2');
    {Give MyTreeNode2 to a child }
    AddChild(MyTreeNode2,'ChildNode2');

    {Change MyTreeNode2 to ChildNode2 }
    { and add a child node to it}
    MyTreeNode2 := TreeView1.Items[3];
    AddChild(MyTreeNode2,'ChildNode2a');

    {Add another child to ChildNode2, after ChildNode2a }
    AddChild(MyTreeNode2,'ChildNode2b');

    {add another root node}
```

```
    Add(MyTreeNode1, 'RootTreeNode3');
  end;
end;

procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X, Y: Integer);
begin
  PopupMenu1.Popup(Left + X, Top + Y);
end;
{
This example requires three buttons, four TEdits, two labels
and a populated TreeView.  The following code defines a
record type of TMyRec and a record pointer type of PMyRec.
}
type
  TForm1 = class(TForm)
    Button1: TButton;
    Button2: TButton;
    Edit1: TEdit;
    TreeView1: TTreeView;
    Label2: TLabel;
    Label3: TLabel;
    Button3: TButton;
    Edit4: TEdit;
    Edit2: TEdit;
    Edit3: TEdit;
    procedure Button1Click(Sender: TObject);
    procedure Button2Click(Sender: TObject);
    procedure Button3Click(Sender: TObject);
  private
    { Private declarations }
  public
    { Public declarations }
  end;
  type
  PMyRec = ^TMyRec;
  TMyRec = record
    FName: string;
    LName: string;
  end;

var
  Form1: TForm1;

implementation

{$R *.dfm}

{
Assuming these types are used, the following code adds a
node to TreeView1 as the last sibling of the selected node.
A TMyRec record is associated with the added item. The FName
and LName fields are obtained from edit boxes Edit1 and
Edit2.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  MyRecPtr: PMyRec;
  TreeViewIndex: LongInt;
begin
  New(MyRecPtr);
  MyRecPtr^.FName := Edit1.Text;
  MyRecPtr^.LName := Edit2.Text;
  with TreeView1 do
  begin
```

```
    TreeViewIndex := Selected.AbsoluteIndex;
    if Items.Count = 0 then
      Items.AddObject(nil, 'Item' + IntToStr(TreeViewIndex), MyRecPtr)
    else if (TreeViewIndex < Items.Count) and (TreeViewIndex >= 0) then
      Items.AddObject(Items[TreeViewIndex], 'Item' + IntToStr(TreeViewIndex), MyRecPtr);
  end;
end;
{
After an item containing a TMyRec record has been added, the
following code retrieves the FName and LName values
associated with the item and displays the values in a label.
}
procedure TForm1.Button2Click(Sender: TObject);
begin
  if (TreeView1.Selected.Data <> nil) then { query only works on new nodes }
    Edit3.Text := PMyRec(TreeView1.Selected.Data)^.FName + ' ' +
                  PMyRec(TreeView1.Selected.Data)^.LName;
end;
procedure TForm1.Button3Click(Sender: TObject);
begin
  Edit4.Text := IntToStr(TreeView1.Selected.AbsoluteIndex);
end;
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
{
The following code uses Item to add the labels of all child
nodes of the selected node to a list box when a button is
clicked.  This example requires a button, a listbox, and a
populated treeview.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I : Integer;
begin
  for I := 0 to (TreeView1.Selected.Count - 1) do
    ListBox1.Items.Add(TreeView1.Selected.Item[I].Text);
```

```
end;
```

OnChange (see page 4017)

OnChanging (see page 4018)

SelectedIndex (see page 5265)

RightClickSelect (see page 4006)

RowSelect (see page 4007)

OnExpanded (see page 4025)

OnExpanding (see page 4025)

MultiSelect (see page 4005)

MultiSelectStyle (see page 4005)

Selections (see page 4012)

27.1.23.6.18 TCustomTreeView.SelectionCount Property

Returns number of nodes selected.

Pascal

```
property SelectionCount: Cardinal;
```

C++

```
__property unsigned SelectionCount;
```

Description

SelectionCount returns the number of nodes currently selected.

27.1.23.6.19 TCustomTreeView.Selections Property

Returns nodes selected.

Pascal

```
property Selections [Index: Integer]: TTreeNode;
```

C++

```
__property TTreeNode Selections[int Index];
```

Description

Selections returns one of selected nodes. The maximum value of Index is SelectionCount (see page 4012)-1. If more than one node is selected, Selections[0] is the primary selected node. This node is the starting point for extended selections if MultiSelectStyle (see page 4005) includes msShiftSelect.

See Also

SelectionCount (see page 4012)

MultiSelectStyle (see page 4005)

27.1.23.6.20 TCustomTreeView.ShowButtons Property

Specifies whether to display plus (+) and minus (-) buttons to the left side of each parent item.

Pascal

```
property ShowButtons: Boolean;
```

C++

```
__property Boolean ShowButtons;
```

Description

If ShowButtons is true, a button will appear to the left of each parent item. The user can click the button to expand or collapse the child items as an alternative to double-clicking the parent item.

See Also

ShowLines (see page 4013)

ShowRoot (see page 4013)

27.1.23.6.21 TCustomTreeView.ShowLines Property

Specifies whether to display the lines that link child nodes to their corresponding parent nodes.

Pascal

```
property ShowLines: Boolean;
```

C++

```
__property Boolean ShowLines;
```

Description

If ShowLines is true, lines linking child nodes to their parent nodes are displayed. Nodes at the root of the hierarchy are not automatically linked. To link nodes at the root, the ShowRoot (see page 4013) property must also be set to true.

See Also

ShowButtons (see page 4013)

ShowRoot (see page 4013)

27.1.23.6.22 TCustomTreeView.ShowRoot Property

Specifies whether lines connecting top-level nodes are displayed.

Pascal

```
property ShowRoot: Boolean;
```

C++

```
__property Boolean ShowRoot;
```

Description

To show lines connecting top-level nodes to a single root, set the tree view's ShowRoot and ShowLines (see page 4013) properties to true.

See Also

ShowButtons (see page 4013)

ShowLines (see page 4013)

27.1.23.6.23 TCustomTreeView.SortType Property

Determines if and how the nodes in a tree view are automatically sorted.

Pascal

```
property SortType: TSortType;
```

C++

```
__property TSortType SortType;
```

Description

Once a tree view is sorted, the original hierarchy is lost. That is, setting the SortType back to stNone will not restore the original order of items. These are the possible values:

Value	Meaning
stNone	No sorting is done.
stData	The items are sorted when the Data object or SortType is changed.
stText	The items are sorted when the Caption or SortType is changed.
stBoth	The items are sorted when either the Data object, the Caption or SortType is changed

Optionally, the OnCompare (see page 4019) event can be hooked to handle comparisons.

See Also

AlphaSort (see page 3972)

OnCompare (see page 4019)

27.1.23.6.24 TCustomTreeView.StateImages Property

Determines which image list to use for state images.

Pascal

```
property StateImages: TCustomImageList;
```

C++

```
__property TCustomImageList StateImages;
```

Description

Use StateImages to provide a set of bitmaps that reflect the state of tree view nodes. The state image appears as an additional image to the left of the item's icon.

See Also

Images (see page 4001)

StateIndex (see page 5265)

27.1.23.6.25 TCustomTreeView.ToolTips Property

Specifies whether the items in the tree view have tool tips.

Pascal

```
property ToolTips: Boolean;
```

C++

```
__property Boolean ToolTips;
```

Description

Set ToolTips to true to specify that items in the tree view control have tool tips (Help Hints).

Specify the ToolTip text in an OnHint event handler using the Hint property.

See Also

Hint (see page 5827)

OnHint (see page 13731)

27.1.23.6.26 TCustomTreeView.TopItem Property

Specifies the topmost node that appears in the tree view.

Pascal

```
property TopItem: TTreeNode;
```

C++

```
__property TTreeNode TopItem;
```

Description

When TopItem is changed, the tree view scrolls vertically so that the specified node is topmost in the list view.

See Also

GetFirstNode (see page 5284)

27.1.23.7 TCustomTreeView Events

The events of the TCustomTreeView class are listed here.

Protected Events

	Name	Description
	OnAddition (see page 4016)	Occurs when new node is added.
	OnAdvancedCustomDraw (see page 4016)	Occurs at discrete stages during the painting of the tree view control.
	OnAdvancedCustomDrawItem (see page 4016)	Occurs at discrete stages during the painting of tree view nodes.
	OnCancelEdit (see page 4017)	Occurs when user cancels editing of a node's Caption.
	OnChange (see page 4017)	Occurs whenever the selection has changed from one node to another.
	OnChanging (see page 4018)	Occurs when the selection is about to change from one node to another.
	OnCollapsed (see page 4018)	Occurs after a node has been collapsed.
	OnCollapsing (see page 4018)	Occurs when a node is about to be collapsed.
	OnCompare (see page 4019)	Occurs when two nodes must be compared during a sort of the nodes in the tree view.
	OnCreateNodeClass (see page 4019)	Occurs when a node in the treeview is about to be created.
	OnCustomDraw (see page 4019)	Occurs immediately prior to painting the tree view control.
	OnCustomDrawItem (see page 4021)	Occurs immediately prior to painting a node in a tree view control.
	OnDeletion (see page 4024)	Occurs when a node in the tree view is deleted.
	OnEdited (see page 4024)	Occurs after the user edits the Text property of a node.
	OnEditing (see page 4024)	Occurs when the user starts to edit the Text property of a node.

	OnExpanded (see page 4025)	Occurs after a node is expanded.
	OnExpanding (see page 4025)	Occurs when a node is about to be expanded.
	OnGetImageIndex (see page 4026)	Occurs when the tree view looks up the ImageIndex of a node.
	OnGetSelectedIndex (see page 4026)	Occurs when the tree view looks up the SelectedIndex of a node.

27.1.23.7.1 TCustomTreeView.OnAddition Event

Occurs when new node is added.

Pascal

```
property OnAddition: TTVExpandedEvent;
```

C++

```
__property TTVExpandedEvent OnAddition;
```

Description

OnAddition occurs when a new node is added to the control.

27.1.23.7.2 TCustomTreeView.OnAdvancedCustomDraw Event

Occurs at discrete stages during the painting of the tree view control.

Pascal

```
property OnAdvancedCustomDraw: TTVAdvancedCustomDrawEvent;
```

C++

```
__property TTVAdvancedCustomDrawEvent OnAdvancedCustomDraw;
```

Description

Write an OnAdvancedCustomDraw event handler to paint an owner-drawn tree view. Use the Canvas (see page 3997) property as a drawing surface when painting the image of the tree view.

To paint individual items, use the OnAdvancedCustomDrawItem (see page 4016) or OnCustomDrawItem (see page 4021) event instead.

Note: OnAdvancedCustomDraw occurs at several stages during the paint process, not just immediately prior to the default rendering. If you only need to use the cdPrePaint stage, it is more efficient to use the OnCustomDraw (see page 4019) event.

See Also

Canvas (see page 3997)

OnAdvancedCustomDrawItem (see page 4016)

OnCustomDraw (see page 4019)

27.1.23.7.3 TCustomTreeView.OnAdvancedCustomDrawItem Event

Occurs at discrete stages during the painting of tree view nodes.

Pascal

```
property OnAdvancedCustomDrawItem: TTVAdvancedCustomDrawItemEvent;
```

C++

```
__property TTVAdvancedCustomDrawItemEvent OnAdvancedCustomDrawItem;
```

Description

Write an OnAdvancedCustomDrawItem event handler to customize the painting of individual items in the tree view.

Note: OnAdvancedCustomDrawItem occurs at several stages during the paint process and allows you to suppress the default painting of tree node images while still allowing the default painting of the node. If you only need to use the cdPrePaint stage and do not want to suppress only the painting of tree node images, it is more efficient to use the OnCustomDrawItem (see page 4021) event.

See Also

Canvas (see page 3997)

OnAdvancedCustomDraw (see page 4016)

OnCustomDrawItem (see page 4021)

27.1.23.7.4 TCustomTreeView.OnCancelEdit Event

Occurs when user cancels editing of a node's Caption.

Pascal

```
property OnCancelEdit: TTVChangedEvent;
```

C++

```
__property TTVChangedEvent OnCancelEdit;
```

Description

The OnCancelEdit event occurs when a user cancels a node-editing operation.

Sender is the tree view that contains the node.

Node is the node whose editing was canceled.

27.1.23.7.5 TCustomTreeView.OnChange Event

Occurs whenever the selection has changed from one node to another.

Pascal

```
property OnChange: TTVChangedEvent;
```

C++

```
__property TTVChangedEvent OnChange;
```

Description

Write an OnChange event handler to take specific action when the selected node changes. The Sender parameter is the tree view whose selected node changes, and the Node parameter is the newly selected node.

Note: The OnChange event does not occur for nodes selected using the right mouse button when RightClickSelect (see page 4006) is true. To respond to changes in the value of the Selected (see page 4007) property when RightClickSelect (see page 4006) is true, use the OnMouseUp event.

See Also

OnChanging (see page 4018)

Selected (see page 4007)

RightClickSelect (see page 4006)

ChangeDelay (see page 3999)

OnMouseUp (see page 5867)

27.1.23.7.6 TCustomTreeView.OnChanging Event

Occurs when the selection is about to change from one node to another.

Pascal

```
property OnChanging: TTVChangingEvent;
```

C++

```
__property TTVChangingEvent OnChanging;
```

Description

Write an OnChanging event handler to selectively prevent selection from moving to specific nodes.

The TTVChangingEvent (see page 5514) type points to a method that is called when the selection is about to be changed from one node to another. Set AllowChange to false, to prevent selection from moving to a new node. The Node parameter specifies the node that is about to be selected.

See Also

OnChange (see page 4017)

Selected (see page 4007)

27.1.23.7.7 TCustomTreeView.OnCollapsed Event

Occurs after a node has been collapsed.

Pascal

```
property OnCollapsed: TTVExpandedEvent;
```

C++

```
__property TTVExpandedEvent OnCollapsed;
```

Description

Write an OnCollapsed event handler to respond after a node in the tree view collapses. The Node parameter is the node whose children are no longer visible.

See Also

Collapse (see page 5235)

FullCollapse (see page 3983)

27.1.23.7.8 TCustomTreeView.OnCollapsing Event

Occurs when a node is about to be collapsed.

Pascal

```
property OnCollapsing: TTVCollapsingEvent;
```

C++

```
__property TTVCollapsingEvent OnCollapsing;
```

Description

The TTVCollapsingEvent (see page 5514) type points to a method that is called when a node is about to be collapsed. Set the AllowCollapse parameter to false to prevent the node specified by the Node parameter from being collapsed.

See Also

Collapse (see page 5235)

FullCollapse (see page 3983)

27.1.23.7.9 TCustomTreeView.OnCompare Event

Occurs when two nodes must be compared during a sort of the nodes in the tree view.

Pascal

```
property OnCompare: TTVCompareEvent;
```

C++

```
__property TTVCompareEvent OnCompare;
```

Description

Write an OnCompare event handler to customize the sort order of the nodes in the tree view. Set the Compare parameter to a value less than 0 if Node1 is less than Node2. Set Compare to 0 if Node1 is equivalent to Node2, and set Compare to a value greater than 0 if Node1 is greater than Node2. If an OnCompare event handler is not provided, tree view nodes are sorted alphabetically, based on their labels.

See Also

AlphaSort (see page 3972)

CustomSort (see page 3978)

SortType (see page 4014)

27.1.23.7.10 TCustomTreeView.OnCreateNodeClass Event

Occurs when a node in the treeview is about to be created.

Pascal

```
property OnCreateNodeClass: TTVCreateNodeClassEvent;
```

C++

```
__property TTVCreateNodeClassEvent OnCreateNodeClass;
```

Description

OnCreateNodeClass occurs when a new node object is about to be created.

Sender is the tree view object that is about to add a new node.

NodeClass returns a class reference that is instantiated to create a new node object.

27.1.23.7.11 TCustomTreeView.OnCustomDraw Event

Occurs immediately prior to painting the tree view control.

Pascal

```
property OnCustomDraw: TTVCustomDrawEvent;
```

C++

```
__property TTVCustomDrawEvent OnCustomDraw;
```

Description

Write an OnCustomDraw event handler to paint an owner-drawn tree view. Use the Canvas (see page 3997) property as a drawing surface when painting the image of the tree view.

To paint individual items, use the OnCustomDrawItem (see page 4021) event instead.

Note: OnCustomDraw only occurs prior to painting the tree view control. To customize the painting at other stages of the paint process (such as after the default drawing), use OnAdvancedCustomDraw (see page 4016) instead.

C++ Examples:

```
/*
The following example is taken from the custom draw demo. It
shows how the OnCustomDraw event handler draws the
background for the tree view before the items and lines are
drawn.
*/
void __fastcall TCustomDrawForm::TVCustomDraw(TCustomTreeView *Sender,
      const TRect &ARect, bool &DefaultDraw)
{
/*
This event should be used to draw any background colors or
images.  ARect represents the entire client area of the TreeView.
Use the TreeView's canvas to do the drawing.
Note that drawing a background bitmap is not really
supported by CustomDraw, so scrolling can get messy. Best to
subclass the TreeView and handle scrolling messages.
*/
  if (None1 != NULL)
  {
    if (None1->Checked) //no picture
    {
      TV->Canvas->Brush->Color = BkgColorDialog->Color;
      TV->Canvas->Brush->Style = FBrushStyle;
      TV->Canvas->FillRect(ARect);
    }
    else if (Tile1->Checked) //tile bitmap
    {
      TV->Canvas->Brush->Bitmap = Image1->Picture->Bitmap;
      TV->Canvas->FillRect(ARect);
    }
    else //Stretch across the canvas.
      TV->Canvas->StretchDraw(ARect, Image1->Picture->Bitmap);
  };
  DefaultDraw = FDefaultDraw;
  // Setting DefaultDraw to false here prevents all calls to
  // OnCustomDrawItem.
}
```

Delphi Examples:

```
{
The following example is taken from the custom draw demo. It
shows how the OnCustomDraw event handler draws the
background for the tree view before the items and lines are
drawn.
```

```
}
procedure TCustomDrawForm.TVCustomDraw(Sender: TCustomTreeView; const ARect: TRect;
  var DefaultDraw: Boolean);
begin
{
This event should be used to draw any background colors or
images.  ARect represents the entire client area of the TreeView.
Use the TreeView's canvas to do the drawing.
Note that drawing a background bitmap is not really
supported by CustomDraw, so scrolling can get messy. Best to
subclass the TreeView and handle scrolling messages.
}
  with TV.Canvas do
  begin
    if None1 <> nil then
    begin
      if None1.Checked then //no picture
      begin
        Brush.Color := BkgColorDialog.Color;
        Brush.Style := FBrushStyle;
        FillRect(ARect);
      end else
        if Tile1.Checked then //tile bitmap
        begin
          Brush.Bitmap := Image1.Picture.Bitmap;
            FillRect(ARect);
          end else //Stretch across the canvas.
              StretchDraw(ARect, Image1.Picture.Bitmap);
    end;
  end;
  DefaultDraw := FDefaultDraw;
  // Setting DefaultDraw to false here prevents all calls to
  // OnCustomDrawItem.
end;
```

OnAdvancedCustomDraw (see page 4016)

27.1.23.7.12 TCustomTreeView.OnCustomDrawItem Event

Occurs immediately prior to painting a node in a tree view control.

Pascal

```
property OnCustomDrawItem: TTVCustomDrawItemEvent;
```

C++

```
__property TTVCustomDrawItemEvent OnCustomDrawItem;
```

Description

Write an OnCustomDrawItem event handler to paint individual items in the tree view, or to provide a background to the item before the default rendering of the item.

Note: OnCustomDrawItem only occurs prior to painting individual tree items. To customize the painting of items at other stages of the paint process (such as after the item is painted), use OnAdvancedCustomDrawItem (see page 4016) instead.

C++ Examples:

```
/*
The following example shows how the OnCustomDrawItem event
handler draws items and lines of the tree view after the
OnCustomDraw event handler has filled in the background.
*/
void __fastcall TCustomDrawForm::TVCustomDrawItem(TCustomTreeView *Sender,
      TTreeNode *Node, TCustomDrawState State, bool &DefaultDraw)
{
  TRect NodeRect;
/*
    If DefaultDraw it is true, any of the node's font
    properties can be changed. Note also that when
    DefaultDraw = True, Windows draws the buttons and
    ignores our font background colors, using instead the
    TreeView's Color property.
*/
    if (State.Contains(cdsSelected))
    {
      TV->Canvas->Font->Assign(SelectedFontDialog->Font);
      TV->Canvas->Brush->Color = SelBkgColorDialog->Color;
    };

    DefaultDraw = FDefaultDrawItem;
/*
    DefaultDraw = False means you have to handle all the
    item drawing yourself, including the buttons, lines,
    images, and text.
*/
    if (!DefaultDraw)
    {
      //draw the selection rect.
      if (State.Contains(cdsSelected))
      {
        NodeRect = Node->DisplayRect(True);
        TV->Canvas->FillRect(NodeRect);
      };
      NodeRect = Node->DisplayRect(False);

      if (None1->Checked)
      //no bitmap, so paint in the background color.
      {
        TV->Canvas->Brush->Color = BkgColorDialog->Color;
        TV->Canvas->Brush->Style = FBrushStyle;
        TV->Canvas->FillRect(NodeRect);
      }
      else
        //don't paint over the background bitmap.
        TV->Canvas->Brush->Style = bsClear;

      NodeRect.Left = NodeRect.Left + (Node->Level * TV->Indent);
      // NodeRect.Left now represents the left-most portion
      // of the expand button
      DrawButton(&NodeRect, Node); // See the CustomDraw demo

      NodeRect.Left = NodeRect.Left + TV->Indent + FButtonSize;
      //NodeRect->Left is now the leftmost portion of the image.
      DrawImage(&NodeRect, Node->ImageIndex); // See the CustomDraw demo

      NodeRect.Left = NodeRect.Left + ImageList->Width;
      //Now we are finally in a position to draw the text.

      TV->Canvas->TextOut(NodeRect.Left, NodeRect.Top, Node->Text);
    };
}
```

Delphi Examples:

```
{
The following example shows how the OnCustomDrawItem event
handler draws items and lines of the tree view after the
OnCustomDraw event handler has filled in the background.
}
procedure TCustomDrawForm.TVCustomDrawItem(Sender: TCustomTreeView; Node: TTreeNode;
  State: TCustomDrawState; var DefaultDraw: Boolean);
var
  NodeRect: TRect;
begin
  with TV.Canvas do
  begin
{
    If DefaultDraw it is true, any of the node's font
    properties can be changed. Note also that when
    DefaultDraw = True, Windows draws the buttons and
    ignores our font background colors, using instead the
    TreeView's Color property.
}
    if cdsSelected in State then
    begin
      Font.Assign(SelectedFontDialog.Font);
      Brush.Color := SelBkgColorDialog.Color;
    end;

    DefaultDraw := False; // FDefaultDrawItem;
{
    DefaultDraw = False means you have to handle all the
    item drawing yourself, including the buttons, lines,
    images, and text.
}
    if not DefaultDraw then
    begin
      //draw the selection rect.
      if cdsSelected in State then
      begin
        NodeRect := Node.DisplayRect(True);
        FillRect(NodeRect);
      end;
      NodeRect := Node.DisplayRect(False);

      if None1.Checked then
      //no bitmap, so paint in the background color.
      begin
        Brush.Color := BkgColorDialog.Color;
        Brush.Style := FBrushStyle;
        FillRect(NodeRect)
      end
      else
        //don't paint over the background bitmap.
        Brush.Style := bsClear;

      NodeRect.Left := NodeRect.Left + (Node.Level * TV.Indent);
      // NodeRect.Left now represents the left-most portion
      // of the expand button
      DrawButton(NodeRect, Node); // See the CustomDraw demo

      NodeRect.Left := NodeRect.Left + TV.Indent + FButtonSize;
      //NodeRect.Left is now the leftmost portion of the image.
      DrawImage(NodeRect, Node.ImageIndex); // See the CustomDraw demo

      NodeRect.Left := NodeRect.Left + ImageList.Width;
      //Now we are finally in a position to draw the text.

      TextOut(NodeRect.Left, NodeRect.Top, Node.Text);
    end;
```

```
    end;
  end;
```

OnAdvancedCustomDrawItem (see page 4016)

27.1.23.7.13 TCustomTreeView.OnDeletion Event

Occurs when a node in the tree view is deleted.

Pascal

```
property OnDeletion: TTVExpandedEvent;
```

C++

```
__property TTVExpandedEvent OnDeletion;
```

Description

Write an OnDeletion event handler to respond when a node is deleted from the tree view control.

See Also

Delete (see page 5237)

27.1.23.7.14 TCustomTreeView.OnEdited Event

Occurs after the user edits the Text property of a node.

Pascal

```
property OnEdited: TTVEditedEvent;
```

C++

```
__property TTVEditedEvent OnEdited;
```

Description

Write an OnEdited event handler to respond to changes the user makes to the node labels. The Node parameter is the node whose label was edited. The S parameter is the new value of the node's Text property. The node's label can be changed in an OnEdited event handler before the user's edits are committed. This event can occur only if ReadOnly (see page 4006) is set to false.

See Also

OnEditing (see page 4024)

ReadOnly (see page 4006)

Text (see page 5265)

27.1.23.7.15 TCustomTreeView.OnEditing Event

Occurs when the user starts to edit the Text property of a node.

Pascal

```
property OnEditing: TTVEditingEvent;
```

C++

```
__property TTVEditingEvent OnEditing;
```

Description

Write an OnEditing event handler to determine whether the user is allowed to edit the label of a specific node in the tree view. Set the AllowEdit parameter to false to prevent the user from editing the node specified by the Node parameter. To disallow editing of all nodes in the tree view, use the ReadOnly (see page 4006) property instead.

See Also

OnEdited (see page 4024)

ReadOnly (see page 4006)

27.1.23.7.16 TCustomTreeView.OnExpanded Event

Occurs after a node is expanded.

Pascal

```
property OnExpanded: TTVExpandedEvent;
```

C++

```
__property TTVExpandedEvent OnExpanded;
```

Description

Write an OnExpanded event handler to respond when a node in the tree view is expanded. The Node parameter specifies the node whose children are now displayed to the user.

See Also

FullExpand (see page 3984)

OnExpanding (see page 4025)

Expand (see page 5242)

27.1.23.7.17 TCustomTreeView.OnExpanding Event

Occurs when a node is about to be expanded.

Pascal

```
property OnExpanding: TTVExpandingEvent;
```

C++

```
__property TTVExpandingEvent OnExpanding;
```

Description

Write an OnExpanding event handler to determine whether a node can be expanded. Set the AllowExpansion parameter to false to prevent the node from expanding.

See Also

FullExpand (see page 3984)

OnExpanded (see page 4025)

Expand (see page 5242)

27.1.23.7.18 TCustomTreeView.OnGetImageIndex Event

Occurs when the tree view looks up the ImageIndex of a node.

Pascal

```
property OnGetImageIndex: TTVExpandedEvent;
```

C++

```
__property TTVExpandedEvent OnGetImageIndex;
```

Description

Write an OnGetImageIndex event handler to change the image index for the particular node before it is drawn. For example, the bitmap of a node can be changed to indicate a different state for the node.

Delphi Examples:

```
{
The following example shows how the OnGetImageIndex event
handler can be used to indicate a different state for the
node.
}
procedure TCustomDrawForm.TVGetImageIndex(Sender: TObject; Node: TTreeNode);
begin
  if Node.HasChildren then
    if Node.Expanded then
      Node.ImageIndex := 3
    else
      Node.ImageIndex := 0
  else
    Node.ImageIndex := 1;
end;

procedure TCustomDrawForm.TVGetSelectedIndex(Sender: TObject; Node: TTreeNode);
begin
  Node.SelectedIndex := Node.ImageIndex;
end;
```

See Also

Images (see page 4001)

OnGetSelectedIndex (see page 4026)

ImageIndex (see page 5259)

27.1.23.7.19 TCustomTreeView.OnGetSelectedIndex Event

Occurs when the tree view looks up the SelectedIndex of a node.

Pascal

```
property OnGetSelectedIndex: TTVExpandedEvent;
```

C++

```
__property TTVExpandedEvent OnGetSelectedIndex;
```

Description

Write an OnGetSelectedIndex event handler to change the selected image index of a node before it is drawn.

Delphi Examples:

```
{
```

```
The following example shows how the OnGetImageIndex event
handler can be used to indicate a different state for the
node.
}
procedure TCustomDrawForm.TVGetImageIndex(Sender: TObject; Node: TTreeNode);
begin
  if Node.HasChildren then
    if Node.Expanded then
      Node.ImageIndex := 3
    else
      Node.ImageIndex := 0
  else
    Node.ImageIndex := 1;
end;

procedure TCustomDrawForm.TVGetSelectedIndex(Sender: TObject; Node: TTreeNode);
begin
  Node.SelectedIndex := Node.ImageIndex;
end;
```

SelectedIndex (see page 5265)

27.1.24 TCustomUpDown Class

TCustomUpDown is the base type for up-down size controls such as TUpDown (see page 5380).

Class Hierarchy

Pascal

```
TCustomUpDown = class(TWinControl);
```

C++

```
class TCustomUpDown : public TWinControl;
```

File

ComCtrls

Description

Use TCustomUpDown as a base class when defining up-down controls such as the arrows that appear in a spin box. Up-down controls allow users to change the size of a numerical value by clicking on arrow buttons. TCustomUpDown introduces several properties, events, and methods to associate an up-down control with another control in a form and to communicate the size changes specified by the user.

Do not create instances of TCustomUpDown. To put an up-down control in a form, use TUpDown (see page 5380).

See Also

TUpDown (see page 5380)

27.1.24.1 TCustomUpDown Members

The following tables list the members exposed by TCustomUpDown.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnChanging (see page 4046)	Occurs when the position of an up-down control is about to change.
	OnChangingEx (see page 4047)	Occurs when the position of an up-down control is about to change.
	OnClick (see page 4047)	Occurs when the user clicks an arrow button.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.

	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanChange (see page 4039)	Indicates whether Position (see page 4045) can change.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 4039)	Generates an OnClick (see page 4047) event.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 4039)	Initializes the window creation parameters for the up-down control.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 4040)	Creates the window used by the up-down control.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.

	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DoCanChange (see page 4040)	Pending change event dispatcher.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.

	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 4041)	Responds to notifications when components are about to be created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.

	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AlignButton (see page 4042)	Specifies the position of the up-down control relative to its companion control.
	ArrowKeys (see page 4042)	Determines whether the up-down control receives input from the Up arrow and Down arrow keys.
	Associate (see page 4043)	Specifies a companion control for the up-down control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	Increment (see page 4043)	Specifies the amount the Position (see page 4045) value changes each time the up or down button is pressed.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	Max (see page 4043)	Specifies the maximum value of the Position (see page 4045) property.
	Min (see page 4044)	Specifies the minimum value of the Position (see page 4045) property.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	Orientation (see page 4044)	Specifies the direction that the arrow keys point.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	Position (see page 4045)	Specifies the current value represented by the up-down control.

	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	Thousands (see page 4045)	Determines whether a thousands separator appears between every three digits of a decimal string.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.
	Wrap (see page 4045)	Specifies how the up-down control handles attempts to exceed the value of Max (see page 4043) or Min (see page 4044).

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 4038)	Creates and initializes an instance of TCustomUpDown (see page 4027).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.

	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.

R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

27.1.24.2 TCustomUpDown.Create Constructor

Creates and initializes an instance of TCustomUpDown (see page 4027).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomUpDown(TComponent * AOwner);
```

Description

Call Create to instantiate an up-down control at runtime. Up-down controls placed on forms at design time are created automatically.AOwner is a component, typically the form, that is responsible for freeing the up-down control. It becomes the value of the Owner property.

See Also

Owner (see page 2807)

27.1.24.3 TCustomUpDown Methods

The methods of the TCustomUpDown class are listed here.

Protected Methods

	Name	Description
	CanChange (see page 4039)	Indicates whether Position (see page 4045) can change.
	Click (see page 4039)	Generates an OnClick (see page 4047) event.
V	CreateParams (see page 4039)	Initializes the window creation parameters for the up-down control.
V	CreateWnd (see page 4040)	Creates the window used by the up-down control.
	DoCanChange (see page 4040)	Pending change event dispatcher.
V	Notification (see page 4041)	Responds to notifications when components are about to be created or destroyed.

27.1.24.3.1 TCustomUpDown.CanChange Method

Indicates whether Position (see page 4045) can change.

Pascal

```
function CanChange: Boolean; dynamic;
```

C++

```
__fastcall Boolean CanChange();
```

Description

CanChange is called automatically when the user clicks the arrow buttons or an attempt is made to change the value of Position (see page 4045) programmatically. CanChange generates an OnChanging (see page 4046) event followed by an OnChangingEx (see page 4047) event. It allows the change unless an OnChanging (see page 4046) or OnChangingEx (see page 4047) event handler prevents it.

See Also

OnChanging (see page 4046)

Position (see page 4045)

OnChangingEx (see page 4047)

DoCanChange (see page 4040)

27.1.24.3.2 TCustomUpDown.Click Method

Generates an OnClick (see page 4047) event.

Pascal

```
procedure Click(Button: TUDBtnType); dynamic; reintroduce;
```

C++

```
__fastcall Click(TUDBtnType Button);
```

Description

Click is called automatically when the user clicks an arrow button or presses an Up or Down arrow key. Override this method to specify special processing that should occur before the OnClick (see page 4047) event handler executes, or to block the OnClick (see page 4047) event. The Button parameter specifies which button was clicked: btNext refers to the Up or Right arrow, and btPrev refers to the Down or Left arrow.

See Also

OnClick (see page 4047)

27.1.24.3.3 TCustomUpDown.CreateParams Method

Initializes the window creation parameters for the up-down control.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

CreateParams is called automatically before the window for an up-down control is created. CreateParams calls the inherited method, then sets the Params parameter to reflect the values of the AlignButton (see page 4042), ArrowKeys (see page 4042), Orientation (see page 4044), Thousands (see page 4045), and Wrap (see page 4045) properties.

See Also

AlignButton (see page 4042)

ArrowKeys (see page 4042)

Orientation (see page 4044)

Thousands (see page 4045)

CreateParams (see page 6135)

Wrap (see page 4045)

27.1.24.3.4 TCustomUpDown.CreateWnd Method

Creates the window used by the up-down control.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

After calling the inherited method to create the up-down control's window, CreateWnd sends the newly created windows messages so that it reflects the current values of the Associate (see page 4043), Increment (see page 4043), Max (see page 4043), Min (see page 4044), and Position (see page 4045) properties.

See Also

Associate (see page 4043)

CreateParams (see page 4039)

Increment (see page 4043)

Max (see page 4043)

Min (see page 4044)

Position (see page 4045)

CreateWnd (see page 6137)

27.1.24.3.5 TCustomUpDown.DoCanChange Method

Pending change event dispatcher.

Pascal

```
function DoCanChange(NewVal: SmallInt; Delta: SmallInt): Boolean;
```

C++

```
__fastcall Boolean DoCanChange(SmallInt NewVal, SmallInt Delta);
```

Description

DoCanChange is called automatically when the user clicks the arrow buttons or an attempt is made to change the value of Position (see page 4045) programmatically. DoCanChange stores the value of the NewVal and Delta parameters and then calls CanChange (see page 4039) to generate an OnChanging (see page 4046) event followed by an OnChangingEx (see page 4047) event. It allows the change to position unless an OnChanging (see page 4046) or OnChangingEx (see page 4047) event handler prevents it.

NewVal specifies the proposed new value of Position (see page 4045) if the change is allowed.

Delta indicates the size of the change, where positive values increase Position (see page 4045) and negative values decrease Position (see page 4045).

DoCanChange returns true if the change is allowed, false otherwise.

See Also

OnChanging (see page 4046)

Position (see page 4045)

OnChangingEx (see page 4047)

CanChange (see page 4039)

27.1.24.3.6 TCustomUpDown.Notification Method

Responds to notifications when components are about to be created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

After calling the inherited method, Notification checks whether the control specified by the Associate (see page 4043) property is about to be destroyed, and if so, sets the Associate (see page 4043) property to nil (Delphi) or NULL (C++).

See Also

Associate (see page 4043)

27.1.24.4 TCustomUpDown Properties

The properties of the TCustomUpDown class are listed here.

Protected Properties

	Name	Description
	AlignButton (see page 4042)	Specifies the position of the up-down control relative to its companion control.
	ArrowKeys (see page 4042)	Determines whether the up-down control receives input from the Up arrow and Down arrow keys.
	Associate (see page 4043)	Specifies a companion control for the up-down control.
	Increment (see page 4043)	Specifies the amount the Position (see page 4045) value changes each time the up or down button is pressed.
	Max (see page 4043)	Specifies the maximum value of the Position (see page 4045) property.
	Min (see page 4044)	Specifies the minimum value of the Position (see page 4045) property.
	Orientation (see page 4044)	Specifies the direction that the arrow keys point.

	Position (see page 4045)	Specifies the current value represented by the up-down control.
	Thousands (see page 4045)	Determines whether a thousands separator appears between every three digits of a decimal string.
	Wrap (see page 4045)	Specifies how the up-down control handles attempts to exceed the value of Max (see page 4043) or Min (see page 4044).

27.1.24.4.1 TCustomUpDown.AlignButton Property

Specifies the position of the up-down control relative to its companion control.

Pascal

```
property AlignButton: TUDAlignButton;
```

C++

```
__property TUDAlignButton AlignButton;
```

Description

Set AlignButton to indicate where to position the up-down control. The up-down control appears attached to the outer edge of the control specified by the Associate (see page 4043) property. These are the possible values:

Value	Meaning
udLeft	Position (see page 4045) the up-down control on the left edge of the companion control.
udRight	Position (see page 4045) the up-down control on the right edge of the companion control.

The up-down control resizes itself to the height of the companion control.

See Also

Associate (see page 4043)

27.1.24.4.2 TCustomUpDown.ArrowKeys Property

Determines whether the up-down control receives input from the Up arrow and Down arrow keys.

Pascal

```
property ArrowKeys: Boolean;
```

C++

```
__property Boolean ArrowKeys;
```

Description

Use ArrowKeys to specify whether the up-down control responds to keyboard input. ArrowKeys is used only when the up-down control is associated with a companion control. When ArrowKeys is true, the up-down control responds to the Up arrow and Down arrow keys, even when its companion control has input focus. When ArrowKeys is false, the user must click the buttons of the up-down control with the mouse. To set a companion control use the Associate (see page 4043) property.

Note: Up-down controls can respond to only the Up and Down arrow keys, even when the value of Orientation (see page 4044) is udHorizontal.

See Also

Associate (see page 4043)

Orientation (see page 4044)

27.1.24.4.3 TCustomUpDown.Associate Property

Specifies a companion control for the up-down control.

Pascal

```
property Associate: TWinControl;
```

C++

```
__property TWinControl * Associate;
```

Description

Use Associate to link the up-down control to a companion control (sometimes called a buddy window). The up-down control automatically positions itself on the outer edge of the companion control and adjusts its height to match the companion control.

At design-time the companion control does not move with the up-down control. To keep the up-down control and its companion control together at design time, either multi-select both controls before moving them, or first move the companion control and then reset the Associate property for the up-down control.

See Also

AlignButton (see page 4042)

ArrowKeys (see page 4042)

Position (see page 4045)

27.1.24.4.4 TCustomUpDown.Increment Property

Specifies the amount the Position (see page 4045) value changes each time the up or down button is pressed.

Pascal

```
property Increment: Integer;
```

C++

```
__property int Increment;
```

Description

Use Increment to control the granularity of changes the up-down control can make. Set Increment to indicate the number of units between Min (see page 4044) and Max (see page 4043) the Position (see page 4045) moves whenever the user clicks on one of the arrow buttons. Increment represents the mapping between the units used to specify Min (see page 4044), Max (see page 4043), and Position (see page 4045), and the logical units represented by the up-down control.

See Also

Max (see page 4043)

Min (see page 4044)

Position (see page 4045)

27.1.24.4.5 TCustomUpDown.Max Property

Specifies the maximum value of the Position (see page 4045) property.

Pascal

```
property Max: SmallInt;
```

C++

```
__property SmallInt Max;
```

Description

Use Max to provide an upper limit to the range of values the Position (see page 4045) property can assume.

See Also

Min (see page 4044)

Position (see page 4045)

27.1.24.4.6 TCustomUpDown.Min Property

Specifies the minimum value of the Position (see page 4045) property.

Pascal

```
property Min: SmallInt;
```

C++

```
__property SmallInt Min;
```

Description

Use Min to provide a lower limit to the range of values the Position (see page 4045) property can assume.

See Also

Max (see page 4043)

Position (see page 4045)

27.1.24.4.7 TCustomUpDown.Orientation Property

Specifies the direction that the arrow keys point.

Pascal

```
property Orientation: TUDOrientation;
```

C++

```
__property TUDOrientation Orientation;
```

Description

Use Orientation to determine the orientation of the arrow buttons. These are the possible values:

Value	Meaning
udHorizontal	The arrow buttons point to the left and right, and appear side by side.
udVertical	The arrow buttons point up and down and are stacked vertically.

Note: Even when the Orientation is udHorizontal, the up-down control can respond only to the Up and Down arrow keys.

See Also

ArrowKeys (see page 4042)

27.1.24.4.8 TCustomUpDown.Position Property

Specifies the current value represented by the up-down control.

Pascal

```
property Position: SmallInt;
```

C++

```
__property SmallInt Position;
```

Description

Use Position to get or change the value the up-down control represents. Position must be a value between Min (see page 4044) and Max (see page 4043).

When the Associate (see page 4043) property specifies an edit control, its text is automatically set to the value of Position. When Position changes, the text of the edit control is updated. If the Associate (see page 4043) property is nil (Delphi) or NULL (C++), use the OnClick (see page 4047) event to respond to changes in the value of Position.

See Also

Associate (see page 4043)

Max (see page 4043)

Min (see page 4044)

OnChanging (see page 4046)

Thousands (see page 4045)

27.1.24.4.9 TCustomUpDown.Thousands Property

Determines whether a thousands separator appears between every three digits of a decimal string.

Pascal

```
property Thousands: Boolean;
```

C++

```
__property Boolean Thousands;
```

Description

Use Thousands to control the formatting of the text of the companion control of the up-down control. If Thousands is true, a separator appears between every three digits. The numeric value that is displayed by the companion control is given by the Position (see page 4045) property.

See Also

Associate (see page 4043)

Position (see page 4045)

27.1.24.4.10 TCustomUpDown.Wrap Property

Specifies how the up-down control handles attempts to exceed the value of Max (see page 4043) or Min (see page 4044).

Pascal

```
property Wrap: Boolean;
```

C++

```
__property Boolean Wrap;
```

Description

Use Wrap to specify whether the up-down control treats the range determined by the Max (see page 4043) and Min (see page 4044) properties as a continuous loop. If Wrap is true, the value of Position (see page 4045) becomes the value of the Min (see page 4044) property when the user increments Position (see page 4045) beyond the value of Max (see page 4043), and becomes the value of Max (see page 4043) when the user decrements Position (see page 4045) beyond the value of Min (see page 4044).

See Also

Max (see page 4043)

Min (see page 4044)

Position (see page 4045)

27.1.24.5 TCustomUpDown Events

The events of the TCustomUpDown class are listed here.

Protected Events

	Name	Description
	OnChanging (see page 4046)	Occurs when the position of an up-down control is about to change.
	OnChangingEx (see page 4047)	Occurs when the position of an up-down control is about to change.
	OnClick (see page 4047)	Occurs when the user clicks an arrow button.

27.1.24.5.1 TCustomUpDown.OnChanging Event

Occurs when the position of an up-down control is about to change.

Pascal

```
property OnChanging: TUDChangingEvent;
```

C++

```
__property TUDChangingEvent OnChanging;
```

Description

Write an OnChanging event handler to conditionally disallow changes to the value of Position (see page 4045). Set the AllowChange parameter to false to prevent a change to the current value of Position (see page 4045).

OnChanging occurs both when the user clicks the arrow buttons of the up-down control and when an attempt is made to change the value of Position (see page 4045) programmatically. To determine which button the user clicked, use the OnChangingEx (see page 4047) event or the OnClick (see page 4047) event, both of which follow the OnChanging event.

See Also

CanChange (see page 4039)

OnClick (see page 4047)

OnChangingEx (see page 4047)

Position (see page 4045)

27.1.24.5.2 TCustomUpDown.OnChangingEx Event

Occurs when the position of an up-down control is about to change.

Pascal

```
property OnChangingEx: TUDChangingEventEx;
```

C++

```
__property TUDChangingEventEx OnChangingEx;
```

Description

Write an OnChangingEx event handler to conditionally disallow changes to the value of Position (see page 4045). Set the AllowChange parameter to false to prevent a change to the current value of Position (see page 4045).

Sender is the up-down control that received the event. This may be in response to a user click on the arrow buttons or an attempt to change the value of Position (see page 4045) programmatically.

AllowChange returns a value that indicates whether the change is permitted.

NewValue indicates the new value of Position (see page 4045) if the change is allowed.

Direction indicates whether the value of Position (see page 4045) is to be increased or decreased.

See Also

CanChange (see page 4039)

Position (see page 4045)

OnChanging (see page 4046)

27.1.24.5.3 TCustomUpDown.OnClick Event

Occurs when the user clicks an arrow button.

Pascal

```
property OnClick: TUDClickEvent;
```

C++

```
__property TUDClickEvent OnClick;
```

Description

Write an OnClick event handler to take specific action when the user clicks one of the arrow buttons. If the Associate (see page 4043) property is not used to automatically update the text of an edit control when the value of Position (see page 4045) changes, use the OnClick event handler to respond to changes just before the value of Position (see page 4045) is changed.

The Button parameter specifies how the value of Position (see page 4045) is about to change. When Button is btNext, the Up or Right arrow was clicked, and the value of Position (see page 4045) is about to increase by Increment (see page 4043). When Button is btPrev, the Down or Left arrow was clicked, and the value of Position (see page 4045) is about to decrease by Increment (see page 4043).

C++ Examples:

```
/*
This example requires a new TPageControl, as-is, with no new pages
created at design time, and a TUpDown control, also from the Win95
page of the component palette.  The form OnCreate event handler
adds several new TabSheet controls to the Page Control.  The
UpDown1Click event handler fires when the user clicks the up or
```

```
down button on the TUpDown control.  The SelectNextPage method of
the Page Control goes forward the comparison (Button = btNext)
evaluates as true.  If Button is not btNext, the previous Tab Page
is selected.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
const
  TColor colorPalette[12] = {
    clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
    clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *page = new TTabSheet(PageControl1);
    page->PageControl = PageControl1;
    page->Caption = AnsiString("Page") + IntToStr(i);
    page->Brush->Color = colorPalette[i];
  }
}

void __fastcall TForm1::UpDown1Click(TObject *Sender, TUDBtnType Button)
{
  PageControl1->SelectNextPage(Button == btNext);
}
```

Delphi Examples:

```
{
This example requires a new TPageControl, as-is, with no new pages
created at design time, and a TUpDown control, also from the Win95
page of the component palette.  The form OnCreate event handler
adds several new TabSheet controls to the Page Control.  The
UpDown1Click event handler fires when the user clicks the up or
down button on the TUpDown control.  The SelectNextPage method of
the Page Control goes forward the comparison (Button = btNext)
evaluates as true.  If Button is not btNext, the previous Tab Page
is selected.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
const
  colorPalette: Array[0..11] of TColor =
    (clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
    clTeal, clNavy, clMaroon, clLime, clOlive, clPurple);
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet #' + IntToStr(i);
      Brush.Color := colorPalette[i];
    end;
end;

procedure TForm1.UpDown1Click(Sender: TObject; Button: TUDBtnType);
begin

27.1.25 TDateTimePicker Class

TDateTimePicker displays a list box for entering dates or times.

Class Hierarchy

Pascal

```
TDateTimePicker = class(TCommonCalendar);
```

C++

```
class TDateTimePicker : public TCommonCalendar;
```

File

ComCtrls

Description

TDateTimePicker is a visual component designed specifically for entering dates or times. In dmComboBox date mode, it resembles a list box or combo box, except that the drop-down list is replaced with a calendar illustration; users can select a date from the calendar. Dates or times can also be selected by scrolling with Up and Down arrows and by typing.

Date (see page 4075)-time picker ignores the BiDiMode (see page 4072) setting for right-to-left reading, displaying dates according to the system locale.

TDateTimePicker formats date and time values according to the date and time settings in the Regional Settings of the Control panel on the user's system. Because TDateTimePicker is a wrapper for a Windows control, these formats can't be changed by changing the formatting variables in the SysUtils (see page 22709) unit. However, you can use the Windows API call DateTime_SetFormat to programmatically specify these settings.

Note: The underlying Windows control is known to behave unpredictably when used to set dates in 1752, the year English-speaking countries changed to the Gregorian calendar. Similar problems may appear for different dates when a non-English locale is used. If an application might be used to specify dates on or before the changeover in the current locale (for example, 1918 or before in Russian locales), be sure to test the application using the dates affected.

List Controls

27.1.25.1 TDateTimePicker Members

The following tables list the members exposed by TDateTimePicker.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnGetMonthInfo (see page 3581)	Called whenever a new month is displayed in the calendar.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.

	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 4061)	This is Change, a member of class TDateTimePicker.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	CheckEmptyDate (see page 4061)	Clears the check box associated with the calendar.
	CheckValidDate (see page 3571)	Confirms that a date falls between MinDate (see page 3579) and MaxDate (see page 3578).
	Click (see page 5743)	Respond to user click.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 4062)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 4062)	Creates the windows control for the calendar.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus

	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetCalendarHandle (see page 4063)	Returns the calendar control's window handle.
	GetCalStyles (see page 3573)	Returns the style flags that are used when creating the calendar's window.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).

	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	MsgSetCalColors (see page 4063)	Sets the calendar's colors.
	MsgSetDateTime (see page 4064)	Sets the calendar's date/time.
	MsgSetRange (see page 4064)	Implements the MinDate and MaxDate properties.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.

	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	CalendarHandle (see page 3576)	Indicates the calendar control's window handle.
	CalExceptionClass (see page 3576)	Specifies the calendar's exception class.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.

	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	EndDate (see page 3577)	Indicates the last date that in the range of selected dates.
	FirstDayOfWeek (see page 3578)	Specifies the left-most day on the calendar.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MaxSelectRange (see page 3579)	Specifies the maximum number of days that can be selected.
	MonthDelta (see page 3579)	Specifies how many months that the calendar scrolls.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	MultiSelect (see page 3580)	Specifies whether multiple dates can be selected on the calendar.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	ShowToday (see page 3580)	Specifies whether today's date is shown below the calendar.
	ShowTodayCircle (see page 3580)	Specifies whether today's date is circled on the calendar.
	Text (see page 5842)	Contains a text string associated with the control.
	WeekNumbers (see page 3581)	Specifies whether week numbers are shown to the left of the calendar.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BoldDays (see page 3570)	Encodes a set of dates for use in the OnGetMonthInfo (see page 3581) event handler.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 4060)	Creates and initializes a TDateTimePicker (see page 4049) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.

	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 3570)	Destroys the TCommonCalendar (see page 3558) instance.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.

	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetDesignVisible (see page 6178)	Makes a control visible at design time.
	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Update (see page 5789)	Processes any pending paint messages immediately.
	Update (see page 6183)	Forces the control to update.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DateTime (see page 4076)	Indicates the date and time.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	DroppedDown (see page 4079)	Specifies whether the date time picker control is dropped down.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.

	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnChange (see page 4096)	Occurs when a date or time is entered.
	OnClick (see page 4097)	Occurs when the user clicks the control.
	OnCloseUp (see page 4099)	Occurs when the drop-down calendar closes.
	OnContextPopup (see page 4099)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 4100)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 4100)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 4102)	Occurs when the user drags an object over a control.
	OnDropDown (see page 4105)	Occurs when the user opens the drop-down calendar by clicking the arrow at the right of the control.
	OnEndDock (see page 4105)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 4105)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 4106)	Occurs when a control receives the input focus.
	OnExit (see page 4109)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 4110)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 4113)	Occurs when a key is pressed.
	OnKeyUp (see page 4114)	Occurs when the user releases a key that has been pressed.
	OnMouseEnter (see page 4116)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 4116)	Occurs when the user moves the mouse outside of a control.
	OnStartDock (see page 4116)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 4117)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUserInput (see page 4118)	Occurs when the user types directly into the component's edit box.

Published Properties

	Name	Description
	Align (see page 4066)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 4069)	Specifies how the control is anchored to its parent.
	BevelEdges (see page 4070)	Specifies which edges of the control are beveled.
	BevelInner (see page 4070)	Specifies the cut of the inner bevel.
	BevelKind (see page 4071)	Specifies the control's bevel style.
	BevelOuter (see page 4071)	Specifies the cut of the outer bevel.
	BevelWidth (see page 4072)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 4072)	Specifies the bi-directional mode for the control.
	CalAlignment (see page 4073)	Determines the alignment of the drop-down calendar.
	CalColors (see page 4073)	Contains the colors used for each part of the calendar.
	Checked (see page 4073)	Indicates whether the check box next to the date or time is selected.
	Color (see page 4074)	Specifies the background color of the control.
	Constraints (see page 4074)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.

	Date (see page 4075)	Indicates the date that is marked on the calendar.
	DateFormat (see page 4076)	Specifies format in which the date is presented.
	DateMode (see page 4076)	Determines the method of date selection used by the component.
	DragCursor (see page 4077)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 4077)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 4077)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 4079)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 4080)	Controls the attributes of text written on or in the control.
	Format (see page 4081)	Specify format for date-time string.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	ImeMode (see page 4082)	Determines the behavior of the input method editor (IME).
	ImeName (see page 4082)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	Kind (see page 4083)	Determines whether the component is a date selector or a time selector.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	MaxDate (see page 4084)	Determines the latest allowable date that can be entered.
	MinDate (see page 4084)	Determines the earliest allowable date that can be entered.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 4084)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 4085)	Determines where a control looks for its color information.
	ParentFont (see page 4085)	Determines where a control looks for its font information.
	ParentShowHint (see page 4086)	Determines where a control looks to find out if its Help Hint should be shown.
	ParseInput (see page 4086)	This is ParseInput, a member of class TDateTimePicker.
	PopupMenu (see page 4086)	Identifies the pop-up menu associated with the control.
	ShowCheckbox (see page 4091)	Displays a check box next to the date or time.
	ShowHint (see page 4091)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 4093)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 4093)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Time (see page 4094)	Indicates the time entered by the user.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 4094)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

27.1.25.2 TDateTimePicker.Create Constructor

Creates and initializes a TDateTimePicker (see page 4049) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDateTimePicker(TComponent * AOwner);
```

Description

Create calls the inherited constructor method and initializes the Date (see page 4075) and Time (see page 4094) properties to the current date and time. It also sets the following ControlStyle flags: csCaptureMouse, csOpaque, csClickEvents, csDoubleClicks, and csFixedHeight.

See Also

ControlStyle (see page 5814)

Date (see page 3576)

Time (see page 4094)

Create (see page 6123)

27.1.25.3 TDateTimePicker Methods

The methods of the TDateTimePicker class are listed here.

Protected Methods

	Name	Description
	Change (see page 4061)	This is Change, a member of class TDateTimePicker.
V	CheckEmptyDate (see page 4061)	Clears the check box associated with the calendar.
V	CreateParams (see page 4062)	Initializes a window-creation parameter data structure.
V	CreateWnd (see page 4062)	Creates the windows control for the calendar.
V	GetCalendarHandle (see page 4063)	Returns the calendar control's window handle.
V	MsgSetCalColors (see page 4063)	Sets the calendar's colors.
V	MsgSetDateTime (see page 4064)	Sets the calendar's date/time.
V	MsgSetRange (see page 4064)	Implements the MinDate and MaxDate properties.

27.1.25.3.1 TDateTimePicker.Change Method

Pascal

```
procedure Change; dynamic;
```

C++

```
__fastcall Change();
```

Description

This is Change, a member of class TDateTimePicker.

27.1.25.3.2 TDateTimePicker.CheckEmptyDate Method

Clears the check box associated with the calendar.

Pascal

```
procedure CheckEmptyDate; override;
```

C++

```
virtual __fastcall CheckEmptyDate();
```

Description

CheckEmptyDate is called automatically when DateTime is assigned a value that represents a time and not a date value (or Date is assigned a value of 0). As implemented in TCommonCalendar, CheckEmptyDate does nothing.

TDateTimePicker overrides CheckEmptyDate to clear the check box associated with the calendar, or raise an EDateTimeError if the ShowCheckbox property is false. This allows TDateTimePicker to represent time values that do not include a date portion. (When a TDateTime value represents a time and not a date, the date portion is 0).

See Also

Checked (see page 4073)

ShowCheckbox (see page 4091)

Date (see page 3576)

DateTime (see page 3577)

27.1.25.3.3 TDateTimePicker.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

27.1.25.3.4 TDateTimePicker.CreateWnd Method

Creates the windows control for the calendar.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the windowed control is first created or when the window must be destroyed and recreated to reflect property changes. Override CreateWnd to pass additional initialization messages to the window when it is first created.

CreateWnd calls the TWinControl CreateWnd method to generate the window, and then sends messages to initialize the control so that it reflects the current property settings.

See Also

CreateWnd (see page 6137)

27.1.25.3.5 TDateTimePicker.GetCalendarHandle Method

Returns the calendar control's window handle.

Pascal

```
function GetCalendarHandle: HWND; override;
```

C++

```
virtual __fastcall HWND GetCalendarHandle();
```

Description

GetCalendarHandle is the protected read implementation of the CalendarHandle property. For TCommonCalendar, this is an abstract method. It must be implemented in descendant classes.

See Also

CalendarHandle (see page 3576)

27.1.25.3.6 TDateTimePicker.MsgSetCalColors Method

Sets the calendar's colors.

Pascal

```
function MsgSetCalColors(ColorIndex: Integer; ColorValue: TColor): Boolean; override;
```

C++

```
virtual __fastcall Boolean MsgSetCalColors(int ColorIndex, TColor ColorValue);
```

Description

MsgSetCalColors implements the CalColors property by sending a message to the calendar window handle. MsgSetCalColors is an abstract method, and must be overridden in descendant objects to send the appropriate message.

The ColorIndex parameter indicates which of the TMonthCalColors properties is being set. It is one of the following values:

Value	Property
0	BackColor
1	TextColor
2	TitleBackColor
3	TitleTextColor
4	MonthBackColor
5	TrailingTextColor

The ColorValue parameter is the value that should be set.

MsgSetCalColors returns true if the color is set by the method.

See Also

CalColors (see page 3575)

CalendarHandle (see page 3576)

TextColor (see page 4395)

BackColor (see page 4395)

TitleBackColor (see page 4396)

TitleTextColor (see page 4396)

MonthBackColor (see page 4395)

TrailingTextColor (see page 4396)

27.1.25.3.7 TDateTimePicker.MsgSetDateTime Method

Sets the calendar's date/time.

Pascal

```
function MsgSetDateTime(Value: TSystemTime): Boolean; override;
```

C++

```
virtual __fastcall Boolean MsgSetDateTime(TSystemTime Value);
```

Description

MsgSetDateTime implements the DateTime property by sending a message to the calendar window handle. MsgSetDateTime is an abstract method, and must be overridden in descendant objects to send the appropriate message.

The Value parameter indicates the value of DateTime as a TSystemTime value. This can be obtained from the DateTime property value by calling DateTimeToSystemTime.

MsgSetDateTime returns true if the date/time value is set by the method.

See Also

DateTime (see page 3577)

CalendarHandle (see page 3576)

DateTimeToSystemTime (see page 22825)

SystemTimeToDateTime (see page 22974)

27.1.25.3.8 TDateTimePicker.MsgSetRange Method

Implements the MinDate and MaxDate properties.

Pascal

```
function MsgSetRange(Flags: Integer; SysTime: PSystemTime): Boolean; override;
```

C++

```
virtual __fastcall Boolean MsgSetRange(int Flags, PSystemTime SysTime);
```

Description

MsgSetRange implements the MinDate and MaxDate properties by sending a message to the calendar window handle. MsgSetRange is an abstract method, and must be overridden in descendant objects to send the appropriate message.

The Flags parameter indicates what type of information is included in the SysTime array. It includes the GDTR_MIN flag if a minimum date is supplied and GDTR_MAX if a maximum date is supplied.

The SysTime parameter is a two-element array containing the minimum date as the first element and the maximum date as the second element. These values can be obtained from the MinDate and MaxDate properties by calling DateTimeToSystemTime.

MsgSetRange returns true if the range is set by the method.

See Also

MinDate (see page 3579)

MaxDate (see page 3578)

CalendarHandle (see page 3576)

DateTimeToSystemTime (see page 22825)

SystemTimeToDateTime (see page 22974)

27.1.25.4 TDateTimePicker Properties

The properties of the TDateTimePicker class are listed here.

Public Properties

	Name	Description
	DateTime (see page 4076)	Indicates the date and time.
R	DroppedDown (see page 4079)	Specifies whether the date time picker control is dropped down.

Published Properties

	Name	Description
	Align (see page 4066)	Determines how the control aligns within its container (parent control).
	Anchors (see page 4069)	Specifies how the control is anchored to its parent.
	BevelEdges (see page 4070)	Specifies which edges of the control are beveled.
	BevelInner (see page 4070)	Specifies the cut of the inner bevel.
	BevelKind (see page 4071)	Specifies the control's bevel style.
	BevelOuter (see page 4071)	Specifies the cut of the outer bevel.
	BevelWidth (see page 4072)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 4072)	Specifies the bi-directional mode for the control.
	CalAlignment (see page 4073)	Determines the alignment of the drop-down calendar.
	CalColors (see page 4073)	Contains the colors used for each part of the calendar.
	Checked (see page 4073)	Indicates whether the check box next to the date or time is selected.
	Color (see page 4074)	Specifies the background color of the control.
	Constraints (see page 4074)	Specifies the size constraints for the control.
	Date (see page 4075)	Indicates the date that is marked on the calendar.
	DateFormat (see page 4076)	Specifies format in which the date is presented.
	DateMode (see page 4076)	Determines the method of date selection used by the component.
	DragCursor (see page 4077)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 4077)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 4077)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 4079)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 4080)	Controls the attributes of text written on or in the control.
	Format (see page 4081)	Specify format for date-time string.
	ImeMode (see page 4082)	Determines the behavior of the input method editor (IME).
	ImeName (see page 4082)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.

	Kind (see page 4083)	Determines whether the component is a date selector or a time selector.
	MaxDate (see page 4084)	Determines the latest allowable date that can be entered.
	MinDate (see page 4084)	Determines the earliest allowable date that can be entered.
	ParentBiDiMode (see page 4084)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 4085)	Determines where a control looks for its color information.
	ParentFont (see page 4085)	Determines where a control looks for its font information.
	ParentShowHint (see page 4086)	Determines where a control looks to find out if its Help Hint should be shown.
	ParseInput (see page 4086)	This is ParseInput, a member of class TDateTimePicker.
	PopupMenu (see page 4086)	Identifies the pop-up menu associated with the control.
	ShowCheckbox (see page 4091)	Displays a check box next to the date or time.
	ShowHint (see page 4091)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 4093)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 4093)	Determines if the user can tab to a control.
	Time (see page 4094)	Indicates the time entered by the user.
	Visible (see page 4094)	Determines whether the component appears onscreen.

27.1.25.4.1 TDateTimePicker.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
```

```
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
```

```
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

procedure TForm1.Button1Click(Sender: TObject);
var
  ProgressBar: TProgressBar;
begin
  ProgressBar := TProgressBar.Create(Self);
  with ProgressBar do

    begin
      Parent := Self;
      Align := alBottom;
    end;
  end;
  {
  This example dynamically creates a Page Control, then a
  series of Tab Sheets on the Page Control.
  }
  var
    PageControl1: TPageControl;
    pts: array[0..3] of TTabSheet;
  const
    TabTitles: array[0..3] of ShortString = ('Customer', 'Orders', 'Items', 'Parts' );

  procedure TForm1.FormCreate(Sender: TObject);
  const
    colorpalette: Array[0..11] of TColor = (
      clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia, clTeal,
      clNavy, clMaroon, clLime, clOlive, clPurple);
  var
    i: Integer;
  begin
    PageControl1 := TPageControl.Create(Self);
    PageControl1.Parent := Self;
    PageControl1.Align := alClient;
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i]:= TTabSheet.Create(PageControl1);
      with pts[i] do
      begin
        PageControl := PageControl1;
        Name := 'ts' + TabTitles[i];
        Caption := TabTitles[i];
        Brush.Color := colorPalette[i];
     end;
    end;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    i: Integer;
  begin
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i].Free;
    end;
    PageControl1.Free;
  end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

27.1.25.4.2 TDateTimePicker.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

27.1.25.4.3 TDateTimePicker.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges: TBevelEdges;
```

C++

```
__property TBevelEdges BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner (see page 6193)

BevelOuter (see page 6194)

BevelKind (see page 6193)

27.1.25.4.4 TDateTimePicker.BevelInner Property

Specifies the cut of the inner bevel.

Pascal

```
property BevelInner: TBevelCut;
```

C++

```
__property TBevelCut BevelInner;
```

Description

Use BevelInner to specify whether the inner bevel has a raised, lowered, or flat look.

The inner bevel appears immediately inside the outer bevel. If there is no outer bevel (BevelOuter is bvNone), the inner bevel appears immediately inside the border.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelKind (see page 6193)

BevelWidth (see page 6194)

BorderWidth (see page 6195)

27.1.25.4.5 TDateTimePicker.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind: TBevelKind;
```

C++

```
__property TBevelKind BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelInner (see page 6193)

BevelWidth (see page 6194)

27.1.25.4.6 TDateTimePicker.BevelOuter Property

Specifies the cut of the outer bevel.

Pascal

```
property BevelOuter: TBevelCut;
```

C++

```
__property TBevelCut BevelOuter;
```

Description

Use BevelInner to specify whether the outer bevel has a raised, lowered, or flat look.

The outer bevel appears immediately inside the border and outside the inner bevel.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelWidth (see page 6194)

27.1.25.4.7 TDateTimePicker.BevelWidth Property

Specifies the width of the inner and outer bevels.

Pascal

```
property BevelWidth: TBevelWidth;
```

C++

```
__property TBevelWidth BevelWidth;
```

Description

Use BevelWidth to specify the width, in pixels, of the inner and outer bevels.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelOuter (see page 6194)

27.1.25.4.8 TDateTimePicker.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

27.1.25.4.9 TDateTimePicker.CalAlignment Property

Determines the alignment of the drop-down calendar.

Pascal

```
property CalAlignment: TDTCalAlignment;
```

C++

```
__property TDTCalAlignment CalAlignment;
```

Description

Set CalAlignment to dtaLeft or dtaRight to align the drop-down calendar on the left or right side of the component. This property is applicable only if the Kind (see page 4083) property is dtkDate and the DateMode (see page 4076) property is dmComboBox.

See Also

DateMode (see page 4076)

Kind (see page 4083)

27.1.25.4.10 TDateTimePicker.CalColors Property

Contains the colors used for each part of the calendar.

Pascal

```
property CalColors: TMonthCalColors;
```

C++

```
__property TMonthCalColors CalColors;
```

Description

Use the CalColors property to get or set the calendar's background color, month background color, text color, title background color, title text color, and trailing text color.

See Also

BoldDays (see page 3570)

MsgSetCalColors (see page 3573)

27.1.25.4.11 TDateTimePicker.Checked Property

Indicates whether the check box next to the date or time is selected.

Pascal

```
property Checked: Boolean;
```

C++

```
__property Boolean Checked;
```

Description

Checked is true if the check box in the TDateTimePicker (see page 4049) component is selected. Setting Checked to true at design time makes the check box appear selected by default.

See Also

ShowCheckbox (see page 4091)

27.1.25.4.12 TDateTimePicker.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

27.1.25.4.13 TDateTimePicker.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

27.1.25.4.14 TDateTimePicker.Date Property

Indicates the date that is marked on the calendar.

Pascal

```
property Date: TDate;
```

C++

```
__property TDate Date;
```

Description

Use Date to get or set the date that is marked on the calendar. The value of Date must lie within the range specified by the MaxDate and MinDate properties.

If MultiSelect is true, the selected range of dates goes from Date to EndDate.

Note: You can also set the marked date with the DateTime property.

See Also

DateTime (see page 3577)

EndDate (see page 3577)

MaxDate (see page 3578)

MinDate (see page 3579)

MultiSelect (see page 3580)

27.1.25.4.15 TDateTimePicker.DateFormat Property

Specifies format in which the date is presented.

Pascal

```
property DateFormat: TDTDateFormat;
```

C++

```
__property TDTDateFormat DateFormat;
```

Description

If DateFormat is set to dfShort, the date is formatted using the short date format specified in the Windows control panel. By default, it appears like this: 3/21/97.

If DateFormat is set to dfLong, the date is formatted using the long date format specified in the Windows control panel. By default, it appears like this: Friday, March 21, 1997. (Applies only when Kind (see page 4083) is dtkDate.)

For custom date formats, set the Format (see page 4081) property.

See Also

Kind (see page 4083)

Format (see page 4081)

27.1.25.4.16 TDateTimePicker.DateMode Property

Determines the method of date selection used by the component.

Pascal

```
property DateMode: TDTDateMode;
```

C++

```
__property TDTDateMode DateMode;
```

Description

If DateMode is dmComboBox, the component has a drop-down calendar illustration from which the user can select a date. If DateMode is dmUpDown, the component has Up/Down arrows with which the user can adjust the date. (Applies only when Kind (see page 4083) is dtkDate.)

See Also

Kind (see page 4083)

27.1.25.4.17 TDateTimePicker.DateTime Property

Indicates the date and time.

Pascal

```
property DateTime: TDateTime;
```

C++

```
__property TDateTime DateTime;
```

Description

DateTime represents both a date and a time. If the Kind (see page 4083) property is switched at runtime, TDateTimePicker (

see page 4049) continues to track both the last date entered and the last time entered. If the Kind (see page 4083) property never changes, DateTime can be set programmatically (for example, by reading system date and time information) to indicate both a date and a time.

See Also

Kind (see page 4083)

Date (see page 3576)

Time (see page 4094)

27.1.25.4.18 TDateTimePicker.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

27.1.25.4.19 TDateTimePicker.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

27.1.25.4.20 TDateTimePicker.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
```

```
    begin
      if (htOnItem in HT) or (htOnIcon in HT) then
        AttachMode := naAddChild
      else if htNowhere in HT then AttachMode := naAdd
      else if htOnIndent in HT then AttachMode := naInsert;
      TreeView1.Selected.MoveTo(AnItem, AttachMode);
    end;
  end;

  procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TTreeView;
  end;
```

OnEndDrag (see page 5860)

OnStartDrag (see page 5871)

DragKind (see page 5819)

Arranging the Order of Persistent Columns

27.1.25.4.21 TDateTimePicker.DroppedDown Property

Specifies whether the date time picker control is dropped down.

Pascal

```
property DroppedDown: Boolean;
```

C++

```
__property Boolean DroppedDown;
```

Description

DroppedDown specifies whether the date time picker control is dropped down.

27.1.25.4.22 TDateTimePicker.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

27.1.25.4.23 TDateTimePicker.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
```

```
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

27.1.25.4.24 TDateTimePicker.Format Property

Specify format for date-time string.

Pascal

```
property Format: String;
```

C++

```
__property AnsiString Format;
```

Description

Format specifies custom format string for the date-time display, overriding the control panel strings. A custom format can include both date and time fields, but time fields are not editable unless the Kind (see page 4083) property is dtkTime. The following format characters are understood.

Element	Description
d	The one- or two-digit day.
dd	The two-digit day. Single-digit day values are preceded by a zero.
ddd	The three-character weekday abbreviation.
dddd	The full weekday name.
h	The one- or two-digit hour in 12-hour format.
hh	The two-digit hour in 12-hour format. Single-digit values are preceded by a zero.
H	The one- or two-digit hour in 24-hour format.
HH	The two-digit hour in 24-hour format. Single-digit values are preceded by a zero.
m	The one- or two-digit minute.
mm	The two-digit minute. Single-digit values are preceded by a zero.
M	The one- or two-digit month number.
MM	The two-digit month number. Single-digit values are preceded by a zero.
MMM	The three-character month abbreviation.
MMMM	The full month name.
t	The one-letter AM/PM abbreviation (that is, AM is displayed as "A").
tt	The two-letter AM/PM abbreviation (that is, AM is displayed as "AM").
yy	The last two digits of the year (that is, 2001 would be displayed as "01").
yyyy	The full year (that is, 2001 would be displayed as "2001").

To include literal strings in the format, enclose them in single quotes. Failing to quote literal strings can have unpredictable results, even if they do not include formatting codes. Use two single quotes to represent one single quote character in a literal string. For example,

'Today''s date:' MMM dd, yyyy

entered in the property editor, produces the following results for April 1, 2001:

"Today's date: Apr 01, 2001"

Note: When setting Format programmatically in Delphi code, double each single quote again:

```
DateTimePicker1.Format := '''Today''''s date:'' MMM dd, yyyy';
```

See Also

DateFormat (see page 4076)

DateMode (see page 4076)

27.1.25.4.25 TDateTimePicker.ImeMode Property

Determines the behavior of the input method editor (IME).

Pascal

```
property ImeMode: TImeMode;
```

C++

```
__property TImeMode ImeMode;
```

Description

Set ImeMode to configure the way an IME processes user keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeMode allows a control to influence the type of conversion performed by the IME so that it is appropriate for the input expected by the control. For example, a control that only accepts numeric input might specify an ImeMode of imClose, as no conversion is necessary for numeric input.

Note: The value of ImeMode only takes effect when the control receives focus. To change the value of ImeMode when the control already has input focus, call the SetIme method.

See Also

ImeName (see page 6208)

ResetIme (see page 6174)

ResetImeComposition (see page 6175)

SetIme (see page 6181)

SetImeCompositionWindow (see page 6181)

27.1.25.4.26 TDateTimePicker.ImeName Property

Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.

Pascal

```
property ImeName: TImeName;
```

C++

```
__property TImeName ImeName;
```

Description

Set ImeName to specify which IME to use for converting keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeName must specify one of the IMEs that has been installed through the Windows control panel. The property inspector provides a drop-down list of all currently installed IMEs on the system. At runtime, applications can obtain a list of currently installed IMEs from the global Screen variable.

If ImeName specifies an unavailable IME, the IME that was active when the application started is used instead. No exception is generated.

Note: The value of ImeName only takes effect when the control receives focus. To change the value of ImeName after the control has input focus, call the SetIme method.

See Also

ImeMode (see page 6207)

ResetIme (see page 6174)

SetIme (see page 6181)

DefaultIme (see page 14216)

Imes (see page 14227)

27.1.25.4.27 TDateTimePicker.Kind Property

Determines whether the component is a date selector or a time selector.

Pascal

```
property Kind: TDateTimeKind;
```

C++

```
__property TDateTimeKind Kind;
```

Description

If the Kind property is dtkDate, the control is configured to support date editing. The default format gives only the date portion of the control value, and a drop-down calendar is available if the DateMode (see page 4076) property is dmComboxBox.

If the Kind property is dtkTime, the control is configured to support time editing. The default format give only the time portion of the control value, but the date portion can also be edited if the Format (see page 4081) property includes date field codes..

See Also

DateFormat (see page 4076)

DateMode (see page 4076)

Format (see page 4081)

27.1.25.4.28 TDateTimePicker.MaxDate Property

Determines the latest allowable date that can be entered.

Pascal

```
property MaxDate: TDate;
```

C++

```
__property TDate MaxDate;
```

Description

Assign a value to MaxDate to limit the range of dates that the user can enter. Out-of-range dates raise the EDateTimeError (see page 3421) exception. (Applies only when Kind (see page 4083) = dtkDate.)

See Also

EDateTimeError (see page 3421)

Kind (see page 4083)

MinDate (see page 4084)

27.1.25.4.29 TDateTimePicker.MinDate Property

Determines the earliest allowable date that can be entered.

Pascal

```
property MinDate: TDate;
```

C++

```
__property TDate MinDate;
```

Description

Assign a value to MinDate to limit the range of dates that the user can enter. Out-of-range dates raise the EDateTimeError (see page 3421) exception. (Applies only when Kind (see page 4083) = dtkDate.)

See Also

EDateTimeError (see page 3421)

Kind (see page 4083)

MaxDate (see page 4084)

27.1.25.4.30 TDateTimePicker.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

27.1.25.4.31 TDateTimePicker.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

27.1.25.4.32 TDateTimePicker.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

27.1.25.4.33 TDateTimePicker.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

27.1.25.4.34 TDateTimePicker.ParseInput Property

Pascal

```
property ParseInput: Boolean;
```

C++

```
__property Boolean ParseInput;
```

Description

This is ParseInput, a member of class TDateTimePicker.

27.1.25.4.35 TDateTimePicker.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
```

```
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
```

```
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
```

```
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

type
  TForm1 = class(TForm)
    AddButton: TButton;

27.1.25.4.36 TDateTimePicker.ShowCheckbox Property

Displays a check box next to the date or time.

Pascal

```
property ShowCheckbox: Boolean;
```

C++

```
__property Boolean ShowCheckbox;
```

Description

Set ShowCheckbox to true to display a check box in the TDateTimePicker (see page 4049) component.

See Also

Checked (see page 4073)

27.1.25.4.37 TDateTimePicker.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
```

```
      Hint := 'Select an item';
      ShowHint := True;
    end;
    Application.ShowHint := True;
  end;
  {
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  }
```

Displaying Fly-over Help

27.1.25.4.38 TDateTimePicker.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

27.1.25.4.39 TDateTimePicker.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

27.1.25.4.40 TDateTimePicker.Time Property

Indicates the time entered by the user.

Pascal

```
property Time: TTime;
```

C++

```
__property TTime Time;
```

Description

Time represents the time entered by the user. Set Time in program code or in the Object Inspector to determine which time is selected by default. (Applies only when Kind (see page 4083) = dtkTime.)

See Also

Date (see page 3576)

Kind (see page 4083)

DateTime (see page 4076)

27.1.25.4.41 TDateTimePicker.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
```

```
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
```

```
end;
```

27.1.25.5 TDateTimePicker Events

The events of the TDateTimePicker class are listed here.

Published Events

	Name	Description
	OnChange (see page 4096)	Occurs when a date or time is entered.
	OnClick (see page 4097)	Occurs when the user clicks the control.
	OnCloseUp (see page 4099)	Occurs when the drop-down calendar closes.
	OnContextPopup (see page 4099)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 4100)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 4100)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 4102)	Occurs when the user drags an object over a control.
	OnDropDown (see page 4105)	Occurs when the user opens the drop-down calendar by clicking the arrow at the right of the control.
	OnEndDock (see page 4105)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 4105)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 4106)	Occurs when a control receives the input focus.
	OnExit (see page 4109)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 4110)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 4113)	Occurs when a key is pressed.
	OnKeyUp (see page 4114)	Occurs when the user releases a key that has been pressed.
	OnMouseEnter (see page 4116)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 4116)	Occurs when the user moves the mouse outside of a control.
	OnStartDock (see page 4116)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 4117)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUserInput (see page 4118)	Occurs when the user types directly into the component's edit box.

27.1.25.5.1 TDateTimePicker.OnChange Event

Occurs when a date or time is entered.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action whenever the date or time entered in the component changes.

See Also

Time (see page 4094)

DateTime (see page 3577)

Date (see page 3576)

27.1.25.5.2 TDateTimePicker.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

27.1.25.5.3 TDateTimePicker.OnCloseUp Event

Occurs when the drop-down calendar closes.

Pascal

```
property OnCloseUp: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCloseUp;
```

Description

Write an OnCloseUp event handler to implement special processing that needs to occur only when the drop-down calendar closes.

See Also

Kind (see page 4083)

DateMode (see page 4076)

OnDropDown (see page 4105)

27.1.25.5.4 TDateTimePicker.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

TPopupMenu (see page 16169)

PopupMenu (see page 5835)

AutoPopup (see page 16178)

27.1.25.5.5 TDateTimePicker.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

27.1.25.5.6 TDateTimePicker.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
```

```
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
```

```
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

OnEndDrag (see page 5860)

OnStartDrag (see page 5871)

TDragObject (see page 6031)

27.1.25.5.7 TDateTimePicker.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
```

```
    Accept := False;
    if (Source is TLabel) and (State = dsDragEnter) then
      (Source as TLabel).EndDrag(False);
  end;
  {
  This code comes from an application that contains a list box
  and three labels, each with a different font and color.  The
  DragMode property for each of the labels is dmAutomatic.
  The user can select a label and drag it to a list box and
  drop it. When the label is dropped, the items in the list
  box assume the color and font of the dropped label.
  }

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ListBox1.Items.Add('Not');
    ListBox1.Items.Add('In');
    ListBox1.Items.Add('Alphabetical');
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

27.1.25.5.8 TDateTimePicker.OnDropDown Event

Occurs when the user opens the drop-down calendar by clicking the arrow at the right of the control.

Pascal

```
property OnDropDown: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDropDown;
```

Description

Write an OnDropDown event handler to implement special processing that needs to occur only when the drop-down calendar is opened.

See Also

Kind (see page 4083)

DateMode (see page 4076)

OnCloseUp (see page 4099)

27.1.25.5.9 TDateTimePicker.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

27.1.25.5.10 TDateTimePicker.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

27.1.25.5.11 TDateTimePicker.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
```

```
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
```

```
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

27.1.25.5.12 TDateTimePicker.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
```

```
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

27.1.25.5.13 TDateTimePicker.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can

respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
```

```
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
    else
      ComboBox1.Text := 'KeyUp';
    WriteLn(ComboBox1.Text);
  end;
end;
{
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
}

uses Printers;

procedure TForm1.Button1Click(Sender: TObject);
var
  I, X, Y: Integer;
  Memo1 : TMemo;
  r: TRect;

27.1.25.5.14 TDateTimePicker.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the

OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

27.1.25.5.15 TDateTimePicker.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
```

```
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)

      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
```

```
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
    else
      ComboBox1.Text := 'KeyUp';
    WriteLn(ComboBox1.Text);
  end;
end;
```

OnKeyDown (see page 6225)

OnKeyPress (see page 6227)

27.1.25.5.16 TDateTimePicker.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

27.1.25.5.17 TDateTimePicker.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

27.1.25.5.18 TDateTimePicker.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

OnEndDock (see page 5859)

TDragDockObjectEx (see page 6018)

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

27.1.25.5.19 TDateTimePicker.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

27.1.25.5.20 TDateTimePicker.OnUserInput Event

Occurs when the user types directly into the component's edit box.

Pascal

```
property OnUserInput: TDTParseInputEvent;
```

C++

```
__property TDTParseInputEvent OnUserInput;
```

Description

This event occurs only if ParseInput (see page 4086) is set to true. Write an OnUserInput event handler implement special processing that needs to occur when the user types directly into the TDateTimePicker (see page 4049) (rather than selecting with the drop-down calendar or scroll arrows). UserString is the string that the user types, and DateAndTime represents the value of the Date (see page 4075) or Time (see page 4094) property.

See Also

Date (see page 3576)

ParseInput (see page 4086)

Time (see page 4094)

27.1.26 THeaderControl Class

THeaderControl is a container for THeaderSection (see page 4173) objects. It provides a set of resizable column headers.

Class Hierarchy

Pascal

```
THeaderControl = class(TCustomHeaderControl);
```

C++

```
class THeaderControl : public TCustomHeaderControl;
```

File

ComCtrls

Description

A THeaderControl is a set of column headers that the user can resize at runtime. Each header is represented by a THeaderSection (see page 4173) object listed in the Sections (see page 4147) property.

The header sections can be positioned above columns or fields of information. For example, header sections could be placed over a list box (TListBox). Because THeaderControl provides a generic header element that can be paired with virtually any other visual component, runtime manipulation of the header sections is not automatically extended to the components beneath it. If, for example, you want the column beneath a header section to be resized whenever the header section is resized, you will have to write a custom OnSectionResize (see page 4171) event handler to accomplish this.

See Also

THeaderSection (see page 4173)

THeaderSections (see page 4185)

TListBox (see page 21598)

Grouping Controls

Header Controls

27.1.26.1 THeaderControl Members

The following tables list the members exposed by THeaderControl.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.

	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 3715)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateSection (see page 3715)	This is CreateSection, a member of class TCustomHeaderControl.
V	CreateSections (see page 3715)	This is CreateSections, a member of class TCustomHeaderControl.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 3716)	Creates the underlying window.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.

	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 3716)	Destroys the control's window.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawSection (see page 3716)	This is DrawSection, a member of class TCustomHeaderControl.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.

	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 3717)	Responds to notifications that components are being created or destroyed.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.

	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SectionClick (see page 3717)	This is SectionClick, a member of class TCustomHeaderControl.
	SectionDrag (see page 3717)	This is SectionDrag, a member of class TCustomHeaderControl.
	SectionEndDrag (see page 3718)	This is SectionEndDrag, a member of class TCustomHeaderControl.
	SectionResize (see page 3718)	This is SectionResize, a member of class TCustomHeaderControl.
	SectionTrack (see page 3718)	This is SectionTrack, a member of class TCustomHeaderControl.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetImages (see page 3718)	This is SetImages, a member of class TCustomHeaderControl.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.

	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 3719)	Provides specific message responses for the control.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 3714)	Instantiate a TCustomHeaderControl (see page 3702) object.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 3714)	Destroy.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.

	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
V	FlipChildren (see page 3717)	Reverses the order in which sections are displayed.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.

	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 3728)	Provides runtime access to the header control's drawing surface.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.

R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnContextPopup (see page 4152)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnCreateSectionClass (see page 4153)	Runtime specification of section object class.
	OnDragDrop (see page 4153)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 4155)	Occurs when the user drags an object over a control.
	OnDrawSection (see page 4158)	Occurs when a header section needs to be redrawn.
	OnEndDock (see page 4159)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 4160)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

	OnMouseActivate (see page 4161)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 4162)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 4164)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 4164)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 4164)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 4167)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnResize (see page 4169)	Occurs immediately after the control is resized.
	OnSectionClick (see page 4170)	Occurs when one of the header control's sections is clicked.
	OnSectionDrag (see page 4170)	Occurs when the user drags a header section to a new position.
	OnSectionEndDrag (see page 4170)	Occurs after the header control rearranges its sections in response to a drag operation.
	OnSectionResize (see page 4171)	Occurs when one of the header control's sections is resized.
	OnSectionTrack (see page 4171)	Occurs as one of the header control's sections is being resized.
	OnStartDock (see page 4172)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 4172)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 4130)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 4134)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 4134)	Specifies the bi-directional mode for the control.
	BorderWidth (see page 4135)	Specifies the width of the control's border.
	Constraints (see page 4135)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 4136)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 4136)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 4137)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DragReorder (see page 4138)	Make header reorderable.
	Enabled (see page 4138)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 4139)	Controls the attributes of text written on or in the control.
	FullDrag (see page 4140)	Specifies whether headers are repainted when they are dragged.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	HotTrack (see page 4140)	Highlights the header sections as the mouse passes over them.
	Images (see page 4141)	Specifies header images
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 4141)	Specifies whether the control uses its parent's BiDiMode.
	ParentFont (see page 4141)	Determines where a control looks for its font information.
	ParentShowHint (see page 4142)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 4142)	Identifies the pop-up menu associated with the control.
	Sections (see page 4147)	Lists the header sections (column headings).

	ShowHint (see page 4148)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Style (see page 4150)	Specifies the header control's style.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 4150)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

27.1.26.2 THeaderControl Properties

The properties of the THeaderControl class are listed here.

Published Properties

	Name	Description
	Align (see page 4130)	Determines how the control aligns within its container (parent control).
	Anchors (see page 4134)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 4134)	Specifies the bi-directional mode for the control.
	BorderWidth (see page 4135)	Specifies the width of the control's border.
	Constraints (see page 4135)	Specifies the size constraints for the control.
	DragCursor (see page 4136)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 4136)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 4137)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DragReorder (see page 4138)	Make header reorderable.
	Enabled (see page 4138)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 4139)	Controls the attributes of text written on or in the control.
	FullDrag (see page 4140)	Specifies whether headers are repainted when they are dragged.
	HotTrack (see page 4140)	Highlights the header sections as the mouse passes over them.
	Images (see page 4141)	Specifies header images
	ParentBiDiMode (see page 4141)	Specifies whether the control uses its parent's BiDiMode.
	ParentFont (see page 4141)	Determines where a control looks for its font information.
	ParentShowHint (see page 4142)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 4142)	Identifies the pop-up menu associated with the control.
	Sections (see page 4147)	Lists the header sections (column headings).
	ShowHint (see page 4148)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Style (see page 4150)	Specifies the header control's style.
	Visible (see page 4150)	Determines whether the component appears onscreen.

27.1.26.2.1 THeaderControl.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>
```

```
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];

    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
```

```
  { now add the splitter to divide the directory pane from the file pane }
    Split := TSplitter.Create(Form1);
    Split.Parent := Form1;
    { make sure the splitter is to the right of the directory list box! }
    Split.Left := Dirs.Left + Dirs.Width + 1;
    Split.Align := Dirs.Align; { give it the same alignment as the directory }
    { each pane must be at least one quarter of the form's width }
    Split.MinSize := Form1.ClientWidth div 4;
    { Finally, create the last pane – a file list box }
    Files := TFileListBox.Create(Form1);
    Files.Parent := Form1;
    Files.Align := alClient;
    Dirs.FileList := Files; { link the file list box to the directory list box }
  end;
  {
  Dynamically create a TProgressBar control and align it to
  the bottom of the form.
  }

  var

  for i := Low(TabTitles) to High(TabTitles) do
  begin
    pts[i].Free;
  end;
  PageControl1.Free;
end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

27.1.26.2.2 THeaderControl.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

27.1.26.2.3 THeaderControl.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

27.1.26.2.4 THeaderControl.BorderWidth Property

Specifies the width of the control's border.

Pascal

```
property BorderWidth: TBorderWidth;
```

C++

```
__property TBorderWidth BorderWidth;
```

Description

Use BorderWidth to get or set the width of the control's border. Graphics or text drawn by the control is clipped to the area within the border.

See Also

ClientRect

BevelOuter (see page 6194)

27.1.26.2.5 THeaderControl.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

27.1.26.2.6 THeaderControl.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

27.1.26.2.7 THeaderControl.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

27.1.26.2.8 THeaderControl.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
```

```
    HT: THitTests;
  begin
    if TreeView1.Selected = nil then Exit;
    HT := TreeView1.GetHitTestInfoAt(X, Y);
    AnItem := TreeView1.GetNodeAt(X, Y);
    if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
    begin
      if (htOnItem in HT) or (htOnIcon in HT) then
        AttachMode := naAddChild
      else if htNowhere in HT then AttachMode := naAdd
      else if htOnIndent in HT then AttachMode := naInsert;
      TreeView1.Selected.MoveTo(AnItem, AttachMode);
    end;
  end;

  procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TTreeView;
  end;
```

Arranging the Order of Persistent Columns

27.1.26.2.9 THeaderControl.DragReorder Property

Make header reorderable.

Pascal

```
property DragReorder: Boolean;
```

C++

```
__property Boolean DragReorder;
```

Description

If DragReorder is true (default is false), the user can rearrange headers by dragging them.

See Also

OnSectionDrag (see page 3737)

OnSectionEndDrag (see page 3738)

27.1.26.2.10 THeaderControl.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

Enabling Mouse

27.1.26.2.11 THeaderControl.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
```

```
  is loaded into the combo box. When the combo box is clicked,
  the memo or Rich Edit control font is set to the
  corresponding font name in the combo box.
  }
  procedure TForm1.FormCreate(Sender: TObject);
  var
    i : Integer;
  begin
    for i := 0 to Screen.Fonts.Count - 1 do
     ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
  //  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
    RichEdit1.Lines.Text := 'How is it to be you?';
  end;

  procedure TForm1.ComboBox1Click(Sender: TObject);
  begin
    RichEdit1.Font.Name := ComboBox1.Text;
  end;
```

Displaying and Editing Text in a Memo Control

27.1.26.2.12 THeaderControl.FullDrag Property

Specifies whether headers are repainted when they are dragged.

Pascal

```
property FullDrag: Boolean;
```

C++

```
__property Boolean FullDrag;
```

Description

Use FullDrag to specify whether headers are repainted while they are dragged.

See Also

OnSectionDrag (see page 3737)

27.1.26.2.13 THeaderControl.HotTrack Property

Highlights the header sections as the mouse passes over them.

Pascal

```
property HotTrack: Boolean;
```

C++

```
__property Boolean HotTrack;
```

Description

If HotTrack is set to true, the text on each header section appears highlighted when the mouse passes over it at runtime.

See Also

Text (see page 4183)

27.1.26.2.14 THeaderControl.Images Property

Specifies header images

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Images contains a list of images that can be used as icons. Each section's ImageIndex property determines the specific image displayed on it. If Images is unassigned, items are displayed as captions with no icons.

See Also

ImageIndex

27.1.26.2.15 THeaderControl.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

27.1.26.2.16 THeaderControl.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform

appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

27.1.26.2.17 THeaderControl.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

27.1.26.2.18 THeaderControl.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse

button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
```

```
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
```

```
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
```

```
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  }

  type
    TForm1 = class(TForm)

      { Private declarations }
    public
      procedure PopupMenuItemsClick(Sender: TObject);

    end;

  var
    Form1: TForm1;

  implementation

  {$R *.dfm}

  procedure TForm1.AddButtonClick(Sender: TObject);
  var
    index: Integer;
    NewItem: TMenuItem;
  begin
    for index := 0 to 3 do
    begin
      NewItem :=
        TMenuItem.Create(PopupMenu1); // create the new item
      PopupMenu1.Items.Add(NewItem);// add it to the Popupmenu
      NewItem.Caption := 'Menu Item ' + IntToStr(index);
      NewItem.Tag := index;
      NewItem.OnClick :=
        PopupMenuItemsClick; // assign it an event handler
    end;
  end;

  procedure TForm1.PopupMenuItemsClick(Sender: TObject);
  begin
    with Sender as TMenuItem do
    begin
      case Tag of
        0:  ShowMessage('first item clicked');
        1:  ShowMessage('second item clicked');
        2:  ShowMessage('third item clicked');
        3:  ShowMessage('fourth item clicked');
      end;
    end;
  end;

  {
  To edit or destroy an item, grab its pointer via the Items
  property.
  }
```

```
procedure TForm1.EditButtonClick(Sender: TObject);
var
  ItemToEdit: TMenuItem;
begin
  ItemToEdit := PopupMenu.Items[1];
  ItemToEdit.Caption := 'Changed Caption';
end;

procedure TForm1.DestroyButtonClick(Sender: TObject);
var
  ItemToDelete: TMenuItem;
begin
  ItemToDelete := PopupMenu.Items[2];
  ItemToDelete.Free;
end;

27.1.26.2.19 THeaderControl.Sections Property

Lists the header sections (column headings).

Pascal

```
property Sections: THeaderSections;
```

C++

```
__property THeaderSections Sections;
```

Description

The Sections property holds a THeaderSections (see page 4185)—that is, a collection of THeaderSection (see page 4173) objects. At design time, header sections can be added, removed, or modified with the Sections editor. To open the Sections editor, select the Sections property in the Object Inspector, then double-click in the Value column to the right or click the ellipsis (...) button.

C++ Examples:

```
/*
Add a THeaderControl to the form and call
HeaderControl1DrawSection for the OnDrawSection event.
*/
void __fastcall TForm1::HeaderControl1DrawSection(THeaderControl *HeaderControl,
      THeaderSection *Section, const TRect &Rect, bool Pressed)
{
  if (Pressed)
    HeaderControl->Canvas->Font->Color = clRed;
  else
    HeaderControl->Canvas->Font->Color = clBlue;
  HeaderControl->Canvas->TextOut(Rect.Left + HeaderControl->Canvas->Font->Size, Rect.Top + 2,
"Custom " + IntToStr(Section->Index));
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  THeaderSection *Section;
  for (int i = 0; i <= 4; i++)
  {
    Section = HeaderControl1->Sections->Add();
```

```
      Section->Text = "Section " + IntToStr(i);
      Section->MinWidth =
        (Section->Text).Length() *
        HeaderControl1->Font->Size;
      // Owner draw every other section
      if (i % 2 == 0)
        Section->Style = hsOwnerDraw;
      else
        Section->Style = hsText;
    }
  }
```

Delphi Examples:

```
{
Add a THeaderControl to the form and call
HeaderControl1DrawSection for the OnDrawSection event.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  HeaderSection: THeaderSection;
  I: Integer;
begin
  for I := 0 to 4 do
  begin
    HeaderSection := HeaderControl1.Sections.Add;
    HeaderSection.Text := 'Text Section ' + IntToStr(I);
    HeaderSection.MinWidth := length(HeaderSection.Text) * Font.Size;
    // Owner draw every other section
    if (I mod 2 = 0) then
      HeaderSection.Style := hsOwnerDraw
    else
      HeaderSection.Style := hsText;
  end;
end;

procedure TForm1.HeaderControl1DrawSection(HeaderControl: THeaderControl;
  Section: THeaderSection; const Rect: TRect; Pressed: Boolean);
begin
  with HeaderControl.Canvas do
  begin
    // highlight pressed sections
    if Pressed then
      Font.Color := clRed
    else
      Font.Color := clBlue;
    TextOut(Rect.Left + Font.Size, Rect.Top + 2, 'Owner Drawn text');
  end;
end;
```

27.1.26.2.20 THeaderControl.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
```

```
      Hint := 'Select an item';
      ShowHint := True;
    end;
    Application.ShowHint := True;
  end;
  {
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  }
```

27.1.26.2.21 THeaderControl.Style Property

Specifies the header control's style.

Pascal

```
property Style: THeaderStyle;
```

C++

```
__property THeaderStyle Style;
```

Description

Use Style to determine the appearance of the header sections.

27.1.26.2.22 THeaderControl.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
```

```
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

27.1.26.3 THeaderControl Events

The events of the THeaderControl class are listed here.

Published Events

	Name	Description
	OnContextPopup (see page 4152)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnCreateSectionClass (see page 4153)	Runtime specification of section object class.
	OnDragDrop (see page 4153)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 4155)	Occurs when the user drags an object over a control.
	OnDrawSection (see page 4158)	Occurs when a header section needs to be redrawn.
	OnEndDock (see page 4159)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 4160)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 4161)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 4162)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 4164)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 4164)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 4164)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 4167)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnResize (see page 4169)	Occurs immediately after the control is resized.
	OnSectionClick (see page 4170)	Occurs when one of the header control's sections is clicked.
	OnSectionDrag (see page 4170)	Occurs when the user drags a header section to a new position.
	OnSectionEndDrag (see page 4170)	Occurs after the header control rearranges its sections in response to a drag operation.
	OnSectionResize (see page 4171)	Occurs when one of the header control's sections is resized.
	OnSectionTrack (see page 4171)	Occurs as one of the header control's sections is being resized.
	OnStartDock (see page 4172)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 4172)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

27.1.26.3.1 THeaderControl.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to

override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

TPopupMenu (see page 16169)

PopupMenu (see page 5835)

AutoPopup (see page 16178)

27.1.26.3.2 THeaderControl.OnCreateSectionClass Event

Runtime specification of section object class.

Pascal

```
property OnCreateSectionClass: TCustomHCCreateSectionClassEvent;
```

C++

```
__property TCustomHCCreateSectionClassEvent OnCreateSectionClass;
```

Description

The OnCreateSectionClass event occurs when a new header section object is about to be created. If the event handler exists, it is called with SectionClass set to THeaderSection. The event handler can modify this value to any descendant of THeaderSection, which will then be used to create the header section object.

27.1.26.3.3 THeaderControl.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
```

```
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
```

```
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;

27.1.26.3.4 THeaderControl.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
```

```
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin

27.1.26.3.5 THeaderControl.OnDrawSection Event

Occurs when a header section needs to be redrawn.

Pascal

```
property OnDrawSection: TDrawSectionEvent;
```

C++

```
__property TDrawSectionEvent OnDrawSection;
```

Description

The OnDrawSection event occurs when a header section needs to be redisplayed—for example, when the user selects or resizes a section. OnDrawSection occurs only if the header section's Style (see page 4150) property is set to hsOwnerDraw.

C++ Examples:

```
/*
Add a THeaderControl to the form and call
HeaderControl1DrawSection for the OnDrawSection event.
*/
void __fastcall TForm1::HeaderControl1DrawSection(THeaderControl *HeaderControl,
      THeaderSection *Section, const TRect &Rect, bool Pressed)
{
  if (Pressed)
    HeaderControl->Canvas->Font->Color = clRed;
  else
    HeaderControl->Canvas->Font->Color = clBlue;
  HeaderControl->Canvas->TextOut(Rect.Left + HeaderControl->Canvas->Font->Size, Rect.Top + 2,
"Custom " + IntToStr(Section->Index));
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  THeaderSection *Section;
  for (int i = 0; i <= 4; i++)
  {
    Section = HeaderControl1->Sections->Add();
    Section->Text = "Section " + IntToStr(i);
    Section->MinWidth =
      (Section->Text).Length() *
      HeaderControl1->Font->Size;
    // Owner draw every other section
    if (i % 2 == 0)
```

```
      Section->Style = hsOwnerDraw;
    else
      Section->Style = hsText;
  }
}
```

Delphi Examples:

```
{
Add a THeaderControl to the form and call
HeaderControl1DrawSection for the OnDrawSection event.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  HeaderSection: THeaderSection;
  I: Integer;
begin
  for I := 0 to 4 do
  begin
    HeaderSection := HeaderControl1.Sections.Add;
    HeaderSection.Text := 'Text Section ' + IntToStr(I);
    HeaderSection.MinWidth := length(HeaderSection.Text) * Font.Size;
    // Owner draw every other section
    if (I mod 2 = 0) then
      HeaderSection.Style := hsOwnerDraw
    else
      HeaderSection.Style := hsText;
  end;
end;

procedure TForm1.HeaderControl1DrawSection(HeaderControl: THeaderControl;
  Section: THeaderSection; const Rect: TRect; Pressed: Boolean);
begin
  with HeaderControl.Canvas do
  begin
    // highlight pressed sections
    if Pressed then
      Font.Color := clRed
    else
      Font.Color := clBlue;
    TextOut(Rect.Left + Font.Size, Rect.Top + 2, 'Owner Drawn text');
  end;
end;
```

Style (see page 4181)

27.1.26.3.6 THeaderControl.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

OnStartDock (see page 5871)

27.1.26.3.7 THeaderControl.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

27.1.26.3.8 THeaderControl.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

OnMouseMove (see page 5865)

OnMouseUp (see page 5867)

MouseCapture (see page 5831)

27.1.26.3.9 THeaderControl.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
```

```
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
      end;
    if X > StartX then
```

```
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end

27.1.26.3.10 THeaderControl.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

27.1.26.3.11 THeaderControl.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

27.1.26.3.12 THeaderControl.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.

      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
      end;
  end;
end;
```

See Also

OnMouseDown (see page 5862)

OnMouseUp (see page 5867)

MouseCapture (see page 5831)

27.1.26.3.13 THeaderControl.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
```

```
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
```

```
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

Responding to a Mouse-up Action

27.1.26.3.14 THeaderControl.OnResize Event

Occurs immediately after the control is resized.

Pascal

```
property OnResize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnResize;
```

Description

Use OnResize to make any final adjustments after a control is resized.

To modify the way a control responds when an attempt is made to resize it, use OnCanResize or OnConstrainedResize.

Note: Some controls call this event handler when the control is first created.

Delphi Examples:

```
{
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
}
procedure TForm1.FormResize(Sender: TObject);
begin
  Button1.Left := Form1.ClientWidth-Button1.Width;
end;
```

See Also

OnCanResize (see page 5851)

SetBounds (see page 5783)

AutoSize (see page 5803)

OnConstrainedResize (see page 5853)

27.1.26.3.15 THeaderControl.OnSectionClick Event

Occurs when one of the header control's sections is clicked.

Pascal

```
property OnSectionClick: TSectionNotifyEvent;
```

C++

```
__property TSectionNotifyEvent OnSectionClick;
```

Description

The OnSectionClick event occurs when a header section is clicked at runtime. To disable a section from being clicked set its AllowClick property to false.

See Also

AllowClick (see page 4178)

27.1.26.3.16 THeaderControl.OnSectionDrag Event

Occurs when the user drags a header section to a new position.

Pascal

```
property OnSectionDrag: TSectionDragEvent;
```

C++

```
__property TSectionDragEvent OnSectionDrag;
```

Description

Write an OnSectionDrag event handler to respond when a user tries to reorder the sections in the header control. The OnSectionDrag event handler can conditionally prevent the user from dragging a header to a new position.

If the AllowDrag parameter is true on exit from the event handler, the header control reorders the sections and generates an OnSectionEndDrag (see page 4170) event when the reorder is complete.

OnSectionDrag only occurs if the DragReorder (see page 4138) property is true.

See Also

DragReorder (see page 3733)

Sections (see page 4147)

OnSectionEndDrag (see page 4170)

27.1.26.3.17 THeaderControl.OnSectionEndDrag Event

Occurs after the header control rearranges its sections in response to a drag operation.

Pascal

```
property OnSectionEndDrag: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSectionEndDrag;
```

Description

Write an OnSectionEndDrag event handler to respond after a user reorders the sections in the header control.

OnSectionEndDrag only occurs if the DragReorder (see page 4138) property is true.

See Also

DragReorder (see page 3733)

Sections (see page 4147)

OnSectionDrag (see page 4170)

27.1.26.3.18 THeaderControl.OnSectionResize Event

Occurs when one of the header control's sections is resized.

Pascal

```
property OnSectionResize: TSectionNotifyEvent;
```

C++

```
__property TSectionNotifyEvent OnSectionResize;
```

Description

The OnSectionResize event occurs when a header section is resized at runtime. This happens when the user positions the mouse pointer between two sections and drags their border to the right or left.

See Also

OnSectionTrack (see page 4171)

27.1.26.3.19 THeaderControl.OnSectionTrack Event

Occurs as one of the header control's sections is being resized.

Pascal

```
property OnSectionTrack: TSectionTrackEvent;
```

C++

```
__property TSectionTrackEvent OnSectionTrack;
```

Description

The OnSectionTrack event tracks the dragging of a header section's border as it happens. OnSectionTrack occurs when the mouse pointer is positioned between two header sections and the left mouse button is depressed.

OnSectionTrack is of type TSectionTrackEvent (see page 5506), whose Width and State parameters indicate the size of the header section (in pixels) and the status of the event. The State property can take three values:

Value	Meaning
tsTrackBegin	The border has not yet been dragged.
tsTrackMove	The border is being dragged.
tsTrackEnd	The border is no longer being dragged.

Use OnSectionTrack when you want something to happen at runtime as a header section is being resized.

See Also

OnSectionResize (see page 4171)

27.1.26.3.20 THeaderControl.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

See Also

OnEndDock (see page 5859)

TDragDockObjectEx (see page 6018)

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

27.1.26.3.21 THeaderControl.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

27.1.27 THeaderSection Class

THeaderSection represents a section of a header control.

Class Hierarchy

Pascal

```
THeaderSection = class(TCollectionItem);
```

C++

```
class THeaderSection : public TCollectionItem;
```

File

ComCtrls

Description

THeaderControl (see page 4118) objects use THeaderSection objects to maintain collections of THeaderSection objects. These THeaderSection objects represent resizable column headers. Each column header includes a text label and possibly a graphic image.

See Also

TCollection (see page 2731)

TCollectionItem (see page 2755)

THeaderSections (see page 4185)

THeaderControl (see page 4118)

27.1.27.1 THeaderSection Members

The following tables list the members exposed by THeaderSection.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 4176)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 4176)	Copies the contents of the source header section to a new header section.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 4175)	Creates and initializes a header section.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentBiDiModeChanged (see page 4176)	Synchronizes the header section's BiDiMode (see page 4179) with the associated header control's BiDiMode (see page 4179).
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	UseRightToLeftAlignment (see page 4177)	Specifies whether the control's alignment is in a right-to-left mode.
	UseRightToLeftReading (see page 4177)	Specifies whether the control is using a right-to-left reading order.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
R	Left (see page 4180)	Specifies the horizontal position of the header section's left edge.
R	Right (see page 4181)	Specifies the horizontal position of the header section's right edge.

Published Properties

	Name	Description
	Alignment (see page 4178)	Specifies how text is aligned within the header section.
	AllowClick (see page 4178)	Allows the section to respond to mouse clicks at runtime.
	AutoSize (see page 4179)	Indicates whether the header section should size itself to exactly hold its contents.
	BiDiMode (see page 4179)	Specifies the bi-directional mode for the header section.
	ImageIndex (see page 4179)	Identifies the image that appears next to the text on the header section.
	MaxWidth (see page 4180)	Specifies the maximum width of the header section.
	MinWidth (see page 4180)	Specifies the minimum width of the header section.
	ParentBiDiMode (see page 4181)	Specifies whether the header section uses its parent's bi-directional mode.
	Style (see page 4181)	Determines how the header section's text is displayed.
	Text (see page 4183)	Specifies the header section's caption.
	Width (see page 4184)	Specifies the width of the header section.

27.1.27.2 THeaderSection.Create Constructor

Creates and initializes a header section.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall THeaderSection(TCollection Collection);
```

Description

Do not instantiate a THeaderSection (see page 4173) object. Header sections are created automatically by the THeaderSections (see page 4185) objects that use them. To add a section to a THeaderSections (see page 4185) object, use its Add method instead.

Create takes a THeaderSections (see page 4185) instance as its argument.

See Also

THeaderSections (see page 4185)

Add (see page 4188)

27.1.27.3 THeaderSection Methods

The methods of the THeaderSection class are listed here.

Protected Methods

	Name	Description
V	GetDisplayName (see page 4176)	Returns the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	Assign (see page 4176)	Copies the contents of the source header section to a new header section.
	ParentBiDiModeChanged (see page 4176)	Synchronizes the header section's BiDiMode (see page 4179) with the associated header control's BiDiMode (see page 4179).
	UseRightToLeftAlignment (see page 4177)	Specifies whether the control's alignment is in a right-to-left mode.
	UseRightToLeftReading (see page 4177)	Specifies whether the control is using a right-to-left reading order.

27.1.27.3.1 THeaderSection.Assign Method

Copies the contents of the source header section to a new header section.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Assign copies the values of the source object's Alignment (see page 4178), AllowClick (see page 4178), MaxWidth (see page 4180), MinWidth (see page 4180), Style (see page 4181), Text (see page 4183), and Width (see page 4184) properties to another header section.

See Also

Assign (see page 2930)

27.1.27.3.2 THeaderSection.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName (see page 2761)

GetNamePath (see page 2759)

27.1.27.3.3 THeaderSection.ParentBiDiModeChanged Method

Synchronizes the header section's BiDiMode (see page 4179) with the associated header control's BiDiMode (see page 4179).

Pascal

```
procedure ParentBiDiModeChanged;
```

C++

```
__fastcall ParentBiDiModeChanged();
```

Description

Use ParentBiDiModeChanged to synchronize the header section's BiDiMode (see page 4179) with the associated header control's BiDiMode (see page 4179).

27.1.27.3.4 THeaderSection.UseRightToLeftAlignment Method

Specifies whether the control's alignment is in a right-to-left mode.

Pascal

```
function UseRightToLeftAlignment: Boolean;
```

C++

```
__fastcall Boolean UseRightToLeftAlignment();
```

Description

Call UseRightToLeftAlignment to determine whether the control's alignment is in a right-to-left mode. This information can be used when painting the control, or when responding to mouse events.

UseRightToLeft alignment returns true if the MiddleEast field of the global SysLocale is true and the BiDiMode (see page 4179) property is bdRightToLeft.

See Also

BiDiMode (see page 5803)

UseRightToLeftAlignment (see page 5790)

variables

TSysLocale (see page 23008)

27.1.27.3.5 THeaderSection.UseRightToLeftReading Method

Specifies whether the control is using a right-to-left reading order.

Pascal

```
function UseRightToLeftReading: Boolean;
```

C++

```
__fastcall Boolean UseRightToLeftReading();
```

Description

Call UseRightToLeftReading to determine which style flags to set for the control when it is created and which flags to set for drawing text (for example, when calling ExTextOut or DrawText).

UseRightToLeftReading returns true if the MiddleEast field of the global SysLocale is true and the BiDiMode (see page 4179) property is not bdRightToLeft.

See Also

BiDiMode (see page 5803)

UseRightToLeftReading (see page 5790)

27.1.27.4 THeaderSection Properties

The properties of the THeaderSection class are listed here.

Public Properties

	Name	Description
R	Left (see page 4180)	Specifies the horizontal position of the header section's left edge.
R	Right (see page 4181)	Specifies the horizontal position of the header section's right edge.

Published Properties

	Name	Description
	Alignment (see page 4178)	Specifies how text is aligned within the header section.
	AllowClick (see page 4178)	Allows the section to respond to mouse clicks at runtime.
	AutoSize (see page 4179)	Indicates whether the header section should size itself to exactly hold its contents.
	BiDiMode (see page 4179)	Specifies the bi-directional mode for the header section.
	ImageIndex (see page 4179)	Identifies the image that appears next to the text on the header section.
	MaxWidth (see page 4180)	Specifies the maximum width of the header section.
	MinWidth (see page 4180)	Specifies the minimum width of the header section.
	ParentBiDiMode (see page 4181)	Specifies whether the header section uses its parent's bi-directional mode.
	Style (see page 4181)	Determines how the header section's text is displayed.
	Text (see page 4183)	Specifies the header section's caption.
	Width (see page 4184)	Specifies the width of the header section.

27.1.27.4.1 THeaderSection.Alignment Property

Specifies how text is aligned within the header section.

Pascal

```
property Alignment: TAlignment;
```

C++

```
__property TAlignment Alignment;
```

Description

Use Alignment to specify whether the header section text should be left-justified, right-justified, or centered.

These are the possible values of Alignment:

Value	Meaning
taLeftJustify	Align text on the left side of the header section.
taCenter	Center text in the header section.
taRightJustify	Align text on the right side of the header section.

See Also

Text (see page 4183)

Style (see page 4181)

27.1.27.4.2 THeaderSection.AllowClick Property

Allows the section to respond to mouse clicks at runtime.

Pascal

```
property AllowClick: Boolean;
```

C++

```
__property Boolean AllowClick;
```

Description

If AllowClick is set to true (the default), the header section can be clicked with the mouse at runtime. Header sections behave like buttons when clicked: They loose their raised borders and appear depressed on the form. To attach functionality to the clicking of header sections, write an event handler for the header control's OnSectionClick event.

See Also

OnSectionClick (see page 4170)

27.1.27.4.3 THeaderSection.AutoSize Property

Indicates whether the header section should size itself to exactly hold its contents.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

When AutoSize is true, the header section (and the header control that contains it) automatically resizes to adjust to changes. When AutoSize is false, the header section size is fixed unless changed programmatically.

27.1.27.4.4 THeaderSection.BiDiMode Property

Specifies the bi-directional mode for the header section.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to specify the bi-directional mode for the header section.

27.1.27.4.5 THeaderSection.ImageIndex Property

Identifies the image that appears next to the text on the header section.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

Use ImageIndex to specify an image that appears next to the text on the header section. ImageIndex is the (0-offset) index of the

image in the TCustomImageList component that is available through the header control's Images property.

See Also

Images (see page 3735)

Text (see page 4183)

27.1.27.4.6 THeaderSection.Left Property

Specifies the horizontal position of the header section's left edge.

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

The Left property is the horizontal coordinate of the header section's left edge, relative to the left border of the header control and measured in pixels.

See Also

Right (see page 4181)

Width (see page 4184)

27.1.27.4.7 THeaderSection.MaxWidth Property

Specifies the maximum width of the header section.

Pascal

```
property MaxWidth: Integer;
```

C++

```
__property int MaxWidth;
```

Description

Sets the maximum width, in pixels, for the header section. If MaxWidth = MinWidth (see page 4180), the header section cannot be resized at runtime.

See Also

Width (see page 4184)

MinWidth (see page 4180)

27.1.27.4.8 THeaderSection.MinWidth Property

Specifies the minimum width of the header section.

Pascal

```
property MinWidth: Integer;
```

C++

```
__property int MinWidth;
```

Description

Sets the minimum width, in pixels, for the header section. If MinWidth = MaxWidth (see page 4180), the header section cannot be resized at runtime.

See Also

Width (see page 4184)

MaxWidth (see page 4180)

27.1.27.4.9 THeaderSection.ParentBiDiMode Property

Specifies whether the header section uses its parent's bi-directional mode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use BiDiMode (see page 4179) to specify whether the header section uses its parent's bi-directional mode.

27.1.27.4.10 THeaderSection.Right Property

Specifies the horizontal position of the header section's right edge.

Pascal

```
property Right: Integer;
```

C++

```
__property int Right;
```

Description

The Right property is the horizontal coordinate of the header section's right edge, relative to the left border of the header control and measured in pixels. The Right value is the value of Left (see page 4180) plus the value of Width (see page 4184).

See Also

Left (see page 4180)

Width (see page 4184)

27.1.27.4.11 THeaderSection.Style Property

Determines how the header section's text is displayed.

Pascal

```
property Style: THeaderSectionStyle;
```

C++

```
__property THeaderSectionStyle Style;
```

Description

If Style is set to hsText (the default), the string contained in the Text (see page 4183) property is displayed in the header section, using the alignment specified by Alignment (see page 4178). The font is determined by the header control's Font

property. A graphic image can appear beside the text if the ImageIndex (see page 4179) property is set.

If Style is set to hsOwnerDraw, the content displayed in the header section is drawn at run time on the header control's canvas by code in an OnDrawSection event handler.

C++ Examples:

```
/*
Add a THeaderControl to the form and call
HeaderControl1DrawSection for the OnDrawSection event.
*/
void __fastcall TForm1::HeaderControl1DrawSection(THeaderControl *HeaderControl,
      THeaderSection *Section, const TRect &Rect, bool Pressed)
{
  if (Pressed)
    HeaderControl->Canvas->Font->Color = clRed;
  else
    HeaderControl->Canvas->Font->Color = clBlue;
  HeaderControl->Canvas->TextOut(Rect.Left + HeaderControl->Canvas->Font->Size, Rect.Top + 2,
"Custom " + IntToStr(Section->Index));
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  THeaderSection *Section;
  for (int i = 0; i <= 4; i++)
  {
    Section = HeaderControl1->Sections->Add();
    Section->Text = "Section " + IntToStr(i);
    Section->MinWidth =
      (Section->Text).Length() *
      HeaderControl1->Font->Size;
    // Owner draw every other section
    if (i % 2 == 0)
      Section->Style = hsOwnerDraw;
    else
      Section->Style = hsText;
  }
}
```

Delphi Examples:

```
{
Add a THeaderControl to the form and call
HeaderControl1DrawSection for the OnDrawSection event.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  HeaderSection: THeaderSection;
  I: Integer;
begin
  for I := 0 to 4 do
  begin
    HeaderSection := HeaderControl1.Sections.Add;
    HeaderSection.Text := 'Text Section ' + IntToStr(I);
    HeaderSection.MinWidth := length(HeaderSection.Text) * Font.Size;
    // Owner draw every other section
    if (I mod 2 = 0) then
      HeaderSection.Style := hsOwnerDraw
    else
      HeaderSection.Style := hsText;
  end;
end;

procedure TForm1.HeaderControl1DrawSection(HeaderControl: THeaderControl;
  Section: THeaderSection; const Rect: TRect; Pressed: Boolean);
begin
```

```
    with HeaderControl.Canvas do
    begin
      // highlight pressed sections
      if Pressed then
        Font.Color := clRed
      else
        Font.Color := clBlue;
      TextOut(Rect.Left + Font.Size, Rect.Top + 2, 'Owner Drawn text');
    end;
  end;
```

See Also

Text (see page 4183)

Alignment (see page 4178)

Font (see page 5823)

Canvas (see page 3728)

OnDrawSection (see page 4158)

ImageIndex (see page 4179)

27.1.27.4.12 THeaderSection.Text Property

Specifies the header section's caption.

Pascal

```
property Text: string;
```

C++

```
__property AnsiString Text;
```

Description

The Text property contains a string that identifies the header section or the column beneath it. If Style (see page 4181) is set to hsText, the value of Text appears in the header section.

C++ Examples:

```
/*
Add a THeaderControl to the form and call
HeaderControl1DrawSection for the OnDrawSection event.
*/
void __fastcall TForm1::HeaderControl1DrawSection(THeaderControl *HeaderControl,
      THeaderSection *Section, const TRect &Rect, bool Pressed)
{
  if (Pressed)
    HeaderControl->Canvas->Font->Color = clRed;
  else
    HeaderControl->Canvas->Font->Color = clBlue;
  HeaderControl->Canvas->TextOut(Rect.Left + HeaderControl->Canvas->Font->Size, Rect.Top + 2,
"Custom " + IntToStr(Section->Index));
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  THeaderSection *Section;
  for (int i = 0; i <= 4; i++)
  {
    Section = HeaderControl1->Sections->Add();
    Section->Text = "Section " + IntToStr(i);
    Section->MinWidth =
```

```
        (Section->Text).Length() *
        HeaderControl1->Font->Size;
      // Owner draw every other section
      if (i % 2 == 0)
        Section->Style = hsOwnerDraw;
      else
        Section->Style = hsText;
    }
  }
```

Delphi Examples:

```
{
Add a THeaderControl to the form and call
HeaderControl1DrawSection for the OnDrawSection event.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  HeaderSection: THeaderSection;
  I: Integer;
begin
  for I := 0 to 4 do
  begin
    HeaderSection := HeaderControl1.Sections.Add;
    HeaderSection.Text := 'Text Section ' + IntToStr(I);
    HeaderSection.MinWidth := length(HeaderSection.Text) * Font.Size;
    // Owner draw every other section
    if (I mod 2 = 0) then
      HeaderSection.Style := hsOwnerDraw
    else
      HeaderSection.Style := hsText;
  end;
end;

procedure TForm1.HeaderControl1DrawSection(HeaderControl: THeaderControl;
  Section: THeaderSection; const Rect: TRect; Pressed: Boolean);
begin
  with HeaderControl.Canvas do
  begin
    // highlight pressed sections
    if Pressed then
      Font.Color := clRed
    else
      Font.Color := clBlue;
    TextOut(Rect.Left + Font.Size, Rect.Top + 2, 'Owner Drawn text');
  end;
end;
```

See Also

Style (see page 4181)

Alignment (see page 4178)

27.1.27.4.13 THeaderSection.Width Property

Specifies the width of the header section.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

The Width property determines the default width of the header section, in pixels. Header sections can be resized at runtime by dragging their borders.

See Also

Left (see page 4180)

Right (see page 4181)

MaxWidth (see page 4180)

MinWidth (see page 4180)

27.1.28 THeaderSections Class

THeaderSections is a container for THeaderSection (see page 4173) objects.

Class Hierarchy

Pascal

```
THeaderSections = class(TCollection);
```

C++

```
class THeaderSections : public TCollection;
```

File

ComCtrls

Description

Each THeaderSections objects holds a collection of THeaderSection (see page 4173) objects displayed in a specific THeaderControl (see page 4118) object. THeaderSections object maintains an index of the header sections in its Items (see page 4190) array. The Count property contains the number of header sections in the collection. At design time, use the header control's Sections editor to add, remove, or modify header sections.

See Also

TCollection (see page 2731)

TCollectionItem (see page 2755)

THeaderSection (see page 4173)

THeaderControl (see page 4118)

THeaderControl (see page 4118)

27.1.28.1 THeaderSections Members

The following tables list the members exposed by THeaderSections.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 4188)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 4189)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 4188)	Creates a new THeaderSection (see page 4173) instance and adds it to the Items (see page 4190) array.
	AddItem (see page 4188)	Add (see page 4188) section object to collection.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 4187)	Creates and initializes a THeaderSections (see page 4185) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 4189)	Add (see page 4188) new section object to collection.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 4190)	Lists the header sections in the collection.

27.1.28.2 THeaderSections.Create Constructor

Creates and initializes a THeaderSections (see page 4185) object.

Pascal

```
constructor Create(HeaderControl: TCustomHeaderControl);
```

C++

```
__fastcall THeaderSections(TCustomHeaderControl HeaderControl);
```

Description

The Create method takes a THeaderControl (see page 4118) instance as a parameter.

See Also

THeaderControl (see page 4118)

27.1.28.3 THeaderSections Methods

The methods of the THeaderSections class are listed here.

Protected Methods

	Name	Description
V	GetOwner (see page 4188)	Returns the owner of an object.
V	Update (see page 4189)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Add (see page 4188)	Creates a new THeaderSection (see page 4173) instance and adds it to the Items (see page 4190) array.
	AddItem (see page 4188)	Add (see page 4188) section object to collection.
	Insert (see page 4189)	Add (see page 4188) new section object to collection.

27.1.28.3.1 THeaderSections.Add Method

Creates a new THeaderSection (see page 4173) instance and adds it to the Items (see page 4190) array.

Pascal

```
function Add: THeaderSection;
```

C++

```
__fastcall THeaderSection Add();
```

Description

Add returns the new header section. At design time, use the header control's Sections editor to add sections to the header.

See Also

Items (see page 4190)

Sections (see page 4147)

27.1.28.3.2 THeaderSections.AddItem Method

Add (see page 4188) section object to collection.

Pascal

```
function AddItem(Item: THeaderSection; Index: Integer): THeaderSection;
```

C++

```
__fastcall THeaderSection AddItem(THeaderSection Item, int Index);
```

Description

The AddItem method is similar to the Add (see page 4188) method, but is more flexible.

The Item parameter specifies the section object to add. If Item is nil, then a new panel object is created automatically. To determine the object type at runtime, define the status bar's OnCreateSectionClass event handler. If this event handler is not defined, the new section object is an instance of THeaderSection (see page 4173).

The Index parameter determines the Index property of the panel object. If Index is negative, the panel object is added at the end of the collection.

AddItem returns the panel object added.

See Also

Add (see page 4188)

Insert (see page 4189)

27.1.28.3.3 THeaderSections.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath (see page 2932)

TCollection (see page 2731)

TComponent (see page 2762)

Owner (see page 2807)

27.1.28.3.4 THeaderSections.Insert Method

Add (see page 4188) new section object to collection.

Pascal

```
function Insert(Index: Integer): THeaderSection;
```

C++

```
__fastcall THeaderSection Insert(int Index);
```

Description

The Insert method creates a new section object and adds it the the collection. To determine the object type at runtime, define the header control's OnCreateSectionClass event handler. If this event handler is not defined, the new section object is an instance of THeaderSection (see page 4173).

The Index parameter determines the Index property of the panel object. If Index is negative, the panel object is added at the end of the collection.

Insert returns the new panel object.

See Also

Add (see page 4188)

AddItem (see page 4188)

27.1.28.3.5 THeaderSections.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem Item);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

See Also

Changed (see page 2740)

Changed (see page 2758)

27.1.28.4 THeaderSections Properties

The properties of the THeaderSections class are listed here.

Public Properties

	Name	Description
	Items (see page 4190)	Lists the header sections in the collection.

27.1.28.4.1 THeaderSections.Items Property

Lists the header sections in the collection.

Pascal

```
property Items [Index: Integer]: THeaderSection;
```

C++

```
__property THeaderSection Items[int Index];
```

Description

The value of the Index parameter corresponds to the Index property of THeaderSection (see page 4173). It represents the position of the header section in the header.

See Also

THeaderSection (see page 4173)

Index (see page 2762)

operator_[]

27.1.29 THotKey Class

THotKey is a wrapper for a Windows Common Control hot key.

Class Hierarchy

Pascal

```
THotKey = class(TCustomHotKey);
```

C++

```
class THotKey : public TCustomHotKey;
```

File

ComCtrls

Description

THotKey implements the generic behavior introduced in TCustomHotKey (see page 3739). THotKey publishes many of the properties inherited from TCustomHotKey (see page 3739), but does not introduce any new behavior.

Use THotKey to create key combinations that can be used as a shortcut.

See Also

Hot Key Controls (VCL Only)

Specialized Input Controls

27.1.29.1 THotKey Members

The following tables list the members exposed by THotKey.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.

	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	CNCommand (see page 3750)	This is CNCommand, a member of class TCustomHotKey.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.

	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 3751)	Initializes a window-creation parameter data structure.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 3751)	Creates the underlying window.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.

	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.

	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 3752)	This is SetAutoSize, a member of class TCustomHotKey.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.

	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.

	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 3750)	Instantiates an accelerator key control.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.

	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.

	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnChange (see page 4220)	Occurs when the properties of the accelerator key change.
	OnContextPopup (see page 4220)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnEnter (see page 4221)	Occurs when a control receives the input focus.
	OnExit (see page 4223)	Occurs when the input focus shifts away from one control to another.
	OnMouseActivate (see page 4225)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

	OnMouseDown (see page 4226)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 4228)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 4228)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 4228)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 4231)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 4202)	Specifies how the control is anchored to its parent.
	AutoSize (see page 4202)	Determines whether the accelerator key automatically changes its height to accommodate the font size.
	BiDiMode (see page 4203)	Specifies the bi-directional mode for the control.
	Constraints (see page 4203)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Enabled (see page 4204)	Controls whether the control responds to mouse, keyboard, and timer events.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 4204)	Contains the text string that can appear when the user moves the mouse over the control.
	HotKey (see page 4206)	Contains the current key combination of the accelerator key control.
	InvalidKeys (see page 4207)	Allows you to specify that one or more modifier keys should be considered invalid.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Modifiers (see page 4209)	Specifies the key or keys that are used in combination with a non-modifier key.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 4210)	Specifies whether the control uses its parent's BiDiMode.
	ParentShowHint (see page 4210)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 4211)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 4215)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 4217)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 4217)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 4218)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

27.1.29.2 THotKey Properties

The properties of the THotKey class are listed here.

Published Properties

	Name	Description
	Anchors (see page 4202)	Specifies how the control is anchored to its parent.
	AutoSize (see page 4202)	Determines whether the accelerator key automatically changes its height to accommodate the font size.
	BiDiMode (see page 4203)	Specifies the bi-directional mode for the control.

	Constraints (see page 4203)	Specifies the size constraints for the control.
	Enabled (see page 4204)	Controls whether the control responds to mouse, keyboard, and timer events.
	Hint (see page 4204)	Contains the text string that can appear when the user moves the mouse over the control.
	HotKey (see page 4206)	Contains the current key combination of the accelerator key control.
	InvalidKeys (see page 4207)	Allows you to specify that one or more modifier keys should be considered invalid.
	Modifiers (see page 4209)	Specifies the key or keys that are used in combination with a non-modifier key.
	ParentBiDiMode (see page 4210)	Specifies whether the control uses its parent's BiDiMode.
	ParentShowHint (see page 4210)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 4211)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 4215)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 4217)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 4217)	Determines if the user can tab to a control.
	Visible (see page 4218)	Determines whether the component appears onscreen.

27.1.29.2.1 THotKey.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

27.1.29.2.2 THotKey.AutoSize Property

Determines whether the accelerator key automatically changes its height to accommodate the font size.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;__property Boolean AutoSize;
```

Description

Use AutoSize to fully display the font on the accelerator key control. When AutoSize is true, the height of the accelerator key changes to display the key combinations typed in it. When AutoSize is false, the accelerator key remains the same height, regardless of any font changes. The default value is true.

27.1.29.2.3 THotKey.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

27.1.29.2.4 THotKey.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict,

the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

27.1.29.2.5 THotKey.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

27.1.29.2.6 THotKey.Hint Property

Contains the text string that can appear when the user moves the mouse over the control.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Use the Hint property to provide a string of help text either as a Help Hint, or as help text on a particular location such as a status bar.

A Help Hint is a box containing help text that appears for a control when the user moves the mouse pointer over the control and pauses momentarily. To set up Help Hints:

Specify the Hint property of each control for which a Help Hint should appear.

Set the ShowHint property of each appropriate control to true, or set the ParentShowHint property of all controls to true and set the ShowHint property of the form to true.

At runtime, set the value of the application's ShowHint property to true.

To show the Hint on a status bar or other location, use the OnHint event handler of the application. The application's OnHint event occurs when the mouse pointer moves over the control.

Specify a hint to be used for both a Help Hint box and by an OnHint handler by specifying two values separated by a | character (the vertical bar "or" symbol). For example,

```
Edit1.Hint := 'Name|Enter Name in the edit box';
Edit1->Hint = "Name|Enter Name in the edit box";
```

The "Name" part appears in the Help Hint box and the "Enter full name in the edit box" part can be extracted using the GetLongHint function for use in an OnHint event handler.

If Hint contains only one value, the entire string is used as a Help Hint and returned by the GetLongHint function. If a control has no Hint value specified, but its parent control does, the control uses the Hint value of the parent control (as long as the control's ShowHint property is true).

Note: If the application's ShowHint property is false, the Help Hint does not appear, but the OnHint event handler is still called.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
```

```
    Edit1.Hint := 'Enter your name';
    Edit1.ShowHint := True;
    with ListBox1 do
    begin
      for I := 1 to 10 do
        Items.Add('Item ' + IntToStr(I));
      Hint := 'Select an item';
      ShowHint := True;
    end;
    Application.ShowHint := True;
  end;
  {
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  }
```

ParentShowHint (see page 5835)

ShowHint (see page 5840)

Hint (see page 13712)

OnHint (see page 13731)

ShowHint (see page 13721)

Hint (see page 312)

27.1.29.2.7 THotKey.HotKey Property

Contains the current key combination of the accelerator key control.

Pascal

```
property HotKey: TShortCut;
```

C++

```
__property TShortCut HotKey;
```

Description

Use HotKey to set or change the key combination associated with the accelerator key. Alt+A is the default. To modify the value of HotKey either edit it directly or set the value of the Modifiers property. At runtime, HotKey is reset when the accelerator key has focus and the user presses valid key combinations.

C++ Examples:

```
/*
To use this example, create a form with a main menu
component and a HotKey component.  At design time, use the
Menu designer to add menu items, including a "File" menu
with subitems that includes a "New" menu item.  Add the
following code to the OnCreate method of the form and the
OnClick event of the File menu item.
*/
void __fastcall TForm1::File1Click(TObject *Sender)
{
  // Assign HotKey to the menu's File "New" item.
  New1->ShortCut = HotKey1->HotKey;
```

```
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  // Default to "Ctrl + A"
  HotKey1->Modifiers.Clear();
  HotKey1->Modifiers << hkCtrl;
  // Don't allow shift or alt
  HotKey1->InvalidKeys.Clear();
  (HotKey1->InvalidKeys << hcShift) << hcAlt;
//  HotKey1->Visible = false;
}
```

Delphi Examples:

```
{
To use this example, create a form with a main menu
component and a HotKey component.  At design time, use the
Menu designer to add menu items, including a "File" menu
with subitems that includes a "New" menu item.  Add the
following code to the OnCreate method of the form and the
OnClick event of the File menu item.
}
procedure TForm1.File1Click(Sender: TObject);
begin
  // Assign hotkey to the menu's File "New" item.
  New1.ShortCut := HotKey1.HotKey;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  // Default to "Ctrl + A"
  HotKey1.Modifiers := [hkCtrl];
  // Don't allow shift or alt
  HotKey1.InvalidKeys := [hcShift, hcAlt];
end;
```

See Also

Modifiers (see page 3755)

27.1.29.2.8 THotKey.InvalidKeys Property

Allows you to specify that one or more modifier keys should be considered invalid.

Pascal

```
property InvalidKeys: THKInvalidKeys;
```

C++

```
__property THKInvalidKeys InvalidKeys;
```

Description

Use InvalidKeys to select which modifier keys are not allowed. If this property is set, a default modifier should also be specified in the Modifiers property. When the invalid key is selected, the default modifier is displayed in its place.

THKInvalidKey is the type of the InvalidKeys property. These are the possible values:

Value	Meaning
hcNone	Unmodified keys are invalid.
hcShift	The Shift key is invalid as a modifier.
hcCtrl	The Ctrl key is invalid as a modifier.

hcAlt	The Alt key is invalid as a modifier.
hcShiftCtrl	The Shift+Ctrl key combination is invalid as a modifier.
hcShiftAlt	The Shift+Alt key combinations invalid as a modifier.
hcCtrlAlt	The Ctrl+Alt key combination is invalid as a modifier.
hcShiftCtrlAlt	The Shift+Ctrl+Alt key combination is invalid as a modifier.

The default values are hcNone and hcShift.

C++ Examples:

```
/*
To use this example, create a form with a main menu
component and a HotKey component.  At design time, use the
Menu designer to add menu items, including a "File" menu
with subitems that includes a "New" menu item.  Add the
following code to the OnCreate method of the form and the
OnClick event of the File menu item.
*/
void __fastcall TForm1::File1Click(TObject *Sender)
{
  // Assign HotKey to the menu's File "New" item.
  New1->ShortCut = HotKey1->HotKey;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  // Default to "Ctrl + A"
  HotKey1->Modifiers.Clear();
  HotKey1->Modifiers << hkCtrl;
  // Don't allow shift or alt
  HotKey1->InvalidKeys.Clear();
  (HotKey1->InvalidKeys << hcShift) << hcAlt;
//  HotKey1->Visible = false;
}
```

Delphi Examples:

```
{
To use this example, create a form with a main menu
component and a HotKey component.  At design time, use the
Menu designer to add menu items, including a "File" menu
with subitems that includes a "New" menu item.  Add the
following code to the OnCreate method of the form and the
OnClick event of the File menu item.
}
procedure TForm1.File1Click(Sender: TObject);
begin
  // Assign hotkey to the menu's File "New" item.
  New1.ShortCut := HotKey1.HotKey;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  // Default to "Ctrl + A"
  HotKey1.Modifiers := [hkCtrl];
  // Don't allow shift or alt
  HotKey1.InvalidKeys := [hcShift, hcAlt];
end;
```

See Also

Modifiers (see page 3755)

27.1.29.2.9 THotKey.Modifiers Property

Specifies the key or keys that are used in combination with a non-modifier key.

Pascal

```
property Modifiers: THKModifiers;
```

C++

```
__property THKModifiers Modifiers;
```

Description

Use Modifiers to select a modifier key such as Ctrl, Alt, or Shift for the hot key. These are the possible values:

Value	Meaning
hkShift	The Shift key is used as a modifier.
hkCtrl	The Ctrl key is used as a modifier.
hkAlt	The Alt key is used as a modifier.
hkExt	The Extra key is used as a modifier.

The default value is hkAlt.

Modifier keys are used with other non-modifier keys such as character and function keys, arrow keys, and so on. More than one modifier key can be used.

C++ Examples:

```
/*
To use this example, create a form with a main menu
component and a HotKey component.  At design time, use the
Menu designer to add menu items, including a "File" menu
with subitems that includes a "New" menu item.  Add the
following code to the OnCreate method of the form and the
OnClick event of the File menu item.
*/
void __fastcall TForm1::File1Click(TObject *Sender)
{
  // Assign HotKey to the menu's File "New" item.
  New1->ShortCut = HotKey1->HotKey;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  // Default to "Ctrl + A"
  HotKey1->Modifiers.Clear();
  HotKey1->Modifiers << hkCtrl;
  // Don't allow shift or alt
  HotKey1->InvalidKeys.Clear();
  (HotKey1->InvalidKeys << hcShift) << hcAlt;
//  HotKey1->Visible = false;
}
```

Delphi Examples:

```
{
To use this example, create a form with a main menu
component and a HotKey component.  At design time, use the
Menu designer to add menu items, including a "File" menu
with subitems that includes a "New" menu item.  Add the
following code to the OnCreate method of the form and the
OnClick event of the File menu item.
```

```
}
procedure TForm1.File1Click(Sender: TObject);
begin
  // Assign hotkey to the menu's File "New" item.
  New1.ShortCut := HotKey1.HotKey;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  // Default to "Ctrl + A"
  HotKey1.Modifiers := [hkCtrl];
  // Don't allow shift or alt
  HotKey1.InvalidKeys := [hcShift, hcAlt];
end;
```

27.1.29.2.10 THotKey.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

27.1.29.2.11 THotKey.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

27.1.29.2.12 THotKey.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
```

```
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Cut1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->CutToClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Paste1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->PasteFromClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }
  /*
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  */
  void __fastcall TForm1::AddButtonClick(TObject *Sender)
  {
      const int num_items = 4;
      for (int index = 0; index < num_items; ++index)
      {
          TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
          PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
          NewItem->Caption = "Menu Item " + IntToStr(index);
          NewItem->Tag = index;
          NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
          TNotifyEvent();
      }
  }

  void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
  {
      TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
      if (ClickedItem)
      {
          switch (ClickedItem->Tag)
          {
              case 0:
              {
                  ShowMessage("first item clicked");
```

```
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
```

```
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.CopyToClipboard
    else
      Beep;
  end;

  procedure TForm1.Cut1Click(Sender: TObject);
  begin
    if PopupMenu1.PopupComponent = Edit1 then
      Edit1.CutToClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.CutToClipboard
    else
      Beep;
  end;

  procedure TForm1.Paste1Click(Sender: TObject);
  begin
    if PopupMenu1.PopupComponent = Edit1 then
      Edit1.PasteFromClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.PasteFromClipboard
    else
      Beep;
  end;
  {
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  }

27.1.29.2.13 THotKey.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
```

```
      Hint := 'Select an item';
      ShowHint := True;
    end;
    Application.ShowHint := True;
  end;
  {
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  }
```

Displaying Fly-over Help

27.1.29.2.14 THotKey.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

27.1.29.2.15 THotKey.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

27.1.29.2.16 THotKey.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
```

```
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

27.1.29.3 THotKey Events

The events of the THotKey class are listed here.

Published Events

	Name	Description
	OnChange (see page 4220)	Occurs when the properties of the accelerator key change.
	OnContextPopup (see page 4220)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

	OnEnter (see page 4221)	Occurs when a control receives the input focus.
	OnExit (see page 4223)	Occurs when the input focus shifts away from one control to another.
	OnMouseActivate (see page 4225)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 4226)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 4228)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 4228)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 4228)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 4231)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

27.1.29.3.1 THotKey.OnChange Event

Occurs when the properties of the accelerator key change.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to respond when the accelerator key changes to represent a different combination of keys. OnChange occurs after the TCustomHotKey properties have been updated to reflect the change.

27.1.29.3.2 THotKey.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

27.1.29.3.3 THotKey.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
```

```
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
```

```
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

27.1.29.3.4 THotKey.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on

the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
```

```
  Memo1.Color := clWindow;
end;
```

27.1.29.3.5 THotKey.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

27.1.29.3.6 THotKey.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
```

```
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

27.1.29.3.7 THotKey.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

27.1.29.3.8 THotKey.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

27.1.29.3.9 THotKey.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

27.1.29.3.10 THotKey.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
```

```
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
```

```
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

27.1.30 TIconOptions Class

TIconOptions describes how the icons in a list view should be arranged.

Class Hierarchy

Pascal

```
TIconOptions = class(TPersistent);
```

C++

```
class TIconOptions : public TPersistent;
```

File

ComCtrls

Description

Use TIconOptions with a list view object that has a ViewStyle property set to vsIcon or vsSmallIcon. The IconOptions property of the view contains a TIconOptions object that determines the arrangement of the icons.

See Also

TCustomForm (see page 13849)

TPicture (see page 14584)

TCustomListView (see page 3757)

TCustomListView (see page 3757)

TCustomListView (see page 3757)

27.1.30.1 TIconOptions Members

The following tables list the members exposed by TIconOptions.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 4235)	Creates an instance of TIconOptions (see page 4233).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Published Properties

	Name	Description
	Arrangement (see page 4235)	Determines where the items are to be aligned in the view.
	AutoArrange (see page 4236)	Determines if icons in a view are automatically rearranged when an item is added, removed, or moved.
	WrapText (see page 4236)	Determines whether the icon caption is displayed all on one line, or if it can wrap.

27.1.30.2 TIconOptions.Create Constructor

Creates an instance of TIconOptions (see page 4233).

Pascal

```
constructor Create(AOwner: TCustomListView);
```

C++

```
__fastcall TIconOptions(TCustomListView AOwner);
```

Description

Do not call Create directly in an application. The properties of TIconOptions (see page 4233) are only valid when it is owned by a view object. The view instantiates a TIconOptions (see page 4233) object to represent the arrangement properties of its icon views.

After calling the inherited constructor, Create initializes

Arrangement (see page 4235) to iaTop.

AutoArrange (see page 4236) to false.

WrapText (see page 4236) to true.

See Also

Arrangement (see page 4235)

AutoArrange (see page 4236)

WrapText (see page 4236)

27.1.30.3 TIconOptions Properties

The properties of the TIconOptions class are listed here.

Published Properties

	Name	Description
	Arrangement (see page 4235)	Determines where the items are to be aligned in the view.
	AutoArrange (see page 4236)	Determines if icons in a view are automatically rearranged when an item is added, removed, or moved.
	WrapText (see page 4236)	Determines whether the icon caption is displayed all on one line, or if it can wrap.

27.1.30.3.1 TIconOptions.Arrangement Property

Determines where the items are to be aligned in the view.

Pascal

```
property Arrangement: TIconArrangement;
```

C++

```
__property TIconArrangement Arrangement;
```

Description

Set Arrangement to indicate whether the view should display icon entries in rows or columns. Arrangement has no effect on the arrangement of entries in the view when the ViewStyle is not vsIcon or vsSmallIcon. These are the possible values of

Arrangement:

Value	Meaning
iaTop	Items are aligned left to right in rows at the top of the view control
iaLeft	Items are aligned in columns top to bottom at the left of the view control

See Also

AutoArrange (see page 4236)

ViewStyle (see page 3829)

27.1.30.3.2 TIconOptions.AutoArrange Property

Determines if icons in a view are automatically rearranged when an item is added, removed, or moved.

Pascal

```
property AutoArrange: Boolean;
```

C++

```
__property Boolean AutoArrange;
```

Description

Set AutoArrange to specify whether the view should rearrange its items whenever changes are made. If AutoArrange is true, the icons are automatically arranged. If AutoArrange is false, the icons are not arranged until the Arrange method of the view is called.

See Also

Arrangement (see page 4235)

Arrange (see page 3777)

27.1.30.3.3 TIconOptions.WrapText Property

Determines whether the icon caption is displayed all on one line, or if it can wrap.

Pascal

```
property WrapText: Boolean;
```

C++

```
__property Boolean WrapText;
```

Description

Set WrapText to true to have the caption of icons wrap rather than display on one line when it exceeds the width of the icon.

See Also

TCustomListView (see page 3757)

27.1.31 TListColumn Class

TListColumn represents a column in a report-style list view.

Class Hierarchy

Pascal

```
TListColumn = class(TCollectionItem);
```

C++

```
class TListColumn : public TCollectionItem;
```

File

ComCtrls

Description

TListView (see page 4285) objects use TListColumns (see page 4245) to maintain a collection of TListColumn objects.

See Also

TListColumns (see page 4245)

TListView (see page 4285)

27.1.31.1 TListColumn Members

The following tables list the members exposed by TListColumn.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 4240)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 4241)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 4241)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 4239)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 4238)	Creates and initializes a TCollectionItem instance.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 4239)	Destroys the list column and frees its memory.

V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
R	WidthType (see page 4245)	This is WidthType, a member of class TListColumn.

Published Properties

	Name	Description
	Alignment (see page 4242)	Specifies how all text is aligned within the list column.
	AutoSize (see page 4242)	Specifies whether the list column automatically sizes itself to the width of its text.
	Caption (see page 4242)	Specifies the text that appears at the top of the column.
	ImageIndex (see page 4244)	This is ImageIndex, a member of class TListColumn.
	MaxWidth (see page 4244)	This is MaxWidth, a member of class TListColumn.
	MinWidth (see page 4244)	This is MinWidth, a member of class TListColumn.
	Tag (see page 4244)	This is Tag, a member of class TListColumn.
	Width (see page 4245)	Specifies the width of the column.

27.1.31.2 TListColumn.Create Constructor

Creates and initializes a TCollectionItem instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TListColumn(TCollection Collection);
```

Description

Do not call Create to instantiate a collection item. Instead, call the Add method of the collection to which the item should belong.

Collection identifies the TCollection instance to which the new item belongs.

See Also

Add (see page 2736)

Collection (see page 2761)

27.1.31.3 TListColumn.Destroy Destructor

Destroys the list column and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TListColumn();
```

Description

Do not call Destroy. TListColumn (see page 4236) objects are destroyed by the TListColumns (see page 4245) object that contains them.

Destroy eliminates the TListColumn (see page 4236) instance and, if necessary, deletes the column from the list view control.

See Also

Free (see page 22300)

TListView (see page 4285)

TListColumns (see page 4245)

27.1.31.4 TListColumn Methods

The methods of the TListColumn class are listed here.

Protected Methods

	Name	Description
	DefineProperties (see page 4240)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 4241)	Returns the name of the collection item as it appears in the collection editor.
	SetIndex (see page 4241)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	Assign (see page 4239)	Copies the contents of another, similar object.

27.1.31.4.1 TListColumn.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo (see page 2931)

EConvertError (see page 22724)

27.1.31.4.2 TListColumn.DefineProperties Method

Provides an interface for a method that reads and writes otherwise unpublished data.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

Descendants of TPersistent override DefineProperties to designate a method for storing the object's unpublished data to a stream such as a form file. By default, writing an object to a stream writes the values of all its published properties, and reading the object in reads those values and assigns them to the properties. Objects can also specify methods that read and write data other than published properties by overriding the DefineProperties method.

When overriding DefineProperties, consider including some or all of the following:

A call to the inherited method

Calls to the filer object's DefineProperty method

Calls to the filer object's DefineBinaryProperty method

DefineProperties is virtual, so descendant classes can override it as necessary but are not required to do so.

See Also

DefineProperties (see page 2771)

DefineBinaryProperty (see page 2837)

DefineProperty (see page 2838)

27.1.31.4.3 TListColumn.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName (see page 2761)

GetNamePath (see page 2759)

27.1.31.4.4 TListColumn.SetIndex Method

Moves the collection item to a specified position in the parent collection.

Pascal

```
procedure SetIndex(Value: Integer); override;
```

C++

```
virtual __fastcall SetIndex(int Value);
```

Description

SetIndex is the protected write implementation of the Index property. The Value parameter specifies the new (0-based) position for the item in its parent collection.

See Also

Index (see page 2762)

27.1.31.5 TListColumn Properties

The properties of the TListColumn class are listed here.

Public Properties

	Name	Description
R	WidthType (see page 4245)	This is WidthType, a member of class TListColumn.

Published Properties

	Name	Description
	Alignment (see page 4242)	Specifies how all text is aligned within the list column.

	AutoSize (see page 4242)	Specifies whether the list column automatically sizes itself to the width of its text.
	Caption (see page 4242)	Specifies the text that appears at the top of the column.
	ImageIndex (see page 4244)	This is ImageIndex, a member of class TListColumn.
	MaxWidth (see page 4244)	This is MaxWidth, a member of class TListColumn.
	MinWidth (see page 4244)	This is MinWidth, a member of class TListColumn.
	Tag (see page 4244)	This is Tag, a member of class TListColumn.
	Width (see page 4245)	Specifies the width of the column.

27.1.31.5.1 TListColumn.Alignment Property

Specifies how all text is aligned within the list column.

Pascal

```
property Alignment: TAlignment;
```

C++

```
__property TAlignment Alignment;
```

Description

Use Alignment to specify the horizontal placement of text in the column. The text includes the Caption (see page 4242) that appears at the top of the column and the text labels of individual list items that appear in the column.

See Also

Caption (see page 4242)

Caption (see page 4258)

27.1.31.5.2 TListColumn.AutoSize Property

Specifies whether the list column automatically sizes itself to the width of its text.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

Use AutoSize to get or set whether the list column automatically sizes itself to the width of its text.

27.1.31.5.3 TListColumn.Caption Property

Specifies the text that appears at the top of the column.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to label the type of item that appears in the column. If the list view control's ViewStyle and ShowColumnHeaders properties are set to vsReport and true, respectively, the value of Caption appears at the top of the column.

C++ Examples:

```
/*
This example requires only a blank form.  All other objects:
TListView, TListColumns, TListItems, are created dynamically.
You must add comctrls to the uses defs file.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  const char Names[6][2][10] =
   {{"Rubble","Barny"},
    {"Michael", "Johnson"},
    {"Bunny", "Bugs"},
    {"Silver", "HiHo"},
    {"Simpson", "Bart"},
    {"Squirrel", "Rocky"}};

  TListColumn  *NewColumn;
  TListItem  *ListItem;
  TListView   *ListView = new TListView(this);

  ListView->Parent = this;
  ListView->Align = alClient;
  ListView->ViewStyle = vsReport;
  NewColumn = ListView->Columns->Add();
  NewColumn->Caption = "Last";
  NewColumn = ListView->Columns->Add();
  NewColumn->Caption = "First";
  for (int i = 0; i < 6; i++)
  {
    ListItem = ListView->Items->Add();
    ListItem->Caption = Names[i][0];
    ListItem->SubItems->Add(Names[i][1]);
  }
}
```

Delphi Examples:

```
{
This example requires only a blank form.  All other objects:
TListView, TListColumns, TListItems, are created dynamically.
You must add comctrls to the uses clause of the unit file.
}
procedure TForm1.FormCreate(Sender: TObject);
const
  Names: array[0..5, 0..1] of string = (
    ('Rubble', 'Barney'),
    ('Michael', 'Johnson'),
    ('Bunny', 'Bugs'),
    ('Silver', 'HiHo'),
    ('Simpson', 'Bart'),
    ('Squirrel', 'Rocky')
    );

var
  I: Integer;
  NewColumn: TListColumn;
  ListItem: TListItem;
  ListView: TListView;
begin
  ListView := TListView.Create(Self);
  with ListView do
  begin
    Parent := Self;
    Align := alClient;
    ViewStyle := vsReport;

    NewColumn := Columns.Add;
    NewColumn.Caption := 'Last';
```

```
      NewColumn := Columns.Add;
      NewColumn.Caption := 'First';

      for I := Low(Names) to High(Names) do
      begin
        ListItem := Items.Add;
        ListItem.Caption := Names[I][0];
        ListItem.SubItems.Add(Names[I][1]);
      end;
    end;
  end;
```

ShowColumnHeaders (see page 3824)

ViewStyle (see page 3829)

27.1.31.5.4 TListColumn.ImageIndex Property

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

This is ImageIndex, a member of class TListColumn.

27.1.31.5.5 TListColumn.MaxWidth Property

Pascal

```
property MaxWidth: TWidth;
```

C++

```
__property TWidth MaxWidth;
```

Description

This is MaxWidth, a member of class TListColumn.

27.1.31.5.6 TListColumn.MinWidth Property

Pascal

```
property MinWidth: TWidth;
```

C++

```
__property TWidth MinWidth;
```

Description

This is MinWidth, a member of class TListColumn.

27.1.31.5.7 TListColumn.Tag Property

Pascal

```
property Tag: Integer;
```

C++

```
__property int Tag;
```

Description

This is Tag, a member of class TListColumn.

27.1.31.5.8 TListColumn.Width Property

Specifies the width of the column.

Pascal

```
property Width: TWidth;
```

C++

```
__property TWidth Width;
```

Description

The Width property determines the default width of the column, in pixels. List columns can be resized at runtime by dragging their borders.

Caption (see page 4242)

Columns (see page 3808)

AutoSize

27.1.31.5.9 TListColumn.WidthType Property

Pascal

```
property WidthType: TWidth;
```

C++

```
__property TWidth WidthType;
```

Description

This is WidthType, a member of class TListColumn.

27.1.32 TListColumns Class

TListColumns is a collection of TListColumn (see page 4236) objects.

Class Hierarchy

Pascal

```
TListColumns = class(TCollection);
```

C++

```
class TListColumns : public TCollection;
```

File

ComCtrls

Description

Each TListColumns represents a collection of TListColumn (see page 4236) objects in a TListView (see page 4285). At design time, use the list view control's Columns editor to add, remove, or modify columns.

See Also

TListColumn (see page 4236)

TListView (see page 4285)

TCustomListView (see page 3757)

27.1.32.1 TListColumns Members

The following tables list the members exposed by TListColumns.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 4248)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 4249)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 4248)	Creates a new TListColumn (see page 4236) instance and adds it to the Items (see page 4250) array.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 4247)	Creates and initializes a TListColumns (see page 4245) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 4249)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 4250)	Lists the columns in the collection.

27.1.32.2 TListColumns.Create Constructor

Creates and initializes a TListColumns (see page 4245) object.

Pascal

```
constructor Create(AOwner: TCustomListView);
```

C++

```
__fastcall TListColumns(TCustomListView AOwner);
```

Description

Applications should not need to call the Create method directly. Instances of TListView (see page 4285) create the TListColumns (see page 4245) object from their own constructors. The AOwner parameter is the TListView (see page 4285) instance that uses the TListColumns (see page 4245) object to implement its Columns property.

See Also

Columns (see page 3808)

27.1.32.3 TListColumns Methods

The methods of the TListColumns class are listed here.

Protected Methods

	Name	Description
	GetOwner (see page 4248)	Returns the owner of an object.
	Update (see page 4249)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Add (see page 4248)	Creates a new TListColumn (see page 4236) instance and adds it to the Items (see page 4250) array.
	Owner (see page 4249)	Returns the Owner of the collection.

27.1.32.3.1 TListColumns.Add Method

Creates a new TListColumn (see page 4236) instance and adds it to the Items (see page 4250) array.

Pascal

```
function Add: TListColumn;
```

C++

```
__fastcall TListColumn Add();
```

Description

Call Add to add a new list column to the end of the items array. Add returns the new list column. At design time, use the list view control's Columns editor to add columns to the list view.

See Also

Items (see page 4250)

Columns (see page 3808)

27.1.32.3.2 TListColumns.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath (see page 2932)

TCollection (see page 2731)

TComponent (see page 2762)

Owner (see page 2807)

27.1.32.3.3 TListColumns.Owner Method

Returns the Owner of the collection.

Pascal

```
function Owner: TCustomListView;
```

C++

```
__fastcall TCustomListView Owner();
```

Description

Call Owner to obtain a reference to the list view that owns this collection.

27.1.32.3.4 TListColumns.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem Item);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

See Also

Changed (see page 2740)

Changed (see page 2758)

27.1.32.4 TListColumns Properties

The properties of the TListColumns class are listed here.

Public Properties

	Name	Description
	Items (see page 4250)	Lists the columns in the collection.

27.1.32.4.1 TListColumns.Items Property

Lists the columns in the collection.

Pascal

```
property Items [Index: Integer]: TListColumn;
```

C++

```
__property TListColumn Items[int Index];
```

Description

Use Items to directly access the list column objects in the collection. The value of the Index parameter corresponds to the Index property of TListColumn (see page 4236). It represents the position of the column in the list view.

See Also

Count (see page 2749)

operator_[]

27.1.33 TListItem Class

TListItem is an individual item of a TListView (see page 4285) control.

Class Hierarchy

Pascal

```
TListItem = class(TPersistent);
```

C++

```
class TListItem : public TPersistent;
```

File

ComCtrls

Description

Use TListItem to specify the appearance and data associations of an item in a list view. All the list items of the list view are collected by a TListItems (see page 4270) object to make up the Items property of the TListView (see page 4285) control.

See Also

TListItems (see page 4270)

TListView (see page 4285)

27.1.33.1 TListItem Members

The following tables list the members exposed by TListItem.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 4253)	Copies the properties of another list item.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CancelEdit (see page 4254)	Cancels the editing of the list item's caption.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 4252)	Creates an instance of TListItem (see page 4250).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 4254)	Deletes the list item from its list view.
	Destroy (see page 4252)	Destroys an instance of TListItem (see page 4250).
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DisplayRect (see page 4254)	Returns the bounding rectangle of the list item.
	EditCaption (see page 4255)	Begins in-place editing of the list item's caption.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetPosition (see page 4255)	Returns the position of the list item as a point.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MakeVisible (see page 4256)	Scrolls the list view, if necessary, to ensure a list item is in view.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetPosition (see page 4256)	Positions the list item in its list view control.

	Update (see page 4256)	Updates the image of the list item in the list view display.
	WorkArea (see page 4257)	Returns the work area (if any) that contains the list item.

Public Properties

	Name	Description
	Caption (see page 4258)	Specifies the text that labels the item in the list.
	Checked (see page 4258)	Determines whether a check mark appears next to the list item.
	Cut (see page 4259)	Determines whether the list item is drawn as if it is selected for a cut operation.
	Data (see page 4259)	Specifies any application-specific data associated with the list item.
R	Deleting (see page 4260)	Indicates whether an item's Destroy (see page 4252) method has been called and the item is in the process of being deleted.
	DropTarget (see page 4260)	Determines whether the list item appears selected as a drag and drop target.
	Focused (see page 4260)	Indicates whether the list item has input focus.
R	Handle (see page 4261)	Indicates the window handle of the list view that displays the list item.
	ImageIndex (see page 4261)	Determines which image is displayed as the icon for the list item.
	Indent (see page 4263)	Specifies how far the list item is indented.
R	Index (see page 4264)	Indicates the position of the list item in the TListItems (see page 4270) collection.
	Left (see page 4265)	Specifies the distance, in pixels, from the left edge of the list view to the left edge of the list item.
R	ListView (see page 4265)	Indicates the list view control that displays the list item.
	OverlayIndex (see page 4266)	Determines which image from the image list is used as an overlay mask.
R	Owner (see page 4266)	Specifies the TListItems (see page 4270) object that owns the list item.
	Position (see page 4267)	Specifies the position of the list item.
	Selected (see page 4267)	Indicates whether the list item is selected.
	StateIndex (see page 4267)	Specifies which image from the StateImages image list to display for the item.
	SubItemImages (see page 4268)	Indicates which images (if any) should appear next to subitems of the item.
	SubItems (see page 4268)	Contains any strings that appear as subitems to the list item.
	Top (see page 4270)	Specifies the distance, in pixels, from the top of the list view to the top of the list item.

27.1.33.2 TListItem.Create Constructor

Creates an instance of TListItem (see page 4250).

Pascal

```
constructor Create(AOwner: TListItems);
```

C++

```
__fastcall TListItem(TListItems AOwner);
```

Description

Call Create to instantiate a TListItem (see page 4250) object at runtime. List items added to the list view at design time are created automatically. At runtime, use the Add method of the TListItems (see page 4270) object to create a list item and add it to the list view.

See Also

Add (see page 4273)

27.1.33.3 TListItem.Destroy Destructor

Destroys an instance of TListItem (see page 4250).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TListItem();
```

Description

Do not call Destroy directly. Instead, use Delete (see page 4254), which removes the item from the list view windows before freeing the associated memory.

See Also

Delete (see page 4254)

Free (see page 22300)

27.1.33.4 TListItem Methods

The methods of the TListItem class are listed here.

Public Methods

	Name	Description
	Assign (see page 4253)	Copies the properties of another list item.
	CancelEdit (see page 4254)	Cancels the editing of the list item's caption.
	Delete (see page 4254)	Deletes the list item from its list view.
	DisplayRect (see page 4254)	Returns the bounding rectangle of the list item.
	EditCaption (see page 4255)	Begins in-place editing of the list item's caption.
	GetPosition (see page 4255)	Returns the position of the list item as a point.
	MakeVisible (see page 4256)	Scrolls the list view, if necessary, to ensure a list item is in view.
	SetPosition (see page 4256)	Positions the list item in its list view control.
	Update (see page 4256)	Updates the image of the list item in the list view display.
	WorkArea (see page 4257)	Returns the work area (if any) that contains the list item.

27.1.33.4.1 TListItem.Assign Method

Copies the properties of another list item.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

It the Source parameter is a TListItem (see page 4250) object, Assign copies its Caption (see page 4258), Data (see page 4259), ImageIndex (see page 4261), OverlayIndex (see page 4266), StateIndex (see page 4267), and SubItems (see page 4268) properties. Otherwise, Assign calls the inherited method so that any object that copies properties to a list item in its AssignTo method can do so.

See Also

Caption (see page 4258)

Data (see page 4259)

ImageIndex (see page 4261)

OverlayIndex (see page 4266)

StateIndex (see page 4267)

SubItems (see page 4268)

AssignTo (see page 2931)

27.1.33.4.2 TListItem.CancelEdit Method

Cancels the editing of the list item's caption.

Pascal

```
procedure CancelEdit;
```

C++

```
__fastcall CancelEdit();
```

Description

Call CancelEdit to end the editing of the item's caption, discarding any changes made by the user.

See Also

Caption (see page 4258)

EditCaption (see page 4255)

27.1.33.4.3 TListItem.Delete Method

Deletes the list item from its list view.

Pascal

```
procedure Delete;
```

C++

```
__fastcall Delete();
```

Description

Use the Delete method to delete a list item.

See Also

Destroy (see page 4252)

Free (see page 22300)

27.1.33.4.4 TListItem.DisplayRect Method

Returns the bounding rectangle of the list item.

Pascal

```
function DisplayRect(Code: TDisplayCode): TRect;
```

C++

```
__fastcall TRect DisplayRect(TDisplayCode Code);
```

Description

Use DisplayRect to get the coordinates of the list item in the client coordinates of the containing listview. The Code parameter

specifies what part of the item the bounding rectangle surrounds. These are the possible values for the Code parameter.

Value	Meaning
drBounds	Returns the bounding rectangle of the entire list item, including the icon and label.
drIcon	Returns the bounding rectangle of the icon or small icon.
drLabel	Returns the bounding rectangle of the item text.
drSelectBounds	Returns the union of the icon and label rectangles, but excludes columns in report view.

See Also

GetPosition (see page 4255)

Left (see page 4265)

Top (see page 4270)

27.1.33.4.5 TListItem.EditCaption Method

Begins in-place editing of the list item's caption.

Pascal

```
function EditCaption: Boolean;
```

C++

```
__fastcall Boolean EditCaption();
```

Description

Call EditCaption to put the list item into edit mode. Before bringing up the in-place editor for the item's caption, EditCaption makes the item the only selected item in the list view and gives it input focus.

See Also

CancelEdit (see page 4254)

Caption (see page 4258)

Focused (see page 4260)

Selected (see page 4267)

OnEdited (see page 3849)

OnEditing (see page 3850)

27.1.33.4.6 TListItem.GetPosition Method

Returns the position of the list item as a point.

Pascal

```
function GetPosition: TPoint;
```

C++

```
__fastcall TPoint GetPosition();
```

Description

Call GetPosition to obtain the upper left coordinate of the list item. GetPosition returns a point with the x coordinate set to the value of Left (see page 4265) and the y coordinate set to the value of Top (see page 4270).

See Also

DisplayRect (see page 4254)

Left (see page 4265)

SetPosition (see page 4256)

Top (see page 4270)

27.1.33.4.7 TListItem.MakeVisible Method

Scrolls the list view, if necessary, to ensure a list item is in view.

Pascal

```
procedure MakeVisible(PartialOK: Boolean);
```

C++

```
__fastcall MakeVisible(Boolean PartialOK);
```

Description

Call MakeVisible to ensure that the user can see the list item in the list view. The PartialOK parameter specifies whether the item must be entirely visible. If PartialOK is true, no scrolling occurs if the item is at least partially visible. If PartialOK is false, MakeVisible ensures that the entire list item is visible in the list view.

See Also

DisplayRect (see page 4254)

27.1.33.4.8 TListItem.SetPosition Method

Positions the list item in its list view control.

Pascal

```
procedure SetPosition(const Value: TPoint);
```

C++

```
__fastcall SetPosition(const TPoint Value);
```

Description

Call SetPosition to move the list item to a specified position. The Value parameter specifies the desired coordinates of the upper left corner of the list item.

Note: The list view control must have its ViewStyle property set to either vsIcon or vsSmallIcon.

See Also

DisplayRect (see page 4254)

Left (see page 4265)

Top (see page 4270)

ViewStyle (see page 3829)

27.1.33.4.9 TListItem.Update Method

Updates the image of the list item in the list view display.

Pascal

```
procedure Update;
```

C++

```
__fastcall Update();
```

Description

Call Update to update the image of the list view to reflect any changes made to the list item. Changing the Caption (see page 4258), position, or state of the list item automatically updates the list item's image.

See Also

Caption (see page 4258)

Cut (see page 4259)

Focused (see page 4260)

Left (see page 4265)

Selected (see page 4267)

Top (see page 4270)

27.1.33.4.10 TListItem.WorkArea Method

Returns the work area (if any) that contains the list item.

Pascal

```
function WorkArea: Integer;
```

C++

```
__fastcall int WorkArea();
```

Description

When the list view that contains the list item organizes its client area into separate rectangular work areas, each list item is associated with a single work area. WorkArea returns the index of this work area in the list maintained by the list view's WorkAreas property. If the list view does not use work areas, WorkArea returns –1.

To change the work area of a list item, move it into a position of the list view's client area that is covered by a different work area.

Note: Work areas are not supported if the application is running in virtual mode.

See Also

WorkAreas (see page 3833)

TWorkArea (see page 5425)

Position (see page 4267)

27.1.33.5 TListItem Properties

The properties of the TListItem class are listed here.

Public Properties

	Name	Description
	Caption (see page 4258)	Specifies the text that labels the item in the list.

	Checked (see page 4258)	Determines whether a check mark appears next to the list item.
	Cut (see page 4259)	Determines whether the list item is drawn as if it is selected for a cut operation.
	Data (see page 4259)	Specifies any application-specific data associated with the list item.
R	Deleting (see page 4260)	Indicates whether an item's Destroy (see page 4252) method has been called and the item is in the process of being deleted.
	DropTarget (see page 4260)	Determines whether the list item appears selected as a drag and drop target.
	Focused (see page 4260)	Indicates whether the list item has input focus.
R	Handle (see page 4261)	Indicates the window handle of the list view that displays the list item.
	ImageIndex (see page 4261)	Determines which image is displayed as the icon for the list item.
	Indent (see page 4263)	Specifies how far the list item is indented.
R	Index (see page 4264)	Indicates the position of the list item in the TListItems (see page 4270) collection.
	Left (see page 4265)	Specifies the distance, in pixels, from the left edge of the list view to the left edge of the list item.
R	ListView (see page 4265)	Indicates the list view control that displays the list item.
	OverlayIndex (see page 4266)	Determines which image from the image list is used as an overlay mask.
R	Owner (see page 4266)	Specifies the TListItems (see page 4270) object that owns the list item.
	Position (see page 4267)	Specifies the position of the list item.
	Selected (see page 4267)	Indicates whether the list item is selected.
	StateIndex (see page 4267)	Specifies which image from the StateImages image list to display for the item.
	SubItemImages (see page 4268)	Indicates which images (if any) should appear next to subitems of the item.
	SubItems (see page 4268)	Contains any strings that appear as subitems to the list item.
	Top (see page 4270)	Specifies the distance, in pixels, from the top of the list view to the top of the list item.

27.1.33.5.1 TListItem.Caption Property

Specifies the text that labels the item in the list.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to name the list item. The Caption appears with an associated image that depends on the ViewStyle property of the list view.

If the ReadOnly property of the list view is false, the user can edit the caption.

See Also

ImageIndex (see page 4261)

ReadOnly (see page 3821)

ViewStyle (see page 3829)

27.1.33.5.2 TListItem.Checked Property

Determines whether a check mark appears next to the list item.

Pascal

```
property Checked: Boolean;
```

C++

```
__property Boolean Checked;
```

Description

Use Checked to indicate whether the list item represents a selected option by displaying a check mark next to the item in the list view. When Checked is true, a check mark appears next to the item. When Checked is false, no check mark appears.

Note: Set the CheckBoxes property of the List View to true before using the Checked property.

See Also

Selected (see page 4267)

StateIndex (see page 4267)

Checkboxes (see page 3805)

27.1.33.5.3 TListItem.Cut Property

Determines whether the list item is drawn as if it is selected for a cut operation.

Pascal

```
property Cut: Boolean;
```

C++

```
__property Boolean Cut;
```

Description

Set the Cut property to give the list item the grayed-out appearance of an item selected for cutting. Cut does not copy the item to the Clipboard or remove it from the list: the application must still perform these operations.

See Also

DropTarget (see page 4260)

Selected (see page 4267)

StateIndex (see page 4267)

27.1.33.5.4 TListItem.Data Property

Specifies any application-specific data associated with the list item.

Pascal

```
property Data: Pointer;
```

C++

```
__property void * Data;
```

Description

Use Data to associate arbitrary data structure with the list item. When the user selects or deletes the list item, Data allows the application to quickly access information about the meaning of the list item to implement the appropriate response.

See Also

Delete (see page 4254)

Selected (see page 4267)

27.1.33.5.5 TListItem.Deleting Property

Indicates whether an item's Destroy (see page 4252) method has been called and the item is in the process of being deleted.

Pascal

```
property Deleting: Boolean;
```

C++

```
__property Boolean Deleting;
```

Description

Deleting returns true if the item object is in the process of being deleted. Use Deleting to prevent infinite recursion in event handlers.

See Also

Destroy (see page 4252)

OnDeletion (see page 3848)

27.1.33.5.6 TListItem.DropTarget Property

Determines whether the list item appears selected as a drag and drop target.

Pascal

```
property DropTarget: Boolean;
```

C++

```
__property Boolean DropTarget;
```

Description

Use DropTarget to display the list item as the current drop target of the object the user is dragging. Setting DropTarget to true sets the DropTarget property of all other items in the list view to false.

See Also

Cut (see page 4259)

StateIndex (see page 4267)

27.1.33.5.7 TListItem.Focused Property

Indicates whether the list item has input focus.

Pascal

```
property Focused: Boolean;
```

C++

```
__property Boolean Focused;
```

Description

Set Focused to true to allow the user to edit the Caption (see page 4258).

Note: Only one item in the view should have focus at a time. When setting Focused to true, be sure to set the Focused property of all other items in the list view to false. When the list item is Focused, it appears surrounded by a standard focus rectangle.

See Also

Caption (see page 4258)

Selected (see page 4267)

27.1.33.5.8 TListItem.Handle Property

Indicates the window handle of the list view that displays the list item.

Pascal

```
property Handle: HWND;
```

C++

```
__property HWND Handle;
```

Description

A window handle identifies a the window to the underlying API. Handle is a read-only property containing the handle of the list view that displays the list item.

See Also

Handle (see page 6207)

27.1.33.5.9 TListItem.ImageIndex Property

Determines which image is displayed as the icon for the list item.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

Set ImageIndex to associate the list item with one of the images in the LargeImages or SmallImages property of the list view. If the ViewStyle of the list view is vsIcon, ImageIndex is the index of the image in the LargeImages property of the list view, where 0 specifies the first image. If the ViewStyle of the list view is vsSmallIcon, vsList, or vsReport, ImageIndex is the index of the image in the SmallImages property of the list view.

C++ Examples:

```
/*
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {"C++ Image", "Borland Image", "Delphi Image"};
  const char Col2Array[3][40] = {"Documentation for the C++ icon.", "Borland icon.", "Delphi
icon."};
  // Create a ListView item for each image in the ImageList
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
    Item = ListView1->Items->Add();
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 1";
  Column->Width = 200;
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 2";
  Column->Width = 200;
  // Add View styles and constants to the Combo Box
  ComboBox1->Items->AddObject("vsIcon", (TObject *)vsIcon);
  ComboBox1->Items->AddObject("vsList", (TObject *)vsList);
  ComboBox1->Items->AddObject("vsReport", (TObject *)vsReport);
  ComboBox1->Items->AddObject("vsSmallIcon", (TObject *)vsSmallIcon);
  // Display first item in the Combo Box
  ComboBox1->ItemIndex = 0;
}

void __fastcall TForm1::ComboBox1Click(TObject *Sender)
{
  ListView1->ViewStyle = (TViewStyle) ComboBox1->Items->Objects[ComboBox1->ItemIndex];
}
```

Delphi Examples:

```
{
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. You can use *.bmp or *.ico files from the
\Images\Icons directory. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
}

procedure TComboForm.FormCreate(Sender: TObject);
var
  I: Integer;
  ListItem: TListItem;
  NewColumn: TListColumn;
begin
  Col2Array[0]:= 'Documentation for Image0.';
  Col2Array[1]:= 'Documentation for Image1.';
  Col2Array[2]:= 'Documentation for Image2.';
  // Create a ListView item for each image in the ImageList
  with ListView1 do
  begin
```

```
      SmallImages := ImageList1;
      LargeImages := ImageList1;
      for I := 0 to ImageList1.Count - 1 do
      begin
        ListItem := Items.Add;
        Listitem.Caption := 'Image' + IntToStr(I);
        ListItem.ImageIndex := I;
        Listitem.SubItems.Add(Col2Array[I]);
      end;
      // Create two columns to show during viewing as vsReport
      NewColumn := Columns.Add;
      NewColumn.Caption := 'Column 1';
      NewColumn.Width := 200;
      NewColumn := Columns.Add;
      NewColumn.Caption := 'Column 2';
      NewColumn.Width := 200;
      // Add View styles and constants to the Combo Box
      ComboBox1.Items.AddObject('vsIcon', TObject(vsIcon));
      ComboBox1.Items.AddObject('vsList', TObject(vsList));
      ComboBox1.Items.AddObject('vsReport', TObject(vsReport));
      ComboBox1.Items.AddObject(
        'vsSmallIcon', TObject(vsSmallIcon));
      // Display first item in the Combo Box
      ComboBox1.ItemIndex := 0;
    end;
  end;

  procedure TComboForm.ComboBox1Click(Sender: TObject);
  begin
    with ComboBox1 do
      ListView1.ViewStyle := TViewStyle(Items.Objects[ItemIndex]);

  end;
```

See Also

OverlayIndex (see page 4266)

StateIndex (see page 4267)

LargeImages (see page 3817)

SmallImages (see page 3825)

ViewStyle (see page 3829)

27.1.33.5.10 TListItem.Indent Property

Specifies how far the list item is indented.

Pascal

```
property Indent: Integer;
```

C++

```
__property int Indent;
```

Description

Use Indent to get or set how far the list item is indented when the listview's ViewStyle property is vsReport. Indent specifies the factor times which the Width property of the SmallImages image list is multiplied to obtain the indent in a report style list view. That is, items are indented by

```
Indent*ListView.SmallImages.Width.
Indent*ListView->SmallImages->Width
```

See Also

ViewStyle (see page 3829)

SmallImages (see page 3825)

Width (see page 15392)

27.1.33.5.11 TListItem.Index Property

Indicates the position of the list item in the TListItems (see page 4270) collection.

Pascal

```
property Index: Integer;
```

C++

```
__property int Index;
```

Description

Use Index to locate the item in the list view. The first item has an index of 0, the second item has an index of 1, and so on.

C++ Examples:

```
/*
The following example inserts a list item after the selected
item in the list view.  Place a TButton, a TEdit and a
TListView in the form.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TListItem *InsertItem;
  if (ListView1->Selected == NULL) return;
  InsertItem =
    ListView1->Items->Insert(ListView1->Selected->Index);
  InsertItem->Caption = Edit1->Text;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *ListItem;
  ListView1->ViewStyle = vsList;
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Apples";
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Oranges";
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Pears";
}
```

Delphi Examples:

```
{
The following example inserts a list item after the selected
item in the list view.  Place a TButton, a TEdit and a
TListView in the form.
}
procedure TForm1.Button1Click(Sender: TObject);
var InsertItem : TListItem;
begin
  with ListView1 do
  begin
    if (Selected = nil) then exit;
    InsertItem := Items.Insert(Selected.Index);
  end;
```

```
    InsertItem.Caption := Edit1.Text;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  var ListItem : TListItem;
  begin
    ListView1.ViewStyle := vsList;
    ListItem := ListView1.Items.Add;
    ListItem.Caption := 'Apples';
    ListItem := ListView1.Items.Add;
    ListItem.Caption := 'Oranges';
    ListItem := ListView1.Items.Add;
    ListItem.Caption := 'Pears';
  end;
```

See Also

Items (see page 3814)

TListItems (see page 4270)

27.1.33.5.12 TListItem.Left Property

Specifies the distance, in pixels, from the left edge of the list view to the left edge of the list item.

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

Use Left to horizontally position the list item within the list view. Only use the Left property when the ViewStyle property of the list view is vsIcon or vsSmallIcon.

See Also

DisplayRect (see page 4254)

GetPosition (see page 4255)

SetPosition (see page 4256)

Top (see page 4270)

ViewStyle (see page 3829)

27.1.33.5.13 TListItem.ListView Property

Indicates the list view control that displays the list item.

Pascal

```
property ListView: TCustomListView;
```

C++

```
__property TCustomListView ListView;
```

Description

Read ListView to access the list view object that displays the item. Use the properties and methods of the list view object to make changes that affect the list item or to manipulate other items in the list.

Do not confuse the ListView that displays the item with the Owner (see page 4266) of the item. The Owner (see page 4266) is the TListItems (see page 4270) object that manages the collection of all list items. The list view is the Owner (see page 4266) of that TListItems (see page 4270) object.

See Also

Owner (see page 4266)

TListView (see page 4285)

27.1.33.5.14 TListItem.OverlayIndex Property

Determines which image from the image list is used as an overlay mask.

Pascal

```
property OverlayIndex: TImageIndex;
```

C++

```
__property TImageIndex OverlayIndex;
```

Description

Use OverlayIndex to display an overlay mask on an item in the list when the ViewStyle of the list view is vsIcon or vsSmallIcon. OverlayIndex is the index of the overlay image in the StateImages property of the list view.

An overlay mask is an image drawn transparently over the icon for the item in the list view. For example, to indicate that an item is no longer available, an application could use an overlay image of an X over the item's image.

See Also

ImageIndex (see page 4261)

StateIndex (see page 4267)

StateImages (see page 3828)

ViewStyle (see page 3829)

27.1.33.5.15 TListItem.Owner Property

Specifies the TListItems (see page 4270) object that owns the list item.

Pascal

```
property Owner: TListItems;
```

C++

```
__property TListItems Owner;
```

Description

Use Owner to access the TListItems (see page 4270) object that manages all the list items for the list view. Use the methods of the Owner object to temporarily prevent updates to the image of the list item while it is changed or to add or delete list items.

Do not confuse the Owner property with the list view control that displays the item. The ListView (see page 4265) property specifies the list view control that owns the TListItems (see page 4270) object.

See Also

ListView (see page 4265)

27.1.33.5.16 TListItem.Position Property

Specifies the position of the list item.

Pascal

```
property Position: TPoint;
```

C++

```
__property TPoint Position;
```

Description

Use Position to get or set the position of the list item. Position indicates the position, in client coordinates, of the list item's icon in the client area of the parent list view.

Note: Position has no effect unless the list view has a ViewStyle of vsIcon or vsSmallIcon.

See Also

ViewStyle (see page 3829)

27.1.33.5.17 TListItem.Selected Property

Indicates whether the list item is selected.

Pascal

```
property Selected: Boolean;
```

C++

```
__property Boolean Selected;
```

Description

Use Selected to select or unselect the list item. If the MultiSelect property of the list view is false, setting Selected to true sets the Selected property of all other list items in the list view to false. The appearance of a selected item depends on whether it has focus and whether the system colors are used for selection.

See Also

Focused (see page 4260)

MultiSelect (see page 3820)

27.1.33.5.18 TListItem.StateIndex Property

Specifies which image from the StateImages image list to display for the item.

Pascal

```
property StateIndex: TImageIndex;
```

C++

```
__property TImageIndex StateIndex;
```

Description

Set StateIndex to associate the list item with one of the images in the StateImages property of the list view, where 0 specifies the first image. Change StateIndex to display a different image when the state of the item changes.

The state image appears to the left of the normal list item.

See Also

ImageIndex (see page 4261)

StateImages (see page 3828)

27.1.33.5.19 TListItem.SubItemImages Property

Indicates which images (if any) should appear next to subitems of the item.

Pascal

```
property SubItemImages [Index: Integer]: Integer;
```

C++

```
__property int SubItemImages[int Index];
```

Description

Use SubItemImages to associate the subitems of this list item with images from the list view's SmallImages property, where 0 identifies the first image in SmallImages, 1 identifies the second image, and so on.

The Index (see page 4264) parameter identifies the subitem. It corresponds to the index of each subitem string in the SubItems (see page 4268) property.

The value of any subitem image index can be overridden in an OnGetSubItemImage event handler.

Note: Subitems are only visible when the list view's ViewStyle property is set to vsReport.

See Also

SmallImages (see page 3825)

SubItems (see page 4268)

OnGetSubItemImage (see page 3850)

27.1.33.5.20 TListItem.SubItems Property

Contains any strings that appear as subitems to the list item.

Pascal

```
property SubItems: TStrings;
```

C++

```
__property TStrings SubItems;
```

Description

Use SubItems to add strings that appear in the additional columns to the right of the list view item when the list view's ViewStyle property is vsReport. The TStrings object that implements the SubItems property is created when the list item is created. To the methods of the SubItems object to add or delete subitems.

Note: Subitems are only visible when the list view's ViewStyle property is set to vsReport.

C++ Examples:

```
/*
This example requires only a blank form.  All other objects:
TListView, TListColumns, TListItems, are created dynamically.
You must add comctrls to the uses defs file.
```

```
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  const char Names[6][2][10] =
   {{"Rubble","Barny"},
    {"Michael", "Johnson"},
    {"Bunny", "Bugs"},
    {"Silver", "HiHo"},
    {"Simpson", "Bart"},
    {"Squirrel", "Rocky"}};

  TListColumn  *NewColumn;
  TListItem  *ListItem;
  TListView   *ListView = new TListView(this);

  ListView->Parent = this;
  ListView->Align = alClient;
  ListView->ViewStyle = vsReport;
  NewColumn = ListView->Columns->Add();
  NewColumn->Caption = "Last";
  NewColumn = ListView->Columns->Add();
  NewColumn->Caption = "First";
  for (int i = 0; i < 6; i++)
  {
    ListItem = ListView->Items->Add();
    ListItem->Caption = Names[i][0];
    ListItem->SubItems->Add(Names[i][1]);
  }
}
```

Delphi Examples:

```
{
This example requires only a blank form.  All other objects:
TListView, TListColumns, TListItems, are created dynamically.
You must add comctrls to the uses clause of the unit file.
}
procedure TForm1.FormCreate(Sender: TObject);
const
  Names: array[0..5, 0..1] of string = (
    ('Rubble', 'Barney'),
    ('Michael', 'Johnson'),
    ('Bunny', 'Bugs'),
    ('Silver', 'HiHo'),
    ('Simpson', 'Bart'),
    ('Squirrel', 'Rocky')
    );

var
  I: Integer;
  NewColumn: TListColumn;
  ListItem: TListItem;
  ListView: TListView;
begin
  ListView := TListView.Create(Self);
  with ListView do
  begin
    Parent := Self;
    Align := alClient;
    ViewStyle := vsReport;

    NewColumn := Columns.Add;
    NewColumn.Caption := 'Last';
    NewColumn := Columns.Add;
    NewColumn.Caption := 'First';

    for I := Low(Names) to High(Names) do
```

```
      begin
        ListItem := Items.Add;
        ListItem.Caption := Names[I][0];
        ListItem.SubItems.Add(Names[I][1]);
      end;
    end;
  end;
```

See Also

ViewStyle (see page 3829)

27.1.33.5.21 TListItem.Top Property

Specifies the distance, in pixels, from the top of the list view to the top of the list item.

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

Description

Use Top to vertically position the list item within the list view. Only use the Top property when the ViewStyle property of the list view is vsIcon or vsSmallIcon.

See Also

DisplayRect (see page 4254)

GetPosition (see page 4255)

Left (see page 4265)

SetPosition (see page 4256)

ViewStyle (see page 3829)

27.1.34 TListItems Class

TListItems maintains the collection of items that appear in a list view control.

Class Hierarchy

Pascal

```
TListItems = class(TPersistent);
```

C++

```
class TListItems : public TPersistent;
```

File

ComCtrls

Description

Use the properties and methods of TListItems to manipulate the list of items displayed by a list view control. TListItems only lists the main items in the list view. Subitems are specified using a property of the individual TListItem (see page 4250) objects.

See Also

TListItem (see page 4250)

TListView (see page 4285)

27.1.34.1 TListItems Members

The following tables list the members exposed by TListItems.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CreateItem (see page 4276)	This is CreateItem, a member of class TListItems.
	DefineProperties (see page 4277)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetCount (see page 4278)	This is GetCount, a member of class TListItems.
	GetHandle (see page 4278)	This is GetHandle, a member of class TListItems.
	GetItem (see page 4278)	This is GetItem, a member of class TListItems.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCount (see page 4280)	Sets the number of list items.
	SetItem (see page 4280)	This is SetItem, a member of class TListItems.
	SetUpdateState (see page 4281)	This is SetUpdateState, a member of class TListItems.

Public Methods

	Name	Description
	Add (see page 4273)	Creates a new list item and adds it to the list view control.
	AddItem (see page 4275)	Adds an item in a specified location.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 4275)	Copies the list of list items from another TListItems (see page 4270) object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginUpdate (see page 4276)	Prevents updating of the list view until the EndUpdate (see page 4277) method is called.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 4276)	Removes all items from the list.
	Create (see page 4272)	Creates an instance of TListItems (see page 4270).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 4277)	Deletes a specified item and updates the list view accordingly.
	Destroy (see page 4272)	Destroys an instance of TListItems (see page 4270).
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 4277)	Reenables screen repainting that was turned off with the BeginUpdate (see page 4276) method.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 4278)	This is GetEnumerator, a member of class TListItems.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	IndexOf (see page 4278)	Returns the position of a list item in the list view window.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 4279)	Creates a new list item and inserts it into the list view.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Count (see page 4281)	Indicates the number of items in the Item (see page 4282) property array.
R	Handle (see page 4281)	Specifies the window handle for the list view that displays the items managed by TListItems (see page 4270).
	Item (see page 4282)	Lists all list items managed by the TListItems (see page 4270) object.
R	Owner (see page 4283)	Indicates the list view object that uses the list items object to manage its items.

27.1.34.2 TListItems.Create Constructor

Creates an instance of TListItems (see page 4270).

Pascal

```
constructor Create(AOwner: TCustomListView);
```

C++

```
__fastcall TListItems(TCustomListView AOwner);
```

Description

Create instantiates a TListItems (see page 4270) object. This constructor is rarely used in application code, because the list view object creates the list items object as needed.

See Also

Items (see page 3814)

27.1.34.3 TListItems.Destroy Destructor

Destroys an instance of TListItems (see page 4270).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TListItems();
```

Description

Do not call Destroy directly. Instead, call Free, which verifies that the TListItems (see page 4270) reference is not nil before calling Destroy

Destroy~TListItems (see page 4270) frees the list before calling the inherited destructor.

See Also

Free (see page 22300)

27.1.34.4 TListItems Methods

The methods of the TListItems class are listed here.

Protected Methods

	Name	Description
	CreateItem (see page 4276)	This is CreateItem, a member of class TListItems.
	DefineProperties (see page 4277)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetCount (see page 4278)	This is GetCount, a member of class TListItems.
	GetHandle (see page 4278)	This is GetHandle, a member of class TListItems.
	GetItem (see page 4278)	This is GetItem, a member of class TListItems.
	SetCount (see page 4280)	Sets the number of list items.
	SetItem (see page 4280)	This is SetItem, a member of class TListItems.
	SetUpdateState (see page 4281)	This is SetUpdateState, a member of class TListItems.

Public Methods

	Name	Description
	Add (see page 4273)	Creates a new list item and adds it to the list view control.
	AddItem (see page 4275)	Adds an item in a specified location.
	Assign (see page 4275)	Copies the list of list items from another TListItems (see page 4270) object.
	BeginUpdate (see page 4276)	Prevents updating of the list view until the EndUpdate (see page 4277) method is called.
	Clear (see page 4276)	Removes all items from the list.
	Delete (see page 4277)	Deletes a specified item and updates the list view accordingly.
	EndUpdate (see page 4277)	Reenables screen repainting that was turned off with the BeginUpdate (see page 4276) method.
	GetEnumerator (see page 4278)	This is GetEnumerator, a member of class TListItems.
	IndexOf (see page 4278)	Returns the position of a list item in the list view window.
	Insert (see page 4279)	Creates a new list item and inserts it into the list view.

27.1.34.4.1 TListItems.Add Method

Creates a new list item and adds it to the list view control.

Pascal

```
function Add: TListItem;
```

C++

```
__fastcall TListItem Add();
```

Description

Call Add to add a new list item to the end of the list. Add returns the newly created TListItem (see page 4250) object.

To create an item and insert it into the beginning or middle of the list, use the Insert (see page 4279) method instead.

C++ Examples:

```
/*
This example requires only a blank form.  All other objects:
TListView, TListColumns, TListItems, are created dynamically.
```

```
You must add comctrls to the uses defs file.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  const char Names[6][2][10] =
   {{"Rubble","Barny"},
    {"Michael", "Johnson"},
    {"Bunny", "Bugs"},
    {"Silver", "HiHo"},
    {"Simpson", "Bart"},
    {"Squirrel", "Rocky"}};

  TListColumn  *NewColumn;
  TListItem  *ListItem;
  TListView   *ListView = new TListView(this);

  ListView->Parent = this;
  ListView->Align = alClient;
  ListView->ViewStyle = vsReport;
  NewColumn = ListView->Columns->Add();
  NewColumn->Caption = "Last";
  NewColumn = ListView->Columns->Add();
  NewColumn->Caption = "First";
  for (int i = 0; i < 6; i++)
  {
    ListItem = ListView->Items->Add();
    ListItem->Caption = Names[i][0];
    ListItem->SubItems->Add(Names[i][1]);
  }
}
```

Delphi Examples:

```
{
This example requires only a blank form.  All other objects:
TListView, TListColumns, TListItems, are created dynamically.
You must add comctrls to the uses clause of the unit file.
}
procedure TForm1.FormCreate(Sender: TObject);
const
  Names: array[0..5, 0..1] of string = (
    ('Rubble', 'Barney'),
    ('Michael', 'Johnson'),
    ('Bunny', 'Bugs'),
    ('Silver', 'HiHo'),
    ('Simpson', 'Bart'),
    ('Squirrel', 'Rocky')
    );

var
  I: Integer;
  NewColumn: TListColumn;
  ListItem: TListItem;
  ListView: TListView;
begin
  ListView := TListView.Create(Self);
  with ListView do
  begin
    Parent := Self;
    Align := alClient;
    ViewStyle := vsReport;

    NewColumn := Columns.Add;
    NewColumn.Caption := 'Last';
    NewColumn := Columns.Add;
    NewColumn.Caption := 'First';
```

```
      for I := Low(Names) to High(Names) do
      begin
        ListItem := Items.Add;
        ListItem.Caption := Names[I][0];
        ListItem.SubItems.Add(Names[I][1]);
      end;
    end;
  end;
```

See Also

AddItem (see page 4275)

Delete (see page 4277)

Insert (see page 4279)

27.1.34.4.2 TListItems.AddItem Method

Adds an item in a specified location.

Pascal

```
function AddItem(Item: TListItem; Index: Integer = -1): TListItem;
```

C++

```
__fastcall TListItem AddItem(TListItem Item, int Index = -1);
```

Description

Call AddItem to add an Item (see page 4282) at any place in the list. The properties of Item (see page 4282) are duplicated if Item (see page 4282) is not nil. Index is location of the added item; if Index is negative, the TListItem (see page 4250) is appended to the end of the list.

AddItem returns the TListItem (see page 4250) that was added.

See Also

Add (see page 4273)

Delete

Insert (see page 4279)

27.1.34.4.3 TListItems.Assign Method

Copies the list of list items from another TListItems (see page 4270) object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the list of items from another object. If the Source parameter specifies another TListItems (see page 4270) object, Assign discards the current value of Item (see page 4282) and rebuilds the list by copying the items maintained by Source. If Source is any other type of object, Assign calls the inherited method, which will copy the list from any object that specifies how to copy to a TListItems (see page 4270) object in its AssignTo method.

See Also

Item (see page 4282)

AssignTo (see page 2931)

27.1.34.4.4 TListItems.BeginUpdate Method

Prevents updating of the list view until the EndUpdate (see page 4277) method is called.

Pascal

```
procedure BeginUpdate;
```

C++

```
__fastcall BeginUpdate();
```

Description

Call BeginUpdate before making multiple changes to the list of items. When all changes are complete, call EndUpdate (see page 4277) so that the changes can be reflected on screen. BeginUpdate and EndUpdate (see page 4277) prevent excessive redraws and speed processing time when new items are added, deleted, or inserted.

See Also

EndUpdate (see page 4277)

27.1.34.4.5 TListItems.Clear Method

Removes all items from the list.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the list view of all items. Clear frees all memory associated with the list items and updates the image of the list view.

See Also

Delete (see page 4277)

27.1.34.4.6 TListItems.CreateItem Method

Pascal

```
function CreateItem(Index: Integer; ListItem: TListItem): TLVItem;
```

C++

```
__fastcall TLVItem CreateItem(int Index, TListItem ListItem);
```

Description

This is CreateItem, a member of class TListItems.

27.1.34.4.7 TListItems.DefineProperties Method

Provides an interface for a method that reads and writes otherwise unpublished data.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TListItems (see page 4270) overrides DefineProperties in order to persist individual items.

See Also

DefineProperties (see page 2931)

27.1.34.4.8 TListItems.Delete Method

Deletes a specified item and updates the list view accordingly.

Pascal

```
procedure Delete(Index: Integer);
```

C++

```
__fastcall Delete(int Index);
```

Description

The Delete method deletes the item in the list view specified with the Index parameter. The first item has an index of 0, the second item has an index of 1, and so on.

See Also

Add (see page 4273)

Clear (see page 4276)

Insert (see page 4279)

Item (see page 4282)

27.1.34.4.9 TListItems.EndUpdate Method

Reenables screen repainting that was turned off with the BeginUpdate (see page 4276) method.

Pascal

```
procedure EndUpdate;
```

C++

```
__fastcall EndUpdate();
```

Description

Call EndUpdate after completing changes to the list that were begun with a call to the BeginUpdate (see page 4276) method. When every call to BeginUpdate (see page 4276) is matched by a subsequent call to EndUpdate, the list view image updates to reflect all changes that occurred while repaints were disabled.

See Also

BeginUpdate (see page 4276)

27.1.34.4.10 TListItems.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class TListItems.

27.1.34.4.11 TListItems.GetEnumerator Method

Pascal

```
function GetEnumerator: TListItemsEnumerator;
```

C++

```
__fastcall TListItemsEnumerator GetEnumerator();
```

Description

This is GetEnumerator, a member of class TListItems.

27.1.34.4.12 TListItems.GetHandle Method

Pascal

```
function GetHandle: HWND;
```

C++

```
__fastcall HWND GetHandle();
```

Description

This is GetHandle, a member of class TListItems.

27.1.34.4.13 TListItems.GetItem Method

Pascal

```
function GetItem(Index: Integer): TListItem;
```

C++

```
__fastcall TListItem GetItem(int Index);
```

Description

This is GetItem, a member of class TListItems.

27.1.34.4.14 TListItems.IndexOf Method

Returns the position of a list item in the list view window.

Pascal

```
function IndexOf(Value: TListItem): Integer;
```

C++

```
__fastcall int IndexOf(TListItem Value);
```

Description

Call IndexOf to determine the position of the list item specified by the Value parameter. IndexOf returns -1 if the list item is not in the list view.

See Also

Item (see page 4282)

TListItem (see page 4250)

27.1.34.4.15 TListItems.Insert Method

Creates a new list item and inserts it into the list view.

Pascal

```
function Insert(Index: Integer): TListItem;
```

C++

```
__fastcall TListItem Insert(int Index);
```

Description

Call Insert to insert a new TListItem (see page 4250) object into the list view at the specified Index. Insert returns the list item that is inserted.

C++ Examples:

```
/*
The following example inserts a list item after the selected
item in the list view.  Place a TButton, a TEdit and a
TListView in the form.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TListItem *InsertItem;
  if (ListView1->Selected == NULL) return;
  InsertItem =
    ListView1->Items->Insert(ListView1->Selected->Index);
  InsertItem->Caption = Edit1->Text;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *ListItem;
  ListView1->ViewStyle = vsList;
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Apples";
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Oranges";
  ListItem = ListView1->Items->Add();
  ListItem->Caption = "Pears";
}
```

Delphi Examples:

```
{
The following example inserts a list item after the selected
```

```
  item in the list view.  Place a TButton, a TEdit and a
  TListView in the form.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  var InsertItem : TListItem;
  begin
    with ListView1 do
    begin
      if (Selected = nil) then exit;
      InsertItem := Items.Insert(Selected.Index);
    end;
    InsertItem.Caption := Edit1.Text;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  var ListItem : TListItem;
  begin
    ListView1.ViewStyle := vsList;
    ListItem := ListView1.Items.Add;
    ListItem.Caption := 'Apples';
    ListItem := ListView1.Items.Add;
    ListItem.Caption := 'Oranges';
    ListItem := ListView1.Items.Add;
    ListItem.Caption := 'Pears';
  end;
```

See Also

Add (see page 4273)

Delete (see page 4277)

27.1.34.4.16 TListItems.SetCount Method

Sets the number of list items.

Pascal

```
procedure SetCount(Value: Integer);
```

C++

```
__fastcall SetCount(int Value);
```

Description

Call SetCount to set the number of list items.

27.1.34.4.17 TListItems.SetItem Method

Pascal

```
procedure SetItem(Index: Integer; Value: TListItem);
```

C++

```
__fastcall SetItem(int Index, TListItem Value);
```

Description

This is SetItem, a member of class TListItems.

27.1.34.4.18 TListItems.SetUpdateState Method

Pascal

```
procedure SetUpdateState(Updating: Boolean);
```

C++

```
__fastcall SetUpdateState(Boolean Updating);
```

Description

This is SetUpdateState, a member of class TListItems.

27.1.34.5 TListItems Properties

The properties of the TListItems class are listed here.

Public Properties

	Name	Description
	Count (see page 4281)	Indicates the number of items in the Item (see page 4282) property array.
R	Handle (see page 4281)	Specifies the window handle for the list view that displays the items managed by TListItems (see page 4270).
	Item (see page 4282)	Lists all list items managed by the TListItems (see page 4270) object.
R	Owner (see page 4283)	Indicates the list view object that uses the list items object to manage its items.

27.1.34.5.1 TListItems.Count Property

Indicates the number of items in the Item (see page 4282) property array.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Use Count to determine the number of items displayed by the list view. Count provides an upper bound when iterating through the individual TListItem (see page 4250) objects in the Item (see page 4282) property array.

Set the Count when the list view's OwnerData property is false to make the control allocate its internal data structures for the specified number of items. This prevents the control from having to allocate the data structures every time an item is added.

Set the Count when the list view's OwnerData property is true to set the virtual number of items that the control contains.

See Also

Item (see page 4282)

27.1.34.5.2 TListItems.Handle Property

Specifies the window handle for the list view that displays the items managed by TListItems (see page 4270).

Pascal

```
property Handle: HWND;
```

C++

```
__property HWND Handle;
```

Description

Use Handle as a parameter for calls to the underlying API that require a window handle.

See Also

Owner (see page 4283)

27.1.34.5.3 TListItems.Item Property

Lists all list items managed by the TListItems (see page 4270) object.

Pascal

```
property Item [Index: Integer]: TListItem;
```

C++

```
__property TListItem Item[int Index];
```

Description

Use Item to directly access a list item, given its position in the list view. The first item has an index of 0, the second an index of 1, and so on.

C++ Examples:

```
/*
The following code uses Item to add the labels of all child
nodes of the selected node to a list box when a button is
clicked.  This example requires a button, a listbox, and a
populated treeview.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < TreeView1->Selected->Count; i++)
    ListBox1->Items->Add(TreeView1->Selected->Item[i]->Text);
}
```

Delphi Examples:

```
{
The following code uses Item to add the labels of all child
nodes of the selected node to a list box when a button is
clicked.  This example requires a button, a listbox, and a
populated treeview.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I : Integer;
begin
  for I := 0 to (TreeView1.Selected.Count - 1) do
    ListBox1.Items.Add(TreeView1.Selected.Item[I].Text);
end;
```

See Also

Count (see page 4281)

IndexOf (see page 4278)

operator_[]

27.1.34.5.4 TListItems.Owner Property

Indicates the list view object that uses the list items object to manage its items.

Pascal

```
property Owner: TCustomListView;
```

C++

```
__property TCustomListView Owner;
```

Description

Use Owner to access the list view object that uses this TListItems (see page 4270) object to implement its Items property.

See Also

Items (see page 3814)

27.1.35 TListItemsEnumerator Class

Class Hierarchy

ComCtrls.TListItemsEnumerator

Pascal

```
TListItemsEnumerator = class;
```

C++

```
class TListItemsEnumerator;
```

File

ComCtrls

Description

This is class ComCtrls.TListItemsEnumerator.

27.1.35.1 TListItemsEnumerator Members

The following tables list the members exposed by TListItemsEnumerator.

Public Methods

	Name	Description
	Create (see page 4284)	This is Create, a member of class TListItemsEnumerator.
	GetCurrent (see page 4284)	This is GetCurrent, a member of class TListItemsEnumerator.
	MoveNext (see page 4284)	This is MoveNext, a member of class TListItemsEnumerator.

Public Properties

	Name	Description
R	Current (see page 4285)	This is Current, a member of class TListItemsEnumerator.

27.1.35.2 TListItemsEnumerator.Create Constructor

Pascal

```
constructor Create(AListItems: TListItems);
```

C++

```
__fastcall TListItemsEnumerator(TListItems AListItems);
```

Description

This is Create, a member of class TListItemsEnumerator.

27.1.35.3 TListItemsEnumerator Methods

The methods of the TListItemsEnumerator class are listed here.

Public Methods

	Name	Description
	GetCurrent (see page 4284)	This is GetCurrent, a member of class TListItemsEnumerator.
	MoveNext (see page 4284)	This is MoveNext, a member of class TListItemsEnumerator.

27.1.35.3.1 TListItemsEnumerator.GetCurrent Method

Pascal

```
function GetCurrent: TListItem;
```

C++

```
__fastcall TListItem GetCurrent();
```

Description

This is GetCurrent, a member of class TListItemsEnumerator.

27.1.35.3.2 TListItemsEnumerator.MoveNext Method

Pascal

```
function MoveNext: Boolean;
```

C++

```
__fastcall Boolean MoveNext();
```

Description

This is MoveNext, a member of class TListItemsEnumerator.

27.1.35.4 TListItemsEnumerator Properties

The properties of the TListItemsEnumerator class are listed here.

Public Properties

	Name	Description
R	Current (see page 4285)	This is Current, a member of class TListItemsEnumerator.

27.1.35.4.1 TListItemsEnumerator.Current Property

Pascal

```
property Current: TListItem;
```

C++

```
__property TListItem Current;
```

Description

This is Current, a member of class TListItemsEnumerator.

27.1.36 TListView Class

TListView displays a list of items in various ways.

Class Hierarchy

Pascal

```
TListView = class(TCustomListView);
```

C++

```
class TListView : public TCustomListView;
```

File

ComCtrls

Description

Use TListView to manage and display a list of items in a form. The items can be displayed in columns with column headers and sub-items, or vertically or horizontally, with small or large icons.

TListView publishes many of the properties, events, and methods of TCustomListView (see page 3757), but does not introduce any new behavior.

27.1.36.1 TListView Members

The following tables list the members exposed by TListView.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnCreateItemClass (see page 3844)	Occurs when a list item object is about to be created.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FMultiSelect (see page 5956)	This is FMultiSelect, a member of class TCustomMultiSelectListControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActionChange (see page 3773)	Responds when the action for which this list view is a client changes.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.

	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanChange (see page 3777)	Specifies whether the properties of a list item can be changed.
	CanEdit (see page 3778)	Specifies whether the text of a list item can be changed by the user.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 3778)	Generates an OnChange (see page 3836) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 3778)	Rescaling event dispatcher
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	ColClick (see page 3780)	Column (see page 3806) click event dispatcher.
	ColRightClick (see page 3780)	Column (see page 3806) right-click event dispatcher.
	ColumnsShowing (see page 3780)	Indicates whether the ViewStyle (see page 3829) property is vsReport.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateListItem (see page 3781)	Creates a list item for the collection specified by the Items (see page 3814) property.
	CreateListItems (see page 3782)	Creates the TListItems (see page 4270) object that implements the Items (see page 3814) property.
	CreateParams (see page 3782)	Initializes the window-creation parameter record.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 3782)	Creates the window used by the list view.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	CustomDraw (see page 3783)	Custom draw event dispatcher.
	CustomDrawItem (see page 3783)	Custom draw item event dispatcher.
	CustomDrawSubItem (see page 3783)	Custom draw subitem event dispatcher.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	Delete (see page 3785)	Removes an item from the list view and frees the associated memory.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 3786)	Destroys the window referenced by the list view's window handle.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.

	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
V	DoEndDrag (see page 3787)	Drag end event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
V	DoInfoTip (see page 3787)	InfoTip event dispatcher.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 3787)	Start drag event dispatcher..
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
V	DrawItem (see page 3788)	Draw item event dispatcher.
	Edit (see page 3788)	Edit event dispatcher.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
V	GetActionLinkClass (see page 3789)	Returns the action link class that is associated with list view controls.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetCount (see page 3789)	Returns the number of items in the list.
