	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.

R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7103)	Represents the value of the date in the date-time field.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayFormat (see page 7101)	Controls (see page 5711) the formatting of the date-time field for display purposes.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	EditMask (see page 7102)	Contains a mask that restricts the data that can be entered into a data field.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.

	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.22.2 TDateTimeField.Create Constructor

Creates and initializes a TDateTimeField (see page 7090) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDateTimeField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TDateTimeField (see page 7090). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) property to ftDateTime. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TDateTimeField (see page 7090). After instantiating a TDateTimeField (see page 7090), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TDateTimeField (see page 7090) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TDateTimeField (see page 7090) with a dataset component by setting its DataSet (see page 7157) property to the name of the dataset component. Optionally set the DisplayFormat (see page 7101) property to the desired date and time format.

The example below creates a TDateTimeField (see page 7090) object for a field named CheckOut accessed through a TClientDataSet named ClientDataSet1.

```
var
  T: TDateTimeField;
begin
  ClientDataSet1.Close;
  T := TDateTimeField.Create(ClientDataSet1);
  T.FieldName := 'CheckOut';
  T.Name := ClientDataSet1.Name + T.FieldName;
  T.Index := ClientDataSet1.FieldCount;
  T.DataSet := ClientDataSet1;
  T.DisplayFormat := 'mm/dd/yyyy hh:nn:ss ampm';
  ClientDataSet1.FieldDefs.UpDate;
  ClientDataSet1.Open;
end;
ClientDataSet1->Close();
TDateTimeField *T = new TDateTimeField(ClientDataSet1);
```

```
T->FieldName = "CheckOut";
T->Name = ClientDataSet1->Name + T->FieldName;
T->Index = ClientDataSet1->FieldCount;
T->DataSet = ClientDataSet1;
T->DisplayFormat = "mm//dd//yyyy hh:nn:ss ampm";
ClientDataSet1->FieldDefs->UpDate();
ClientDataSet1->Open();
```

39.1.22.3 TDateTimeField Methods

The methods of the TDateTimeField class are listed here.

Protected Methods

	Name	Description
	CopyData (see page 7098)	This is CopyData, a member of class TDateTimeField.
	GetAsDateTime (see page 7098)	This is GetAsDateTime, a member of class TDateTimeField.
	GetAsFloat (see page 7099)	This is GetAsFloat, a member of class TDateTimeField.
	GetAsString (see page 7099)	This is GetAsString, a member of class TDateTimeField.
	GetAsVariant (see page 7099)	This is GetAsVariant, a member of class TDateTimeField.
	GetDataSize (see page 7099)	This is GetDataSize, a member of class TDateTimeField.
	GetDefaultWidth (see page 7100)	This is GetDefaultWidth, a member of class TDateTimeField.
	GetText (see page 7100)	This is GetText, a member of class TDateTimeField.
	SetAsDateTime (see page 7100)	This is SetAsDateTime, a member of class TDateTimeField.
	SetAsFloat (see page 7100)	This is SetAsFloat, a member of class TDateTimeField.
	SetAsString (see page 7100)	This is SetAsString, a member of class TDateTimeField.
	SetVarValue (see page 7101)	This is SetVarValue, a member of class TDateTimeField.

39.1.22.3.1 TDateTimeField.CopyData Method

Pascal

```
procedure CopyData(Source: Pointer; Dest: Pointer); override;
```

C++

```
virtual __fastcall CopyData(void * Source, void * Dest);
```

Description

This is CopyData, a member of class TDateTimeField.

39.1.22.3.2 TDateTimeField.GetAsDateTime Method

Pascal

```
function GetAsDateTime: TDateTime; override;
```

C++

```
virtual __fastcall TDateTime GetAsDateTime();
```

Description

This is GetAsDateTime, a member of class TDateTimeField.

39.1.22.3.3 TDateTimeField.GetAsFloat Method

Pascal

```
function GetAsFloat: Double; override;
```

C++

```
virtual __fastcall Double GetAsFloat();
```

Description

This is GetAsFloat, a member of class TDateTimeField.

39.1.22.3.4 TDateTimeField.GetAsString Method

Pascal

```
function GetAsString: string; override;
```

C++

```
virtual __fastcall AnsiString GetAsString();
```

Description

This is GetAsString, a member of class TDateTimeField.

39.1.22.3.5 TDateTimeField.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TDateTimeField.

39.1.22.3.6 TDateTimeField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; override;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TDateTimeField.

39.1.22.3.7 TDateTimeField.GetDefaultWidth Method

Pascal

```
function GetDefaultWidth: Integer; override;
```

C++

```
virtual __fastcall int GetDefaultWidth();
```

Description

This is GetDefaultWidth, a member of class TDateTimeField.

39.1.22.3.8 TDateTimeField.GetText Method

Pascal

```
procedure GetText(var Text: string; DisplayText: Boolean); override;
```

C++

```
virtual __fastcall GetText(AnsiString Text, Boolean DisplayText);
```

Description

This is GetText, a member of class TDateTimeField.

39.1.22.3.9 TDateTimeField.SetAsDateTime Method

Pascal

```
procedure SetAsDateTime(Value: TDateTime); override;
```

C++

```
virtual __fastcall SetAsDateTime(TDateTime Value);
```

Description

This is SetAsDateTime, a member of class TDateTimeField.

39.1.22.3.10 TDateTimeField.SetAsFloat Method

Pascal

```
procedure SetAsFloat(Value: Double); override;
```

C++

```
virtual __fastcall SetAsFloat(Double Value);
```

Description

This is SetAsFloat, a member of class TDateTimeField.

39.1.22.3.11 TDateTimeField.SetAsString Method

Pascal

```
procedure SetAsString(const Value: string); override;
```

C++

```
virtual __fastcall SetAsString(const AnsiString Value);
```

Description

This is SetAsString, a member of class TDateTimeField.

39.1.22.3.12 TDateTimeField.SetVarValue Method

Pascal

```
procedure SetVarValue(const Value: Variant); override;
```

C++

```
virtual __fastcall SetVarValue(const Variant Value);
```

Description

This is SetVarValue, a member of class TDateTimeField.

39.1.22.4 TDateTimeField Properties

The properties of the TDateTimeField class are listed here.

Public Properties

	Name	Description
	Value (see page 7103)	Represents the value of the date in the date-time field.

Published Properties

	Name	Description
	DisplayFormat (see page 7101)	Controls (see page 5711) the formatting of the date-time field for display purposes.
	EditMask (see page 7102)	Contains a mask that restricts the data that can be entered into a data field.

39.1.22.4.1 TDateTimeField.DisplayFormat Property

Controls (see page 5711) the formatting of the date-time field for display purposes.

Pascal

```
property DisplayFormat: string;
```

C++

```
__property AnsiString DisplayFormat;
```

Description

Use DisplayFormat to specify the formatting string to use for formatting the value in a date-time field when the field's value appears as a string. If DisplayFormat is not assigned a string, the value is formatted according to the default date-time format specified by the Windows Control Panel.

Note: DisplayFormat does not affect the value of the AsString (see page 7151) property.

Construct a DisplayFormat string using these format specifiers:

Specifier	Displays
c	The date using the format given by the ShortDateFormat global variable, followed by the time using the format given by the LongTimeFormat global variable. The time is not displayed if the fractional part of the DateTime value is zero.
d	The day as a number without a leading zero (1-31).
dd	The day as a number with a leading zero (01-31).

ddd	The day as an abbreviation (Sun-Sat) using the strings given by the ShortDayNames global variable.
dddd	The day as a full name (Sunday-Saturday) using the strings given by the LongDayNames global variable.
ddddd	The date using the format given by the ShortDateFormat global variable.
dddddd	The date using the format given by the LongDateFormat global variable.
m	The month as a number without a leading zero (1-12). If the m specifier immediately follows an h or hh specifier, the minute rather than the month is displayed.
mm	The month as a number with a leading zero (01-12). If the mm specifier immediately follows an h or hh specifier, the minute rather than the month is displayed.
mmm	The month as an abbreviation (Jan-Dec) using the strings given by the ShortMonthNames global variable.
mmmm	The month as a full name (January-December) using the strings given by the LongMonthNames global variable.
yy	The year as a two-digit number (00-99).
yyyy	The year as a four-digit number (0000-9999).
h	The hour without a leading zero (0-23).
hh	The hour with a leading zero (00-23).
n	The minute without a leading zero (0-59).
nn	The minute with a leading zero (00-59).
s	The second without a leading zero (0-59).
ss	The second with a leading zero (00-59).
t	The time using the format given by the ShortTimeFormat global variable.
tt	The time using the format given by the LongTimeFormat global variable.
am/pm	The time using the 12-hour clock for the preceding h or hh specifier, followed by "am" for any hour before noon, or "pm" for any hour after noon. The am/pm specifier can use lower, upper, or mixed case, and the result is displayed accordingly.
a/p	The time using the 12-hour clock for the preceding h or hh specifier, followed by "a" for any hour before noon, or "p" for any hour after noon. The a/p specifier can use lower, upper, or mixed case, and the result is displayed accordingly.
ampm	The time using the 12-hour clock for the preceding h or hh specifier, followed by the contents of the TimeAMString global variable for any hour before noon, or the contents of the TimePMString global variable for any hour after noon.
/	The date separator character given by the DateSeparator global variable.
:	The time separator character given by the TimeSeparator global variable.
'xx'/"xx"	Characters enclosed in single or double quotes are displayed as-is, with no formatting changes.

Format specifiers may be written in uppercase or lowercase letters; both produce the same result.

If the string given by the Format parameter is empty, the date and time value is formatted as if a c format specifier had been given.

See Also

AsString

39.1.22.4.2 TDateTimeField.EditMask Property

Contains a mask that restricts the data that can be entered into a data field.

Pascal

```
property EditMask: TEditMask;
```

C++

```
__property TEditMask EditMask;
```

Description

Use EditMask to restrict the characters a user can enter. If the user attempts to enter a character that is not valid, the character is not accepted. Validation using the EditMask property is performed on a character-by-character basis. Use the OnValidate event instead to validate the entire input, just before it is posted.

Setting EditMask to an empty string removes the mask.

Note: For a description of the format required by EditMask, see the

TEditMask type.

See Also

DisplayText (see page 7162)

IsValidChar (see page 7136)

OnValidate (see page 7183)

Validate (see page 7144)

Value (see page 7180)

39.1.22.4.3 TDateTimeField.Value Property

Represents the value of the date in the date-time field.

Pascal

```
property Value: TDateTime;
```

C++

```
__property TDateTime Value;
```

Description

Use Value to read data directly from and write data directly to a date-time field component at runtime. TDateTimeField (see page 7090) components store and manipulate their data as TDateTime values. Thus, for date-time fields, the Value property is the same as the AsDateTime (see page 7148) property.

```
var
  DT: TDateTime;
begin
  DT := Table1DateField.Value;
  ShowMessage(DateTimeToStr(DT));
end;
```

See Also

AsDateTime

39.1.23 TDefCollection Class

TDefCollection holds the definition objects (TNamedItem (see page 7357)) that represent the specifications for database entities such as fields or indexes.

Class Hierarchy

Pascal

```
TDefCollection = class(TOwnedCollection);
```

C++

```
class TDefCollection : public TOwnedCollection;
```

File

DB

Description

TDefCollection is used as a base class for collections of definition objects such as index or field definitions. TTable objects and TClientDataSet objects use these definition objects to specify the attributes of a database entity before creating the underlying table or dataset.

Use the properties and methods of TDefCollection to:

Access a specific definition object.

Add or delete definition objects from the list.

Find (see page 7107) out how many definition objects are defined.

Copy a set of definitions to another dataset.

See Also

TFieldDefs (see page 7198)

TNamedItem (see page 7357)

TIndexDefs (see page 7292)

TTable (see page 10168)

TClientDataSet (see page 8289)

39.1.23.1 TDefCollection Members

The following tables list the members exposed by TDefCollection.

Protected Events

	Name	Description
	OnUpdate (see page 7111)	This is OnUpdate, a member of class TDefCollection.

Protected Methods

	Name	Description
	Added (see page 2736)	Responds when items are added to the collection.

V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	DoUpdate (see page 7107)	This is DoUpdate, a member of class TDefCollection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 7109)	Initializes the name of a newly inserted collection item.
V	Update (see page 7109)	Updates the collection to reflect changes to its items.
	UpdateDefs (see page 7109)	This is UpdateDefs, a member of class TDefCollection.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 2736)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 7106)	Instantiates a TDefCollection (see page 7104) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Find (see page 7107)	Locates a definition object in the Items array from its name.
	FindItemID (see page 2743)	Returns the item with the specified ID.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItemNames (see page 7108)	This is the overview for the GetItemNames method overload.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	IndexOf (see page 7108)	Finds the index number of a definition in the Items array from its name.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	DataSet (see page 7110)	Indicates the dataset that uses the TDefCollection (see page 7104) object to manage its definition objects.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 2751)	Lists the items in the collection.
	Updated (see page 7110)	Indicates whether the definition objects in the Items array match the corresponding instantiated objects in the dataset.

39.1.23.2 TDefCollection.Create Constructor

Instantiates a TDefCollection (see page 7104) object.

Pascal

```
constructor Create(ADataSet: TDataSet; AOwner: TPersistent; AClass: TCollectionItemClass);
```

C++

```
__fastcall TDefCollection(TDataSet ADataSet, TPersistent * AOwner, TCollectionItemClass
AClass);
```

Description

Do not call the Create method. TDefCollection (see page 7104) objects are created by the dataset that uses them to manage definition objects. The ADataset parameter specifies the dataset that creates the TDefCollection (see page 7104) object. It becomes the value of the Dataset property. The AOwner parameter indicates the object on whose behalf the definition is created. The AClass parameter specifies a descendant class of TNamedItem (see page 7357), and indicates the type of definition objects in the Items property array.

See Also

DataSet (see page 7110)

Items (see page 2751)

39.1.23.3 TDefCollection Methods

The methods of the TDefCollection class are listed here.

Protected Methods

	Name	Description
	DoUpdate (see page 7107)	This is DoUpdate, a member of class TDefCollection.
V	SetItemName (see page 7109)	Initializes the name of a newly inserted collection item.
V	Update (see page 7109)	Updates the collection to reflect changes to its items.
	UpdateDefs (see page 7109)	This is UpdateDefs, a member of class TDefCollection.

Public Methods

	Name	Description
	Find (see page 7107)	Locates a definition object in the Items array from its name.
	GetItemNames (see page 7108)	This is the overview for the GetItemNames method overload.
	IndexOf (see page 7108)	Finds the index number of a definition in the Items array from its name.

39.1.23.3.1 TDefCollection.DoUpdate Method

Pascal

```
procedure DoUpdate(Sender: TObject);
```

C++

```
__fastcall DoUpdate(TObject * Sender);
```

Description

This is DoUpdate, a member of class TDefCollection.

39.1.23.3.2 TDefCollection.Find Method

Locates a definition object in the Items array from its name.

Pascal

```
function Find(const AName: WideString): TNamedItem;
```

C++

```
__fastcall TNamedItem Find(const BSTR AName);
```

Description

Call Find to obtain information about a particular definition object. Specify the name of the definition object as the value of the Name parameter.

See Also

IndexOf (see page 7108)

Items (see page 2751)

Name (see page 7359)

39.1.23.3.3 GetItemNames Method

This is the overview for the GetItemNames method overload.

Overload List

	Name	Description
	TDefCollection.GetItemNames (TStrings) (see page 7108)	Fills a TStrings object with the names of all definitions in the list.
	TDefCollection.GetItemNames (TWideStrings) (see page 7108)	Fills a TStrings object with the names of all definitions in the list.

39.1.23.3.3.1 TDefCollection.GetItemNames Method (TStrings)

Fills a TStrings object with the names of all definitions in the list.

Pascal

```
procedure GetItemNames(List: TWideStrings); overload;
procedure GetItemNames(List: TStrings); overload;
```

C++

```
__fastcall GetItemNames(TWideStrings List);
__fastcall GetItemNames(TStrings List);
```

Description

Call GetItemNames to retrieve the names of all definitions managed by the TDefCollection (see page 7104) object. Pass an empty string list as the List parameter. GetItemNames fills the string list with the names of all definitions.

See Also

Name (see page 7359)

39.1.23.3.4 TDefCollection.IndexOf Method

Finds the index number of a definition in the Items array from its name.

Pascal

```
function IndexOf(const AName: WideString): Integer;
```

C++

```
__fastcall int IndexOf(const BSTR AName);
```

Description

Use the IndexOf method to locate the position of a definition in the Items property array. IndexOf returns a value from zero (the first position) to Count - 1. Specify the name of the definition as the Name parameter.

If Items contains no definition with the specified Name, the return value is -1.

See Also

Count (see page 2749)

Find (see page 7107)

Items (see page 2751)

Name (see page 7359)

39.1.23.3.5 TDefCollection.SetItemName Method

Initializes the name of a newly inserted collection item.

Pascal

```
procedure SetItemName(AItem: TCollectionItem); override;
```

C++

```
virtual __fastcall SetItemName(TCollectionItem AItem);
```

Description

The Insert method calls SetItemName to initialize the Name property of items when it inserts them into the collection.

As implemented in TCollection, SetItemName does nothing. Some TCollection descendants override this method to provide collection items with default names.

See Also

Insert (see page 2746)

Name (see page 2805)

39.1.23.3.6 TDefCollection.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(AItem: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem AItem);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

See Also

Changed (see page 2740)

Changed (see page 2758)

39.1.23.3.7 TDefCollection.UpdateDefs Method

Pascal

```
procedure UpdateDefs(AMethod: TDefUpdateMethod);
```

C++

```
__fastcall UpdateDefs(TDefUpdateMethod AMethod);
```

Description

This is UpdateDefs, a member of class TDefCollection.

39.1.23.4 TDefCollection Properties

The properties of the TDefCollection class are listed here.

Public Properties

	Name	Description
R	DataSet (see page 7110)	Indicates the dataset that uses the TDefCollection (see page 7104) object to manage its definition objects.
	Updated (see page 7110)	Indicates whether the definition objects in the Items array match the corresponding instantiated objects in the dataset.

39.1.23.4.1 TDefCollection.DataSet Property

Indicates the dataset that uses the TDefCollection (see page 7104) object to manage its definition objects.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to access the dataset that uses the definitions in the Items array.

See Also

FieldDefs (see page 7019)

IndexDefs (see page 8480)

Items (see page 2751)

39.1.23.4.2 TDefCollection.Updated Property

Indicates whether the definition objects in the Items array match the corresponding instantiated objects in the dataset.

Pascal

```
property Updated: Boolean;
```

C++

```
__property Boolean Updated;
```

Description

Use Updated to determine whether the definitions managed by the TDefCollection (see page 7104) object match the corresponding entities (fields or indexes) of the dataset. Updated is set to true when the definitions are retrieved from the dataset at design time, or when the definitions are used to create the corresponding entities in the dataset. Updated is set to false when the properties of the definition objects are changed.

See Also

DataSet (see page 7110)

Items (see page 2751)

Update (see page 7205)

Update (see page 7299)

39.1.23.5 TDefCollection Events

The events of the TDefCollection class are listed here.

Protected Events

	Name	Description
	OnUpdate (see page 7111)	This is OnUpdate, a member of class TDefCollection.

39.1.23.5.1 TDefCollection.OnUpdate Event

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

This is OnUpdate, a member of class TDefCollection.

39.1.24 TDetailDataLink Class

TDetailDataLink is the ancestor to datalink classes that manage the relationships between datasets that are linked in master/detail relationships.

Class Hierarchy

Pascal

```
TDetailDataLink = class(TDataLink);
```

C++

```
class TDetailDataLink : public TDataLink;
```

File

DB

Description

TDetailDataLink descendants are used to create master/detail relationships. They underlie the DataSource (see page 6891) property of dataset components.

TDetailDataLink has two descendants,

TMasterDataLink (see page 7339), which is used by BDE-enabled datasets, ADO-based datasets, and client datasets.

TSQLDataLink, which is used by unidirectional datasets.

See Also

TMasterDataLink (see page 7339)

TSQLDataLink (see page 20260)

TDataSet (see page 6894)

39.1.24.1 TDetailDataLink Members

The following tables list the members exposed by TDetailDataLink.

Protected Methods

	Name	Description
	ActiveChanged (see page 6880)	Responds to changes in the Active (see page 6888) property.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CheckBrowseMode (see page 6880)	Allows the data-aware object to respond just before an event that changes the dataset state.
	DataEvent (see page 6881)	Responds to various events that occur while working with data.
	DataSetChanged (see page 6881)	Responds to changes in the dataset.
	DataSetScrolled (see page 6882)	Allows a response to scrolling the representation of the dataset within the data-aware object.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EditingChanged (see page 6883)	Responds to changes in the editing state of the data source.
	FocusControl (see page 6884)	Provides the interface for a method to force focus to the data-aware component associated with the TDataLink (see page 6876).
	GetActiveRecord (see page 6884)	This is GetActiveRecord, a member of class TDataLink.
	GetBOF (see page 6884)	This is GetBOF, a member of class TDataLink.
	GetBufferCount (see page 6884)	This is GetBufferCount, a member of class TDataLink.
	GetDetailDataSet (see page 7114)	Returns the value of the DetailDataSet (see page 7114) property.
	GetEOF (see page 6885)	This is GetEOF, a member of class TDataLink.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRecordCount (see page 6885)	This is GetRecordCount, a member of class TDataLink.
	LayoutChanged (see page 6885)	Responds to changes in the representation of the data by the data-aware object.
	MoveBy (see page 6885)	Repositions the dataset to another record relative to its active record.
	RecordChanged (see page 6886)	Responds to changes in the contents of the current record or field of the dataset.
	SetActiveRecord (see page 6886)	This is SetActiveRecord, a member of class TDataLink.
	SetBufferCount (see page 6887)	This is SetBufferCount, a member of class TDataLink.
	UpdateData (see page 6887)	Provides an interface for writing edits to a record in the dataset.

Protected Properties

	Name	Description
	VisualControl (see page 6894)	Indicates whether a visual control uses the datalink.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6878)	Creates an instance of TDataLink (see page 6876).

	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 6879)	Destroys an instance of TDataLink (see page 6876).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6882)	Attempts to drive the data source into an editing state if it is not already in one.
	ExecuteAction (see page 6883)	Invokes an action with the datasource as its target.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	UpdateAction (see page 6887)	Updates an action to reflect the current state of the TDataLink (see page 6876).
	UpdateRecord (see page 6888)	Responds to notifications that edits should be posted to the dataset.

Public Properties

	Name	Description
R	Active (see page 6888)	Specifies whether the dataset that TDataLink (see page 6876) manages is active.
	ActiveRecord (see page 6889)	Specifies the index of the current record within the internal record buffer maintained by the dataset for the Owner of the TDataLink (see page 6876) object.
R	BOF (see page 6889)	Indicates whether the first record in a dataset is active.
	BufferCount (see page 6890)	Specifies the number of records cached by the dataset for the Owner of the TDataLink (see page 6876) object.
R	DataSet (see page 6890)	Specifies the TDataSet (see page 6894) object that represents the data that this TDataLink (see page 6876) is tracking.
	DataSource (see page 6891)	Specifies the TDataSource (see page 7070) object that the Owner of the TDataLink (see page 6876) uses to connect to the dataset.
	DataSourceFixed (see page 6891)	Indicates whether the DataSource (see page 6891) property can be set.
R	DetailDataSet (see page 7114)	Indicates the detail dataset in the master/detail relationship.
R	Editing (see page 6892)	Indicates whether the DataSource (see page 6891) is in edit mode.
R	Eof (see page 6892)	Indicates whether the last record in a dataset is active.
	ReadOnly (see page 6893)	Indicates whether the dataset for this TDataLink (see page 6876) can be modified.
R	RecordCount (see page 6893)	Indicates the number of records in the internal record buffer maintained by the dataset.

39.1.24.2 TDetailDataLink Methods

The methods of the TDetailDataLink class are listed here.

Protected Methods

	Name	Description
	GetDetailDataSet (see page 7114)	Returns the value of the DetailDataSet (see page 7114) property.

39.1.24.2.1 TDetailDataLink.GetDetailDataSet Method

Returns the value of the DetailDataSet (see page 7114) property.

Pascal

```
function GetDetailDataSet: TDataSet; virtual;
```

C++

```
virtual __fastcall TDataSet GetDetailDataSet();
```

Description

GetDetailDataSet is the protected read implementation of the DetailDataSet (see page 7114) property. As implemented in TDetailDataLink (see page 7111), GetDetailDataSet always returns nil (Delphi) or NULL (C++). Descendants override this method to return the dataset that uses the data link to link to a master dataset.

See Also

DetailDataSet (see page 7114)

39.1.24.3 TDetailDataLink Properties

The properties of the TDetailDataLink class are listed here.

Public Properties

	Name	Description
	DetailDataSet (see page 7114)	Indicates the detail dataset in the master/detail relationship.

39.1.24.3.1 TDetailDataLink.DetailDataSet Property

Indicates the detail dataset in the master/detail relationship.

Pascal

```
property DetailDataSet: TDataSet;
```

C++

```
__property TDataSet DetailDataSet;
```

Description

Read DetailDataSet to access the detail dataset. This is the dataset that uses a DetailDataLink to access its master dataset. The detail dataset is the detail datalink's owner, and uses the datalink to implement its DataSource (see page 6891) property.

Note: Do not confuse the DetailDataSet property with the DataSet (see page 6890) property. The DataSet (see page 6890) property is the dataset whose data events the detail datalink tracks. That is, DataSet (see page 6890) is the master dataset while DetailDataSet is the detail set.

See Also

DataSet (see page 6890)

DataSource (see page 7014)

39.1.25 TField Class

TField is the common ancestor of all the field components.

Class Hierarchy

Pascal

```
TField = class(TComponent);
```

C++

```
class TField : public TComponent;
```

File

DB

Description

TField encapsulates the fundamental behavior common to all field components. It introduces the properties, events, and methods that are used to:

Change (see page 7126) the value of a field in a dataset.

Convert the value of a field from one data type to another.

Validate (see page 7144) data that the user enters for a field.

Define how the data in the field appears as it is displayed or edited.

Calculate the value of a field from code written in the OnCalcFields event of the dataset.

Look up the field's value from another dataset.

Do not create instances of TField. TField descendants are created automatically each time a dataset is activated. These descendants can be dynamic (the default) or persistent. Dynamic field components reflect the columns in the underlying metadata at the time a dataset is opened. Persistent field components are created at design time using the Fields editor, which specifies the fields in the dataset, their properties, and their ordering.

Creating persistent field components guarantees that each time an application runs, it uses and displays the same columns, in the same order, even if the physical structure of the underlying database changes. If a column on which a persistent field component is based is deleted or changed, the IDE generates an exception rather than opening the dataset against a nonexistent column or mismatched data. If this happens, remove the field component for the nonexistent field using the Fields editor.

A field in a dataset is always treated as one of the following TField descendant classes below:

TADTField (see page 6736)	TDateField (see page 7083)	TReferenceField (see page 7452)	TAggregateField (see page 6743)

TDateTimeField (see page 7090)	TSmallIntField	TArrayField (see page 6760)	TFloatField (see page 7229)
TSQLTimeStampField (see page 7469)	TAutoIncField (see page 6768)	TFMTBCDField (see page 7242)	TStringField (see page 7483)
TBCDField (see page 6776)	TGraphicField (see page 7257)	TTimeField (see page 7499)	TBinaryField (see page 6791)
TGuidField (see page 7265)	TVarBytesField (see page 7507)	TBlobField (see page 6801)	TIDispatchField (see page 7274)
TVariantField (see page 7514)	TBooleanField (see page 6822)	TIntegerField (see page 7301)	TWideStringField (see page 7549)
TBytesField (see page 6833)	TInterfaceField (see page 7314)	TWordField (see page 7560)	TCurrencyField (see page 6850)
TLargeintField (see page 7323)	TDataSetField (see page 7060)	TMemoField (see page 7348)

Dynamic Field Components

Working with Field Components: Overview

39.1.25.1 TField Members

The following tables list the members exposed by TField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.

	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
	GetAsString (see page 7130)	This is GetAsString, a member of class TField.
	GetAsVariant (see page 7130)	This is GetAsVariant, a member of class TField.
	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
	GetDataSize (see page 7133)	This is GetDataSize, a member of class TField.
	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 7140)	This is SetAsString, a member of class TField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.

	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
V	SetSize (see page 7143)	This is SetSize, a member of class TField.
V	SetText (see page 7144)	This is SetText, a member of class TField.
V	SetVarValue (see page 7144)	This is SetVarValue, a member of class TField.
V	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 7126)	Sets the value of the field to NULL.
V	Create (see page 7121)	Creates and initializes a field component.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.

	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.

	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7180)	Represents the data in a field component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.25.2 TField.Create Constructor

Creates and initializes a field component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TField(TComponent * AOwner);
```

Description

Do not create TField (see page 7115) instances. TField (see page 7115) is intended only as a base class, and should not be

directly instantiated. The constructor for descendant classes is usually called by the dataset when it is opened.

After calling the inherited constructor, TField (see page 7115) initializes the Visible (see page 7181) property to true.

See Also

Visible (see page 7181)

Destroy (see page 7122)

39.1.25.3 TField.Destroy Destructor

Destroys an instance of TField (see page 7115).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TField();
```

Description

Do not call Destroy directly in an application. Destroy is called automatically by the dataset that owns the field component, and applications never need to call it explicitly. If an application creates a descendant of TField (see page 7115) without an owner, it should call Free instead of Destroy, to guard against nil values.

Destroy closes the dataset, deletes the instance of TField (see page 7115) from the dataset, and calls the inherited destructor.

See Also

DataSet (see page 7157)

Free (see page 22300)

Destroy (see page 2766)

Create (see page 7121)

39.1.25.4 TField Methods

The methods of the TField class are listed here.

Protected Methods

	Name	Description
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
V	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.

	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
	GetAsString (see page 7130)	This is GetAsString, a member of class TField.
	GetAsVariant (see page 7130)	This is GetAsVariant, a member of class TField.
	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
	GetDataSize (see page 7133)	This is GetDataSize, a member of class TField.
	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 7140)	This is SetAsString, a member of class TField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 7144)	This is SetVarValue, a member of class TField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.

Public Methods

	Name	Description
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
	Clear (see page 7126)	Sets the value of the field to NULL.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.

	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	SetData (see page 7141)	Assigns unformatted data to the field.
	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

39.1.25.4.1 TField.AccessError Method

Pascal

```
function AccessError(const TypeName: string): EDatabaseError; dynamic;
```

C++

```
__fastcall EDatabaseError AccessError(const AnsiString TypeName);
```

Description

This is AccessError, a member of class TField.

39.1.25.4.2 TField.Assign Method

Copies the Value (see page 7180) property from another field component or assigns another object to the field component.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Use Assign to copy the Value (see page 7180) property from one field to another. The fields must have compatible data types.

When Source is another field object, Assign calls the AssignValue (see page 7124) method, using the Source field's Value (see page 7180) property. Calling Assign with the Source parameter set to nil (Delphi) or NULL (C++) assigns a blank value to the field component. Calling Assign with any other object type calls the inherited method, which allows assignment from objects that implement a TField (see page 7115) object in their AssignTo method.

See Also

AssignValue (see page 7124)

Clear (see page 7126)

DataType (see page 7159)

AssignTo (see page 2931)

Value (see page 7180)

39.1.25.4.3 TField.AssignValue Method

Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.

Pascal

```
procedure AssignValue(const Value: TVarRec);
```

C++

```
__fastcall AssignValue(const TVarRec Value);
```

Description

Use AssignValue to assign a value to a field and, in Delphi, that comes from an array of const. AssignValue uses an As? property for the assignment based on the type of the Value (see page 7180) parameter:

Value (see page 7180)	As... property used
vtInteger	AsInteger (see page 7149)
vtBoolean	AsBoolean (see page 7147)
vtChar	AsString (see page 7151)
vtExtended	AsFloat (see page 7149)
vtString	AsString (see page 7151)
vtPChar	AsString (see page 7151)
vtAnsiString	AsString (see page 7151)
vtCurrency	AsCurrency (see page 7148)
vtVariant	AsVariant (see page 7152)

If Value (see page 7180) is not one of the types in the table, but is of type TObject or a TObject descendant, AssignValue uses the Assign (see page 7124) method to assign the value to the field.

AssignValue exists primarily for internal use. In C++ applications and components, use the TField::Value (see page 7180) property instead. In most Delphi situations, you should use the data type-specific assignment properties like AsString (see page 7151) and AsInteger (see page 7149). In cases where a component or an application must be able to make field assignments from untyped arrays, the syntax for AssignValue looks like that below. In this example, a custom data class uses AssignValue in a member method named SetFieldValues to assign values to multiple fields. The values for the field assignments come from an untyped array.

```
procedure TCustomDataClass.SetFieldValues(Values: array of const);
var
  i: Integer;
begin
for i := 0 to High(Values) do
    Fields[i].AssignValue(Values[i]);
end;
```

See Also

AsBoolean (see page 7147)

AsCurrency (see page 7148)

AsFloat (see page 7149)

AsInteger (see page 7149)

Assign (see page 7124)

AsString (see page 7151)

39.1.25.4.4 TField.Bind Method

Pascal

```
procedure Bind(Binding: Boolean); virtual;
```

C++

```
virtual __fastcall Bind(Boolean Binding);
```

Description

This is Bind, a member of class TField.

39.1.25.4.5 TField.Change Method

Pascal

```
procedure Change; virtual;
```

C++

```
virtual __fastcall Change();
```

Description

This is Change, a member of class TField.

39.1.25.4.6 TField.CheckInactive Method

Pascal

```
procedure CheckInactive;
```

C++

```
__fastcall CheckInactive();
```

Description

This is CheckInactive, a member of class TField.

39.1.25.4.7 TField.CheckTypeSize Method

Pascal

```
class procedure CheckTypeSize(Value: Integer); virtual;
```

C++

```
virtual __fastcall CheckTypeSize(int Value);
```

Description

This is CheckTypeSize, a member of class TField.

39.1.25.4.8 TField.Clear Method

Sets the value of the field to NULL.

Pascal

```
procedure Clear; virtual;
```

C++

```
virtual __fastcall Clear();
```

Description

Call the Clear method to give the field a blank value (a NULL value in SQL terms).

See Also

IsNull (see page 7169)

Required (see page 7177)

39.1.25.4.9 TField.CopyData Method

Pascal

```
procedure CopyData(Source: Pointer; Dest: Pointer); virtual;
```

C++

```
virtual __fastcall CopyData(void * Source, void * Dest);
```

Description

This is CopyData, a member of class TField.

39.1.25.4.10 TField.DataChanged Method

Pascal

```
procedure DataChanged;
```

C++

```
__fastcall DataChanged();
```

Description

This is DataChanged, a member of class TField.

39.1.25.4.11 TField.DefineProperties Method

Designates methods for storing an object's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TComponent overrides the DefineProperties method defined in TPersistent to define "fake" Top and Left properties. These are defined so that components that are not controls can be manipulated at design-time. However, the Top and Left properties are hidden, that is, they are not published, because only controls appear at run-time.

DefineProperties is virtual; descendant classes can override it. When overriding DefineProperties, be aware that the Ancestor property of Filer might be set, and that this property can determine whether or not it is appropriate to write properties.

DefineProperties is called automatically as part of the component streaming system; do not call it directly.

See Also

Ancestor (see page 2839)

DefineBinaryProperty (see page 2837)

DefineProperties (see page 2931)

DefineProperty (see page 2838)

39.1.25.4.12 TField.FocusControl Method

Forces a form's focus to the first data-aware component associated with the field object.

Pascal

```
procedure FocusControl;
```

C++

```
__fastcall FocusControl();
```

Description

Call FocusControl to switch the focus of the form to a data-aware control associated with the field. Because it is possible that the field's value can change even if its associated data-aware control does not have the focus, calling FocusControl can aid in drawing attention to a new value when it fails to be validated.

See Also

OnValidate (see page 7183)

Validate (see page 7144)

Working with Field Component Methods at Runtime

39.1.25.4.13 TField.FreeBuffers Method

Pascal

```
procedure FreeBuffers; virtual;
```

C++

```
virtual __fastcall FreeBuffers();
```

Description

This is FreeBuffers, a member of class TField.

39.1.25.4.14 TField.GetAsBCD Method

Pascal

```
function GetAsBCD: TBcd; virtual;
```

C++

```
virtual __fastcall TBcd GetAsBCD();
```

Description

This is GetAsBCD, a member of class TField.

39.1.25.4.15 TField.GetAsBoolean Method

Pascal

```
function GetAsBoolean: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetAsBoolean();
```

Description

This is GetAsBoolean, a member of class TField.

39.1.25.4.16 TField.GetAsByteArray Method

Pascal

```
function GetAsByteArray: Variant; virtual;
```

C++

```
virtual __fastcall Variant GetAsByteArray();
```

Description

This is GetAsByteArray, a member of class TField.

39.1.25.4.17 TField.GetAsCurrency Method

Pascal

```
function GetAsCurrency: Currency; virtual;
```

C++

```
virtual __fastcall Currency GetAsCurrency();
```

Description

This is GetAsCurrency, a member of class TField.

39.1.25.4.18 TField.GetAsDateTime Method

Pascal

```
function GetAsDateTime: TDateTime; virtual;
```

C++

```
virtual __fastcall TDateTime GetAsDateTime();
```

Description

This is GetAsDateTime, a member of class TField.

39.1.25.4.19 TField.GetAsFloat Method

Pascal

```
function GetAsFloat: Double; virtual;
```

C++

```
virtual __fastcall Double GetAsFloat();
```

Description

This is GetAsFloat, a member of class TField.

39.1.25.4.20 TField.GetAsInteger Method

Pascal

```
function GetAsInteger: Longint; virtual;
```

C++

```
virtual __fastcall Longint GetAsInteger();
```

Description

This is GetAsInteger, a member of class TField.

39.1.25.4.21 TField.GetAsSQLTimeStamp Method

Pascal

```
function GetAsSQLTimeStamp: TSQLTimeStamp; virtual;
```

C++

```
virtual __fastcall TSQLTimeStamp GetAsSQLTimeStamp();
```

Description

This is GetAsSQLTimeStamp, a member of class TField.

39.1.25.4.22 TField.GetAsString Method

Pascal

```
function GetAsString: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetAsString();
```

Description

This is GetAsString, a member of class TField.

39.1.25.4.23 TField.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant; virtual;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TField.

39.1.25.4.24 TField.GetAsWideString Method

Pascal

```
function GetAsWideString: WideString; virtual;
```

C++

```
virtual __fastcall BSTR GetAsWideString();
```

Description

This is GetAsWideString, a member of class TField.

39.1.25.4.25 TField.GetCanModify Method

Pascal

```
function GetCanModify: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetCanModify();
```

Description

This is GetCanModify, a member of class TField.

39.1.25.4.26 TField.GetClassDesc Method

Pascal

```
function GetClassDesc: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetClassDesc();
```

Description

This is GetClassDesc, a member of class TField.

39.1.25.4.27 TField.GetData Method

Returns the unformatted data for the field.

Pascal

```
function GetData(Buffer: Pointer; NativeFormat: Boolean = True): Boolean;
```

C++

```
__fastcall Boolean GetData(void * Buffer, Boolean NativeFormat = True);
```

Description

Call GetData to return the data in a field to a buffer. GetData is intended primarily for internal use.

Buffer must have sufficient space allocated for the data. Use the DataSize (see page 7157) property to determine the space required.

Unlike the DisplayText (see page 7162), Text (see page 7179), or AsXXX properties, GetData does not translate the data into a specific type. Instead, it uses a type that reflects the underlying database information unless you set NativeFormat to false. NativeFormat indicates whether the raw database information must be translated into the underlying type associated with the specific type of database field. When NativeFormat is true, the dataset does not translate the raw database information. When

NativeFormat is false, the dataset must translate the field value into the type associated with the field.

If the data is NULL, GetData returns false and no data is transferred to Buffer. Otherwise, GetData returns true.

Note: GetData cannot be used to read data from BLOB or memo fields. To read BLOB data, use the stream returned by the dataset's CreateBlobStream method or the BLOB field's SaveToStream method.

C++ Examples:

```
/*
This example requires a button, a test edit, and a populated
ClientDataSet.  Pipe the ClientDataSet through a DataSource
to a DGGrid or DBNavigator to control the current field.
Cast the data correctly according to the field type when
assigning to the test edit.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  // Retrieve the "raw" data from Field1
  if (!CDS->Fields->Fields[0]->IsBlob(__classid(TField))) // GetData does not work for BLOB
fields
  {
    void *MyBuffer = malloc(CDS->Fields->Fields[0]->DataSize);
    try
    {
      if (!CDS->Fields->Fields[0]->GetData(MyBuffer))
        MessageDlg(CDS->Fields->Fields[0]->DisplayName + "is blank.", mtInformation,
TMsgDlgButtons() << mbOK,0);
      else
        // Do something with the data;
        Edit1->Text = (char *)MyBuffer; // for a stringfield
    }
    __finally
    {
      free(MyBuffer);
    }
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  CDS->LoadFromFile("../CDS.XML");
}
```

Delphi Examples:

```
{
This example requires a button, a test edit, and a populated
ClientDataSet.  Pipe the ClientDataSet through a DataSource
to a DGGrid or DBNavigator to control the current field.
Cast the data correctly according to the field type when
assigning to the test edit.
}

{$IFNDEF UNICODE}
uses SwSystem;
{$ENDIF}

procedure TForm1.Button1Click(Sender: TObject);
var MyBuffer: Pointer;
begin
{ Retrieve the "raw" data from Field1 }
with CDS.Fields[0] do
  begin
    if not IsBlob then { this does not work for BLOB fields }
```

```
      begin
        { Allocate space }
        MyBuffer:= GetMemory(DataSize);
        try
          if not GetData(MyBuffer) then
            MessageDlg(DisplayName + ' is NULL', mtInformation, [mbOK], 0)
          else
            { Do something with the data };
            Edit1.Text:= string(MyBuffer); // for a stringfield
        finally
          { Free the space }
          FreeMem(MyBuffer, DataSize);
        end;
      end;
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
  {$IFDEF UNICODE}
    CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
  {$ELSE}
    CDS.LoadFromFile(gsAppPath + 'CDS.XML');
  {$ENDIF}
  end;
```

SaveToStream (see page 6816)

39.1.25.4.28 TField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; virtual;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TField.

39.1.25.4.29 TField.GetDefaultWidth Method

Pascal

```
function GetDefaultWidth: Integer; virtual;
```

C++

```
virtual __fastcall int GetDefaultWidth();
```

Description

This is GetDefaultWidth, a member of class TField.

39.1.25.4.30 TField.GetFieldNo Method

Pascal

```
function GetFieldNo: Integer; virtual;
```

C++

```
virtual __fastcall int GetFieldNo();
```

Description

This is GetFieldNo, a member of class TField.

39.1.25.4.31 TField.GetHasConstraints Method

Pascal

```
function GetHasConstraints: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetHasConstraints();
```

Description

This is GetHasConstraints, a member of class TField.

39.1.25.4.32 TField.GetIsNull Method

Pascal

```
function GetIsNull: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetIsNull();
```

Description

This is GetIsNull, a member of class TField.

39.1.25.4.33 TField.GetParentComponent Method

Returns the component which directs the loading and saving of the field.

Pascal

```
function GetParentComponent: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetParentComponent();
```

Description

The streaming system that loads and saves components calls GetParentComponent to identify the component that uses this field to represent one of its parts. If the field represents a subfield in an object field, GetParentComponent returns the value of ParentField (see page 7176). Otherwise, GetParentComponent returns the value of DataSet (see page 7157).

See Also

HasParent (see page 7135)

GetChildren

DataSet (see page 7157)

ParentField (see page 7176)

39.1.25.4.34 TField.GetSize Method

Pascal

```
function GetSize: Integer; virtual;
```

C++

```
virtual __fastcall int GetSize();
```

Description

This is GetSize, a member of class TField.

39.1.25.4.35 TField.GetText Method

Pascal

```
procedure GetText(var Text: String; DisplayText: Boolean); virtual;
```

C++

```
virtual __fastcall GetText(AnsiString Text, Boolean DisplayText);
```

Description

This is GetText, a member of class TField.

39.1.25.4.36 TField.GetWideText Method

Pascal

```
procedure GetWideText(var Text: WideString; DisplayText: Boolean); virtual;
```

C++

```
virtual __fastcall GetWideText(BSTR Text, Boolean DisplayText);
```

Description

This is GetWideText, a member of class TField.

39.1.25.4.37 TField.HasParent Method

Returns true, indicating that field components act as part of a larger composite.

Pascal

```
function HasParent: Boolean; override;
```

C++

```
virtual __fastcall Boolean HasParent();
```

Description

The streaming system that loads and saves components calls HasParent to determine when a component acts as part of a composite. The component that represents the entire composite is returned by the GetParentComponent (see page 7134) method. The parent component is responsible for directing the loading and saving of its subcomponents.

See Also

GetParentComponent (see page 7134)

GetChildren

39.1.25.4.38 TField.IsBlob Method

Indicates whether the field represents the data in a binary large object (BLOB) field.

Pascal

```
class function IsBlob: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsBlob();
```

Description

Call IsBlob to determine whether the field represents BLOB data. For example, before using the GetData (see page 7131) or SetData (see page 7141) method, call IsBlob to determine whether the method can be used. The IsBlob method for TField (see page 7115) always returns false. Descendants of TField (see page 7115) that implement blob fields override this method to indicate that they represent BLOB data.

See Also

GetData (see page 7131)

SetData (see page 7141)

39.1.25.4.39 TField.IsValidChar Method

Indicates whether a particular character is valid for the field.

Pascal

```
function IsValidChar(InputChar: Char): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsValidChar(Char InputChar);
```

Description

Call IsValidChar to determine if the character specified by InputChar can appear in the text representation of the field's value. Many data-aware controls use IsValidChar to check characters entered by the user to determine if they are valid. IsValidChar returns true if InputChar can appear in the field. IsValidChar returns false if InputChar is not a valid character for the field type.

The valid characters for a field object are given by the ValidChars (see page 7179) property. By default, field objects accept all characters as valid. For each DataType (see page 7159) that restricts the set of valid characters, the default valid characters are listed below:

DataType (see page 7159)	Valid characters
ftSmallint	Digits 0 to 9, plus sign (+), and minus sign (-).
ftWord	Digits 0 to 9, plus sign (+), and minus sign (-)
ftAutoInc	Digits 0 to 9, plus sign (+), and minus sign (-)
ftInteger	Digits 0 to 9, plus sign (+), and minus sign (-)
ftLargeInt	Digits 0 to 9, plus sign (+), and minus sign (-)
ftCurrency	Digits 0 to 9, plus sign (+), minus sign (-), the letter E (E or e) and the decimal separator from the regional settings in the Windows control panel.
ftFloat	Digits 0 to 9, plus sign (+), minus sign (-), the letter E (E or e) and the decimal separator from the regional settings in the Windows control panel
ftBCD	Digits 0 to 9, plus sign (+), minus sign (-), and the decimal separator from the regional settings in the Windows control panel.

Note: For some datatypes, such as ftGraphic, IsValidChar returns true for all characters although not every character is valid for the field. IsValidChar provides only a rough validation of input characters. More refined character-by-character validation can be provided by an edit mask. Also, the value for a field is validated as a whole when it is written to the database record.

See Also

DataType (see page 7159)

EditMask (see page 7163)

OnValidate (see page 7183)

ValidChars (see page 7179)

39.1.25.4.40 TField.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

39.1.25.4.41 TField.PropertyChanged Method

Pascal

```
procedure PropertyChanged(LayoutAffected: Boolean);
```

C++

```
__fastcall PropertyChanged(Boolean LayoutAffected);
```

Description

This is PropertyChanged, a member of class TField.

39.1.25.4.42 TField.ReadState Method

Pascal

```
procedure ReadState(Reader: TReader); override;
```

C++

```
virtual __fastcall ReadState(TReader Reader);
```

Description

This is ReadState, a member of class TField.

39.1.25.4.43 TField.RefreshLookupList Method

Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).

Pascal

```
procedure RefreshLookupList;
```

C++

```
__fastcall RefreshLookupList();
```

Description

Call RefreshLookupList to load the lookup cache when setting the LookupCache (see page 7170) property at runtime or when the values of the LookupResultField (see page 7173) or the LookupKeyFields (see page 7172) in the LookupDataSet (see page 7171) may have changed.

See Also

LookupCache (see page 7170)

LookupDataSet (see page 7171)

LookupKeyFields (see page 7172)

LookupList (see page 7172)

LookupResultField (see page 7173)

Defining a Lookup Field

39.1.25.4.44 TField.SetAsBCD Method

Pascal

```
procedure SetAsBCD(const Value: TBcd); virtual;
```

C++

```
virtual __fastcall SetAsBCD(const TBcd Value);
```

Description

This is SetAsBCD, a member of class TField.

39.1.25.4.45 TField.SetAsBoolean Method

Pascal

```
procedure SetAsBoolean(Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetAsBoolean(Boolean Value);
```

Description

This is SetAsBoolean, a member of class TField.

39.1.25.4.46 TField.SetAsByteArray Method

Pascal

```
procedure SetAsByteArray(const Value: Variant); virtual;
```

C++

```
virtual __fastcall SetAsByteArray(const Variant Value);
```

Description

This is SetAsByteArray, a member of class TField.

39.1.25.4.47 TField.SetAsCurrency Method

Pascal

```
procedure SetAsCurrency(Value: Currency); virtual;
```

C++

```
virtual __fastcall SetAsCurrency(Currency Value);
```

Description

This is SetAsCurrency, a member of class TField.

39.1.25.4.48 TField.SetAsDateTime Method

Pascal

```
procedure SetAsDateTime(Value: TDateTime); virtual;
```

C++

```
virtual __fastcall SetAsDateTime(TDateTime Value);
```

Description

This is SetAsDateTime, a member of class TField.

39.1.25.4.49 TField.SetAsFloat Method

Pascal

```
procedure SetAsFloat(Value: Double); virtual;
```

C++

```
virtual __fastcall SetAsFloat(Double Value);
```

Description

This is SetAsFloat, a member of class TField.

39.1.25.4.50 TField.SetAsInteger Method

Pascal

```
procedure SetAsInteger(Value: Longint); virtual;
```

C++

```
virtual __fastcall SetAsInteger(Longint Value);
```

Description

This is SetAsInteger, a member of class TField.

39.1.25.4.51 TField.SetAsSQLTimeStamp Method

Pascal

```
procedure SetAsSQLTimeStamp(const Value: TSQLTimeStamp); virtual;
```

C++

```
virtual __fastcall SetAsSQLTimeStamp(const TSQLTimeStamp Value);
```

Description

This is SetAsSQLTimeStamp, a member of class TField.

39.1.25.4.52 TField.SetAsString Method

Pascal

```
procedure SetAsString(const Value: string); virtual;
```

C++

```
virtual __fastcall SetAsString(const AnsiString Value);
```

Description

This is SetAsString, a member of class TField.

39.1.25.4.53 TField.SetAsVariant Method

Pascal

```
procedure SetAsVariant(const Value: Variant); virtual;
```

C++

```
virtual __fastcall SetAsVariant(const Variant Value);
```

Description

This is SetAsVariant, a member of class TField.

39.1.25.4.54 TField.SetAsWideString Method

Pascal

```
procedure SetAsWideString(const Value: WideString); virtual;
```

C++

```
virtual __fastcall SetAsWideString(const BSTR Value);
```

Description

This is SetAsWideString, a member of class TField.

39.1.25.4.55 TField.SetAutoGenerateValue Method

Pascal

```
procedure SetAutoGenerateValue(const Value: TAutoRefreshFlag);
```

C++

```
__fastcall SetAutoGenerateValue(const TAutoRefreshFlag Value);
```

Description

This is SetAutoGenerateValue, a member of class TField.

39.1.25.4.56 TField.SetData Method

Assigns unformatted data to the field.

Pascal

```
procedure SetData(Buffer: Pointer; NativeFormat: Boolean = True);
```

C++

```
__fastcall SetData(void * Buffer, Boolean NativeFormat = True);
```

Description

Use SetData to assign data to a field in the format that is used by the underlying database table. Ultimately, any method of setting the data for the field component calls SetData, once the data has been parsed into the format expected by the database table.

SetData calls the OnValidate (see page 7183) event handler before writing the data to the current record buffer. If the data is successfully written, SetData calls the OnChange (see page 7181) event handler.

Buffer contains the field value in the field components underlying type. NativeFormat indicates whether the value in Buffer must be translated before the dataset assigns its value to its internal record.

Note: SetData cannot be used to assign data to BLOB or memo fields. To write BLOB data, use the stream returned by the dataset's CreateBlobStream method or the BLOB field's LoadFromStream method.

See Also

GetData (see page 7131)

IsBlob (see page 7136)

OnChange (see page 7181)

OnValidate (see page 7183)

CreateBlobStream (see page 6922)

LoadFromStream (see page 6815)

39.1.25.4.57 TField.SetDataSet Method

Pascal

```
procedure SetDataSet(ADataSet: TDataSet); virtual;
```

C++

```
virtual __fastcall SetDataSet(TDataSet ADataSet);
```

Description

This is SetDataSet, a member of class TField.

39.1.25.4.58 TField.SetDataType Method

Pascal

```
procedure SetDataType(Value: TFieldType);
```

C++

```
__fastcall SetDataType(TFieldType Value);
```

Description

This is SetDataType, a member of class TField.

39.1.25.4.59 TField.SetFieldKind Method

Pascal

```
procedure SetFieldKind(Value: TFieldKind); virtual;
```

C++

```
virtual __fastcall SetFieldKind(TFieldKind Value);
```

Description

This is SetFieldKind, a member of class TField.

39.1.25.4.60 TField.SetFieldType Method

Provides the interface for a method that can set the DataType (see page 7159) for the field.

Pascal

```
procedure SetFieldType(Value: TFieldType); virtual;
```

C++

```
virtual __fastcall SetFieldType(TFieldType Value);
```

Description

As implemented in TField (see page 7115), SetFieldType does nothing. Descendant classes override SetFieldType to set the DataType (see page 7159) for the field component. SetFieldType is useful for derived classes that can support more than one underlying data type. For example, a TBlobField (see page 6801) may support ftBlob, ftFmtMemo, ftParadoxOle, ftDBaseOle, or ftTypedBinary.

See Also

DataType (see page 7159)

TBlobField (see page 6801)

39.1.25.4.61 TField.SetParentComponent Method

Pascal

```
procedure SetParentComponent(AParent: TComponent); override;
```

C++

```
virtual __fastcall SetParentComponent(TComponent * AParent);
```

Description

This is SetParentComponent, a member of class TField.

39.1.25.4.62 TField.SetParentField Method

Pascal

```
procedure SetParentField(AField: TObjectField); virtual;
```

C++

```
virtual __fastcall SetParentField(TObjectField AField);
```

Description

This is SetParentField, a member of class TField.

39.1.25.4.63 TField.SetSize Method

Pascal

```
procedure SetSize(Value: Integer); virtual;
```

C++

```
virtual __fastcall SetSize(int Value);
```

Description

This is SetSize, a member of class TField.

39.1.25.4.64 TField.SetText Method

Pascal

```
procedure SetText(const Value: string); virtual;
```

C++

```
virtual __fastcall SetText(const AnsiString Value);
```

Description

This is SetText, a member of class TField.

39.1.25.4.65 TField.SetVarValue Method

Pascal

```
procedure SetVarValue(const Value: Variant); virtual;
```

C++

```
virtual __fastcall SetVarValue(const Variant Value);
```

Description

This is SetVarValue, a member of class TField.

39.1.25.4.66 TField.SetWideText Method

Pascal

```
procedure SetWideText(const Value: WideString); virtual;
```

C++

```
virtual __fastcall SetWideText(const BSTR Value);
```

Description

This is SetWideText, a member of class TField.

39.1.25.4.67 TField.Validate Method

Generates an OnValidate (see page 7183) event.

Pascal

```
procedure Validate(Buffer: Pointer);
```

C++

```
__fastcall Validate(void * Buffer);
```

Description

Call Validate to validate the unformatted data pointed to by the Buffer parameter. Validate is called by the dataset when writing new values to the current record.

The value of Buffer does not affect the value of the field outside the OnValidate (see page 7183) event handler.

See Also

OnValidate (see page 7183)

Value (see page 7180)

39.1.25.5 TField Properties

The properties of the TField class are listed here.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7180)	Represents the data in a field component.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.

	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.25.5.1 TField.Alignment Property

Determines how the field's data is displayed within a data-aware control.

Pascal

```
property Alignment: TAlignment;
```

C++

```
__property TAlignment Alignment;
```

Description

Use Alignment to specify the position of the field's data within data-aware controls. These are the possible values:

Value (see page 7180)	Meaning
taLeftJustify	Align data to the left side of the control
taCenter	Center data horizontally in the control
taRightJustify	Align data to the right side of the control

See Also

DisplayLabel (see page 7160)

DisplayName (see page 7160)

DisplayText (see page 7162)

DisplayWidth (see page 7162)

TDBEdit (see page 8735)

39.1.25.5.2 TField.AsBCD Property

Represents the field's value as a TBcd value.

Pascal

```
property AsBCD: TBcd;
```

C++

```
__property TBcd AsBCD;
```

Description

Use AsBCD to read the value of the field's data into a TBcd or assign a TBcd value to the contents of the field.

As implemented by TField (see page 7115), reading AsBCD returns the value of AsCurrency (see page 7148) converted to a TBcd value, and setting AsBCD sets the AsCurrency (see page 7148) property after converting a supplied TBcd value to the Currency type. Some TField (see page 7115) descendants override AsBCD to perform a more direct conversion.

Note: If the field does not support Currency values, the field component raises an exception when an attempt is made to get or set the AsBCD or AsCurrency (see page 7148) property.

See Also

DataType (see page 7159)

Value (see page 7180)

BCDToCurr (see page 13637)

CurrToBCD (see page 13640)

39.1.25.5.3 TField.AsBoolean Property

Represents the field's value as a boolean value.

Pascal

```
property AsBoolean: Boolean;
```

C++

```
__property Boolean AsBoolean;
```

Description

Use AsBoolean to read the value of the field's data into a boolean or assign a boolean value to the contents of the field. TField (see page 7115) does not support boolean values, and raises an exception when an attempt is made to get or set the AsBoolean property.

Descendants of TField (see page 7115) that represent boolean fields or that support conversions between the field's Value (see page 7180) property and a boolean value, override AsBoolean to read and write the value of the field as a boolean value.

See Also

DataType (see page 7159)

Value (see page 7180)

39.1.25.5.4 TField.AsCurrency Property

Represents the field's value as a Currency value.

Pascal

```
property AsCurrency: Currency;
```

C++

```
__property Currency AsCurrency;
```

Description

Use AsCurrency to read the value of the field's data into an object or variable of type Currency or to assign a Currency value to the contents of the field.

As implemented by TField (see page 7115), reading AsCurrency returns the value of AsFloat (see page 7149) converted to a Currency value, and setting AsCurrency sets the AsFloat (see page 7149) property after converting a supplied Currency value to a double. Some TField (see page 7115) descendants override AsCurrency to work directly with Currency values rather than implicitly converting between the Currency type and doubles.

Note: If the field does not support double values, the field component raises an exception when an attempt is made to get or set the AsFloat (see page 7149) or AsCurrency property.

See Also

AsFloat (see page 7149)

DataType (see page 7159)

Value (see page 7180)

39.1.25.5.5 TField.AsDateTime Property

Represents the field's value as a TDateTime value.

Pascal

```
property AsDateTime: TDateTime;
```

C++

```
__property TDateTime AsDateTime;
```

Description

Use AsDateTime to read the value of the field's data into an object or variable of type TDateTime, or to assign a TDateTime value to the contents of the field. TField (see page 7115) does not support TDateTime values, and raises an exception when an attempt is made to get or set the AsDateTime property.

Descendants of TField (see page 7115) that represent datetime (timestamp) fields or that support conversions between the field's Value (see page 7180) property and a TDateTime value, override AsDateTime to read and write the value of the field as a TDateTime value.

See Also

DataType (see page 7159)

Value (see page 7180)

AsSQLTimeStamp (see page 7150)

39.1.25.5.6 TField.AsFloat Property

Represents the field's value as a double value.

Pascal

```
property AsFloat: Double;
```

C++

```
__property Double AsFloat;
```

Description

Use AsFloat to read the value of the field's data into a double, or to assign a Double value to the contents of the field. TField (see page 7115) does not support floating point values, and raises an exception when an attempt is made to get or set the AsFloat property.

Descendants of TField (see page 7115) that represent floating point numeric fields or that support conversions between the field's Value (see page 7180) property and a double value, override AsFloat to read and write the value of the field as a double.

See Also

AsCurrency (see page 7148)

DataType (see page 7159)

Value (see page 7180)

39.1.25.5.7 TField.AsInteger Property

Represents the field's value as a 32-bit integer.

Pascal

```
property AsInteger: Longint;
```

C++

```
__property Longint AsInteger;
```

Description

Use AsInteger to read the value of the field's data into an integer, or to assign an integer value to the contents of the field. TField (see page 7115) does not support integer values, and raises an exception when an attempt is made to get or set the AsInteger property.

Descendants of TField (see page 7115) that represent integer fields or that support conversions between the field's Value (see page 7180) property and an integer value, override AsInteger to read and write the value of the field as an integer value.

Delphi Examples:

```
{
This example uses the BeforeInsert event to do data
validation. If the StrToInt function raises an exception,
the edit control's contents are set to a valid value so
that the assignment to the INTEGER field in the dataset
will succeed.  Continuing after the exception causes a
'0' to be placed in the PORTA field.
DataSet design:
This example requires a ClientDataSet, a DBGrid, a
DataSource and a DBNavigator.  Name the ClientDataSet CDS.
Set the DataSet property in the DataSource to CDS and name
that DataSource DS.  Set the DataSource in the DBNavigator
to DS the DataSource in the DBGrid to DS.  Right click on CDS
```

```
  and select the Fields Editor, then right click on the Field
  Editor form and create two fields by selecting "new field".
  In the field configuration window, set the name to HOST, the
  Component value will automatically be set to CDSHOST.  Set
  the filed type to String.  In the field configuration window
  for the second field, set the name to PORTA, the Component
  value will automatically be set to CDSPORTA.  Set the field
  type to Integer.  The file used to load CDS must have an
  attribute name of HOST with an attribute type of string and
  an attribute name of PORTA with an attribute type of integer.
  Add DB, DBCtrls, Grids, DBGrids and DBClient to the uses clause.
  }
  {$IFNDEF UNICODE}
  uses SwSystem;
  {$ENDIF}

  procedure TForm1.Button3Click(Sender: TObject);
  begin
    CDS.Insert;
    CDS.FieldByName('PORTA').AsInteger := StrToInt(Edit1.Text);
    CDS.Post;
  end;

  procedure TForm1.CDSBeforeInsert(DataSet: TDataSet);
  begin
    try
    { Make sure edit field can be converted to integer --
     this will raise an exception if it can't }
      StrToInt(Edit1.Text);
    except
      Edit1.Text := '0';
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
  {$IFDEF UNICODE}
    CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
  {$ELSE}
    CDS.LoadFromFile(gsAppPath + 'CDS.XML');
  {$ENDIF}
  end;
```

See Also

AsFloat (see page 7149)

DataType (see page 7159)

Value (see page 7180)

39.1.25.5.8 TField.AsSQLTimeStamp Property

Represents the field's value as a TSQLTimeStamp.

Pascal

```
property AsSQLTimeStamp: TSQLTimeStamp;
```

C++

```
__property TSQLTimeStamp AsSQLTimeStamp;
```

Description

Use AsSQLTimeStamp to read the value of the field's data into a TSQLTimeStamp record (Delphi) or structure (C++), or to assign a TSQLTimeStamp value to the contents of the field. TField (see page 7115) does not support TSQLTimeStamp

values, and raises an exception when an attempt is made to get or set the AsSQLTimeStamp property.

Descendants of TField (see page 7115) that represent SQL timestamp fields or that support conversions between the field's Value (see page 7180) property and TSQLTimeStamp, override AsSQLTimeStamp to read and write the value of the field as a TSQLTimeStamp record (Delphi) or structure (C++).

See Also

DataType (see page 7159)

Value (see page 7180)

AsDateTime (see page 7148)

39.1.25.5.9 TField.AsString Property

Represents the field's value as a string (Delphi) or an AnsiString (C++).

Pascal

```
property AsString: string;
```

C++

```
__property AnsiString AsString;
```

Description

Reading the AsString property returns the abbreviated class name of the field component enclosed in parentheses. The abbreviated class name is built by stripping the leading 'T' from the class name and removing the trailing word 'FIELD', except in the case of TField (see page 7115) where that would leave an empty string. Thus, the abbreviated class name of TField (see page 7115) is "FIELD", the abbreviated class name of TVarBytesField (see page 7507) is "VarBytes", and so on.

Trying to set the AsString property raises an exception.

Descendants of TField (see page 7115) that represent string fields or that support conversions between the field's Value (see page 7180) property and a string override AsString to read and write the value of the field as a different, more meaningful, string.

Delphi Examples:

```
{
This example uses a button to copy the value of a field in
the previous record into the corresponding field in the
current record.  The field to copy is specified by using
FindField and the name of the field.
}
procedure TForm1.Button1Click(Sender: TObject);
var
   SavePlace: TBookmark;
   PrevValue: Variant;
begin
   with Customers do
   begin
    { get a bookmark so that we can return to the same record }
    SavePlace := GetBookmark;
    try
      { move to prior record}
      FindPrior;
      { get the value }
      { This is the safe way to get 'CustNo' field }
      PrevValue := FindField('Field2').Value;
      { This is *not* the safe way to change 'CustNo' field }
//    PrevValue := Fields[1].Value;
      { Move back to the bookmark
```

```
        this may not be the next record anymore
        if something else is changing the dataset asynchronously }
        GotoBookmark(SavePlace);
        { Set the value }
        Edit;
        { This is the safe way to change 'CustNo' field }
        FindField('Field2').AsString := PrevValue;
        { This is *not* the safe way to change 'CustNo' field }
//        Fields[1].AsString := PrevValue;
        { Free the bookmark }
      finally
        FreeBookmark(SavePlace);
      end;
    end;
  end;
```

See Also

DataType (see page 7159)

Value (see page 7180)

39.1.25.5.10 TField.AsVariant Property

Represents the Value (see page 7180) of the field as a Variant.

Pascal

```
property AsVariant: Variant;
```

C++

```
__property Variant AsVariant;
```

Description

Use AsVariant to read the value of the field's data into a Variant, or to assign a Variant value to the contents of the field. TField (see page 7115) does not support Variant values, and raises an exception when an attempt is made to read the AsVariant property. TField (see page 7115) also raises an exception when an attempt is made to set the AsVariant property, unless the Variant is of type varNull, in which case TField (see page 7115) calls the Clear (see page 7126) method.

Descendants of TField (see page 7115) implement the AsVariant method to get or set the value of the field as a Variant.

See Also

Clear (see page 7126)

Value (see page 7180)

39.1.25.5.11 TField.AsWideString Property

Pascal

```
property AsWideString: WideString;
```

C++

```
__property BSTR AsWideString;
```

Description

This is AsWideString, a member of class TField.

39.1.25.5.12 TField.AttributeSet Property

Specifies the name of an attribute set in the data dictionary to apply to the field component.

Pascal

```
property AttributeSet: string;
```

C++

```
__property AnsiString AttributeSet;
```

Description

An attribute set defines the display and format properties of a field component that are displayed in a data-aware control at design time. It also defines any constraint and default properties of the field component. Attribute sets are only available on Windows.

Attribute sets are stored in the data dictionary by name so that at design time developers can create and apply the same set of attributes to different field components in one or more datasets. When an attribute set is assigned to a field component at design time and that field component is owned by a TQuery or TStoredProc dataset, AttributeSet contains the name of the assigned attribute set.

See Also

TDataSet (see page 6894)

TQuery (see page 10059)

TStoredProc (see page 10139)

39.1.25.5.13 TField.AutoGenerateValue Property

Indicates whether the field values can be generated by the server rather than entered by the user.

Pascal

```
property AutoGenerateValue: TAutoRefreshFlag;
```

C++

```
__property TAutoRefreshFlag AutoGenerateValue;
```

Description

Use AutoGenerateValue to indicate when field values can be generated by the database. Such fields include autoincrement fields and fields with default values.

Some database drivers can't determine which fields can have values supplied automatically by the server. This can lead to problems when posting edits. For these cases, applications can provide this information by setting the AutoGenerateValue property. Use this property to indicate whether the field is an autoincrement field (arAutoInc), a field with a default value (arDefault), or a field whose value is not automatically generated (arNone).

AutoGenerateValue is not always required. Fields with an AutoGenerateValue property of arNone may still be updated if the driver supplies metadata that indicates it has a default value or an autoincrement value. However, it is good practice to supply this information because not all drivers supply this metadata.

If you do use AutoGenerateValue for any fields that have values generated by the database, you must set AutoGenerateValue to arAutoInc or arDefault on every field whose value is automatically generated by the database. This is because when records are posted, the application immediately executes a query to fetch the automatically-generated values. If you leave an automatically-generated field with AutoGenerateValue set to arNone, this query looks for a record with a blank value on that field, which will fail to locate the correct record.

Warning: AutoGenerateValue can fail in some cases when the automatically-generated field value is on a key field. This is because the query that re-fetches the new field value can't always uniquely locate the record that was just posted.

Note: Trying to change the AutoGenerateValue property when the field's dataset is open generates an exception. Thus, AutoGenerateValue only works with persistent field components, which remain when the dataset is closed.

Value (see page 7180)

39.1.25.5.14 TField.Calculated Property

Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.

Pascal

```
property Calculated: Boolean;
```

C++

```
__property Boolean Calculated;
```

Description

Use Calculated to determine if the field is a calculated field. When Calculated is true and the OnCalcFields event occurs, the OnCalcFields event handler updates the value of the field. The default value is false.

The value of a Calculated field is not stored in or retrieved from the physical tables underlying a dataset. Instead, calculated fields are calculated for each record in the table by the dataset's OnCalcFields event handler, which typically uses expressions involving values from other fields in the record to generate a value for each calculated field.

For example, a dataset might have non-calculated fields for Quantity and UnitPrice, and a calculated field for ExtendedPrice, which would be calculated by multiplying the values of the Quantity and UnitPrice fields in an OnCalcFields event handler.

Note: Do not change the setting of Calculated in application code. Calculated is automatically set to true by the Fields editor at design time if a field's value is specified as calculated.

Note: Do not confuse the Calculated property with the InternalCalcField property of a field definition. The value of a calculated field is computed in the OnCalcFields event handler. The value of an internally calculated field is computed by the SQL server or the Borland (see page 1761) Database Engine

.

See Also

OnCalcFields (see page 7053)

InternalCalcField (see page 7192)

Setting Display and Edit Properties at Design Time

39.1.25.5.15 TField.CanModify Property

Specifies whether a field can be modified.

Pascal

```
property CanModify: Boolean;
```

C++

```
__property Boolean CanModify;
```

Description

Check CanModify to determine if a field's data can be edited. CanModify is true only if the ReadOnly (see page 7177) property is false, and the dataset for this field component allows write access to the corresponding database field.

See Also

DataSet (see page 7157)

ReadOnly (see page 7177)

CanModify (see page 7012)

39.1.25.5.16 TField.ConstraintErrorMessage Property

Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.

Pascal

```
property ConstraintErrorMessage: string;
```

C++

```
__property AnsiString ConstraintErrorMessage;
```

Description

Set ConstraintErrorMessage to specify the message that appears when the user-supplied value for the field does not meet the constraints imposed by the server or specified in the CustomConstraint (see page 7156) property.

See Also

CustomConstraint (see page 7156)

ImportedConstraint (see page 7167)

39.1.25.5.17 TField.CurValue Property

Represents the current value of the field component including changes made by other users of the database.

Pascal

```
property CurValue: Variant;
```

C++

```
__property Variant CurValue;
```

Description

Use CurValue to examine the value of a field when a problem occurs while posting a value to the database using a provider. If the current field value causes a problem, such as a key violation, when posting the value, an event is generated to allow applications to respond to the problem. Provider (see page 18419) components generate an OnUpdateError event. If a provider returns problem records to the client dataset, the client dataset generates an OnReconcileError event. In the OnUpdateError or OnReconcileError event handler, NewValue (see page 7174) is the unposted value that caused the problem, OldValue (see page 7175) is the value that was originally assigned to the field before any edits were made, and

CurValue is the value that is currently assigned to the field. CurValue may differ from OldValue (see page 7175) if another user changed the value of the field after OldValue (see page 7175) was read.

Note: CurValue is only supported when the dataset is a TClientDataSet. In the provider's OnUpdateError event, a temporary client dataset containing fields with a CurValue property is passed to the event handler.

See Also

NewValue (see page 7174)

OldValue (see page 7175)

OnUpdateError (see page 18444)

OnReconcileError (see page 8524)

TClientDataSet (see page 8289)

Reconciling Update Errors

Resolving Update Errors On the Provider

39.1.25.5.18 TField.CustomConstraint Property

Specifies an SQL string the enforces any application-specific constraints on the field's value.

Pascal

```
property CustomConstraint: string;
```

C++

```
__property AnsiString CustomConstraint;
```

Description

Set CustomConstraint to limit the values that the user can enter into a field. CustomConstraint must be a valid SQL search expression such as

```
x > 0 and x < 100
```

The name used to refer to the field's value can be any string that is not a reserved SQL keyword, as long as it is used consistently throughout the constraint expression.

Custom constraints are imposed in addition to any constraints to the field's value that come from the server. To see the constraints imposed by the server, read the ImportedConstraint (see page 7167) property.

Note: When setting the CustomConstraint property, be sure to set the ConstraintErrorMessage (see page 7155) property as well, so that a message can appear when the user enters a value that violates the custom constraint.

Note: Custom constraints are SQL expressions. Because of this, always use a period (.) as a floating-point separator. This may be inconsistent with international Windows

environment settings.

See Also

ConstraintErrorMessage (see page 7155)

ImportedConstraint (see page 7167)

Constraining Data Values

39.1.25.5.19 TField.DataSet Property

Identifies the dataset to which a field component belongs.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Check the value of DataSet to determine the dataset that uses the field component to represent one of its fields. Applications should not directly assign the DataSet property of a field. It is assigned automatically when the field is created from a TFieldDef (see page 7184) object.

See Also

CreateField (see page 7188)

39.1.25.5.20 TField.DataSize Property

Indicates the amount of memory needed to store a field component's value.

Pascal

```
property DataSize: Integer;
```

C++

```
__property int DataSize;
```

Description

Check DataSize to determine the number of bytes required to store a field component's value. Use DataSize to determine the required size of a buffer for working with the field's value in native format. For example, use DataSize to determine the buffer size needed by the GetData (see page 7131) and SetData (see page 7141) methods.

The value of DataSize for TField (see page 7115) is 0. Most descendants of TField (see page 7115) override this property to specify the size required by the specific field type they represent. BLOB fields, however, represent data of indeterminate size. They do not override the inherited method, so the value of DataSize for BLOB fields is 0. A value of zero should not be interpreted as meaning the field value requires no memory. A value of zero indicates that the memory required for the field is indeterminate.

C++ Examples:

```
/*
This example requires a button, a test edit, and a populated
ClientDataSet.  Pipe the ClientDataSet through a DataSource
to a DGGrid or DBNavigator to control the current field.
Cast the data correctly according to the field type when
assigning to the test edit.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  // Retrieve the "raw" data from Field1
  if (!CDS->Fields->Fields[0]->IsBlob(__classid(TField))) // GetData does not work for BLOB
fields
  {
    void *MyBuffer = malloc(CDS->Fields->Fields[0]->DataSize);
    try
    {
```

```
      if (!CDS->Fields->Fields[0]->GetData(MyBuffer))
        MessageDlg(CDS->Fields->Fields[0]->DisplayName + "is blank.", mtInformation,
TMsgDlgButtons() << mbOK,0);
      else
        // Do something with the data;
        Edit1->Text = (char *)MyBuffer; // for a stringfield
    }
    __finally
    {
      free(MyBuffer);
    }
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  CDS->LoadFromFile("../CDS.XML");
}
```

Delphi Examples:

```
{
This example requires a button, a test edit, and a populated
ClientDataSet.  Pipe the ClientDataSet through a DataSource
to a DGGrid or DBNavigator to control the current field.
Cast the data correctly according to the field type when
assigning to the test edit.
}

{$IFNDEF UNICODE}
uses SwSystem;
{$ENDIF}

procedure TForm1.Button1Click(Sender: TObject);
var MyBuffer: Pointer;
begin
{ Retrieve the "raw" data from Field1 }
with CDS.Fields[0] do
  begin
    if not IsBlob then { this does not work for BLOB fields }
    begin
      { Allocate space }
      MyBuffer:= GetMemory(DataSize);
      try
        if not GetData(MyBuffer) then
          MessageDlg(DisplayName + ' is NULL', mtInformation, [mbOK], 0)
        else
          { Do something with the data };
          Edit1.Text:= string(MyBuffer); // for a stringfield
      finally
        { Free the space }
        FreeMem(MyBuffer, DataSize);
      end;
    end;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
{$ELSE}
  CDS.LoadFromFile(gsAppPath + 'CDS.XML');
{$ENDIF}
end;
```

See Also

DataType (see page 7159)

GetData (see page 7131)

SetData (see page 7141)

39.1.25.5.21 TField.DataType Property

Identifies the data type of the field component.

Pascal

```
property DataType: TFieldType;
```

C++

```
__property TFieldType DataType;
```

Description

Read the DataType property to learn the type of the data the field contains.

See Also

DataSize (see page 7157)

IsValidChar (see page 7136)

39.1.25.5.22 TField.DefaultExpression Property

Specifies an SQL expression that is assigned to the field if the user does not provide a value.

Pascal

```
property DefaultExpression: string;
```

C++

```
__property AnsiString DefaultExpression;
```

Description

Set DefaultExpression to provide a default value for a field. DefaultExpression can be any valid SQL value expression that does not refer to field values. If the expression contains literals other than numeric values, they must appear in quotes. For example, a default value of noon for a time field is

```
'12:00:00'
```

including the quotes around the literal value.

Note: If you supply a value for DefaultExpression, this value takes precedence over any default values for the field implemented on the database server. This is because DefaultExpression is applied to the field in your application before any edits are sent to the server.

See Also

Value (see page 7180)

Constraining Data Values

Setting a Default Value for a Field

39.1.25.5.23 TField.DisplayLabel Property

Contains the text to display in the corresponding column heading of a data grid.

Pascal

```
property DisplayLabel: WideString;
```

C++

```
__property BSTR DisplayLabel;
```

Description

Use DisplayLabel to assign column headings to a data grid. The column headings of the data grid use the DisplayName (see page 7160) property of the field whose value they represent. Setting DisplayLabel changes the read-only DisplayName (see page 7160) property from FieldName (see page 7164) to the string specified as DisplayLabel.

See Also

DisplayName (see page 7160)

FieldName (see page 7164)

TDBGrid (see page 9668)

Creating a Customized Grid

39.1.25.5.24 TField.DisplayName Property

Represents the name of the field for display purposes.

Pascal

```
property DisplayName: WideString;
```

C++

```
__property BSTR DisplayName;
```

Description

Use DisplayName when displaying a string that represents the field to the user. For example, when raising an exception concerning the field, format an error string that includes the DisplayName to refer to the field. DisplayName is a read-only property. To change the value of DisplayName, use the DisplayLabel (see page 7160) property.

If DisplayLabel (see page 7160) is defined, DisplayName is the same as DisplayLabel (see page 7160). Otherwise, DisplayName is the same as the FieldName (see page 7164) property.

C++ Examples:

```
/*
This example requires a button, a test edit, and a populated
ClientDataSet.  Pipe the ClientDataSet through a DataSource
to a DGGrid or DBNavigator to control the current field.
Cast the data correctly according to the field type when
assigning to the test edit.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  // Retrieve the "raw" data from Field1
  if (!CDS->Fields->Fields[0]->IsBlob(__classid(TField))) // GetData does not work for BLOB
fields
  {
    void *MyBuffer = malloc(CDS->Fields->Fields[0]->DataSize);
```

```
    try
    {
      if (!CDS->Fields->Fields[0]->GetData(MyBuffer))
        MessageDlg(CDS->Fields->Fields[0]->DisplayName + "is blank.", mtInformation,
TMsgDlgButtons() << mbOK,0);
      else
        // Do something with the data;
        Edit1->Text = (char *)MyBuffer; // for a stringfield
    }
    __finally
    {
      free(MyBuffer);
    }
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  CDS->LoadFromFile("../CDS.XML");
}
```

Delphi Examples:

```
{
This example requires a button, a test edit, and a populated
ClientDataSet.  Pipe the ClientDataSet through a DataSource
to a DGGrid or DBNavigator to control the current field.
Cast the data correctly according to the field type when
assigning to the test edit.
}

{$IFNDEF UNICODE}
uses SwSystem;
{$ENDIF}

procedure TForm1.Button1Click(Sender: TObject);
var MyBuffer: Pointer;
begin
{ Retrieve the "raw" data from Field1 }
with CDS.Fields[0] do
  begin
    if not IsBlob then { this does not work for BLOB fields }
    begin
      { Allocate space }
      MyBuffer:= GetMemory(DataSize);
      try
        if not GetData(MyBuffer) then
          MessageDlg(DisplayName + ' is NULL', mtInformation, [mbOK], 0)
        else
          { Do something with the data };
          Edit1.Text:= string(MyBuffer); // for a stringfield
      finally
        { Free the space }
        FreeMem(MyBuffer, DataSize);
      end;
    end;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
{$ELSE}
  CDS.LoadFromFile(gsAppPath + 'CDS.XML');
{$ENDIF}
end;
```

See Also

DisplayLabel (see page 7160)

FieldName (see page 7164)

39.1.25.5.25 TField.DisplayText Property

Represents the field's value as it is displayed in a data-aware control.

Pascal

```
property DisplayText: string;
```

C++

```
__property AnsiString DisplayText;
```

Description

DisplayText is a read-only string representation of a field's value for displaying in data-aware controls. It represents the field's value when it is not being edited. When the field is being edited, use the Text (see page 7179) property.

If the field has an OnGetText (see page 7182) event handler, DisplayText is the value returned in the Text (see page 7179) parameter of the OnGetText (see page 7182) event handler when its DisplayText parameter is true. Otherwise, DisplayText is the value of the AsString (see page 7151) property.

See Also

AsString (see page 7151)

OnGetText (see page 7182)

Text (see page 7179)

Value (see page 7180)

39.1.25.5.26 TField.DisplayWidth Property

Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set DisplayWidth to control how many characters are used to calculate the column width for the field when it is displayed by a TDBLookupListBox object or a descendant of TCustomDBGrid. The width of columns is determined by the average character width. If the data-aware control that displays the field is not using a fixed pitch font, DisplayWidth may indicate more or fewer characters than will fit in the column for any given string.

Note: The DisplayWidth property has no effect if there is an explicit Columns value for the field in a TDBGrid object.

See Also

DisplayText (see page 7162)

TCustomDBGrid (see page 9608)

TDBLookupListBox (see page 9070)

Using a Grid Control in Its Default State

Working with Field Components: Overview

39.1.25.5.27 TField.EditMask Property

Contains a mask that restricts the data that can be entered into a data field.

Pascal

```
property EditMask: TEditMask;
```

C++

```
__property TEditMask EditMask;
```

Description

Use EditMask to restrict the characters a user can enter. If the user attempts to enter a character that is not valid, the character is not accepted. Validation using the EditMask property is performed on a character-by-character basis. Use the OnValidate (see page 7183) event instead to validate the entire input, just before it is posted.

Setting EditMask to an empty string removes the mask.

Note: For a description of the format required by EditMask, see the

TEditMask type.

See Also

DisplayText (see page 7162)

IsValidChar (see page 7136)

OnValidate (see page 7183)

Validate (see page 7144)

Value (see page 7180)

39.1.25.5.28 TField.EditMaskPtr Property

Provides read-only access to the EditMask (see page 7163) property.

Pascal

```
property EditMaskPtr: TEditMask;
```

C++

```
__property TEditMask EditMaskPtr;
```

Description

Use EditMaskPtr when reading the EditMask (see page 7163) property. Because EditMaskPtr is a read-only property, EditMaskPtr guards against accidentally changing the value of the mask in code that should only read it.

Note: For a description of the format required by EditMask (see page 7163), see the

TEditMask type.

See Also

EditMask (see page 7163)

39.1.25.5.29 TField.FieldKind Property

Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.

Pascal

```
property FieldKind: TFieldKind;
```

C++

```
__property TFieldKind FieldKind;
```

Description

Use FieldKind to determine if a field is a data field, a calculated field, a lookup field, or an aggregate field. The value of FieldKind can be changed programmatically, but in practice FieldKind is set at design time when creating Field components with the Fields editor.

Note: Fields calculated by SQL servers or the Borland (see page 1761) Database Engine to display the results of a query that returns a live dataset

have a FieldKind of fkInternalCalc, not fkCalculated. This is because the field values are stored in the dataset. Calculated (see page 7154) fields in a client dataset that are calculated in an OnCalcFields event handler but stored in the dataset also have a FieldKind of fkInternalCalc instead of fkCalculated. Unlike regular calculated fields, internally calculated fields can be used in filter expressions. They can be edited, but the changes are discarded. To prevent editing, set the ReadOnly (see page 7177) property to true.

Note: The FieldKind property of a field is only stored with the field object if the value is fkInternalCalc.

See Also

Calculated (see page 7154)

Lookup (see page 7170)

ReadOnly (see page 7177)

39.1.25.5.30 TField.FieldName Property

Indicates the name of the physical column in the underlying table or query result to which a field component is bound.

Pascal

```
property FieldName: WideString;
```

C++

```
__property BSTR FieldName;
```

Description

When creating a field component, the TFieldDef (see page 7184) object uses FieldName to specify which field in the underlying dataset the field component represents. FieldName is used when displaying references to the field to users, unless a DisplayLabel (see page 7160) has been set. For calculated fields, supply a FieldName when defining the field. For non-calculated fields, an EDatabaseError (see page 6731) exception is raised if FieldName is not a column name in the underlying table.

Delphi Examples:

```
{
This example displays a message box with the names of all
fields in a table.
}
procedure TForm1.Button1Click(Sender: TObject);
```

```
var
   i: Integer;
   Info: String;
begin
   Info := 'The fields of table ' + Table1.TableName +
           ' are:'#13#10#13#10;
   for i := 0 to Table1.FieldCount - 1 do
      Info := Info + Table1.Fields[i].FieldName + #13#10;
  ShowMessage(Info);
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
    DatabaseName := 'DBDEMOS';
    TableType := ttParadox;
    TableName := 'CustInfo';
    Table1.Active := False;
    { Don't overwrite an existing table }
    if not Table1.Exists then
    begin
      { The Table component must not be active }
      { First, describe the type of table and give }
      { it a name }
      { Next, describe the fields in the table }
      with FieldDefs do
      begin
        Clear;
        with AddFieldDef do
        begin
          Name := 'Field1';
          DataType := ftInteger;
          Required := True;
        end;
        with AddFieldDef do
        begin
          Name := 'Field2';
          DataType := ftString;
          Size := 30;
        end;
      end;
      { Next, describe any indexes }
      with IndexDefs do
      begin
        Clear;
        { The 1st index has no name because it is
        { a Paradox primary key }
        with AddIndexDef do
        begin
          Name := '';
          Fields := 'Field1';
          Options := [ixPrimary];
        end;
        with AddIndexDef do
        begin
          Name := 'Fld2Indx';
          Fields := 'Field2';
          Options := [ixCaseInsensitive];
        end;
      end;
      { Call the CreateTable method to create the table }
      CreateTable;
    end;
  end;
```

```
  DS2.DataSet:= Table1;
  DBGrid2.DataSource.DataSet:= Table1;
  Table1.Active:= True;
end;
```

See Also

Origin (see page 7176)

CreateField (see page 7188)

FullName (see page 7166)

Defining New Persistent Fields

39.1.25.5.31 TField.FieldNo Property

Indicates the ordinal position of the field's column in the underlying table or query result.

Pascal

```
property FieldNo: Integer;
```

C++

```
__property int FieldNo;
```

Description

Read FieldNo to learn a field component's ordinal position in the table underlying the dataset, where 1 is the first field. Use the FieldNo property to specify the field only in direct API calls to the Borland (see page 1761) Database Engine.

Note: Do not confuse FieldNo, which is the field component's ordinal position in the physical database table, with Index (see page 7168), the field component's position in the dataset's Fields property.

See Also

FieldName (see page 7164)

Index (see page 7168)

39.1.25.5.32 TField.FullName Property

Indicates the field name qualified by the full name of the parent field, if any.

Pascal

```
property FullName: WideString;
```

C++

```
__property BSTR FullName;
```

Description

Inspect FullName to determine the field's name when it may be a subfield in the flattened version of a more complex object field. FullName prefixes the FieldName (see page 7164) property with the full name of the more complex object field of which it is a part.

See Also

FieldName (see page 7164)

ParentField (see page 7176)

39.1.25.5.33 TField.HasConstraints Property

Indicates whether field values are constrained.

Pascal

```
property HasConstraints: Boolean;
```

C++

```
__property Boolean HasConstraints;
```

Description

Read HasConstraints to determine whether the field component imposes custom constraints, imported constraints, or a default expression. HasConstraints is true if the CustomConstraint (see page 7156), DefaultExpression (see page 7159), or ImportedConstraint (see page 7167) property is set. Otherwise, HasConstraints is false, indicating that no constraints on field values are implemented.

Field values can still be limited when HasConstraints is false. For example, an edit mask or OnValidate (see page 7183) event handler can constrain field values.

See Also

CustomConstraint (see page 7156)

DefaultExpression (see page 7159)

EditMask (see page 7163)

ImportedConstraint (see page 7167)

OnValidate (see page 7183)

39.1.25.5.34 TField.ImportedConstraint Property

Represents an SQL clause that enforces constraints stored on the server.

Pascal

```
property ImportedConstraint: string;
```

C++

```
__property AnsiString ImportedConstraint;
```

Description

Read ImportedConstraint to determine the limits imposed by the server on what values are valid for the field. ImportedConstraint is an SQL search expression such as

```
Value > 0 and Value < 100
```

Do not change the value of ImportedConstraint. To add additional constraints on the field value, use the CustomConstraint (see page 7156) property instead. Custom constraints are imposed in addition to the imported constraints. If the server constraints change, the value of ImportedConstraint will be changed but constraints introduced in the CustomConstraint (see page 7156) property will persist.

Removing constraints from the ImportedConstraint property will not change the validity of field values that violate those

constraints. Removing constraints results in the constraints being checked by the server instead of locally. When constraints are checked locally, the error message supplied as the ConstraintErrorMessage (see page 7155) property is displayed when violations are posted, instead of an error message from the server when updates are applied.

Note: On Windows, ImportedConstraint is only set for fields of datasets that import constraints. These include client datasets (when they receive imported constraints in data packets) and BDE-based datasets.

Note: On Linux, the IDE does not provide any mechanism for importing server constraints. However, client datasets can receive imported constraints in data packets from an application server running on another platform.

See Also

ConstraintErrorMessage (see page 7155)

CustomConstraint (see page 7156)

39.1.25.5.35 TField.Index Property

Specifies the field component's index in the Fields property of the dataset.

Pascal

```
property Index: Integer;
```

C++

```
__property int Index;
```

Description

Use the Index property to:

Find the position of the field in the dataset.

Change (see page 7126) the order of a field's position in the dataset by changing the value of Index. Changing the Index value affects the order in which fields are displayed in data grids, but not the position of the fields in physical database tables.

Note: The field order can also be changed by dragging and dropping fields in the Fields editor at design time.

See Also

FieldNo (see page 7166)

Fields (see page 7023)

TDBGrid (see page 9668)

39.1.25.5.36 TField.IsIndexField Property

Indicates whether a field is an index field.

Pascal

```
property IsIndexField: Boolean;
```

C++

```
__property Boolean IsIndexField;
```

Description

Inspect the IsIndexField to determine if a field is used in the dataset's current index. If IsIndexField is true, the field is one of the fields that makes up the dataset's current index. If IsIndexField is false, the field is not an index field. A field component must be

an index field to serve as one of the fields in the LookupKeyFields (see page 7172) property of another field component.

See Also

LookupKeyFields (see page 7172)

39.1.25.5.37 TField.IsNull Property

Indicates whether the field has a value assigned to it.

Pascal

```
property IsNull: Boolean;
```

C++

```
__property Boolean IsNull;
```

Description

Inspect IsNull to ascertain whether the field contains a value. If IsNull is true, the field is blank. If IsNull is false, the field has a value.

See Also

Clear (see page 7126)

39.1.25.5.38 TField.KeyFields Property

Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.

Pascal

```
property KeyFields: WideString;
```

C++

```
__property BSTR KeyFields;
```

Description

Set KeyFields only on lookup fields (fields where FieldKind (see page 7164) is fkLookup and Lookup (see page 7170) is true). KeyFields specifies the field or fields to match when a lookup occurs. To use more than one field, separate each field name with a semicolon. The specified fields must be of the same types as the corresponding fields in LookupKeyFields (see page 7172), or the lookup fails.

The values of the KeyFields in the DataSet (see page 7157) are matched with the values of the LookupKeyFields (see page 7172) in the LookupDataSet (see page 7171) to determine a particular record of the lookup table. The value of the LookupResultField (see page 7173) on that record becomes the Value (see page 7180) property for the field component.

LookupResultField (see page 7173)

Value (see page 7180)

Defining a Lookup Field

39.1.25.5.39 TField.Lookup Property

Determines whether the field is specified as a lookup field.

Pascal

```
property Lookup: Boolean;
```

C++

```
__property Boolean Lookup;
```

Description

Lookup is provided for backward compatibility. To determine if a field is a lookup field, use the FieldKind (see page 7164) property instead Lookup indicates whether FieldKind (see page 7164) is fkLookup. When FieldKind (see page 7164) is fkLookup, Lookup is true. When FieldKind (see page 7164) is any other value, Lookup is false. Changing Lookup to false implicitly sets FieldKind (see page 7164) to fkData. Note that lookup fields do not work if the field is in a unidirectional dataset.

If the field is a lookup field, the KeyFields (see page 7169) property indicates which fields in the dataset must match the LookupKeyFields (see page 7172) in the LookupDataSet (see page 7171), to identify a record in the LookupDataSet (see page 7171). The value of the LookupResultField (see page 7173) for that record becomes the Value (see page 7180) of the field component.

See Also

FieldKind (see page 7164)

KeyFields (see page 7169)

LookupCache (see page 7170)

LookupResultField (see page 7173)

Value (see page 7180)

39.1.25.5.40 TField.LookupCache Property

Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.

Pascal

```
property LookupCache: Boolean;
```

C++

```
__property Boolean LookupCache;
```

Description

Set LookupCache to true to cache the values of a lookup field when the LookupDataSet (see page 7171) is unlikely to change and the number of distinct lookup values is small. Caching lookup values can speed performance, because the lookup values for every set of LookupKeyFields (see page 7172) values are preloaded when the DataSet (see page 7157) is opened. When the current record in the DataSet (see page 7157) changes, the field object can locate its Value (see page 7180) in the cache, rather than accessing the LookupDataSet (see page 7171). This performance improvement is especially dramatic if the LookupDataSet (see page 7171) is on a network where access is slow.

If every record of DataSet (see page 7157) has different values for KeyFields (see page 7169), the overhead of locating values in the cache can be greater than any performance benefit provided by the cache. The overhead of locating values in the cache increases with the number of distinct values that can be taken by KeyFields (see page 7169).

If LookupDataSet (see page 7171) is volatile, caching lookup values can lead to inaccurate results. Call RefreshLookupList (see page 7138) to update the values in the lookup cache. RefreshLookupList (see page 7138) regenerates the LookupList (see page 7172) property, which contains the value of the LookupResultField (see page 7173) for every set of LookupKeyFields (see page 7172) values.

When setting LookupCache at runtime, call RefreshLookupList (see page 7138) to initialize the cache.

Note: LookupCache is only meaningful if the value of FieldKind (see page 7164) is fkLookup.

LookupList (see page 7172)

LookupResultField (see page 7173)

RefreshLookupList (see page 7138)

Defining a Lookup Field

39.1.25.5.41 TField.LookupDataSet Property

Identifies the dataset used to look up field values.

Pascal

```
property LookupDataSet: TDataSet;
```

C++

```
__property TDataSet LookupDataSet;
```

Description

Use LookupDataSet to specify the dataset to use for looking up field values in a field with a FieldKind (see page 7164) of fkLookup.

Note: LookupDataSet can't refer to a unidirectional dataset.

When a field component is a lookup field, the Value (see page 7180) of the field component is the value of the LookupResultField (see page 7173) in the LookupDataSet. The record in the LookupDataSet that contains the correct value is found by matching the LookupKeyFields (see page 7172) in the LookupDataSet with the current values of the KeyFields (see page 7169) in the DataSet (see page 7157).

See Also

FieldKind (see page 7164)

KeyFields (see page 7169)

LookupKeyFields (see page 7172)

LookupResultField (see page 7173)

Value (see page 7180)

DataSet (see page 7157)

Defining a Lookup Field

39.1.25.5.42 TField.LookupKeyFields Property

Identifies the field or fields in the lookup dataset to match when doing a lookup.

Pascal

```
property LookupKeyFields: WideString;
```

C++

```
__property BSTR LookupKeyFields;
```

Description

Only use LookupKeyFields on field components with a FieldKind (see page 7164) of fkLookup. LookupKeyFields are the fields in the index of the LookupDataSet (see page 7171) whose values must match the KeyFields (see page 7169) in the field component's DataSet (see page 7157).

To specify more than one field, separate each field name with a semicolon. The fields specified in LookupKeyFields must be of the same types as the corresponding fields in KeyFields (see page 7169), or the lookup can't work.

Matching the values of the LookupKeyFields in the LookupDataSet (see page 7171) with the values of the KeyFields (see page 7169) in the DataSet (see page 7157) determines a specific record in the LookupDataSet (see page 7171). The Value (see page 7180) of the field component is the value of the LookupResultField (see page 7173) in the indicated record.

See Also

FieldKind (see page 7164)

KeyFields (see page 7169)

Lookup (see page 7170)

LookupDataSet (see page 7171)

LookupResultField (see page 7173)

Value (see page 7180)

DataSet (see page 7157)

Defining a Lookup Field

39.1.25.5.43 TField.LookupList Property

Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.

Pascal

```
property LookupList: TLookupList;
```

C++

```
__property TLookupList LookupList;
```

Description

Inspect LookupList to find the cached value assigned to the field for a given set of values on the fields specified by KeyFields (see page 7169). The value of LookupList is set when the dataset is open or the RefreshLookupList (see page 7138) method is called.

Tip: Applications can also fill LookupList programmatically to provide lookup values as long as the LookupDataSet (see page 7171) property is not set.

The ValueOfKey method of the LookupList returns the value of the LookupResultField (see page 7173) for a set of values on the LookupKeyFields (see page 7172). This allows the value of the lookup field object to be computed as follows:

```
Value := LookupList.ValueOfKey(DataSet.FieldValues[KeyFields]);
Value = LookupList->ValueOfKey(DataSet->FieldValues[KeyFields]);
```

Note: LookupList is only meaningful when the value of FieldKind (see page 7164) is fklookup and the LookupCache (see page 7170) property is true.

See Also

LookupResultField (see page 7173)

FieldValues (see page 7025)

ValueOfKey (see page 7339)

39.1.25.5.44 TField.LookupResultField Property

Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.

Pascal

```
property LookupResultField: WideString;
```

C++

```
__property BSTR LookupResultField;
```

Description

Use LookupResultField to specify a single field in the LookupDataSet (see page 7171) whose value becomes the value of the field component. The field component must have a FieldKind (see page 7164) of fkLookup, and the DataType (see page 7159) of the field component must be the same as the data type of LookupResultField.

When a field component is a lookup field, the Value (see page 7180) of the field component is the value of the LookupResultField in the LookupDataSet (see page 7171). The record in the LookupDataSet (see page 7171) that contains the correct value is found by matching the LookupKeyFields (see page 7172) in the LookupDataSet (see page 7171) with the current values of the KeyFields (see page 7169) in the DataSet (see page 7157).

See Also

DataSet (see page 7157)

DataType (see page 7159)

FieldKind (see page 7164)

KeyFields (see page 7169)

LookupDataSet (see page 7171)

LookupKeyFields (see page 7172)

Value (see page 7180)

Defining a Lookup Field

39.1.25.5.45 TField.NewValue Property

Represents the current value of the field component including pending cached updates.

Pascal

```
property NewValue: Variant;
```

C++

```
__property Variant NewValue;
```

Description

Use NewValue to examine or change the current value of a field when in the process of applying multiple updates. If the current field value is causing a problem, such as a key violation, when applying updates, datasets generate an OnUpdateError event. Similarly, provider components generate an OnUpdateError event when problems occur posting records from a client, and client datasets generate an OnReconcileError event when informed of problems by the provider. In the event handler, assign a new value to NewValue to correct the problem.

NewValue is the same as Value (see page 7180), except when errors are encountered while posting records. Setting NewValue in an OnUpdateError event handler, an OnUpdateRecord event handler, or an OnReconcileError event handler causes NewValue to differ from Value (see page 7180) until the records have finished being applied to the underlying database table.

Note: The NewValue property is only usable when the data is accessed using a TClientDataSet component or cached updates is enabled

.

See Also

CurValue (see page 7155)

OldValue (see page 7175)

OnReconcileError (see page 8524)

OnUpdateError (see page 9956)

OnUpdateRecord (see page 9957)

TClientDataSet (see page 8289)

Reconciling Update Errors

Resolving Update Errors On the Provider

39.1.25.5.46 TField.Offset Property

Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).

Pascal

```
property Offset: Integer;
```

C++

```
__property int Offset;
```

Description

Read Offset to determine the extra space in the record buffer of a TClientDataSet object allocated for cached information on calculated fields or BLOB fields. Offset should only be used by component writers when developing new descendants of TClientDataSet.

See Also

Calculated (see page 7154)

IsBlob (see page 7136)

TClientDataSet (see page 8289)

39.1.25.5.47 TField.OldValue Property

Represents the original value of the field (as a Variant).

Pascal

```
property OldValue: Variant;
```

C++

```
__property Variant OldValue;
```

Description

Read the OldValue property to examine or retrieve the original value of the field that was obtained from the dataset before any edits were posted. For example, in Delphi the following line replaces current pending changes with a field's original value:

```
NewValue :=OldValue;
```

Once records are applied successfully to the database, the old field value cannot be retrieved.

Note: the OldValue property is only usable when the data is accessed using a TClientDataSet component or cached updates is enabled

.

See Also

OnReconcileError (see page 8524)

OnUpdateError (see page 9956)

OnUpdateRecord (see page 9957)

Reconciling Update Errors

Resolving Update Errors On the Provider

39.1.25.5.48 TField.Origin Property

Indicates the name of the field in its original database table.

Pascal

```
property Origin: string;
```

C++

```
__property AnsiString Origin;
```

Description

Origin is only assigned at design time by the Fields editor, and only when the field component is used by a TQuery object. The Origin property distinguishes the name of the field as it appears in its dataset from the name of the field in the base table on which it is based. For example, in a query that uses the following SQL statement, the value of Origin is CUSTOMER.CUSTNO.

```
SELECT CUSTNO AS ID FROM CUSTOMER
```

In this case, the FieldName (see page 7164) property is ID.

Note: Origin is not available on Linux. The Origin property is only implemented for BDE-enabled datasets, which appear only in the Windows product.

See Also

FieldName (see page 7164)

39.1.25.5.49 TField.ParentField Property

Specifies the TObjectField (see page 7372) object from which this field is derived.

Pascal

```
property ParentField: TObjectField;
```

C++

```
__property TObjectField ParentField;
```

Description

Use ParentField when the field represents a subfield in the flattened version of a more complex object field. ParentField represents the object field (an Oracle8 array field or ADT).

When ParentField is nil (Delphi) or NULL (C++), the field does not represent part of a composite field.

See Also

ObjectView (see page 7031)

39.1.25.5.50 TField.ProviderFlags Property

Specifies how a provider uses the field value when applying updates.

Pascal

```
property ProviderFlags: TProviderFlags;
```

C++

```
__property TProviderFlags ProviderFlags;
```

Description

ProviderFlags is only relevant for fields that appear in the data packets supplied to a provider component's event handlers. This property is a set of flags that determine how the field is used when applying updates or resolving update errors.

See Also

TDataSetProvider (see page 18508)

UpdateMode (see page 10028)

UpdateMode (see page 18441)

CurValue (see page 7155)

OldValue (see page 7175)

NewValue (see page 7174)

Influencing How Updates Are Applied

Specifying What Fields Appear in Data Packets

39.1.25.5.51 TField.ReadOnly Property

Determines whether the field can be modified.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set ReadOnly to true to prevent a field from being modified. In a data grid, tabbing from field to field skips over ReadOnly fields.

To learn whether a field can be modified, use the CanModify (see page 7154) property instead. CanModify (see page 7154) reflects not only the value of the ReadOnly property, but also any restrictions imposed by the underlying dataset.

See Also

CanModify (see page 7154)

39.1.25.5.52 TField.Required Property

Specifies whether a nonblank value for a field is required.

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;
```

Description

Use Required to find out if a field requires a value or if the field can be blank.

If a field is created with the Fields editor, this property is set based on the underlying table. Applications that set Required to true

for fields that must have values (for example, a password or part number), but for which the underlying table does not require the field, must write an OnValidate (see page 7183) event handler to enforce the property.

When the Required property reflects a property of the underlying database table, trying to post apply a null value causes an exception to be raised. Applications that set the Required property to true when the underlying table does not require the field, should raise an EDatabaseError (see page 6731) exception on null values in the OnValidate (see page 7183) event handler in order to achieve the same result.

See Also

OnValidate (see page 7183)

Validate (see page 7144)

39.1.25.5.53 TField.Size Property

Indicates the size used in the definition of the physical database field for data types that support different sizes.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

The interpretation of Size depends on the data type. The meaning of Size for data types that use it is given in the following table. For all other data types, Size is not used and its value is always 0.

DataType (see page 7159)	Meaning of Size
ftBCD	Size is the number of digits after the decimal place.
ftString	Size is the maximum number of characters in the string.
ftVarBytes	Size is the maximum number of bytes of data, not counting the first two bytes which indicate the actual number of bytes of data that were used.
ftBytes	Size is the maximum number of bytes of data.
ftBlob	Size is the number of bytes from the BLOB that are stored in the record buffer.
ftDBaseOle	Size is the number of bytes from the dBASE OLE BLOB that are stored in the record buffer.
ftFMTBCD	Size is the number of digits after the decimal place.
ftFmtMemo	Size is the number of bytes from the memo that are stored in the record buffer.
ftGraphic	Size is the number of bytes from the image that are stored in the record buffer.
ftMemo	Size is the number of characters from the memo that are stored in the record buffer.
ftParadoxOle	Size is the number of bytes from the Paradox OLE BLOB that are stored in the record buffer.
ftTypedBinary	Size is the number of bytes from the BLOB that are stored in the record buffer.
ftADT	Size is the total number of fields contained in the ADT field, including the fields of child fields that are of type ADT.
ftArray	Size is the number of elements in the array.

See Also

DataSize (see page 7157)

DataType (see page 7159)

39.1.25.5.54 TField.Text Property

Contains the string to display in a data-aware control when the field is in edit mode.

Pascal

```
property Text: string;
```

C++

```
__property AnsiString Text;
```

Description

Data-aware controls rely on the Text property to provide the editing format for each field. For example, by default the Text property of a currency field omits the thousands separators and currency symbol.

Text can differ from the DisplayText (see page 7162) property if the field uses a different string representation when the value is being edited. To implement two different string representations of a field's value, use the OnGetText (see page 7182) event handler. If an OnGetText (see page 7182) event handler is assigned, Text is the value returned in the Text parameter of the event handler when the DisplayText (see page 7162) parameter is false. If there is no OnGetText (see page 7182) event handler, Text is the value of the AsString (see page 7151) property.

See Also

AsString (see page 7151)

DisplayText (see page 7162)

OnGetText (see page 7182)

Value (see page 7180)

39.1.25.5.55 TField.ValidChars Property

Specifies the characters that can be included in the text representation of the field's value.

Pascal

```
property ValidChars: TFieldChars;
```

C++

```
__property TFieldChars ValidChars;
```

Description

Set ValidChars to restrict the characters that can be validly entered as part of the text representation of the field's value. ValidChars is used by the IsValidChar (see page 7136) method to determine whether a character typed into a data-aware edit control can make up part of the field's value. Unlike the EditMask (see page 7163) property which specifies which characters can appear in specific positions, ValidChars limits the characters that can appear anywhere in the field's value.

TField (see page 7115) initializes ValidChars to include all characters. Numeric descendants of TField (see page 7115) change the default value to include only the characters that can make up a numeric value. Applications can change this value to restrict the character set for a field in other ways or to allow characters that are not permitted by default.

See Also

EditMask (see page 7163)

IsValidChar (see page 7136)

39.1.25.5.56 TField.Value Property

Represents the data in a field component.

Pascal

```
property Value: Variant;
```

C++

```
__property Variant Value;
```

Description

Use Value to read data directly from and write data directly to a field component at runtime. For example, use the Value property to affect the contents of a field that is not Visible (see page 7181).

Delphi Examples:

```
{
This example uses a button to copy the value of a field in
the previous record into the corresponding field in the
current record.
}
procedure TForm1.Button1Click(Sender: TObject);
var
   SavePlace: TBookmark;
   PrevValue: Variant;
begin
   with Customers do
   begin
    { get a bookmark so that we can return to the same record }
    SavePlace := GetBookmark;
    try
      { move to prior record}
      FindPrior;
      { get the value }
      PrevValue := Fields[1].Value;
      {Move back to the bookmark
      this may not be the next record anymore
      if something else is changing the dataset asynchronously }
      GotoBookmark(SavePlace);
      { Set the value }
      Edit;
      Fields[1].Value := PrevValue;
      { Free the bookmark }
    finally
      FreeBookmark(SavePlace);
    end;
  end;
end;

{
To ensure that the button is disabled when there is no
previous record, the OnDataChange event of the DataSource
detects when the user moves to the beginning of file (BOF
property becomes true), and disables the button.  Detection
occurs on scrolling and editing, not selection with the mouse.
}
procedure TForm1.DS2DataChange(Sender: TObject; Field: TField);
begin
  if Customers.Bof then
    Button1.Enabled := False
  else
    Button1.Enabled := True;
end;
```

See Also

Text (see page 7179)

DisplayText (see page 7162)

NewValue (see page 7174)

Visible (see page 7181)

39.1.25.5.57 TField.Visible Property

Determines whether the field appears in a data grid.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

To hide a field in a data grid, set Visible to false. If Visible is true, the field appears in the grid.

Note: The Visible property has no effect if the grid has an explicit Columns value for the field. It also has no effect on controls other than TDBGrid, such as TDBEdit.

See Also

Columns (see page 9653)

39.1.25.6 TField Events

The events of the TField class are listed here.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

39.1.25.6.1 TField.OnChange Event

Occurs immediately after the data in the field is written to the record buffer.

Pascal

```
property OnChange: TFieldNotifyEvent;
```

C++

```
__property TFieldNotifyEvent OnChange;
```

Description

Write an OnChange event handler to respond to any changes in the field's data. OnChange allows a response once the data has been successfully written to the record buffer.

When writing the value of a field to the current record buffer, the following steps occur:

1The OnValidate (see page 7183) event handler is called to validate the data.

2If the OnValidate (see page 7183) event handler accepts the current Value (see page 7180), the data is written to the record buffer.

3If writing the data does not raise an exception, the OnChange event handler is called to allow a response to the change.

See Also

OnValidate (see page 7183)

AfterPost (see page 7046)

Value (see page 7180)

39.1.25.6.2 TField.OnGetText Event

Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.

Pascal

```
property OnGetText: TFieldGetTextEvent;
```

C++

```
__property TFieldGetTextEvent OnGetText;
```

Description

Write an OnGetText handler to perform custom processing for the DisplayText (see page 7162) and Text (see page 7179) properties. Use OnGetText to format the Value (see page 7180) of the field differently when it must be edited from the format used when simply displaying the value, or use OnGetText to display something other than the field's value when it is displayed.

If there is no OnGetText handler, the value of the DisplayText (see page 7162) and Text (see page 7179) properties is simply the value of the AsString (see page 7151) property.

See Also

AsString (see page 7151)

DisplayText (see page 7162)

OnSetText (see page 7182)

Text (see page 7179)

Value (see page 7180)

Handling Events

Using Default Formatting for Numeric

39.1.25.6.3 TField.OnSetText Event

Occurs when the Text (see page 7179) property is assigned a value.

Pascal

```
property OnSetText: TFieldSetTextEvent;
```

C++

```
__property TFieldSetTextEvent OnSetText;
```

Description

Write an OnSetText event handler to specify processing that occurs whenever Text (see page 7179) receives a new value. If there is an OnGetText (see page 7182) event handler that formats the Value (see page 7180) of the field in some special way for editing purposes, OnSetText should reverse the process when parsing the edited string.

If there is no OnSetText handler, the Text (see page 7179) property is set by setting the AsString (see page 7151) property.

See Also

AsString (see page 7151)

OnGetText (see page 7182)

Text (see page 7179)

Value (see page 7180)

Handling Events

Using Default Formatting for Numeric

39.1.25.6.4 TField.OnValidate Event

Occurs just before the data is written to the record buffer.

Pascal

```
property OnValidate: TFieldNotifyEvent;
```

C++

```
__property TFieldNotifyEvent OnValidate;
```

Description

Write an OnValidate event handler to validate changes made to the data in the field, just before the data is written to the current record buffer. The EditMask (see page 7163) property allows validation of the data on a character by character basis while it is being entered by the user. OnValidate allows an application to validate the data as a whole.

When the value of a field component is assigned programmatically, validation by the EditMask (see page 7163) is bypassed, since there is no data-aware control to enforce adherence to the mask. OnValidate allows an application to validate such data before it is posted to the database table.

To reject the current value of the field from the OnValidate event handler, raise an exception.

When writing the value of a field to the current record buffer, the following steps occur:

1The OnValidate event handler is called to validate the data.

2If the OnValidate event handler does not raise an exception, the data is written to the current record buffer.

3If writing the data does not raise an exception, the OnChange (see page 7181) event handler is called to allow a response to the change.

See Also

EditMask (see page 7163)

IsValidChar (see page 7136)

OnChange (see page 7181)

BeforePost (see page 7052)

Validate (see page 7144)

Value (see page 7180)

Handling Events

39.1.26 TFieldDef Class

TFieldDef is a field definition that corresponds to a physical field of a record in a table underlying a dataset.

Class Hierarchy

Pascal

```
TFieldDef = class(TNamedItem);
```

C++

```
class TFieldDef : public TNamedItem;
```

File

DB

Description

A TFieldDef object contains the definition of one field in a table. The definition for a field includes such attributes as the field's name, data type, and size. TFieldDef objects are typically used in collections of such objects, such as the FieldDefs property of the TDataSet (see page 6894) component.

There are two primary reasons for working with TFieldDef objects:

To obtain information about field types in a dataset without opening the dataset.

To specify field definitions for a new table.

When using an existing table, a field definition is automatically created for each field in the dataset that comes from the underlying database. Inspect the properties of TFieldDef to retrieve information about specific fields in the dataset.

When creating new tables, such as with the CreateTable method of TTableor the CreateDataSet method of TClientDataSet, TFieldDef objects supply the definitions for the new fields that will comprise the new table.

A field definition has a corresponding TField (see page 7115) object, but not all TField (see page 7115) objects have a corresponding field definition. For example, calculated fields do not have field definition objects.

See Also

TFieldDefs (see page 7198)

TFieldDefList (see page 7195)

TDataSet (see page 6894)

TTable (see page 10168)

TCustomClientDataSet (see page 8373)

Creating and Deleting Tables

39.1.26.1 TFieldDef Members

The following tables list the members exposed by TFieldDef.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 7189)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
	GetDisplayName (see page 7359)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetDisplayName (see page 7359)	This is SetDisplayName, a member of class TNamedItem.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	AddChild (see page 7187)	Adds a new TFieldDef (see page 7184) object to the ChildDefs (see page 7191) array.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 7188)	Copies the properties of one field definition to another.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 7186)	Creates and initializes a TFieldDef (see page 7184) instance.
	CreateField (see page 7188)	Creates a TField (see page 7115) component that matches the specifications of the TFieldDef (see page 7184) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 7187)	Destroys the TFieldDef (see page 7184) instance and frees its memory.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	HasChildDefs (see page 7189)	Indicates whether the field of the TFieldDef (see page 7184) object has any child field definitions.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	FieldClass (see page 7192)	Determines the class of the field object that corresponds to this field definition object.
	FieldNo (see page 7192)	Identifies the physical field number used to reference the field.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
	InternalCalcField (see page 7192)	Determines if the field is calculated by the underlying database.
R	ParentDef (see page 7193)	The ParentDef property references the parent field definition for the field definition, if it exists.
	Required (see page 7194)	Indicates whether a value for the physical field in the underlying table is required.

Published Properties

	Name	Description
	Attributes (see page 7190)	Identifies attributes of the field associated with the field def.
	ChildDefs (see page 7191)	Specifies the TFieldDefs (see page 7198) object that contains an array of child fields.
	DataType (see page 7191)	Determines the type of a physical field.
	Name (see page 7359)	Specifies the name of the database entity defined by the TNamedItem (see page 7357) object.
	Precision (see page 7193)	Specifies the number of digits of accuracy used to store the field value.
	Size (see page 7194)	Reports the size associated with the field in the physical database table.

39.1.26.2 TFieldDef.Create Constructor

Creates and initializes a TFieldDef (see page 7184) instance.

Pascal

```
constructor Create(Owner: TFieldDefs; const Name: WideString; DataType: TFieldType; Size:
Integer; Required: Boolean; FieldNo: Integer); overload; reintroduce;
```

C++

```
__fastcall TFieldDef(TFieldDefs Owner, const BSTR Name, TFieldType DataType, int Size, Boolean
Required, int FieldNo);
```

Description

Applications should not call Create directly. A TFieldDef (see page 7184) is created automatically by the dataset for each field in an already existing table. When composing field definitions preparatory to creating a new dataset, the TFieldDefs.AddFieldDef method (or the older TFieldDefs.Add method) creates the needed instance of TFieldDef (see page 7184).

See Also

CreateField (see page 7188)

Add (see page 7202)

AddFieldDef (see page 7202)

CreateTable (see page 10189)

CreateDataSet (see page 8401)

39.1.26.3 TFieldDef.Destroy Destructor

Destroys the TFieldDef (see page 7184) instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TFieldDef();
```

Description

Destroy calls the inherited Destroy method, and then frees and child field definition objects.

An application will seldom need to destroy a TFieldDef (see page 7184) object using this method. Instead, call the Free method, inherited from TObject.

See Also

Create (see page 7186)

Free (see page 22300)

39.1.26.4 TFieldDef Methods

The methods of the TFieldDef class are listed here.

Protected Methods

	Name	Description
	DefineProperties (see page 7189)	Provides an interface for a method that reads and writes otherwise unpublished data.

Public Methods

	Name	Description
	AddChild (see page 7187)	Adds a new TFieldDef (see page 7184) object to the ChildDefs (see page 7191) array.
	Assign (see page 7188)	Copies the properties of one field definition to another.
	CreateField (see page 7188)	Creates a TField (see page 7115) component that matches the specifications of the TFieldDef (see page 7184) object.
	HasChildDefs (see page 7189)	Indicates whether the field of the TFieldDef (see page 7184) object has any child field definitions.

39.1.26.4.1 TFieldDef.AddChild Method

Adds a new TFieldDef (see page 7184) object to the ChildDefs (see page 7191) array.

Pascal

```
function AddChild: TFieldDef;
```

C++

```
__fastcall TFieldDef AddChild();
```

Description

Use AddChild to add a new field definition for a child field of the TFieldDef (see page 7184) object's field. AddChild returns the new field definition for the subfield.

Typically, applications never need to call AddChild because you can't create tables that include object fields.

See Also

ChildDefs (see page 7191)

ParentDef (see page 7193)

HasChildDefs (see page 7189)

39.1.26.4.2 TFieldDef.Assign Method

Copies the properties of one field definition to another.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy a field definition. Assign checks whether the Source parameter specifies another field definition, and if so, copies the values of the Name (see page 7359), DataType (see page 7191), Size (see page 7194), Precision (see page 7193), and InternalCalcField (see page 7192) properties. Note that the value of FieldNo (see page 7192) is not changed.

If the source is not a field definition, Assign calls the inherited method, which assigns properties from any object that specifies how to copy to a field definition in its AssignTo method.

See Also

DataType (see page 7191)

FieldNo (see page 7192)

Name (see page 7359)

Required (see page 7194)

Size (see page 7194)

InternalCalcField (see page 7192)

Precision (see page 7193)

Assign (see page 2930)

Assign (see page 2930)

AssignTo (see page 2931)

39.1.26.4.3 TFieldDef.CreateField Method

Creates a TField (see page 7115) component that matches the specifications of the TFieldDef (see page 7184) object.

Pascal

```
function CreateField(Owner: TComponent; ParentField: TObjectField = nil; const FieldName:
```

```
WideString = ''; CreateChildren: Boolean = True): TField;
```

C++

```
__fastcall TField CreateField(TComponent * Owner, TObjectField ParentField = nil, const BSTR
FieldName = '', Boolean CreateChildren = True);
```

Description

A dataset object calls CreateField to create the field components from the field definition objects. Applications need never call CreateField directly.

See Also

FieldClass (see page 7192)

TDataSet (see page 6894)

TField (see page 7115)

39.1.26.4.4 TFieldDef.DefineProperties Method

Provides an interface for a method that reads and writes otherwise unpublished data.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

Descendants of TPersistent override DefineProperties to designate a method for storing the object's unpublished data to a stream such as a form file. By default, writing an object to a stream writes the values of all its published properties, and reading the object in reads those values and assigns them to the properties. Objects can also specify methods that read and write data other than published properties by overriding the DefineProperties method.

When overriding DefineProperties, consider including some or all of the following:

A call to the inherited method

Calls to the filer object's DefineProperty method

Calls to the filer object's DefineBinaryProperty method

DefineProperties is virtual, so descendant classes can override it as necessary but are not required to do so.

See Also

DefineProperties (see page 2771)

DefineBinaryProperty (see page 2837)

DefineProperty (see page 2838)

39.1.26.4.5 TFieldDef.HasChildDefs Method

Indicates whether the field of the TFieldDef (see page 7184) object has any child field definitions.

Pascal

```
function HasChildDefs: Boolean;
```

C++

```
__fastcall Boolean HasChildDefs();
```

Description

If the TFieldDef (see page 7184) object defines an object field, such as TADTField (see page 6736) or TArrayField (see page 6760), HasChildDefs returns true.

See Also

ParentDef (see page 7193)

AddChild (see page 7187)

ChildDefs (see page 7191)

39.1.26.5 TFieldDef Properties

The properties of the TFieldDef class are listed here.

Public Properties

	Name	Description
R	FieldClass (see page 7192)	Determines the class of the field object that corresponds to this field definition object.
	FieldNo (see page 7192)	Identifies the physical field number used to reference the field.
	InternalCalcField (see page 7192)	Determines if the field is calculated by the underlying database.
R	ParentDef (see page 7193)	The ParentDef property references the parent field definition for the field definition, if it exists.
	Required (see page 7194)	Indicates whether a value for the physical field in the underlying table is required.

Published Properties

	Name	Description
	Attributes (see page 7190)	Identifies attributes of the field associated with the field def.
	ChildDefs (see page 7191)	Specifies the TFieldDefs (see page 7198) object that contains an array of child fields.
	DataType (see page 7191)	Determines the type of a physical field.
	Precision (see page 7193)	Specifies the number of digits of accuracy used to store the field value.
	Size (see page 7194)	Reports the size associated with the field in the physical database table.

39.1.26.5.1 TFieldDef.Attributes Property

Identifies attributes of the field associated with the field def.

Pascal

```
property Attributes: TFieldAttributes;
```

C++

```
__property TFieldAttributes Attributes;
```

Description

Attributes lists various attributes that are used to describe the role of the field that the TFieldDef (see page 7184) object defines.

Note: In Delphi, faReadonly value has the same name as a constant is in the SysUtils (see page 22709) unit. If both the SysUtils (see page 22709) and the Db units are used in your source files, you must disambiguate by specifying the unit to qualify the use of faReadonly. That is,write Db.faReadonly. In C++, this is not a problem because the constant in the SysUtils (

see page 22709) unit differs in case (faReadOnly).

See Also

UnNamed (see page 7386)

ReadOnly (see page 7177)

Required (see page 7194)

HiddenFields (see page 7206)

39.1.26.5.2 TFieldDef.ChildDefs Property

Specifies the TFieldDefs (see page 7198) object that contains an array of child fields.

Pascal

```
property ChildDefs: TFieldDefs;
```

C++

```
__property TFieldDefs ChildDefs;
```

Description

If the field that the TFieldDef (see page 7184) object represents is an object field such as TADTField (see page 6736) or TArrayField (see page 6760), child fields of the object field are stored in the TFieldDefs (see page 7198) array referenced by the ChildDefs property.

Note: You can't create tables that contain object fields. ChildDefs is only used in field definitions that reflect an existing dataset, not field definitions that are used to create a new dataset.

See Also

AddChild (see page 7187)

ParentDef (see page 7193)

TADTField (see page 6736)

TArrayField (see page 6760)

39.1.26.5.3 TFieldDef.DataType Property

Determines the type of a physical field.

Pascal

```
property DataType: TFieldType;
```

C++

```
__property TFieldType DataType;
```

Description

Use DataType to find out what type of data the field contains. When adding field definitions to a dataset, set DataType to specify what type of field is being defined.

See Also

FieldClass (see page 7192)

Size (see page 7194)

39.1.26.5.4 TFieldDef.FieldClass Property

Determines the class of the field object that corresponds to this field definition object.

Pascal

```
property FieldClass: TFieldClass;
```

C++

```
__property TFieldClass FieldClass;
```

Description

Inspect the read-only FieldClass property to find out the class of field object to which this field definition corresponds. The FieldClass is determined by the DataType (see page 7191) of the field. For example, if the DataType (see page 7191) is ftString, the FieldClass is TStringField (see page 7483) (Delphi) or __classid(TStringField (see page 7483)) (C++).

The field object created from a field definition by the CreateField (see page 7188) method is an instance of the FieldClass.

See Also

CreateField (see page 7188)

DataType (see page 7191)

TField (see page 7115)

ClassName (see page 22290)

39.1.26.5.5 TFieldDef.FieldNo Property

Identifies the physical field number used to reference the field.

Pascal

```
property FieldNo: Integer;
```

C++

```
__property int FieldNo;
```

Description

Use FieldNo to find out where the physical field the field definition references is in the set of fields in the table. For example, if the value of FieldNo is 2, then the field is the second field in the underlying database table.

When adding field definitions to a dataset, set FieldNo to specify the location at which to create the field.

See Also

Name (see page 7359)

FieldNo (see page 7166)

39.1.26.5.6 TFieldDef.InternalCalcField Property

Determines if the field is calculated by the underlying database.

Pascal

```
property InternalCalcField: Boolean;
```

C++

```
__property Boolean InternalCalcField;
```

Description

Read InternalCalcField to find out if the field represents a value provided by the underlying database but is not a field in the physical database table. Internally calculated fields are calculated by SQL servers or the Borland (see page 1761) Database Engine in a live query view and stored in the dataset like data fields.

For example, in the following SQL statement, the dataset includes a field for the calculated value ONHAND * COST.

```
SELECT PartNo, Description, OnHand, Cost, (OnHand * Cost)
FROM PARTS
```

When the TQuery object has its RequestLive property set to true, the field definition for that calculated value will have InternalCalcField set to true.

InternalCalcField is a read-only property.

See Also

RequestLive (see page 10088)

FieldKind (see page 7164)

Using Internally Calculated Fields in Client Datasets

39.1.26.5.7 TFieldDef.ParentDef Property

The ParentDef property references the parent field definition for the field definition, if it exists.

Pascal

```
property ParentDef: TFieldDef;
```

C++

```
__property TFieldDef ParentDef;
```

Description

If the TFieldDef (see page 7184) object is the field definition of the child field of an object field, such as an ADT field or an array field, then ParentDef references the parent object's field definition. If the TFieldDef (see page 7184) object does not define the child field of an object field, ParentDef is nil (Delphi) or NULL (C++)..

Note: You can't create tables that contain object fields. ParentDef is only used in field definitions that reflect an existing dataset, not field definitions that are used to create a new dataset.

See Also

ParentField (see page 7176)

AddChild (see page 7187)

HasChildDefs (see page 7189)

39.1.26.5.8 TFieldDef.Precision Property

Specifies the number of digits of accuracy used to store the field value.

Pascal

```
property Precision: Integer;
```

C++

```
__property int Precision;
```

Description

When defining a BCD field, set Precision to the total number of digits stored for each field value. The value of Precision is ignored unless DataType (see page 7191) is ftBCD.

See Also

DataType (see page 7191)

Size (see page 7194)

39.1.26.5.9 TFieldDef.Required Property

Indicates whether a value for the physical field in the underlying table is required.

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;
```

Description

Use Required to find out if a field in a dataset must have a value. If Required is true, the field must have a value. If Required is false, the field can be left blank.

When adding field definitions to a dataset, set Required to specify whether blank values for the new field should be prohibited.

See Also

Required (see page 7177)

39.1.26.5.10 TFieldDef.Size Property

Reports the size associated with the field in the physical database table.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

Use Size to determine the size associated with the corresponding physical field.

Size is meaningful only for a field definition object with one of the following TFieldType (see page 7612) values: ftString, ftBCD, ftBytes, ftVarBytes, ftBlob, ftMemo or ftGraphic. For string and byte fields, Size is the number of bytes reserved in the table for the field. For a BCD field, Size is the number of digits following the decimal point. For a BLOB, memo, or graphic field, Size is the number of bytes from the field's value that are stored in the actual database table.

See Also

DataType (see page 7191)

Size (see page 7178)

39.1.27 TFieldDefList Class

TFieldDefList lists the field definition (TFieldDef (see page 7184)) objects of a dataset in a flattened form.

Class Hierarchy

Pascal

```
TFieldDefList = class(TFlatList);
```

C++

```
class TFieldDefList : public TFlatList;
```

File

DB

Description

TFieldDefList is used by a dataset to implement its FieldDefList property. This object lists field definitions in a flattened format.

With object field types, such as TADTField (see page 6736) and TArrayField (see page 6760), there are two ways to represent the field definitions: hierarchically or flattened. When represented hierarchically, object field definitions contain a set of child definitions for the constituent subfields. When represented as a flattened set, child field definitions appear as siblings sequentially after the parent field definition.

TFieldDefList stores the flattened field definitions of a dataset. This is a linear representation of the data, and is in contrast to TFieldDefs (see page 7198) which has a hierarchical representation of the data.

TFieldDefList is a descendant of TStringList. The strings in this string list are the names of fields. The objects that correspond to those strings are the TFieldDef (see page 7184) objects.

39.1.27.1 TFieldDefList Members

The following tables list the members exposed by TFieldDefList.

Protected Methods

	Name	Description
	FindItem (see page 7227)	This is FindItem, a member of class TFlatList.
V	GetCount (see page 7227)	This is GetCount, a member of class TFlatList.
V	GetUpdated (see page 7197)	This is GetUpdated, a member of class TFieldDefList.
	ListChanging (see page 7227)	This is ListChanging, a member of class TFlatList.
V	UpdateList (see page 7197)	This is UpdateList, a member of class TFieldDefList.

Protected Properties

	Name	Description
	Locked (see page 7229)	This is Locked, a member of class TFlatList.
	Updated (see page 7229)	This is Updated, a member of class TFlatList.

Public Methods

	Name	Description
	Create (see page 7226)	Creates an instance of TFlatList (see page 7225).
	FieldByName (see page 7196)	Returns a field definition object given its field name.
	Find (see page 7197)	Returns a field definition object given its field name.
	Update (see page 7228)	Refreshes the strings and objects to reflect the current state of the physical fields underlying the dataset.

Public Properties

	Name	Description
R	DataSet (see page 7228)	Identifies the dataset to which the TFlatList (see page 7225) object belongs.
R	FieldDefs (see page 7198)	Lists the field definitions for the dataset associated with the TFieldDefList (see page 7195) object.

39.1.27.2 TFieldDefList Methods

The methods of the TFieldDefList class are listed here.

Protected Methods

	Name	Description
V	GetUpdated (see page 7197)	This is GetUpdated, a member of class TFieldDefList.
V	UpdateList (see page 7197)	This is UpdateList, a member of class TFieldDefList.

Public Methods

	Name	Description
	FieldByName (see page 7196)	Returns a field definition object given its field name.
	Find (see page 7197)	Returns a field definition object given its field name.

39.1.27.2.1 TFieldDefList.FieldByName Method

Returns a field definition object given its field name.

Pascal

```
function FieldByName(const Name: WideString): TFieldDef;
```

C++

```
__fastcall TFieldDef FieldByName(const BSTR Name);
```

Description

Call FieldByName to obtain information about a particular field definition object. Specify the name of the field as the value of the Name parameter. If Name is not found, FieldByName raises an EDatabaseError (see page 6731) exception with the error message "Field not found".

Note: FieldByName differs from the Find (see page 7197) method only when the named field definition is not in the list. When the field definition is not found, FieldByName raises an exception, while Find (see page 7197) returns nil (Delphi) or NULL (C++).

See Also

FieldDefs (see page 7198)

Find (see page 7197)

39.1.27.2.2 TFieldDefList.Find Method

Returns a field definition object given its field name.

Pascal

```
function Find(const Name: WideString): TFieldDef; reintroduce;
```

C++

```
__fastcall TFieldDef Find(const BSTR Name);
```

Description

Call Find to obtain information about a particular field definition object. Specify the name of the field as the value of the Name parameter. If Find finds a field with a matching name, it returns the TFieldDef (see page 7184) component for the specified Name. Otherwise it returns nil (Delphi) or NULL (C++).

Note: Find differs from the FieldByName (see page 7196) method only when the named field definition is not in the list. When the field definition is not found, Find returns nil (Delphi) or NULL (C++), while FieldByName (see page 7196) raises an exception.

See Also

FieldDefs (see page 7198)

FieldByName (see page 7196)

39.1.27.2.3 TFieldDefList.GetUpdated Method

Pascal

```
function GetUpdated: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetUpdated();
```

Description

This is GetUpdated, a member of class TFieldDefList.

39.1.27.2.4 TFieldDefList.UpdateList Method

Pascal

```
procedure UpdateList; override;
```

C++

```
virtual __fastcall UpdateList();
```

Description

This is UpdateList, a member of class TFieldDefList.

39.1.27.3 TFieldDefList Properties

The properties of the TFieldDefList class are listed here.

Public Properties

	Name	Description
R	FieldDefs (see page 7198)	Lists the field definitions for the dataset associated with the TFieldDefList (see page 7195) object.

39.1.27.3.1 TFieldDefList.FieldDefs Property

Lists the field definitions for the dataset associated with the TFieldDefList (see page 7195) object.

Pascal

```
property FieldDefs [Index: Integer]: TFieldDef;
```

C++

```
__property TFieldDef FieldDefs[int Index];
```

Description

FieldDefs points to a internal list of field definitions for a dataset. A TFieldDefList (see page 7195) with object field types, such as TADTField (see page 6736) and TArrayField (see page 6760), lists child TFieldDef (see page 7184) objects sequentially after the parent TFieldDef (see page 7184).

Find (see page 7197)

DataSet (see page 7228)

operator_sb

39.1.28 TFieldDefs Class

TFieldDefs holds the field definition (TFieldDef (see page 7184)) objects that represent the physical fields underlying a dataset.

Class Hierarchy

Pascal

```
TFieldDefs = class(TDefCollection);
```

C++

```
class TFieldDefs : public TDefCollection;
```

File

DB

Description

Datasets use TFieldDefs to manage the field definitions they use to create field objects that correspond to fields in a database table. Every field definition listed by TFieldDefs has a corresponding TField (see page 7115) object, but not all TField (see page 7115) objects have a corresponding field definition. For example, calculated fields do not have field definitions.

TTable and TClientDataSet objects also use TFieldDefs when creating a new table.

With object field types, such as TADTField (see page 6736) and TArrayField (see page 6760), there are two ways to represent the field definitions: hierarchically or flattened. When represented hierarchically, object field definitions contain a set of child definitions for the constituent subfields. When represented as a flattened set, child field definitions appear as siblings

sequentially after the parent field definition.

TFieldDefs stores field definitions hierarchically. This is in contrast to TFieldDefList (see page 7195), which lists the child TFieldDef (see page 7184) objects of object fields sequentially after the parent TFieldDef (see page 7184).

Use the properties and methods of TFieldDefs to:

Access a specific field definition.

Add (see page 7202) or delete field definitions from the list (when creating new tables).

Find (see page 7204) out how many fields are defined.

Copy a set of field definitions to another dataset.

39.1.28.1 TFieldDefs Members

The following tables list the members exposed by TFieldDefs.

Protected Events

	Name	Description
	OnUpdate (see page 7111)	This is OnUpdate, a member of class TDefCollection.

Protected Methods

	Name	Description
	Added (see page 2736)	Responds when items are added to the collection.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
	ChildDefUpdate (see page 7204)	This is ChildDefUpdate, a member of class TFieldDefs.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	Deleting (see page 2741)	Responds when items are deleted from the collection.
	DoUpdate (see page 7107)	This is DoUpdate, a member of class TDefCollection.
	FieldDefUpdate (see page 7204)	This is FieldDefUpdate, a member of class TFieldDefs.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.

V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 7205)	Initializes the name of a newly inserted collection item.
	UpdateDefs (see page 7109)	This is UpdateDefs, a member of class TDefCollection.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 7202)	Creates a new field definition object and adds it to the Items (see page 7206) property.
	AddFieldDef (see page 7202)	Creates a new field definition object and adds it to the Items (see page 7206) property of this TFieldDefs (see page 7198) object.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 7201)	Creates an instance of TFieldDefs (see page 7198).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Find (see page 7204)	Returns a field definition, given the name of the field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItemNames (see page 7108)	This is the overview for the GetItemNames method overload.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	IndexOf (see page 7108)	Finds the index number of a definition in the Items array from its name.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Update (see page 7205)	Refreshes the field definitions in the Items (see page 7206) property array to reflect the current state of the physical fields underlying the dataset.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	DataSet (see page 7110)	Indicates the dataset that uses the TDefCollection (see page 7104) object to manage its definition objects.
	HiddenFields (see page 7206)	Determines whether to show the extra hidden columns that may be included to ensure unique records.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 7206)	Lists the field definitions that describe each physical field in the dataset.
R	ParentDef (see page 7207)	References the field definition of the parent field, if there is one.
	Updated (see page 7110)	Indicates whether the definition objects in the Items array match the corresponding instantiated objects in the dataset.

39.1.28.2 TFieldDefs.Create Constructor

Creates an instance of TFieldDefs (see page 7198).

Pascal

```
constructor Create(AOwner: TPersistent);
```

C++

```
__fastcall TFieldDefs(TPersistent * AOwner);
```

Description

Applications should not need to instantiate TFieldDefs (see page 7198). TFieldDefs (see page 7198) objects are created automatically by dataset components. An example of such a default TFieldDefs (see page 7198) object is the FieldDefs property of the TDataSet (see page 6894) component or the ChildDefs property of a TFieldDef (see page 7184) object.

The AOwner parameter specifies the object that uses TFieldDefs (see page 7198) to implement one of its properties (the dataset or field definition object).

See Also

FieldDefs (see page 7019)

ChildDefs (see page 7191)

39.1.28.3 TFieldDefs Methods

The methods of the TFieldDefs class are listed here.

Protected Methods

	Name	Description
	ChildDefUpdate (see page 7204)	This is ChildDefUpdate, a member of class TFieldDefs.
	FieldDefUpdate (see page 7204)	This is FieldDefUpdate, a member of class TFieldDefs.
V	SetItemName (see page 7205)	Initializes the name of a newly inserted collection item.

Public Methods

	Name	Description
	Add (see page 7202)	Creates a new field definition object and adds it to the Items (see page 7206) property.
	AddFieldDef (see page 7202)	Creates a new field definition object and adds it to the Items (see page 7206) property of this TFieldDefs (see page 7198) object.
	Find (see page 7204)	Returns a field definition, given the name of the field.
	Update (see page 7205)	Refreshes the field definitions in the Items (see page 7206) property array to reflect the current state of the physical fields underlying the dataset.

39.1.28.3.1 TFieldDefs.Add Method

Creates a new field definition object and adds it to the Items (see page 7206) property.

Pascal

```
procedure Add(const Name: string; DataType: TFieldType; Size: Integer = 0; Required: Boolean =
False);
```

C++

```
__fastcall Add(const AnsiString Name, TFieldType DataType, int Size = 0, Boolean Required =
False);
```

Description

Add is provided for backward compatibility. The recommended way to add new field definitions to the Items (see page 7206) property array is using the AddFieldDef (see page 7202) method.

Add uses the values passed in the Name, DataType, Size, and Required parameters and assigns them to the respective properties of the new field definition object.

If a field definition with same name already exists, Add raises an EDatabaseError (see page 6731) exception.

See Also

Items (see page 7206)

DataType (see page 7191)

Name (see page 7359)

Required (see page 7194)

Size (see page 7194)

AddFieldDef (see page 7202)

39.1.28.3.2 TFieldDefs.AddFieldDef Method

Creates a new field definition object and adds it to the Items (see page 7206) property of this TFieldDefs (see page 7198) object.

Pascal

```
function AddFieldDef: TFieldDef;
```

C++

```
__fastcall TFieldDef AddFieldDef();
```

Description

Call AddFieldDef to add field definitions when creating a client dataset's data or a database table. AddFieldDef returns the new TFieldDef (see page 7184) object that is added to the collection of field definitions. After calling AddFieldDef, set the properties of the newly added TFieldDef (see page 7184) object to specify the name, type, and size of field that should be created.

Note: AddFieldDef is only valid in the context of creating field definitions for a table to be created with a subsequent call to the CreateTable

or CreateDataSet method. It cannot be used to add fields to an already-existing table.

C++ Examples:

```
/*
The following code creates and activates a client dataset in
the form’s OnCreate event handler.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TFieldDefs *pDefs = CDS2->FieldDefs;
  TFieldDef *pDef = pDefs->AddFieldDef();
  pDef->DataType = ftInteger;
  pDef->Name = "Field1";

  pDef = pDefs->AddFieldDef();
  pDef->DataType = ftString;
  pDef->Size = 10;
  pDef->Name = "Field2";

  TIndexDef *pIDef = CDS2->IndexDefs->AddIndexDef();
  pIDef->Fields = "Field1";
  pIDef->Name = "IntIndex";

  CDS2->CreateDataSet();
}
```

Delphi Examples:

```
{
The following code creates and activates a client dataset in
the form’s OnCreate event handler.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  with CDS2 do
  begin
    with FieldDefs.AddFieldDef do
    begin
      DataType := ftInteger;
      Name := 'Field1';
    end;
    with FieldDefs.AddFieldDef do
    begin
      DataType := ftString;
      Size := 10;
      Name := 'Field2';
    end;
    with IndexDefs.AddIndexDef do
    begin
      Fields := 'Field1';
      Name := 'IntIndex';
    end;
```

```
      CreateDataSet;
    end;
  end;
```

See Also

AddChild (see page 7187)

Items (see page 7206)

CreateTable (see page 10189)

CreateDataSet (see page 8401)

Creating and Deleting Tables

39.1.28.3.3 TFieldDefs.ChildDefUpdate Method

Pascal

```
procedure ChildDefUpdate(Sender: TObject);
```

C++

```
__fastcall ChildDefUpdate(TObject * Sender);
```

Description

This is ChildDefUpdate, a member of class TFieldDefs.

39.1.28.3.4 TFieldDefs.FieldDefUpdate Method

Pascal

```
procedure FieldDefUpdate(Sender: TObject);
```

C++

```
__fastcall FieldDefUpdate(TObject * Sender);
```

Description

This is FieldDefUpdate, a member of class TFieldDefs.

39.1.28.3.5 TFieldDefs.Find Method

Returns a field definition, given the name of the field.

Pascal

```
function Find(const Name: string): TFieldDef;
```

C++

```
__fastcall TFieldDef Find(const AnsiString Name);
```

Description

Call Find to obtain information about a particular field definition. Specify the name of the field as the value of the Name parameter.

If no matching field is found, Find raises an exception. The IndexOf (see page 7108) method (inherited from TDefCollection (see page 7104)) can be used to determine if the field exists first before calling Find. If IndexOf (see page 7108) returns a value greater than –1, the TFieldDef (see page 7184) exists and Find can be used.

See Also

Items (see page 7206)

TFieldDef (see page 7184)

Name (see page 7359)

IndexOf (see page 7108)

39.1.28.3.6 TFieldDefs.SetItemName Method

Initializes the name of a newly inserted collection item.

Pascal

```
procedure SetItemName(AItem: TCollectionItem); override;
```

C++

```
virtual __fastcall SetItemName(TCollectionItem AItem);
```

Description

The Insert method calls SetItemName to initialize the Name property of items when it inserts them into the collection.

As implemented in TCollection, SetItemName does nothing. Some TCollection descendants override this method to provide collection items with default names.

See Also

Insert (see page 2746)

Name (see page 2805)

39.1.28.3.7 TFieldDefs.Update Method

Refreshes the field definitions in the Items (see page 7206) property array to reflect the current state of the physical fields underlying the dataset.

Pascal

```
procedure Update; reintroduce;
```

C++

```
__fastcall Update();
```

Description

Call Update to refresh the field definitions when the structure of the underlying dataset may have changed. Update updates the field definitions without opening the dataset.

Before updating, the Updated (see page 7110) property is checked to determine if the list is already up to date. You can force the list to be regenerated by setting the Updated (see page 7110) property to false.

See Also

Updated (see page 7110)

Items (see page 7206)

TDataSet (see page 6894)

TFieldDef (see page 7184)

39.1.28.4 TFieldDefs Properties

The properties of the TFieldDefs class are listed here.

Public Properties

	Name	Description
	HiddenFields (see page 7206)	Determines whether to show the extra hidden columns that may be included to ensure unique records.
	Items (see page 7206)	Lists the field definitions that describe each physical field in the dataset.
R	ParentDef (see page 7207)	References the field definition of the parent field, if there is one.

39.1.28.4.1 TFieldDefs.HiddenFields Property

Determines whether to show the extra hidden columns that may be included to ensure unique records.

Pascal

```
property HiddenFields: Boolean;
```

C++

```
__property Boolean HiddenFields;
```

Description

When the user performs a live query, the BDE returns extra hidden columns in the query result set. Similarly, pProviders sometimes include extra hidden columns in data packets. These extra columns ensure that each record contains enough information to locate the corresponding record in the underlying database tables.

Setting HiddenFields to true and calling TFieldDefs (see page 7198) . ::Update (see page 7205) allows these columns to be seen. HiddenFields is primarily for internal use.

See Also

Update (see page 7205)

39.1.28.4.2 TFieldDefs.Items Property

Lists the field definitions that describe each physical field in the dataset.

Pascal

```
property Items [Index: Integer]: TFieldDef;
```

C++

```
__property TFieldDef Items[int Index];
```

Description

Use Items to access a particular field definition. Specify the field definition to access with the Index parameter. Index is an integer identifying the field definition's position in the list of field definitions, in the range 0 to Count - 1.

For example, the following code displays the name of the first field definition in a label:

On Windows:

```
Label1.Caption := Table1.FieldDefs.Items[0].DisplayName;
```

On cross-platform:

```
Label1.Caption := ClientDataSet1.FieldDefs.Items[0].DisplayName;
```

On Windows:

```
Label1->Caption = Table1->FieldDefs->Items[0]->DisplayName;
```

On cross-platform:

```
Label1->Caption = ClientDataSet1->FieldDefs->Items[0]->DisplayName;
```

See Also

Add (see page 7202)

AddFieldDef (see page 7202)

Clear (see page 2741)

Count (see page 2749)

operator_sb

39.1.28.4.3 TFieldDefs.ParentDef Property

References the field definition of the parent field, if there is one.

Pascal

```
property ParentDef: TFieldDef;
```

C++

```
__property TFieldDef ParentDef;
```

Description

When a TFieldDefs (see page 7198) object represents the data members of an object field type (such as TADTField (see page 6736)), ParentDef specifies the field definition for that object field. Otherwise, ParentDef is nil (Delphi) or NULL (C++).

ChildDefs (see page 7191)

ParentField (see page 7176)

AddFieldDef (see page 7202)

HasChildDefs (see page 7189)

39.1.29 TFieldList Class

TFieldList lists the fields of a dataset, flattening out the structure of any object fields.

Class Hierarchy

Pascal

```
TFieldList = class(TFlatList);
```

C++

```
class TFieldList : public TFlatList;
```

File

DB

Description

TFieldList is used by a dataset to implement its FieldList property. It lists the fields of the dataset in a flattened format.

With object field types, such as TADTField (see page 6736) and TArrayField (see page 6760), there are two ways to represent the field components: hierarchically or flattened. When represented hierarchically, object fields contain a set of child field components for the constituent subfields. When represented as a flattened set, child fields appear as siblings sequentially after the parent field.

TFieldList is a descendant of TStringList. The strings in this string list are the names of fields. The objects that correspond to those strings are the TField (see page 7115) objects.

See Also

TDataSet (see page 6894)

TFields (see page 7211)

TField (see page 7115)

TADTField (see page 6736)

TArrayField (see page 6760)

TObjectField (see page 7372)

39.1.29.1 TFieldList Members

The following tables list the members exposed by TFieldList.

Protected Methods

	Name	Description
	FindItem (see page 7227)	This is FindItem, a member of class TFlatList.
V	GetCount (see page 7227)	This is GetCount, a member of class TFlatList.
V	GetUpdated (see page 7227)	This is GetUpdated, a member of class TFlatList.
	ListChanging (see page 7227)	This is ListChanging, a member of class TFlatList.
V	UpdateList (see page 7210)	This is UpdateList, a member of class TFieldList.

Protected Properties

	Name	Description
	Locked (see page 7229)	This is Locked, a member of class TFlatList.
	Updated (see page 7229)	This is Updated, a member of class TFlatList.

Public Methods

	Name	Description
	Create (see page 7226)	Creates an instance of TFlatList (see page 7225).
	FieldByName (see page 7209)	Returns a field, given its name.
	Find (see page 7209)	Returns a field component given the field name.
	Update (see page 7228)	Refreshes the strings and objects to reflect the current state of the physical fields underlying the dataset.

Public Properties

	Name	Description
R	DataSet (see page 7228)	Identifies the dataset to which the TFlatList (see page 7225) object belongs.

R	Fields (see page 7210)	Lists the fields in the dataset.

39.1.29.2 TFieldList Methods

The methods of the TFieldList class are listed here.

Protected Methods

	Name	Description
V	UpdateList (see page 7210)	This is UpdateList, a member of class TFieldList.

Public Methods

	Name	Description
	FieldByName (see page 7209)	Returns a field, given its name.
	Find (see page 7209)	Returns a field component given the field name.

39.1.29.2.1 TFieldList.FieldByName Method

Returns a field, given its name.

Pascal

```
function FieldByName(const Name: string): TField;
```

C++

```
__fastcall TField FieldByName(const AnsiString Name);
```

Description

Call FieldByName to retrieve field information for a field when only the field's name is known. FieldName is the name of an existing field. FieldByName returns the TField (see page 7115) component for the specified field. An application can access specific properties and methods of the field directly.

If the specified field is not found, FieldByName raises an EDatabaseError (see page 6731) exception.

Note: FieldByName differs from the Find (see page 7209) method only when the named field is not in the list. When the field is not found, FieldByName raises an exception, while Find (see page 7209) returns nil (Delphi) or NULL (C++).

See Also

Fields (see page 7210)

Find (see page 7209)

39.1.29.2.2 TFieldList.Find Method

Returns a field component given the field name.

Pascal

```
function Find(const Name: WideString): TField; reintroduce;
```

C++

```
__fastcall TField Find(const BSTR Name);
```

Description

Call Find to determine if a specified field component is referenced in the TFieldList (see page 7207) object. FieldName is the name of the field for which to search. If Find finds a field with a matching name, it returns the TField (see page 7115) component for the specified field. Otherwise it returns nil (Delphi) or NULL (C++).

Note: Find differs from the FieldByName (see page 7209) method only when the named field is not in the list. When the field is not found, Find returns nil (Delphi) or NULL (C++), while FieldByName (see page 7209) raises an exception.

See Also

Fields (see page 7210)

FieldByName (see page 7209)

39.1.29.2.3 TFieldList.UpdateList Method

Pascal

```
procedure UpdateList; override;
```

C++

```
virtual __fastcall UpdateList();
```

Description

This is UpdateList, a member of class TFieldList.

39.1.29.3 TFieldList Properties

The properties of the TFieldList class are listed here.

Public Properties

	Name	Description
R	Fields (see page 7210)	Lists the fields in the dataset.

39.1.29.3.1 TFieldList.Fields Property

Lists the fields in the dataset.

Pascal

```
property Fields [Index: Integer]: TField;
```

C++

```
__property TField Fields[int Index];
```

Description

Use Fields to obtain a pointer to a specific field component. The Index parameter indicates the index of the field, where 0 is the index of the first field, 1 is the index of the second field, and so on.

A TFieldList (see page 7207) with object field types, such as TADTField (see page 6736) and TArrayField (see page 6760), lists child TField (see page 7115) objects sequentially after the parent TField (see page 7115).

Use Fields with the Count property to iterate through all of the fields in the list.

See Also

Count

ParentField (see page 7176)

operator_sb

39.1.30 TFields Class

TFields holds the field (TField (see page 7115)) objects that represent the physical fields underlying a dataset or an object field such as TADTField (see page 6736) and TArrayField (see page 6760).

Class Hierarchy

Pascal

```
TFields = class(TObject);
```

C++

```
class TFields : public TObject;
```

File

DB

Description

TFields is used by a dataset to manage the field objects that correspond to fields in the database table and by object fields to manage child fields.

When TDataSet (see page 6894). ::ObjectView is true, the fields are stored hierarchically, meaning any child fields of an object field are referenced by the object field and do not appear sequentially after the object field in the Fields (see page 7221) array. When TDataSet (see page 6894). ::ObjectView is false, the fields are stored sequentially, or flattened out, meaning any child fields of an object field are stored sequentially in the Fields (see page 7221) array.

Use the properties and methods of TFields to:

Access a specific field.

Add (see page 7214) or delete persistent field components from the list.

Find out how many fields there are.

See Also

TField (see page 7115)

TDataSet (see page 6894)

TObjectField (see page 7372)

39.1.30.1 TFields Members

The following tables list the members exposed by TFields.

Protected Events

	Name	Description
	OnChange (see page 7222)	This is OnChange, a member of class TFields.

Protected Methods

	Name	Description
	Changed (see page 7214)	This is Changed, a member of class TFields.
	CheckFieldKind (see page 7215)	This is CheckFieldKind, a member of class TFields.

	GetCount (see page 7217)	This is GetCount, a member of class TFields.
	GetField (see page 7218)	This is GetField, a member of class TFields.
	SetField (see page 7220)	This is SetField, a member of class TFields.
	SetFieldIndex (see page 7220)	This is SetFieldIndex, a member of class TFields.

Protected Properties

	Name	Description
	SparseFields (see page 7221)	This is SparseFields, a member of class TFields.
	ValidFieldKinds (see page 7222)	This is ValidFieldKinds, a member of class TFields.

Public Methods

	Name	Description
	Add (see page 7214)	Inserts a new field to the end of the Fields (see page 7221) array.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckFieldName (see page 7215)	Checks if a field name already exists in the TFields (see page 7211) object.
	CheckFieldNames (see page 7215)	Checks if fields exist in the TFields (see page 7211) object.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7216)	Deletes all fields from the TFields (see page 7211) object.
	Create (see page 7213)	Creates an instance of TFields (see page 7211).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 7213)	Destroys an instance of TFields (see page 7211).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 7216)	Returns a field given its field name.
	FieldByNumber (see page 7217)	Finds a field based on a specified field number.
	FindField (see page 7217)	Returns a field given its field name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 7218)	This is GetEnumerator, a member of class TFields.
	GetFieldNames (see page 7218)	This is the overview for the GetFieldNames method overload.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	IndexOf (see page 7219)	Finds the index of a field object in the Fields (see page 7221) array from the field object.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Remove (see page 7219)	Deletes the reference to the Field parameter from the Fields (see page 7221) array.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Count (see page 7220)	Indicates the number of fields in the fields object.
R	DataSet (see page 7221)	Identifies the dataset to which a TFields (see page 7211) object belongs.
	Fields (see page 7221)	Lists the field references that are managed by the TFields (see page 7211) object.

39.1.30.2 TFields.Create Constructor

Creates an instance of TFields (see page 7211).

Pascal

```
constructor Create(ADataSet: TDataSet);
```

C++

```
__fastcall TFields(TDataSet ADataSet);
```

Description

Most applications do not need to create a TFields (see page 7211) object. These objects are created by the dataset or object field that uses them.

See Also

Fields (see page 7221)

Destroy (see page 7213)

39.1.30.3 TFields.Destroy Destructor

Destroys an instance of TFields (see page 7211).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TFields();
```

Description

Most applications do not explicitly free a TFields (see page 7211) object. TFields (see page 7211) instances are freed by the dataset or object field that uses them.

Destroy frees the memory used to store the list of fields, including the field components themselves.

See Also

Fields (see page 7221)

Create (see page 7213)

Free (see page 22300)

39.1.30.4 TFields Methods

The methods of the TFields class are listed here.

Protected Methods

	Name	Description
	Changed (see page 7214)	This is Changed, a member of class TFields.
	CheckFieldKind (see page 7215)	This is CheckFieldKind, a member of class TFields.
	GetCount (see page 7217)	This is GetCount, a member of class TFields.
	GetField (see page 7218)	This is GetField, a member of class TFields.
	SetField (see page 7220)	This is SetField, a member of class TFields.
	SetFieldIndex (see page 7220)	This is SetFieldIndex, a member of class TFields.

Public Methods

	Name	Description
	Add (see page 7214)	Inserts a new field to the end of the Fields (see page 7221) array.
	CheckFieldName (see page 7215)	Checks if a field name already exists in the TFields (see page 7211) object.
	CheckFieldNames (see page 7215)	Checks if fields exist in the TFields (see page 7211) object.
	Clear (see page 7216)	Deletes all fields from the TFields (see page 7211) object.
	FieldByName (see page 7216)	Returns a field given its field name.
	FieldByNumber (see page 7217)	Finds a field based on a specified field number.
	FindField (see page 7217)	Returns a field given its field name.
	GetEnumerator (see page 7218)	This is GetEnumerator, a member of class TFields.
	GetFieldNames (see page 7218)	This is the overview for the GetFieldNames method overload.
	IndexOf (see page 7219)	Finds the index of a field object in the Fields (see page 7221) array from the field object.
	Remove (see page 7219)	Deletes the reference to the Field parameter from the Fields (see page 7221) array.

39.1.30.4.1 TFields.Add Method

Inserts a new field to the end of the Fields (see page 7221) array.

Pascal

```
procedure Add(Field: TField);
```

C++

```
__fastcall Add(TField Field);
```

Description

Applications do not normally call the Add method directly. When field objects are created, Add is called automatically by the dataset.

See Also

Fields (see page 7221)

Remove (see page 7219)

39.1.30.4.2 TFields.Changed Method

Pascal

```
procedure Changed;
```

C++

```
__fastcall Changed();
```

Description

This is Changed, a member of class TFields.

39.1.30.4.3 TFields.CheckFieldKind Method

Pascal

```
procedure CheckFieldKind(FieldKind: TFieldKind; Field: TField);
```

C++

```
__fastcall CheckFieldKind(TFieldKind FieldKind, TField Field);
```

Description

This is CheckFieldKind, a member of class TFields.

39.1.30.4.4 TFields.CheckFieldName Method

Checks if a field name already exists in the TFields (see page 7211) object.

Pascal

```
procedure CheckFieldName(const FieldName: WideString);
```

C++

```
__fastcall CheckFieldName(const BSTR FieldName);
```

Description

CheckFieldName checks for the field specified by FieldName in the Fields (see page 7221) property array. If the field with the specified name is already listed, CheckFieldName raises an EDatabaseError (see page 6731) exception with a duplicate field name error message.

See Also

Fields (see page 7221)

GetFieldNames (see page 7218)

EDatabaseError (see page 6731)

39.1.30.4.5 TFields.CheckFieldNames Method

Checks if fields exist in the TFields (see page 7211) object.

Pascal

```
procedure CheckFieldNames(const FieldNames: WideString);
```

C++

```
__fastcall CheckFieldNames(const BSTR FieldNames);
```

Description

CheckFieldNames checks for the set of fields specified by FieldNames in the Fields (see page 7221) property array. FieldNames lists the names of the fields to check, separated by semicolons. If any of the fields in FieldNames are not listed, CheckFieldNames raises an EDatabaseError (see page 6731) exception with a field not found error message.

See Also

CheckFieldName (see page 7215)

EDatabaseError (see page 6731)

GetFieldNames (see page 7218)

Fields (see page 7221)

39.1.30.4.6 TFields.Clear Method

Deletes all fields from the TFields (see page 7211) object.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Applications do not normally call the Clear method directly. Clear empties the Fields (see page 7221) property array, frees the memory used to store the array and sets the DataSet (see page 7221) property to nil (Delphi) or NULL (C++).

See Also

Remove (see page 7219)

Fields (see page 7221)

DataSet (see page 7221)

39.1.30.4.7 TFields.FieldByName Method

Returns a field given its field name.

Pascal

```
function FieldByName(const FieldName: WideString): TField;
```

C++

```
__fastcall TField FieldByName(const BSTR FieldName);
```

Description

Call FieldByName to retrieve field information for a field when only the field's name is known. FieldName is the name of an existing field. FieldByName returns the TField (see page 7115) component for the specified field. If the field can not be found, an exception is raised.

When the Fields (see page 7221) array contains ADT fields, you can use FieldByName to access the subfields of those ADT fields. To access subfields, specify FieldName as the name of the subfield qualified by the name of the ADT field, as in the following:

```
CityEdit.Text := Customer.FieldByName('Address.City').AsString;
CityEdit->Text = Customer->FieldByName("Address.City")->AsString;
```

FieldByName is especially useful when you do not have access to the underlying table and cannot use persistent field components.

Note: FieldByName differs from the FindField (see page 7217) method only when the named field is not in the list. When the field is not found, FieldByName raises an exception, while FindField (see page 7217) returns nil (Delphi) or NULL (C++).

See Also

FieldByNumber (see page 7217)

Fields (see page 7221)

FieldName (see page 7164)

FindField (see page 7217)

39.1.30.4.8 TFields.FieldByNumber Method

Finds a field based on a specified field number.

Pascal

```
function FieldByNumber(FieldNo: Integer): TField;
```

C++

```
__fastcall TField FieldByNumber(int FieldNo);
```

Description

Call FieldByNumber to retrieve field information for a field given its field number. Note that the field number is the position of the field in the underlying database table, not the index of the field in the TFields (see page 7211) object.

See Also

FieldByName (see page 7216)

Fields (see page 7221)

FieldNo (see page 7166)

39.1.30.4.9 TFields.FindField Method

Returns a field given its field name.

Pascal

```
function FindField(const FieldName: WideString): TField;
```

C++

```
__fastcall TField FindField(const BSTR FieldName);
```

Description

Call FindField to determine if a specified field component is referenced in the TFields (see page 7211) object. FieldName is the name of the field for which to search. If FindField finds a field with a matching name, it returns the TField (see page 7115) component for the specified field. Otherwise it returns nil (Delphi) or NULL (C++).

Note: FindField differs from the FieldByName (see page 7216) method only when the named field is not in the list. When the field is not found, FindField returns nil (Delphi) or NULL (C++), while FieldByName (see page 7216) raises an exception.

See Also

FieldByName (see page 7216)

Fields (see page 7221)

FieldName (see page 7164)

39.1.30.4.10 TFields.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class TFields.

39.1.30.4.11 TFields.GetEnumerator Method

Pascal

```
function GetEnumerator: TFieldsEnumerator;
```

C++

```
__fastcall TFieldsEnumerator GetEnumerator();
```

Description

This is GetEnumerator, a member of class TFields.

39.1.30.4.12 TFields.GetField Method

Pascal

```
function GetField(Index: Integer): TField;
```

C++

```
__fastcall TField GetField(int Index);
```

Description

This is GetField, a member of class TFields.

39.1.30.4.13 GetFieldNames Method

This is the overview for the GetFieldNames method overload.

Overload List

	Name	Description
	TFields.GetFieldNames (TStrings) (see page 7218)	Retrieves a list of names for all fields in a fields object.
	TFields.GetFieldNames (TWideStrings) (see page 7218)	Retrieves a list of names for all fields in a fields object.

39.1.30.4.13.1 TFields.GetFieldNames Method (TStrings)

Retrieves a list of names for all fields in a fields object.

Pascal

```
procedure GetFieldNames(List: TStrings); overload;
procedure GetFieldNames(List: TWideStrings); overload;
```

C++

```
__fastcall GetFieldNames(TStrings List);
__fastcall GetFieldNames(TWideStrings List);
```

Description

Call GetFieldNames to fill a list with the field names for all fields in the fields object. List is a TStrings descendant created and maintained by the application.

Retrieving a list of field names is especially useful for applications that work with datasets whose field objects are created dynamically at runtime. By retrieving a list of field names, the application can be restricted to working only with fields that exist at runtime.

See Also

FieldByName (see page 7216)

Fields (see page 7221)

39.1.30.4.14 TFields.IndexOf Method

Finds the index of a field object in the Fields (see page 7221) array from the field object.

Pascal

```
function IndexOf(Field: TField): Integer;
```

C++

```
__fastcall int IndexOf(TField Field);
```

Description

Call IndexOf to get the index for a field in the Fields (see page 7221) array. Specify the field as the Field parameter.

The first field in the array has index 0, the second field has index 1, and so on. If a field is not in the Fields (see page 7221) array, IndexOf returns -1.

See Also

FindField (see page 7217)

Fields (see page 7221)

39.1.30.4.15 TFields.Remove Method

Deletes the reference to the Field parameter from the Fields (see page 7221) array.

Pascal

```
procedure Remove(Field: TField);
```

C++

```
__fastcall Remove(TField Field);
```

Description

Applications do not normally call the Remove method directly. After a field is removed, all of the items that follow it are moved up in index position and the Count (see page 7220) is reduced by one.

Note: Unlike the Clear (see page 7216) method, which frees the field components when it removes them, Remove does not free the specified field component.

See Also

Add (see page 7214)

Fields (see page 7221)

39.1.30.4.16 TFields.SetField Method

Pascal

```
procedure SetField(Index: Integer; Value: TField);
```

C++

```
__fastcall SetField(int Index, TField Value);
```

Description

This is SetField, a member of class TFields.

39.1.30.4.17 TFields.SetFieldIndex Method

Pascal

```
procedure SetFieldIndex(Field: TField; Value: Integer);
```

C++

```
__fastcall SetFieldIndex(TField Field, int Value);
```

Description

This is SetFieldIndex, a member of class TFields.

39.1.30.5 TFields Properties

The properties of the TFields class are listed here.

Protected Properties

	Name	Description
	SparseFields (see page 7221)	This is SparseFields, a member of class TFields.
	ValidFieldKinds (see page 7222)	This is ValidFieldKinds, a member of class TFields.

Public Properties

	Name	Description
R	Count (see page 7220)	Indicates the number of fields in the fields object.
R	DataSet (see page 7221)	Identifies the dataset to which a TFields (see page 7211) object belongs.
	Fields (see page 7221)	Lists the field references that are managed by the TFields (see page 7211) object.

39.1.30.5.1 TFields.Count Property

Indicates the number of fields in the fields object.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Use Count to determine the number of fields referenced by the TFields (see page 7211) object.

See Also

Fields (see page 7221)

39.1.30.5.2 TFields.DataSet Property

Identifies the dataset to which a TFields (see page 7211) object belongs.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Check the value of the DataSet property to determine the dataset that is associated with the TFields (see page 7211) object. Applications should not directly assign the DataSet property of a field. It is assigned automatically when the field is created from a TFieldDef (see page 7184) object.

See Also

Fields (see page 7221)

TFieldDef (see page 7184)

Fields (see page 7023)

39.1.30.5.3 TFields.Fields Property

Lists the field references that are managed by the TFields (see page 7211) object.

Pascal

```
property Fields [Index: Integer]: TField;
```

C++

```
__property TField Fields[int Index];
```

Description

Use Fields to obtain a pointer to a specific field. The Index parameter indicates the index of the field, where 0 is the index of the first field, 1 is the index of the second field, and so on.

Set Fields to assign the properties of another field component to one of the fields in the list.

Use Fields with the Count (see page 7220) property to iterate through all of the fields in the list.

See Also

Count (see page 7220)

operator_sb

39.1.30.5.4 TFields.SparseFields Property

Pascal

```
property SparseFields: Integer;
```

C++

```
__property int SparseFields;
```

Description

This is SparseFields, a member of class TFields.

39.1.30.5.5 TFields.ValidFieldKinds Property

Pascal

```
property ValidFieldKinds: TFieldKinds;
```

C++

```
__property TFieldKinds ValidFieldKinds;
```

Description

This is ValidFieldKinds, a member of class TFields.

39.1.30.6 TFields Events

The events of the TFields class are listed here.

Protected Events

	Name	Description
	OnChange (see page 7222)	This is OnChange, a member of class TFields.

39.1.30.6.1 TFields.OnChange Event

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

This is OnChange, a member of class TFields.

39.1.31 TFieldsEnumerator Class

Enumerates database fields.

Class Hierarchy

DB.TFieldsEnumerator

Pascal

```
TFieldsEnumerator = class;
```

C++

```
class TFieldsEnumerator;
```

File

DB

Description

This class enumerates the TField (see page 7115) objects in a TFields (see page 7211) object.

See Also

TField (see page 7115)

TFields (see page 7211)

39.1.31.1 TFieldsEnumerator Members

The following tables list the members exposed by TFieldsEnumerator.

Public Methods

	Name	Description
	Create (see page 7223)	Creates an instance of TFieldsEnumerator (see page 7222).
	GetCurrent (see page 7224)	Gets current field object being enumerated.
	MoveNext (see page 7224)	Move to next field in field enumeration.

Public Properties

	Name	Description
R	Current (see page 7224)	Current field object being enumerated.

39.1.31.2 TFieldsEnumerator.Create Constructor

Creates an instance of TFieldsEnumerator (see page 7222).

Pascal

```
constructor Create(AFields: TFields);
```

C++

```
__fastcall TFieldsEnumerator(TFields AFields);
```

Description

This method creates an instance of TFieldsEnumerator (see page 7222), suitable for enumerating all the TField (see page 7115) objects specified in the **AFields** parameter.

See Also

TField (see page 7115)

TFields (see page 7211)

39.1.31.3 TFieldsEnumerator Methods

The methods of the TFieldsEnumerator class are listed here.

Public Methods

	Name	Description
	GetCurrent (see page 7224)	Gets current field object being enumerated.

	MoveNext (see page 7224)	Move to next field in field enumeration.

39.1.31.3.1 TFieldsEnumerator.GetCurrent Method

Gets current field object being enumerated.

Pascal

```
function GetCurrent: TField;
```

C++

```
__fastcall TField GetCurrent();
```

Description

GetCurrent gets the current TField (see page 7115) instance in the TFields (see page 7211) being enumerated.

See Also

TField (see page 7115)

TFields (see page 7211)

Current (see page 7224)

39.1.31.3.2 TFieldsEnumerator.MoveNext Method

Move to next field in field enumeration.

Pascal

```
function MoveNext: Boolean;
```

C++

```
__fastcall Boolean MoveNext();
```

Description

MoveNext moves to the next TField (see page 7115) instance in the TFields (see page 7211) being enumerated.

See Also

TField (see page 7115)

TFields (see page 7211)

39.1.31.4 TFieldsEnumerator Properties

The properties of the TFieldsEnumerator class are listed here.

Public Properties

	Name	Description
R	Current (see page 7224)	Current field object being enumerated.

39.1.31.4.1 TFieldsEnumerator.Current Property

Current field object being enumerated.

Pascal

```
property Current: TField;
```

C++

```
__property TField Current;
```

Description

Current contains the current TField (see page 7115) instance in the TFields (see page 7211) being enumerated.

See Also

TField (see page 7115)

TFields (see page 7211)

GetCurrent (see page 7224)

39.1.32 TFlatList Class

TFlatList is an abstract base class for objects that represent a flattened list of fields or field definitions.

Class Hierarchy

Pascal

```
TFlatList = class(TWideStringList);
```

C++

```
class TFlatList : public TWideStringList;
```

File

DB

Description

Derive a class from TFlatList to store and manipulate a list of fields or field definitions in an iterative manner. When fields are stored iteratively, the child fields of object fields such as ADTs and Arrays, appear as siblings after the parent object field rather than nested within the parent field.

Descendants of TFlatList include TFieldList (see page 7207) and TFieldDefList (see page 7195).

TFlatList is a descendant of TStringList. It uses the string list to maintain its list of fields or field definitions, where the strings in the list are the field names and the associated objects are TField (see page 7115) or TFieldDef (see page 7184) objects.

See Also

TDataSet (see page 6894)

TField (see page 7115)

TFieldDef (see page 7184)

39.1.32.1 TFlatList Members

The following tables list the members exposed by TFlatList.

Protected Methods

	Name	Description
	FindItem (see page 7227)	This is FindItem, a member of class TFlatList.
V	GetCount (see page 7227)	This is GetCount, a member of class TFlatList.
V	GetUpdated (see page 7227)	This is GetUpdated, a member of class TFlatList.
	ListChanging (see page 7227)	This is ListChanging, a member of class TFlatList.
A	UpdateList (see page 7228)	This is UpdateList, a member of class TFlatList.

Protected Properties

	Name	Description
	Locked (see page 7229)	This is Locked, a member of class TFlatList.
	Updated (see page 7229)	This is Updated, a member of class TFlatList.

Public Methods

	Name	Description
	Create (see page 7226)	Creates an instance of TFlatList (see page 7225).
	Update (see page 7228)	Refreshes the strings and objects to reflect the current state of the physical fields underlying the dataset.

Public Properties

	Name	Description
R	DataSet (see page 7228)	Identifies the dataset to which the TFlatList (see page 7225) object belongs.

39.1.32.2 TFlatList.Create Constructor

Creates an instance of TFlatList (see page 7225).

Pascal

```
constructor Create(ADataSet: TDataSet);
```

C++

```
__fastcall TFlatList(TDataSet ADataSet);
```

Description

Applications should not call the Create method. TFlatList (see page 7225) objects are created by the dataset that uses them to manage information about its fields. The ADataset parameter specifies the dataset that creates the TFlatList (see page 7225) object. It becomes the value of the Dataset property.

See Also

DataSet (see page 7228)

TFieldDefList (see page 7195)

TFieldList (see page 7207)

39.1.32.3 TFlatList Methods

The methods of the TFlatList class are listed here.

Protected Methods

	Name	Description
	FindItem (see page 7227)	This is FindItem, a member of class TFlatList.
V	GetCount (see page 7227)	This is GetCount, a member of class TFlatList.

	GetUpdated (see page 7227)	This is GetUpdated, a member of class TFlatList.
	ListChanging (see page 7227)	This is ListChanging, a member of class TFlatList.
	UpdateList (see page 7228)	This is UpdateList, a member of class TFlatList.

Public Methods

	Name	Description
	Update (see page 7228)	Refreshes the strings and objects to reflect the current state of the physical fields underlying the dataset.

39.1.32.3.1 TFlatList.FindItem Method

Pascal

```
function FindItem(const Name: WideString; MustExist: Boolean): TObject;
```

C++

```
__fastcall TObject * FindItem(const BSTR Name, Boolean MustExist);
```

Description

This is FindItem, a member of class TFlatList.

39.1.32.3.2 TFlatList.GetCount Method

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

This is GetCount, a member of class TFlatList.

39.1.32.3.3 TFlatList.GetUpdated Method

Pascal

```
function GetUpdated: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetUpdated();
```

Description

This is GetUpdated, a member of class TFlatList.

39.1.32.3.4 TFlatList.ListChanging Method

Pascal

```
procedure ListChanging(Sender: TObject);
```

C++

```
__fastcall ListChanging(TObject * Sender);
```

Description

This is ListChanging, a member of class TFlatList.

39.1.32.3.5 TFlatList.Update Method

Refreshes the strings and objects to reflect the current state of the physical fields underlying the dataset.

Pascal

```
procedure Update;
```

C++

```
__fastcall Update();
```

Description

Call Update to refresh the fields or field definitions when the structure of the underlying dataset may have changed. Update updates the field names listed by Strings and the corresponding objects without opening the dataset.

See Also

DataSet (see page 7228)

Strings

Objects

39.1.32.3.6 TFlatList.UpdateList Method

Pascal

```
procedure UpdateList; virtual; abstract;
```

C++

```
virtual __fastcall UpdateList() = 0;
```

Description

This is UpdateList, a member of class TFlatList.

39.1.32.4 TFlatList Properties

The properties of the TFlatList class are listed here.

Protected Properties

	Name	Description
	Locked (see page 7229)	This is Locked, a member of class TFlatList.
	Updated (see page 7229)	This is Updated, a member of class TFlatList.

Public Properties

	Name	Description
R	DataSet (see page 7228)	Identifies the dataset to which the TFlatList (see page 7225) object belongs.

39.1.32.4.1 TFlatList.DataSet Property

Identifies the dataset to which the TFlatList (see page 7225) object belongs.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Check the value of the DataSet property to determine the dataset that uses the TFlatList (see page 7225) object to manage information about its fields. Applications should not directly assign the DataSet property of a TFlatList (see page 7225) object. It is assigned automatically when a TFlatList (see page 7225) object descendant is created.

See Also

Create (see page 7226)

39.1.32.4.2 TFlatList.Locked Property

Pascal

```
property Locked: Boolean;
```

C++

```
__property Boolean Locked;
```

Description

This is Locked, a member of class TFlatList.

39.1.32.4.3 TFlatList.Updated Property

Pascal

```
property Updated: Boolean;
```

C++

```
__property Boolean Updated;
```

Description

This is Updated, a member of class TFlatList.

39.1.33 TFloatField Class

TFloatField represents a field that contains floating-point values in a dataset.

Class Hierarchy

Pascal

```
TFloatField = class(TNumericField);
```

C++

```
class TFloatField : public TNumericField;
```

File

DB

Description

TFloatField encapsulates the fundamental behavior common to numeric data. Floating-point fields can hold values in the range from (positive or negative) 5.0 * 10^-324 to 1.7 * 10^308 with an accuracy of 15 digits. TFloatField introduces new properties to convert between integer values and other data types, to control the precision of numbers that the field will permit, and to format the value for display purposes.

If you use the Fields editor at design time to create a persistent field component for the float field, you can access it by name at runtime. When using dynamic field components, you can access the TFloatField instance using the dataset's Fields property or FieldByName method.

Working with Field Components: Overview

39.1.33.1 TFloatField Members

The following tables list the members exposed by TFloatField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.

	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
	GetAsFloat (see page 7237)	This is GetAsFloat, a member of class TFloatField.
	GetAsInteger (see page 7237)	This is GetAsInteger, a member of class TFloatField.
	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
	GetAsString (see page 7238)	This is GetAsString, a member of class TFloatField.
	GetAsVariant (see page 7238)	This is GetAsVariant, a member of class TFloatField.
	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
	GetDataSize (see page 7238)	This is GetDataSize, a member of class TFloatField.
	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7238)	This is GetText, a member of class TFloatField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	RangeError (see page 7368)	This is RangeError, a member of class TNumericField.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.

	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7239)	This is SetAsFloat, a member of class TFloatField.
	SetAsInteger (see page 7239)	This is SetAsInteger, a member of class TFloatField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 7239)	This is SetAsString, a member of class TFloatField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayFormat (see page 7368)	This is SetDisplayFormat, a member of class TNumericField.
	SetEditFormat (see page 7368)	This is SetEditFormat, a member of class TNumericField.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 7239)	This is SetVarValue, a member of class TFloatField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 7126)	Sets the value of the field to NULL.
V	Create (see page 7236)	Creates an instance of TFloatField (see page 7229).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.

R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7242)	Specifies the value of the floating-point field.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	Alignment (see page 7369)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	currency (see page 7240)	Determines whether the value in the field should be formatted as a currency value.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayFormat (see page 7369)	Determines how a numeric field's value is formatted for display in a data-aware control.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	EditFormat (see page 7371)	Determines how a numeric field's value is formatted when it is being edited in a data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.

	MaxValue (see page 7240)	Limits the maximum value in the floating-point field.
	MinValue (see page 7241)	Limits the minimum value in the floating-point field.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	Precision (see page 7241)	Determines the precision used in formatting the value in a floating-point field.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.33.2 TFloatField.Create Constructor

Creates an instance of TFloatField (see page 7229).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TFloatField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TFloatField (see page 7229). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) property to ftFloat and Precision (see page 7241) to 15. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TFloatField (see page 7229). After instantiating a TFloatField (see page 7229), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TFloatField (see page 7229) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TFloatField (see page 7229) with a dataset component by setting its DataSet (see page 7157) property to the name of the dataset component. Optionally set the Precision (see page 7241) property to the desired degree of precision.

The example below creates a TFloatField (see page 7229) object for a field named Amount accessed through a TSQLDataSet named SQLDataSet1.

```
var
  T: TFloatField;
begin
  SQLDataSet1.Close;
  T := TFloatField.Create(SQLDataSet1);
  T.Precision := 2;
  T.FieldName := 'Amount';
  T.Name := SQLDataSet1.Name + T.FieldName;
  T.Index := SQLDataSet1.FieldCount;
  T.DataSet := SQLDataSet1;
  SQLDataSet1.FieldDefs.UpDate;
  SQLDataSet1.Open;
end;
SQLDataSet1->Close();
TFloatField *T = new TFloatField(SQLDataSet1);
T->Precision = 2;
```

```
T->FieldName = "Amount";
T->Name = SQLDataSet1->Name + T->FieldName;
T->Index = SQLDataSet1->FieldCount;
T->DataSet = SQLDataSet1;
SQLDataSet1->FieldDefs->UpDate();
SQLDataSet1->Open();
```

39.1.33.3 TFloatField Methods

The methods of the TFloatField class are listed here.

Protected Methods

	Name	Description
	GetAsFloat (see page 7237)	This is GetAsFloat, a member of class TFloatField.
	GetAsInteger (see page 7237)	This is GetAsInteger, a member of class TFloatField.
	GetAsString (see page 7238)	This is GetAsString, a member of class TFloatField.
	GetAsVariant (see page 7238)	This is GetAsVariant, a member of class TFloatField.
	GetDataSize (see page 7238)	This is GetDataSize, a member of class TFloatField.
	GetText (see page 7238)	This is GetText, a member of class TFloatField.
	SetAsFloat (see page 7239)	This is SetAsFloat, a member of class TFloatField.
	SetAsInteger (see page 7239)	This is SetAsInteger, a member of class TFloatField.
	SetAsString (see page 7239)	This is SetAsString, a member of class TFloatField.
	SetVarValue (see page 7239)	This is SetVarValue, a member of class TFloatField.

39.1.33.3.1 TFloatField.GetAsFloat Method

Pascal

```
function GetAsFloat: Double; override;
```

C++

```
virtual __fastcall Double GetAsFloat();
```

Description

This is GetAsFloat, a member of class TFloatField.

39.1.33.3.2 TFloatField.GetAsInteger Method

Pascal

```
function GetAsInteger: Longint; override;
```

C++

```
virtual __fastcall Longint GetAsInteger();
```

Description

This is GetAsInteger, a member of class TFloatField.

39.1.33.3.3 TFloatField.GetAsString Method

Pascal

```
function GetAsString: string; override;
```

C++

```
virtual __fastcall AnsiString GetAsString();
```

Description

This is GetAsString, a member of class TFloatField.

39.1.33.3.4 TFloatField.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TFloatField.

39.1.33.3.5 TFloatField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; override;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TFloatField.

39.1.33.3.6 TFloatField.GetText Method

Pascal

```
procedure GetText(var Text: string; DisplayText: Boolean); override;
```

C++

```
virtual __fastcall GetText(AnsiString Text, Boolean DisplayText);
```

Description

This is GetText, a member of class TFloatField.

39.1.33.3.7 TFloatField.SetAsFloat Method

Pascal

```
procedure SetAsFloat(Value: Double); override;
```

C++

```
virtual __fastcall SetAsFloat(Double Value);
```

Description

This is SetAsFloat, a member of class TFloatField.

39.1.33.3.8 TFloatField.SetAsInteger Method

Pascal

```
procedure SetAsInteger(Value: Longint); override;
```

C++

```
virtual __fastcall SetAsInteger(Longint Value);
```

Description

This is SetAsInteger, a member of class TFloatField.

39.1.33.3.9 TFloatField.SetAsString Method

Pascal

```
procedure SetAsString(const Value: string); override;
```

C++

```
virtual __fastcall SetAsString(const AnsiString Value);
```

Description

This is SetAsString, a member of class TFloatField.

39.1.33.3.10 TFloatField.SetVarValue Method

Pascal

```
procedure SetVarValue(const Value: Variant); override;
```

C++

```
virtual __fastcall SetVarValue(const Variant Value);
```

Description

This is SetVarValue, a member of class TFloatField.

39.1.33.4 TFloatField Properties

The properties of the TFloatField class are listed here.

Public Properties

	Name	Description
	Value (see page 7242)	Specifies the value of the floating-point field.

Published Properties

	Name	Description
	currency (see page 7240)	Determines whether the value in the field should be formatted as a currency value.
	MaxValue (see page 7240)	Limits the maximum value in the floating-point field.
	MinValue (see page 7241)	Limits the minimum value in the floating-point field.
	Precision (see page 7241)	Determines the precision used in formatting the value in a floating-point field.

39.1.33.4.1 TFloatField.currency Property

Determines whether the value in the field should be formatted as a currency value.

Pascal

```
property currency: Boolean;
```

C++

```
__property Boolean currency;
```

Description

Use the currency property to specify the formatting of the field for viewing and editing in a data-aware control.

The field is formatted for display using the DisplayFormat (see page 7369) property if it is assigned. If DisplayFormat (see page 7369) is not assigned, currency determines how the field is formatted for display. If currency is true, the value is formatted for display using the FloatToText function with the ffCurrency formatting code. If currency is false, the value is formatted with the ffGeneral format.

The field is formatted for editing purposes using the EditFormat (see page 7371) (or DisplayFormat (see page 7369)) property if it is assigned. If neither EditFormat (see page 7371) nor DisplayFormat (see page 7369) is assigned, currency determines how the field is formatted for editing. If currency is true, the value is formatted for editing using the FloatToText function with the ffFixed formatting code. If currency is false, the value is formatted with the ffGeneral format.

See Also

DisplayFormat (see page 7369)

DisplayText (see page 7162)

EditFormat (see page 7371)

FloatToText (see page 22892)

FloatToTextFmt (see page 22893)

Text (see page 7179)

39.1.33.4.2 TFloatField.MaxValue Property

Limits the maximum value in the floating-point field.

Pascal

```
property MaxValue: Double;
```

C++

```
__property Double MaxValue;
```

Description

Use MaxValue to get or set the maximum value that can be entered into the field. If a value greater than MaxValue is entered, an EDatabaseError (see page 6731) exception is raised.

See Also

EDatabaseError (see page 6731)

MinValue (see page 7241)

39.1.33.4.3 TFloatField.MinValue Property

Limits the minimum value in the floating-point field.

Pascal

```
property MinValue: Double;
```

C++

```
__property Double MinValue;
```

Description

Use MinValue to get or set the minimum value that can be entered into the field. If a value smaller than MinValue is entered, an EDatabaseError (see page 6731) exception is raised.

See Also

EDatabaseError (see page 6731)

MaxValue (see page 7240)

39.1.33.4.4 TFloatField.Precision Property

Determines the precision used in formatting the value in a floating-point field.

Pascal

```
property Precision: Integer;
```

C++

```
__property int Precision;
```

Description

Use Precision to set the number of digits beyond the decimal point that the value should be formatted to before rounding begins. Precision affects the format of the floating-point value when it is displayed as a text string, not the actual floating-point value that is stored in the field.

The default value of Precision is 15 decimal places.

Note: Precision must be greater than or equal to 2. Trying to set Precision to a value less than 2 changes the value of Precision to 2.

See Also

AsString

DisplayFormat (see page 7369)

Working with Field Components: Overview

39.1.33.4.5 TFloatField.Value Property

Specifies the value of the floating-point field.

Pascal

```
property Value: Double;
```

C++

```
__property Double Value;
```

Description

Use Value to read data from and write data to a floating-point component at runtime. Using the Value property is the same as using the AsFloat (see page 7149) property. Use Value when you know the field component is a floating-point field. Use AsFloat (see page 7149) when working with a generic field component.

AsFloat

39.1.34 TFMTBCDField Class

TFMTBCDField represents a binary-coded decimal (BCD) field in a dataset.

Class Hierarchy

Pascal

```
TFMTBCDField = class(TNumericField);
```

C++

```
class TFMTBCDField : public TNumericField;
```

File

DB

Description

TFMTBCDField encapsulates the fundamental behavior common to binary-coded decimal (BCD) fields. BCD values provide greater precision and accuracy than floating-point numbers. BCD fields are often used for storing and manipulating monetary values.

The IDE uses two different field types for representing BCD fields: TFMTBCDField and TBCDField (see page 6776). TFMTBCDField uses a true BCD value (TBCD) to store and manipulate BCD values. This gives greater precision and accuracy than the Currency type used by TBCDField (see page 6776) objects, but results in somewhat slower performance. If your application does not require more than 4 decimal places or 20 significant digits, you may want to use TBCDField (see page 6776) instead to take advantage of its better performance.

If you use the Fields editor at design time to create a persistent field component for the BCD field, you can access it by name at runtime. When using dynamic field components, you can access the TFMTBCDField instance using the dataset's Fields property

or FieldByName method.

Using Default Formatting for Numeric

39.1.34.1 TFMTBCDField Members

The following tables list the members exposed by TFMTBCDField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7250)	This is CheckTypeSize, a member of class TFMTBCDField.
V	CopyData (see page 7250)	This is CopyData, a member of class TFMTBCDField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	GetAsBCD (see page 7250)	This is GetAsBCD, a member of class TFMTBCDField.
V	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7251)	This is GetAsCurrency, a member of class TFMTBCDField.
V	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
V	GetAsFloat (see page 7251)	This is GetAsFloat, a member of class TFMTBCDField.
V	GetAsInteger (see page 7251)	This is GetAsInteger, a member of class TFMTBCDField.
V	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
V	GetAsString (see page 7251)	This is GetAsString, a member of class TFMTBCDField.
V	GetAsVariant (see page 7252)	This is GetAsVariant, a member of class TFMTBCDField.
V	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.

	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
	GetDataSize (see page 7252)	This is GetDataSize, a member of class TFMTBCDField.
	GetDefaultWidth (see page 7252)	This is GetDefaultWidth, a member of class TFMTBCDField.
	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7252)	This is GetText, a member of class TFMTBCDField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 7252)	This is GetValue, a member of class TFMTBCDField.
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	RangeError (see page 7368)	This is RangeError, a member of class TNumericField.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7253)	This is SetAsBCD, a member of class TFMTBCDField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7253)	This is SetAsCurrency, a member of class TFMTBCDField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7253)	This is SetAsFloat, a member of class TFMTBCDField.
	SetAsInteger (see page 7253)	This is SetAsInteger, a member of class TFMTBCDField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 7254)	This is SetAsString, a member of class TFMTBCDField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayFormat (see page 7368)	This is SetDisplayFormat, a member of class TNumericField.
	SetEditFormat (see page 7368)	This is SetEditFormat, a member of class TNumericField.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property

	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 7254)	This is SetVarValue, a member of class TFMTBCDField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7126)	Sets the value of the field to NULL.
	Create (see page 7248)	Create creates an instance of TFMTBCDField (see page 7242).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.

	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7257)	Represents the value of the BCD field as a TBcd value.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.

	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	Alignment (see page 7369)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	currency (see page 7254)	Determines whether the value in the field should be formatted as a currency value.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayFormat (see page 7369)	Determines how a numeric field's value is formatted for display in a data-aware control.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	EditFormat (see page 7371)	Determines how a numeric field's value is formatted when it is being edited in a data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	MaxValue (see page 7255)	Limits the maximum value in the binary-coded decimal field.
	MinValue (see page 7255)	Limits the minimum value in the binary-coded decimal field.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	Precision (see page 7256)	Specifies the number of digits of accuracy used to store the field value.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Size (see page 7256)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.34.2 TFMTBCDField.Create Constructor

Create creates an instance of TFMTBCDField (see page 7242).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TFMTBCDField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TFMTBCDField (see page 7242). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TFMTBCDField (see page 7242). After instantiating a TFMTBCDField (see page 7242), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TFMTBCDField (see page 7242) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TFMTBCDField (see page 7242) with a dataset component by setting its DataSet (see page 7157) property to the name of the dataset component. Specify the precision of the TFMTBCDField (see page 7242) by setting the Precision (see page 7256) property.

The example below creates a TFMTBCDField (see page 7242) object for a field named Amount accessed through a TSQLQuery named SQLQuery1.

```
var
  T: TFMTBCDField;
begin
  SQLQuery1.Close;
  T := TFMTBCDField.Create(SQLQuery1);
  T.FieldName := 'Amount';
  T.Name := SQLQuery1.Name + T.FieldName;
  T.Index := SQLQuery1.FieldCount;
  T.DataSet := SQLQuery1;
  T.Precision := 20;
  SQLQuery1.FieldDefs.UpDate;
  SQLQuery1.Open;
end;
SQLQuery1->Close();
TFMTBCDField *T = new TFMTBCDField(SQLQuery1);
T->FieldName = "Amount";
T->Name = SQLQuery1->Name + T->FieldName;
T->Index = SQLQuery1->FieldCount;
T->DataSet = SQLQuery1;
T->Precision = 20;
SQLQuery1->FieldDefs->UpDate();
SQLQuery1->Open();
```

39.1.34.3 TFMTBCDField Methods

The methods of the TFMTBCDField class are listed here.

Protected Methods

	Name	Description
	CheckTypeSize (see page 7250)	This is CheckTypeSize, a member of class TFMTBCDField.
	CopyData (see page 7250)	This is CopyData, a member of class TFMTBCDField.
	GetAsBCD (see page 7250)	This is GetAsBCD, a member of class TFMTBCDField.
	GetAsCurrency (see page 7251)	This is GetAsCurrency, a member of class TFMTBCDField.
	GetAsFloat (see page 7251)	This is GetAsFloat, a member of class TFMTBCDField.
	GetAsInteger (see page 7251)	This is GetAsInteger, a member of class TFMTBCDField.
	GetAsString (see page 7251)	This is GetAsString, a member of class TFMTBCDField.
	GetAsVariant (see page 7252)	This is GetAsVariant, a member of class TFMTBCDField.
	GetDataSize (see page 7252)	This is GetDataSize, a member of class TFMTBCDField.
	GetDefaultWidth (see page 7252)	This is GetDefaultWidth, a member of class TFMTBCDField.
	GetText (see page 7252)	This is GetText, a member of class TFMTBCDField.
	GetValue (see page 7252)	This is GetValue, a member of class TFMTBCDField.
	SetAsBCD (see page 7253)	This is SetAsBCD, a member of class TFMTBCDField.
	SetAsCurrency (see page 7253)	This is SetAsCurrency, a member of class TFMTBCDField.
	SetAsFloat (see page 7253)	This is SetAsFloat, a member of class TFMTBCDField.
	SetAsInteger (see page 7253)	This is SetAsInteger, a member of class TFMTBCDField.
	SetAsString (see page 7254)	This is SetAsString, a member of class TFMTBCDField.
	SetVarValue (see page 7254)	This is SetVarValue, a member of class TFMTBCDField.

39.1.34.3.1 TFMTBCDField.CheckTypeSize Method

Pascal

```
class procedure CheckTypeSize(Value: Integer); override;
```

C++

```
virtual __fastcall CheckTypeSize(int Value);
```

Description

This is CheckTypeSize, a member of class TFMTBCDField.

39.1.34.3.2 TFMTBCDField.CopyData Method

Pascal

```
procedure CopyData(Source: Pointer; Dest: Pointer); override;
```

C++

```
virtual __fastcall CopyData(void * Source, void * Dest);
```

Description

This is CopyData, a member of class TFMTBCDField.

39.1.34.3.3 TFMTBCDField.GetAsBCD Method

Pascal

```
function GetAsBCD: TBcd; override;
```

C++

```
virtual __fastcall TBcd GetAsBCD();
```

Description

This is GetAsBCD, a member of class TFMTBCDField.

39.1.34.3.4 TFMTBCDField.GetAsCurrency Method

Pascal

```
function GetAsCurrency: Currency; override;
```

C++

```
virtual __fastcall Currency GetAsCurrency();
```

Description

This is GetAsCurrency, a member of class TFMTBCDField.

39.1.34.3.5 TFMTBCDField.GetAsFloat Method

Pascal

```
function GetAsFloat: Double; override;
```

C++

```
virtual __fastcall Double GetAsFloat();
```

Description

This is GetAsFloat, a member of class TFMTBCDField.

39.1.34.3.6 TFMTBCDField.GetAsInteger Method

Pascal

```
function GetAsInteger: Longint; override;
```

C++

```
virtual __fastcall Longint GetAsInteger();
```

Description

This is GetAsInteger, a member of class TFMTBCDField.

39.1.34.3.7 TFMTBCDField.GetAsString Method

Pascal

```
function GetAsString: string; override;
```

C++

```
virtual __fastcall AnsiString GetAsString();
```

Description

This is GetAsString, a member of class TFMTBCDField.

39.1.34.3.8 TFMTBCDField.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TFMTBCDField.

39.1.34.3.9 TFMTBCDField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; override;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TFMTBCDField.

39.1.34.3.10 TFMTBCDField.GetDefaultWidth Method

Pascal

```
function GetDefaultWidth: Integer; override;
```

C++

```
virtual __fastcall int GetDefaultWidth();
```

Description

This is GetDefaultWidth, a member of class TFMTBCDField.

39.1.34.3.11 TFMTBCDField.GetText Method

Pascal

```
procedure GetText(var Text: string; DisplayText: Boolean); override;
```

C++

```
virtual __fastcall GetText(AnsiString Text, Boolean DisplayText);
```

Description

This is GetText, a member of class TFMTBCDField.

39.1.34.3.12 TFMTBCDField.GetValue Method

Pascal

```
function GetValue(var Value: TBcd): Boolean;
```

C++

```
__fastcall Boolean GetValue(TBcd Value);
```

Description

This is GetValue, a member of class TFMTBCDField.

39.1.34.3.13 TFMTBCDField.SetAsBCD Method

Pascal

```
procedure SetAsBCD(const Value: TBcd); override;
```

C++

```
virtual __fastcall SetAsBCD(const TBcd Value);
```

Description

This is SetAsBCD, a member of class TFMTBCDField.

39.1.34.3.14 TFMTBCDField.SetAsCurrency Method

Pascal

```
procedure SetAsCurrency(Value: Currency); override;
```

C++

```
virtual __fastcall SetAsCurrency(Currency Value);
```

Description

This is SetAsCurrency, a member of class TFMTBCDField.

39.1.34.3.15 TFMTBCDField.SetAsFloat Method

Pascal

```
procedure SetAsFloat(Value: Double); override;
```

C++

```
virtual __fastcall SetAsFloat(Double Value);
```

Description

This is SetAsFloat, a member of class TFMTBCDField.

39.1.34.3.16 TFMTBCDField.SetAsInteger Method

Pascal

```
procedure SetAsInteger(Value: Longint); override;
```

C++

```
virtual __fastcall SetAsInteger(Longint Value);
```

Description

This is SetAsInteger, a member of class TFMTBCDField.

39.1.34.3.17 TFMTBCDField.SetAsString Method

Pascal

```
procedure SetAsString(const Value: string); override;
```

C++

```
virtual __fastcall SetAsString(const AnsiString Value);
```

Description

This is SetAsString, a member of class TFMTBCDField.

39.1.34.3.18 TFMTBCDField.SetVarValue Method

Pascal

```
procedure SetVarValue(const Value: Variant); override;
```

C++

```
virtual __fastcall SetVarValue(const Variant Value);
```

Description

This is SetVarValue, a member of class TFMTBCDField.

39.1.34.4 TFMTBCDField Properties

The properties of the TFMTBCDField class are listed here.

Public Properties

	Name	Description
	Value (see page 7257)	Represents the value of the BCD field as a TBcd value.

Published Properties

	Name	Description
	currency (see page 7254)	Determines whether the value in the field should be formatted as a currency value.
	MaxValue (see page 7255)	Limits the maximum value in the binary-coded decimal field.
	MinValue (see page 7255)	Limits the minimum value in the binary-coded decimal field.
	Precision (see page 7256)	Specifies the number of digits of accuracy used to store the field value.
	Size (see page 7256)	Indicates the size used in the definition of the physical database field for data types that support different sizes.

39.1.34.4.1 TFMTBCDField.currency Property

Determines whether the value in the field should be formatted as a currency value.

Pascal

```
property currency: Boolean;
```

C++

```
__property Boolean currency;
```

Description

Use the currency property to influence how the value in the field should be formatted for viewing and editing in a data-aware

control.

For display purposes, the field is formatted using the DisplayFormat (see page 7369) property if it is assigned. Similarly, for editing purposes, the field is formatted using the EditFormat (see page 7371) (or DisplayFormat (see page 7369)) property if it is assigned.

If DisplayFormat (see page 7369) or EditFormat (see page 7371) is not assigned, C currency determines how the field is formatted. If currency is true, the value is formatted to represent a monetary value. If currency is false, it is formatted to reflect the precision and decimal places of the BCD type.

See Also

DisplayFormat (see page 7369)

DisplayText (see page 7162)

EditFormat (see page 7371)

FloatToText (see page 22892)

FloatToTextFmt (see page 22893)

Text (see page 7179)

TFloatFormat (see page 22999)

39.1.34.4.2 TFMTBCDField.MaxValue Property

Limits the maximum value in the binary-coded decimal field.

Pascal

```
property MaxValue: String;
```

C++

```
__property AnsiString MaxValue;
```

Description

Use MaxValue to get or set the maximum value that can be entered into the field. MaxValue is the string representation of the maximum value.

If a value greater than MaxValue is entered, TFMTBCDField (see page 7242) raises an EDatabaseError (see page 6731) exception.

See Also

MinValue (see page 7255)

Value (see page 7257)

39.1.34.4.3 TFMTBCDField.MinValue Property

Limits the minimum value in the binary-coded decimal field.

Pascal

```
property MinValue: String;
```

C++

```
__property AnsiString MinValue;
```

Description

Use MinValue to get or set the minimum value that can be entered into the field. MinValue is the string representation of the minimum value.

If a value smaller than MinValue is entered, TFMTBCDField (see page 7242) raises an EDatabaseError (see page 6731) exception.

See Also

MaxValue (see page 7255)

Value (see page 7257)

39.1.34.4.4 TFMTBCDField.Precision Property

Specifies the number of digits of accuracy used to store the field value.

Pascal

```
property Precision: Integer;
```

C++

```
__property int Precision;
```

Description

Precision can be a value between 0 and 32. Some database servers support more digits than 32, but these can't be handled by client datasets, and so TFMTBCDField (see page 7242) limits the value of Precision to be no greater than 32.

See Also

AsCurrency

SetData (see page 7141)

39.1.34.4.5 TFMTBCDField.Size Property

Indicates the size used in the definition of the physical database field for data types that support different sizes.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

The interpretation of Size depends on the data type. The meaning of Size for data types that use it is given in the following table. For all other data types, Size is not used and its value is always 0.

DataType	Meaning of Size
ftBCD	Size is the number of digits after the decimal place.
ftString	Size is the maximum number of characters in the string.
ftVarBytes	Size is the maximum number of bytes of data, not counting the first two bytes which indicate the actual number of bytes of data that were used.
ftBytes	Size is the maximum number of bytes of data.
ftBlob	Size is the number of bytes from the BLOB that are stored in the record buffer.

ftDBaseOle	Size is the number of bytes from the dBASE OLE BLOB that are stored in the record buffer.
ftFMTBCD	Size is the number of digits after the decimal place.
ftFmtMemo	Size is the number of bytes from the memo that are stored in the record buffer.
ftGraphic	Size is the number of bytes from the image that are stored in the record buffer.
ftMemo	Size is the number of characters from the memo that are stored in the record buffer.
ftParadoxOle	Size is the number of bytes from the Paradox OLE BLOB that are stored in the record buffer.
ftTypedBinary	Size is the number of bytes from the BLOB that are stored in the record buffer.
ftADT	Size is the total number of fields contained in the ADT field, including the fields of child fields that are of type ADT.
ftArray	Size is the number of elements in the array.

See Also

DataSize (see page 7157)

DataType (see page 7159)

39.1.34.4.6 TFMTBCDField.Value Property

Represents the value of the BCD field as a TBcd value.

Pascal

```
property Value: TBcd;
```

C++

```
__property TBcd Value;
```

Description

Use Value to read data from and write data to a BCD field. Using the Value property is the same as using the AsBCD (see page 7147) property.

If a value assigned to the field is not within the range established by the MinValue (see page 7255) and the MaxValue (see page 7255) properties, an EDatabaseError (see page 6731) exception is raised.

AsBCD

SetData (see page 7141)

39.1.35 TGraphicField Class

TGraphicField represents a graphics field in a dataset.

Class Hierarchy

Pascal

```
TGraphicField = class(TBlobField);
```

C++

```
class TGraphicField : public TBlobField;
```

File

DB

Description

TGraphicField encapsulates the fundamental behavior common to fields that hold graphic data. Graphics (see page 14387) fields are a form of binary large object (BLOB) field where the data includes a BLOB header describing the encoding of the graphical value.

If you use the Fields editor at design time to create a persistent field component for the graphics field, you can access it by name at runtime. When using dynamic field components, you can access the TGraphicField instance using the dataset's Fields property or FieldByName method.

See Also

TImage (see page 12777)

TMemoField (see page 7348)

TPicture (see page 14584)

39.1.35.1 TGraphicField Members

The following tables list the members exposed by TGraphicField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 6810)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 6811)	This is FreeBuffers, a member of class TBlobField.

	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
	GetAsString (see page 6811)	This is GetAsString, a member of class TBlobField.
	GetAsString (see page 7130)	This is GetAsString, a member of class TField.
	GetAsVariant (see page 6811)	This is GetAsVariant, a member of class TBlobField.
	GetAsVariant (see page 7130)	This is GetAsVariant, a member of class TField.
	GetAsWideString (see page 6812)	This is GetAsWideString, a member of class TBlobField.
	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
	GetBlobSize (see page 6812)	This is GetBlobSize, a member of class TBlobField.
	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClassDesc (see page 6812)	This is GetClassDesc, a member of class TBlobField.
	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
	GetDataSize (see page 7133)	This is GetDataSize, a member of class TField.
	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIsNull (see page 6812)	This is GetIsNull, a member of class TBlobField.
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 6812)	This is GetText, a member of class TBlobField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.

	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 6817)	This is SetAsString, a member of class TBlobField.
	SetAsString (see page 7140)	This is SetAsString, a member of class TField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 6817)	This is SetAsWideString, a member of class TBlobField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 6818)	This is SetText, a member of class TBlobField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 6818)	This is SetVarValue, a member of class TBlobField.
	SetVarValue (see page 7144)	This is SetVarValue, a member of class TField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 6809)	Copies a value to the BLOB field.
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.

	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 6810)	Clears the current value in the BLOB field.
V	Clear (see page 7126)	Sets the value of the field to NULL.
V	Create (see page 7264)	Creates an instance of TGraphicField (see page 7257).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 6813)	Indicates that this is a BLOB field.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	LoadFromFile (see page 6814)	Loads BLOB data from a file into the field.
	LoadFromStream (see page 6815)	Loads BLOB data from a stream into the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 6816)	Saves the contents of the BLOB field to a file.
	SaveToStream (see page 6816)	Saves the contents of the BLOB field to a stream.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 6817)	Specifies the type of the BLOB field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
R	BlobSize (see page 6819)	Indicates the number of bytes of data contained in the blob field on the current record.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.

	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	Modified (see page 6820)	Indicates whether a the value for the BLOB field was changed since it was last read from the underlying database.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	Transliterate (see page 6821)	Determines whether any text in the BLOB field should be converted to and from the character set identified by the dataset.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 6822)	Represents the data in the BLOB field.
	Value (see page 7180)	Represents the data in a field component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	BlobType (see page 6819)	Identifies the type of the BLOB field associated with a BLOB field object.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.

	GraphicHeader (see page 6820)	Indicates whether the field's value includes a Paradox graphic BLOB header.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Size (see page 6820)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.35.2 TGraphicField.Create Constructor

Creates an instance of TGraphicField (see page 7257).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TGraphicField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TGraphicField (see page 7257). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) property to ftGraphic. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TGraphicField (see page 7257). After instantiating a TGraphicField (see page 7257), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TGraphicField (see page 7257) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TGraphicField (see page 7257) with a dataset component by setting its DataSet (see page 7157) property to the name of the dataset component.

The example below creates a TGraphicField (see page 7257) object for a field named Pics accessed through a TSQLDataSet named SQLDataSet1.

```
var
  T: TGraphicField;
begin
  SQLDataSet1.Close;
  T := TGraphicField.Create(SQLDataSet1);
  T.FieldName := 'Pics';
  T.Name := SQLDataSet1.Name + T.FieldName;
```

```
    T.Index := SQLDataSet1.FieldCount;
    T.DataSet := SQLDataSet1;
    SQLDataSet1.FieldDefs.UpDate;
    SQLDataSet1.Open;
  end;
  TGraphicField *T;
  SQLDataSet1->Close();
  T = new TGraphicField(SQLDataSet1);
  T->FieldName = "Pics";
  T->Name = SQLDataSet1->Name + T->FieldName;
  T->Index = SQLDataSet1->FieldCount;
  T->DataSet = SQLDataSet1;
  SQLDataSet1->FieldDefs->UpDate();
  SQLDataSet1->Open();
```

39.1.36 TGuidField Class

TGuidField represents a guid field in a dataset.

Class Hierarchy

Pascal

```
TGuidField = class(TStringField);
```

C++

```
class TGuidField : public TStringField;
```

File

DB

Description

TGuidField encapsulates the fundamental behavior common to fields storing Globally Unique Identifiers (GUIDs). In addition to the properties, methods, and events common to all fields that are introduced by the TField (see page 7115) class, TGuidField introduces the AsGuid (see page 7274) property for setting and getting the field's value as a TGUID data type.

If you use the Fields editor at design time to create a persistent field component for the guid field, you can access it by name at runtime. When using dynamic field components, you can access the TGuidField instance using the dataset's Fields property or FieldByName method.

Maximum/minimum data storage limits?

TDataSet (see page 6894)

TDataSet (see page 6894)

39.1.36.1 TGuidField Members

The following tables list the members exposed by TGuidField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7273)	This is CheckTypeSize, a member of class TGuidField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
V	GetAsBCD (see page 7492)	This is GetAsBCD, a member of class TStringField.
V	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
V	GetAsBoolean (see page 7492)	This is GetAsBoolean, a member of class TStringField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
V	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
V	GetAsDateTime (see page 7492)	This is GetAsDateTime, a member of class TStringField.
V	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
V	GetAsFloat (see page 7492)	This is GetAsFloat, a member of class TStringField.
	GetAsGuid (see page 7273)	This is GetAsGuid, a member of class TGuidField.
V	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
V	GetAsInteger (see page 7493)	This is GetAsInteger, a member of class TStringField.
V	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
V	GetAsSQLTimeStamp (see page 7493)	This is GetAsSQLTimeStamp, a member of class TStringField.
V	GetAsString (see page 7130)	This is GetAsString, a member of class TField.
V	GetAsString (see page 7493)	This is GetAsString, a member of class TStringField.
V	GetAsVariant (see page 7130)	This is GetAsVariant, a member of class TField.
V	GetAsVariant (see page 7493)	This is GetAsVariant, a member of class TStringField.
V	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.

	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
	GetDataSize (see page 7133)	This is GetDataSize, a member of class TField.
	GetDataSize (see page 7493)	This is GetDataSize, a member of class TStringField.
	GetDefaultWidth (see page 7273)	This is GetDefaultWidth, a member of class TGuidField.
	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetText (see page 7494)	This is GetText, a member of class TStringField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 7494)	This is GetValue, a member of class TStringField.
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBCD (see page 7494)	This is SetAsBCD, a member of class TStringField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsBoolean (see page 7495)	This is SetAsBoolean, a member of class TStringField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsDateTime (see page 7495)	This is SetAsDateTime, a member of class TStringField.
	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsFloat (see page 7495)	This is SetAsFloat, a member of class TStringField.
	SetAsGuid (see page 7273)	This is SetAsGuid, a member of class TGuidField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsInteger (see page 7495)	This is SetAsInteger, a member of class TStringField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsSQLTimeStamp (see page 7495)	This is SetAsSQLTimeStamp, a member of class TStringField.
	SetAsString (see page 7140)	This is SetAsString, a member of class TField.
	SetAsString (see page 7496)	This is SetAsString, a member of class TStringField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 7144)	This is SetVarValue, a member of class TField.
	SetVarValue (see page 7496)	This is SetVarValue, a member of class TStringField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7126)	Sets the value of the field to NULL.
	Create (see page 7272)	Creates an instance of a TGuidField (see page 7265) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsGuid (see page 7274)	Represents the value of the field as a Globally Unique Identifier (GUID).
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.

	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7180)	Represents the data in a field component.
	Value (see page 7499)	Represents the data in the string field.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	EditMask (see page 7496)	Contains a mask that restricts the data that can be entered into a data field.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
	FixedChar (see page 7497)	Specifies whether the represented field is of Char type.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Size (see page 7497)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Transliterate (see page 7498)	Determines whether text should be converted to and from the character set identified by the dataset.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.36.2 TGuidField.Create Constructor

Creates an instance of a TGuidField (see page 7265) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TGuidField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TGuidField (see page 7265). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) property to ftGuid. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TGuidField (see page 7265). After instantiating a TGuidField (see page 7265), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TGuidField (see page 7265) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TGuidField (see page 7265) with a dataset component by setting its DataSet (see page 7157) property.

The example below creates a TGuidField (see page 7265) object for a field named Guid accessed through a TQuery named Query1.

```
var
  T: TGuidField;
begin
  Query1.Close;
  T := TGuidField.Create(Query1);
  T.FieldName := 'Guid';
  T.Name := Query1.Name + T.FieldName;
  T.Index := Query1.FieldCount;
  T.DataSet := Query1;
  Query1.FieldDefs.UpDate;
  Query1.Open;
end;
TGuidField *T;
Query1->Close();
T = new TGuidField(Query1);
T->FieldName = "Guid";
T->Name = Query1->Name + T->FieldName;
T->Index = Query1->FieldCount;
T->DataSet = Query1;
Query1->FieldDefs->UpDate();
Query1->Open();
```

39.1.36.3 TGuidField Methods

The methods of the TGuidField class are listed here.

Protected Methods

	Name	Description
	CheckTypeSize (see page 7273)	This is CheckTypeSize, a member of class TGuidField.
	GetAsGuid (see page 7273)	This is GetAsGuid, a member of class TGuidField.
	GetDefaultWidth (see page 7273)	This is GetDefaultWidth, a member of class TGuidField.
	SetAsGuid (see page 7273)	This is SetAsGuid, a member of class TGuidField.

39.1.36.3.1 TGuidField.CheckTypeSize Method

Pascal

```
class procedure CheckTypeSize(Value: Integer); override;
```

C++

```
virtual __fastcall CheckTypeSize(int Value);
```

Description

This is CheckTypeSize, a member of class TGuidField.

39.1.36.3.2 TGuidField.GetAsGuid Method

Pascal

```
function GetAsGuid: TGUID;
```

C++

```
__fastcall TGUID GetAsGuid();
```

Description

This is GetAsGuid, a member of class TGuidField.

39.1.36.3.3 TGuidField.GetDefaultWidth Method

Pascal

```
function GetDefaultWidth: Integer; override;
```

C++

```
virtual __fastcall int GetDefaultWidth();
```

Description

This is GetDefaultWidth, a member of class TGuidField.

39.1.36.3.4 TGuidField.SetAsGuid Method

Pascal

```
procedure SetAsGuid(const Value: TGUID);
```

C++

```
__fastcall SetAsGuid(const TGUID Value);
```

Description

This is SetAsGuid, a member of class TGuidField.

39.1.36.4 TGuidField Properties

The properties of the TGuidField class are listed here.

Public Properties

	Name	Description
	AsGuid (see page 7274)	Represents the value of the field as a Globally Unique Identifier (GUID).

39.1.36.4.1 TGuidField.AsGuid Property

Represents the value of the field as a Globally Unique Identifier (GUID).

Pascal

```
property AsGuid: TGUID;
```

C++

```
__property TGUID AsGuid;
```

Description

Use AsGuid to

Assign (see page 7124) the GUID field value to a TGUID variable (Delphi) or GUID variable (C++).

Assign (see page 7124) a TGUID value (Delphi) or GUID value (C++) as the value of the field.

AsGuid uses the StringToGUID and GUIDToString functions internally to converts between the internal representation of the GUID as a string and a TGUID type.

See Also

StringToGUID (see page 22952)

GuidToString

39.1.37 TIDispatchField Class

TIDispatchField represents an IDispatch field in a dataset.

Class Hierarchy

Pascal

```
TIDispatchField = class(TInterfaceField);
```

C++

```
class TIDispatchField : public TInterfaceField;
```

File

DB

Description

TIDispatchField encapsulates the fundamental behavior common to fields that contain pointers to IDispatch interfaces as data.

If you use the Fields editor at design time to create a persistent field component for the IDispatch field, you can access it by name at runtime. When using dynamic field components, you can access the TIDispatchField instance using the dataset's Fields property or FieldByName method.

Maximum/minimum capacities?

TDataSet (see page 6894)

TDataSet (see page 6894)

39.1.37.1 TIDispatchField Members

The following tables list the members exposed by TIDispatchField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
V	CheckTypeSize (see page 7321)	This is CheckTypeSize, a member of class TInterfaceField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
V	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.

	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
	GetAsString (see page 7130)	This is GetAsString, a member of class TField.
	GetAsVariant (see page 7130)	This is GetAsVariant, a member of class TField.
	GetAsVariant (see page 7321)	This is GetAsVariant, a member of class TInterfaceField.
	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
	GetDataSize (see page 7133)	This is GetDataSize, a member of class TField.
	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 7282)	This is GetValue, a member of class TIDispatchField.
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 7140)	This is SetAsString, a member of class TField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetValue (see page 7282)	This is SetValue, a member of class TIDispatchField.
	SetVarValue (see page 7144)	This is SetVarValue, a member of class TField.
	SetVarValue (see page 7322)	This is SetVarValue, a member of class TInterfaceField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7126)	Sets the value of the field to NULL.
	Create (see page 7280)	Creates and initializes an IDispatch field component.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.

	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7282)	Represents the data in an IDispatch field component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.37.2 TIDispatchField.Create Constructor

Creates and initializes an IDispatch field component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIDispatchField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TIDispatchField (see page 7274). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) property to ftIDispatch. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TIDispatchField (see page 7274). After instantiating a TIDispatchField (see page 7274), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TIDispatchField (see page 7274) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TIDispatchField (see page 7274) with a dataset component by setting its DataSet (see page 7157) property.

The example below creates a TIDispatchField (see page 7274) object for a field named IDispatch accessed through a TQuery named Query1.

```
var
  T: TIDispatchField;
begin
  Query1.Close;
  T := TIDispatchField.Create(Query1);
  T.FieldName := 'IDispatch';
  T.Name := Query1.Name + T.FieldName;
  T.Index := Query1.FieldCount;
  T.DataSet := Query1;
  Query1.FieldDefs.UpDate;
  Query1.Open;
end;
TIDispatchField *T;
Query1->Close();
T = new TIDispatchField(Query1);
T->FieldName = "IDispatch";
T->Name = Query1->Name + T->FieldName;
T->Index = Query1->FieldCount;
T->DataSet = Query1;
Query1->FieldDefs->UpDate();
Query1->Open();
```

39.1.37.3 TIDispatchField Methods

The methods of the TIDispatchField class are listed here.

Protected Methods

	Name	Description
	GetValue (see page 7282)	This is GetValue, a member of class TIDispatchField.
	SetValue (see page 7282)	This is SetValue, a member of class TIDispatchField.

39.1.37.3.1 TIDispatchField.GetValue Method

Pascal

```
function GetValue: IDispatch;
```

C++

```
__fastcall IDispatch GetValue();
```

Description

This is GetValue, a member of class TIDispatchField.

39.1.37.3.2 TIDispatchField.SetValue Method

Pascal

```
procedure SetValue(const Value: IDispatch);
```

C++

```
__fastcall SetValue(const IDispatch Value);
```

Description

This is SetValue, a member of class TIDispatchField.

39.1.37.4 TIDispatchField Properties

The properties of the TIDispatchField class are listed here.

Public Properties

	Name	Description
	Value (see page 7282)	Represents the data in an IDispatch field component.

39.1.37.4.1 TIDispatchField.Value Property

Represents the data in an IDispatch field component.

Pascal

```
property Value: IDispatch;
```

C++

```
__property IDispatch Value;
```

Description

Use Value to read data directly from and write data directly to a field component at runtime. The Value property can affect the contents of a field that is not Visible (see page 7181).

See Also

Text (see page 7179)

DisplayText (see page 7162)

NewValue (see page 7174)

Visible (see page 7181)

AsVariant

39.1.38 TIndexDef Class

TIndexDef describes an index in a database table.

Class Hierarchy

Pascal

```
TIndexDef = class(TNamedItem);
```

C++

```
class TIndexDef : public TNamedItem;
```

File

DB

Description

Use the properties and methods of an index definition to:

Set the attributes of a new index in a table created with TTable . :: CreateTable or TClientDataSet. ::CreateDataSet.

Determine the name of an index.

Identify the fields that make up the index, or the dBASE expression that orders the index.

Determine the characteristics of the index.

Note: you cannot use TIndexDef objects in a dataset component's IndexDefs property to add indexes to already existing tables. To do that, use methods such as TTable

. :: AddIndex and TClientDataSet. ::AddIndex.

See Also

TIndexDefs (see page 7292)

TTable (see page 10168)

AddIndex

TCustomClientDataSet (see page 8373)

Creating and Deleting Tables

39.1.38.1 TIndexDef Members

The following tables list the members exposed by TIndexDef.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 7286)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetDisplayName (see page 7359)	This is SetDisplayName, a member of class TNamedItem.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 7285)	Copies the properties of one index definition to another.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 7285)	Creates an instance of TIndexDef (see page 7283).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	FieldExpression (see page 7289)	Provides access to either a list of field names or an index expression.
R	ID (see page 2761)	A unique, permanent index for the item.

	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Properties

	Name	Description
	CaseInsFields (see page 7287)	Specifies which fields of the index are case-insensitive.
	DescFields (see page 7288)	Specifies the fields of the index that are sorted in descending order.
	Expression (see page 7289)	Contains a dBASE key expression.
	Fields (see page 7290)	Identifies the fields that comprise the index.
	GroupingLevel (see page 7291)	Indicates the depth of grouping provided by the index.
	Name (see page 7359)	Specifies the name of the database entity defined by the TNamedItem (see page 7357) object.
	Options (see page 7291)	Describes the characteristics of the index.
	Source (see page 7292)	Contains the name of a dBASE maintained index.

39.1.38.2 TIndexDef.Create Constructor

Creates an instance of TIndexDef (see page 7283).

Pascal

```
constructor Create(Owner: TIndexDefs; const Name: string; const Fields: string; Options:
TIndexOptions); overload; reintroduce;
```

C++

```
__fastcall TIndexDef(TIndexDefs Owner, const AnsiString Name, const AnsiString Fields,
TIndexOptions Options);
```

Description

Do not explicitly create index definition objects. A TIndexDef (see page 7283) is created automatically by the dataset for each existing index of the table. When creating new indexes, use the TIndexDefs.AddIndexDef method.

See Also

Create (see page 2757)

AddIndex (see page 10184)

Add (see page 7295)

AddIndexDef (see page 7296)

39.1.38.3 TIndexDef Methods

The methods of the TIndexDef class are listed here.

Protected Methods

	Name	Description
	GetDisplayName (see page 7286)	Returns the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	Assign (see page 7285)	Copies the properties of one index definition to another.

39.1.38.3.1 TIndexDef.Assign Method

Copies the properties of one index definition to another.

Pascal

```
procedure Assign(ASource: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * ASource);
```

Description

Call Assign to copy another index definition. Assign checks whether the ASource parameter is another index definition, and, if so, copies the values of the Options (see page 7291), Name (see page 7359), Source (see page 7292), Expression (see page 7289), and Fields (see page 7290) properties.

If the source is not an index definition, Assign calls the inherited (Delphi) or parent class's (C++) method, which assigns properties from any object that specifies how to copy to an index definition in its AssignTo method.

Fields (see page 7290)

Name (see page 7359)

Options (see page 7291)

Source (see page 7292)

AssignTo (see page 2931)

39.1.38.3.2 TIndexDef.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName (see page 2761)

GetNamePath (see page 2759)

39.1.38.4 TIndexDef Properties

The properties of the TIndexDef class are listed here.

Public Properties

	Name	Description
R	FieldExpression (see page 7289)	Provides access to either a list of field names or an index expression.

Published Properties

	Name	Description
	CaseInsFields (see page 7287)	Specifies which fields of the index are case-insensitive.
	DescFields (see page 7288)	Specifies the fields of the index that are sorted in descending order.
	Expression (see page 7289)	Contains a dBASE key expression.
	Fields (see page 7290)	Identifies the fields that comprise the index.
	GroupingLevel (see page 7291)	Indicates the depth of grouping provided by the index.
	Options (see page 7291)	Describes the characteristics of the index.
	Source (see page 7292)	Contains the name of a dBASE maintained index.

39.1.38.4.1 TIndexDef.CaseInsFields Property

Specifies which fields of the index are case-insensitive.

Pascal

```
property CaseInsFields: string;
```

C++

```
__property AnsiString CaseInsFields;
```

Description

Set CaseInsFields to a string that lists the names of fields in the index, separated by semicolons. The ordering imposed by the index on the fields specified in CaseInsFields is case-insensitive. Fields (see page 7290) in the index definition but not in the CaseInsFields list use case sensitive ordering (the default for the database type). It is possible that a single index can have fields using both case-insensitive and case-sensitive ordering.

For a field to be included in CaseInsFields, the field must be included in the fields on which the index is based. These fields are specified in the Fields (see page 7290) property of the TIndexDef (see page 7283) object.

Note: Not all database servers support both case-insensitive and case-sensitive field orderings in the same index. Consult the documentation for the particular database server used to determine whether this is actually supported. Some database systems require an index be designated case-insensitive as a whole (all of its base fields).

In the example below, the CaseInsFields property is given a list of two table fields for the index being created: LastName and Company.

```
with Table1 do begin
  ...
  with IndexDefs do begin
    with AddIndexDef do begin
      Name := 'MultiIndex'
      Fields := 'LastName;Company;State'
      Options := [ixUnique];
    end;
    Items[IndexDefs.Count – 1].CaseInFields := 'LastName;Company';
  end;
  ...
  CreateTable;
end;
```

...

```
  Table1->IndexDefs->Add("MultiIndex", "LastName;Company;State",
    TIndexOptions() << ixUnique);
  Table1->IndexDefs->Items[Table1->IndexDefs->Count-1]->CaseInsFields = "LastName;Company";
  ...
```

See Also

TIndexDefs (see page 7292)

Options (see page 7291)

IndexDefs (see page 10219)

AddIndexDef (see page 7296)

Fields (see page 7290)

39.1.38.4.2 TIndexDef.DescFields Property

Specifies the fields of the index that are sorted in descending order.

Pascal

```
property DescFields: string;
```

C++

```
__property AnsiString DescFields;
```

Description

Set DescFields to a string that lists the names of fields in the index, separated by semicolons. The ordering imposed by the index on the fields specified in DescFields is descending. Fields (see page 7290) in the index definition but not in the DescFields list use the default ascending order. It is possible for a single index to have fields using both ascending and descending ordering.

For a field to be included in DescFields, the field must be included in the fields on which the index is based. These fields are specified in the Fields (see page 7290) property of the TIndexDef (see page 7283) object.

Note: Not all database servers support both ascending and descending field orderings in the same index. Consult the documentation for the particular database server to determine whether this is actually supported.

In the example below, the DescFields property is given a list of two table fields for the index being created: TransDate and Company.

```
with Table1 do begin
  ...
  with IndexDefs do begin
    with AddIndexDef do begin
      Name := 'MultiIndex'
      Fields := 'TransDate;Company;State'
      Options := [ixUnique];
    end;
    Items[IndexDefs.Count – 1].DescInFields := 'TransDate;Company';
  end;
  ...
  CreateTable;
end;
...
Table1->IndexDefs->Add("MultiIndex","TransDate;Company;State",
  TIndexOptions() << ixUnique);
Table1->IndexDefs->Items[Table1->IndexDefs->Count-1]->DescFields = "TransDate;Company";
...
```

See Also

Options (see page 7291)

TIndexDefs (see page 7292)

IndexDefs (see page 10219)

AddIndexDef (see page 7296)

Fields (see page 7290)

39.1.38.4.3 TIndexDef.Expression Property

Contains a dBASE key expression.

Pascal

```
property Expression: string;
```

C++

```
__property AnsiString Expression;
```

Description

Read Expression to learn the key expression of a dBASE expression index. This property is only used on the Windows product, where there are components that can represent dBASE tables.

A key expression for a dBASE table is a field name, or a combination of field names, functions, and operators that specifies how the index orders records in the table. If the table is not a dBASE table or the index is not an expression index, Expression is an empty string and the Fields (see page 7290) property contains the field(s) for the index. When the index is a dBASE expression index, Expression contains a value and the Fields (see page 7290) property contains an empty string.

Note: For more information about key expressions, see your dBASE documentation.

See Also

Fields (see page 7290)

Options (see page 7291)

39.1.38.4.4 TIndexDef.FieldExpression Property

Provides access to either a list of field names or an index expression.

Pascal

```
property FieldExpression: string;
```

C++

```
__property AnsiString FieldExpression;
```

Description

FieldExpression provides access to the private data member on TIndexDef (see page 7283) which contains either a list of field names or an index expression. This data member is used to return the value for the Fields (see page 7290) property or the Expression (see page 7289) property depending on whether ixExpression is in Options (see page 7291).

This property is only used in the Windows product, where there are components that can represent dBASE tables. This property is used by TBDEDataSet but normally d Developers should use the Fields (see page 7290) or Expression (see page 7289) properties instead.

See Also

Expression (see page 7289)

Fields (see page 7290)

Options (see page 7291)

39.1.38.4.5 TIndexDef.Fields Property

Identifies the fields that comprise the index.

Pascal

```
property Fields: WideString;
```

C++

```
__property BSTR Fields;
```

Description

When creating an index, set Fields to a list of fields separated by semicolons (no semicolon is required if there is only one field in the index). The order of field names in the string determines the order of fields in the index.

When inspecting already-existing indexes, read Fields to determine the fields that make up the index. The string returned can be either the names of the fields, or the numbers of the field. When numbers are used, the numbers correspond to the physical field numbers in the table. Multiple fields in the string are separated by semicolons (;).

Note:

C++ Examples:

```
/*
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
*/
void __fastcall TForm1::Button3Click(TObject *Sender)
{
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2->Active = False;
  // Get the current available indices
  CDS2->IndexDefs->Update();
  // Find a field named "Field2"
  for (int I = 0; I < CDS2->IndexDefs->Count; I++)
    if (CDS2->IndexDefs->Items[I]->Fields == "Field2")
    {
      // set that index as the current index for the dataset}
      CDS2->IndexName = CDS2->IndexDefs->Items[I]->Name;
    }
  CDS2->Active = True;
}
```

Delphi Examples:

```
{
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
}
procedure TForm1.Button3Click(Sender: TObject);
var
  I : Integer;
begin
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2.Active := False;
  { Get the current available indices }
  CDS2.IndexDefs.Update;
  { Find a field named 'Field2' }
  for I := 0 to CDS2.IndexDefs.Count - 1 do
    if CDS2.IndexDefs.Items[I].Fields = 'Field2' then
```

```
      begin
        { set that index as the current index for the dataset}
        CDS2.IndexName := CDS2.IndexDefs.Items[I].Name;
      end;
    CDS2.Active := True;
  end;
```

See Also

Expression (see page 7289)

Options (see page 7291)

FieldNo (see page 7166)

FieldName (see page 7164)

Add (see page 7295)

39.1.38.4.6 TIndexDef.GroupingLevel Property

Indicates the depth of grouping provided by the index.

Pascal

```
property GroupingLevel: Integer;
```

C++

```
__property int GroupingLevel;
```

Description

Grouping level specifies the level of grouping information maintained by the index. Grouping is only supported on client datasets.

See Also

GroupingLevel (see page 8277)

39.1.38.4.7 TIndexDef.Options Property

Describes the characteristics of the index.

Pascal

```
property Options: TIndexOptions;
```

C++

```
__property TIndexOptions Options;
```

Description

When creating a new index, use Options to specify the attributes of the index. Options can contain zero or more of the TIndexOption (see page 7617) constants ixPrimary, ixUnique, ixDescending, ixCaseInsensitive, and ixExpression.

When inspecting the definitions of existing indexes, read Options to determine the option(s) used to create the index.

Note: Different database drivers may support only a subset of these options. For example, with dBASE tables, ixCaseInsensitive is not supported. Including an option that is not valid for a table will raise an exception.

Note: Primary indexes are, by definition unique. If setting the Options value ixPrimary, you need not also use ixUnique.

See Also

Expression (see page 7289)

39.1.38.4.8 TIndexDef.Source Property

Contains the name of a dBASE maintained index.

Pascal

```
property Source: string;
```

C++

```
__property AnsiString Source;
```

Description

When the table uses dBASE .MDX indexes, Name (see page 7359) indicates the index tag name and Source is the name of the index file. Source is applicable to dBASE table indexes only.

Source is not used on the Linux platform. This property is available for the Windows product, where there are components that represent dBASE tables.

See Also

Name (see page 7359)

39.1.39 TIndexDefs Class

TIndexDefs holds the list of available index definitions for a table.

Class Hierarchy

Pascal

```
TIndexDefs = class(TDefCollection);
```

C++

```
class TIndexDefs : public TDefCollection;
```

File

DB

Description

TTable and TClientDataSet components use TIndexDefs to implement their IndexDefs property. These index definitions can be used to obtain information about the indexes defined for the underlying data or, when the component is used to create a table, to create the indexes of that table.

Use the properties and methods of TIndexDefs to:

Access a specific index definition.

Determine how many index definitions this TIndexDefs object contains.

Add (see page 7295) or delete index definitions.

Copy all index definitions from one TIndexDefs to another.

Note: you cannot use TIndexDef (see page 7283) objects in a dataset component's IndexDefs property to add indexes to already existing tables. To do that, use methods such as AddIndex.

See Also

TIndexDef (see page 7283)

TCustomClientDataSet (see page 8373)

IndexDefs

AddIndex

39.1.39.1 TIndexDefs Members

The following tables list the members exposed by TIndexDefs.

Protected Events

	Name	Description
	OnUpdate (see page 7111)	This is OnUpdate, a member of class TDefCollection.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	DoUpdate (see page 7107)	This is DoUpdate, a member of class TDefCollection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	SetItemName (see page 7109)	Initializes the name of a newly inserted collection item.
	UpdateDefs (see page 7109)	This is UpdateDefs, a member of class TDefCollection.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 7295)	Creates a new index definition and adds it to the Items (see page 7300) property.
	AddIndexDef (see page 7296)	Creates a new index definition object and adds it to the Items (see page 7300) property.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 7295)	Creates an instance of TIndexDefs (see page 7292).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
	Destroy (see page 2735)	Destroys the collection and each item in it.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Find (see page 7297)	Returns the TIndexDef (see page 7283) object for the index definition with a specified name.
	FindIndexForFields (see page 7298)	Locates an index definition in the Items (see page 7300) array.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetIndexForFields (see page 7298)	Locates an index definition in the Items (see page 7300) array.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItemNames (see page 7108)	This is the overview for the GetItemNames method overload.
	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	IndexOf (see page 7108)	Finds the index number of a definition in the Items array from its name.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Update (see page 7299)	Refreshes index definitions in Items (see page 7300) to reflect the current state of the dataset.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	DataSet (see page 7110)	Indicates the dataset that uses the TDefCollection (see page 7104) object to manage its definition objects.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 7300)	Lists the index definitions that describe each index of a dataset.
	Updated (see page 7110)	Indicates whether the definition objects in the Items array match the corresponding instantiated objects in the dataset.

39.1.39.2 TIndexDefs.Create Constructor

Creates an instance of TIndexDefs (see page 7292).

Pascal

```
constructor Create(ADataSet: TDataSet);
```

C++

```
__fastcall TIndexDefs(TDataSet ADataSet);
```

Description

Applications should not instantiate TIndexDefs (see page 7292). TIndexDefs (see page 7292) objects are created automatically by the dataset that uses them (even if the dataset currently has no indexes).

See Also

Items (see page 7300)

IndexDefs (see page 10219)

39.1.39.3 TIndexDefs Methods

The methods of the TIndexDefs class are listed here.

Public Methods

	Name	Description
	Add (see page 7295)	Creates a new index definition and adds it to the Items (see page 7300) property.
	AddIndexDef (see page 7296)	Creates a new index definition object and adds it to the Items (see page 7300) property.
	Find (see page 7297)	Returns the TIndexDef (see page 7283) object for the index definition with a specified name.
	FindIndexForFields (see page 7298)	Locates an index definition in the Items (see page 7300) array.
	GetIndexForFields (see page 7298)	Locates an index definition in the Items (see page 7300) array.
	Update (see page 7299)	Refreshes index definitions in Items (see page 7300) to reflect the current state of the dataset.

39.1.39.3.1 TIndexDefs.Add Method

Creates a new index definition and adds it to the Items (see page 7300) property.

Pascal

```
procedure Add(const Name: string; const Fields: string; Options: TIndexOptions);
```

C++

```
__fastcall Add(const AnsiString Name, const AnsiString Fields, TIndexOptions Options);
```

Description

Add is provided for backward compatibility. The recommended way to add new index definitions before creating a table is to use the AddIndexDef (see page 7296) method. To add an index to an existing table, use the AddIndex method of the dataset instead. To change the array of indexes when a new index has been added to the dataset, use the Update (see page 7299) method instead.

Add creates an index definition and assigns the values passed in the Name, Fields, and Options parameters to the TIndexDef (see page 7283) properties of the same names. If an index definition with same name already exists, Add raises an EDatabaseError (see page 6731) exception.

See Also

Items (see page 7300)

TIndexDef (see page 7283)

Fields (see page 7290)

Name (see page 7359)

Options (see page 7291)

AddIndex (see page 10184)

Update (see page 7299)

AddIndexDef (see page 7296)

39.1.39.3.2 TIndexDefs.AddIndexDef Method

Creates a new index definition object and adds it to the Items (see page 7300) property.

Pascal

```
function AddIndexDef: TIndexDef;
```

C++

```
__fastcall TIndexDef AddIndexDef();
```

Description

Call AddIndexDef to add index definitions when creating a database table. AddIndexDef returns the new TIndexDef (see page 7283) object that was added to the IndexDefs collection of index definitions. After calling AddIndexDef, set the properties of the newly added TIndexDef (see page 7283) object to specify the name, type, and options of index that will be created.

Note: AddIndexDef is only valid in the context of creating index definitions for a table to be created with a subsequent call to the CreateTable

or CreateDataSet method. It cannot be used to add indexes to an already-existing table.

C++ Examples:

```
/*
The following code creates and activates a client dataset in
the form's OnCreate event handler.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TFieldDefs *pDefs = CDS2->FieldDefs;
```

```
  TFieldDef *pDef = pDefs->AddFieldDef();
  pDef->DataType = ftInteger;
  pDef->Name = "Field1";

  pDef = pDefs->AddFieldDef();
  pDef->DataType = ftString;
  pDef->Size = 10;
  pDef->Name = "Field2";

  TIndexDef *pIDef = CDS2->IndexDefs->AddIndexDef();
  pIDef->Fields = "Field1";
  pIDef->Name = "IntIndex";

  CDS2->CreateDataSet();
}
```

Delphi Examples:

```
{
The following code creates and activates a client dataset in
the form's OnCreate event handler.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  with CDS2 do
  begin
    with FieldDefs.AddFieldDef do
    begin
      DataType := ftInteger;
      Name := 'Field1';
    end;
    with FieldDefs.AddFieldDef do
    begin
      DataType := ftString;
      Size := 10;
      Name := 'Field2';
    end;
    with IndexDefs.AddIndexDef do
    begin
      Fields := 'Field1';
      Name := 'IntIndex';
    end;
    CreateDataSet;
  end;
end;
```

Items (see page 7300)

CreateTable (see page 10189)

CreateDataSet (see page 8401)

Creating and Deleting Tables

39.1.39.3.3 TIndexDefs.Find Method

Returns the TIndexDef (see page 7283) object for the index definition with a specified name.

Pascal

```
function Find(const Name: string): TIndexDef;
```

C++

```
__fastcall TIndexDef Find(const AnsiString Name);
```

Description

Call Find to obtain information about a particular index definition. Specify the name of the index as the value of the Name parameter.

Find raises an EDatabaseError (see page 6731) exception if there is no index definition with the given name.

Note: To locate an index definition based on the indexed fields rather than the name of the index, use the FindIndexForFields (see page 7298) method.

See Also

FindIndexForFields (see page 7298)

Items (see page 7300)

IndexOf (see page 7108)

39.1.39.3.4 TIndexDefs.FindIndexForFields Method

Locates an index definition in the Items (see page 7300) array.

Pascal

```
function FindIndexForFields(const Fields: string): TIndexDef;
```

C++

```
__fastcall TIndexDef FindIndexForFields(const AnsiString Fields);
```

Description

Use FindIndexForFields to search for the index that starts with the fields specified in the Fields parameter. If the index is constructed using more than one field, separate the fields with semicolons.

FindIndexForFields returns the index definition that exactly matches the fields specified (in the order specified), if one exists. If no exact match is found, FindIndexForFields returns the first index that begins with the indicated fields. If no match is found, FindIndexForFields raises an EDatabaseError (see page 6731) exception.

Note: FindIndexForFields can only locate ascending indexes. To include descending indexes in the search, use GetIndexForFields (see page 7298).

Note: To restrict the search to case-insensitive indexes, use the GetIndexForFields (see page 7298) method.

Items (see page 7300)

Fields (see page 7290)

39.1.39.3.5 TIndexDefs.GetIndexForFields Method

Locates an index definition in the Items (see page 7300) array.

Pascal

```
function GetIndexForFields(const Fields: string; CaseInsensitive: Boolean): TIndexDef;
```

C++

```
__fastcall TIndexDef GetIndexForFields(const AnsiString Fields, Boolean CaseInsensitive);
```

Description

Use GetIndexForFields to search for the index that starts with the fields specified in the Fields parameter. If more than one field comprises the index, separate the fields with semicolons. Set the CaseInsensitive parameter to true to restrict the search to only the case insensitive indexes in the Items (see page 7300) array.

GetIndexForFields returns the index definition that exactly matches the specified fields in the order specified, if it exists. If no exact match is found, GetIndexForFields returns the first index that begins with the indicated fields. If no match can be found, GetIndexForFields returns nil (Delphi) or NULL (C++).

Note: When CaseInsensitive is true, descending indexes are considered even if they are case-sensitive.

39.1.39.3.6 TIndexDefs.Update Method

Refreshes index definitions in Items (see page 7300) to reflect the current state of the dataset.

Pascal

```
procedure Update; reintroduce;
```

C++

```
__fastcall Update();
```

Description

Call Update when the set of indexes for the dataset may have changed. Update refreshes the index definitions without opening the dataset.

C++ Examples:

```
/*
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
*/
void __fastcall TForm1::Button3Click(TObject *Sender)
{
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2->Active = False;
  // Get the current available indices
  CDS2->IndexDefs->Update();
  // Find a field named "Field2"
  for (int I = 0; I < CDS2->IndexDefs->Count; I++)
    if (CDS2->IndexDefs->Items[I]->Fields == "Field2")
    {
      // set that index as the current index for the dataset}
      CDS2->IndexName = CDS2->IndexDefs->Items[I]->Name;
    }
  CDS2->Active = True;
}
```

Delphi Examples:

```
{
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
}
procedure TForm1.Button3Click(Sender: TObject);
var
  I : Integer;
begin
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2.Active := False;
  { Get the current available indices }
  CDS2.IndexDefs.Update;
  { Find a field named 'Field2' }
  for I := 0 to CDS2.IndexDefs.Count - 1 do
    if CDS2.IndexDefs.Items[I].Fields = 'Field2' then
    begin
      { set that index as the current index for the dataset}
      CDS2.IndexName := CDS2.IndexDefs.Items[I].Name;
    end;
  CDS2.Active := True;
end;
```

39.1.39.4 TIndexDefs Properties

The properties of the TIndexDefs class are listed here.

Public Properties

	Name	Description
	Items (see page 7300)	Lists the index definitions that describe each index of a dataset.

39.1.39.4.1 TIndexDefs.Items Property

Lists the index definitions that describe each index of a dataset.

Pascal

```
property Items [Index: Integer]: TIndexDef;
```

C++

```
__property TIndexDef Items[int Index];
```

Description

Use Items to access a particular index definition. Specify the index definition to access with the Index parameter. Index identifies the index definition's position in the list of index definitions, in the range 0 to Count - 1.

```
IdxFldsVar := Table1.IndexDefs.Items[i].Fields;
IdxFldsVar = Table1->IndexDefs->Items[i]->Fields;
```

C++ Examples:

```
/*
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
```

```
*/
void __fastcall TForm1::Button3Click(TObject *Sender)
{
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2->Active = False;
  // Get the current available indices
  CDS2->IndexDefs->Update();
  // Find a field named "Field2"
  for (int I = 0; I < CDS2->IndexDefs->Count; I++)
    if (CDS2->IndexDefs->Items[I]->Fields == "Field2")
    {
      // set that index as the current index for the dataset}
      CDS2->IndexName = CDS2->IndexDefs->Items[I]->Name;
    }
  CDS2->Active = True;
}
```

Delphi Examples:

```
{
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
}
procedure TForm1.Button3Click(Sender: TObject);
var
  I : Integer;
begin
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2.Active := False;
  { Get the current available indices }
  CDS2.IndexDefs.Update;
  { Find a field named 'Field2' }
  for I := 0 to CDS2.IndexDefs.Count - 1 do
    if CDS2.IndexDefs.Items[I].Fields = 'Field2' then
    begin
      { set that index as the current index for the dataset}
      CDS2.IndexName := CDS2.IndexDefs.Items[I].Name;
    end;
  CDS2.Active := True;
end;
```

39.1.40 TIntegerField Class

TIntegerField represents a signed 32-bit integer field in a dataset.

Class Hierarchy

Pascal

```
TIntegerField = class(TNumericField);
```

C++

```
class TIntegerField : public TNumericField;
```

File

DB

Description

TIntegerField encapsulates the fundamental behavior common to fields that contain integer data. Integer fields can hold values in the range -2,147,483,648 to 2,147,483,647, and are frequently used to hold values that are large, signed whole numbers. In addition to the properties, methods, and events common to all fields that are introduced by the TField (see page 7115) class, TIntegerField introduces new properties to convert between integer values and other data types, and to limit the range of valid integers that the field will permit.

If you use the Fields editor at design time to create a persistent field component for the integer field, you can access it by name at runtime. When using dynamic field components, you can access the TIntegerField instance using the dataset's Fields property or FieldByName method.

TIntegerField is the direct ancestor of three other field types that represent whole numbers: TAutoIncField (see page 6768), TSmallIntField, and TWordField (see page 7560).

Delphi Examples:

```
{
This example requires two ClientDataSets, two DBGrids, two
DataSources and two DBNavigators.  Name the two
ClientDataSets CDS and CDS2. Set the DataSet property in the
first DataSource to CDS and name that DataSource DS.  Set the
DataSet property in the second DataSource to CDS2 and name
that DataSource DS2.  Set the DataSource in the first
DBNavigator to DS and the DataSource in the second DBNavigator
to DS2.  Set the DataSource in the first DBGrid to DS and the
DataSource in the second DBGrid to DS2.  Right click on CDS
and select the Fields Editor, then right click on the Field
Editor form and create two fields by selecting "new field".
In the field configuration window, set the name to HOST, the
Component value will automatically be set to CDSHOST.  Set
the filed type to String.  In the field configuration window
for the second field, set the name to PORTA, the Component
value will automatically be set to CDSPORTA.  Set the field
type to Integer.  The file used to load CDS must have an
attribute name of HOST with an attribute type of string and
an attribute name of PORTA with an attribute type of integer.
Add DB, DBCtrls, Grids, DBGrids, DBClient and SwSystem to the
uses clause.  "LoadFormFile" to start with the file, or
"CreateDataSet" to start from scratch.  You must "CloseDataSet"
after a "LoadFromFile" before you can do another "CreateDataSet".
}
{$IFNDEF UNICODE}
uses SwSystem;
{$ENDIF}

procedure TForm1.Button1Click(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
{$ELSE}
  CDS.LoadFromFile(gsAppPath + 'CDS.XML');
{$ENDIF}
end;
```

```
procedure TForm1.Button2Click(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.SaveToFile(GetCurrentDir + '\CDS.XML', dfXML);
{$ELSE}
  CDS.SaveToFile(gsAppPath + 'CDS.XML', dfXML);
{$ENDIF}
end;

procedure TForm1.Button3Click(Sender: TObject);
begin
  CDS.CreateDataSet;
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  CDS2.Data := CDS.Data;
end;

procedure TForm1.Button5Click(Sender: TObject);
begin
  CDS.Close;
end;
```

39.1.40.1 TIntegerField Members

The following tables list the members exposed by TIntegerField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.

	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
V	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
V	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
V	GetAsFloat (see page 7310)	This is GetAsFloat, a member of class TIntegerField.
V	GetAsInteger (see page 7310)	This is GetAsInteger, a member of class TIntegerField.
V	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
V	GetAsString (see page 7311)	This is GetAsString, a member of class TIntegerField.
V	GetAsVariant (see page 7311)	This is GetAsVariant, a member of class TIntegerField.
V	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
V	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
V	GetDataSize (see page 7311)	This is GetDataSize, a member of class TIntegerField.
V	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
V	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
V	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetSize (see page 7135)	This is GetSize, a member of class TField.
V	GetText (see page 7311)	This is GetText, a member of class TIntegerField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 7312)	This is GetValue, a member of class TIntegerField.
V	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	RangeError (see page 7368)	This is RangeError, a member of class TNumericField.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 7138)	This is ReadState, a member of class TField.

	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
V	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
V	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
V	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
V	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
V	SetAsFloat (see page 7312)	This is SetAsFloat, a member of class TIntegerField.
V	SetAsInteger (see page 7312)	This is SetAsInteger, a member of class TIntegerField.
V	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
V	SetAsString (see page 7312)	This is SetAsString, a member of class TIntegerField.
V	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
V	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayFormat (see page 7368)	This is SetDisplayFormat, a member of class TNumericField.
	SetEditFormat (see page 7368)	This is SetEditFormat, a member of class TNumericField.
V	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
V	SetSize (see page 7143)	This is SetSize, a member of class TField.
V	SetText (see page 7144)	This is SetText, a member of class TField.
V	SetVarValue (see page 7312)	This is SetVarValue, a member of class TIntegerField.
V	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 7126)	Sets the value of the field to NULL.
V	Create (see page 7309)	Creates an instance of TIntegerField (see page 7301).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.

R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7314)	Represents the value of the integer field.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	Alignment (see page 7369)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayFormat (see page 7369)	Determines how a numeric field's value is formatted for display in a data-aware control.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	EditFormat (see page 7371)	Determines how a numeric field's value is formatted when it is being edited in a data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.

	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	MaxValue (see page 7313)	Limits the maximum value in the integer field.
	MinValue (see page 7313)	Limits the minimum value in the integer field.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.40.2 TIntegerField.Create Constructor

Creates an instance of TIntegerField (see page 7301).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIntegerField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TIntegerField (see page 7301). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) property to ftInteger, MinValue (see page 7313) to -2147483648, and MaxValue (see page 7313) to 2147483647. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TIntegerField (see page 7301). After instantiating a TIntegerField (see page 7301), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TIntegerField (see page 7301) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TIntegerField (see page 7301) with a dataset component by setting its DataSet (see page 7157) property.

The example below creates a TIntegerField (see page 7301) object for a field named Quantity accessed through a TSQLDataSet named SQLDataSet1.

```
var
  T: TIntegerField;
begin
  SQLDataSet1.Close;
  T := TIntegerField.Create(SQLDataSet1);
  T.FieldName := 'Quantity';
  T.Name := SQLDataSet1.Name + T.FieldName;
  T.Index := SQLDataSet1.FieldCount;
  T.DataSet := SQLDataSet1;
  SQLDataSet1.FieldDefs.UpDate;
  SQLDataSet1.Open;
end;
SQLDataSet1->Close();
TIntegerField *T = new TIntegerField(SQLDataSet1);
T->FieldName = "Quantity";
```

```
T->Name = SQLDataSet1->Name + T->FieldName;
T->Index = SQLDataSet1->FieldCount;
T->DataSet = SQLDataSet1;
SQLDataSet1->FieldDefs->UpDate();
SQLDataSet1->Open();
```

39.1.40.3 TIntegerField Methods

The methods of the TIntegerField class are listed here.

Protected Methods

	Name	Description
	GetAsFloat (see page 7310)	This is GetAsFloat, a member of class TIntegerField.
	GetAsInteger (see page 7310)	This is GetAsInteger, a member of class TIntegerField.
	GetAsString (see page 7311)	This is GetAsString, a member of class TIntegerField.
	GetAsVariant (see page 7311)	This is GetAsVariant, a member of class TIntegerField.
	GetDataSize (see page 7311)	This is GetDataSize, a member of class TIntegerField.
	GetText (see page 7311)	This is GetText, a member of class TIntegerField.
	GetValue (see page 7312)	This is GetValue, a member of class TIntegerField.
	SetAsFloat (see page 7312)	This is SetAsFloat, a member of class TIntegerField.
	SetAsInteger (see page 7312)	This is SetAsInteger, a member of class TIntegerField.
	SetAsString (see page 7312)	This is SetAsString, a member of class TIntegerField.
	SetVarValue (see page 7312)	This is SetVarValue, a member of class TIntegerField.

39.1.40.3.1 TIntegerField.GetAsFloat Method

Pascal

```
function GetAsFloat: Double; override;
```

C++

```
virtual __fastcall Double GetAsFloat();
```

Description

This is GetAsFloat, a member of class TIntegerField.

39.1.40.3.2 TIntegerField.GetAsInteger Method

Pascal

```
function GetAsInteger: Longint; override;
```

C++

```
virtual __fastcall Longint GetAsInteger();
```

Description

This is GetAsInteger, a member of class TIntegerField.

39.1.40.3.3 TIntegerField.GetAsString Method

Pascal

```
function GetAsString: string; override;
```

C++

```
virtual __fastcall AnsiString GetAsString();
```

Description

This is GetAsString, a member of class TIntegerField.

39.1.40.3.4 TIntegerField.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TIntegerField.

39.1.40.3.5 TIntegerField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; override;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TIntegerField.

39.1.40.3.6 TIntegerField.GetText Method

Pascal

```
procedure GetText(var Text: string; DisplayText: Boolean); override;
```

C++

```
virtual __fastcall GetText(AnsiString Text, Boolean DisplayText);
```

Description

This is GetText, a member of class TIntegerField.

39.1.40.3.7 TIntegerField.GetValue Method

Pascal

```
function GetValue(var Value: Longint): Boolean;
```

C++

```
__fastcall Boolean GetValue(Longint Value);
```

Description

This is GetValue, a member of class TIntegerField.

39.1.40.3.8 TIntegerField.SetAsFloat Method

Pascal

```
procedure SetAsFloat(Value: Double); override;
```

C++

```
virtual __fastcall SetAsFloat(Double Value);
```

Description

This is SetAsFloat, a member of class TIntegerField.

39.1.40.3.9 TIntegerField.SetAsInteger Method

Pascal

```
procedure SetAsInteger(Value: Longint); override;
```

C++

```
virtual __fastcall SetAsInteger(Longint Value);
```

Description

This is SetAsInteger, a member of class TIntegerField.

39.1.40.3.10 TIntegerField.SetAsString Method

Pascal

```
procedure SetAsString(const Value: string); override;
```

C++

```
virtual __fastcall SetAsString(const AnsiString Value);
```

Description

This is SetAsString, a member of class TIntegerField.

39.1.40.3.11 TIntegerField.SetVarValue Method

Pascal

```
procedure SetVarValue(const Value: Variant); override;
```

C++

```
virtual __fastcall SetVarValue(const Variant Value);
```

Description

This is SetVarValue, a member of class TIntegerField.

39.1.40.4 TIntegerField Properties

The properties of the TIntegerField class are listed here.

Public Properties

	Name	Description
	Value (see page 7314)	Represents the value of the integer field.

Published Properties

	Name	Description
	MaxValue (see page 7313)	Limits the maximum value in the integer field.
	MinValue (see page 7313)	Limits the minimum value in the integer field.

39.1.40.4.1 TIntegerField.MaxValue Property

Limits the maximum value in the integer field.

Pascal

```
property MaxValue: Longint;
```

C++

```
__property Longint MaxValue;
```

Description

Use MaxValue to get or set the maximum value that can be entered into the field. If a value greater than MaxValue is entered, an EDatabaseError (see page 6731) exception is raised.

If the value of MaxValue is 0, the integer field can have a value up to the maximum value that can be represented by the native database type. For 32-bit integer fields, this value is 2147483647.

See Also

MinValue (see page 7313)

39.1.40.4.2 TIntegerField.MinValue Property

Limits the minimum value in the integer field.

Pascal

```
property MinValue: Longint;
```

C++

```
__property Longint MinValue;
```

Description

Use MinValue to get or set the minimum value that can be entered into the field. If a value smaller than MinValue is entered, an EDatabaseError (see page 6731) exception is raised.

If the value of MinValue is 0, the integer field can have a value as small as the native database type can represent. For 32-bit integer fields, this minimum value is -2147483648.

See Also

MaxValue (see page 7313)

39.1.40.4.3 TIntegerField.Value Property

Represents the value of the integer field.

Pascal

```
property Value: Longint;
```

C++

```
__property Longint Value;
```

Description

Use Value to read data directly from and write data directly to an integer field. Using the Value property is the same as using the AsInteger (see page 7149) property. Use Value when you know the field component is a 32-bit integer field. Use AsInteger (see page 7149) when working with a generic field component.

See Also

AsInteger

39.1.41 TInterfaceField Class

TInterfaceField represents an interface field in a dataset.

Class Hierarchy

Pascal

```
TInterfaceField = class(TField);
```

C++

```
class TInterfaceField : public TField;
```

File

DB

Description

TInterfaceField encapsulates the fundamental behavior common to fields that contain pointers to interfaces (IUnknown) as data. TInterfaceField reimplements the Value (see page 7322) and AsVariant (see page 7152) properties to adapt them to accessing fields containing interfaces.

If you use the Fields editor at design time to create a persistent field component for the interface field, you can access it by name at runtime. When using dynamic field components, you can access the TInterfaceField instance using the dataset's Fields property or FieldByName method.

See Also

TDataSet (see page 6894)

TMemoField (see page 7348)

TDataSet (see page 6894)

TDataSet (see page 6894)

39.1.41.1 TInterfaceField Members

The following tables list the members exposed by TInterfaceField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7321)	This is CheckTypeSize, a member of class TInterfaceField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
V	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
V	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
V	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
V	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
V	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
V	GetAsString (see page 7130)	This is GetAsString, a member of class TField.
V	GetAsVariant (see page 7321)	This is GetAsVariant, a member of class TInterfaceField.
V	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
V	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
V	GetDataSize (see page 7133)	This is GetDataSize, a member of class TField.
V	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
V	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
V	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 7322)	This is GetValue, a member of class TInterfaceField.
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 7140)	This is SetAsString, a member of class TField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetValue (see page 7322)	This is SetValue, a member of class TInterfaceField.
	SetVarValue (see page 7322)	This is SetVarValue, a member of class TInterfaceField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 7126)	Sets the value of the field to NULL.
V	Create (see page 7320)	Creates and initializes an interface field component.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.

R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7322)	Represents the data in an interface field component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.

	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.41.2 TInterfaceField.Create Constructor

Creates and initializes an interface field component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TInterfaceField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TInterfaceField (see page 7314). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) property to ftInterface. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TIntegerField (see page 7301). After instantiating a TInterfaceField (see page 7314), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TInterfaceField (see page 7314) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TInterfaceField (see page 7314) with a dataset component by setting its DataSet (see page 7157) property to the name of the dataset component.

The example below creates a TInterfaceField (see page 7314) object for a field named Interface accessed through a TQuery named Query1.

```
var
  T: TInterfaceField;
begin
  Query1.Close;
  T := TInterfaceField.Create(Query1);
  T.FieldName := 'Interface';
  T.Name := Query1.Name + T.FieldName;
  T.Index := Query1.FieldCount;
  T.DataSet := Query1;
  Query1.FieldDefs.UpDate;
  Query1.Open;
end;
TInterfaceField *T;
Query1->Close();
T = new TInterfaceField(Query1);
T->FieldName = "Interface";
T->Name = Query1->Name + T->FieldName;
T->Index = Query1->FieldCount;
T->DataSet = Query1;
Query1->FieldDefs->UpDate();
Query1->Open();
```

39.1.41.3 TInterfaceField Methods

The methods of the TInterfaceField class are listed here.

Protected Methods

	Name	Description
	CheckTypeSize (see page 7321)	This is CheckTypeSize, a member of class TInterfaceField.
	GetAsVariant (see page 7321)	This is GetAsVariant, a member of class TInterfaceField.
	GetValue (see page 7322)	This is GetValue, a member of class TInterfaceField.
	SetValue (see page 7322)	This is SetValue, a member of class TInterfaceField.
	SetVarValue (see page 7322)	This is SetVarValue, a member of class TInterfaceField.

39.1.41.3.1 TInterfaceField.CheckTypeSize Method

Pascal

```
class procedure CheckTypeSize(Value: Integer); override;
```

C++

```
virtual __fastcall CheckTypeSize(int Value);
```

Description

This is CheckTypeSize, a member of class TInterfaceField.

39.1.41.3.2 TInterfaceField.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TInterfaceField.

39.1.41.3.3 TInterfaceField.GetValue Method

Pascal

```
function GetValue: IUnknown;
```

C++

```
__fastcall IUnknown GetValue();
```

Description

This is GetValue, a member of class TInterfaceField.

39.1.41.3.4 TInterfaceField.SetValue Method

Pascal

```
procedure SetValue(const Value: IUnknown);
```

C++

```
__fastcall SetValue(const IUnknown Value);
```

Description

This is SetValue, a member of class TInterfaceField.

39.1.41.3.5 TInterfaceField.SetVarValue Method

Pascal

```
procedure SetVarValue(const Value: Variant); override;
```

C++

```
virtual __fastcall SetVarValue(const Variant Value);
```

Description

This is SetVarValue, a member of class TInterfaceField.

39.1.41.4 TInterfaceField Properties

The properties of the TInterfaceField class are listed here.

Public Properties

	Name	Description
	Value (see page 7322)	Represents the data in an interface field component.

39.1.41.4.1 TInterfaceField.Value Property

Represents the data in an interface field component.

Pascal

```
property Value: IUnknown;
```

C++

```
__property IUnknown Value;
```

Description

Use Value to read data directly from and write data directly to a field component at runtime. The Value property can affect the contents of a field even if it is not Visible (see page 7181).

Text (see page 7179)

DisplayText (see page 7162)

AsVariant

Visible (see page 7181)

39.1.42 TLargeintField Class

A TLargeintField object represents a large integer field in a dataset.

Class Hierarchy

Pascal

```
TLargeintField = class(TNumericField);
```

C++

```
class TLargeintField : public TNumericField;
```

File

DB

Description

TLargeintField fields are database fields that contain large (64-bit) integer values.

If you use the Fields editor at design time to create a persistent field component for the large integer field, you can access it by name at runtime. When using dynamic field components, you can access the TIntegerField (see page 7301) instance using the dataset's Fields property or FieldByName method.

See Also

TDataSet (see page 6894)

TDataSet (see page 6894)

TDataSet (see page 6894)

TField (see page 7115)

TAutoIncField (see page 6768)

TSmallintField (see page 7461)

TWordField (see page 7560)

39.1.42.1 TLargeintField Members

The following tables list the members exposed by TLargeintField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
V	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
V	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
V	GetAsFloat (see page 7331)	This is GetAsFloat, a member of class TLargeintField.
V	GetAsInteger (see page 7331)	This is GetAsInteger, a member of class TLargeintField.
	GetAsLargeint (see page 7331)	This is GetAsLargeint, a member of class TLargeintField.
V	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
V	GetAsString (see page 7331)	This is GetAsString, a member of class TLargeintField.
V	GetAsVariant (see page 7331)	This is GetAsVariant, a member of class TLargeintField.
V	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
V	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
V	GetDataSize (see page 7332)	This is GetDataSize, a member of class TLargeintField.
V	GetDefaultWidth (see page 7332)	This is GetDefaultWidth, a member of class TLargeintField.
V	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
V	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7332)	This is GetText, a member of class TLargeintField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 7332)	This is GetValue, a member of class TLargeintField.
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	RangeError (see page 7368)	This is RangeError, a member of class TNumericField.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7333)	This is SetAsFloat, a member of class TLargeintField.
	SetAsInteger (see page 7333)	This is SetAsInteger, a member of class TLargeintField.
	SetAsLargeint (see page 7333)	This is SetAsLargeint, a member of class TLargeintField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 7333)	This is SetAsString, a member of class TLargeintField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayFormat (see page 7368)	This is SetDisplayFormat, a member of class TNumericField.
	SetEditFormat (see page 7368)	This is SetEditFormat, a member of class TNumericField.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 7333)	This is SetVarValue, a member of class TLargeintField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7126)	Sets the value of the field to NULL.
	Create (see page 7329)	Create creates an instance of TLargeintField (see page 7323).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsLargeInt (see page 7334)	Represents the field value as a large integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.

	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7335)	Represents the value of the large integer field.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	Alignment (see page 7369)	Determines how the field's data is displayed within a data-aware control.

	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayFormat (see page 7369)	Determines how a numeric field's value is formatted for display in a data-aware control.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	EditFormat (see page 7371)	Determines how a numeric field's value is formatted when it is being edited in a data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	MaxValue (see page 7335)	Limits the maximum value in the large integer field.
	MinValue (see page 7335)	Limits the minimum value in the large integer field.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.42.2 TLargeintField.Create Constructor

Create creates an instance of TLargeintField (see page 7323).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TLargeintField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TLargeintField (see page 7323). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) property to ftLargeint, and valid characters to '+', '-', and '0'..'9'. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TLargeintField (see page 7323). After instantiating a TLargeintField (see page 7323), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TLargeintField (see page 7323) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TLargeintField (see page 7323) with a dataset component by setting its DataSet (see page 7157) property.

The example below creates a TLargeintField (see page 7323) object for a field named Population accessed through a TSQLDataSet named SQLDataSet1.

```
var
  T: TLargeintField;
begin
  SQLDataSet1.Close;
  T := TLargeintField.Create(SQLDataSet1);
  T.FieldName := 'Population';
  T.Name := SQLDataSet1.Name + T.FieldName;
  T.Index := SQLDataSet1.FieldCount;
  T.DataSet := SQLDataSet1;
  SQLDataSet1.FieldDefs.UpDate;
  SQLDataSet1.Open;
end;
SQLDataSet1->Close();
TLargeintField *T = new TLargeintField(SQLDataSet1);
T->FieldName = "Population";
T->Name = SQLDataSet1->Name + T->FieldName;
T->Index = SQLDataSet1->FieldCount;
T->DataSet = SQLDataSet1;
SQLDataSet1->FieldDefs->UpDate();
SQLDataSet1->Open();
```

Create (see page 7121)

Owner (see page 2807)

DataType (see page 7159)

Destroy (see page 7122)

39.1.42.3 TLargeintField Methods

The methods of the TLargeintField class are listed here.

Protected Methods

	Name	Description
	GetAsFloat (see page 7331)	This is GetAsFloat, a member of class TLargeintField.
	GetAsInteger (see page 7331)	This is GetAsInteger, a member of class TLargeintField.
	GetAsLargeint (see page 7331)	This is GetAsLargeint, a member of class TLargeintField.
	GetAsString (see page 7331)	This is GetAsString, a member of class TLargeintField.
	GetAsVariant (see page 7331)	This is GetAsVariant, a member of class TLargeintField.
	GetDataSize (see page 7332)	This is GetDataSize, a member of class TLargeintField.
	GetDefaultWidth (see page 7332)	This is GetDefaultWidth, a member of class TLargeintField.
	GetText (see page 7332)	This is GetText, a member of class TLargeintField.
	GetValue (see page 7332)	This is GetValue, a member of class TLargeintField.
	SetAsFloat (see page 7333)	This is SetAsFloat, a member of class TLargeintField.
	SetAsInteger (see page 7333)	This is SetAsInteger, a member of class TLargeintField.
	SetAsLargeint (see page 7333)	This is SetAsLargeint, a member of class TLargeintField.

	SetAsString (see page 7333)	This is SetAsString, a member of class TLargeintField.
	SetVarValue (see page 7333)	This is SetVarValue, a member of class TLargeintField.

39.1.42.3.1 TLargeintField.GetAsFloat Method

Pascal

```
function GetAsFloat: Double; override;
```

C++

```
virtual __fastcall Double GetAsFloat();
```

Description

This is GetAsFloat, a member of class TLargeintField.

39.1.42.3.2 TLargeintField.GetAsInteger Method

Pascal

```
function GetAsInteger: Longint; override;
```

C++

```
virtual __fastcall Longint GetAsInteger();
```

Description

This is GetAsInteger, a member of class TLargeintField.

39.1.42.3.3 TLargeintField.GetAsLargeint Method

Pascal

```
function GetAsLargeint: Largeint;
```

C++

```
__fastcall Largeint GetAsLargeint();
```

Description

This is GetAsLargeint, a member of class TLargeintField.

39.1.42.3.4 TLargeintField.GetAsString Method

Pascal

```
function GetAsString: string; override;
```

C++

```
virtual __fastcall AnsiString GetAsString();
```

Description

This is GetAsString, a member of class TLargeintField.

39.1.42.3.5 TLargeintField.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TLargeintField.

39.1.42.3.6 TLargeintField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; override;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TLargeintField.

39.1.42.3.7 TLargeintField.GetDefaultWidth Method

Pascal

```
function GetDefaultWidth: Integer; override;
```

C++

```
virtual __fastcall int GetDefaultWidth();
```

Description

This is GetDefaultWidth, a member of class TLargeintField.

39.1.42.3.8 TLargeintField.GetText Method

Pascal

```
procedure GetText(var Text: string; DisplayText: Boolean); override;
```

C++

```
virtual __fastcall GetText(AnsiString Text, Boolean DisplayText);
```

Description

This is GetText, a member of class TLargeintField.

39.1.42.3.9 TLargeintField.GetValue Method

Pascal

```
function GetValue(var Value: Largeint): Boolean;
```

C++

```
__fastcall Boolean GetValue(Largeint Value);
```

Description

This is GetValue, a member of class TLargeintField.

39.1.42.3.10 TLargeintField.SetAsFloat Method

Pascal

```
procedure SetAsFloat(Value: Double); override;
```

C++

```
virtual __fastcall SetAsFloat(Double Value);
```

Description

This is SetAsFloat, a member of class TLargeintField.

39.1.42.3.11 TLargeintField.SetAsInteger Method

Pascal

```
procedure SetAsInteger(Value: Longint); override;
```

C++

```
virtual __fastcall SetAsInteger(Longint Value);
```

Description

This is SetAsInteger, a member of class TLargeintField.

39.1.42.3.12 TLargeintField.SetAsLargeint Method

Pascal

```
procedure SetAsLargeint(Value: Largeint);
```

C++

```
__fastcall SetAsLargeint(Largeint Value);
```

Description

This is SetAsLargeint, a member of class TLargeintField.

39.1.42.3.13 TLargeintField.SetAsString Method

Pascal

```
procedure SetAsString(const Value: string); override;
```

C++

```
virtual __fastcall SetAsString(const AnsiString Value);
```

Description

This is SetAsString, a member of class TLargeintField.

39.1.42.3.14 TLargeintField.SetVarValue Method

Pascal

```
procedure SetVarValue(const Value: Variant); override;
```

C++

```
virtual __fastcall SetVarValue(const Variant Value);
```

Description

This is SetVarValue, a member of class TLargeintField.

39.1.42.4 TLargeintField Properties

The properties of the TLargeintField class are listed here.

Public Properties

	Name	Description
	AsLargeInt (see page 7334)	Represents the field value as a large integer.
	Value (see page 7335)	Represents the value of the large integer field.

Published Properties

	Name	Description
	MaxValue (see page 7335)	Limits the maximum value in the large integer field.
	MinValue (see page 7335)	Limits the minimum value in the large integer field.

39.1.42.4.1 TLargeintField.AsLargeInt Property

Represents the field value as a large integer.

Pascal

```
property AsLargeInt: LargeInt;
```

C++

```
__property LargeInt AsLargeInt;
```

Description

Use AsLargeInt to:

Assign (see page 7124) the large integer field value to a 64-bit integer variable.

Assign (see page 7124) a 64-bit integer value to the large integer field.

For example, this code assigns a 64-bit integer value to a large integer field:

```
MyLargeIntegerField.AsLargeInt := 2147483648;
MyLargeIntegerField->AsLargeInt = 2147483648;
```

To assign a large integer field value to a 64-bit integer, use code similar to this:

```
LargeIntegerVariable := MyLargeIntegerField.AsLargeInt;
LargeIntVariable = MyLargeIntegerField->AsLargeInt;
```

If a value assigned to the field is not within the range established by the MinValue (see page 7335) and MaxValue (see page 7335) properties, an EDatabaseError (see page 6731) exception is raised.

See Also

Value (see page 7335)

MaxValue (see page 7335)

MinValue (see page 7335)

39.1.42.4.2 TLargeintField.MaxValue Property

Limits the maximum value in the large integer field.

Pascal

```
property MaxValue: Largeint;
```

C++

```
__property Largeint MaxValue;
```

Description

Use MaxValue to get or set the maximum value that can be entered into the field. If a value greater than MaxValue is entered, an EDatabaseError (see page 6731) exception is raised.

If the value of MaxValue is 0, the large integer field can have a value up to the maximum value that can be represented by the native database type. For 64-bit integer fields, this value is 2 ^63 - 1.

See Also

MinValue (see page 7335)

39.1.42.4.3 TLargeintField.MinValue Property

Limits the minimum value in the large integer field.

Pascal

```
property MinValue: Largeint;
```

C++

```
__property Largeint MinValue;
```

Description

Use MinValue to get or set the minimum value that can be entered into the field. If a value smaller than MinValue is entered, an EDatabaseError (see page 6731) exception is raised.

If the value of MinValue is 0, the large integer field can have a value as small as the native database type can represent. For 64-bit integer fields, this minimum value is -2 ^63

See Also

MaxValue (see page 7335)

39.1.42.4.4 TLargeintField.Value Property

Represents the value of the large integer field.

Pascal

```
property Value: Largeint;
```

C++

```
__property Largeint Value;
```

Description

Use Value to read data directly from and write data directly to a large integer field. Using the Value property is the same as using the AsLargeInt (see page 7334) property.

If a value assigned to the field is not within the range established by the MinValue (see page 7335) and the MaxValue (see page 7335) properties, an EDatabaseError (see page 6731) exception is raised.

See Also

AsLargeInt (see page 7334)

AsVariant

MaxValue (see page 7335)

MinValue (see page 7335)

39.1.43 TLookupList Class

TLookupList maintains a list of lookup values associated with a set of key field values.

Class Hierarchy

Pascal

```
TLookupList = class(TObject);
```

C++

```
class TLookupList : public TObject;
```

File

DB

Description

TField (see page 7115) uses TLookupList to implement a cache of lookup values. Each value in the lookup list is associated with a set of values on the key fields in the lookup data set. Lookup fields match the values of the fields identified by their KeyFields property with the values of the key fields from the lookup data set. When these values match, the value of the lookup field is set to the associated value from TLookupList.

Use TLookupList to generate a lookup list programmatically when there is no actual lookup dataset. Use the methods of the field's LookupList property to fill the lookup list with values and set the LookupCache property of the field to true. If no other lookup properties of the field are set, the field will use the supplied lookup list without overwriting it with values from a lookup dataset.

See Also

TField (see page 7115)

TField (see page 7115)

TField (see page 7115)

TField (see page 7115)

39.1.43.1 TLookupList Members

The following tables list the members exposed by TLookupList.

Public Methods

	Name	Description
	Add (see page 7338)	Adds a lookup value to the list for a given key value.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7339)	Empties the lookup list and frees the associated memory.
	Create (see page 7337)	Creates an instance of TLookupList (see page 7336).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 7338)	Destroys an instance of TLookupList (see page 7336).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ValueOfKey (see page 7339)	Returns the lookup value associated with a set of key field values.

39.1.43.2 TLookupList.Create Constructor

Creates an instance of TLookupList (see page 7336).

Pascal

```
constructor Create;
```

C++

```
__fastcall TLookupList();
```

Description

Applications should not need to call Create. Instances of TLookupList (see page 7336) are created by the field component that uses the list for its lookup cache. To obtain one of these instances, read the LookupList property of the field.

See Also

Create (see page 22287)

Destroy (see page 7338)

39.1.43.3 TLookupList.Destroy Destructor

Destroys an instance of TLookupList (see page 7336).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TLookupList();
```

Description

Do not call Destroy directly in an application. The lookup field that uses TLookupList (see page 7336) destroys the lookup list when it is done.

Destroy frees all memory used to store the list of lookup values.

See Also

Free (see page 22300)

Create (see page 7337)

39.1.43.4 TLookupList Methods

The methods of the TLookupList class are listed here.

Public Methods

	Name	Description
	Add (see page 7338)	Adds a lookup value to the list for a given key value.
	Clear (see page 7339)	Empties the lookup list and frees the associated memory.
	ValueOfKey (see page 7339)	Returns the lookup value associated with a set of key field values.

39.1.43.4.1 TLookupList.Add Method

Adds a lookup value to the list for a given key value.

Pascal

```
procedure Add(const AKey: Variant; const AValue: Variant);
```

C++

```
__fastcall Add(const Variant AKey, const Variant AValue);
```

Description

Lookup fields call Add when building the lookup cache to associate lookup values with the values of the key fields in the lookup dataset. The AKey parameter is a variant or variant array that represents the value or values of the key fields. AValue is a variant that represents the value of the lookup field associated with the key field values.

Use Add to build a lookup list from scratch when there is no actual lookup dataset.

See Also

LookupCache (see page 7170)

LookupList (see page 7172)

RefreshLookupList (see page 7138)

ValueOfKey (see page 7339)

39.1.43.4.2 TLookupList.Clear Method

Empties the lookup list and frees the associated memory.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the current values in the lookup list when building a lookup list programmatically. Lookup fields call Clear automatically before regenerating the lookup cache if the list represents the values in a lookup dataset.

See Also

RefreshLookupList (see page 7138)

39.1.43.4.3 TLookupList.ValueOfKey Method

Returns the lookup value associated with a set of key field values.

Pascal

```
function ValueOfKey(const AKey: Variant): Variant;
```

C++

```
__fastcall Variant ValueOfKey(const Variant AKey);
```

Description

Call ValueOfKey to look up the value for a lookup field that has the set of values specified by the AKey parameter on the fields identified by its KeyFields property. AKey is a Variant or Variant array that contains the values on the key fields in the lookup data set that uniquely specify a lookup field value.

See Also

KeyFields (see page 7169)

LookupList (see page 7172)

39.1.44 TMasterDataLink Class

TMasterDataLink allows a dataset to establish a master/detail relationship.

Class Hierarchy

Pascal

```
TMasterDataLink = class(TDetailDataLink);
```

C++

```
class TMasterDataLink : public TDetailDataLink;
```

File

DB

Description

Use TMasterDataLink as a private member of a custom dataset class that can represent the detail records for another dataset. TMasterDataLink maintains a list of field components from the master dataset, and passes on data events to the dataset that owns it. In the constructor of the dataset that uses TMasterDataLink to link to another data source, create the TMasterDataLink object and set any event handlers to respond to data events.

Do not confuse the dataset that is the value of the TMasterDataLink object's DataSet (see page 6890) property with the dataset that uses TMasterDataLink to link to a master dataset. The DataSet (see page 6890) property is the master dataset, while the dataset that owns the TMasterDataLink object is the detail set.

TClientDataSet, ADO-based datasets, and TTable objects already include a TMasterDataLink object.

Note: Unidirectional datasets and TQuery objects

use their own dedicated datalink classes to perform the same types of tasks.

See Also

TClientDataSet (see page 8289)

TTable (see page 10168)

TSQLDataLink (see page 20260)

39.1.44.1 TMasterDataLink Members

The following tables list the members exposed by TMasterDataLink.

Protected Methods

	Name	Description
	ActiveChanged (see page 7343)	Regenerates the Fields (see page 7346) property and triggers an OnMasterChange (see page 7347) or OnMasterDisable (see page 7347) event.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CheckBrowseMode (see page 7344)	Informs the dataset that owns the TMasterDataLink (see page 7339) object when the current record in the source dataset is about to change.
	DataEvent (see page 6881)	Responds to various events that occur while working with data.
	DataSetChanged (see page 6881)	Responds to changes in the dataset.
	DataSetScrolled (see page 6882)	Allows a response to scrolling the representation of the dataset within the data-aware object.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EditingChanged (see page 6883)	Responds to changes in the editing state of the data source.
	FocusControl (see page 6884)	Provides the interface for a method to force focus to the data-aware component associated with the TDataLink (see page 6876).
	GetActiveRecord (see page 6884)	This is GetActiveRecord, a member of class TDataLink.
	GetBOF (see page 6884)	This is GetBOF, a member of class TDataLink.
	GetBufferCount (see page 6884)	This is GetBufferCount, a member of class TDataLink.
	GetDetailDataSet (see page 7344)	Returns the value of the DetailDataSet (see page 7114) property.
	GetEOF (see page 6885)	This is GetEOF, a member of class TDataLink.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRecordCount (see page 6885)	This is GetRecordCount, a member of class TDataLink.
	LayoutChanged (see page 7344)	Informs the dataset that owns the TMasterDataLink (see page 7339) object after the data source has changed the number of records buffered.

	MoveBy (see page 6885)	Repositions the dataset to another record relative to its active record.
	RecordChanged (see page 7345)	Generates an OnMasterChange (see page 7347) event when the contents of one of the fields in the current record changes.
	SetActiveRecord (see page 6886)	This is SetActiveRecord, a member of class TDataLink.
	SetBufferCount (see page 6887)	This is SetBufferCount, a member of class TDataLink.
	UpdateData (see page 6887)	Provides an interface for writing edits to a record in the dataset.

Protected Properties

	Name	Description
	VisualControl (see page 6894)	Indicates whether a visual control uses the datalink.

Public Events

	Name	Description
	OnMasterChange (see page 7347)	Occurs after the Fields (see page 7346) property changes.
	OnMasterDisable (see page 7347)	Occurs when the source dataset becomes inactive.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 7342)	Creates an instance of TMasterDataLink (see page 7339).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 7342)	Destroys an instance of TMasterDataLink (see page 7339).
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6882)	Attempts to drive the data source into an editing state if it is not already in one.
	ExecuteAction (see page 6883)	Invokes an action with the datasource as its target.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	UpdateAction (see page 6887)	Updates an action to reflect the current state of the TDataLink (see page 6876).
	UpdateRecord (see page 6888)	Responds to notifications that edits should be posted to the dataset.

Public Properties

	Name	Description
R	Active (see page 6888)	Specifies whether the dataset that TDataLink (see page 6876) manages is active.
	ActiveRecord (see page 6889)	Specifies the index of the current record within the internal record buffer maintained by the dataset for the Owner of the TDataLink (see page 6876) object.
R	BOF (see page 6889)	Indicates whether the first record in a dataset is active.
	BufferCount (see page 6890)	Specifies the number of records cached by the dataset for the Owner of the TDataLink (see page 6876) object.
R	DataSet (see page 6890)	Specifies the TDataSet (see page 6894) object that represents the data that this TDataLink (see page 6876) is tracking.
	DataSource (see page 6891)	Specifies the TDataSource (see page 7070) object that the Owner of the TDataLink (see page 6876) uses to connect to the dataset.
	DataSourceFixed (see page 6891)	Indicates whether the DataSource (see page 6891) property can be set.
R	DetailDataSet (see page 7114)	Indicates the detail dataset in the master/detail relationship.
R	Editing (see page 6892)	Indicates whether the DataSource (see page 6891) is in edit mode.
R	Eof (see page 6892)	Indicates whether the last record in a dataset is active.
	FieldNames (see page 7345)	Names the fields from the master dataset that are used to define the link to the detail dataset.
R	Fields (see page 7346)	Lists all the field components from the master dataset that are used to establish a link to the detail dataset.
	ReadOnly (see page 6893)	Indicates whether the dataset for this TDataLink (see page 6876) can be modified.
R	RecordCount (see page 6893)	Indicates the number of records in the internal record buffer maintained by the dataset.

39.1.44.2 TMasterDataLink.Create Constructor

Creates an instance of TMasterDataLink (see page 7339).

Pascal

```
constructor Create(DataSet: TDataSet);
```

C++

```
__fastcall TMasterDataLink(TDataSet DataSet);
```

Description

Call Create from the constructor of the dataset that uses TMasterDataLink (see page 7339) to link to a master dataset. The dataset that uses the TMasterDataLink (see page 7339) passes itself as the DataSet (see page 6890) parameter.

Create associates the instance of TMasterDataLink (see page 7339) with the dataset that owns it, and creates the helper objects it uses to manage the list of field components.

See Also

Fields (see page 7346)

Create (see page 6878)

Destroy (see page 6879)

39.1.44.3 TMasterDataLink.Destroy Destructor

Destroys an instance of TMasterDataLink (see page 7339).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMasterDataLink();
```

Description

Applications do not free instances of TMasterDataLink (see page 7339). The dataset that owns the TMasterDataLink (see page 7339) instance frees the datalink from its own destructor.

Component writers call the Free method from the destructor of the dataset that owns the TMasterDataLink (see page 7339) object. Free checks that the TMasterDataLink (see page 7339) reference is not already freed, and only then calls Destroy.

Destroy frees up the memory used to manage the list of field components.

See Also

Create (see page 7342)

Free (see page 22300)

39.1.44.4 TMasterDataLink Methods

The methods of the TMasterDataLink class are listed here.

Protected Methods

	Name	Description
	ActiveChanged (see page 7343)	Regenerates the Fields (see page 7346) property and triggers an OnMasterChange (see page 7347) or OnMasterDisable (see page 7347) event.
	CheckBrowseMode (see page 7344)	Informs the dataset that owns the TMasterDataLink (see page 7339) object when the current record in the source dataset is about to change.
	GetDetailDataSet (see page 7344)	Returns the value of the DetailDataSet (see page 7114) property.
	LayoutChanged (see page 7344)	Informs the dataset that owns the TMasterDataLink (see page 7339) object after the data source has changed the number of records buffered.
	RecordChanged (see page 7345)	Generates an OnMasterChange (see page 7347) event when the contents of one of the fields in the current record changes.

39.1.44.4.1 TMasterDataLink.ActiveChanged Method

Regenerates the Fields (see page 7346) property and triggers an OnMasterChange (see page 7347) or OnMasterDisable (see page 7347) event.

Pascal

```
procedure ActiveChanged; override;
```

C++

```
virtual __fastcall ActiveChanged();
```

Description

Applications can not call the protected ActiveChanged procedure. Changes in the Active (see page 6888) property or the FieldNames (see page 7345) property trigger this procedure. When the source dataset becomes inactive, ActiveChanged empties the Fields (see page 7346) property and generates an OnMasterDisable (see page 7347) event. When the dataset becomes active, ActiveChanged regenerates Fields (see page 7346) from the source dataset and generates an OnMasterChange (see page 7347) event.

See Also

Active (see page 6888)

Fields (see page 7346)

OnMasterChange (see page 7347)

OnMasterDisable (see page 7347)

FieldNames (see page 7345)

39.1.44.4.2 TMasterDataLink.CheckBrowseMode Method

Informs the dataset that owns the TMasterDataLink (see page 7339) object when the current record in the source dataset is about to change.

Pascal

```
procedure CheckBrowseMode; override;
```

C++

```
virtual __fastcall CheckBrowseMode();
```

Description

Applications can not call the protected CheckBrowseMode procedure. CheckBrowseMode is called immediately before the current record in the source dataset changes. It calls the CheckBrowseMode method of the dataset that owns the TMasterDataLink (see page 7339) object, so that it can post any pending edits before the record changes.

See Also

OnMasterChange (see page 7347)

CheckBrowseMode (see page 6918)

39.1.44.4.3 TMasterDataLink.GetDetailDataSet Method

Returns the value of the DetailDataSet (see page 7114) property.

Pascal

```
function GetDetailDataSet: TDataSet; override;
```

C++

```
virtual __fastcall TDataSet GetDetailDataSet();
```

Description

GetDetailDataSet is the protected read implementation of the DetailDataSet (see page 7114) property.

See Also

DetailDataSet

39.1.44.4.4 TMasterDataLink.LayoutChanged Method

Informs the dataset that owns the TMasterDataLink (see page 7339) object after the data source has changed the number of records buffered.

Pascal

```
procedure LayoutChanged; override;
```

C++

```
virtual __fastcall LayoutChanged();
```

Description

Applications can not call the protected LayoutChanged method. LayoutChanged is called automatically when the source dataset changes to reflect a change in the layout of a control linked to that source dataset. LayoutChanged regenerates the Fields (see page 7346) property and triggers an OnMasterChange (see page 7347) event.

See Also

Fields (see page 7346)

OnMasterChange (see page 7347)

39.1.44.4.5 TMasterDataLink.RecordChanged Method

Generates an OnMasterChange (see page 7347) event when the contents of one of the fields in the current record changes.

Pascal

```
procedure RecordChanged(Field: TField); override;
```

C++

```
virtual __fastcall RecordChanged(TField Field);
```

Description

Applications can not call the protected RecordChanged method. It is called automatically when the contents of the current record change. The Field parameter indicates which field in the current record has changed. If Field is nil (Delphi) or NULL (C++), the entire record has changed.

If the Field parameter is nil (Delphi) or NULL (C++), or if the Field parameter is one of the fields listed in the Fields (see page 7346) property, RecordChanged triggers an OnMasterChange (see page 7347) event.

See Also

Fields (see page 7346)

OnMasterChange (see page 7347)

39.1.44.5 TMasterDataLink Properties

The properties of the TMasterDataLink class are listed here.

Public Properties

	Name	Description
	FieldNames (see page 7345)	Names the fields from the master dataset that are used to define the link to the detail dataset.
R	Fields (see page 7346)	Lists all the field components from the master dataset that are used to establish a link to the detail dataset.

39.1.44.5.1 TMasterDataLink.FieldNames Property

Names the fields from the master dataset that are used to define the link to the detail dataset.

Pascal

```
property FieldNames: string;
```

C++

```
__property AnsiString FieldNames;
```

Description

Set FieldNames to the fields in the master dataset that supply values that must be matched by fields in the detail dataset. Each field name in the string must be separated from other field names with a semicolon.

Setting FieldNames causes TMasterDataLink (see page 7339) to regenerate the Fields (see page 7346) property from the field components of the master dataset. Once the Fields (see page 7346) property has been regenerated, TMasterDataLink (see page 7339) triggers an OnMasterChange (see page 7347) event.

See Also

DataSet (see page 6890)

Fields (see page 7346)

OnMasterChange (see page 7347)

39.1.44.5.2 TMasterDataLink.Fields Property

Lists all the field components from the master dataset that are used to establish a link to the detail dataset.

Pascal

```
property Fields: TList;
```

C++

```
__property TList Fields;
```

Description

Use Fields to access individual link field components from the master data set. Fields lists the field components in the master dataset named by the FieldNames (see page 7345) property. Datasets use this property to ascertain the current values of the link fields.

Fields is a read-only property. Fields is generated by locating the field components referenced by the FieldNames (see page 7345) property in the master dataset.

DataSet (see page 6890)

FieldNames (see page 7345)

TField (see page 7115)

39.1.44.6 TMasterDataLink Events

The events of the TMasterDataLink class are listed here.

Public Events

	Name	Description
	OnMasterChange (see page 7347)	Occurs after the Fields (see page 7346) property changes.
	OnMasterDisable (see page 7347)	Occurs when the source dataset becomes inactive.

39.1.44.6.1 TMasterDataLink.OnMasterChange Event

Occurs after the Fields (see page 7346) property changes.

Pascal

```
property OnMasterChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMasterChange;
```

Description

Write an OnMasterChange event handler to update the dataset that owns the TMasterSourceLink to reflect any changes that occurred in the source (master) dataset or the FieldNames (see page 7345) property. The Fields (see page 7346) property reflects the new state of the source (master) dataset and the FieldNames (see page 7345) property. If FieldNames (see page 7345) refers to any fields that disappeared from the source dataset, the Fields (see page 7346) property contains undefined field components for those fields.

Typically, the OnMasterChange event handler updates the detail dataset to reflect those details that correspond to the master field values obtained from the Fields (see page 7346) property.

See Also

FieldNames (see page 7345)

Fields (see page 7346)

OnMasterDisable (see page 7347)

39.1.44.6.2 TMasterDataLink.OnMasterDisable Event

Occurs when the source dataset becomes inactive.

Pascal

```
property OnMasterDisable: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMasterDisable;
```

Description

Write an OnMasterDisable event handler to respond when the source (master) dataset becomes inactive. When the source dataset is inactive, the field components in the Fields (see page 7346) property can not be used to obtain the data from records in the source dataset. Thus, only information cached by the detail dataset that owns the TMasterDataLink (see page 7339) can be used after OnMasterDisable until the next OnMasterChange (see page 7347) event occurs.

39.1.45 TMemoField Class

TMemoField represents a memo field in a dataset.

Class Hierarchy

Pascal

```
TMemoField = class(TBlobField);
```

C++

```
class TMemoField : public TBlobField;
```

File

DB

Description

TMemoField encapsulates the fundamental behavior common to fields that contain text data or arbitrary length. Memo fields are a form of binary large object (BLOB) field where the data consists of simple text.

If you use the Fields editor at design time to create a persistent field component for the memo field, you can access it by name at runtime. When using dynamic field components, you can access the TMemoField instance using the dataset's Fields property or FieldByName method.

TDataSet (see page 6894)

TField (see page 7115)

39.1.45.1 TMemoField Members

The following tables list the members exposed by TMemoField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.

	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 6810)	Copies the properties of an object to a destination object.
	Bind (see page 7126)	This is Bind, a member of class TField.
	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	FreeBuffers (see page 6811)	This is FreeBuffers, a member of class TBlobField.
	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
	GetAsString (see page 6811)	This is GetAsString, a member of class TBlobField.
	GetAsString (see page 7130)	This is GetAsString, a member of class TField.
	GetAsVariant (see page 6811)	This is GetAsVariant, a member of class TBlobField.
	GetAsVariant (see page 7130)	This is GetAsVariant, a member of class TField.
	GetAsWideString (see page 7355)	This is GetAsWideString, a member of class TMemoField.
	GetBlobSize (see page 6812)	This is GetBlobSize, a member of class TBlobField.
	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClassDesc (see page 6812)	This is GetClassDesc, a member of class TBlobField.
	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
	GetDataSize (see page 7133)	This is GetDataSize, a member of class TField.
	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIsNull (see page 6812)	This is GetIsNull, a member of class TBlobField.
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 6812)	This is GetText, a member of class TBlobField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 6817)	This is SetAsString, a member of class TBlobField.
	SetAsString (see page 7140)	This is SetAsString, a member of class TField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7356)	This is SetAsWideString, a member of class TMemoField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 6818)	This is SetText, a member of class TBlobField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 6818)	This is SetVarValue, a member of class TBlobField.
	SetVarValue (see page 7144)	This is SetVarValue, a member of class TField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.

	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	Assign (see page 6809)	Copies a value to the BLOB field.
V	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 6810)	Clears the current value in the BLOB field.
V	Clear (see page 7126)	Sets the value of the field to NULL.
V	Create (see page 7354)	Creates an instance of TMemoField (see page 7348).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 6813)	Indicates that this is a BLOB field.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	LoadFromFile (see page 6814)	Loads BLOB data from a file into the field.
	LoadFromStream (see page 6815)	Loads BLOB data from a stream into the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 6816)	Saves the contents of the BLOB field to a file.
	SaveToStream (see page 6816)	Saves the contents of the BLOB field to a stream.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 6817)	Specifies the type of the BLOB field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
R	BlobSize (see page 6819)	Indicates the number of bytes of data contained in the blob field on the current record.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.

R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	Modified (see page 6820)	Indicates whether a the value for the BLOB field was changed since it was last read from the underlying database.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 6822)	Represents the data in the BLOB field.
	Value (see page 7180)	Represents the data in a field component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.

	BlobType (see page 6819)	Identifies the type of the BLOB field associated with a BLOB field object.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
	GraphicHeader (see page 6820)	Indicates whether the field's value includes a Paradox graphic BLOB header.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Size (see page 6820)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Transliterate (see page 7356)	Determines whether any text in the BLOB field should be converted to and from the character set identified by the dataset.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.45.2 TMemoField.Create Constructor

Creates an instance of TMemoField (see page 7348).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TMemoField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TMemoField (see page 7348). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) property to ftMemo, and initializes the Transliterate (see page 7356) property to true. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of

TMemoField (see page 7348). After instantiating a TMemoField (see page 7348), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TMemoField (see page 7348) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TMemoField (see page 7348) with a dataset component by setting its DataSet (see page 7157) property.

The example below creates a TMemoField (see page 7348) object for a field named Notes accessed through a TQuery named Query1.

```
var
  T: TMemoField;
begin
  Query1.Close;
  T := TMemoField.Create(Query1);
  T.FieldName := 'Notes';
  T.Name := Query1.Name + T.FieldName;
  T.Index := Query1.FieldCount;
  T.DataSet := Query1;
  Query1.FieldDefs.UpDate;
  Query1.Open;
end;
TMemoField *T;
Query1->Close();
T = new TMemoField(Query1);
T->FieldName = "Notes";
T->Name = Query1->Name + T->FieldName;
T->Index = Query1->FieldCount;
T->DataSet = Query1;
Query1->FieldDefs->UpDate();
Query1->Open();
```

39.1.45.3 TMemoField Methods

The methods of the TMemoField class are listed here.

Protected Methods

	Name	Description
	GetAsWideString (see page 7355)	This is GetAsWideString, a member of class TMemoField.
	SetAsWideString (see page 7356)	This is SetAsWideString, a member of class TMemoField.

39.1.45.3.1 TMemoField.GetAsWideString Method

Pascal

```
function GetAsWideString: WideString; override;
```

C++

```
virtual __fastcall BSTR GetAsWideString();
```

Description

This is GetAsWideString, a member of class TMemoField.

39.1.45.3.2 TMemoField.SetAsWideString Method

Pascal

```
procedure SetAsWideString(const Value: WideString); override;
```

C++

```
virtual __fastcall SetAsWideString(const BSTR Value);
```

Description

This is SetAsWideString, a member of class TMemoField.

39.1.45.4 TMemoField Properties

The properties of the TMemoField class are listed here.

Published Properties

	Name	Description
	Transliterate (see page 7356)	Determines whether any text in the BLOB field should be converted to and from the character set identified by the dataset.

39.1.45.4.1 TMemoField.Transliterate Property

Determines whether any text in the BLOB field should be converted to and from the character set identified by the dataset.

Pascal

```
property Transliterate: Boolean;
```

C++

```
__property Boolean Transliterate;
```

Description

Use Transliterate when the physical database table identified by the dataset does not use an ANSI language driver and the data may contain extended ASCII characters uses a different character set than UTF-8 (on Linux) or ANSI (on Windows) and the BLOB field contains text.

When Transliterate is true, BLOB fields call the dataset's Translate method to translate ANSI UTF-8 characters to the character set used by the dataset when the value is changed using the Value property, the AsString property, or the AsVariant property. When these properties are read to obtain the value of the BLOB field, the Translate method translates the characters in the database table to the UTF-8 (Linux) or ANSI (Windows) character set.

Note: BLOB streams (returned by the dataset's CreateBlobStream method) also check the Transliterate property when reading from or writing to a BLOB field.

39.1.46 TNamedItem Class

TNamedItem is the base class for definitions used by datasets.

Class Hierarchy

Pascal

```
TNamedItem = class(TCollectionItem);
```

C++

```
class TNamedItem : public TCollectionItem;
```

File

DB

Description

Use TNamedItem as a base class when defining a class for definitions that are maintained in a collection by a dataset. Sets of TNamedItem objects are maintained by a descendant of TDefCollection (see page 7104) that is specific to the type of object defined.

Definition objects are used by datasets to specify the properties of database entities such as fields or indexes.

See Also

TFieldDef (see page 7184)

TIndexDef (see page 7283)

TDefCollection (see page 7104)

39.1.46.1 TNamedItem Members

The following tables list the members exposed by TNamedItem.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 7359)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.

	SetDisplayName (see page 7359)	This is SetDisplayName, a member of class TNamedItem.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2757)	Creates and initializes a TCollectionItem (see page 2755) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Properties

	Name	Description
	Name (see page 7359)	Specifies the name of the database entity defined by the TNamedItem (see page 7357) object.

39.1.46.2 TNamedItem Methods

The methods of the TNamedItem class are listed here.

Protected Methods

	Name	Description
	GetDisplayName (see page 7359)	Returns the name of the collection item as it appears in the collection editor.
	SetDisplayName (see page 7359)	This is SetDisplayName, a member of class TNamedItem.

39.1.46.2.1 TNamedItem.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName (see page 2761)

GetNamePath (see page 2759)

39.1.46.2.2 TNamedItem.SetDisplayName Method

Pascal

```
procedure SetDisplayName(const Value: WideString); virtual; overload;
```

C++

```
virtual __fastcall SetDisplayName(const BSTR Value);
```

Description

This is SetDisplayName, a member of class TNamedItem.

39.1.46.3 TNamedItem Properties

The properties of the TNamedItem class are listed here.

Published Properties

	Name	Description
	Name (see page 7359)	Specifies the name of the database entity defined by the TNamedItem (see page 7357) object.

39.1.46.3.1 TNamedItem.Name Property

Specifies the name of the database entity defined by the TNamedItem (see page 7357) object.

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

Use Name to specify the name that the underlying database table uses to refer to the defined object. For example, if the TNamedItem (see page 7357) object is a field definition, the value of Name is the name of the corresponding field in the underlying database table.

Note: For dBASE maintained indexes, Name refers to the tag name of the index. For Paradox tables, the Name of the primary key is an empty string.

C++ Examples:

```
/*
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
*/
void __fastcall TForm1::Button3Click(TObject *Sender)
{
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2->Active = False;
  // Get the current available indices
  CDS2->IndexDefs->Update();
  // Find a field named "Field2"
  for (int I = 0; I < CDS2->IndexDefs->Count; I++)
    if (CDS2->IndexDefs->Items[I]->Fields == "Field2")
    {
      // set that index as the current index for the dataset}
      CDS2->IndexName = CDS2->IndexDefs->Items[I]->Name;
    }
  CDS2->Active = True;
}
```

Delphi Examples:

```
{
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
}
procedure TForm1.Button3Click(Sender: TObject);
var
  I : Integer;
begin
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2.Active := False;
  { Get the current available indices }
  CDS2.IndexDefs.Update;
  { Find a field named 'Field2' }
  for I := 0 to CDS2.IndexDefs.Count - 1 do
    if CDS2.IndexDefs.Items[I].Fields = 'Field2' then
    begin
      { set that index as the current index for the dataset}
      CDS2.IndexName := CDS2.IndexDefs.Items[I].Name;
    end;
  CDS2.Active := True;
end;
```

Source (see page 7292)

IndexName (see page 10222)

39.1.47 TNumericField Class

TNumericField is the common ancestor of all the numeric fields in a dataset.

Class Hierarchy

Pascal

```
TNumericField = class(TField);
```

C++

```
class TNumericField : public TField;
```

File

DB

Description

TNumericField encapsulates the fundamental behavior common to all numeric field components. In addition to the properties, events, and methods common to all field components introduced by TField (see page 7115), TNumericField introduces new properties for formatting numeric data for display or editing purposes.

Do not instantiate objects of type TNumericField. Instead, use one of its descendant classes such as TIntegerField (see page 7301) and TFloatField (see page 7229).

See Also

TBCDField (see page 6776)

TDataSet (see page 6894)

TDataSet (see page 6894)

TDataSet (see page 6894)

TField (see page 7115)

TAutoIncField (see page 6768)

TSmallintField (see page 7461)

TIntegerField (see page 7301)

TWordField (see page 7560)

39.1.47.1 TNumericField Members

The following tables list the members exposed by TNumericField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
V	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
V	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
V	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
V	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
V	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
V	GetAsString (see page 7130)	This is GetAsString, a member of class TField.
V	GetAsVariant (see page 7130)	This is GetAsVariant, a member of class TField.
V	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
V	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
V	GetDataSize (see page 7133)	This is GetDataSize, a member of class TField.
V	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
V	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
V	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.

	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	RangeError (see page 7368)	This is RangeError, a member of class TNumericField.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 7140)	This is SetAsString, a member of class TField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayFormat (see page 7368)	This is SetDisplayFormat, a member of class TNumericField.
	SetEditFormat (see page 7368)	This is SetEditFormat, a member of class TNumericField.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 7144)	This is SetVarValue, a member of class TField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.

	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7126)	Sets the value of the field to NULL.
	Create (see page 7367)	Creates an instance of a TNumericField (see page 7361) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.

	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7180)	Represents the data in a field component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7369)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayFormat (see page 7369)	Determines how a numeric field's value is formatted for display in a data-aware control.

	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	EditFormat (see page 7371)	Determines how a numeric field's value is formatted when it is being edited in a data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.47.2 TNumericField.Create Constructor

Creates an instance of a TNumericField (see page 7361) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TNumericField(TComponent * AOwner);
```

Description

Do not call the create method for TNumericField (see page 7361) directly. TNumericField (see page 7361) is an abstract class and its constructor should only be called as an inherited method from the constructor of a derived class.

Create changes the Alignment (see page 7369) property to taRightJustify.

See Also

Alignment (see page 7146)

Create (see page 7121)

39.1.47.3 TNumericField Methods

The methods of the TNumericField class are listed here.

Protected Methods

	Name	Description
	RangeError (see page 7368)	This is RangeError, a member of class TNumericField.
	SetDisplayFormat (see page 7368)	This is SetDisplayFormat, a member of class TNumericField.
	SetEditFormat (see page 7368)	This is SetEditFormat, a member of class TNumericField.

39.1.47.3.1 TNumericField.RangeError Method

Pascal

```
procedure RangeError(Value: Extended; Min: Extended; Max: Extended);
```

C++

```
__fastcall RangeError(Extended Value, Extended Min, Extended Max);
```

Description

This is RangeError, a member of class TNumericField.

39.1.47.3.2 TNumericField.SetDisplayFormat Method

Pascal

```
procedure SetDisplayFormat(const Value: string);
```

C++

```
__fastcall SetDisplayFormat(const AnsiString Value);
```

Description

This is SetDisplayFormat, a member of class TNumericField.

39.1.47.3.3 TNumericField.SetEditFormat Method

Pascal

```
procedure SetEditFormat(const Value: string);
```

C++

```
__fastcall SetEditFormat(const AnsiString Value);
```

Description

This is SetEditFormat, a member of class TNumericField.

39.1.47.4 TNumericField Properties

The properties of the TNumericField class are listed here.

Published Properties

	Name	Description
	Alignment (see page 7369)	Determines how the field's data is displayed within a data-aware control.
	DisplayFormat (see page 7369)	Determines how a numeric field's value is formatted for display in a data-aware control.
	EditFormat (see page 7371)	Determines how a numeric field's value is formatted when it is being edited in a data-aware control.

39.1.47.4.1 TNumericField.Alignment Property

Determines how the field's data is displayed within a data-aware control.

Pascal

```
property Alignment: TAlignment;
```

C++

```
__property TAlignment Alignment;
```

Description

Use Alignment to specify the position of the field's data within data-aware controls. These are the possible values:

Value	Meaning
taLeftJustify	Align data to the left side of the control
taCenter	Center data horizontally in the control
taRightJustify	Align data to the right side of the control

See Also

DisplayLabel (see page 7160)

DisplayName (see page 7160)

DisplayText (see page 7162)

DisplayWidth (see page 7162)

TDBEdit (see page 8735)

39.1.47.4.2 TNumericField.DisplayFormat Property

Determines how a numeric field's value is formatted for display in a data-aware control.

Pascal

```
property DisplayFormat: string;
```

C++

```
__property AnsiString DisplayFormat;
```

Description

Use the DisplayFormat property to override automatic formatting of a field for display purposes.

Note: DisplayFormat affects only the display of the field's data. It does not affect the validity of strings assigned to a numeric field using the AsString (see page 7151) property.

The value of DisplayFormat is a string that encodes the formatting of numeric data using the specifiers in the following table:

Specifier	Represents
0	Digit placeholder. If the value being formatted has a digit in the position where the "0" appears in the format string, then that digit is copied to the output string. Otherwise, a "0" is stored in that position in the output string.
#	Digit placeholder. If the value being formatted has a digit in the position where the "#" appears in the format string, then that digit is copied to the output string. Otherwise, nothing is stored in that position in the output string.

.	Decimal point. The first "." character in the format string determines the location of the decimal separator in the formatted value; any additional "." characters are ignored. The actual character used as a the decimal separator in the output string is determined by the DecimalSeparator global variable. The default value of DecimalSeparator is specified in the Number Format of the Regional Settings section in the Windows Control Panel.
,	Thousand separator. If the format string contains one or more "," characters, the output will have thousand separators inserted between each group of three digits to the left of the decimal point. The placement and number of "," characters in the format string does not affect the output, except to indicate that thousand separators are wanted. The actual character used as a the thousand separator in the output is determined by the ThousandSeparator global variable. The default value of ThousandSeparator is specified in the Number Format of the Regional Settings section in the Windows Control Panel.
E+	Scientific notation. If any of the strings "E+", "E-", "e+", or "e-" are contained in the format string, the number is formatted using scientific notation. A group of up to four "0" characters can immediately follow the "E+", "E-", "e+", or "e-" to determine the minimum number of digits in the exponent. The "E+" and "e+" formats cause a plus sign to be output for positive exponents and a minus sign to be output for negative exponents. The "E-" and "e-" formats output a sign character only for negative exponents.
'xx'/"xx"	Characters enclosed in single or double quotes are output as-is, and do not affect formatting.
;	Separates sections for positive, negative, and zero numbers in the format string.

The locations of the leftmost "0" before the decimal point in the format string and the rightmost "0" after the decimal point in the format string determine the range of digits that are always present in the output string.

The number being formatted is always rounded to as many decimal places as there are digit placeholders ("0" or "#") to the right of the decimal point. If the format string contains no decimal point, the value being formatted is rounded to the nearest whole number.

If the number being formatted has more digits to the left of the decimal separator than there are digit placeholders to the left of the "." character in the format string, the extra digits are output before the first digit placeholder.

The following table shows the effect of various format strings:

DisplayFormat	Value (see page 7180)	Result	Comment

To allow different formats for positive, negative, and zero values, the format string can contain between one and three sections separated by semicolons.

One section: The format string applies to all values.

Two sections: The first section applies to positive values and zeros, and the second section applies to negative values.

Three sections: The first section applies to positive values, the second applies to negative values, and the third applies to zeros.

If the section for negative values or the section for zero values is empty, that is, if there is nothing between the semicolons that delimit the section, the section for positive values is used instead.

If the section for positive values is empty, or if the entire format string is empty, the value is formatted using general floating-point formatting with 15 significant digits. General floating-point formatting is also used if the value has more than 18 digits to the left of the decimal point and the format string does not specify scientific notation.

EditFormat (see page 7371)

OnGetText (see page 7182)

FormatFloat (see page 22904)

39.1.47.4.3 TNumericField.EditFormat Property

Determines how a numeric field's value is formatted when it is being edited in a data-aware control.

Pascal

```
property EditFormat: string;
```

C++

```
__property AnsiString EditFormat;
```

Description

Use the EditFormat property to override the formatting of a field when the field's value is being edited in a data-aware control.

When EditFormat is unassigned, but the DisplayFormat (see page 7369) property has a value, the DisplayFormat (see page 7369) string is used.

The value of EditFormat is a string that encodes the formatting of numeric data using the specifiers in the following table:

Specifier	Represents
0	Digit placeholder. If the value being formatted has a digit in the position where the "0" appears in the format string, then that digit is copied to the output string. Otherwise, a "0" is stored in that position in the output string.
#	Digit placeholder. If the value being formatted has a digit in the position where the "#" appears in the format string, then that digit is copied to the output string. Otherwise, nothing is stored in that position in the output string.
.	Decimal point. The first "." character in the format string determines the location of the decimal separator in the formatted value; any additional "." characters are ignored. The actual character used as a the decimal separator in the output string is determined by the DecimalSeparator global variable. The default value of DecimalSeparator is specified in the Number Format of the Regional Settings section in the Windows Control Panel.
,	Thousand separator. If the format string contains one or more "," characters, the output will have thousand separators inserted between each group of three digits to the left of the decimal point. The placement and number of "," characters in the format string does not affect the output, except to indicate that thousand separators are wanted. The actual character used as a the thousand separator in the output is determined by the ThousandSeparator global variable. The default value of ThousandSeparator is specified in the Number Format of the Regional Settings section in the Windows Control Panel.
E+	Scientific notation. If any of the strings "E+", "E-", "e+", or "e-" are contained in the format string, the number is formatted using scientific notation. A group of up to four "0" characters can immediately follow the "E+", "E-", "e+", or "e-" to determine the minimum number of digits in the exponent. The "E+" and "e+" formats cause a plus sign to be output for positive exponents and a minus sign to be output for negative exponents. The "E-" and "e-" formats output a sign character only for negative exponents.
'xx'/"xx"	Characters enclosed in single or double quotes are output as-is, and do not affect formatting.
;	Separates sections for positive, negative, and zero numbers in the format string.

The locations of the leftmost "0" before the decimal point in the format string and the rightmost "0" after the decimal point in the format string determine the range of digits that are always present in the output string.

The number being formatted is always rounded to as many decimal places as there are digit placeholders ("0" or "#") to the right of the decimal point. If the format string contains no decimal point, the value being formatted is rounded to the nearest whole number.

If the number being formatted has more digits to the left of the decimal separator than there are digit placeholders to the left of the "." character in the format string, the extra digits are output before the first digit placeholder.

To allow different formats for positive, negative, and zero values, the format string can contain between one and three sections separated by semicolons.

One section: The format string applies to all values.

Two sections: The first section applies to positive values and zeros, and the second section applies to negative values.

Three sections: The first section applies to positive values, the second applies to negative values, and the third applies to zeros.

If the section for negative values or the section for zero values is empty, that is if there is nothing between the semicolons that delimit the section, the section for positive values is used instead.

If the section for positive values is empty, or if the entire format string is empty, the value is formatted using general floating-point formatting with 15 significant digits. General floating-point formatting is also used if the value has more than 18 digits to the left of the decimal point and the format string does not specify scientific notation.

Note: EditFormat affects only the display of the field's data when it is being edited. It does not affect the validity of strings assigned to a numeric field using the AsString (see page 7151) property, nor does it affect the display of the field's data when it is not being edited.

39.1.48 TObjectField Class

TObjectField is the common ancestor of TADTField (see page 6736), TArrayField (see page 6760), TDataSetField (see page 7060), and TReferenceField (see page 7452) components in a dataset.

Class Hierarchy

Pascal

```
TObjectField = class(TField);
```

C++

```
class TObjectField : public TField;
```

File

DB

Description

TObjectField encapsulates the fundamental behavior common to fields that are a composite of simpler types. These include ADT fields and array fields, which are built up of subfields, and dataset fields and reference fields, which refer to another dataset. TObjectField introduces the Fields (see page 7384) property and the FieldValues (see page 7385) property for accessing the subfields that make up the composite (or that reside in the dataset that is the field's value).

Do not create instances of TObjectField. It is intended only as a base class.

See Also

TADTField (see page 6736)

TArrayField (see page 6760)

TDataSetField (see page 7060)

TReferenceField (see page 7452)

39.1.48.1 TObjectField Members

The following tables list the members exposed by TObjectField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7380)	This is CheckTypeSize, a member of class TObjectField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 7380)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7380)	This is FreeBuffers, a member of class TObjectField.
V	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
V	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
V	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
V	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
V	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
V	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
V	GetAsString (see page 7381)	This is GetAsString, a member of class TObjectField.
V	GetAsVariant (see page 7381)	This is GetAsVariant, a member of class TObjectField.
V	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
V	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
V	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
V	GetDataSize (see page 7133)	This is GetDataSize, a member of class TField.
V	GetDefaultWidth (see page 7381)	This is GetDefaultWidth, a member of class TObjectField.
	GetFieldCount (see page 7381)	This is GetFieldCount, a member of class TObjectField.
V	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.

	GetFields (see page 7382)	This is GetFields, a member of class TObjectField.
	GetFieldValue (see page 7382)	This is GetFieldValue, a member of class TObjectField.
	GetHasConstraints (see page 7382)	This is GetHasConstraints, a member of class TObjectField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 7140)	This is SetAsString, a member of class TField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 7382)	This is SetChildOrder, a member of class TObjectField.
	SetDataSet (see page 7383)	This is SetDataSet, a member of class TObjectField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldKind (see page 7383)	This is SetFieldKind, a member of class TObjectField.
	SetFieldValue (see page 7383)	This is SetFieldValue, a member of class TObjectField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7383)	This is SetParentField, a member of class TObjectField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetUnNamed (see page 7383)	This is SetUnNamed, a member of class TObjectField.
	SetVarValue (see page 7384)	This is SetVarValue, a member of class TObjectField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7126)	Sets the value of the field to NULL.
	Create (see page 7378)	Creates and initializes a TObjectField (see page 7372) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 7379)	Destroys an instance of TObjectField (see page 7372).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetChildren (see page 7381)	This is GetChildren, a member of class TObjectField.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.

R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldCount (see page 7384)	Indicates the number of child fields that comprise the object field.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	Fields (see page 7384)	Specifies the TFields (see page 7211) object that contains an array of child fields.
	FieldValues (see page 7385)	Provides access to the values for all child fields in the object field.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
R	UnNamed (see page 7386)	Indicates whether an object field in a nested table has a name associated with it.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7180)	Represents the data in a field component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ObjectType (see page 7385)	Specifies the classification of the field object in Oracle.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.48.2 TObjectField.Create Constructor

Creates and initializes a TObjectField (see page 7372) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TObjectField(TComponent * AOwner);
```

Description

Do not create TObjectField (see page 7372) instances. TObjectField (see page 7372) is an abstract base class that should not be directly instantiated. The constructor for descendant classes is usually called indirectly by using the Fields (see page 7384) editor at design time to create a persistent field component. Dataset objects also call field constructors automatically to create dynamic field components.

Create creates a TFields (see page 7211) object to manage the child fields of the object field.

See Also

Destroy (see page 7379)

39.1.48.3 TObjectField.Destroy Destructor

Destroys an instance of TObjectField (see page 7372).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TObjectField();
```

Description

Do not call Destroy directly in an application. The destructor is called automatically by the dataset that owns the object field component, and applications never need to call it explicitly.

If an application creates a descendant of TObjectField (see page 7372) without an owner, it should call Free instead of Destroy. Free checks that the field reference is not nil, and only then calls Destroy.

Destroy closes the dataset, deletes the instance of TObjectField (see page 7372) from the dataset, and calls the inherited destructor.

See Also

Free (see page 22300)

39.1.48.4 TObjectField Methods

The methods of the TObjectField class are listed here.

Protected Methods

	Name	Description
	CheckTypeSize (see page 7380)	This is CheckTypeSize, a member of class TObjectField.
	DefineProperties (see page 7380)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	FreeBuffers (see page 7380)	This is FreeBuffers, a member of class TObjectField.
	GetAsString (see page 7381)	This is GetAsString, a member of class TObjectField.
	GetAsVariant (see page 7381)	This is GetAsVariant, a member of class TObjectField.
	GetDefaultWidth (see page 7381)	This is GetDefaultWidth, a member of class TObjectField.
	GetFieldCount (see page 7381)	This is GetFieldCount, a member of class TObjectField.
	GetFields (see page 7382)	This is GetFields, a member of class TObjectField.
	GetFieldValue (see page 7382)	This is GetFieldValue, a member of class TObjectField.
	GetHasConstraints (see page 7382)	This is GetHasConstraints, a member of class TObjectField.
	SetChildOrder (see page 7382)	This is SetChildOrder, a member of class TObjectField.
	SetDataSet (see page 7383)	This is SetDataSet, a member of class TObjectField.
	SetFieldKind (see page 7383)	This is SetFieldKind, a member of class TObjectField.
	SetFieldValue (see page 7383)	This is SetFieldValue, a member of class TObjectField.
	SetParentField (see page 7383)	This is SetParentField, a member of class TObjectField.
	SetUnNamed (see page 7383)	This is SetUnNamed, a member of class TObjectField.
	SetVarValue (see page 7384)	This is SetVarValue, a member of class TObjectField.

Public Methods

	Name	Description
	GetChildren (see page 7381)	This is GetChildren, a member of class TObjectField.

39.1.48.4.1 TObjectField.CheckTypeSize Method

Pascal

```
class procedure CheckTypeSize(Value: Integer); override;
```

C++

```
virtual __fastcall CheckTypeSize(int Value);
```

Description

This is CheckTypeSize, a member of class TObjectField.

39.1.48.4.2 TObjectField.DefineProperties Method

Designates methods for storing an object's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TComponent overrides the DefineProperties method defined in TPersistent to define "fake" Top and Left properties. These are defined so that components that are not controls can be manipulated at design-time. However, the Top and Left properties are hidden, that is, they are not published, because only controls appear at run-time.

DefineProperties is virtual; descendant classes can override it. When overriding DefineProperties, be aware that the Ancestor property of Filer might be set, and that this property can determine whether or not it is appropriate to write properties.

DefineProperties is called automatically as part of the component streaming system; do not call it directly.

See Also

Ancestor (see page 2839)

DefineBinaryProperty (see page 2837)

DefineProperties (see page 2931)

DefineProperty (see page 2838)

39.1.48.4.3 TObjectField.FreeBuffers Method

Pascal

```
procedure FreeBuffers; override;
```

C++

```
virtual __fastcall FreeBuffers();
```

Description

This is FreeBuffers, a member of class TObjectField.

39.1.48.4.4 TObjectField.GetAsString Method

Pascal

```
function GetAsString: string; override;
```

C++

```
virtual __fastcall AnsiString GetAsString();
```

Description

This is GetAsString, a member of class TObjectField.

39.1.48.4.5 TObjectField.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TObjectField.

39.1.48.4.6 TObjectField.GetChildren Method

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

This is GetChildren, a member of class TObjectField.

39.1.48.4.7 TObjectField.GetDefaultWidth Method

Pascal

```
function GetDefaultWidth: Integer; override;
```

C++

```
virtual __fastcall int GetDefaultWidth();
```

Description

This is GetDefaultWidth, a member of class TObjectField.

39.1.48.4.8 TObjectField.GetFieldCount Method

Pascal

```
function GetFieldCount: Integer;
```

C++

```
__fastcall int GetFieldCount();
```

Description

This is GetFieldCount, a member of class TObjectField.

39.1.48.4.9 TObjectField.GetFields Method

Pascal

```
function GetFields: TFields; virtual;
```

C++

```
virtual __fastcall TFields GetFields();
```

Description

This is GetFields, a member of class TObjectField.

39.1.48.4.10 TObjectField.GetFieldValue Method

Pascal

```
function GetFieldValue(Index: Integer): Variant; virtual;
```

C++

```
virtual __fastcall Variant GetFieldValue(int Index);
```

Description

This is GetFieldValue, a member of class TObjectField.

39.1.48.4.11 TObjectField.GetHasConstraints Method

Pascal

```
function GetHasConstraints: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetHasConstraints();
```

Description

This is GetHasConstraints, a member of class TObjectField.

39.1.48.4.12 TObjectField.SetChildOrder Method

Pascal

```
procedure SetChildOrder(Component: TComponent; Order: Integer); override;
```

C++

```
virtual __fastcall SetChildOrder(TComponent * Component, int Order);
```

Description

This is SetChildOrder, a member of class TObjectField.

39.1.48.4.13 TObjectField.SetDataSet Method

Pascal

```
procedure SetDataSet(ADataSet: TDataSet); override;
```

C++

```
virtual __fastcall SetDataSet(TDataSet ADataSet);
```

Description

This is SetDataSet, a member of class TObjectField.

39.1.48.4.14 TObjectField.SetFieldKind Method

Pascal

```
procedure SetFieldKind(Value: TFieldKind); override;
```

C++

```
virtual __fastcall SetFieldKind(TFieldKind Value);
```

Description

This is SetFieldKind, a member of class TObjectField.

39.1.48.4.15 TObjectField.SetFieldValue Method

Pascal

```
procedure SetFieldValue(Index: Integer; const Value: Variant); virtual;
```

C++

```
virtual __fastcall SetFieldValue(int Index, const Variant Value);
```

Description

This is SetFieldValue, a member of class TObjectField.

39.1.48.4.16 TObjectField.SetParentField Method

Pascal

```
procedure SetParentField(AField: TObjectField); override;
```

C++

```
virtual __fastcall SetParentField(TObjectField AField);
```

Description

This is SetParentField, a member of class TObjectField.

39.1.48.4.17 TObjectField.SetUnNamed Method

Pascal

```
procedure SetUnNamed(Value: Boolean);
```

C++

```
__fastcall SetUnNamed(Boolean Value);
```

Description

This is SetUnNamed, a member of class TObjectField.

39.1.48.4.18 TObjectField.SetVarValue Method

Pascal

```
procedure SetVarValue(const Value: Variant); override;
```

C++

```
virtual __fastcall SetVarValue(const Variant Value);
```

Description

This is SetVarValue, a member of class TObjectField.

39.1.48.5 TObjectField Properties

The properties of the TObjectField class are listed here.

Public Properties

	Name	Description
R	FieldCount (see page 7384)	Indicates the number of child fields that comprise the object field.
R	Fields (see page 7384)	Specifies the TFields (see page 7211) object that contains an array of child fields.
	FieldValues (see page 7385)	Provides access to the values for all child fields in the object field.
R	UnNamed (see page 7386)	Indicates whether an object field in a nested table has a name associated with it.

Published Properties

	Name	Description
	ObjectType (see page 7385)	Specifies the classification of the field object in Oracle.

39.1.48.5.1 TObjectField.FieldCount Property

Indicates the number of child fields that comprise the object field.

Pascal

```
property FieldCount: Integer;
```

C++

```
__property int FieldCount;
```

Description

Examine FieldCount to determine the number of child fields associated with the object field. This is the number of fields managed by the Fields (see page 7384) property.

See Also

Fields (see page 7384)

FieldValues (see page 7385)

39.1.48.5.2 TObjectField.Fields Property

Specifies the TFields (see page 7211) object that contains an array of child fields.

Pascal

```
property Fields: TFields;
```

C++

```
__property TFields Fields;
```

Description

Child fields of the object field are maintained in a TFields (see page 7211) object specified by the Fields property. Use this property to access individual subfield components.

See Also

Working with ADT Fields

Working with Array Fields

39.1.48.5.3 TObjectField.FieldValues Property

Provides access to the values for all child fields in the object field.

Pascal

```
property FieldValues [Index: Integer]: Variant;
```

C++

```
__property Variant FieldValues[int Index];
```

Description

Use FieldValues to get or set the values of the object field's subfields. FieldValues accepts and returns a Variant, so it can handle and convert fields of any type. For example, the following statements are syntactically identical and write the value from an edit box into an ADT field with a child string field called STREET:

```
DataSet1.FieldByName('ADDRESS.STREET').Value := Edit1.Text;
TADTField(DataSet1.FieldByName('ADDRESS')).FieldValues[0] := Edit1.Text;
Table1->FieldByName("ADDRESS.STREET")->Value = Edit1->Text;
((TADTField*)Table1->FieldByName("ADDRESS"))->FieldValues[0] = Edit1->Text;
```

The next statements reads a string value from the first child field of the object field ADDRESS into an edit box:

```
Edit1.Text := DataSet1.FieldByName('ADDRESS').FieldValues[0];
Edit1->Text = ((TADTField*)DataSet1->FieldByName("ADDRESS"))->FieldValues[0];
```

Note: Because FieldValues always uses Variants (see page 23567), it may be slower than directly accessing a subfield and using its native format (i.e., using its AsXXX property), especially in applications that process large amounts of data.

Working with ADT Fields

39.1.48.5.4 TObjectField.ObjectType Property

Specifies the classification of the field object in Oracle.

Pascal

```
property ObjectType: WideString;
```

C++

```
__property BSTR ObjectType;
```

Description

In Oracle, objects are classified into object types.

39.1.48.5.5 TObjectField.UnNamed Property

Indicates whether an object field in a nested table has a name associated with it.

Pascal

```
property UnNamed: Boolean;
```

C++

```
__property Boolean UnNamed;
```

Description

UnNamed is set to true when the object field in a nested table has no name associated with it.

39.1.49 TParam Class

TParam represents a field parameter for a query or stored procedure.

Class Hierarchy

Pascal

```
TParam = class(TCollectionItem);
```

C++

```
class TParam : public TCollectionItem;
```

File

DB

Description

Use the properties of a TParam to set the value of a parameter that represents the value of a field. Datasets that represent queries and stored procedures create TParam objects to represent the parameters of their query or stored procedures. Client datasets use TParam objects to pass parameter values to a source dataset.

Note: ADO-based datasets do not use TParam objects to represent parameter values. They use the TParameter class instead.

TParam shares many properties with TField (see page 7115), as both describe the value of a field in a dataset. However, a TField (see page 7115) object has several properties to describe the field binding, and how the field is displayed, edited, or calculated that are not needed in a TParam object. Conversely, TParam includes properties that indicate how the field value is passed as a parameter.

Using Parameters in Queries

39.1.49.1 TParam Members

The following tables list the members exposed by TParam.

Protected Methods

	Name	Description
	AssignParam (see page 7393)	This is AssignParam, a member of class TParam.
V	AssignTo (see page 7394)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetAsBCD (see page 7395)	This is GetAsBCD, a member of class TParam.
	GetAsBoolean (see page 7395)	This is GetAsBoolean, a member of class TParam.
	GetAsCurrency (see page 7395)	This is GetAsCurrency, a member of class TParam.
	GetAsDateTime (see page 7395)	This is GetAsDateTime, a member of class TParam.
	GetAsFloat (see page 7395)	This is GetAsFloat, a member of class TParam.
	GetAsFMTBCD (see page 7396)	This is GetAsFMTBCD, a member of class TParam.
	GetAsInteger (see page 7396)	This is GetAsInteger, a member of class TParam.
	GetAsMemo (see page 7396)	This is GetAsMemo, a member of class TParam.
	GetAsSQLTimeStamp (see page 7396)	This is GetAsSQLTimeStamp, a member of class TParam.
	GetAsString (see page 7397)	This is GetAsString, a member of class TParam.
	GetAsVariant (see page 7397)	This is GetAsVariant, a member of class TParam.
	GetAsWideString (see page 7397)	This is GetAsWideString, a member of class TParam.
V	GetDisplayName (see page 7399)	Returns the name of the collection item as it appears in the collection editor.
	GetIsNull (see page 7400)	This is GetIsNull, a member of class TParam.
V	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	IsEqual (see page 7400)	This is IsEqual, a member of class TParam.
	SetAsBCD (see page 7401)	This is SetAsBCD, a member of class TParam.
	SetAsBlob (see page 7401)	This is SetAsBlob, a member of class TParam.
	SetAsBoolean (see page 7401)	This is SetAsBoolean, a member of class TParam.
	SetAsCurrency (see page 7401)	This is SetAsCurrency, a member of class TParam.
	SetAsDate (see page 7402)	This is SetAsDate, a member of class TParam.
	SetAsDateTime (see page 7402)	This is SetAsDateTime, a member of class TParam.
	SetAsFloat (see page 7402)	This is SetAsFloat, a member of class TParam.
	SetAsFMTBCD (see page 7402)	This is SetAsFMTBCD, a member of class TParam.
	SetAsInteger (see page 7403)	This is SetAsInteger, a member of class TParam.
	SetAsMemo (see page 7403)	This is SetAsMemo, a member of class TParam.
	SetAsSmallInt (see page 7403)	This is SetAsSmallInt, a member of class TParam.
	SetAsSQLTimeStamp (see page 7403)	This is SetAsSQLTimeStamp, a member of class TParam.
	SetAsString (see page 7403)	This is SetAsString, a member of class TParam.
	SetAsTime (see page 7404)	This is SetAsTime, a member of class TParam.
	SetAsVariant (see page 7404)	This is SetAsVariant, a member of class TParam.
	SetAsWideString (see page 7404)	This is SetAsWideString, a member of class TParam.

	SetAsWord (see page 7404)	This is SetAsWord, a member of class TParam.
V	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDataType (see page 7405)	This is SetDataType, a member of class TParam.
V	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
V	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.
	SetText (see page 7406)	This is SetText, a member of class TParam.

Protected Properties

	Name	Description
R	DataSet (see page 7427)	This is DataSet, a member of class TParam.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 7391)	Copies the Name (see page 7430) and Value (see page 7433) of another TParam (see page 7386) object.
	AssignField (see page 7392)	Assigns the DataType (see page 7427), Name (see page 7430), and Value (see page 7433) properties from a TField (see page 7115) object.
	AssignFieldValue (see page 7393)	Assigns the DataType (see page 7427) and Value (see page 7433) properties from a TField (see page 7115) object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7394)	Sets the Value (see page 7433) of the parameter to NULL.
V	Create (see page 7389)	This is the overview for the Create constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetData (see page 7397)	Fills the buffer with the Value (see page 7433) of the parameter in the native format of a database field of the appropriate type.
	GetDataSize (see page 7398)	Returns the number of bytes needed to hold the parameter's value in the format used by the corresponding type of database field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	LoadFromFile (see page 7400)	Loads the value of a BLOB parameter from the specified file.
	LoadFromStream (see page 7400)	Loads the value of a BLOB parameter from a stream.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetBlobData (see page 7404)	Copies a new value for the parameter in physical database format from Buffer.
	SetData (see page 7405)	Copies a new value for the parameter in physical database format from Buffer.

Public Properties

	Name	Description
	AsBCD (see page 7407)	Specifies the value of the parameter when it represents a binary-coded decimal (BCD) field with less than 4 decimal places or 20 significant digits.
	AsBlob (see page 7408)	Specifies the value of the parameter when it represents a binary large object (BLOB) field.
	AsBoolean (see page 7409)	Specifies the value of the parameter when it represents a boolean field.
	AsCurrency (see page 7410)	Specifies the value of the parameter when it represents a field of type Currency.
	AsDate (see page 7412)	Specifies the value of the parameter when it represents a date field.
	AsDateTime (see page 7413)	Specifies the value of the parameter when it represents a date-time field.
	AsFloat (see page 7415)	Specifies the value of the parameter when it represents a float field.
	AsFMTBCD (see page 7416)	Specifies the value of the parameter when it represents a binary-coded decimal (BCD) field with more than 4 decimal places or 20 significant digits
	AsInteger (see page 7417)	Specifies the value of the parameter when it represents an integer field.
	AsMemo (see page 7419)	Specifies the value of the parameter when it represents a memo field.
	AsSmallInt (see page 7419)	Specifies the value of the parameter when it represents a small integer field.
	AsSQLTimeStamp (see page 7421)	Specifies the value of the parameter when it represents an SQL timestamp field.
	AsString (see page 7421)	Specifies the value of the parameter when it represents a string field.
	AsTime (see page 7423)	Specifies the value of the parameter when it represents a time field.
	AsWideString (see page 7424)	This is AsWideString, a member of class TParam.
	AsWord (see page 7425)	Specifies the value of the parameter when it represents a word field.
	Bound (see page 7426)	Indicates whether a value (NULL or otherwise) has been assigned to the parameter.
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
R	IsNull (see page 7429)	Indicates whether the value assigned to the parameter is NULL (blank).
	NativeStr (see page 7431)	Indicates the value of the parameter as a string, using the character set of the database table.
	Text (see page 7433)	Represents the value of the parameter as a string.

Published Properties

	Name	Description
	DataType (see page 7427)	Indicates the type of field whose value the parameter represents.
	Name (see page 7430)	Specifies the name of the parameter.
	NumericScale (see page 7431)	Specifies the number of decimal places for the parameter.
	ParamType (see page 7431)	Indicates the type of the parameter the TParam (see page 7386) represents.
	Precision (see page 7432)	Specifies the number of digits allowed for a numeric parameter.
	Size (see page 7432)	Specifies the number of characters in a string-type parameter.
	Value (see page 7433)	Represents the value of the parameter as a Variant.

39.1.49.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TParam.Create (TCollection) (see page 7390)	Creates an instance of TParam (see page 7386) and inserts it in a parameter list.
	TParam.Create (TParams, TParamType) (see page 7390)	Creates an instance of TParam (see page 7386) and inserts it in a parameter list.

39.1.49.2.1 TParam.Create Constructor (TCollection)

Creates an instance of TParam (see page 7386) and inserts it in a parameter list.

Pascal

```
constructor Create(Collection: TCollection); override; overload;
constructor Create(AParams: TParams; AParamType: TParamType); overload; reintroduce;
```

C++

```
virtual __fastcall TParam(TCollection Collection);
__fastcall TParam(TParams AParams, TParamType AParamType);
```

Description

Call Create to instantiate a TParam (see page 7386) object. TParam (see page 7386) objects are usually created by the dataset that uses them to represent its field parameters.

AParams is the TParams (see page 7434) object to which the parameter belongs.

AParamType indicates how the parameter is to be used. It becomes the value of the ParamType (see page 7431) property.

Collection is the TParams (see page 7434) object to which the parameter belongs.

ParamType (see page 7431)

TParams (see page 7434)

39.1.49.3 TParam Methods

The methods of the TParam class are listed here.

Protected Methods

	Name	Description
	AssignParam (see page 7393)	This is AssignParam, a member of class TParam.
	AssignTo (see page 7394)	Copies the properties of an object to a destination object.
	GetAsBCD (see page 7395)	This is GetAsBCD, a member of class TParam.
	GetAsBoolean (see page 7395)	This is GetAsBoolean, a member of class TParam.
	GetAsCurrency (see page 7395)	This is GetAsCurrency, a member of class TParam.
	GetAsDateTime (see page 7395)	This is GetAsDateTime, a member of class TParam.
	GetAsFloat (see page 7395)	This is GetAsFloat, a member of class TParam.
	GetAsFMTBCD (see page 7396)	This is GetAsFMTBCD, a member of class TParam.
	GetAsInteger (see page 7396)	This is GetAsInteger, a member of class TParam.

	GetAsMemo (see page 7396)	This is GetAsMemo, a member of class TParam.
	GetAsSQLTimeStamp (see page 7396)	This is GetAsSQLTimeStamp, a member of class TParam.
	GetAsString (see page 7397)	This is GetAsString, a member of class TParam.
	GetAsVariant (see page 7397)	This is GetAsVariant, a member of class TParam.
	GetAsWideString (see page 7397)	This is GetAsWideString, a member of class TParam.
	GetDisplayName (see page 7399)	Returns the name of the collection item as it appears in the collection editor.
	GetIsNull (see page 7400)	This is GetIsNull, a member of class TParam.
	IsEqual (see page 7400)	This is IsEqual, a member of class TParam.
	SetAsBCD (see page 7401)	This is SetAsBCD, a member of class TParam.
	SetAsBlob (see page 7401)	This is SetAsBlob, a member of class TParam.
	SetAsBoolean (see page 7401)	This is SetAsBoolean, a member of class TParam.
	SetAsCurrency (see page 7401)	This is SetAsCurrency, a member of class TParam.
	SetAsDate (see page 7402)	This is SetAsDate, a member of class TParam.
	SetAsDateTime (see page 7402)	This is SetAsDateTime, a member of class TParam.
	SetAsFloat (see page 7402)	This is SetAsFloat, a member of class TParam.
	SetAsFMTBCD (see page 7402)	This is SetAsFMTBCD, a member of class TParam.
	SetAsInteger (see page 7403)	This is SetAsInteger, a member of class TParam.
	SetAsMemo (see page 7403)	This is SetAsMemo, a member of class TParam.
	SetAsSmallInt (see page 7403)	This is SetAsSmallInt, a member of class TParam.
	SetAsSQLTimeStamp (see page 7403)	This is SetAsSQLTimeStamp, a member of class TParam.
	SetAsString (see page 7403)	This is SetAsString, a member of class TParam.
	SetAsTime (see page 7404)	This is SetAsTime, a member of class TParam.
	SetAsVariant (see page 7404)	This is SetAsVariant, a member of class TParam.
	SetAsWideString (see page 7404)	This is SetAsWideString, a member of class TParam.
	SetAsWord (see page 7404)	This is SetAsWord, a member of class TParam.
	SetDataType (see page 7405)	This is SetDataType, a member of class TParam.
	SetText (see page 7406)	This is SetText, a member of class TParam.

Public Methods

	Name	Description
	Assign (see page 7391)	Copies the Name (see page 7430) and Value (see page 7433) of another TParam (see page 7386) object.
	AssignField (see page 7392)	Assigns the DataType (see page 7427), Name (see page 7430), and Value (see page 7433) properties from a TField (see page 7115) object.
	AssignFieldValue (see page 7393)	Assigns the DataType (see page 7427) and Value (see page 7433) properties from a TField (see page 7115) object.
	Clear (see page 7394)	Sets the Value (see page 7433) of the parameter to NULL.
	GetData (see page 7397)	Fills the buffer with the Value (see page 7433) of the parameter in the native format of a database field of the appropriate type.
	GetDataSize (see page 7398)	Returns the number of bytes needed to hold the parameter's value in the format used by the corresponding type of database field.
	LoadFromFile (see page 7400)	Loads the value of a BLOB parameter from the specified file.
	LoadFromStream (see page 7400)	Loads the value of a BLOB parameter from a stream.
	SetBlobData (see page 7404)	Copies a new value for the parameter in physical database format from Buffer.
	SetData (see page 7405)	Copies a new value for the parameter in physical database format from Buffer.

39.1.49.3.1 TParam.Assign Method

Copies the Name (see page 7430) and Value (see page 7433) of another TParam (see page 7386) object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Use Assign to copy from another parameter or from a field component. If the Source parameter is another parameter, Assign transfers the value of

The DataType (see page 7427) property

The Bound (see page 7426) property

The Value (see page 7433) property

The Name (see page 7430) property

The ParamType (see page 7431) property only if it is currently ftUnknown.

If the Source parameter is a field component, Assign transfers the value of

The DataType (see page 7427) property

The Value (see page 7433) property

The Name (see page 7430) property (from the FieldName of the field)

When assigning values from a field, Assign sets the Bound (see page 7426) property to true.

Note: Assign does not alter the use of a parameter, only the identifier and the value.

See Also

AssignField (see page 7392)

Bound (see page 7426)

DataType (see page 7427)

Name (see page 7430)

ParamType (see page 7431)

TField (see page 7115)

Value (see page 7433)

39.1.49.3.2 TParam.AssignField Method

Assigns the DataType (see page 7427), Name (see page 7430), and Value (see page 7433) properties from a TField (see page 7115) object.

Pascal

```
procedure AssignField(Field: TField);
```

C++

```
__fastcall AssignField(TField Field);
```

Description

Use AssignField to set a parameter to represent a particular TField (see page 7115) object. AssignField sets the Bound (see page 7426) property to true.

Unlike AssignFieldValue (see page 7393), AssignField names the parameter after the field object as well as taking its value.

See Also

Assign (see page 7391)

AssignFieldValue (see page 7393)

Bound (see page 7426)

DataType (see page 7427)

Name (see page 7430)

DataType (see page 7159)

FieldName (see page 7164)

Value (see page 7180)

Value (see page 7433)

39.1.49.3.3 TParam.AssignFieldValue Method

Assigns the DataType (see page 7427) and Value (see page 7433) properties from a TField (see page 7115) object.

Pascal

```
procedure AssignFieldValue(Field: TField; const Value: Variant);
```

C++

```
__fastcall AssignFieldValue(TField Field, const Variant Value);
```

Description

Use AssignFieldValue to set the Value (see page 7433) property to the value passed as the Value (see page 7433) parameter. AssignFieldValue assumes that the Value (see page 7433) represents a value from a field like the Field parameter, and assigns the DataType (see page 7427) property accordingly. AssignFieldValue sets the Bound (see page 7426) property to true.

Unlike AssignField (see page 7392), AssignFieldValue does not name the parameter after the field object.

See Also

AssignField (see page 7392)

Bound (see page 7426)

DataType (see page 7427)

DataType (see page 7159)

FieldName (see page 7164)

Value (see page 7180)

Value (see page 7433)

39.1.49.3.4 TParam.AssignParam Method

Pascal

```
procedure AssignParam(Param: TParam);
```

C++

```
__fastcall AssignParam(TParam Param);
```

Description

This is AssignParam, a member of class TParam.

39.1.49.3.5 TParam.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign (see page 2930)

EConvertError (see page 22724)

39.1.49.3.6 TParam.Clear Method

Sets the Value (see page 7433) of the parameter to NULL.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Use Clear to assign a NULL value to a parameter. Calling Clear neither sets nor clears the Bound (see page 7426) property. When assigning a NULL value to a parameter, set the Bound (see page 7426) property as well as calling Clear.

See Also

Bound (see page 7426)

IsNull (see page 7429)

Value (see page 7433)

39.1.49.3.7 TParam.GetAsBCD Method

Pascal

```
function GetAsBCD: Currency;
```

C++

```
__fastcall Currency GetAsBCD();
```

Description

This is GetAsBCD, a member of class TParam.

39.1.49.3.8 TParam.GetAsBoolean Method

Pascal

```
function GetAsBoolean: Boolean;
```

C++

```
__fastcall Boolean GetAsBoolean();
```

Description

This is GetAsBoolean, a member of class TParam.

39.1.49.3.9 TParam.GetAsCurrency Method

Pascal

```
function GetAsCurrency: Currency;
```

C++

```
__fastcall Currency GetAsCurrency();
```

Description

This is GetAsCurrency, a member of class TParam.

39.1.49.3.10 TParam.GetAsDateTime Method

Pascal

```
function GetAsDateTime: TDateTime;
```

C++

```
__fastcall TDateTime GetAsDateTime();
```

Description

This is GetAsDateTime, a member of class TParam.

39.1.49.3.11 TParam.GetAsFloat Method

Pascal

```
function GetAsFloat: Double;
```

C++

```
__fastcall Double GetAsFloat();
```

Description

This is GetAsFloat, a member of class TParam.

39.1.49.3.12 TParam.GetAsFMTBCD Method

Pascal

```
function GetAsFMTBCD: TBcd;
```

C++

```
__fastcall TBcd GetAsFMTBCD();
```

Description

This is GetAsFMTBCD, a member of class TParam.

39.1.49.3.13 TParam.GetAsInteger Method

Pascal

```
function GetAsInteger: Longint;
```

C++

```
__fastcall Longint GetAsInteger();
```

Description

This is GetAsInteger, a member of class TParam.

39.1.49.3.14 TParam.GetAsMemo Method

Pascal

```
function GetAsMemo: string;
```

C++

```
__fastcall AnsiString GetAsMemo();
```

Description

This is GetAsMemo, a member of class TParam.

39.1.49.3.15 TParam.GetAsSQLTimeStamp Method

Pascal

```
function GetAsSQLTimeStamp: TSQLTimeStamp;
```

C++

```
__fastcall TSQLTimeStamp GetAsSQLTimeStamp();
```

Description

This is GetAsSQLTimeStamp, a member of class TParam.

39.1.49.3.16 TParam.GetAsString Method

Pascal

```
function GetAsString: string;
```

C++

```
__fastcall AnsiString GetAsString();
```

Description

This is GetAsString, a member of class TParam.

39.1.49.3.17 TParam.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant;
```

C++

```
__fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TParam.

39.1.49.3.18 TParam.GetAsWideString Method

Pascal

```
function GetAsWideString: WideString;
```

C++

```
__fastcall BSTR GetAsWideString();
```

Description

This is GetAsWideString, a member of class TParam.

39.1.49.3.19 TParam.GetData Method

Fills the buffer with the Value (see page 7433) of the parameter in the native format of a database field of the appropriate type.

Pascal

```
procedure GetData(Buffer: Pointer);
```

C++

```
__fastcall GetData(void * Buffer);
```

Description

Use GetData to obtain the value of a parameter in the format ready to be written directly to the underlying database. That format is the format used by physical database fields corresponding to DataType (see page 7427). Buffer must have enough space to hold the information. Use the GetDataSize (see page 7398) method to determine the necessary size.

The native format for a database field may not be the same as the datatype used by the corresponding field object. Use the As... properties to get the value in the type used by the corresponding field object. Use GetData to get the value in the native database format.

For example, when DataType (see page 7427) is ftBCD, GetData retrieves the value in binary-coded decimal, even though the

TBCDField (see page 6776) object uses Currency to store and manipulate its values. AsBCD (see page 7407) gets the value in the Currency type.

See Also

DataType (see page 7427)

GetDataSize (see page 7398)

SetData (see page 7405)

GetData (see page 7131)

SetData (see page 7141)

Value (see page 7433)

39.1.49.3.20 TParam.GetDataSize Method

Returns the number of bytes needed to hold the parameter's value in the format used by the corresponding type of database field.

Pascal

```
function GetDataSize: Integer;
```

C++

```
__fastcall int GetDataSize();
```

Description

Call GetDataSize to determine the number of bytes used to represent the parameter's value. GetDataSize indicates the buffer size needed before calling the GetData (see page 7397) method. The value returned by GetDataSize depends on the Value (see page 7433) of the parameter. For some values of DataType (see page 7427), this is always the same:

DataType (see page 7427)	Value (see page 7433) of DataSize
ftBoolean	2
ftSmallint	2
ftWord	2
ftAutoInc	4
ftDate	4
ftInteger	4
ftTime	4
ftCurrency	8
ftDateTime	8
ftFloat	8
ftTimeStamp	16
ftBCD	34
ftString	length of the string + 1
ftFixedChar	length of the string + 1
ftVarBytes	If the value is a Variant array, the number of elements in the array, else 0
ftBytes	If the value is a Variant array, the number of elements in the array, else 0

ftBlob	number of bytes of blob data
ftFmtMemo	number of bytes of blob data
ftGraphic	number of bytes of blob data
ftMemo	length of memo string + 1
ftDBaseOle	number of bytes of blob data
ftParadoxOle	number of bytes of blob data
ftOraBlob	number of bytes of blob data
ftOraClob	number of bytes of blob data
ftTypedBinary	number of bytes of data
ftADT	0
ftArray	0
ftDataSet	0
ftReference	0
ftCursor	0
ftUnknown	raises an EDatabaseError (see page 6731) exception

Note: The size returned by GetDataSize is the size required for the physical database representation of the Value (see page 7433). The field object that corresponds to that physical database field may store its data in another format requiring a different number of bytes.

See Also

DataType (see page 7427)

GetData (see page 7397)

DataSize (see page 7157)

Value (see page 7433)

39.1.49.3.21 TParam.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName (see page 2761)

GetNamePath (see page 2759)

39.1.49.3.22 TParam.GetIsNull Method

Pascal

```
function GetIsNull: Boolean;
```

C++

```
__fastcall Boolean GetIsNull();
```

Description

This is GetIsNull, a member of class TParam.

39.1.49.3.23 TParam.IsEqual Method

Pascal

```
function IsEqual(Value: TParam): Boolean;
```

C++

```
__fastcall Boolean IsEqual(TParam Value);
```

Description

This is IsEqual, a member of class TParam.

39.1.49.3.24 TParam.LoadFromFile Method

Loads the value of a BLOB parameter from the specified file.

Pascal

```
procedure LoadFromFile(const FileName: string; BlobType: TBlobType);
```

C++

```
__fastcall LoadFromFile(const AnsiString FileName, TBlobType BlobType);
```

Description

Use LoadFromFile to set the value of a BLOB parameter from a value stored in the file specified by the FileName parameter. The DataType (see page 7427) property is set to the value passed as the BlobType parameter.

```
Query2.ParamByName('Notes').LoadFromFile('c:\Files\Note1234.txt', ftMemo);
```

See Also

DataType (see page 7427)

LoadFromStream (see page 7400)

39.1.49.3.25 TParam.LoadFromStream Method

Loads the value of a BLOB parameter from a stream.

Pascal

```
procedure LoadFromStream(Stream: TStream; BlobType: TBlobType);
```

C++

```
__fastcall LoadFromStream(TStream Stream, TBlobType BlobType);
```

Description

Use LoadFromStream to set the value of a BLOB parameter from a value read from the stream specified by the Stream parameter. For example, use LoadFromStream to set the value of a BLOB parameter directly from a BLOB stream. The DataType (see page 7427) property is set to the value passed as the BlobType parameter.

See Also

DataType (see page 7427)

LoadFromFile (see page 7400)

CreateBlobStream (see page 6922)

TStream (see page 2973)

39.1.49.3.26 TParam.SetAsBCD Method

Pascal

```
procedure SetAsBCD(const Value: Currency);
```

C++

```
__fastcall SetAsBCD(const Currency Value);
```

Description

This is SetAsBCD, a member of class TParam.

39.1.49.3.27 TParam.SetAsBlob Method

Pascal

```
procedure SetAsBlob(const Value: TBlobData);
```

C++

```
__fastcall SetAsBlob(const TBlobData Value);
```

Description

This is SetAsBlob, a member of class TParam.

39.1.49.3.28 TParam.SetAsBoolean Method

Pascal

```
procedure SetAsBoolean(Value: Boolean);
```

C++

```
__fastcall SetAsBoolean(Boolean Value);
```

Description

This is SetAsBoolean, a member of class TParam.

39.1.49.3.29 TParam.SetAsCurrency Method

Pascal

```
procedure SetAsCurrency(const Value: Currency);
```

C++

```
__fastcall SetAsCurrency(const Currency Value);
```

Description

This is SetAsCurrency, a member of class TParam.

39.1.49.3.30 TParam.SetAsDate Method

Pascal

```
procedure SetAsDate(const Value: TDateTime);
```

C++

```
__fastcall SetAsDate(const TDateTime Value);
```

Description

This is SetAsDate, a member of class TParam.

39.1.49.3.31 TParam.SetAsDateTime Method

Pascal

```
procedure SetAsDateTime(const Value: TDateTime);
```

C++

```
__fastcall SetAsDateTime(const TDateTime Value);
```

Description

This is SetAsDateTime, a member of class TParam.

39.1.49.3.32 TParam.SetAsFloat Method

Pascal

```
procedure SetAsFloat(const Value: Double);
```

C++

```
__fastcall SetAsFloat(const Double Value);
```

Description

This is SetAsFloat, a member of class TParam.

39.1.49.3.33 TParam.SetAsFMTBCD Method

Pascal

```
procedure SetAsFMTBCD(const Value: TBcd);
```

C++

```
__fastcall SetAsFMTBCD(const TBcd Value);
```

Description

This is SetAsFMTBCD, a member of class TParam.

39.1.49.3.34 TParam.SetAsInteger Method

Pascal

```
procedure SetAsInteger(Value: Longint);
```

C++

```
__fastcall SetAsInteger(Longint Value);
```

Description

This is SetAsInteger, a member of class TParam.

39.1.49.3.35 TParam.SetAsMemo Method

Pascal

```
procedure SetAsMemo(const Value: string);
```

C++

```
__fastcall SetAsMemo(const AnsiString Value);
```

Description

This is SetAsMemo, a member of class TParam.

39.1.49.3.36 TParam.SetAsSmallInt Method

Pascal

```
procedure SetAsSmallInt(Value: LongInt);
```

C++

```
__fastcall SetAsSmallInt(LongInt Value);
```

Description

This is SetAsSmallInt, a member of class TParam.

39.1.49.3.37 TParam.SetAsSQLTimeStamp Method

Pascal

```
procedure SetAsSQLTimeStamp(const Value: TSQLTimeStamp);
```

C++

```
__fastcall SetAsSQLTimeStamp(const TSQLTimeStamp Value);
```

Description

This is SetAsSQLTimeStamp, a member of class TParam.

39.1.49.3.38 TParam.SetAsString Method

Pascal

```
procedure SetAsString(const Value: string);
```

C++

```
__fastcall SetAsString(const AnsiString Value);
```

Description

This is SetAsString, a member of class TParam.

39.1.49.3.39 TParam.SetAsTime Method

Pascal

```
procedure SetAsTime(const Value: TDateTime);
```

C++

```
__fastcall SetAsTime(const TDateTime Value);
```

Description

This is SetAsTime, a member of class TParam.

39.1.49.3.40 TParam.SetAsVariant Method

Pascal

```
procedure SetAsVariant(const Value: Variant);
```

C++

```
__fastcall SetAsVariant(const Variant Value);
```

Description

This is SetAsVariant, a member of class TParam.

39.1.49.3.41 TParam.SetAsWideString Method

Pascal

```
procedure SetAsWideString(const Value: WideString);
```

C++

```
__fastcall SetAsWideString(const BSTR Value);
```

Description

This is SetAsWideString, a member of class TParam.

39.1.49.3.42 TParam.SetAsWord Method

Pascal

```
procedure SetAsWord(Value: LongInt);
```

C++

```
__fastcall SetAsWord(LongInt Value);
```

Description

This is SetAsWord, a member of class TParam.

39.1.49.3.43 TParam.SetBlobData Method

Copies a new value for the parameter in physical database format from Buffer.

Pascal

```
procedure SetBlobData(Buffer: Pointer; Size: Integer);
```

C++

```
__fastcall SetBlobData(void * Buffer, int Size);
```

Description

Use SetBlobData to set the value of a parameter from a buffer that contains data from a Binary Large Object (BLOB) field. SetBlobData copies the number of bytes specified by the Size (see page 7432) parameter from the buffer specified by the Buffer parameter, and sets the DataType (see page 7427) property to ftBlob.

See Also

AsBlob (see page 7408)

DataType (see page 7427)

SetData (see page 7405)

39.1.49.3.44 TParam.SetData Method

Copies a new value for the parameter in physical database format from Buffer.

Pascal

```
procedure SetData(Buffer: Pointer);
```

C++

```
__fastcall SetData(void * Buffer);
```

Description

Use SetData to set the value of a parameter from a buffer that contains data in the physical database format. The GetData (see page 7397) method of a TField (see page 7115) object fetches data in the physical database format. Borland (see page 1761) Database Engine API calls can also provide data in physical database format.

Note: When the DataType (see page 7427) property is ftUnknown, ftBytes, ftVarBytes, ftAutoInc, ftBlob, ftGraphic, ftFmtMemo, ftParadoxOle, ftDBaseOle, or ftTypedBinary, SetData raises an EDatabaseError (see page 6731) exception. For BLOB fields, use the SetBlobData (see page 7404) method instead.

See Also

GetData (see page 7397)

SetBlobData (see page 7404)

GetData (see page 7131)

Value (see page 7433)

39.1.49.3.45 TParam.SetDataType Method

Pascal

```
procedure SetDataType(Value: TFieldType);
```

C++

```
__fastcall SetDataType(TFieldType Value);
```

Description

This is SetDataType, a member of class TParam.

39.1.49.3.46 TParam.SetText Method

Pascal

```
procedure SetText(const Value: string);
```

C++

```
__fastcall SetText(const AnsiString Value);
```

Description

This is SetText, a member of class TParam.

39.1.49.4 TParam Properties

The properties of the TParam class are listed here.

Protected Properties

	Name	Description
R	DataSet (see page 7427)	This is DataSet, a member of class TParam.

Public Properties

	Name	Description
	AsBCD (see page 7407)	Specifies the value of the parameter when it represents a binary-coded decimal (BCD) field with less than 4 decimal places or 20 significant digits.
	AsBlob (see page 7408)	Specifies the value of the parameter when it represents a binary large object (BLOB) field.
	AsBoolean (see page 7409)	Specifies the value of the parameter when it represents a boolean field.
	AsCurrency (see page 7410)	Specifies the value of the parameter when it represents a field of type Currency.
	AsDate (see page 7412)	Specifies the value of the parameter when it represents a date field.
	AsDateTime (see page 7413)	Specifies the value of the parameter when it represents a date-time field.
	AsFloat (see page 7415)	Specifies the value of the parameter when it represents a float field.
	AsFMTBCD (see page 7416)	Specifies the value of the parameter when it represents a binary-coded decimal (BCD) field with more than 4 decimal places or 20 significant digits
	AsInteger (see page 7417)	Specifies the value of the parameter when it represents an integer field.
	AsMemo (see page 7419)	Specifies the value of the parameter when it represents a memo field.
	AsSmallInt (see page 7419)	Specifies the value of the parameter when it represents a small integer field.
	AsSQLTimeStamp (see page 7421)	Specifies the value of the parameter when it represents an SQL timestamp field.
	AsString (see page 7421)	Specifies the value of the parameter when it represents a string field.
	AsTime (see page 7423)	Specifies the value of the parameter when it represents a time field.
	AsWideString (see page 7424)	This is AsWideString, a member of class TParam.
	AsWord (see page 7425)	Specifies the value of the parameter when it represents a word field.
	Bound (see page 7426)	Indicates whether a value (NULL or otherwise) has been assigned to the parameter.
R	IsNull (see page 7429)	Indicates whether the value assigned to the parameter is NULL (blank).
	NativeStr (see page 7431)	Indicates the value of the parameter as a string, using the character set of the database table.
	Text (see page 7433)	Represents the value of the parameter as a string.

Published Properties

	Name	Description
	DataType (see page 7427)	Indicates the type of field whose value the parameter represents.

	Name (see page 7430)	Specifies the name of the parameter.
	NumericScale (see page 7431)	Specifies the number of decimal places for the parameter.
	ParamType (see page 7431)	Indicates the type of the parameter the TParam (see page 7386) represents.
	Precision (see page 7432)	Specifies the number of digits allowed for a numeric parameter.
	Size (see page 7432)	Specifies the number of characters in a string-type parameter.
	Value (see page 7433)	Represents the value of the parameter as a Variant.

39.1.49.4.1 TParam.AsBCD Property

Specifies the value of the parameter when it represents a binary-coded decimal (BCD) field with less than 4 decimal places or 20 significant digits.

Pascal

```
property AsBCD: Currency;
```

C++

```
__property Currency AsBCD;
```

Description

Set AsBCD to assign the value for a BCD field to the parameter when the BCD field can be converted to the Currency type without a loss of precision. TBCDField (see page 6776) objects use the Currency type to represent the value of BCD fields, so AsBCD takes a Currency value as well. Setting AsBCD sets the DataType (see page 7427) property to ftBCD.

Read the AsBCD property to determine the value that was assigned to an output parameter, represented as a Currency type. The value of the parameter is converted to a Currency value if possible.

Tip: If the BCD field requires greater precision than allowed by the Currency type, use a TFMTBCDField (see page 7242) object and the AsFMTBCD (see page 7416) property instead.

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
  ListItem: string;
begin
  { Call FetchParams to ensure parameters reflect server metadata }
  ClientDataSet1.FetchParams;
  with ClientDataSet1.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
        ftWord:
          Items[I].AsWord := StrToIntDef(ListItem, 0);
        ftBoolean:
          begin
            if ListItem = 'True' then
```

```
              Items[I].AsBoolean := True
            else
              Items[I].AsBoolean := False;
          end;
        ftFloat:
          Items[I].AsFloat := StrToFloat(ListItem);
        ftCurrency:
          Items[I].AsCurrency := StrToFloat(ListItem);
        ftBCD:
          Items[I].AsBCD := StrToCurr(ListItem);
        ftDate:
          Items[I].AsDate := StrToDate(ListItem);
        ftTime:
          Items[I].AsTime := StrToTime(ListItem);
        ftDateTime:
          Items[I].AsDateTime := StrToDateTime(ListItem);
      end;
    end;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Here is a string');
  ListBox1.Items.Add('4');
  ListBox1.Items.Add('3456789');
  ListBox1.Items.Add('34');
  ListBox1.Items.Add('0');
  ListBox1.Items.Add('12.56');
  ListBox1.Items.Add('4.23');
  ListBox1.Items.Add('99.5');
  ListBox1.Items.Add('4/12/53');
  ListBox1.Items.Add('7:45:00');
  ListBox1.Items.Add('4/12/53 7:45:00');

end;
```

TBCDField (see page 6776)

AsFMTBCD (see page 7416)

TFMTBCDField (see page 7242)

39.1.49.4.2 TParam.AsBlob Property

Specifies the value of the parameter when it represents a binary large object (BLOB) field.

Pascal

```
property AsBlob: TBlobData;
```

C++

```
__property TBlobData AsBlob;
```

Description

Set AsBlob to assign the value for a Blob field to the parameter. AsBlob takes a TBlobData (see page 7627) (Delphi) or an AnsiString (C++) value, which can act as an untyped string of bytes. Setting AsBlob sets the DataType (see page 7427) property to ftBlob.

For example, if the variable Buffer is of type PChar and contains binary data read from a file, the contents of Buffer are directly

assigned to the BLOB parameter using the AsBlob property:

```
Query1.Params[0].AsBlob := Buffer;
```

Note: Applications seldom need to read AsBlob because Blob fields can't be used as output parameters.

See Also

DataType (see page 7427)

TBlobField (see page 6801)

39.1.49.4.3 TParam.AsBoolean Property

Specifies the value of the parameter when it represents a boolean field.

Pascal

```
property AsBoolean: Boolean;
```

C++

```
__property Boolean AsBoolean;
```

Description

Set AsBoolean to assign the value for a boolean field to the parameter. Setting AsBoolean sets the DataType (see page 7427) property to ftBoolean.

Read the AsBoolean property to determine the value that was assigned to an output parameter, represented as a Boolean (Delphi) or bool (C++). The value of the parameter is converted to a Boolean or bool value if possible.

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
  ListItem: string;
begin
  { Call FetchParams to ensure parameters reflect server metadata }
  ClientDataSet1.FetchParams;
  with ClientDataSet1.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
        ftWord:
          Items[I].AsWord := StrToIntDef(ListItem, 0);
        ftBoolean:
          begin
            if ListItem = 'True' then
              Items[I].AsBoolean := True
            else
              Items[I].AsBoolean := False;
          end;
        ftFloat:
```

```
          Items[I].AsFloat := StrToFloat(ListItem);
        ftCurrency:
          Items[I].AsCurrency := StrToFloat(ListItem);
        ftBCD:
          Items[I].AsBCD := StrToCurr(ListItem);
        ftDate:
          Items[I].AsDate := StrToDate(ListItem);
        ftTime:
          Items[I].AsTime := StrToTime(ListItem);
        ftDateTime:
          Items[I].AsDateTime := StrToDateTime(ListItem);
      end;
    end;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Here is a string');
  ListBox1.Items.Add('4');
  ListBox1.Items.Add('3456789');
  ListBox1.Items.Add('34');
  ListBox1.Items.Add('0');
  ListBox1.Items.Add('12.56');
  ListBox1.Items.Add('4.23');
  ListBox1.Items.Add('99.5');
  ListBox1.Items.Add('4/12/53');
  ListBox1.Items.Add('7:45:00');
  ListBox1.Items.Add('4/12/53 7:45:00');

end;
```

DataType (see page 7427)

TBooleanField (see page 6822)

39.1.49.4.4 TParam.AsCurrency Property

Specifies the value of the parameter when it represents a field of type Currency.

Pascal

```
property AsCurrency: Currency;
```

C++

```
__property Currency AsCurrency;
```

Description

Set AsCurrency to assign the value for a parameter of type Currency. Setting AsCurrency sets the DataType (see page 7427) property to ftCurrency.

Read the AsCurrency property to determine the value that was assigned to an output parameter, represented as a Currency type. The value of the parameter is converted if possible.

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
```

```
    ListItem: string;
  begin
    { Call FetchParams to ensure parameters reflect server metadata }
    ClientDataSet1.FetchParams;
    with ClientDataSet1.Params do
    begin
      for I := 0 to Count - 1 do
      begin
        ListItem := ListBox1.Items[I];
        case Items[I].DataType of
          ftString:
            Items[I].AsString := ListItem;
          ftSmallInt:
            Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
          ftInteger:
            Items[I].AsInteger := StrToIntDef(ListItem, 0);
          ftWord:
            Items[I].AsWord := StrToIntDef(ListItem, 0);
          ftBoolean:
            begin
              if ListItem = 'True' then
                Items[I].AsBoolean := True
              else
                Items[I].AsBoolean := False;
            end;
          ftFloat:
            Items[I].AsFloat := StrToFloat(ListItem);
          ftCurrency:
            Items[I].AsCurrency := StrToFloat(ListItem);
          ftBCD:
            Items[I].AsBCD := StrToCurr(ListItem);
          ftDate:
            Items[I].AsDate := StrToDate(ListItem);
          ftTime:
            Items[I].AsTime := StrToTime(ListItem);
          ftDateTime:
            Items[I].AsDateTime := StrToDateTime(ListItem);
        end;
      end;
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ListBox1.Items.Add('Here is a string');
    ListBox1.Items.Add('4');
    ListBox1.Items.Add('3456789');
    ListBox1.Items.Add('34');
    ListBox1.Items.Add('0');
    ListBox1.Items.Add('12.56');
    ListBox1.Items.Add('4.23');
    ListBox1.Items.Add('99.5');
    ListBox1.Items.Add('4/12/53');
    ListBox1.Items.Add('7:45:00');
    ListBox1.Items.Add('4/12/53 7:45:00');

  end;
```

39.1.49.4.5 TParam.AsDate Property

Specifies the value of the parameter when it represents a date field.

Pascal

```
property AsDate: TDateTime;
```

C++

```
__property TDateTime AsDate;
```

Description

Set AsDate to assign the value for a date field to the parameter. Setting AsDate sets the DataType (see page 7427) property to ftDate.

Read the AsDate property to determine the value that was assigned to an output parameter, represented as a TDateTime. The value of the parameter is converted to a DateTime value if possible. If the DataType (see page 7427) for the parameter is ftDate, only the date portion of the TDateTime value is valid. If a TDateTime value is assigned to a parameter via the AsDate property and the TDateTime value has a nonzero time, the time is ignored and only the date is assigned. If AsDate is used to get the value for a TDateTime container, the date from the parameter is stored but the TDateTime gets a zero time value.

Note: It is not possible to store a NULL value directly to a parameter using AsDate. Use the TParam (see page 7386) .

:: Clear (see page 7394) method instead.

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
  ListItem: string;
begin
  { Call FetchParams to ensure parameters reflect server metadata }
  ClientDataSet1.FetchParams;
  with ClientDataSet1.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
        ftWord:
          Items[I].AsWord := StrToIntDef(ListItem, 0);
        ftBoolean:
          begin
            if ListItem = 'True' then
              Items[I].AsBoolean := True
            else
              Items[I].AsBoolean := False;
          end;
        ftFloat:
          Items[I].AsFloat := StrToFloat(ListItem);
        ftCurrency:
          Items[I].AsCurrency := StrToFloat(ListItem);
```

```
          ftBCD:
            Items[I].AsBCD := StrToCurr(ListItem);
          ftDate:
            Items[I].AsDate := StrToDate(ListItem);
          ftTime:
            Items[I].AsTime := StrToTime(ListItem);
          ftDateTime:
            Items[I].AsDateTime := StrToDateTime(ListItem);
        end;
      end;
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ListBox1.Items.Add('Here is a string');
    ListBox1.Items.Add('4');
    ListBox1.Items.Add('3456789');
    ListBox1.Items.Add('34');
    ListBox1.Items.Add('0');
    ListBox1.Items.Add('12.56');
    ListBox1.Items.Add('4.23');
    ListBox1.Items.Add('99.5');
    ListBox1.Items.Add('4/12/53');
    ListBox1.Items.Add('7:45:00');
    ListBox1.Items.Add('4/12/53 7:45:00');

  end;
```

39.1.49.4.6 TParam.AsDateTime Property

Specifies the value of the parameter when it represents a date-time field.

Pascal

```
property AsDateTime: TDateTime;
```

C++

```
__property TDateTime AsDateTime;
```

Description

Set AsDateTime to assign the value for a date-time field to the parameter. Setting AsDateTime sets the DataType (see page 7427) property to ftDateTime.

Read the AsDateTime property to determine the value that was assigned to an output parameter, represented as a DateTime. The value of the parameter is converted to a DateTime value if possible. If a TDate value is assigned to a parameter via the AsDateTime property, the date portion of the TDate value is assigned to the parameter and the time portion is assigned a zero value. If AsDateTime is used to get the value for a TDate container, the date from the parameter is stored but the time value returned by AsDateTime is ignored.

Note: It is not possible to store a NULL value directly to a parameter using AsDateTime. Use the TParam (see page 7386) .

:: Clear (see page 7394) method instead.

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
  ListItem: string;
begin
  { Call FetchParams to ensure parameters reflect server metadata }
  ClientDataSet1.FetchParams;
  with ClientDataSet1.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
        ftWord:
          Items[I].AsWord := StrToIntDef(ListItem, 0);
        ftBoolean:
          begin
            if ListItem = 'True' then
              Items[I].AsBoolean := True
            else
              Items[I].AsBoolean := False;
          end;
        ftFloat:
          Items[I].AsFloat := StrToFloat(ListItem);
        ftCurrency:
          Items[I].AsCurrency := StrToFloat(ListItem);
        ftBCD:
          Items[I].AsBCD := StrToCurr(ListItem);
        ftDate:
          Items[I].AsDate := StrToDate(ListItem);
        ftTime:
          Items[I].AsTime := StrToTime(ListItem);
        ftDateTime:
          Items[I].AsDateTime := StrToDateTime(ListItem);
      end;
    end;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Here is a string');
  ListBox1.Items.Add('4');
  ListBox1.Items.Add('3456789');
  ListBox1.Items.Add('34');
  ListBox1.Items.Add('0');
  ListBox1.Items.Add('12.56');
  ListBox1.Items.Add('4.23');
  ListBox1.Items.Add('99.5');
  ListBox1.Items.Add('4/12/53');
  ListBox1.Items.Add('7:45:00');
  ListBox1.Items.Add('4/12/53 7:45:00');
```

```
end;
```

39.1.49.4.7 TParam.AsFloat Property

Specifies the value of the parameter when it represents a float field.

Pascal

```
property AsFloat: Double;
```

C++

```
__property Double AsFloat;
```

Description

Set AsFloat to assign the value for a float field to the parameter. Setting AsFloat sets the DataType (see page 7427) property to ftFloat.

Read the AsFloat property to determine the value that was assigned to an output parameter, represented as a double. The value of the parameter is converted to a double value if possible.

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
  ListItem: string;
begin
  { Call FetchParams to ensure parameters reflect server metadata }
  ClientDataSet1.FetchParams;
  with ClientDataSet1.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
        ftWord:
          Items[I].AsWord := StrToIntDef(ListItem, 0);
        ftBoolean:
          begin
            if ListItem = 'True' then
              Items[I].AsBoolean := True
            else
              Items[I].AsBoolean := False;
          end;
```

```
          ftFloat:
            Items[I].AsFloat := StrToFloat(ListItem);
          ftCurrency:
            Items[I].AsCurrency := StrToFloat(ListItem);
          ftBCD:
            Items[I].AsBCD := StrToCurr(ListItem);
          ftDate:
            Items[I].AsDate := StrToDate(ListItem);
          ftTime:
            Items[I].AsTime := StrToTime(ListItem);
          ftDateTime:
            Items[I].AsDateTime := StrToDateTime(ListItem);
        end;
      end;
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ListBox1.Items.Add('Here is a string');
    ListBox1.Items.Add('4');
    ListBox1.Items.Add('3456789');
    ListBox1.Items.Add('34');
    ListBox1.Items.Add('0');
    ListBox1.Items.Add('12.56');
    ListBox1.Items.Add('4.23');
    ListBox1.Items.Add('99.5');
    ListBox1.Items.Add('4/12/53');
    ListBox1.Items.Add('7:45:00');
    ListBox1.Items.Add('4/12/53 7:45:00');

  end;
```

See Also

DataType (see page 7427)

TFloatField (see page 7229)

39.1.49.4.8 TParam.AsFMTBCD Property

Specifies the value of the parameter when it represents a binary-coded decimal (BCD) field with more than 4 decimal places or 20 significant digits

Pascal

```
property AsFMTBCD: TBcd;
```

C++

```
__property TBcd AsFMTBCD;
```

Description

Set AsFMTBCD to assign the value for a BCD field to the parameter when the BCD field is represented by a TFMTBCDField (see page 7242) object. TFMTBCDField (see page 7242) objects and the AsFMTBCD property use a true BCD type to represent the value of BCD fields. This is more accurate but slower than the Currency type used by TBCDField (see page 6776) and the AsBCD (see page 7407) property. Setting AsFMTBCD sets the DataType (see page 7427) property to ftFMTBCD.

Read the AsFMTBCD property to determine the value that was assigned to an output parameter, represented as a TBcd type. The value of the parameter is converted to a TBcd value if possible.

Tip: If the BCD field uses less than 4 decimal places or 20 significant digits, you can achieve better performance by using a TBCDField (see page 6776) object and the AsBCD (see page 7407) property instead.

See Also

DataType (see page 7427)

TBCDField (see page 6776)

AsBCD (see page 7407)

TFMTBCDField (see page 7242)

39.1.49.4.9 TParam.AsInteger Property

Specifies the value of the parameter when it represents an integer field.

Pascal

```
property AsInteger: LongInt;
```

C++

```
__property LongInt AsInteger;
```

Description

Set AsInteger to assign the value for an integer field to the parameter. Setting AsInteger sets the DataType (see page 7427) property to ftInteger.

Read the AsInteger property to determine the value that was assigned to an output parameter, represented as a 32-bit integer. The value of the parameter is converted to a 32-bit integer if possible.

C++ Examples:

```
/*
This example requires a TClientDataSet and a button on a form.
Put swSystem in the uses clause for gsAppPath.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
for (int I = 0; I < CDS->Params->Count; I++)
{
  if (CDS->Params->Items[I]->IsNull &&
      CDS->Params->Items[I]->DataType == ftInteger)
    CDS->Params->Items[I]->AsInteger = -1;
}}
```

```
#include <swSystem.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  CDS->LoadFromFile(gsAppPath + "../CDS.XML");
  CDS->Params->CreateParam(ftInteger, "StateParam", ptInput);
  CDS->Params->CreateParam(ftInteger, "MyParam", ptInput);
}
```

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
  ListItem: string;
begin
  { Call FetchParams to ensure parameters reflect server metadata }
```

```
    ClientDataSet1.FetchParams;
    with ClientDataSet1.Params do
    begin
      for I := 0 to Count - 1 do
      begin
        ListItem := ListBox1.Items[I];
        case Items[I].DataType of
          ftString:
            Items[I].AsString := ListItem;

            Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
          ftInteger:
            Items[I].AsInteger := StrToIntDef(ListItem, 0);
          ftWord:
            Items[I].AsWord := StrToIntDef(ListItem, 0);
          ftBoolean:
            begin
              if ListItem = 'True' then
                Items[I].AsBoolean := True
              else
                Items[I].AsBoolean := False;
            end;
          ftFloat:
            Items[I].AsFloat := StrToFloat(ListItem);
          ftCurrency:
            Items[I].AsCurrency := StrToFloat(ListItem);
          ftBCD:
            Items[I].AsBCD := StrToCurr(ListItem);
          ftDate:
            Items[I].AsDate := StrToDate(ListItem);
          ftTime:
            Items[I].AsTime := StrToTime(ListItem);
          ftDateTime:
            Items[I].AsDateTime := StrToDateTime(ListItem);
        end;
      end;
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ListBox1.Items.Add('Here is a string');
    ListBox1.Items.Add('4');
    ListBox1.Items.Add('3456789');
    ListBox1.Items.Add('34');
    ListBox1.Items.Add('0');
    ListBox1.Items.Add('12.56');
    ListBox1.Items.Add('4.23');
    ListBox1.Items.Add('99.5');
    ListBox1.Items.Add('4/12/53');
    ListBox1.Items.Add('7:45:00');
    ListBox1.Items.Add('4/12/53 7:45:00');

  end;
  {
  This example requires a TClientDataSet and a button on a form.
  Put swSystem in the uses clause for gsAppPath.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  var
    I : Integer;
  begin
  { Assign -1 to any integer parameter which does not have a value. }

39.1.49.4.10 TParam.AsMemo Property

Specifies the value of the parameter when it represents a memo field.

Pascal

```
property AsMemo: string;
```

C++

```
__property AnsiString AsMemo;
```

Description

Set AsMemo to assign the value for a memo field to the parameter. Setting AsMemo sets the DataType (see page 7427) property to ftMemo.

A literal string or a null-terminated string may be directly assigned to the parameter for a memo column using the AsMemo property. For example:

```
SQLQuery1.Params[0].AsMemo := 'Some text in a long Pascal String';
SQLQuery2->ParamByName("Notes")->AsString = "Some string value";
```

It is seldom necessary to read AsMemo, because memo fields can not be used as output parameters.

Note: Some servers support string field types that are too long to fit in the record buffer. These fields are represented as memo fields, although they are not actually Blob fields. When working with such "pseudo-Blob" fields, use the AsString (see page 7421) property instead.

See Also

AsString (see page 7421)

DataType (see page 7427)

TMemoField (see page 7348)

39.1.49.4.11 TParam.AsSmallInt Property

Specifies the value of the parameter when it represents a small integer field.

Pascal

```
property AsSmallInt: LongInt;
```

C++

```
__property LongInt AsSmallInt;
```

Description

Set AsSmallInt to assign the value for a small integer field to the parameter. Setting AsSmallInt sets the DataType (see page 7427) property to ftSmallint.

Read the AsSmallInt property to determine the value that was assigned to an output parameter, represented as a 32-bit integer. The value of the parameter is converted to a LongInt value if possible.

Note: AsSmallInt works with a 32-bit integer. Small integer field objects store and manipulate their data as 32-bit integers even though the values in the underlying database are 16-bit integers.

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
  ListItem: string;
begin
  { Call FetchParams to ensure parameters reflect server metadata }
  ClientDataSet1.FetchParams;
  with ClientDataSet1.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
        ftWord:
          Items[I].AsWord := StrToIntDef(ListItem, 0);
        ftBoolean:
          begin
            if ListItem = 'True' then
              Items[I].AsBoolean := True
            else
              Items[I].AsBoolean := False;
          end;
        ftFloat:
          Items[I].AsFloat := StrToFloat(ListItem);
        ftCurrency:
          Items[I].AsCurrency := StrToFloat(ListItem);
        ftBCD:
          Items[I].AsBCD := StrToCurr(ListItem);
        ftDate:
          Items[I].AsDate := StrToDate(ListItem);
        ftTime:
          Items[I].AsTime := StrToTime(ListItem);
        ftDateTime:
          Items[I].AsDateTime := StrToDateTime(ListItem);
      end;
    end;
  end;
```

```
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Here is a string');
  ListBox1.Items.Add('4');
  ListBox1.Items.Add('3456789');
  ListBox1.Items.Add('34');
  ListBox1.Items.Add('0');
  ListBox1.Items.Add('12.56');
  ListBox1.Items.Add('4.23');
  ListBox1.Items.Add('99.5');
  ListBox1.Items.Add('4/12/53');
  ListBox1.Items.Add('7:45:00');
  ListBox1.Items.Add('4/12/53 7:45:00');

end;
```

DataType (see page 7427)

TSmallIntField

39.1.49.4.12 TParam.AsSQLTimeStamp Property

Specifies the value of the parameter when it represents an SQL timestamp field.

Pascal

```
property AsSQLTimeStamp: TSQLTimeStamp;
```

C++

```
__property TSQLTimeStamp AsSQLTimeStamp;
```

Description

Set AsSQLTimeStamp to assign the value for an SQL timestamp field to the parameter. Setting AsSQLTimeStamp sets the DataType (see page 7427) property to ftTimeStamp.

Read the AsSQLTimeStamp property to determine the value that was assigned to an output parameter, represented as an SQLTimeStamp record (Delphi) or structure (C++). The value of the parameter is converted to an SQLTimeStamp record or structure if possible.

See Also

DataType (see page 7427)

TSQLTimeStampField (see page 7469)

39.1.49.4.13 TParam.AsString Property

Specifies the value of the parameter when it represents a string field.

Pascal

```
property AsString: string;
```

C++

```
__property AnsiString AsString;
```

Description

Set AsString to assign the value for a string field to the parameter. Setting AsString sets the DataType (see page 7427)

property to ftString.

Read the AsString property to determine the value that was assigned to an output parameter, represented as a string. The value of the parameter is converted to a string.

Note: Some servers support string field types that are too long to fit in the record buffer. These fields are represented as memo fields, although they are not actually Blob fields. When working with such "pseudo-Blob" fields, use the AsString property rather than the AsMemo (see page 7419) property.

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
  ListItem: string;
begin
  { Call FetchParams to ensure parameters reflect server metadata }
  ClientDataSet1.FetchParams;
  with ClientDataSet1.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
        ftWord:
          Items[I].AsWord := StrToIntDef(ListItem, 0);
        ftBoolean:
          begin
            if ListItem = 'True' then
              Items[I].AsBoolean := True
            else
              Items[I].AsBoolean := False;
          end;
        ftFloat:
          Items[I].AsFloat := StrToFloat(ListItem);
        ftCurrency:
          Items[I].AsCurrency := StrToFloat(ListItem);
        ftBCD:
          Items[I].AsBCD := StrToCurr(ListItem);
        ftDate:
          Items[I].AsDate := StrToDate(ListItem);
        ftTime:
          Items[I].AsTime := StrToTime(ListItem);
        ftDateTime:
          Items[I].AsDateTime := StrToDateTime(ListItem);
      end;
    end;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Here is a string');
  ListBox1.Items.Add('4');
```

```
    ListBox1.Items.Add('3456789');
    ListBox1.Items.Add('34');
    ListBox1.Items.Add('0');
    ListBox1.Items.Add('12.56');
    ListBox1.Items.Add('4.23');
    ListBox1.Items.Add('99.5');
    ListBox1.Items.Add('4/12/53');
    ListBox1.Items.Add('7:45:00');
    ListBox1.Items.Add('4/12/53 7:45:00');

  end;
```

See Also

AsMemo (see page 7419)

DataType (see page 7427)

TStringField (see page 7483)

39.1.49.4.14 TParam.AsTime Property

Specifies the value of the parameter when it represents a time field.

Pascal

```
property AsTime: TDateTime;
```

C++

```
__property TDateTime AsTime;
```

Description

Set AsTime to assign the value for a time field to the parameter. Setting AsTime sets the DataType (see page 7427) property to ftTime.

Read the AsTime property to determine the value that was assigned to the parameter, represented as a DateTime. The value of the parameter is converted to a DateTime value if possible. If the DataType (see page 7427) for the parameter is ftTime, only the time portion of the TDateTime value is valid.

Note: It is not possible to store a NULL value directly to a parameter using AsTime. Use the TParam (see page 7386) .

:: Clear (see page 7394) method instead.

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
  ListItem: string;
begin
  { Call FetchParams to ensure parameters reflect server metadata }
  ClientDataSet1.FetchParams;
  with ClientDataSet1.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
```

```
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
        ftWord:
          Items[I].AsWord := StrToIntDef(ListItem, 0);
        ftBoolean:
          begin
            if ListItem = 'True' then
              Items[I].AsBoolean := True
            else
              Items[I].AsBoolean := False;
          end;
        ftFloat:
          Items[I].AsFloat := StrToFloat(ListItem);
        ftCurrency:
          Items[I].AsCurrency := StrToFloat(ListItem);
        ftBCD:
          Items[I].AsBCD := StrToCurr(ListItem);
        ftDate:
          Items[I].AsDate := StrToDate(ListItem);
        ftTime:
          Items[I].AsTime := StrToTime(ListItem);
        ftDateTime:
          Items[I].AsDateTime := StrToDateTime(ListItem);
      end;
    end;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Here is a string');
  ListBox1.Items.Add('4');
  ListBox1.Items.Add('3456789');
  ListBox1.Items.Add('34');
  ListBox1.Items.Add('0');
  ListBox1.Items.Add('12.56');
  ListBox1.Items.Add('4.23');
  ListBox1.Items.Add('99.5');
  ListBox1.Items.Add('4/12/53');
  ListBox1.Items.Add('7:45:00');
  ListBox1.Items.Add('4/12/53 7:45:00');

end;
```

39.1.49.4.15 TParam.AsWideString Property

Pascal

```
property AsWideString: WideString;
```

C++

```
__property BSTR AsWideString;
```

Description

This is AsWideString, a member of class TParam.

39.1.49.4.16 TParam.AsWord Property

Specifies the value of the parameter when it represents a word field.

Pascal

```
property AsWord: LongInt;
```

C++

```
__property LongInt AsWord;
```

Description

Set AsWord to assign the value for a word field to the parameter. Setting AsWord sets the DataType (see page 7427) property to ftWord.

Read the AsWord property to determine the value that was assigned to the parameter, represented as a 32-bit integer. The value of the parameter is converted to a LongInt value if possible.

Note: AsWord works with a 32-bit integer. Word field objects store and manipulate their data as 32-bit integers even though the values in the underlying database are unsigned 16-bit values.

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
  ListItem: string;
begin
  { Call FetchParams to ensure parameters reflect server metadata }
  ClientDataSet1.FetchParams;
  with ClientDataSet1.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
        ftWord:
          Items[I].AsWord := StrToIntDef(ListItem, 0);
        ftBoolean:
          begin
            if ListItem = 'True' then
              Items[I].AsBoolean := True
            else
              Items[I].AsBoolean := False;
          end;
        ftFloat:
          Items[I].AsFloat := StrToFloat(ListItem);
```

```
          ftCurrency:
            Items[I].AsCurrency := StrToFloat(ListItem);
          ftBCD:
            Items[I].AsBCD := StrToCurr(ListItem);
          ftDate:
            Items[I].AsDate := StrToDate(ListItem);
          ftTime:
            Items[I].AsTime := StrToTime(ListItem);
          ftDateTime:
            Items[I].AsDateTime := StrToDateTime(ListItem);
        end;
      end;
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ListBox1.Items.Add('Here is a string');
    ListBox1.Items.Add('4');
    ListBox1.Items.Add('3456789');
    ListBox1.Items.Add('34');
    ListBox1.Items.Add('0');
    ListBox1.Items.Add('12.56');
    ListBox1.Items.Add('4.23');
    ListBox1.Items.Add('99.5');
    ListBox1.Items.Add('4/12/53');
    ListBox1.Items.Add('7:45:00');
    ListBox1.Items.Add('4/12/53 7:45:00');

  end;
```

See Also

DataType (see page 7427)

TWordField (see page 7560)

39.1.49.4.17 TParam.Bound Property

Indicates whether a value (NULL or otherwise) has been assigned to the parameter.

Pascal

```
property Bound: Boolean;
```

C++

```
__property Boolean Bound;
```

Description

Read Bound to determine whether a value has been assigned to the parameter. Whenever a value is assigned to the TParam (see page 7386) object, Bound is automatically set to true. Set Bound to false to undo the setting of a value. The Clear (see page 7394) method replaces the value of the parameter with NULL, but does not set Bound to false. However, if the Clear (see page 7394) method is used to bind the parameter to a NULL value, Bound must be separately set to true.

Datasets that represent queries and stored procedures use the value of Bound to determine whether to assign a default value for the parameter. If Bound is false, datasets that represent queries attempt to assign a value from the dataset indicated by their DataSource property. Similarly, when Bound is false, datasets that represent stored procedures attempt to supply a value directly from the server.

Clear (see page 7394)

IsNull (see page 7429)

TQuery (see page 10059)

TStoredProc (see page 10139)

39.1.49.4.18 TParam.DataSet Property

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

This is DataSet, a member of class TParam.

39.1.49.4.19 TParam.DataType Property

Indicates the type of field whose value the parameter represents.

Pascal

```
property DataType: TFieldType;
```

C++

```
__property TFieldType DataType;
```

Description

DataType is set automatically when a value is assigned to the parameter. Do not set DataType for bound fields, as that may cause the assigned value to be misinterpreted.

Read DataType to discover the type of data that was assigned to the parameter. Each possible value of DataType corresponds to a type of database field.

C++ Examples:

```
/*
This example requires a TClientDataSet and a button on a form.
Put swSystem in the uses clause for gsAppPath.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
for (int I = 0; I < CDS->Params->Count; I++)
{
  if (CDS->Params->Items[I]->IsNull &&
      CDS->Params->Items[I]->DataType == ftInteger)
    CDS->Params->Items[I]->AsInteger = -1;
}}

#include <swSystem.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  CDS->LoadFromFile(gsAppPath + "../CDS.XML");
  CDS->Params->CreateParam(ftInteger, "StateParam", ptInput);
  CDS->Params->CreateParam(ftInteger, "MyParam", ptInput);
}
```

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
```

```
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
  ListItem: string;
begin
  { Call FetchParams to ensure parameters reflect server metadata }
  ClientDataSet1.FetchParams;
  with ClientDataSet1.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
        ftWord:
          Items[I].AsWord := StrToIntDef(ListItem, 0);
        ftBoolean:
          begin
            if ListItem = 'True' then
              Items[I].AsBoolean := True
            else
              Items[I].AsBoolean := False;
          end;
        ftFloat:
          Items[I].AsFloat := StrToFloat(ListItem);
        ftCurrency:
          Items[I].AsCurrency := StrToFloat(ListItem);
        ftBCD:
          Items[I].AsBCD := StrToCurr(ListItem);
        ftDate:
          Items[I].AsDate := StrToDate(ListItem);
        ftTime:
          Items[I].AsTime := StrToTime(ListItem);
        ftDateTime:
          Items[I].AsDateTime := StrToDateTime(ListItem);
      end;
    end;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Here is a string');
  ListBox1.Items.Add('4');
  ListBox1.Items.Add('3456789');
  ListBox1.Items.Add('34');
  ListBox1.Items.Add('0');
  ListBox1.Items.Add('12.56');
  ListBox1.Items.Add('4.23');
  ListBox1.Items.Add('99.5');
  ListBox1.Items.Add('4/12/53');
  ListBox1.Items.Add('7:45:00');
  ListBox1.Items.Add('4/12/53 7:45:00');

end;
{
This example requires a TClientDataSet and a button on a form.
Put swSystem in the uses clause for gsAppPath.
}
```

```
procedure TForm1.Button1Click(Sender: TObject);
var
  I : Integer;
begin
{ Assign -1 to any integer parameter which does not have a value. }
for I := 0 to CDS.Params.Count - 1 do
  if (CDS.Params.Items[I].IsNull) and
     (CDS.Params.Items[I].DataType = ftInteger) then
    { Items is the default property, so you can omit its name }
    CDS.Params[I].AsInteger := -1;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  CDS.LoadFromFile(gsAppPath + 'CDS.XML');
  CDS.Params.CreateParam(ftInteger, 'StateParam', ptInput);
  CDS.Params.CreateParam(ftInteger, 'MyParam', ptInput);
end;
```

Working with Stored Procedure Parameters

Supplying Parameters at Design Time

39.1.49.4.20 TParam.IsNull Property

Indicates whether the value assigned to the parameter is NULL (blank).

Pascal

```
property IsNull: Boolean;
```

C++

```
__property Boolean IsNull;
```

Description

Inspect IsNull to discover if the value of the parameter is NULL, indicating the value of a blank field. NULL values can arise in the following ways:

Assigning the value of another, NULL, parameter.

Assigning the value of a blank field.

Calling the Clear (see page 7394) method.

Note: NULL parameters are not the same as unbound parameters. Unbound parameters have not had a value assigned. NULL parameters have a NULL value. NULL parameters may be bound or unbound.

C++ Examples:

```
/*
This example requires a TClientDataSet and a button on a form.
Put swSystem in the uses clause for gsAppPath.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
for (int I = 0; I < CDS->Params->Count; I++)
{
  if (CDS->Params->Items[I]->IsNull &&
      CDS->Params->Items[I]->DataType == ftInteger)
    CDS->Params->Items[I]->AsInteger = -1;
}}
```

```
#include <swSystem.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  CDS->LoadFromFile(gsAppPath + "../CDS.XML");
  CDS->Params->CreateParam(ftInteger, "StateParam", ptInput);
  CDS->Params->CreateParam(ftInteger, "MyParam", ptInput);
}
```

Delphi Examples:

```
{
This example requires a TClientDataSet and a button on a form.
Put swSystem in the uses clause for gsAppPath.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I : Integer;
begin
{ Assign -1 to any integer parameter which does not have a value. }
for I := 0 to CDS.Params.Count - 1 do
  if (CDS.Params.Items[I].IsNull) and
     (CDS.Params.Items[I].DataType = ftInteger) then
    { Items is the default property, so you can omit its name }
    CDS.Params[I].AsInteger := -1;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  CDS.LoadFromFile(gsAppPath + 'CDS.XML');
  CDS.Params.CreateParam(ftInteger, 'StateParam', ptInput);
  CDS.Params.CreateParam(ftInteger, 'MyParam', ptInput);
end;
```

See Also

Assign (see page 7391)

Bound (see page 7426)

Clear (see page 7394)

39.1.49.4.21 TParam.Name Property

Specifies the name of the parameter.

Pascal

```
property Name: Widestring;
```

C++

```
__property BSTR Name;
```

Description

Use Name to identify a particular parameter within a TParams (see page 7434) object. Name is the name of the parameter, not the name of the field whose value the parameter represents.

See Also

ParamByName (see page 7447)

Working with Stored Procedure Parameters

39.1.49.4.22 TParam.NativeStr Property

Indicates the value of the parameter as a string, using the character set of the database table.

Pascal

```
property NativeStr: string;
```

C++

```
__property AnsiString NativeStr;
```

Description

Use NativeStr to obtain a string version of the parameter value that uses the character set (code page) associated with the underlying database table.

See Also

Value (see page 7433)

AnsiToNative (see page 10244)

Translate (see page 7001)

39.1.49.4.23 TParam.NumericScale Property

Specifies the number of decimal places for the parameter.

Pascal

```
property NumericScale: Integer;
```

C++

```
__property int NumericScale;
```

Description

Set NumericScale to indicate the maximum number of digits that can appear to the right of the decimal place in a parameter's value (the scale).

Note: NumericScale only applies to parameters used by dbExpress datasets.

Note: The Precision (see page 7432) property controls the total number of digits allowed.

See Also

Precision (see page 7432)

Working with Stored Procedure Parameters

39.1.49.4.24 TParam.ParamType Property

Indicates the type of the parameter the TParam (see page 7386) represents.

Pascal

```
property ParamType: TParamType;
```

C++

```
__property TParamType ParamType;
```

Description

Objects that use TParam (see page 7386) objects to represent field parameters set ParamType to indicate how the parameter is used. ParamType must be one of the following values:

Value (see page 7433)	Description
ptUnknown	Unknown or undetermined. Before executing a stored procedure, the application must set parameters of this type to another kind.
ptInput	Used to input a field value. Identifies a parameter used to pass values to a query or stored procedure for processing.
ptOutput	Used to output a field value. Identifies a parameter used by a stored procedure to return values to an application.
ptInputOutput	Used for both input and output.
ptResult	Used as a return value. Identifies a parameter used by a stored procedure to return an error or status value. A stored procedure can only have one parameter of type ptResult.

Supplying Parameters at Design Time

39.1.49.4.25 TParam.Precision Property

Specifies the number of digits allowed for a numeric parameter.

Pascal

```
property Precision: Integer;
```

C++

```
__property int Precision;
```

Description

Set Precision to indicate the maximum number of digits allowed in the parameter, including both significant and fractional.

Note: Precision only applies to parameters used by dbExpress datasets.

Note: The NumericScale (see page 7431) property controls the total number of decimal digits allowed.

See Also

NumericScale (see page 7431)

Size (see page 7432)

Working with Stored Procedure Parameters

39.1.49.4.26 TParam.Size Property

Specifies the number of characters in a string-type parameter.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

Set Size to indicate the maximum number of characters allowed in the parameter. Size only pertains to string-type parameters. For numeric type parameters, use the NumericScale (see page 7431) and Precision (see page 7432) properties. For other parameter types, Size should be zero.

Note: Size only applies to parameters used by dbExpress datasets.

See Also

Precision (see page 7432)

NumericScale (see page 7431)

Working with Stored Procedure Parameters

39.1.49.4.27 TParam.Text Property

Represents the value of the parameter as a string.

Pascal

```
property Text: string;
```

C++

```
__property AnsiString Text;
```

Description

Set the Text property to assign the value of the parameter to a string without changing the DataType (see page 7427). Unlike the AsString (see page 7421) property, which sets the value to a string and changes the DataType (see page 7427), setting the text property converts the string to the DataType (see page 7427) of the parameter, and sets the value accordingly. Thus, use AsString (see page 7421) to treat the parameter as representing the value of a string field. Use Text instead when assigning a value that is in string form, when making no assumptions about the field type. For example, Text is useful for assigning user data that was input using an edit control.

Reading the Text property is the same as reading the AsString (see page 7421) property.

See Also

AsString (see page 7421)

DataType (see page 7427)

TStringField (see page 7483)

39.1.49.4.28 TParam.Value Property

Represents the value of the parameter as a Variant.

Pascal

```
property Value: Variant;
```

C++

```
__property Variant Value;
```

Description

Use Value in generic code that manipulates the values of parameters without needing to know the field type the parameters represent.

DataType (see page 7427)

Text (see page 7433)

Working with Stored Procedure Parameters

Supplying Parameters at Design Time

39.1.50 TParams Class

TParams manages a list of field parameters.

Class Hierarchy

Pascal

```
TParams = class(TCollection);
```

C++

```
class TParams : public TCollection;
```

File

DB

Description

Datasets that represent queries and stored procedures use TParams objects to represent the parameters of their query or stored procedures. Client datasets use TParams to represent parameters they pass to a source dataset.

Note: ADO-based datasets do not use TParams objects to represent parameters. They use the TParameters class instead.

Use the properties and methods of TParams to:

Access a specific field parameter.

Add or delete field parameters from the list.

Get or set the values of individual field parameters.

Compare field parameters.

Iterate through all field parameters.

Copy a set of field parameters to another parameter list.

39.1.50.1 TParams Members

The following tables list the members exposed by TParams.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 7438)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 7444)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetDataSet (see page 7445)	This is GetDataSet, a member of class TParams.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 7445)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 7448)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 2736)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	AddParam (see page 7438)	Inserts a new field parameter into the Items (see page 7449) list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
	AssignValues (see page 7439)	Assigns new values to the parameters of the Items (see page 7449) property.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 7437)	This is the overview for the Create constructor overload.
	CreateParam (see page 7441)	Creates a new field parameter object and inserts it into the Items (see page 7449) list.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	FindParam (see page 7445)	Locates the parameter with a given name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParamList (see page 7446)	Fills a TList object with the TParam (see page 7386) objects specified by name.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEqual (see page 7446)	Indicates whether two TParams (see page 7434) objects have identical Items (see page 7449).
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
	ParamByName (see page 7447)	Locates the parameter with a given name.
	ParseSQL (see page 7447)	Locates the parameters in an SQL statement and replaces them with question marks.
	RemoveParam (see page 7448)	Removes the specified parameter from the Items (see page 7449) property of a TParams (see page 7434) object.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 7449)	Lists the individual field parameters of a TParams (see page 7434) object.
	ParamValues (see page 7451)	Lists the values of individual field parameters that are specified by name.

39.1.50.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TParams.Create () (see page 7437)	Creates an instance of TParams (see page 7434).
	TParams.Create (TPersistent) (see page 7437)	Creates an instance of TParams (see page 7434).

39.1.50.2.1 TParams.Create Constructor ()

Creates an instance of TParams (see page 7434).

Pascal

```
constructor Create(Owner: TPersistent); overload;
constructor Create; overload;
```

C++

```
__fastcall TParams(TPersistent * Owner);
__fastcall TParams();
```

Description

Call Create to instantiate a TParams (see page 7434) object. Most applications will not need to create a TParams (see page 7434) list, as it is created by the dataset that uses the TParams (see page 7434) object.

See Also

Params (see page 10087)

Params (see page 10165)

Params (see page 8489)

Params (see page 20197)

Params (see page 26073)

39.1.50.3 TParams Methods

The methods of the TParams class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 7438)	Copies the properties of an object to a destination object.
	DefineProperties (see page 7444)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDataSet (see page 7445)	This is GetDataSet, a member of class TParams.
	GetOwner (see page 7445)	Returns the owner of an object.
	Update (see page 7448)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	AddParam (see page 7438)	Inserts a new field parameter into the Items (see page 7449) list.

	AssignValues (see page 7439)	Assigns new values to the parameters of the Items (see page 7449) property.
	CreateParam (see page 7441)	Creates a new field parameter object and inserts it into the Items (see page 7449) list.
	FindParam (see page 7445)	Locates the parameter with a given name.
	GetParamList (see page 7446)	Fills a TList object with the TParam (see page 7386) objects specified by name.
	IsEqual (see page 7446)	Indicates whether two TParams (see page 7434) objects have identical Items (see page 7449).
	ParamByName (see page 7447)	Locates the parameter with a given name.
	ParseSQL (see page 7447)	Locates the parameters in an SQL statement and replaces them with question marks.
	RemoveParam (see page 7448)	Removes the specified parameter from the Items (see page 7449) property of a TParams (see page 7434) object.

39.1.50.3.1 TParams.AddParam Method

Inserts a new field parameter into the Items (see page 7449) list.

Pascal

```
procedure AddParam(Value: TParam);
```

C++

```
__fastcall AddParam(TParam Value);
```

Description

Use AddParam to add an instantiated parameter to the Items (see page 7449) list. To create a field parameter as well as add it to the list, use CreateParam (see page 7441) instead.

Note: Parameters for datasets that represent queries are only created by specifying parameters in the SQL statement. The TParam (see page 7386) objects in such a dataset's1` Params property are created automatically when parameter tokens are added to the SQL statement.

See Also

CreateParam (see page 7441)

RemoveParam (see page 7448)

TParam (see page 7386)

39.1.50.3.2 TParams.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign (see page 2930)

EConvertError (see page 22724)

39.1.50.3.3 TParams.AssignValues Method

Assigns new values to the parameters of the Items (see page 7449) property.

Pascal

```
procedure AssignValues(Value: TParams);
```

C++

```
__fastcall AssignValues(TParams Value);
```

Description

Use AssignValues to update the values of the field parameters in the Items (see page 7449) list to match the values of the corresponding field parameters in another TParams (see page 7434) object. For each entry in Items (see page 7449), the AssignValues method attempts to find a parameter with the same Name property in Value. If successful, the parameter information (type and current data) from the Value parameter is assigned to the Items (see page 7449) entry. Entries in Items (see page 7449) for which no match is found are left unchanged.

Delphi Examples:

```
{
  This example saves params from a ClientDataSet, alters them
  and restores them.
}
procedure TForm1.SaveParamsClick(Sender: TObject);
begin
  { Save the parameters for the TDataSet }
  SavedParams.Assign(CDS.Params);
end;

procedure TForm1.AlterParamsClick(Sender: TObject);
var
  I : Integer;
  ListItem: string;
begin
  CDS.Params.CreateParam(ftString, 'stringParam', ptInput);  // you can also edit the params
in the CDS dynamically
  CDS.Params.CreateParam(ftSmallInt, 'smallIntParam', ptInput);
  CDS.Params.CreateParam(ftInteger, 'intParam', ptInput);
  CDS.Params.CreateParam(ftWord, 'wordParam', ptInput);
  CDS.Params.CreateParam(ftBoolean, 'boolParam', ptInput);
  CDS.Params.CreateParam(ftFloat, 'floatParam', ptInput);
  CDS.Params.CreateParam(ftCurrency, 'currencyParam', ptInput);
  CDS.Params.CreateParam(ftBCD, 'bcdParam', ptInput);
  CDS.Params.CreateParam(ftDate, 'dateParam', ptInput);
```

```
    CDS.Params.CreateParam(ftTime, 'timeParam', ptInput);
    CDS.Params.CreateParam(ftDateTime, 'dateTimeParam', ptInput);
    { Call FetchParams to ensure parameters reflect server metadata }
    CDS.FetchParams;
    with CDS.Params do
    begin
      for I := 0 to Count - 1 do
      begin
        ListItem := ListBox1.Items[I];
        case Items[I].DataType of
          ftString:
            Items[I].AsString := ListItem;
          ftSmallInt:
            Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
          ftInteger:
            Items[I].AsInteger := StrToIntDef(ListItem, 0);
          ftWord:
            Items[I].AsWord := StrToIntDef(ListItem, 0);
          ftBoolean:
            begin
              if ListItem = 'True' then
                Items[I].AsBoolean := True
              else
                Items[I].AsBoolean := False;
            end;
          ftFloat:
            Items[I].AsFloat := StrToFloat(ListItem);
          ftCurrency:
            Items[I].AsCurrency := StrToFloat(ListItem);
          ftBCD:
            Items[I].AsBCD := StrToCurr(ListItem);
          ftDate:
            Items[I].AsDate := StrToDate(ListItem);
          ftTime:
            Items[I].AsTime := StrToTime(ListItem);
          ftDateTime:
            Items[I].AsDateTime := StrToDateTime(ListItem);
        end;
      end;
    end;
  end;

  procedure TForm1.RestoreParamsClick(Sender: TObject);
  begin
    { Restore the parameters to TDataSet }
    CDS.Params.AssignValues(SavedParams);
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    { Initialize SavedParams }
    SavedParams := TParams.Create;
    ListBox1.Items.Add('Here is a string');
    ListBox1.Items.Add('4');
    ListBox1.Items.Add('3456789');
    ListBox1.Items.Add('34');
    ListBox1.Items.Add('0');
    ListBox1.Items.Add('12.56');
    ListBox1.Items.Add('4.23');
    ListBox1.Items.Add('99.5');
    ListBox1.Items.Add('4/12/53');
    ListBox1.Items.Add('7:45:00');
    ListBox1.Items.Add('4/12/53 7:45:00');
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
```

```
begin
  SavedParams.Free;
end;
{
  This example saves params from a ClientDataSet, alters them
  and restores them.
}
procedure TForm1.SaveParamsClick(Sender: TObject);
begin
  { Save the parameters for the TDataSet }
  SavedParams.Assign(CDS.Params);
end;

procedure TForm1.AlterParamsClick(Sender: TObject);
var
  I : Integer;
begin
  CDS.Params.CreateParam(ftInteger, 'StateParam', ptInput);
  CDS.Params.CreateParam(ftInteger, 'MyParam', ptInput);
  for I := 0 to CDS.Params.Count - 1 do
    if (CDS.Params.Items[I].IsNull) and
       (CDS.Params.Items[I].DataType = ftInteger) then
      { Items is the default property, so you can omit its name }
      CDS.Params[I].AsInteger := -1;
end;

procedure TForm1.RestoreParamsClick(Sender: TObject);
begin
  { Restore the parameters to TDataSet }
  CDS.Params.AssignValues(SavedParams);
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  { Initialize SavedParams }
  SavedParams := TParams.Create;
end;

procedure TForm1.FormDestroy(Sender: TObject);
begin
  SavedParams.Free;
end;
```

Name (see page 7430)

Value (see page 7433)

39.1.50.3.4 TParams.CreateParam Method

Creates a new field parameter object and inserts it into the Items (see page 7449) list.

Pascal

```
function CreateParam(FldType: TFieldType; const ParamName: string; ParamType: TParamType):
TParam;
```

C++

```
__fastcall TParam CreateParam(TFieldType FldType, const AnsiString ParamName, TParamType
ParamType);
```

Description

Call CreateParam to instantiate a new TParam (see page 7386) object and add it to the Items (see page 7449) managed by this TParams (see page 7434) object. Specify the field type of the new parameter as the value of FldType, specify the name of the parameter as the value of ParamName, and specify the type of parameter as the value of ParamType.

Note: Parameters for datasets that represent queries are only created by specifying parameters in the SQL statement. The TParam (see page 7386) objects in such as dataset's Params property are created automatically when parameter tokens are added to the SQL statement.

Delphi Examples:

```
{
  This example saves params from a ClientDataSet, alters them
  and restores them.
}
procedure TForm1.SaveParamsClick(Sender: TObject);
begin
  { Save the parameters for the TDataSet }
  SavedParams.Assign(CDS.Params);
end;

procedure TForm1.AlterParamsClick(Sender: TObject);
var
  I : Integer;
  ListItem: string;
begin
  CDS.Params.CreateParam(ftString, 'stringParam', ptInput);  // you can also edit the params
in the CDS dynamically
  CDS.Params.CreateParam(ftSmallInt, 'smallIntParam', ptInput);
  CDS.Params.CreateParam(ftInteger, 'intParam', ptInput);
  CDS.Params.CreateParam(ftWord, 'wordParam', ptInput);
  CDS.Params.CreateParam(ftBoolean, 'boolParam', ptInput);
  CDS.Params.CreateParam(ftFloat, 'floatParam', ptInput);
  CDS.Params.CreateParam(ftCurrency, 'currencyParam', ptInput);
  CDS.Params.CreateParam(ftBCD, 'bcdParam', ptInput);
  CDS.Params.CreateParam(ftDate, 'dateParam', ptInput);
  CDS.Params.CreateParam(ftTime, 'timeParam', ptInput);
  CDS.Params.CreateParam(ftDateTime, 'dateTimeParam', ptInput);
  { Call FetchParams to ensure parameters reflect server metadata }
  CDS.FetchParams;
  with CDS.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
        ftWord:
          Items[I].AsWord := StrToIntDef(ListItem, 0);
        ftBoolean:
          begin
            if ListItem = 'True' then
              Items[I].AsBoolean := True
```

```
            else
              Items[I].AsBoolean := False;
          end;
        ftFloat:
          Items[I].AsFloat := StrToFloat(ListItem);
        ftCurrency:
          Items[I].AsCurrency := StrToFloat(ListItem);
        ftBCD:
          Items[I].AsBCD := StrToCurr(ListItem);
        ftDate:
          Items[I].AsDate := StrToDate(ListItem);
        ftTime:
          Items[I].AsTime := StrToTime(ListItem);
        ftDateTime:
          Items[I].AsDateTime := StrToDateTime(ListItem);
      end;
    end;
  end;
end;

procedure TForm1.RestoreParamsClick(Sender: TObject);
begin
  { Restore the parameters to TDataSet }
  CDS.Params.AssignValues(SavedParams);
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  { Initialize SavedParams }
  SavedParams := TParams.Create;
  ListBox1.Items.Add('Here is a string');
  ListBox1.Items.Add('4');
  ListBox1.Items.Add('3456789');
  ListBox1.Items.Add('34');
  ListBox1.Items.Add('0');
  ListBox1.Items.Add('12.56');
  ListBox1.Items.Add('4.23');
  ListBox1.Items.Add('99.5');
  ListBox1.Items.Add('4/12/53');
  ListBox1.Items.Add('7:45:00');
  ListBox1.Items.Add('4/12/53 7:45:00');
end;

procedure TForm1.FormDestroy(Sender: TObject);
begin
  SavedParams.Free;
end;
{
  This example saves params from a ClientDataSet, alters them
  and restores them.
}
procedure TForm1.SaveParamsClick(Sender: TObject);
begin
  { Save the parameters for the TDataSet }
  SavedParams.Assign(CDS.Params);
end;

procedure TForm1.AlterParamsClick(Sender: TObject);
var
  I : Integer;
begin
  CDS.Params.CreateParam(ftInteger, 'StateParam', ptInput);
  CDS.Params.CreateParam(ftInteger, 'MyParam', ptInput);
  for I := 0 to CDS.Params.Count - 1 do
    if (CDS.Params.Items[I].IsNull) and
       (CDS.Params.Items[I].DataType = ftInteger) then
```

```
      { Items is the default property, so you can omit its name }
      CDS.Params[I].AsInteger := -1;
end;

procedure TForm1.RestoreParamsClick(Sender: TObject);
begin
  { Restore the parameters to TDataSet }
  CDS.Params.AssignValues(SavedParams);
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  { Initialize SavedParams }
  SavedParams := TParams.Create;
end;

procedure TForm1.FormDestroy(Sender: TObject);
begin
  SavedParams.Free;
end;
```

Passing Parameters to the Source Dataset

39.1.50.3.5 TParams.DefineProperties Method

Provides an interface for a method that reads and writes otherwise unpublished data.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

Descendants of TPersistent override DefineProperties to designate a method for storing the object's unpublished data to a stream such as a form file. By default, writing an object to a stream writes the values of all its published properties, and reading the object in reads those values and assigns them to the properties. Objects can also specify methods that read and write data other than published properties by overriding the DefineProperties method.

When overriding DefineProperties, consider including some or all of the following:

A call to the inherited method

Calls to the filer object's DefineProperty method

Calls to the filer object's DefineBinaryProperty method

DefineProperties is virtual, so descendant classes can override it as necessary but are not required to do so.

See Also

DefineProperties (see page 2771)

DefineBinaryProperty (see page 2837)

DefineProperty (see page 2838)

39.1.50.3.6 TParams.FindParam Method

Locates the parameter with a given name.

Pascal

```
function FindParam(const Value: WideString): TParam;
```

C++

```
__fastcall TParam FindParam(const BSTR Value);
```

Description

Use FindParam to find a parameter with the name passed in Value. If a match is found, FindParam returns the parameter. Otherwise, it returns nil (Delphi) or NULL (C++). Use this method rather than a direct reference to the Items (see page 7449) property to avoid depending on the order of the entries.

To locate more than one parameter at a time, by name, use the GetParamList (see page 7446) method instead. To get only the value of a named parameter, use the ParamValues (see page 7451) property.

See Also

Items (see page 7449)

ParamByName (see page 7447)

Name (see page 7430)

GetParamList (see page 7446)

ParamValues (see page 7451)

39.1.50.3.7 TParams.GetDataSet Method

Pascal

```
function GetDataSet: TDataSet;
```

C++

```
__fastcall TDataSet GetDataSet();
```

Description

This is GetDataSet, a member of class TParams.

39.1.50.3.8 TParams.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent,

GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath (see page 2932)

TCollection (see page 2731)

TComponent (see page 2762)

Owner (see page 2807)

39.1.50.3.9 TParams.GetParamList Method

Fills a TList object with the TParam (see page 7386) objects specified by name.

Pascal

```
procedure GetParamList(List: TList; const ParamNames: WideString);
```

C++

```
__fastcall GetParamList(TList List, const BSTR ParamNames);
```

Description

Use GetParamList to obtain a subset of the field parameters in the Items (see page 7449) list that have been identified by name. ParamNames is a string giving the names of all field parameters of interest. Multiple parameter names are separated by semicolons (;).

GetParamList adds the field parameters to List in the order they appear in ParamNames. If ParamNames includes a name that does not match any of the field parameters in Items (see page 7449), an exception is raised.

See Also

Items (see page 7449)

ParamByName (see page 7447)

TList (see page 2868)

Name (see page 7430)

39.1.50.3.10 TParams.IsEqual Method

Indicates whether two TParams (see page 7434) objects have identical Items (see page 7449).

Pascal

```
function IsEqual(Value: TParams): Boolean;
```

C++

```
__fastcall Boolean IsEqual(TParams Value);
```

Description

IsEqual returns true if the Items (see page 7449) property of the Value parameter exactly matches the Items (see page 7449) property. To match, each Items (see page 7449) list must have the same number of field parameters, in the same order, which match on name, datatype, parameter type, and value.

See Also

Items (see page 7449)

DataType (see page 7427)

Name (see page 7430)

ParamType (see page 7431)

Value (see page 7433)

39.1.50.3.11 TParams.ParamByName Method

Locates the parameter with a given name.

Pascal

```
function ParamByName(const Value: string): TParam;
```

C++

```
__fastcall TParam ParamByName(const AnsiString Value);
```

Description

Use ParamByName to find a parameter with the name passed in Value. If a match is found, ParamByName returns the parameter. Otherwise, an exception is raised. Use this method rather than a direct reference to the Items (see page 7449) property to avoid depending on the order of the entries.

To locate a parameter by name without raising an exception if the parameter is not found, use the FindParam (see page 7445) method.

To locate more than one parameter at a time, by name, use the GetParamList (see page 7446) method instead. To get only the value of a named parameter, use the ParamValues (see page 7451) property.

See Also

GetParamList (see page 7446)

Items (see page 7449)

ParamValues (see page 7451)

Name (see page 7430)

FindParam (see page 7445)

39.1.50.3.12 TParams.ParseSQL Method

Locates the parameters in an SQL statement and replaces them with question marks.

Pascal

```
function ParseSQL(SQL: WideString; DoCreate: Boolean): WideString;
```

C++

```
__fastcall BSTR ParseSQL(BSTR SQL, Boolean DoCreate);
```

Description

Call ParseSQL to replace all the parameters in the SQL statement passed as SQL with question marks (?). ParseSQL recognizes parameters by a preceding colon (:). Double colons (::) or colons contained in quoted strings are parsed as literals, and the immediately following name is not replaced with a question mark. The converted SQL statement is returned.

If the DoCreate parameter is true, all parameters in the Items (see page 7449) property are replaced with a set of TParam (see page 7386) objects whose names are the same as the strings removed from the SQL statement.

For example, given the SQL string

```
SELECT * FROM EMPLOYEES
WHERE (ID = :EMP_ID) AND (NAME = :EMP_NAME)
```

ParseSQL returns the string

```
SELECT *
FROM EMPLOYEES
WHERE (ID = ?) AND (NAME = ?)
```

and, if DoCreate is true, the Items (see page 7449) property contains two TParam (see page 7386) objects with the names EMP_ID and EMP_NAME.

See Also

Items (see page 7449)

Name (see page 7430)

39.1.50.3.13 TParams.RemoveParam Method

Removes the specified parameter from the Items (see page 7449) property of a TParams (see page 7434) object.

Pascal

```
procedure RemoveParam(Value: TParam);
```

C++

```
__fastcall RemoveParam(TParam Value);
```

Description

Use RemoveParam to remove a field parameter from the Items (see page 7449) list. RemoveParam takes Value out of the list but does not free it.

Note: Parameters for datasets that represent queries are only created and removed by specifying parameters in the SQL statement. The TParam (see page 7386) objects in such a dataset's Params property are deleted automatically when the corresponding parameter tokens are removed from the SQL statement.

See Also

AddParam (see page 7438)

Clear (see page 2741)

CreateParam (see page 7441)

TParam (see page 7386)

39.1.50.3.14 TParams.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem Item);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

See Also

Changed (see page 2740)

Changed (see page 2758)

39.1.50.4 TParams Properties

The properties of the TParams class are listed here.

Public Properties

	Name	Description
	Items (see page 7449)	Lists the individual field parameters of a TParams (see page 7434) object.
	ParamValues (see page 7451)	Lists the values of individual field parameters that are specified by name.

39.1.50.4.1 TParams.Items Property

Lists the individual field parameters of a TParams (see page 7434) object.

Pascal

```
property Items [Index: Integer]: TParam;
```

C++

```
__property TParam Items[int Index];
```

Description

Use Items to iterate through all the field parameters. Index identifies the index in the range 0 to Count - 1. Items can reference a particular parameter by its index, but the ParamByName (see page 7447) method is preferred when working with named parameters, because it does not depend on the order of the parameters.

C++ Examples:

```
/*
This example requires a TClientDataSet and a button on a form.
Put swSystem in the uses clause for gsAppPath.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
for (int I = 0; I < CDS->Params->Count; I++)
{
  if (CDS->Params->Items[I]->IsNull &&
      CDS->Params->Items[I]->DataType == ftInteger)
    CDS->Params->Items[I]->AsInteger = -1;
}}
```

```
#include <swSystem.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
```

```
{
  CDS->LoadFromFile(gsAppPath + "../CDS.XML");
  CDS->Params->CreateParam(ftInteger, "StateParam", ptInput);
  CDS->Params->CreateParam(ftInteger, "MyParam", ptInput);
}
```

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
  ListItem: string;
begin
  { Call FetchParams to ensure parameters reflect server metadata }
  ClientDataSet1.FetchParams;
  with ClientDataSet1.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
        ftWord:
          Items[I].AsWord := StrToIntDef(ListItem, 0);
        ftBoolean:
          begin
            if ListItem = 'True' then
              Items[I].AsBoolean := True
            else
              Items[I].AsBoolean := False;
          end;
        ftFloat:
          Items[I].AsFloat := StrToFloat(ListItem);
        ftCurrency:
          Items[I].AsCurrency := StrToFloat(ListItem);
        ftBCD:
          Items[I].AsBCD := StrToCurr(ListItem);
        ftDate:
          Items[I].AsDate := StrToDate(ListItem);
        ftTime:
          Items[I].AsTime := StrToTime(ListItem);
        ftDateTime:
          Items[I].AsDateTime := StrToDateTime(ListItem);
      end;
    end;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Here is a string');
  ListBox1.Items.Add('4');
  ListBox1.Items.Add('3456789');
  ListBox1.Items.Add('34');
  ListBox1.Items.Add('0');
  ListBox1.Items.Add('12.56');
  ListBox1.Items.Add('4.23');
  ListBox1.Items.Add('99.5');
```

```
    ListBox1.Items.Add('4/12/53');
    ListBox1.Items.Add('7:45:00');
    ListBox1.Items.Add('4/12/53 7:45:00');

  end;
  {
  This example requires a TClientDataSet and a button on a form.
  Put swSystem in the uses clause for gsAppPath.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  var
    I : Integer;
  begin
  { Assign -1 to any integer parameter which does not have a value. }
  for I := 0 to CDS.Params.Count - 1 do
    if (CDS.Params.Items[I].IsNull) and
       (CDS.Params.Items[I].DataType = ftInteger) then
      { Items is the default property, so you can omit its name }
      CDS.Params[I].AsInteger := -1;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    CDS.LoadFromFile(gsAppPath + 'CDS.XML');
    CDS.Params.CreateParam(ftInteger, 'StateParam', ptInput);
    CDS.Params.CreateParam(ftInteger, 'MyParam', ptInput);
  end;
```

39.1.50.4.2 TParams.ParamValues Property

Lists the values of individual field parameters that are specified by name.

Pascal

```
property ParamValues [const ParamName: string]: Variant;
```

C++

```
__property Variant ParamValues[AnsiString const ParamName];
```

Description

Use ParamValues to get or set the values of individual named field parameters. ParamName is a string containing the names of the individual field parameters of interest. If ParamValues is used to access more than one field parameter, the names are separated by semicolons (;).

Setting ParamValues sets the Value property for each parameter listed in the ParamName string. Specify the values as Variants (see page 23567), in order, in a Variant array.

Getting ParamValues retrieves a Variant array of Variants (see page 23567), each of which represents the value of one of the named parameters.

If ParamName includes a name that does not match any of the field parameters in Items (see page 7449), an exception is raised.

AssignValues (see page 7439)

GetParamList (see page 7446)

ParamByName (see page 7447)

Name (see page 7430)

Value (see page 7433)

39.1.51 TReferenceField Class

TReferenceField represents a REF field in a dataset.

Class Hierarchy

Pascal

```
TReferenceField = class(TDataSetField);
```

C++

```
class TReferenceField : public TDataSetField;
```

File

DB

Description

Reference fields store a pointer or reference to another persistent object. TReferenceField introduces properties for working with references contained in other tables and for working directly with the reference field values.

If you use the Fields (see page 7384) editor at design time to create a persistent field component for the reference field, you can access it by name at runtime. When using dynamic field components, you can access the TReferenceFieldField instance using the dataset's Fields (see page 7384) property or FieldByName method.

See Also

TDataSEtField

TDataSEt

TDataSet (see page 6894)

39.1.51.1 TReferenceField Members

The following tables list the members exposed by TReferenceField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.

	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7069)	This is Bind, a member of class TDataSetField.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
V	CheckTypeSize (see page 7380)	This is CheckTypeSize, a member of class TObjectField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 7380)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	FreeBuffers (see page 7380)	This is FreeBuffers, a member of class TObjectField.
V	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
V	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
V	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
V	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
V	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
V	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
V	GetAsString (see page 7130)	This is GetAsString, a member of class TField.
V	GetAsString (see page 7381)	This is GetAsString, a member of class TObjectField.
V	GetAsVariant (see page 7459)	This is GetAsVariant, a member of class TReferenceField.
V	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
V	GetCanModify (see page 7069)	This is GetCanModify, a member of class TDataSetField.
V	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
V	GetDataSize (see page 7460)	This is GetDataSize, a member of class TReferenceField.
V	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
V	GetDefaultWidth (see page 7381)	This is GetDefaultWidth, a member of class TObjectField.
	GetFieldCount (see page 7381)	This is GetFieldCount, a member of class TObjectField.
V	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
V	GetFields (see page 7069)	This is GetFields, a member of class TDataSetField.
V	GetFields (see page 7382)	This is GetFields, a member of class TObjectField.
V	GetFieldValue (see page 7382)	This is GetFieldValue, a member of class TObjectField.
V	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
V	GetHasConstraints (see page 7382)	This is GetHasConstraints, a member of class TObjectField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
V	GetOwner (see page 2778)	Returns the owner of a component.

	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 7140)	This is SetAsString, a member of class TField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 7382)	This is SetChildOrder, a member of class TObjectField.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataSet (see page 7383)	This is SetDataSet, a member of class TObjectField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetFieldKind (see page 7383)	This is SetFieldKind, a member of class TObjectField.
	SetFieldValue (see page 7383)	This is SetFieldValue, a member of class TObjectField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetParentField (see page 7383)	This is SetParentField, a member of class TObjectField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetUnNamed (see page 7383)	This is SetUnNamed, a member of class TObjectField.
	SetVarValue (see page 7460)	This is SetVarValue, a member of class TReferenceField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 7459)	Copies the Value property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 7126)	Sets the value of the field to NULL.
V	Create (see page 7458)	Creates an instance of TReferenceField (see page 7452).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 7067)	Destroys an instance of TObjectField.
V	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
V	Destroy (see page 7379)	Destroys an instance of TObjectField (see page 7372).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
V	GetChildren (see page 7381)	This is GetChildren, a member of class TObjectField.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.

R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldCount (see page 7384)	Indicates the number of child fields that comprise the object field.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	Fields (see page 7384)	Specifies the TFields (see page 7211) object that contains an array of child fields.
	FieldValues (see page 7385)	Provides access to the values for all child fields in the object field.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
R	NestedDataSet (see page 7070)	Indicates the dataset that is nested in the dataset field.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
R	UnNamed (see page 7386)	Indicates whether an object field in a nested table has a name associated with it.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7180)	Represents the data in a field component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	IncludeObjectField (see page 7069)	Indicates whether this field can be represented as a persistent field in the nested dataset. Reserved for future use.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ObjectType (see page 7385)	Specifies the classification of the field object in Oracle.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	ReferenceTableName (see page 7460)	Names the table that contains the reference associated with the reference field.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Size (see page 7460)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.51.2 TReferenceField.Create Constructor

Creates an instance of TReferenceField (see page 7452).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TReferenceField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TReferenceField (see page 7452). Instead, the field components are created automatically, as persistent field components defined in the Fields (see page 7384) editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) to ftReference.

39.1.51.3 TReferenceField Methods

The methods of the TReferenceField class are listed here.

Protected Methods

	Name	Description
	GetAsVariant (see page 7459)	This is GetAsVariant, a member of class TReferenceField.
	GetDataSize (see page 7460)	This is GetDataSize, a member of class TReferenceField.
	SetVarValue (see page 7460)	This is SetVarValue, a member of class TReferenceField.

Public Methods

	Name	Description
	Assign (see page 7459)	Copies the Value property from another field component or assigns another object to the field component.

39.1.51.3.1 TReferenceField.Assign Method

Copies the Value property from another field component or assigns another object to the field component.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Use Assign to copy the Value property from one field to another. The fields must have compatible data types.

When Source is another field object, Assign calls the AssignValue method, using the Source field's Value property. Calling Assign with the Source parameter set to nil (Delphi) or NULL (C++) assigns a blank value to the field component. Calling Assign with any other object type calls the inherited method, which allows assignment from objects that implement a TField object in their AssignTo method.

See Also

AssignValue (see page 7124)

Clear (see page 7126)

DataType (see page 7159)

AssignTo (see page 2931)

Value (see page 7180)

39.1.51.3.2 TReferenceField.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TReferenceField.

39.1.51.3.3 TReferenceField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; override;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TReferenceField.

39.1.51.3.4 TReferenceField.SetVarValue Method

Pascal

```
procedure SetVarValue(const Value: Variant); override;
```

C++

```
virtual __fastcall SetVarValue(const Variant Value);
```

Description

This is SetVarValue, a member of class TReferenceField.

39.1.51.4 TReferenceField Properties

The properties of the TReferenceField class are listed here.

Published Properties

	Name	Description
	ReferenceTableName (see page 7460)	Names the table that contains the reference associated with the reference field.
	Size (see page 7460)	Indicates the size used in the definition of the physical database field for data types that support different sizes.

39.1.51.4.1 TReferenceField.ReferenceTableName Property

Names the table that contains the reference associated with the reference field.

Pascal

```
property ReferenceTableName: string;
```

C++

```
__property AnsiString ReferenceTableName;
```

Description

When ReferenceTableName is set, edits to the referenced data can be posted on the table of the reference field.

39.1.51.4.2 TReferenceField.Size Property

Indicates the size used in the definition of the physical database field for data types that support different sizes.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

The interpretation of Size depends on the data type. The meaning of Size for data types that use it is given in the following table. For all other data types, Size is not used and its value is always 0.

DataType	Meaning of Size
ftBCD	Size is the number of digits after the decimal place.
ftString	Size is the maximum number of characters in the string.
ftVarBytes	Size is the maximum number of bytes of data, not counting the first two bytes which indicate the actual number of bytes of data that were used.
ftBytes	Size is the maximum number of bytes of data.
ftBlob	Size is the number of bytes from the BLOB that are stored in the record buffer.
ftDBaseOle	Size is the number of bytes from the dBASE OLE BLOB that are stored in the record buffer.
ftFMTBCD	Size is the number of digits after the decimal place.
ftFmtMemo	Size is the number of bytes from the memo that are stored in the record buffer.
ftGraphic	Size is the number of bytes from the image that are stored in the record buffer.
ftMemo	Size is the number of characters from the memo that are stored in the record buffer.
ftParadoxOle	Size is the number of bytes from the Paradox OLE BLOB that are stored in the record buffer.
ftTypedBinary	Size is the number of bytes from the BLOB that are stored in the record buffer.
ftADT	Size is the total number of fields contained in the ADT field, including the fields of child fields that are of type ADT.
ftArray	Size is the number of elements in the array.

39.1.52 TSmallintField Class

TSmallIntField represents a signed 16-bit integer field in a dataset.

Class Hierarchy

Pascal

```
TSmallintField = class(TIntegerField);
```

C++

```
class TSmallintField : public TIntegerField;
```

File

DB

Description

TSmallIntField encapsulates the fundamental behavior common to small-integer fields. Small-integer fields can hold values in the range -32768 to 32767, and are used to hold values that are signed 16-bit whole numbers.

If you use the Fields editor at design time to create a persistent field component for the small integer field, you can access it by name at runtime. When using dynamic field components, you can access the TSmallIntField instance using the dataset's Fields property or FieldByName method.

39.1.52.1 TSmallintField Members

The following tables list the members exposed by TSmallintField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.

	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
	GetAsFloat (see page 7310)	This is GetAsFloat, a member of class TIntegerField.
	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
	GetAsInteger (see page 7310)	This is GetAsInteger, a member of class TIntegerField.
	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
	GetAsString (see page 7130)	This is GetAsString, a member of class TField.
	GetAsString (see page 7311)	This is GetAsString, a member of class TIntegerField.
	GetAsVariant (see page 7130)	This is GetAsVariant, a member of class TField.
	GetAsVariant (see page 7311)	This is GetAsVariant, a member of class TIntegerField.
	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
	GetDataSize (see page 7469)	This is GetDataSize, a member of class TSmallintField.
	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetText (see page 7311)	This is GetText, a member of class TIntegerField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 7312)	This is GetValue, a member of class TIntegerField.
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	RangeError (see page 7368)	This is RangeError, a member of class TNumericField.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.

	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsFloat (see page 7312)	This is SetAsFloat, a member of class TIntegerField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsInteger (see page 7312)	This is SetAsInteger, a member of class TIntegerField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 7140)	This is SetAsString, a member of class TField.
	SetAsString (see page 7312)	This is SetAsString, a member of class TIntegerField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayFormat (see page 7368)	This is SetDisplayFormat, a member of class TNumericField.
	SetEditFormat (see page 7368)	This is SetEditFormat, a member of class TNumericField.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 7144)	This is SetVarValue, a member of class TField.
	SetVarValue (see page 7312)	This is SetVarValue, a member of class TIntegerField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 7126)	Sets the value of the field to NULL.
V	Create (see page 7468)	Creates an instance of a TSmallIntField object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.

R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7180)	Represents the data in a field component.
	Value (see page 7314)	Represents the value of the integer field.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	Alignment (see page 7369)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayFormat (see page 7369)	Determines how a numeric field's value is formatted for display in a data-aware control.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	EditFormat (see page 7371)	Determines how a numeric field's value is formatted when it is being edited in a data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.

	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	MaxValue (see page 7313)	Limits the maximum value in the integer field.
	MinValue (see page 7313)	Limits the minimum value in the integer field.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.52.2 TSmallintField.Create Constructor

Creates an instance of a TSmallIntField object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSmallintField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TSmallIntField. Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) property to ftSmallInt, MinValue (see page 7313) to -32768, and MaxValue (see page 7313) to 32767. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TSmallIntField. After instantiating a TSmallIntField, associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TSmallIntField a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TSmallIntField with a dataset component by setting its DataSet (see page 7157) property.

The example below creates a TSmallIntField object for a field named Children accessed through a TSQLDataSet named SQLDataSet1.

```
var
  T: TSmallintField;
begin
  SQLDataSet1.Close;
  T := TSmallintField.Create(SQLDataSet1);
  T.FieldName := 'Children';
  T.Name := SQLDataSet1.Name + T.FieldName;
  T.Index := SQLDataSet1.FieldCount;
  T.DataSet := SQLDataSet1;
  SQLDataSet1.FieldDefs.UpDate;
  SQLDataSet1.Open;
end;
SQLDataSet1->Close();
TSmallintField *T = new TSmallintField(SQLDataSet1);
```

```
T->FieldName = "Children";
T->Name = SQLDataSet1->Name + T->FieldName;
T->Index = SQLDataSet1->FieldCount;
T->DataSet = SQLDataSet1;
SQLDataSet1->FieldDefs->UpDate();
SQLDataSet1->Open();
```

39.1.52.3 TSmallintField Methods

The methods of the TSmallintField class are listed here.

Protected Methods

	Name	Description
	GetDataSize (see page 7469)	This is GetDataSize, a member of class TSmallintField.

39.1.52.3.1 TSmallintField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; override;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TSmallintField.

39.1.53 TSQLTimeStampField Class

TSQLTimeStampField represents a date-time field in a DBExpress dataset.

Class Hierarchy

Pascal

```
TSQLTimeStampField = class(TField);
```

C++

```
class TSQLTimeStampField : public TField;
```

File

DB

Description

TSQLTimeStampField encapsulates the fundamental behavior common to Date-time fields. Date-time fields contain combined date and time information, sometimes called timestamps. TSQLTimeStampField uses the TSQLTimeStamp type to work with date-time values internally. This is the type used by DBExpress drivers for representing date and time values.

If you use the Fields editor at design time to create a persistent field component for the SQL timestamp field, you can access it by name at runtime. When using dynamic field components, you can access the TSQLTimeStampField instance using the dataset's Fields property or FieldByName method.

39.1.53.1 TSQLTimeStampField Members

The following tables list the members exposed by TSQLTimeStampField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
V	CopyData (see page 7477)	This is CopyData, a member of class TSQLTimeStampField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
	GetAsDateTime (see page 7477)	This is GetAsDateTime, a member of class TSQLTimeStampField.
	GetAsFloat (see page 7477)	This is GetAsFloat, a member of class TSQLTimeStampField.
	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
	GetAsSQLTimeStamp (see page 7478)	This is GetAsSQLTimeStamp, a member of class TSQLTimeStampField.
	GetAsString (see page 7478)	This is GetAsString, a member of class TSQLTimeStampField.
	GetAsVariant (see page 7478)	This is GetAsVariant, a member of class TSQLTimeStampField.
	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
	GetDataSize (see page 7478)	This is GetDataSize, a member of class TSQLTimeStampField.
	GetDefaultWidth (see page 7478)	This is GetDefaultWidth, a member of class TSQLTimeStampField.
	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7479)	This is GetText, a member of class TSQLTimeStampField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7479)	This is SetAsDateTime, a member of class TSQLTimeStampField.
	SetAsFloat (see page 7479)	This is SetAsFloat, a member of class TSQLTimeStampField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsSQLTimeStamp (see page 7479)	This is SetAsSQLTimeStamp, a member of class TSQLTimeStampField.
	SetAsString (see page 7480)	This is SetAsString, a member of class TSQLTimeStampField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.

	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 7480)	This is SetVarValue, a member of class TSQLTimeStampField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7126)	Sets the value of the field to NULL.
	Create (see page 7475)	Creates and initializes a TSQLTimeStampField (see page 7469) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.

	Value (see page 7482)	Represents the value of the data in the SQL timestamp field.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayFormat (see page 7480)	Controls (see page 5711) the formatting of the SQL timestamp field for display purposes.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	EditMask (see page 7482)	Contains a mask that restricts the data that can be entered into a data field.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.53.2 TSQLTimeStampField.Create Constructor

Creates and initializes a TSQLTimeStampField (see page 7469) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSQLTimeStampField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TSQLTimeStampField (see page 7469). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) property to ftTimeStamp. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TSQLTimeStampField (see page 7469). After instantiating a TSQLTimeStampField (see page 7469), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TSQLTimeStampField (see page 7469) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TSQLTimeStampField (see page 7469) with a dataset component by setting its DataSet (see page 7157) property to the name of the dataset component. Optionally set the DisplayFormat (see page 7480) property to the desired date and time format.

The example below creates a TSQLTimeStampField (see page 7469) object for a field named CheckOut accessed through a TSQLDataSet named SQLDataSet1.

```
var
  T: TSQLTimeStampField;
begin
  SQLDataSet1.Close;
  T := TSQLTimeStampField.Create(SQLDataSet1);
  T.FieldName := 'CheckOut';
  T.Name := SQLDataSet1.Name + T.FieldName;
  T.Index := SQLDataSet1.FieldCount;
  T.DataSet := SQLDataSet1;
  T.DisplayFormat := 'mm/dd/yyyy hh:nn:ss ampm';
  SQLDataSet1.FieldDefs.UpDate;
  SQLDataSet1.Open;
end;
SQLDataSet1->Close();
TSQLTimeStampField *T = new TSQLTimeStampField(SQLDataSet1);
T->FieldName = "CheckOut";
T->Name = SQLDataSet1->Name + T->FieldName;
T->Index = SQLDataSet1->FieldCount;
T->DataSet = SQLDataSet1;
T->DisplayFormat = "mm//dd//yyyy hh:nn:ss ampm";
SQLDataSet1->FieldDefs->UpDate();
SQLDataSet1->Open();
```

39.1.53.3 TSQLTimeStampField Methods

The methods of the TSQLTimeStampField class are listed here.

Protected Methods

	Name	Description
	CopyData (see page 7477)	This is CopyData, a member of class TSQLTimeStampField.
	GetAsDateTime (see page 7477)	This is GetAsDateTime, a member of class TSQLTimeStampField.
	GetAsFloat (see page 7477)	This is GetAsFloat, a member of class TSQLTimeStampField.
	GetAsSQLTimeStamp (see page 7478)	This is GetAsSQLTimeStamp, a member of class TSQLTimeStampField.
	GetAsString (see page 7478)	This is GetAsString, a member of class TSQLTimeStampField.
	GetAsVariant (see page 7478)	This is GetAsVariant, a member of class TSQLTimeStampField.
	GetDataSize (see page 7478)	This is GetDataSize, a member of class TSQLTimeStampField.
	GetDefaultWidth (see page 7478)	This is GetDefaultWidth, a member of class TSQLTimeStampField.
	GetText (see page 7479)	This is GetText, a member of class TSQLTimeStampField.
	SetAsDateTime (see page 7479)	This is SetAsDateTime, a member of class TSQLTimeStampField.
	SetAsFloat (see page 7479)	This is SetAsFloat, a member of class TSQLTimeStampField.
	SetAsSQLTimeStamp (see page 7479)	This is SetAsSQLTimeStamp, a member of class TSQLTimeStampField.
	SetAsString (see page 7480)	This is SetAsString, a member of class TSQLTimeStampField.
	SetVarValue (see page 7480)	This is SetVarValue, a member of class TSQLTimeStampField.

39.1.53.3.1 TSQLTimeStampField.CopyData Method

Pascal

```
procedure CopyData(Source: Pointer; Dest: Pointer); override;
```

C++

```
virtual __fastcall CopyData(void * Source, void * Dest);
```

Description

This is CopyData, a member of class TSQLTimeStampField.

39.1.53.3.2 TSQLTimeStampField.GetAsDateTime Method

Pascal

```
function GetAsDateTime: TDateTime; override;
```

C++

```
virtual __fastcall TDateTime GetAsDateTime();
```

Description

This is GetAsDateTime, a member of class TSQLTimeStampField.

39.1.53.3.3 TSQLTimeStampField.GetAsFloat Method

Pascal

```
function GetAsFloat: Double; override;
```

C++

```
virtual __fastcall Double GetAsFloat();
```

Description

This is GetAsFloat, a member of class TSQLTimeStampField.

39.1.53.3.4 TSQLTimeStampField.GetAsSQLTimeStamp Method

Pascal

```
function GetAsSQLTimeStamp: TSQLTimeStamp; override;
```

C++

```
virtual __fastcall TSQLTimeStamp GetAsSQLTimeStamp();
```

Description

This is GetAsSQLTimeStamp, a member of class TSQLTimeStampField.

39.1.53.3.5 TSQLTimeStampField.GetAsString Method

Pascal

```
function GetAsString: string; override;
```

C++

```
virtual __fastcall AnsiString GetAsString();
```

Description

This is GetAsString, a member of class TSQLTimeStampField.

39.1.53.3.6 TSQLTimeStampField.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TSQLTimeStampField.

39.1.53.3.7 TSQLTimeStampField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; override;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TSQLTimeStampField.

39.1.53.3.8 TSQLTimeStampField.GetDefaultWidth Method

Pascal

```
function GetDefaultWidth: Integer; override;
```

C++

```
virtual __fastcall int GetDefaultWidth();
```

Description

This is GetDefaultWidth, a member of class TSQLTimeStampField.

39.1.53.3.9 TSQLTimeStampField.GetText Method

Pascal

```
procedure GetText(var Text: string; DisplayText: Boolean); override;
```

C++

```
virtual __fastcall GetText(AnsiString Text, Boolean DisplayText);
```

Description

This is GetText, a member of class TSQLTimeStampField.

39.1.53.3.10 TSQLTimeStampField.SetAsDateTime Method

Pascal

```
procedure SetAsDateTime(Value: TDateTime); override;
```

C++

```
virtual __fastcall SetAsDateTime(TDateTime Value);
```

Description

This is SetAsDateTime, a member of class TSQLTimeStampField.

39.1.53.3.11 TSQLTimeStampField.SetAsFloat Method

Pascal

```
procedure SetAsFloat(Value: Double); override;
```

C++

```
virtual __fastcall SetAsFloat(Double Value);
```

Description

This is SetAsFloat, a member of class TSQLTimeStampField.

39.1.53.3.12 TSQLTimeStampField.SetAsSQLTimeStamp Method

Pascal

```
procedure SetAsSQLTimeStamp(const Value: TSQLTimeStamp); override;
```

C++

```
virtual __fastcall SetAsSQLTimeStamp(const TSQLTimeStamp Value);
```

Description

This is SetAsSQLTimeStamp, a member of class TSQLTimeStampField.

39.1.53.3.13 TSQLTimeStampField.SetAsString Method

Pascal

```
procedure SetAsString(const Value: string); override;
```

C++

```
virtual __fastcall SetAsString(const AnsiString Value);
```

Description

This is SetAsString, a member of class TSQLTimeStampField.

39.1.53.3.14 TSQLTimeStampField.SetVarValue Method

Pascal

```
procedure SetVarValue(const Value: Variant); override;
```

C++

```
virtual __fastcall SetVarValue(const Variant Value);
```

Description

This is SetVarValue, a member of class TSQLTimeStampField.

39.1.53.4 TSQLTimeStampField Properties

The properties of the TSQLTimeStampField class are listed here.

Public Properties

	Name	Description
	Value (see page 7482)	Represents the value of the data in the SQL timestamp field.

Published Properties

	Name	Description
	DisplayFormat (see page 7480)	Controls (see page 5711) the formatting of the SQL timestamp field for display purposes.
	EditMask (see page 7482)	Contains a mask that restricts the data that can be entered into a data field.

39.1.53.4.1 TSQLTimeStampField.DisplayFormat Property

Controls (see page 5711) the formatting of the SQL timestamp field for display purposes.

Pascal

```
property DisplayFormat: string;
```

C++

```
__property AnsiString DisplayFormat;
```

Description

Use DisplayFormat to specify the formatting string to use for formatting the value in a SQL timestamp field when the field's value appears as a string. If DisplayFormat is not assigned a string, the value is formatted according to the default date-time format specified by the Windows Control Panel.

Note: DisplayFormat does not affect the value of the AsString (see page 7151) property.

Construct a DisplayFormat string using these format specifiers:

Specifier	Displays
c	The date using the format given by the ShortDateFormat global variable, followed by the time using the format given by the LongTimeFormat global variable. The time is not displayed if the fractional part of the DateTime value is zero.
d	The day as a number without a leading zero (1-31).
dd	The day as a number with a leading zero (01-31).
ddd	The day as an abbreviation (Sun-Sat) using the strings given by the ShortDayNames global variable.
dddd	The day as a full name (Sunday-Saturday) using the strings given by the LongDayNames global variable.
ddddd	The date using the format given by the ShortDateFormat global variable.
dddddd	The date using the format given by the LongDateFormat global variable.
m	The month as a number without a leading zero (1-12). If the m specifier immediately follows an h or hh specifier, the minute rather than the month is displayed.
mm	The month as a number with a leading zero (01-12). If the mm specifier immediately follows an h or hh specifier, the minute rather than the month is displayed.
mmm	The month as an abbreviation (Jan-Dec) using the strings given by the ShortMonthNames global variable.
mmmm	The month as a full name (January-December) using the strings given by the LongMonthNames global variable.
yy	The year as a two-digit number (00-99).
yyyy	The year as a four-digit number (0000-9999).
h	The hour without a leading zero (0-23).
hh	The hour with a leading zero (00-23).
n	The minute without a leading zero (0-59).
nn	The minute with a leading zero (00-59).
s	The second without a leading zero (0-59).
ss	The second with a leading zero (00-59).
t	The time using the format given by the ShortTimeFormat global variable.
tt	The time using the format given by the LongTimeFormat global variable.
am/pm	The time using the 12-hour clock for the preceding h or hh specifier, followed by "am" for any hour before noon, or "pm" for any hour after noon. The am/pm specifier can use lower, upper, or mixed case, and the result is displayed accordingly.
a/p	The time using the 12-hour clock for the preceding h or hh specifier, followed by "a" for any hour before noon, or "p" for any hour after noon. The a/p specifier can use lower, upper, or mixed case, and the result is displayed accordingly.
ampm	The time using the 12-hour clock for the preceding h or hh specifier, followed by the contents of the TimeAMString global variable for any hour before noon, or the contents of the TimePMString global variable for any hour after noon.
/	The date separator character given by the DateSeparator global variable.
:	The time separator character given by the TimeSeparator global variable.
'xx'/"xx"	Characters enclosed in single or double quotes are displayed as-is, with no formatting changes.

Format specifiers may be written in uppercase or lowercase letters; both produce the same result.

If the string given by the Format parameter is empty, the date and time value is formatted as if a c format specifier had been given.

See Also

AsString

39.1.53.4.2 TSQLTimeStampField.EditMask Property

Contains a mask that restricts the data that can be entered into a data field.

Pascal

```
property EditMask: TEditMask;
```

C++

```
__property TEditMask EditMask;
```

Description

Use EditMask to restrict the characters a user can enter. If the user attempts to enter a character that is not valid, the character is not accepted. Validation using the EditMask property is performed on a character-by-character basis. Use the OnValidate event instead to validate the entire input, just before it is posted.

Setting EditMask to an empty string removes the mask.

Note: For a description of the format required by EditMask, see the

TEditMask type.

See Also

DisplayText (see page 7162)

IsValidChar (see page 7136)

OnValidate (see page 7183)

Validate (see page 7144)

Value (see page 7180)

39.1.53.4.3 TSQLTimeStampField.Value Property

Represents the value of the data in the SQL timestamp field.

Pascal

```
property Value: TSQLTimeStamp;
```

C++

```
__property TSQLTimeStamp Value;
```

Description

Use Value to read data directly from and write data directly to a SQL timestamp field component at runtime. TSQLTimeStampField (see page 7469) components store and manipulate their data as TSQLTimeStamp values. Thus, for SQL timestamp fields, the Value property is the same as the AsSQLTimeStamp (see page 7150) property.

AsSQLTimeStamp

39.1.54 TStringField Class

TStringField represents a string field in a dataset.

Class Hierarchy

Pascal

```
TStringField = class(TField);
```

C++

```
class TStringField : public TField;
```

File

DB

Description

TStringField encapsulates the fundamental behavior common to fields that contain string data. A value of a string field is physically stored as a sequence of up to 8192 characters. However, some table types may only support string fields of smaller dimensions. Common uses for string fields are to store text, such as names and addresses.

If you use the Fields editor at design time to create a persistent field component for the string field, you can access it by name at runtime. When using dynamic field components, you can access the TStringField instance using the dataset's Fields property or FieldByName method.

Delphi Examples:

```
{
This example requires two ClientDataSets, two DBGrids, two
DataSources and two DBNavigators.  Name the two
ClientDataSets CDS and CDS2. Set the DataSet property in the
first DataSource to CDS and name that DataSource DS.  Set the
DataSet property in the second DataSource to CDS2 and name
that DataSource DS2.  Set the DataSource in the first
DBNavigator to DS and the DataSource in the second DBNavigator
to DS2.  Set the DataSource in the first DBGrid to DS and the
DataSource in the second DBGrid to DS2.  Right click on CDS
and select the Fields Editor, then right click on the Field
Editor form and create two fields by selecting "new field".
In the field configuration window, set the name to HOST, the
Component value will automatically be set to CDSHOST.  Set
the filed type to String.  In the field configuration window
for the second field, set the name to PORTA, the Component
value will automatically be set to CDSPORTA.  Set the field
type to Integer.  The file used to load CDS must have an
attribute name of HOST with an attribute type of string and
an attribute name of PORTA with an attribute type of integer.
Add DB, DBCtrls, Grids, DBGrids, DBClient and SwSystem to the
uses clause.  "LoadFormFile" to start with the file, or
"CreateDataSet" to start from scratch.  You must "CloseDataSet"
after a "LoadFromFile" before you can do another "CreateDataSet".
}
{$IFNDEF UNICODE}
uses SwSystem;
{$ENDIF}
```

```
procedure TForm1.Button1Click(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
{$ELSE}
  CDS.LoadFromFile(gsAppPath + 'CDS.XML');
{$ENDIF}
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.SaveToFile(GetCurrentDir + '\CDS.XML', dfXML);
{$ELSE}
  CDS.SaveToFile(gsAppPath + 'CDS.XML', dfXML);
{$ENDIF}
end;

procedure TForm1.Button3Click(Sender: TObject);
begin
  CDS.CreateDataSet;
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  CDS2.Data := CDS.Data;
end;

procedure TForm1.Button5Click(Sender: TObject);
begin
  CDS.Close;
end;
```

39.1.54.1 TStringField Members

The following tables list the members exposed by TStringField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7491)	This is CheckTypeSize, a member of class TStringField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	GetAsBCD (see page 7492)	This is GetAsBCD, a member of class TStringField.
V	GetAsBoolean (see page 7492)	This is GetAsBoolean, a member of class TStringField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
V	GetAsDateTime (see page 7492)	This is GetAsDateTime, a member of class TStringField.
V	GetAsFloat (see page 7492)	This is GetAsFloat, a member of class TStringField.
V	GetAsInteger (see page 7493)	This is GetAsInteger, a member of class TStringField.
V	GetAsSQLTimeStamp (see page 7493)	This is GetAsSQLTimeStamp, a member of class TStringField.
V	GetAsString (see page 7493)	This is GetAsString, a member of class TStringField.
V	GetAsVariant (see page 7493)	This is GetAsVariant, a member of class TStringField.
V	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
V	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
V	GetDataSize (see page 7493)	This is GetDataSize, a member of class TStringField.
V	GetDefaultWidth (see page 7494)	This is GetDefaultWidth, a member of class TStringField.
V	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
V	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetSize (see page 7135)	This is GetSize, a member of class TField.
V	GetText (see page 7494)	This is GetText, a member of class TStringField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 7494)	This is GetValue, a member of class TStringField.
V	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.

	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7494)	This is SetAsBCD, a member of class TStringField.
	SetAsBoolean (see page 7495)	This is SetAsBoolean, a member of class TStringField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7495)	This is SetAsDateTime, a member of class TStringField.
	SetAsFloat (see page 7495)	This is SetAsFloat, a member of class TStringField.
	SetAsInteger (see page 7495)	This is SetAsInteger, a member of class TStringField.
	SetAsSQLTimeStamp (see page 7495)	This is SetAsSQLTimeStamp, a member of class TStringField.
	SetAsString (see page 7496)	This is SetAsString, a member of class TStringField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 7496)	This is SetVarValue, a member of class TStringField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.

	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 7126)	Sets the value of the field to NULL.
V	Create (see page 7490)	Creates an instance of a TStringField (see page 7483) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.

	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.

R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7499)	Represents the data in the string field.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	EditMask (see page 7496)	Contains a mask that restricts the data that can be entered into a data field.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
	FixedChar (see page 7497)	Specifies whether the represented field is of Char type.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.

	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Size (see page 7497)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Transliterate (see page 7498)	Determines whether text should be converted to and from the character set identified by the dataset.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.54.2 TStringField.Create Constructor

Creates an instance of a TStringField (see page 7483) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TStringField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TStringField (see page 7483). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) property to ftString, Size (see page 7497) to 20, and Transliterate (see page 7498) to true. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TStringField (see page 7483). After instantiating a TStringField (see page 7483), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TStringField (see page 7483) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TStringField (see page 7483) with a dataset component by setting its DataSet (see page 7157) property.

The example below creates a TStringField (see page 7483) object for a field named LastName accessed through a TSQLDataSet named SQLDataSet1.

```
var
  T: TStringField;
begin
  SQLDataSet1.Close;
  T := TStringField.Create(SQLDataSet1);
  T.FieldName := 'LastName';
  T.Name := SQLDataSet1.Name + T.FieldName;
  T.Index := SQLDataSet1.FieldCount;
  T.DataSet := SQLDataSet1;
  SQLDataSet1.FieldDefs.UpDate;
  SQLDataSet1.Open;
end;
SQLDataSet1->Close();
TStringField *T = new TStringField(SQLDataSet1);
```

```
T->FieldName = "LastName";
T->Name = SQLDataSet1->Name + T->FieldName;
T->Index = SQLDataSet1->FieldCount;
T->DataSet = SQLDataSet1;
SQLDataSet1->FieldDefs->UpDate();
SQLDataSet1->Open();
```

39.1.54.3 TStringField Methods

The methods of the TStringField class are listed here.

Protected Methods

	Name	Description
	CheckTypeSize (see page 7491)	This is CheckTypeSize, a member of class TStringField.
	GetAsBCD (see page 7492)	This is GetAsBCD, a member of class TStringField.
	GetAsBoolean (see page 7492)	This is GetAsBoolean, a member of class TStringField.
	GetAsDateTime (see page 7492)	This is GetAsDateTime, a member of class TStringField.
	GetAsFloat (see page 7492)	This is GetAsFloat, a member of class TStringField.
	GetAsInteger (see page 7493)	This is GetAsInteger, a member of class TStringField.
	GetAsSQLTimeStamp (see page 7493)	This is GetAsSQLTimeStamp, a member of class TStringField.
	GetAsString (see page 7493)	This is GetAsString, a member of class TStringField.
	GetAsVariant (see page 7493)	This is GetAsVariant, a member of class TStringField.
	GetDataSize (see page 7493)	This is GetDataSize, a member of class TStringField.
	GetDefaultWidth (see page 7494)	This is GetDefaultWidth, a member of class TStringField.
	GetText (see page 7494)	This is GetText, a member of class TStringField.
	GetValue (see page 7494)	This is GetValue, a member of class TStringField.
	SetAsBCD (see page 7494)	This is SetAsBCD, a member of class TStringField.
	SetAsBoolean (see page 7495)	This is SetAsBoolean, a member of class TStringField.
	SetAsDateTime (see page 7495)	This is SetAsDateTime, a member of class TStringField.
	SetAsFloat (see page 7495)	This is SetAsFloat, a member of class TStringField.
	SetAsInteger (see page 7495)	This is SetAsInteger, a member of class TStringField.
	SetAsSQLTimeStamp (see page 7495)	This is SetAsSQLTimeStamp, a member of class TStringField.
	SetAsString (see page 7496)	This is SetAsString, a member of class TStringField.
	SetVarValue (see page 7496)	This is SetVarValue, a member of class TStringField.

39.1.54.3.1 TStringField.CheckTypeSize Method

Pascal

```
class procedure CheckTypeSize(Value: Integer); override;
```

C++

```
virtual __fastcall CheckTypeSize(int Value);
```

Description

This is CheckTypeSize, a member of class TStringField.

39.1.54.3.2 TStringField.GetAsBCD Method

Pascal

```
function GetAsBCD: TBcd; override;
```

C++

```
virtual __fastcall TBcd GetAsBCD();
```

Description

This is GetAsBCD, a member of class TStringField.

39.1.54.3.3 TStringField.GetAsBoolean Method

Pascal

```
function GetAsBoolean: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetAsBoolean();
```

Description

This is GetAsBoolean, a member of class TStringField.

39.1.54.3.4 TStringField.GetAsDateTime Method

Pascal

```
function GetAsDateTime: TDateTime; override;
```

C++

```
virtual __fastcall TDateTime GetAsDateTime();
```

Description

This is GetAsDateTime, a member of class TStringField.

39.1.54.3.5 TStringField.GetAsFloat Method

Pascal

```
function GetAsFloat: Double; override;
```

C++

```
virtual __fastcall Double GetAsFloat();
```

Description

This is GetAsFloat, a member of class TStringField.

39.1.54.3.6 TStringField.GetAsInteger Method

Pascal

```
function GetAsInteger: Longint; override;
```

C++

```
virtual __fastcall Longint GetAsInteger();
```

Description

This is GetAsInteger, a member of class TStringField.

39.1.54.3.7 TStringField.GetAsSQLTimeStamp Method

Pascal

```
function GetAsSQLTimeStamp: TSQLTimeStamp; override;
```

C++

```
virtual __fastcall TSQLTimeStamp GetAsSQLTimeStamp();
```

Description

This is GetAsSQLTimeStamp, a member of class TStringField.

39.1.54.3.8 TStringField.GetAsString Method

Pascal

```
function GetAsString: string; override;
```

C++

```
virtual __fastcall AnsiString GetAsString();
```

Description

This is GetAsString, a member of class TStringField.

39.1.54.3.9 TStringField.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TStringField.

39.1.54.3.10 TStringField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; override;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TStringField.

39.1.54.3.11 TStringField.GetDefaultWidth Method

Pascal

```
function GetDefaultWidth: Integer; override;
```

C++

```
virtual __fastcall int GetDefaultWidth();
```

Description

This is GetDefaultWidth, a member of class TStringField.

39.1.54.3.12 TStringField.GetText Method

Pascal

```
procedure GetText(var Text: string; DisplayText: Boolean); override;
```

C++

```
virtual __fastcall GetText(AnsiString Text, Boolean DisplayText);
```

Description

This is GetText, a member of class TStringField.

39.1.54.3.13 TStringField.GetValue Method

Pascal

```
function GetValue(var Value: string): Boolean;
```

C++

```
__fastcall Boolean GetValue(AnsiString Value);
```

Description

This is GetValue, a member of class TStringField.

39.1.54.3.14 TStringField.SetAsBCD Method

Pascal

```
procedure SetAsBCD(const Value: TBcd); override;
```

C++

```
virtual __fastcall SetAsBCD(const TBcd Value);
```

Description

This is SetAsBCD, a member of class TStringField.

39.1.54.3.15 TStringField.SetAsBoolean Method

Pascal

```
procedure SetAsBoolean(Value: Boolean); override;
```

C++

```
virtual __fastcall SetAsBoolean(Boolean Value);
```

Description

This is SetAsBoolean, a member of class TStringField.

39.1.54.3.16 TStringField.SetAsDateTime Method

Pascal

```
procedure SetAsDateTime(Value: TDateTime); override;
```

C++

```
virtual __fastcall SetAsDateTime(TDateTime Value);
```

Description

This is SetAsDateTime, a member of class TStringField.

39.1.54.3.17 TStringField.SetAsFloat Method

Pascal

```
procedure SetAsFloat(Value: Double); override;
```

C++

```
virtual __fastcall SetAsFloat(Double Value);
```

Description

This is SetAsFloat, a member of class TStringField.

39.1.54.3.18 TStringField.SetAsInteger Method

Pascal

```
procedure SetAsInteger(Value: Longint); override;
```

C++

```
virtual __fastcall SetAsInteger(Longint Value);
```

Description

This is SetAsInteger, a member of class TStringField.

39.1.54.3.19 TStringField.SetAsSQLTimeStamp Method

Pascal

```
procedure SetAsSQLTimeStamp(const Value: TSQLTimeStamp); override;
```

C++

```
virtual __fastcall SetAsSQLTimeStamp(const TSQLTimeStamp Value);
```

Description

This is SetAsSQLTimeStamp, a member of class TStringField.

39.1.54.3.20 TStringField.SetAsString Method

Pascal

```
procedure SetAsString(const Value: string); override;
```

C++

```
virtual __fastcall SetAsString(const AnsiString Value);
```

Description

This is SetAsString, a member of class TStringField.

39.1.54.3.21 TStringField.SetVarValue Method

Pascal

```
procedure SetVarValue(const Value: Variant); override;
```

C++

```
virtual __fastcall SetVarValue(const Variant Value);
```

Description

This is SetVarValue, a member of class TStringField.

39.1.54.4 TStringField Properties

The properties of the TStringField class are listed here.

Public Properties

	Name	Description
	Value (see page 7499)	Represents the data in the string field.

Published Properties

	Name	Description
	EditMask (see page 7496)	Contains a mask that restricts the data that can be entered into a data field.
	FixedChar (see page 7497)	Specifies whether the represented field is of Char type.
	Size (see page 7497)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Transliterate (see page 7498)	Determines whether text should be converted to and from the character set identified by the dataset.

39.1.54.4.1 TStringField.EditMask Property

Contains a mask that restricts the data that can be entered into a data field.

Pascal

```
property EditMask: TEditMask;
```

C++

```
__property TEditMask EditMask;
```

Description

Use EditMask to restrict the characters a user can enter. If the user attempts to enter a character that is not valid, the character is not accepted. Validation using the EditMask property is performed on a character-by-character basis. Use the OnValidate event instead to validate the entire input, just before it is posted.

Setting EditMask to an empty string removes the mask.

Note: For a description of the format required by EditMask, see the

TEditMask type.

DisplayText (see page 7162)

IsValidChar (see page 7136)

OnValidate (see page 7183)

Validate (see page 7144)

Value (see page 7180)

39.1.54.4.2 TStringField.FixedChar Property

Specifies whether the represented field is of Char type.

Pascal

```
property FixedChar: Boolean;
```

C++

```
__property Boolean FixedChar;
```

Description

FixedChar is true when the field in the underlying database is a CHAR type as opposed to VARCHAR.

See Also

TFieldType (see page 7612)

39.1.54.4.3 TStringField.Size Property

Indicates the size used in the definition of the physical database field for data types that support different sizes.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

The interpretation of Size depends on the data type. The meaning of Size for data types that use it is given in the following table. For all other data types, Size is not used and its value is always 0.

DataType	Meaning of Size
ftBCD	Size is the number of digits after the decimal place.
ftString	Size is the maximum number of characters in the string.

ftVarBytes	Size is the maximum number of bytes of data, not counting the first two bytes which indicate the actual number of bytes of data that were used.
ftBytes	Size is the maximum number of bytes of data.
ftBlob	Size is the number of bytes from the BLOB that are stored in the record buffer.
ftDBaseOle	Size is the number of bytes from the dBASE OLE BLOB that are stored in the record buffer.
ftFMTBCD	Size is the number of digits after the decimal place.
ftFmtMemo	Size is the number of bytes from the memo that are stored in the record buffer.
ftGraphic	Size is the number of bytes from the image that are stored in the record buffer.
ftMemo	Size is the number of characters from the memo that are stored in the record buffer.
ftParadoxOle	Size is the number of bytes from the Paradox OLE BLOB that are stored in the record buffer.
ftTypedBinary	Size is the number of bytes from the BLOB that are stored in the record buffer.
ftADT	Size is the total number of fields contained in the ADT field, including the fields of child fields that are of type ADT.
ftArray	Size is the number of elements in the array.

DataSize (see page 7157)

DataType (see page 7159)

39.1.54.4.4 TStringField.Transliterate Property

Determines whether text should be converted to and from the character set identified by the dataset.

Pascal

```
property Transliterate: Boolean;
```

C++

```
__property Boolean Transliterate;
```

Description

Use Transliterate when the physical database table identified by the dataset does not use an ANSI language driver and the data may contain extended ASCII characters uses a different character set than UTF-8 (on Linux) or ANSI (on Windows).

When Transliterate is true, string fields call the dataset's Translate method to translate UTF-8 or ANSI characters to the character set used by the dataset when the string field value is set. When the string field value is read, the Translate method translates the characters in the database table to the UTF-8 or ANSI character set.

39.1.54.4.5 TStringField.Value Property

Represents the data in the string field.

Pascal

```
property Value: string;
```

C++

```
__property AnsiString Value;
```

Description

Use Value to read data directly from and write data directly to a string field component at runtime. Using the Value property is the same as using the AsString (see page 7151) property. Use Value when you know the field component is a string field. Use AsString (see page 7151) when working with a generic field component.

When setting the Value property, TStringField (see page 7483) can convert the assigned string from UTF-8 or ANSI to the character set used by the dataset, if the Transliterate (see page 7498) property is true. Strings that have more characters than permitted by the value of the Size (see page 7497) property are truncated when setting Value.

Size (see page 7178)

Transliterate (see page 7498)

39.1.55 TTimeField Class

TTimeField represents a time field in a dataset.

Class Hierarchy

Pascal

```
TTimeField = class(TDateTimeField);
```

C++

```
class TTimeField : public TDateTimeField;
```

File

DB

Description

TTimeField encapsulates the fundamental behavior common to fields that contain time values. Time fields contain time values (without any date), which they manage using the TDateTime type (Delphi) or class (C++).

If you use the Fields editor at design time to create a persistent field component for the time field, you can access it by name at runtime. When using dynamic field components, you can access the TTimeField instance using the dataset's Fields property or FieldByName method.

39.1.55.1 TTimeField Members

The following tables list the members exposed by TTimeField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
V	CopyData (see page 7098)	This is CopyData, a member of class TDateTimeField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
V	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
V	GetAsDateTime (see page 7098)	This is GetAsDateTime, a member of class TDateTimeField.
V	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
V	GetAsFloat (see page 7099)	This is GetAsFloat, a member of class TDateTimeField.
V	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
V	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.

	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
	GetAsString (see page 7099)	This is GetAsString, a member of class TDateTimeField.
	GetAsString (see page 7130)	This is GetAsString, a member of class TField.
	GetAsVariant (see page 7099)	This is GetAsVariant, a member of class TDateTimeField.
	GetAsVariant (see page 7130)	This is GetAsVariant, a member of class TField.
	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
	GetDataSize (see page 7507)	This is GetDataSize, a member of class TTimeField.
	GetDefaultWidth (see page 7100)	This is GetDefaultWidth, a member of class TDateTimeField.
	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7100)	This is GetText, a member of class TDateTimeField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7100)	This is SetAsDateTime, a member of class TDateTimeField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7100)	This is SetAsFloat, a member of class TDateTimeField.
	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 7100)	This is SetAsString, a member of class TDateTimeField.
	SetAsString (see page 7140)	This is SetAsString, a member of class TField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 7101)	This is SetVarValue, a member of class TDateTimeField.
	SetVarValue (see page 7144)	This is SetVarValue, a member of class TField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7126)	Sets the value of the field to NULL.
	Create (see page 7505)	Creates and initializes an instance of TTimeField (see page 7499).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.

	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7103)	Represents the value of the date in the date-time field.
	Value (see page 7180)	Represents the data in a field component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayFormat (see page 7101)	Controls (see page 5711) the formatting of the date-time field for display purposes.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	EditMask (see page 7102)	Contains a mask that restricts the data that can be entered into a data field.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.55.2 TTimeField.Create Constructor

Creates and initializes an instance of TTimeField (see page 7499).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TTimeField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TTimeField (see page 7499). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) property to ftTime. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TTimeField (see page 7499). After instantiating a TTimeField (see page 7499), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TTimeField (see page 7499) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TTimeField (see page 7499) with a dataset component by setting its DataSet (see page 7157) property.

The example below creates a TTimeField (see page 7499) object for a field named CheckOutTime accessed through a TQuery named Query1.

```
var
  T: TimeField;
begin
  Query1.Close;
  T := TTimeField.Create(Query1);
  T.FieldName := 'CheckOutTime';
  T.Name := Query1.Name + T.FieldName;
  T.Index := Query1.FieldCount;
  T.DataSet := Query1;
  Query1.FieldDefs.UpDate;
  Query1.Open;
end;
```

39.1.55.3 TTimeField Methods

The methods of the TTimeField class are listed here.

Protected Methods

	Name	Description
	GetDataSize (see page 7507)	This is GetDataSize, a member of class TTimeField.

39.1.55.3.1 TTimeField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; override;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TTimeField.

39.1.56 TVarBytesField Class

TVarBytesField represents a variable-length untyped binary field in a dataset.

Class Hierarchy

Pascal

```
TVarBytesField = class(TBytesField);
```

C++

```
class TVarBytesField : public TBytesField;
```

File

DB

Description

A variable bytes field value is a set of bytes of variable size, with the actual length of the value stored in the first two bytes.

If you use the Fields editor at design time to create a persistent field component for the variable bytes field, you can access it by name at runtime. When using dynamic field components, you can access the TVarBytesField instance using the dataset's Fields property or FieldByName method.

39.1.56.1 TVarBytesField Members

The following tables list the members exposed by TVarBytesField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 6798)	This is CheckTypeSize, a member of class TBinaryField.
V	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
V	CopyData (see page 6798)	This is CopyData, a member of class TBinaryField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
V	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
V	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
V	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
V	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
V	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
V	GetAsString (see page 6799)	This is GetAsString, a member of class TBinaryField.
V	GetAsString (see page 7130)	This is GetAsString, a member of class TField.
V	GetAsVariant (see page 6799)	This is GetAsVariant, a member of class TBinaryField.
V	GetAsVariant (see page 7130)	This is GetAsVariant, a member of class TField.
V	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
V	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
V	GetDataSize (see page 7514)	This is GetDataSize, a member of class TVarBytesField.
V	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
V	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
V	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetSize (see page 7135)	This is GetSize, a member of class TField.

	GetText (see page 6799)	This is GetText, a member of class TBinaryField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7514)	This is SetAsByteArray, a member of class TVarBytesField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 6799)	This is SetAsString, a member of class TBinaryField.
	SetAsString (see page 7140)	This is SetAsString, a member of class TField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 6799)	This is SetText, a member of class TBinaryField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 6800)	This is SetVarValue, a member of class TBinaryField.
	SetVarValue (see page 7144)	This is SetVarValue, a member of class TField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.

	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7126)	Sets the value of the field to NULL.
	Create (see page 7513)	Creates an instance of TVarBytesField (see page 7507).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.

	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7180)	Represents the data in a field component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.

	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Size (see page 6800)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.56.2 TVarBytesField.Create Constructor

Creates an instance of TVarBytesField (see page 7507).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TVarBytesField(TComponent * AOwner);
```

Description

It is seldom necessary to call Create directly, because a VarBytes field object is instantiated automatically for all variable bytes fields in a dataset.

Create sets the DataType (see page 7159) to ftVarBytes and initializes the Size (see page 6800) property to 16.

See Also

Destroy (see page 7122)

DataType (see page 7159)

Size (see page 7178)

Create (see page 7121)

Owner (see page 2807)

39.1.56.3 TVarBytesField Methods

The methods of the TVarBytesField class are listed here.

Protected Methods

	Name	Description
	GetDataSize (see page 7514)	This is GetDataSize, a member of class TVarBytesField.
	SetAsByteArray (see page 7514)	This is SetAsByteArray, a member of class TVarBytesField.

39.1.56.3.1 TVarBytesField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; override;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TVarBytesField.

39.1.56.3.2 TVarBytesField.SetAsByteArray Method

Pascal

```
procedure SetAsByteArray(const Value: Variant); override;
```

C++

```
virtual __fastcall SetAsByteArray(const Variant Value);
```

Description

This is SetAsByteArray, a member of class TVarBytesField.

39.1.57 TVariantField Class

TVariantField represents a variant field in a dataset.

Class Hierarchy

Pascal

```
TVariantField = class(TField);
```

C++

```
class TVariantField : public TField;
```

File

DB

Description

TVariantField encapsulates the fundamental behavior common to fields that contain Variant data.

If you use the Fields editor at design time to create a persistent field component for the variant field, you can access it by name at runtime. When using dynamic field components, you can access the TVariantField instance using the dataset's Fields property

or FieldByName method.

TDataSet (see page 6894)

TDataSet (see page 6894)

39.1.57.1 TVariantField Members

The following tables list the members exposed by TVariantField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7522)	This is CheckTypeSize, a member of class TVariantField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	GetAsBCD (see page 7522)	This is GetAsBCD, a member of class TVariantField.
V	GetAsBoolean (see page 7522)	This is GetAsBoolean, a member of class TVariantField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
V	GetAsDateTime (see page 7522)	This is GetAsDateTime, a member of class TVariantField.
V	GetAsFloat (see page 7522)	This is GetAsFloat, a member of class TVariantField.
V	GetAsInteger (see page 7523)	This is GetAsInteger, a member of class TVariantField.
V	GetAsSQLTimeStamp (see page 7523)	This is GetAsSQLTimeStamp, a member of class TVariantField.
V	GetAsString (see page 7523)	This is GetAsString, a member of class TVariantField.
V	GetAsVariant (see page 7523)	This is GetAsVariant, a member of class TVariantField.
V	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
V	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.

	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
	GetDataSize (see page 7133)	This is GetDataSize, a member of class TField.
	GetDefaultWidth (see page 7524)	This is GetDefaultWidth, a member of class TVariantField.
	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7524)	This is SetAsBCD, a member of class TVariantField.
	SetAsBoolean (see page 7524)	This is SetAsBoolean, a member of class TVariantField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7524)	This is SetAsDateTime, a member of class TVariantField.
	SetAsFloat (see page 7524)	This is SetAsFloat, a member of class TVariantField.
	SetAsInteger (see page 7525)	This is SetAsInteger, a member of class TVariantField.
	SetAsSQLTimeStamp (see page 7525)	This is SetAsSQLTimeStamp, a member of class TVariantField.
	SetAsString (see page 7525)	This is SetAsString, a member of class TVariantField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 7525)	This is SetVarValue, a member of class TVariantField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7126)	Sets the value of the field to NULL.
	Create (see page 7520)	Creates and initializes a variant field component.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.

R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7180)	Represents the data in a field component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.

	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.57.2 TVariantField.Create Constructor

Creates and initializes a variant field component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TVariantField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TVariantField (see page 7514). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) property to ftVariant. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TVariantField (see page 7514). After instantiating a TVariantField (see page 7514), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TVariantField (see page 7514) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TVariantField (see page 7514) with a dataset component by setting its DataSet (see page 7157) property to the name of the dataset component.

The example below creates a TInterfaceField (see page 7314) object for a field named UnknownData accessed through a TQuery named Query1.

```
var
  T: TInterfaceField;
begin
  Query1.Close;
  T := TInterfaceField.Create(Query1);
  T.FieldName := 'UnknownData';
  T.Name := Query1.Name + T.FieldName;
  T.Index := Query1.FieldCount;
  T.DataSet := Query1;
  Query1.FieldDefs.UpDate;
  Query1.Open;
end;
Query1->Close();
TInterfaceField *T = new TInterfaceField(Query1);
T->FieldName = "UnknownData";
T->Name = Query1->Name + T->FieldName;
T->Index = Query1->FieldCount;
T->DataSet = Query1;
Query1->FieldDefs->UpDate();
Query1->Open();
```

39.1.57.3 TVariantField Methods

The methods of the TVariantField class are listed here.

Protected Methods

	Name	Description
	CheckTypeSize (see page 7522)	This is CheckTypeSize, a member of class TVariantField.
	GetAsBCD (see page 7522)	This is GetAsBCD, a member of class TVariantField.
	GetAsBoolean (see page 7522)	This is GetAsBoolean, a member of class TVariantField.
	GetAsDateTime (see page 7522)	This is GetAsDateTime, a member of class TVariantField.
	GetAsFloat (see page 7522)	This is GetAsFloat, a member of class TVariantField.
	GetAsInteger (see page 7523)	This is GetAsInteger, a member of class TVariantField.
	GetAsSQLTimeStamp (see page 7523)	This is GetAsSQLTimeStamp, a member of class TVariantField.
	GetAsString (see page 7523)	This is GetAsString, a member of class TVariantField.
	GetAsVariant (see page 7523)	This is GetAsVariant, a member of class TVariantField.
	GetDefaultWidth (see page 7524)	This is GetDefaultWidth, a member of class TVariantField.
	SetAsBCD (see page 7524)	This is SetAsBCD, a member of class TVariantField.
	SetAsBoolean (see page 7524)	This is SetAsBoolean, a member of class TVariantField.
	SetAsDateTime (see page 7524)	This is SetAsDateTime, a member of class TVariantField.
	SetAsFloat (see page 7524)	This is SetAsFloat, a member of class TVariantField.
	SetAsInteger (see page 7525)	This is SetAsInteger, a member of class TVariantField.
	SetAsSQLTimeStamp (see page 7525)	This is SetAsSQLTimeStamp, a member of class TVariantField.
	SetAsString (see page 7525)	This is SetAsString, a member of class TVariantField.
	SetVarValue (see page 7525)	This is SetVarValue, a member of class TVariantField.

39.1.57.3.1 TVariantField.CheckTypeSize Method

Pascal

```
class procedure CheckTypeSize(Value: Integer); override;
```

C++

```
virtual __fastcall CheckTypeSize(int Value);
```

Description

This is CheckTypeSize, a member of class TVariantField.

39.1.57.3.2 TVariantField.GetAsBCD Method

Pascal

```
function GetAsBCD: TBcd; override;
```

C++

```
virtual __fastcall TBcd GetAsBCD();
```

Description

This is GetAsBCD, a member of class TVariantField.

39.1.57.3.3 TVariantField.GetAsBoolean Method

Pascal

```
function GetAsBoolean: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetAsBoolean();
```

Description

This is GetAsBoolean, a member of class TVariantField.

39.1.57.3.4 TVariantField.GetAsDateTime Method

Pascal

```
function GetAsDateTime: TDateTime; override;
```

C++

```
virtual __fastcall TDateTime GetAsDateTime();
```

Description

This is GetAsDateTime, a member of class TVariantField.

39.1.57.3.5 TVariantField.GetAsFloat Method

Pascal

```
function GetAsFloat: Double; override;
```

C++

```
virtual __fastcall Double GetAsFloat();
```

Description

This is GetAsFloat, a member of class TVariantField.

39.1.57.3.6 TVariantField.GetAsInteger Method

Pascal

```
function GetAsInteger: Longint; override;
```

C++

```
virtual __fastcall Longint GetAsInteger();
```

Description

This is GetAsInteger, a member of class TVariantField.

39.1.57.3.7 TVariantField.GetAsSQLTimeStamp Method

Pascal

```
function GetAsSQLTimeStamp: TSqlTimeStamp; override;
```

C++

```
virtual __fastcall TSqlTimeStamp GetAsSQLTimeStamp();
```

Description

This is GetAsSQLTimeStamp, a member of class TVariantField.

39.1.57.3.8 TVariantField.GetAsString Method

Pascal

```
function GetAsString: string; override;
```

C++

```
virtual __fastcall AnsiString GetAsString();
```

Description

This is GetAsString, a member of class TVariantField.

39.1.57.3.9 TVariantField.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TVariantField.

39.1.57.3.10 TVariantField.GetDefaultWidth Method

Pascal

```
function GetDefaultWidth: Integer; override;
```

C++

```
virtual __fastcall int GetDefaultWidth();
```

Description

This is GetDefaultWidth, a member of class TVariantField.

39.1.57.3.11 TVariantField.SetAsBCD Method

Pascal

```
procedure SetAsBCD(const Value: TBcd); override;
```

C++

```
virtual __fastcall SetAsBCD(const TBcd Value);
```

Description

This is SetAsBCD, a member of class TVariantField.

39.1.57.3.12 TVariantField.SetAsBoolean Method

Pascal

```
procedure SetAsBoolean(Value: Boolean); override;
```

C++

```
virtual __fastcall SetAsBoolean(Boolean Value);
```

Description

This is SetAsBoolean, a member of class TVariantField.

39.1.57.3.13 TVariantField.SetAsDateTime Method

Pascal

```
procedure SetAsDateTime(Value: TDateTime); override;
```

C++

```
virtual __fastcall SetAsDateTime(TDateTime Value);
```

Description

This is SetAsDateTime, a member of class TVariantField.

39.1.57.3.14 TVariantField.SetAsFloat Method

Pascal

```
procedure SetAsFloat(Value: Double); override;
```

C++

```
virtual __fastcall SetAsFloat(Double Value);
```

Description

This is SetAsFloat, a member of class TVariantField.

39.1.57.3.15 TVariantField.SetAsInteger Method

Pascal

```
procedure SetAsInteger(Value: Longint); override;
```

C++

```
virtual __fastcall SetAsInteger(Longint Value);
```

Description

This is SetAsInteger, a member of class TVariantField.

39.1.57.3.16 TVariantField.SetAsSQLTimeStamp Method

Pascal

```
procedure SetAsSQLTimeStamp(const Value: TSqlTimeStamp); override;
```

C++

```
virtual __fastcall SetAsSQLTimeStamp(const TSqlTimeStamp Value);
```

Description

This is SetAsSQLTimeStamp, a member of class TVariantField.

39.1.57.3.17 TVariantField.SetAsString Method

Pascal

```
procedure SetAsString(const Value: string); override;
```

C++

```
virtual __fastcall SetAsString(const AnsiString Value);
```

Description

This is SetAsString, a member of class TVariantField.

39.1.57.3.18 TVariantField.SetVarValue Method

Pascal

```
procedure SetVarValue(const Value: Variant); override;
```

C++

```
virtual __fastcall SetVarValue(const Variant Value);
```

Description

This is SetVarValue, a member of class TVariantField.

39.1.58 TWideDataSet Class

Base class for all dataset components that represent Unicode data in rows and columns.

Class Hierarchy

Pascal

```
TWideDataSet = class(TDataSet, IProviderSupport2);
```

C++

```
class TWideDataSet : public TDataSet, public IProviderSupport2;
```

File

DB

Description

TWideDataSet introduces the basic properties, events, and methods for working with Unicode data.

The TWideDataSet class extends TDataSet (see page 6894) to support the Unicode string type. TWideDataSet inherits the behavior of TDataSet (see page 6894) and TDataSet (see page 6894)'s IProviderSupport (see page 7576) interface, and TWideDataSet supports IProviderSupport2 (see page 7587).

BDE does not support a Unicode type, so TTable and TQuery are derived from TDataSet (see page 6894). However, TADODataSet and TSQLDataSet (dbExpress) derive from TWideDataSet, because ADO and dbExpress need to support Unicode data.

See Also

IProviderSupport2 (see page 7587)

TADODataSet (see page 1041)

TDataSet (see page 6894)

TSQLDataSet (see page 20265)

39.1.58.1 TWideDataSet Members

The following tables list the members exposed by TWideDataSet.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.

	_Release (see page 2769)	Called when an application releases a component interface.
V	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.
V	AllocRecordBuffer (see page 6909)	This is AllocRecordBuffer, a member of class TDataSet.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
V	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
V	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CheckActive (see page 6917)	This is CheckActive, a member of class TDataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
V	CheckFieldCompatibility (see page 6919)	This is CheckFieldCompatibility, a member of class TDataSet.
V	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
V	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.
V	ClearCalcFields (see page 6919)	This is ClearCalcFields, a member of class TDataSet.
V	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
V	CloseCursor (see page 6921)	This is CloseCursor, a member of class TDataSet.
V	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
V	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
V	DataConvert (see page 6924)	This is DataConvert, a member of class TDataSet.
V	DataEvent (see page 6924)	This is DataEvent, a member of class TDataSet.
V	DefChanged (see page 6924)	This is DefChanged, a member of class TDataSet.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
V	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.
V	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
V	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
V	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.
V	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
V	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
V	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.
V	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.
V	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
V	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
V	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
V	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
V	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
V	DoBeforeInsert (see page 6930)	This is DoBeforeInsert, a member of class TDataSet.
V	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
V	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
V	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
V	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.
V	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
V	DoOnNewRecord (see page 6931)	This is DoOnNewRecord, a member of class TDataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.
V	FindRecord (see page 6942)	This is FindRecord, a member of class TDataSet.
V	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
V	FreeRecordBuffer (see page 6947)	This is FreeRecordBuffer, a member of class TDataSet.
V	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.
V	GetAggregateValue (see page 6947)	This is GetAggregateValue, a member of class TDataSet.
V	GetBookmarkData (see page 6949)	This is GetBookmarkData, a member of class TDataSet.

	GetBookmarkFlag (see page 6949)	This is GetBookmarkFlag, a member of class TDataSet.
	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
	GetCanModify (see page 6950)	This is GetCanModify, a member of class TDataSet.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.
	GetDataSource (see page 6951)	This is GetDataSource, a member of class TDataSet.
	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
	GetIsIndexField (see page 6954)	This is GetIsIndexField, a member of class TDataSet.
	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.
	GetRecNo (see page 6956)	This is GetRecNo, a member of class TDataSet.
	GetRecord (see page 6956)	This is GetRecord, a member of class TDataSet.
	GetRecordCount (see page 6956)	This is GetRecordCount, a member of class TDataSet.
	GetRecordSize (see page 6956)	This is GetRecordSize, a member of class TDataSet.
	GetStateFieldValue (see page 6956)	This is GetStateFieldValue, a member of class TDataSet.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
	InitRecord (see page 6959)	This is InitRecord, a member of class TDataSet.
	InternalAddRecord (see page 6963)	This is InternalAddRecord, a member of class TDataSet.
	InternalCancel (see page 6963)	This is InternalCancel, a member of class TDataSet.
	InternalClose (see page 6963)	This is InternalClose, a member of class TDataSet.
	InternalDelete (see page 6964)	This is InternalDelete, a member of class TDataSet.
	InternalEdit (see page 6964)	This is InternalEdit, a member of class TDataSet.
	InternalFirst (see page 6964)	This is InternalFirst, a member of class TDataSet.
	InternalGotoBookmark (see page 6964)	This is InternalGotoBookmark, a member of class TDataSet.
	InternalHandleException (see page 6964)	This is InternalHandleException, a member of class TDataSet.
	InternalInitFieldDefs (see page 6965)	This is InternalInitFieldDefs, a member of class TDataSet.
	InternalInitRecord (see page 6965)	This is InternalInitRecord, a member of class TDataSet.
	InternalInsert (see page 6965)	This is InternalInsert, a member of class TDataSet.
	InternalLast (see page 6965)	This is InternalLast, a member of class TDataSet.
	InternalOpen (see page 6966)	This is InternalOpen, a member of class TDataSet.
	InternalPost (see page 6966)	This is InternalPost, a member of class TDataSet.
	InternalRefresh (see page 6966)	This is InternalRefresh, a member of class TDataSet.
	InternalSetToRecord (see page 6966)	This is InternalSetToRecord, a member of class TDataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsCursorOpen (see page 6966)	This is IsCursorOpen, a member of class TDataSet.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 6969)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	OpenCursor (see page 6976)	This is OpenCursor, a member of class TDataSet.

	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	PSEndTransaction (see page 6979)	Ends a transaction that was started by a call to PSStartTransaction.
V	PSExecute (see page 6980)	Executes the SQL command associated with the dataset.
V	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
V	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
V	PSGetAttributes (see page 6981)	Returns information that is stored in data packets as Name/Value pairs.
V	PSGetCommandText (see page 7537)	Gets the SQL command to be executed by PSExecute.
V	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
V	PSGetCommandType (see page 6982)	Gets the command type to be executed by PSExecute.
V	PSGetDefaultOrder (see page 6983)	Returns the definition of an index that imposes the default order on the data included in data packets.
V	PSGetIndexDefs (see page 6983)	Returns the definitions of all specified indexes defined for the dataset.
V	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
V	PSGetKeyFieldsW (see page 7538)	This is PSGetKeyFieldsW, a member of class TWideDataSet.
V	PSGetParams (see page 6984)	Returns the current parameter values of the dataset.
V	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
V	PSGetQuoteCharW (see page 7539)	This is PSGetQuoteCharW, a member of class TWideDataSet.
V	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
V	PSGetTableNameW (see page 7539)	This is PSGetTableNameW, a member of class TWideDataSet.
V	PSGetUpdateException (see page 6986)	Generates an EUpdateError object based on another exception object.
V	PSInTransaction (see page 6987)	Indicates whether actions against the dataset occur in the context of a transaction.
V	PSIsSQLBased (see page 6987)	Indicates whether the dataset includes native SQL support.
V	PSIsSQLSupported (see page 6987)	Indicates whether the dataset can execute SQL statements.
V	PSReset (see page 6988)	Resets the dataset so that it is positioned on the first record.
V	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
V	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
V	PSSetParams (see page 6989)	Assigns the specified parameter values to the dataset.
V	PSStartTransaction (see page 6989)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
V	PSUpdateRecord (see page 6990)	Applies a single update to the underlying database table or tables.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	RefreshInternalCalcFields (see page 6993)	This is RefreshInternalCalcFields, a member of class TDataSet.
V	ResetAggField (see page 6993)	This is ResetAggField, a member of class TDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
V	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetBlockReadSize (see page 6994)	This is SetBlockReadSize, a member of class TDataSet.
V	SetBookmarkData (see page 6994)	This is SetBookmarkData, a member of class TDataSet.
V	SetBookmarkFlag (see page 6995)	This is SetBookmarkFlag, a member of class TDataSet.
V	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
V	SetBufListSize (see page 6995)	This is SetBufListSize, a member of class TDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.
V	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
V	SetDataSetField (see page 6996)	This is SetDataSetField, a member of class TDataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.
V	SetFiltered (see page 6997)	This is SetFiltered, a member of class TDataSet.
V	SetFilterOptions (see page 6998)	This is SetFilterOptions, a member of class TDataSet.

V	SetFilterText (see page 6998)	This is SetFilterText, a member of class TDataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 6999)	Sets the value of the Name property.
	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
V	SetOnFilterRecord (see page 6999)	This is SetOnFilterRecord, a member of class TDataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetRecNo (see page 6999)	This is SetRecNo, a member of class TDataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
V	SetStateFieldValue (see page 7000)	This is SetStateFieldValue, a member of class TDataSet.
	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.
	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateIndexDefs (see page 7002)	This is UpdateIndexDefs, a member of class TDataSet.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.
R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.
R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.
R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.
	Constraints (see page 7013)	Specifies record-level constraints that must be met when editing the data.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.
	Reserved (see page 7035)	For internal use only.

Public Events

	Name	Description
	AfterCancel (see page 7038)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 7040)	Occurs after an application closes a dataset.
	AfterDelete (see page 7041)	Occurs after an application deletes a record.

	AfterEdit (see page 7044)	Occurs after an application starts editing a record.
	AfterInsert (see page 7044)	Occurs after an application inserts a new record.
	AfterOpen (see page 7045)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 7046)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 7047)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 7047)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 7048)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 7048)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 7049)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 7049)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 7050)	Occurs before an application enters insert mode.
	BeforeOpen (see page 7051)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 7052)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 7052)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 7053)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 7053)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 7054)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 7054)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 7055)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 7056)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 7056)	Occurs when an application attempts to modify or insert a record and an exception is raised.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BookmarkValid (see page 6916)	Indicates the validity of a specified bookmark.
V	Cancel (see page 6916)	Cancels modifications to the active record if those changes are not yet posted.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
	Close (see page 6920)	Closes a dataset.
V	CompareBookmarks (see page 6921)	Implements a virtual function to compare two bookmarks.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.

	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 6904)	Creates an instance of a TDataSet (see page 6894) component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateBlobStream (see page 6922)	Provides the interface for a method that creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 6904)	Destroys the TDataSet (see page 6894) instance.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.
	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetBlobFieldData (see page 6947)	Reads BLOB data into a buffer.
	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentRecord (see page 6950)	Implements a virtual function to retrieve the current record in a buffer.
	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
	GetDetailLinkFields (see page 6951)	Introduces a method to list the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.

	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.
V	IsSequenced (see page 6967)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	Last (see page 6968)	Moves to the last record in the dataset.
V	Locate (see page 6970)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
V	Lookup (see page 6970)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 6973)	Moves to the next record in the dataset.
	Open (see page 6976)	Opens the dataset.
V	Post (see page 6977)	Implements a virtual method to write a modified record to the database or change log.
	Prior (see page 6979)	Moves to the previous record in the dataset.
	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandType (see page 7580)	Gets the command type to be executed by PSExecute (see page 7578).
	PSGetCommandType (see page 7591)	Gets the command type to be executed by PSExecute (see page 7590).
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7581)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 7592)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.
	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.

	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).
	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetFields (see page 6997)	Sets the values for all fields in a record
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.
	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 7002)	Reports the update status for the active record.

Public Properties

	Name	Description
	Active (see page 7004)	Specifies whether or not a dataset is open.
R	AggFields (see page 7006)	Contains any aggregate fields.
	AutoCalcFields (see page 7006)	Determines when the OnCalcFields (see page 7053) event is triggered and when lookup field values are calculated.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.
	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DataSetField (see page 7013)	Indicates the persistent TDataSetField (see page 7060) object that owns a nested dataset.
R	DataSource (see page 7014)	Represents the data source of another dataset that supplies values to the dataset.
R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.

	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.
R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
	FieldDefs (see page 7019)	Points to the list of field definitions for the dataset.
R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset
	Filter (see page 7026)	Specifies the text of the current filter for a dataset.
	Filtered (see page 7027)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 7027)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
R	Modified (see page 7029)	Indicates whether the active record is modified.
	ObjectView (see page 7031)	Specifies whether fields are stored hierarchically or flattened out in the Fields (see page 7023) property.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 7032)	Indicates the total number of records associated with the dataset.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.
	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

39.1.58.2 TWideDataSet Methods

The methods of the TWideDataSet class are listed here.

Protected Methods

	Name	Description
V	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
V	PSGetCommandText (see page 7537)	Gets the SQL command to be executed by PSExecute.
V	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
V	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
V	PSGetKeyFieldsW (see page 7538)	This is PSGetKeyFieldsW, a member of class TWideDataSet.
V	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
V	PSGetQuoteCharW (see page 7539)	This is PSGetQuoteCharW, a member of class TWideDataSet.
V	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
V	PSGetTableNameW (see page 7539)	This is PSGetTableNameW, a member of class TWideDataSet.
V	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.

39.1.58.2.1 PSExecuteStatement Method

This is the overview for the PSExecuteStatement method overload.

Overload List

	Name	Description
	TWideDataSet.PSExecuteStatement (string, TParams, Pointer) (see page 7536)	Executes a specified SQL command.
	TWideDataSet.PSExecuteStatement (WideString, TParams, Pointer) (see page 7536)	Executes a specified SQL command.

39.1.58.2.1.1 TWideDataSet.PSExecuteStatement Method (WideString, TParams, Pointer)

Executes a specified SQL command.

Pascal

```
function PSExecuteStatement(const ASQL: WideString; AParams: TParams; ResultSet: Pointer =
nil): Integer; override; overload;
```

C++

```
virtual __fastcall int PSExecuteStatement(const BSTR ASQL, TParams AParams, void * ResultSet =
nil);
```

Description

If the value of its ResolveToDataSet property is false, a provider component calls PSExecuteStatement (indirectly) to execute SQL statements that it generates for applying updates. Usually, the dataset passes these statements on to its database server for execution.

The ASQL parameter specifies the SQL command to execute.

AParams contains any parameter values that should be applied to ASQL before execution.

ResultSet allows PSExecuteStatement to return a dataset component that contains the results of a SELECT statement. If ResultSet is not nil (Delphi) or NULL (C++), PSExecuteStatement creates a new dataset component as the target of this pointer and fills it with the result set. The caller is responsible for freeing the dataset.

PSExecuteStatement returns the number of rows affected by executing ASQL.

See Also

PSUpdateRecord (see page 7598)

applyupdates (see page 18459)

ResolveToDataSet (see page 18531)

39.1.58.2.1.2 TWideDataSet.PSExecuteStatement Method (string, TParams, Pointer)

Executes a specified SQL command.

Pascal

```
function PSExecuteStatement(const ASQL: string; AParams: TParams; ResultSet: Pointer = nil):
Integer; override; overload; deprecated;
```

C++

```
virtual __fastcall int PSExecuteStatement(const AnsiString ASQL, TParams AParams, void *
ResultSet = nil);
```

Description

If the value its ResolveToDataSet property is false, a provider component calls PSExecuteStatement (indirectly) to execute SQL

statements that it generates for applying updates. Usually, the dataset passes these statements on to its database server for execution.

The ASQL parameter specifies the SQL command to execute.

AParams contains any parameter values that should be applied to ASQL before execution.

ResultSet allows PSExecuteStatement to return a dataset component that contains the results of a SELECT statement. If ResultSet is not nil (Delphi) or NULL (C++), PSExecuteStatement creates a new dataset component as the target of this pointer and fills it with the result set. The caller is responsible for freeing the dataset.

PSExecuteStatement returns the number of rows affected by executing ASQL.

PSUpdateRecord (see page 7586)

applyupdates (see page 18459)

ResolveToDataSet (see page 18531)

39.1.58.2.2 TWideDataSet.PSGetCommandText Method

Gets the SQL command to be executed by PSExecute.

Pascal

```
function PSGetCommandText: string; override; deprecated;
```

C++

```
virtual __fastcall AnsiString PSGetCommandText();
```

Description

If the provider's Options property includes poAllowCommandText, clients can supply an SQL command along with a call to GetRecords or Execute. This command is passed to the dataset by a call to PSSetCommandText, and subsequently executed by a call to PSExecute.

See Also

CommandText (see page 8465)

PSExecute (see page 7578)

PSSetCommandText (see page 7585)

GetRecords (see page 18468)

Execute (see page 18466)

Options (see page 18440)

39.1.58.2.3 TWideDataSet.PSGetCommandTextW Method

Pascal

```
function PSGetCommandTextW: WideString; override;
```

C++

```
virtual __fastcall BSTR PSGetCommandTextW();
```

Description

This is PSGetCommandTextW, a member of class TWideDataSet.

39.1.58.2.4 TWideDataSet.PSGetKeyFields Method

Returns the names of all fields required to uniquely identify records in the data packet.

Pascal

```
function PSGetKeyFields: string; override; deprecated;
```

C++

```
virtual __fastcall AnsiString PSGetKeyFields();
```

Description

The provider component calls PSGetKeyFields to determine what information is required to uniquely identify records in the data packet. This information allows it to locate the records that need to change when it applies updates.

PSGetKeyFields returns a semicolon-delimited string that lists the names of the key fields of the dataset. By default (as implemented by TDataSet), these are the fields with pfInKey included in their ProviderFlags property.

See Also

PSGetDefaultOrder (see page 7580)

ProviderFlags (see page 7176)

PSGetIndexDefs (see page 7581)

39.1.58.2.5 TWideDataSet.PSGetKeyFieldsW Method

Pascal

```
function PSGetKeyFieldsW: WideString; override;
```

C++

```
virtual __fastcall BSTR PSGetKeyFieldsW();
```

Description

This is PSGetKeyFieldsW, a member of class TWideDataSet.

39.1.58.2.6 TWideDataSet.PSGetQuoteChar Method

Returns the character or characters to use in generated SQL statements to enclose quoted strings.

Pascal

```
function PSGetQuoteChar: string; override; deprecated;
```

C++

```
virtual __fastcall AnsiString PSGetQuoteChar();
```

Description

The provider component calls PSGetQuoteChar (indirectly) when generating the dynamic SQL statements that apply updates. These statements are subsequently executed by a call to PSExecuteStatement.

PSGetQuoteChar returns the character or characters that delimit quoted strings in the generated SQL. This string appears both before and after quoted strings.

See Also

applyupdates (see page 18459)

PSExecuteStatement (see page 7579)

ResolveToDataSet (see page 18531)

39.1.58.2.7 TWideDataSet.PSGetQuoteCharW Method

Pascal

```
function PSGetQuoteCharW: WideString; override;
```

C++

```
virtual __fastcall BSTR PSGetQuoteCharW();
```

Description

This is PSGetQuoteCharW, a member of class TWideDataSet.

39.1.58.2.8 TWideDataSet.PSGetTableName Method

Returns the name of the dataset table that appears in generated SQL statements.

Pascal

```
function PSGetTableName: string; override; deprecated;
```

C++

```
virtual __fastcall AnsiString PSGetTableName();
```

Description

PSGetTableName returns the name of the underlying database table against which updates are applied when the provider's ResolveToDataSet property is false. This value is used for generating the SQL statements that apply updates. The generated SQL statements are subsequently executed by a call to PSExecuteStatement.

If PSGetTableName does not return a table name, the provider must have an OnGetTableName event handler to supply this value.

See Also

applyupdates (see page 18459)

PSExecuteStatement (see page 7579)

ResolveToDataSet (see page 18531)

ongettablename (see page 18542)

39.1.58.2.9 TWideDataSet.PSGetTableNameW Method

Pascal

```
function PSGetTableNameW: WideString; override;
```

C++

```
virtual __fastcall BSTR PSGetTableNameW();
```

Description

This is PSGetTableNameW, a member of class TWideDataSet.

39.1.58.2.10 PSSetCommandText Method

This is the overview for the PSSetCommandText method overload.

Overload List

	Name	Description
	TWideDataSet.PSSetCommandText (string) (see page 7540)	Assigns a specified SQL command to be executed by PSExecute.
	TWideDataSet.PSSetCommandText (WideString) (see page 7540)	Assigns a specified SQL command to be executed by PSExecute.

39.1.58.2.10.1 TWideDataSet.PSSetCommandText Method (WideString)

Assigns a specified SQL command to be executed by PSExecute.

Pascal

```
procedure PSSetCommandText(const CommandText: WideString); override; overload;
```

C++

```
virtual __fastcall PSSetCommandText(const BSTR CommandText);
```

Description

If the provider's Options property includes poAllowCommandText, clients can supply an SQL command along with a call to GetRecords or Execute. This command is passed to the dataset by a call to PSSetCommandText, and subsequently executed by a call to PSExecute.

The value of the CommandText parameter replaces the dataset's SQL statement (if it has one), or replaces the name of an underlying database table or stored procedure.

See Also

CommandText (see page 8465)

PSExecute (see page 7590)

GetRecords (see page 18468)

Execute (see page 18466)

Options (see page 18440)

39.1.58.2.10.2 TWideDataSet.PSSetCommandText Method (string)

Assigns a specified SQL command to be executed by PSExecute.

Pascal

```
procedure PSSetCommandText(const CommandText: string); override; overload; deprecated;
```

C++

```
virtual __fastcall PSSetCommandText(const AnsiString CommandText);
```

Description

If the provider's Options property includes poAllowCommandText, clients can supply an SQL command along with a call to GetRecords or Execute. This command is passed to the dataset by a call to PSSetCommandText, and subsequently executed by a call to PSExecute.

The value of the CommandText parameter replaces the dataset's SQL statement (if it has one), or replaces the name of an underlying database table or stored procedure.

See Also

CommandText (see page 8465)

PSExecute (see page 7578)

GetRecords (see page 18468)

Execute (see page 18466)

Options (see page 18440)

39.1.59 TWideMemoField Class

TWideMemoField represents a memo field in a dataset.

Class Hierarchy

Pascal

```
TWideMemoField = class(TBlobField);
```

C++

```
class TWideMemoField : public TBlobField;
```

File

DB

Description

TWideMemoField encapsulates the fundamental behavior common to fields that contain wide text data of arbitrary length. Memo fields are a form of binary large object (BLOB) field where the data consists of simple text.

See Also

TDataSet (see page 6894)

TGraphicField (see page 7257)

TDBMemo (see page 9149)

TBlobField (see page 6801)

TDataSet (see page 6894)

TField (see page 7115)

TMemoField (see page 7348)

39.1.59.1 TWideMemoField Members

The following tables list the members exposed by TWideMemoField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 6810)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 6811)	This is FreeBuffers, a member of class TBlobField.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
V	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
V	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
V	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
V	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
V	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
V	GetAsString (see page 7548)	This is GetAsString, a member of class TWideMemoField.
V	GetAsVariant (see page 6811)	This is GetAsVariant, a member of class TBlobField.
V	GetAsVariant (see page 7130)	This is GetAsVariant, a member of class TField.
V	GetAsWideString (see page 6812)	This is GetAsWideString, a member of class TBlobField.
V	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
V	GetBlobSize (see page 6812)	This is GetBlobSize, a member of class TBlobField.
V	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClassDesc (see page 6812)	This is GetClassDesc, a member of class TBlobField.
V	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
V	GetDataSize (see page 7133)	This is GetDataSize, a member of class TField.
V	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
V	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
V	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetIsNull (see page 6812)	This is GetIsNull, a member of class TBlobField.
V	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.

	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 6812)	This is GetText, a member of class TBlobField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 7548)	This is SetAsString, a member of class TWideMemoField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 6817)	This is SetAsWideString, a member of class TBlobField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 6818)	This is SetText, a member of class TBlobField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 6818)	This is SetVarValue, a member of class TBlobField.
	SetVarValue (see page 7144)	This is SetVarValue, a member of class TField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	Assign (see page 6809)	Copies a value to the BLOB field.
V	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 6810)	Clears the current value in the BLOB field.
V	Clear (see page 7126)	Sets the value of the field to NULL.
V	Create (see page 7547)	Creates an instance of TWideMemoField (see page 7541).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsBlob (see page 6813)	Indicates that this is a BLOB field.
V	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	LoadFromFile (see page 6814)	Loads BLOB data from a file into the field.
	LoadFromStream (see page 6815)	Loads BLOB data from a stream into the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 6816)	Saves the contents of the BLOB field to a file.
	SaveToStream (see page 6816)	Saves the contents of the BLOB field to a stream.
	SetData (see page 7141)	Assigns unformatted data to the field.
V	SetFieldType (see page 6817)	Specifies the type of the BLOB field.
V	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
V	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.

	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
R	BlobSize (see page 6819)	Indicates the number of bytes of data contained in the blob field on the current record.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	Modified (see page 6820)	Indicates whether a the value for the BLOB field was changed since it was last read from the underlying database.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	Transliterate (see page 6821)	Determines whether any text in the BLOB field should be converted to and from the character set identified by the dataset.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7549)	Value of instance's text.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	BlobType (see page 6819)	Identifies the type of the BLOB field associated with a BLOB field object.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
	GraphicHeader (see page 6820)	Indicates whether the field's value includes a Paradox graphic BLOB header.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Size (see page 6820)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.59.2 TWideMemoField.Create Constructor

Creates an instance of TWideMemoField (see page 7541).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWideMemoField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TWideMemoField (see page 7541).

Create sets the DataType (see page 7159) property to ftWideMemo. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

See Also

Destroy (see page 7122)

DataType (see page 7159)

Create (see page 7121)

Transliterate (see page 6821)

Owner (see page 2807)

39.1.59.3 TWideMemoField Methods

The methods of the TWideMemoField class are listed here.

Protected Methods

	Name	Description
	GetAsString (see page 7548)	This is GetAsString, a member of class TWideMemoField.
	SetAsString (see page 7548)	This is SetAsString, a member of class TWideMemoField.

39.1.59.3.1 TWideMemoField.GetAsString Method

Pascal

```
function GetAsString: string; override;
```

C++

```
virtual __fastcall AnsiString GetAsString();
```

Description

This is GetAsString, a member of class TWideMemoField.

39.1.59.3.2 TWideMemoField.SetAsString Method

Pascal

```
procedure SetAsString(const Value: string); override;
```

C++

```
virtual __fastcall SetAsString(const AnsiString Value);
```

Description

This is SetAsString, a member of class TWideMemoField.

39.1.59.4 TWideMemoField Properties

The properties of the TWideMemoField class are listed here.

Public Properties

	Name	Description
	Value (see page 7549)	Value of instance's text.

39.1.59.4.1 TWideMemoField.Value Property

Value of instance's text.

Pascal

```
property Value: WideString;
```

C++

```
__property BSTR Value;
```

Description

Value reads and writes the instance's text as a WideString.

See Also

TMemoField (see page 7348)

39.1.60 TWideStringField Class

TWideStringField represents a large string field in a dataset.

Class Hierarchy

Pascal

```
TWideStringField = class(TStringField);
```

C++

```
class TWideStringField : public TStringField;
```

File

DB

Description

TWideStringField encapsulates the fundamental behavior common to wide string fields. Wide string fields are similar to simple string fields except that their storage capacity is virtually unlimited and the server specifically returns the field as wide string and not string. An example of a wide string field is the Unicode field in Microsoft SQL Server. In all other ways, wide string fields serve the same purpose as string fields.

If you use the Fields editor at design time to create a persistent field component for the wide string field, you can access it by name at runtime. When using dynamic field components, you can access the TWideStringField instance using the dataset's

Fields property or FieldByName method.

TDataSet (see page 6894)

TDataSet (see page 6894)

39.1.60.1 TWideStringField Members

The following tables list the members exposed by TWideStringField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7557)	This is CheckTypeSize, a member of class TWideStringField.
V	CopyData (see page 7557)	This is CopyData, a member of class TWideStringField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
V	GetAsBCD (see page 7492)	This is GetAsBCD, a member of class TStringField.
V	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
V	GetAsBoolean (see page 7492)	This is GetAsBoolean, a member of class TStringField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
V	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
V	GetAsDateTime (see page 7492)	This is GetAsDateTime, a member of class TStringField.
V	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
V	GetAsFloat (see page 7492)	This is GetAsFloat, a member of class TStringField.
V	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
V	GetAsInteger (see page 7493)	This is GetAsInteger, a member of class TStringField.
V	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
V	GetAsSQLTimeStamp (see page 7493)	This is GetAsSQLTimeStamp, a member of class TStringField.
V	GetAsString (see page 7557)	This is GetAsString, a member of class TWideStringField.
V	GetAsVariant (see page 7558)	This is GetAsVariant, a member of class TWideStringField.

	GetAsWideString (see page 7558)	This is GetAsWideString, a member of class TWideStringField.
	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
	GetDataSize (see page 7558)	This is GetDataSize, a member of class TWideStringField.
	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
	GetDefaultWidth (see page 7494)	This is GetDefaultWidth, a member of class TStringField.
	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetText (see page 7494)	This is GetText, a member of class TStringField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 7558)	This is GetValue, a member of class TWideStringField.
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBCD (see page 7494)	This is SetAsBCD, a member of class TStringField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsBoolean (see page 7495)	This is SetAsBoolean, a member of class TStringField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsDateTime (see page 7495)	This is SetAsDateTime, a member of class TStringField.
	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsFloat (see page 7495)	This is SetAsFloat, a member of class TStringField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsInteger (see page 7495)	This is SetAsInteger, a member of class TStringField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsSQLTimeStamp (see page 7495)	This is SetAsSQLTimeStamp, a member of class TStringField.
	SetAsString (see page 7558)	This is SetAsString, a member of class TWideStringField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7559)	This is SetAsWideString, a member of class TWideStringField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.

	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
V	SetSize (see page 7143)	This is SetSize, a member of class TField.
V	SetText (see page 7144)	This is SetText, a member of class TField.
V	SetVarValue (see page 7559)	This is SetVarValue, a member of class TWideStringField.
V	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 7126)	Sets the value of the field to NULL.
V	Create (see page 7555)	Creates an instance of a TWideStringField (see page 7549) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.
	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.

	Value (see page 7559)	Represents the data in the string field.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	EditMask (see page 7496)	Contains a mask that restricts the data that can be entered into a data field.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
	FixedChar (see page 7497)	Specifies whether the represented field is of Char type.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Size (see page 7497)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Transliterate (see page 7498)	Determines whether text should be converted to and from the character set identified by the dataset.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.60.2 TWideStringField.Create Constructor

Creates an instance of a TWideStringField (see page 7549) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWideStringField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TWideStringField (see page 7549). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created automatically by the dataset.

Create sets the DataType (see page 7159) property to ftWideString, Size (see page 7497) to 20, and Transliterate (see page 7498) to true. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TWideStringField (see page 7549). After instantiating a TWideStringField (see page 7549), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TWideStringField (see page 7549) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TWideStringField (see page 7549) with a dataset component by setting its DataSet (see page 7157) property.

The example below creates a TWideStringField (see page 7549) object for a field named BookList accessed through a TQuery named Query1.

```
var
  T: TWideStringField;
begin
  Query1.Close;
  T := TWideStringField.Create(Query1);
  T.FieldName := 'BookList';
  T.Name := Query1.Name + T.FieldName;
  T.Index := Query1.FieldCount;
  T.DataSet := Query1;
  Query1.FieldDefs.UpDate;
  Query1.Open;
end;
TWideStringField *T;
Query1->Close();
T = new TWideStringField(Query1);
T->FieldName = "LastName";
T->Name = Query1->Name + T->FieldName;
T->Index = Query1->FieldCount;
T->DataSet = Query1;
Query1->FieldDefs->UpDate();
Query1->Open();
```

39.1.60.3 TWideStringField Methods

The methods of the TWideStringField class are listed here.

Protected Methods

	Name	Description
	CheckTypeSize (see page 7557)	This is CheckTypeSize, a member of class TWideStringField.
	CopyData (see page 7557)	This is CopyData, a member of class TWideStringField.
	GetAsString (see page 7557)	This is GetAsString, a member of class TWideStringField.
	GetAsVariant (see page 7558)	This is GetAsVariant, a member of class TWideStringField.
	GetAsWideString (see page 7558)	This is GetAsWideString, a member of class TWideStringField.
	GetDataSize (see page 7558)	This is GetDataSize, a member of class TWideStringField.
	GetValue (see page 7558)	This is GetValue, a member of class TWideStringField.
	SetAsString (see page 7558)	This is SetAsString, a member of class TWideStringField.
	SetAsWideString (see page 7559)	This is SetAsWideString, a member of class TWideStringField.
	SetVarValue (see page 7559)	This is SetVarValue, a member of class TWideStringField.

39.1.60.3.1 TWideStringField.CheckTypeSize Method

Pascal

```
class procedure CheckTypeSize(Value: Integer); override;
```

C++

```
virtual __fastcall CheckTypeSize(int Value);
```

Description

This is CheckTypeSize, a member of class TWideStringField.

39.1.60.3.2 TWideStringField.CopyData Method

Pascal

```
procedure CopyData(Source: Pointer; Dest: Pointer); override;
```

C++

```
virtual __fastcall CopyData(void * Source, void * Dest);
```

Description

This is CopyData, a member of class TWideStringField.

39.1.60.3.3 TWideStringField.GetAsString Method

Pascal

```
function GetAsString: string; override;
```

C++

```
virtual __fastcall AnsiString GetAsString();
```

Description

This is GetAsString, a member of class TWideStringField.

39.1.60.3.4 TWideStringField.GetAsVariant Method

Pascal

```
function GetAsVariant: Variant; override;
```

C++

```
virtual __fastcall Variant GetAsVariant();
```

Description

This is GetAsVariant, a member of class TWideStringField.

39.1.60.3.5 TWideStringField.GetAsWideString Method

Pascal

```
function GetAsWideString: WideString; override;
```

C++

```
virtual __fastcall BSTR GetAsWideString();
```

Description

This is GetAsWideString, a member of class TWideStringField.

39.1.60.3.6 TWideStringField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; override;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TWideStringField.

39.1.60.3.7 TWideStringField.GetValue Method

Pascal

```
function GetValue(var Value: WideString): Boolean;
```

C++

```
__fastcall Boolean GetValue(BSTR Value);
```

Description

This is GetValue, a member of class TWideStringField.

39.1.60.3.8 TWideStringField.SetAsString Method

Pascal

```
procedure SetAsString(const Value: string); override;
```

C++

```
virtual __fastcall SetAsString(const AnsiString Value);
```

Description

This is SetAsString, a member of class TWideStringField.

39.1.60.3.9 TWideStringField.SetAsWideString Method

Pascal

```
procedure SetAsWideString(const Value: WideString); override;
```

C++

```
virtual __fastcall SetAsWideString(const BSTR Value);
```

Description

This is SetAsWideString, a member of class TWideStringField.

39.1.60.3.10 TWideStringField.SetVarValue Method

Pascal

```
procedure SetVarValue(const Value: Variant); override;
```

C++

```
virtual __fastcall SetVarValue(const Variant Value);
```

Description

This is SetVarValue, a member of class TWideStringField.

39.1.60.4 TWideStringField Properties

The properties of the TWideStringField class are listed here.

Public Properties

	Name	Description
	Value (see page 7559)	Represents the data in the string field.

39.1.60.4.1 TWideStringField.Value Property

Represents the data in the string field.

Pascal

```
property Value: WideString;
```

C++

```
__property BSTR Value;
```

Description

Use Value to read data directly from and write data directly to a string field component at runtime. Using the Value property is the same as using the AsString (see page 7151) property. Use Value when you know the field component is a wide string field. Use AsString (see page 7151) when working with a generic field component.

When setting the Value property, TWideStringField (see page 7549) converts the assigned string from UTF-8 or ANSI to the character set for the dataset if the Transliterate (see page 7498) property is true. Strings that have more characters than permitted by the value of the Size (see page 7497) property are truncated when setting Value.

```
Table1TheWideStringField.Value := WideStringVariable;
```

See Also

AsString

Size (see page 7178)

Transliterate (see page 7498)

39.1.61 TWordField Class

TWordField represents an unsigned 16-bit integer field in a dataset.

Class Hierarchy

Pascal

```
TWordField = class(TIntegerField);
```

C++

```
class TWordField : public TIntegerField;
```

File

DB

Description

TWordField encapsulates the fundamental behavior common to fields that contain unsigned integer data. Word fields can hold values in the range 0 to 65535, and are used to hold values that are unsigned 16-bit whole numbers.

If you use the Fields editor at design time to create a persistent field component for the word field, you can access it by name at runtime. When using dynamic field components, you can access the TWordField instance using the dataset's Fields property or FieldByName method.

39.1.61.1 TWordField Members

The following tables list the members exposed by TWordField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AccessError (see page 7124)	This is AccessError, a member of class TField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Bind (see page 7126)	This is Bind, a member of class TField.
V	Change (see page 7126)	This is Change, a member of class TField.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 7126)	This is CheckInactive, a member of class TField.
V	CheckTypeSize (see page 7126)	This is CheckTypeSize, a member of class TField.
V	CopyData (see page 7127)	This is CopyData, a member of class TField.
	DataChanged (see page 7127)	This is DataChanged, a member of class TField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7127)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	FreeBuffers (see page 7128)	This is FreeBuffers, a member of class TField.
V	GetAsBCD (see page 7128)	This is GetAsBCD, a member of class TField.
V	GetAsBoolean (see page 7129)	This is GetAsBoolean, a member of class TField.
V	GetAsByteArray (see page 7129)	This is GetAsByteArray, a member of class TField.
V	GetAsCurrency (see page 7129)	This is GetAsCurrency, a member of class TField.
V	GetAsDateTime (see page 7129)	This is GetAsDateTime, a member of class TField.
V	GetAsFloat (see page 7129)	This is GetAsFloat, a member of class TField.
V	GetAsFloat (see page 7310)	This is GetAsFloat, a member of class TIntegerField.
V	GetAsInteger (see page 7130)	This is GetAsInteger, a member of class TField.
V	GetAsInteger (see page 7310)	This is GetAsInteger, a member of class TIntegerField.
V	GetAsSQLTimeStamp (see page 7130)	This is GetAsSQLTimeStamp, a member of class TField.
V	GetAsString (see page 7130)	This is GetAsString, a member of class TField.
V	GetAsString (see page 7311)	This is GetAsString, a member of class TIntegerField.
V	GetAsVariant (see page 7130)	This is GetAsVariant, a member of class TField.
V	GetAsVariant (see page 7311)	This is GetAsVariant, a member of class TIntegerField.
V	GetAsWideString (see page 7131)	This is GetAsWideString, a member of class TField.
V	GetCanModify (see page 7131)	This is GetCanModify, a member of class TField.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClassDesc (see page 7131)	This is GetClassDesc, a member of class TField.
V	GetDataSize (see page 7568)	This is GetDataSize, a member of class TWordField.
V	GetDefaultWidth (see page 7133)	This is GetDefaultWidth, a member of class TField.
V	GetFieldNo (see page 7134)	This is GetFieldNo, a member of class TField.
V	GetHasConstraints (see page 7134)	This is GetHasConstraints, a member of class TField.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIsNull (see page 7134)	This is GetIsNull, a member of class TField.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSize (see page 7135)	This is GetSize, a member of class TField.
	GetText (see page 7135)	This is GetText, a member of class TField.
	GetText (see page 7311)	This is GetText, a member of class TIntegerField.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 7312)	This is GetValue, a member of class TIntegerField.
	GetWideText (see page 7135)	This is GetWideText, a member of class TField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7137)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 7138)	This is PropertyChanged, a member of class TField.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	RangeError (see page 7368)	This is RangeError, a member of class TNumericField.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 7138)	This is ReadState, a member of class TField.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAsBCD (see page 7139)	This is SetAsBCD, a member of class TField.
	SetAsBoolean (see page 7139)	This is SetAsBoolean, a member of class TField.
	SetAsByteArray (see page 7139)	This is SetAsByteArray, a member of class TField.
	SetAsCurrency (see page 7139)	This is SetAsCurrency, a member of class TField.
	SetAsDateTime (see page 7139)	This is SetAsDateTime, a member of class TField.
	SetAsFloat (see page 7140)	This is SetAsFloat, a member of class TField.
	SetAsFloat (see page 7312)	This is SetAsFloat, a member of class TIntegerField.
	SetAsInteger (see page 7140)	This is SetAsInteger, a member of class TField.
	SetAsInteger (see page 7312)	This is SetAsInteger, a member of class TIntegerField.
	SetAsSQLTimeStamp (see page 7140)	This is SetAsSQLTimeStamp, a member of class TField.
	SetAsString (see page 7140)	This is SetAsString, a member of class TField.
	SetAsString (see page 7312)	This is SetAsString, a member of class TIntegerField.
	SetAsVariant (see page 7141)	This is SetAsVariant, a member of class TField.
	SetAsWideString (see page 7141)	This is SetAsWideString, a member of class TField.
	SetAutoGenerateValue (see page 7141)	This is SetAutoGenerateValue, a member of class TField.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 7142)	This is SetDataSet, a member of class TField.
	SetDataType (see page 7142)	This is SetDataType, a member of class TField.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayFormat (see page 7368)	This is SetDisplayFormat, a member of class TNumericField.
	SetEditFormat (see page 7368)	This is SetEditFormat, a member of class TNumericField.
	SetFieldKind (see page 7142)	This is SetFieldKind, a member of class TField.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentField (see page 7143)	This is SetParentField, a member of class TField.
	SetSize (see page 7143)	This is SetSize, a member of class TField.
	SetText (see page 7144)	This is SetText, a member of class TField.
	SetVarValue (see page 7144)	This is SetVarValue, a member of class TField.

	SetVarValue (see page 7312)	This is SetVarValue, a member of class TIntegerField.
	SetWideText (see page 7144)	This is SetWideText, a member of class TField.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	Assign (see page 7124)	Copies the Value (see page 7180) property from another field component or assigns another object to the field component.
	AssignValue (see page 7124)	Sets the field value using one of the AsInteger (see page 7149), AsBoolean (see page 7147), AsString (see page 7151) or AsFloat (see page 7149) properties.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7126)	Sets the value of the field to NULL.
	Create (see page 7566)	Creates an instance of TWordField (see page 7560).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 7122)	Destroys an instance of TField (see page 7115).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FocusControl (see page 7128)	Forces a form's focus to the first data-aware component associated with the field object.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetData (see page 7131)	Returns the unformatted data for the field.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 7134)	Returns the component which directs the loading and saving of the field.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 7135)	Returns true, indicating that field components act as part of a larger composite.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsBlob (see page 7136)	Indicates whether the field represents the data in a binary large object (BLOB) field.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsValidChar (see page 7136)	Indicates whether a particular character is valid for the field.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshLookupList (see page 7138)	Loads LookupList (see page 7172) with all the values for LookupResultField (see page 7173) that match distinct values of LookupKeyFields (see page 7172).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetData (see page 7141)	Assigns unformatted data to the field.
	SetFieldType (see page 7142)	Provides the interface for a method that can set the DataType (see page 7159) for the field.
	SetParentComponent (see page 7143)	This is SetParentComponent, a member of class TField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Validate (see page 7144)	Generates an OnValidate (see page 7183) event.

Public Properties

	Name	Description
	AsBCD (see page 7147)	Represents the field's value as a TBcd value.
	AsBoolean (see page 7147)	Represents the field's value as a boolean value.
	AsCurrency (see page 7148)	Represents the field's value as a Currency value.
	AsDateTime (see page 7148)	Represents the field's value as a TDateTime value.
	AsFloat (see page 7149)	Represents the field's value as a double value.
	AsInteger (see page 7149)	Represents the field's value as a 32-bit integer.
	AsSQLTimeStamp (see page 7150)	Represents the field's value as a TSQLTimeStamp.
	AsString (see page 7151)	Represents the field's value as a string (Delphi) or an AnsiString (C++).
	AsVariant (see page 7152)	Represents the Value (see page 7180) of the field as a Variant.

	AsWideString (see page 7152)	This is AsWideString, a member of class TField.
	AttributeSet (see page 7153)	Specifies the name of an attribute set in the data dictionary to apply to the field component.
	Calculated (see page 7154)	Determines whether the value of the field is calculated by the OnCalcFields event handler of its dataset.
R	CanModify (see page 7154)	Specifies whether a field can be modified.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurValue (see page 7155)	Represents the current value of the field component including changes made by other users of the database.
	DataSet (see page 7157)	Identifies the dataset to which a field component belongs.
R	DataSize (see page 7157)	Indicates the amount of memory needed to store a field component's value.
R	DataType (see page 7159)	Identifies the data type of the field component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 7160)	Represents the name of the field for display purposes.
R	DisplayText (see page 7162)	Represents the field's value as it is displayed in a data-aware control.
	EditMask (see page 7163)	Contains a mask that restricts the data that can be entered into a data field.
R	EditMaskPtr (see page 7163)	Provides read-only access to the EditMask (see page 7163) property.
R	FieldNo (see page 7166)	Indicates the ordinal position of the field's column in the underlying table or query result.
R	FullName (see page 7166)	Indicates the field name qualified by the full name of the parent field, if any.
R	IsIndexField (see page 7168)	Indicates whether a field is an index field.
R	IsNull (see page 7169)	Indicates whether the field has a value assigned to it.
	Lookup (see page 7170)	Determines whether the field is specified as a lookup field.
R	LookupList (see page 7172)	Indicates a cache of values from the LookupDataSet (see page 7171) indexed by a set of values from the KeyFields (see page 7169) property.
	NewValue (see page 7174)	Represents the current value of the field component including pending cached updates.
R	Offset (see page 7175)	Indicates the number of bytes added to the end of the current record buffer in the dataset for storing cached values (for calculated fields or BLOB fields).
R	OldValue (see page 7175)	Represents the original value of the field (as a Variant).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParentField (see page 7176)	Specifies the TObjectField (see page 7372) object from which this field is derived.
	Size (see page 7178)	Indicates the size used in the definition of the physical database field for data types that support different sizes.
	Text (see page 7179)	Contains the string to display in a data-aware control when the field is in edit mode.
	ValidChars (see page 7179)	Specifies the characters that can be included in the text representation of the field's value.
	Value (see page 7180)	Represents the data in a field component.
	Value (see page 7314)	Represents the value of the integer field.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 7181)	Occurs immediately after the data in the field is written to the record buffer.
	OnGetText (see page 7182)	Occurs when the DisplayText (see page 7162) or Text (see page 7179) properties of the field are referenced.
	OnSetText (see page 7182)	Occurs when the Text (see page 7179) property is assigned a value.
	OnValidate (see page 7183)	Occurs just before the data is written to the record buffer.

Published Properties

	Name	Description
	Alignment (see page 7146)	Determines how the field's data is displayed within a data-aware control.
	Alignment (see page 7369)	Determines how the field's data is displayed within a data-aware control.
	AutoGenerateValue (see page 7153)	Indicates whether the field values can be generated by the server rather than entered by the user.
	ConstraintErrorMessage (see page 7155)	Specifies a customized error message that appears when the user tries to set a value that violates the data constraints of the field.
	CustomConstraint (see page 7156)	Specifies an SQL string the enforces any application-specific constraints on the field's value.
	DefaultExpression (see page 7159)	Specifies an SQL expression that is assigned to the field if the user does not provide a value.
	DisplayFormat (see page 7369)	Determines how a numeric field's value is formatted for display in a data-aware control.
	DisplayLabel (see page 7160)	Contains the text to display in the corresponding column heading of a data grid.
	DisplayWidth (see page 7162)	Specifies the number of characters that should be used to display a field's value by a cooperating data-aware control.
	EditFormat (see page 7371)	Determines how a numeric field's value is formatted when it is being edited in a data-aware control.
	FieldKind (see page 7164)	Indicates whether a field represents a column in a dataset, a calculated field, or a lookup field.
	FieldName (see page 7164)	Indicates the name of the physical column in the underlying table or query result to which a field component is bound.
R	HasConstraints (see page 7167)	Indicates whether field values are constrained.
	ImportedConstraint (see page 7167)	Represents an SQL clause that enforces constraints stored on the server.
	Index (see page 7168)	Specifies the field component's index in the Fields property of the dataset.
	KeyFields (see page 7169)	Identifies the field or fields in the dataset that must be matched in a lookup dataset when doing a lookup.
	LookupCache (see page 7170)	Determines whether the values of a lookup field are cached or looked up dynamically every time the current record in the dataset changes.
	LookupDataSet (see page 7171)	Identifies the dataset used to look up field values.
	LookupKeyFields (see page 7172)	Identifies the field or fields in the lookup dataset to match when doing a lookup.
	LookupResultField (see page 7173)	Identifies the field from the lookup dataset whose value becomes the Value (see page 7180) property of the field component.
	MaxValue (see page 7313)	Limits the maximum value in the integer field.
	MinValue (see page 7313)	Limits the minimum value in the integer field.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Origin (see page 7176)	Indicates the name of the field in its original database table.
	ProviderFlags (see page 7176)	Specifies how a provider uses the field value when applying updates.
	ReadOnly (see page 7177)	Determines whether the field can be modified.
	Required (see page 7177)	Specifies whether a nonblank value for a field is required.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 7181)	Determines whether the field appears in a data grid.

39.1.61.2 TWordField.Create Constructor

Creates an instance of TWordField (see page 7560).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWordField(TComponent * AOwner);
```

Description

Most applications do not explicitly create instances of TWordField (see page 7560). Instead, the field components are created automatically, as persistent field components defined in the Fields editor at design time or as dynamic field components created

automatically by the dataset.

Create sets the DataType (see page 7159) property to ftWord, MinValue (see page 7313) to 0, and MaxValue (see page 7313) to 65535. The AOwner parameter specifies the component, typically a dataset, that becomes the new field's Owner. The Owner is responsible for freeing the component.

In the rare cases when you must create a persistent field component at runtime, call Create to create and initialize an instance of TWordField (see page 7560). After instantiating a TWordField (see page 7560), associate it with a specific field by setting its FieldName (see page 7164) property to the name of the field. Give the TWordField (see page 7560) a unique identifier in the Name property. Establish where the field appears in the collection of fields by providing an ordinal number in the Index (see page 7168) property. Associate the TWordField (see page 7560) with a dataset component by setting its DataSet (see page 7157) property.

The example below creates a TWordField (see page 7560) object for a field named Counter accessed through a TSQLDataSet named SQLDataSet1.

```
var
  T: TWordField;
begin
  SQLDataSet1.Close;
  T := TWordField.Create(SQLDataSet1);
  T.FieldName := 'Counter';
  T.Name := SQLDataSet1.Name + T.FieldName;
  T.Index := SQLDataSet1.FieldCount;
  T.DataSet := SQLDataSet1;
  SQLDataSet1.FieldDefs.UpDate;
  SQLDataSet1.Open;
end;
SQLDataSet1->Close();
TWordField *T = new TWordField(SQLDataSet1);
T->FieldName = "Counter";
T->Name = SQLDataSet1->Name + T->FieldName;
T->Index = SQLDataSet1->FieldCount;
T->DataSet = SQLDataSet1;
SQLDataSet1->FieldDefs->UpDate();
SQLDataSet1->Open();
```

See Also

DataType (see page 7159)

MaxValue (see page 7313)

MinValue (see page 7313)

Create (see page 7121)

Owner (see page 2807)

39.1.61.3 TWordField Methods

The methods of the TWordField class are listed here.

Protected Methods

	Name	Description
	GetDataSize (see page 7568)	This is GetDataSize, a member of class TWordField.

39.1.61.3.1 TWordField.GetDataSize Method

Pascal

```
function GetDataSize: Integer; override;
```

C++

```
virtual __fastcall int GetDataSize();
```

Description

This is GetDataSize, a member of class TWordField.

39.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IDBApplication (see page 7569)	Interface for database application.
	IDBScreen (see page 7571)	Interface to display device.
	IDBSession (see page 7573)	IDBSession is the interface for database sessions.
	IProviderSupport (see page 7576)	IProviderSupport is the interface that datasets use to enable a provider to represent them.
	IProviderSupport2 (see page 7587)	Interface datasets use to enable providers to represent them with Unicode support.

39.2.1 IDBApplication Interface

Interface for database application.

Class Hierarchy

DB.IDBApplication

Pascal

```
IDBApplication = interface;
```

C++

```
__interface IDBApplication;
```

File

DB

Description

IDBApplication is an interface for a database application.

39.2.1.1 IDBApplication Members

The following tables list the members exposed by IDBApplication.

Public Methods

	Name	Description
	GetTitle (see page 7570)	Get application title.
	ProcessMessages (see page 7570)	Allow an application to process queued messages.
	SetTitle (see page 7570)	Set application title.

Public Properties

	Name	Description
	Title (see page 7571)	Application title.

39.2.1.2 IDBApplication Methods

The methods of the IDBApplication class are listed here.

Public Methods

	Name	Description
	GetTitle (see page 7570)	Get application title.
	ProcessMessages (see page 7570)	Allow an application to process queued messages.
	SetTitle (see page 7570)	Set application title.

39.2.1.2.1 IDBApplication.GetTitle Method

Get application title.

Pascal

```
function GetTitle: string;
```

C++

```
__fastcall AnsiString GetTitle();
```

Description

GetTitle gets the title of a database application.

See Also

Title (see page 7571)

SetTitle (see page 7570)

39.2.1.2.2 IDBApplication.ProcessMessages Method

Allow an application to process queued messages.

Pascal

```
procedure ProcessMessages;
```

C++

```
__fastcall ProcessMessages();
```

Description

Call ProcessMessages to permit the application to process messages that are currently in the message queue. Neglecting message processing affects only the application calling ProcessMessages, not other applications. In lengthy operations, calling ProcessMessages periodically allows the application to respond to paint and other messages. .

39.2.1.2.3 IDBApplication.SetTitle Method

Set application title.

Pascal

```
procedure SetTitle(const Value: string);
```

C++

```
__fastcall SetTitle(const AnsiString Value);
```

Description

SetTitle sets the title of a database application.

See Also

Title (see page 7571)

GetTitle (see page 7570)

39.2.1.3 IDBApplication Properties

The properties of the IDBApplication class are listed here.

Public Properties

	Name	Description
	Title (see page 7571)	Application title.

39.2.1.3.1 IDBApplication.Title Property

Application title.

Pascal

```
property Title: string;
```

C++

```
__property AnsiString Title;
```

Description

Title allows reading and writing a database application's title.

See Also

GetTitle (see page 7570)

SetTitle (see page 7570)

39.2.2 IDBScreen Interface

Interface to display device.

Class Hierarchy

DB.IDBScreen

Pascal

```
IDBScreen = interface;
```

C++

```
__interface IDBScreen;
```

File

DB

Description

IDBScreen is an interface to a display device.

39.2.2.1 IDBScreen Members

The following tables list the members exposed by IDBScreen.

Public Methods

	Name	Description
	GetCursor (see page 7572)	Get screen cursor.
	SetCursor (see page 7572)	Set screen cursor.

Public Properties

	Name	Description
	Cursor (see page 7573)	Screen cursor.

39.2.2.2 IDBScreen Methods

The methods of the IDBScreen class are listed here.

Public Methods

	Name	Description
	GetCursor (see page 7572)	Get screen cursor.
	SetCursor (see page 7572)	Set screen cursor.

39.2.2.2.1 IDBScreen.GetCursor Method

Get screen cursor.

Pascal

```
function GetCursor: TDBScreenCursor;
```

C++

```
__fastcall TDBScreenCursor GetCursor();
```

Description

GetCursor gets the screen cursor.

See Also

Cursor (see page 7573)

SetCursor (see page 7572)

39.2.2.2.2 IDBScreen.SetCursor Method

Set screen cursor.

Pascal

```
procedure SetCursor(Cursor: TDBScreenCursor);
```

C++

```
__fastcall SetCursor(TDBScreenCursor Cursor);
```

Description

SetCursor sets the screen cursor.

See Also

Cursor (see page 7573)

GetCursor (see page 7572)

39.2.2.3 IDBScreen Properties

The properties of the IDBScreen class are listed here.

Public Properties

	Name	Description
	Cursor (see page 7573)	Screen cursor.

39.2.2.3.1 IDBScreen.Cursor Property

Screen cursor.

Pascal

```
property Cursor: TDBScreenCursor;
```

C++

```
__property TDBScreenCursor Cursor;
```

Description

Cursor allows reading and writing a screen cursor.

See Also

GetCursor (see page 7572)

SetCursor (see page 7572)

39.2.3 IDBSession Interface

IDBSession is the interface for database sessions.

Class Hierarchy

DB.IDBSession

Pascal

```
IDBSession = interface;
```

C++

```
__interface IDBSession;
```

File

DB

Description

IDBSession is a generic interface for logging into a database session. Components that allow an application to provide a password for opening password-protected tables or databases implement IDBSession. This allows the global PasswordDialog (see page 7643) function to work with any component that implements IDBSession to add or remove passwords.

Note: Component Method declarations that use IDBSession use the _di_IDBSession type instead. This type is a DelphiInterface wrapper around the IDBSession interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IDBSession >  _di_IDBSession;
```

See Also

TSession (see page 10093)

PasswordDialog

39.2.3.1 IDBSession Members

The following tables list the members exposed by IDBSession.

Public Methods

	Name	Description
	AddPassword (see page 7574)	Logs in to the session using a specified password.
	RemoveAllPasswords (see page 7575)	Removes all passwords from the session.
	RemovePassword (see page 7575)	Removes a specified password from the session.

39.2.3.2 IDBSession Methods

The methods of the IDBSession class are listed here.

Public Methods

	Name	Description
	AddPassword (see page 7574)	Logs in to the session using a specified password.
	RemoveAllPasswords (see page 7575)	Removes all passwords from the session.
	RemovePassword (see page 7575)	Removes a specified password from the session.

39.2.3.2.1 IDBSession.AddPassword Method

Logs in to the session using a specified password.

Pascal

```
procedure AddPassword(const APassword: string);
```

C++

```
__fastcall AddPassword(const AnsiString APassword);
```

Description

Call AddPassword to supply a password to a session. After calling AddPassword, the application can open any tables or databases protected by that password from within the session until the RemovePassword (see page 7575) or

RemoveAllPasswords (see page 7575) method retracts the password. If the password-protected table is closed, it can be reopened without resupplying the password.

APassword is the password to supply.

See Also

RemovePassword (see page 7575)

RemoveAllPasswords (see page 7575)

39.2.3.2.2 IDBSession.RemoveAllPasswords Method

Removes all passwords from the session.

Pascal

```
procedure RemoveAllPasswords;
```

C++

```
__fastcall RemoveAllPasswords();
```

Description

Use RemoveAllPasswords to delete all passwords that were previously supplied by a call to AddPassword (see page 7574). After a call to RemoveAllPasswords, no password-protected tables or databases can be reopened without resupplying a password using the AddPassword (see page 7574) method.

See Also

AddPassword (see page 7574)

RemovePassword (see page 7575)

39.2.3.2.3 IDBSession.RemovePassword Method

Removes a specified password from the session.

Pascal

```
procedure RemovePassword(const APassword: string);
```

C++

```
__fastcall RemovePassword(const AnsiString APassword);
```

Description

Use RemovePassword delete a specified password from the session. After a call to RemovePassword, any password-protected tables or databases that require the specified password can't be reopened until the password is supplied again by a call to the AddPassword (see page 7574) method.

APassword is the password to remove. It is a string that was previously supplied by the AddPassword (see page 7574) method.

See Also

AddPassword (see page 7574)

RemoveAllPasswords (see page 7575)

39.2.4 IProviderSupport Interface

IProviderSupport is the interface that datasets use to enable a provider to represent them.

Class Hierarchy

DB.IProviderSupport

Pascal

```
IProviderSupport = interface;
```

C++

```
__interface IProviderSupport;
```

File

DB

Description

TDataSetProvider uses the IProviderSupport interface to interact with its associated dataset. Any dataset that implements the IProviderSupport interface can be connected to a client dataset or XML broker via a provider. Once the provider connects the dataset that supports IProvider to a client dataset, that client dataset can obtain data from the dataset and apply updates back to it or its database server.

TDataSet (see page 6894), the base class for all datasets, includes support for IProviderSupport. This support appears as a set of protected methods. However, most of these methods are simple stubs that either do nothing or generate an exception. Most of the dataset classes (dbExpress datasets, BDE-enabled datasets, ADO-enabled datasets, and InterBase Express datasets) override these protected methods to implement the IProviderSupport interface in a more useful fashion. For datasets that simply rely on the implementation inherited from TDataSet (see page 6894) (for example, client datasets), the provider should set its ResolveToDataSet property to true.

Component writers that create their own custom descendants from TDataSet (see page 6894) must override all appropriate IProviderSupport methods if their datasets are to work in an application server or connected to a client dataset or XML broker via a local provider.

See Also

TDataSetProvider (see page 18508)

TDataSet (see page 6894)

Determining the Source of Data

39.2.4.1 IProviderSupport Members

The following tables list the members exposed by IProviderSupport.

Public Methods

	Name	Description
	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7579)	Executes a specified SQL command.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.

	PSGetCommandText (see page 7579)	Gets the SQL command to be executed by PSExecute (see page 7578).
	PSGetCommandType (see page 7580)	Gets the command type to be executed by PSExecute (see page 7578).
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7581)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7585)	Assigns a specified SQL command to be executed by PSExecute (see page 7578).
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.

39.2.4.2 IProviderSupport Methods

The methods of the IProviderSupport class are listed here.

Public Methods

	Name	Description
	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7579)	Executes a specified SQL command.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 7579)	Gets the SQL command to be executed by PSExecute (see page 7578).
	PSGetCommandType (see page 7580)	Gets the command type to be executed by PSExecute (see page 7578).
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7581)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7585)	Assigns a specified SQL command to be executed by PSExecute (see page 7578).
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.

	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.

39.2.4.2.1 IProviderSupport.PSEndTransaction Method

Ends a transaction that was started by a call to PSStartTransaction (see page 7586).

Pascal

```
procedure PSEndTransaction(Commit: Boolean);
```

C++

```
__fastcall PSEndTransaction(Boolean Commit);
```

Description

The provider component applies updates within a transaction, if possible. To do so, it uses PSEndTransaction in conjunction with the PSStartTransaction (see page 7586) method.

The Commit parameter indicates whether the dataset should commit the current transaction (Commit is true), or roll it back (Commit is false).

Note: TDataSetProvider only starts a transaction (Using PSStartTransaction (see page 7586)) if the PSInTransaction (see page 7583) method indicates that there is no transaction already established. That is, it does not assume nested transaction support is available. Thus, there is no need to ensure that PSEndTransaction does not terminate a transaction that was not started by the provider.

See Also

PSStartTransaction (see page 7586)

PSInTransaction (see page 7583)

applyupdates (see page 18459)

39.2.4.2.2 IProviderSupport.PSExecute Method

Executes the SQL command associated with the dataset.

Pascal

```
procedure PSExecute;
```

C++

```
__fastcall PSExecute();
```

Description

The provider component calls PSExecute to implement its Execute method. If the dataset represents a query or stored procedure that does not return a cursor, this method executes the query or stored procedure. If the provider Options includes poAllowCommandText and the dataset supports the PSSetCommandText (see page 7585) method, the statement specified by PSSetCommandText (see page 7585) may be executed instead.

If there is not statement to execute, PSExecute raises an EDatabaseError (see page 6731) exception.

See Also

PSSetCommandText (see page 7585)

Execute (see page 18466)

Options (see page 18440)

39.2.4.2.3 IProviderSupport.PSExecuteStatement Method

Executes a specified SQL command.

Pascal

```
function PSExecuteStatement(const ASQL: string; AParams: TParams; ResultSet: Pointer = nil):
Integer;
```

C++

```
__fastcall int PSExecuteStatement(const AnsiString ASQL, TParams AParams, void * ResultSet =
nil);
```

Description

If the value its ResolveToDataSet property is false, a provider component calls PSExecuteStatement (indirectly) to execute SQL statements that it generates for applying updates. Usually, the dataset passes these statements on to its database server for execution.

The ASQL parameter specifies the SQL command to execute.

AParams contains any parameter values that should be applied to ASQL before execution.

ResultSet allows PSExecuteStatement to return a dataset component that contains the results of a SELECT statement. If ResultSet is not nil (Delphi) or NULL (C++), PSExecuteStatement creates a new dataset component as the target of this pointer and fills it with the result set. The caller is responsible for freeing the dataset.

PSExecuteStatement returns the number of rows affected by executing ASQL.

See Also

PSUpdateRecord (see page 7586)

applyupdates (see page 18459)

ResolveToDataSet (see page 18531)

39.2.4.2.4 IProviderSupport.PSGetAttributes Method

Returns information that is stored in data packets as Name/Value pairs.

Pascal

```
procedure PSGetAttributes(List: TList);
```

C++

```
__fastcall PSGetAttributes(TList List);
```

Description

The provider component calls PSGetAttributes to add information about the dataset to the metadata stored with generated data packets. This information is stored as Name/Value pairs that are added to the list specified by the List parameter.

See Also

DoGetProviderAttributes (see page 18521)

39.2.4.2.5 IProviderSupport.PSGetCommandText Method

Gets the SQL command to be executed by PSExecute (see page 7578).

Pascal

```
function PSGetCommandText: string;
```

C++

```
__fastcall AnsiString PSGetCommandText();
```

Description

If the provider's Options property includes poAllowCommandText, clients can supply an SQL command along with a call to GetRecords or Execute. This command is passed to the dataset by a call to PSSetCommandText (see page 7585), and subsequently executed by a call to PSExecute (see page 7578).

See Also

CommandText (see page 8465)

PSExecute (see page 7578)

PSSetCommandText (see page 7585)

GetRecords (see page 18468)

Execute (see page 18466)

Options (see page 18440)

39.2.4.2.6 IProviderSupport.PSGetCommandType Method

Gets the command type to be executed by PSExecute (see page 7578).

Pascal

```
function PSGetCommandType: TPSCommandType;
```

C++

```
__fastcall TPSCommandType PSGetCommandType();
```

Description

PSGetCommandType gets the command type executed by PSExecute (see page 7578). The type may be a type of SQL command or other command types, such as stored procedures.

See Also

CommandText (see page 8465)

PSExecute (see page 7578)

PSGetCommandText (see page 7579)

Execute (see page 18466)

Options (see page 18440)

39.2.4.2.7 IProviderSupport.PSGetDefaultOrder Method

Returns the definition of an index that imposes the default order on the data included in data packets.

Pascal

```
function PSGetDefaultOrder: TIndexDef;
```

C++

```
__fastcall TIndexDef PSGetDefaultOrder();
```

Description

The provider component calls PSGetDefaultOrder to generate a default index, called DEFAULT_ORDER, for the records that appear in data packets. This index defines the default sort order for records when they appear in the client dataset on the client.

PSGetDefaultOrder creates a TIndexDef (see page 7283) object to describe the default index. The provider that calls PSGetDefaultOrder subsequently frees this TIndexDef (see page 7283) object.

See Also

CreateDataPacket (see page 18518)

39.2.4.2.8 IProviderSupport.PSGetIndexDefs Method

Returns the definitions of all specified indexes defined for the dataset.

Pascal

```
function PSGetIndexDefs(IndexTypes: TIndexOptions = [ixPrimary..ixNonMaintained]): TIndexDefs;
```

C++

```
__fastcall TIndexDefs PSGetIndexDefs(TIndexOptions IndexTypes = [ixPrimary..ixNonMaintained]);
```

Description

The provider component calls PSGetIndexDefs to locate an index that contains information it needs. For example, it uses PSGetIndexDefs to locate an index that contains the key fields returned by PSGetKeyFields (see page 7581). This information allows the provider to locate the records that need to change when it applies updates. The provider also calls this method to locate indexes that it adds to the metadata of data packets.

IndexTypes indicates the options required of the returned indexes. PSGetIndexDefs returns all indexes whose Options property includes the specified flags.

PSGetIndexDefs returns a TIndexDefs (see page 7292) object that contains all the indexes of the dataset that match the IndexTypes parameter.

See Also

Options (see page 7291)

PSGetKeyFields (see page 7581)

PSGetDefaultOrder (see page 7580)

39.2.4.2.9 IProviderSupport.PSGetKeyFields Method

Returns the names of all fields required to uniquely identify records in the data packet.

Pascal

```
function PSGetKeyFields: string;
```

C++

```
__fastcall AnsiString PSGetKeyFields();
```

Description

The provider component calls PSGetKeyFields to determine what information is required to uniquely identify records in the data packet. This information allows it to locate the records that need to change when it applies updates.

PSGetKeyFields returns a semicolon-delimited string that lists the names of the key fields of the dataset. By default (as implemented by TDataSet (see page 6894)), these are the fields with pfInKey included in their ProviderFlags property.

See Also

PSGetDefaultOrder (see page 7580)

ProviderFlags (see page 7176)

PSGetIndexDefs (see page 7581)

39.2.4.2.10 IProviderSupport.PSGetParams Method

Returns the current parameter values of the dataset.

Pascal

```
function PSGetParams: TParams;
```

C++

```
__fastcall TParams PSGetParams();
```

Description

The provider component calls PSGetParams to implement its GetParams method.

PSGetParams returns a TParams (see page 7434) object that describes the current values of all parameters of the dataset. If the dataset does not have any parameters, PSGetParams returns nil (Delphi) or NULL (C++).

Note: The PSGetParams method should not create a new instance of TParams (see page 7434) for the return value. The provider that calls PSGetParams does not free the returned value.

See Also

GetParams (see page 18467)

39.2.4.2.11 IProviderSupport.PSGetQuoteChar Method

Returns the character or characters to use in generated SQL statements to enclose quoted strings.

Pascal

```
function PSGetQuoteChar: string;
```

C++

```
__fastcall AnsiString PSGetQuoteChar();
```

Description

The provider component calls PSGetQuoteChar (indirectly) when generating the dynamic SQL statements that apply updates. These statements are subsequently executed by a call to PSExecuteStatement (see page 7579).

PSGetQuoteChar returns the character or characters that delimit quoted strings in the generated SQL. This string appears both before and after quoted strings.

See Also

applyupdates (see page 18459)

PSExecuteStatement (see page 7579)

ResolveToDataSet (see page 18531)

39.2.4.2.12 IProviderSupport.PSGetTableName Method

Returns the name of the dataset table that appears in generated SQL statements.

Pascal

```
function PSGetTableName: string;
```

C++

```
__fastcall AnsiString PSGetTableName();
```

Description

PSGetTableName returns the name of the underlying database table against which updates are applied when the provider's ResolveToDataSet property is false. This value is used for generating the SQL statements that apply updates. The generated SQL statements are subsequently executed by a call to PSExecuteStatement (see page 7579).

If PSGetTableName does not return a table name, the provider must have an OnGetTableName event handler to supply this value.

See Also

applyupdates (see page 18459)

PSExecuteStatement (see page 7579)

ResolveToDataSet (see page 18531)

ongettablename (see page 18542)

39.2.4.2.13 IProviderSupport.PSGetUpdateException Method

Generates an EUpdateError (see page 6732) object based on another exception object.

Pascal

```
function PSGetUpdateException(E: Exception; Prev: EUpdateError): EUpdateError;
```

C++

```
__fastcall EUpdateError PSGetUpdateException(Exception E, EUpdateError Prev);
```

Description

The provider component calls PSGetUpdateException when the exception E occurs while applying updates. This method allows the provider to create a single EUpdateError (see page 6732) object that encapsulates all the exceptions that occur in an update operation.

PSGetUpdateError determines the error message, context string, and error code from the exception specified by E and creates a new EUpdateError (see page 6732) exception that includes that information as well as the information about a previous error as specified by Prev. The context string and error code for E may be specific to the Exception class associated with the dataset. By default, TDataSet (see page 6894) generates an EUpdateError (see page 6732) with an error code of 1 and an empty context string.

See Also

Create (see page 6733)

39.2.4.2.14 IProviderSupport.PSInTransaction Method

Indicates whether actions against the dataset occur in the context of a transaction.

Pascal

```
function PSInTransaction: Boolean;
```

C++

```
__fastcall Boolean PSInTransaction();
```

Description

The provider component applies updates within a transaction, if possible. To do so, it first checks whether a transaction is already underway, and if not, generates one using PSStartTransaction (see page 7586). To determine whether a transaction is already underway, the provider calls PSInTransaction.

PSInTransaction returns true if there is a transaction underway, and false otherwise.

See Also

PSStartTransaction (see page 7586)

PSEndTransaction (see page 7578)

39.2.4.2.15 IProviderSupport.PSIsSQLBased Method

Indicates whether the dataset includes native SQL support.

Pascal

```
function PSIsSQLBased: Boolean;
```

C++

```
__fastcall Boolean PSIsSQLBased();
```

Description

The provider calls PSIsSQLBased to determine whether the dataset supports some form of native SQL. This information is used when generating SQL commands that are executed by PSExecuteStatement (see page 7579).

Even if the dataset is not SQL-based, it may still allow the provider to execute SQL statements for applying updates. For example, BDE-enabled local databases such as Paradox and DBASE provide SQL support via the BDE's local SQL engine, but are not SQL-based. However, table and field names are not specified in the same way for the local SQL engine as they are for native SQL. The provider uses PSIsSQLBased to determine how these names should appear in generated SQL.

Note: The PSIsSQLSupported (see page 7584) method indicates whether the dataset can execute SQL commands at all, regardless of whether the dataset is SQL-based.

See Also

PSIsSQLSupported (see page 7584)

PSExecuteStatement (see page 7579)

39.2.4.2.16 IProviderSupport.PSIsSQLSupported Method

Indicates whether the dataset can execute SQL statements.

Pascal

```
function PSIsSQLSupported: Boolean;
```

C++

```
__fastcall Boolean PSIsSQLSupported();
```

Description

PSIsSQLSupported indicates whether the provider can call PSExecuteStatement (see page 7579) to execute an SQL statement. When PSIsSQLSupported returns false, calling PSExecuteStatement (see page 7579) generates an exception. The provider can still work with a dataset that returns false from PSIsSQLSupported, but it must set the ResolveToDataSet property to true, or provide data on a read-only basis.

See Also

PSIsSQLBased (see page 7584)

PSExecuteStatement (see page 7579)

ResolveToDataSet (see page 18531)

39.2.4.2.17 IProviderSupport.PSReset Method

Resets the dataset so that it is positioned on the first record.

Pascal

```
procedure PSReset;
```

C++

```
__fastcall PSReset();
```

Description

The provider calls PSReset to reposition the dataset on the first record before fetching records.

See Also

GetRecords (see page 18468)

AS_GetRecords (see page 16455)

39.2.4.2.18 IProviderSupport.PSSetCommandText Method

Assigns a specified SQL command to be executed by PSExecute (see page 7578).

Pascal

```
procedure PSSetCommandText(const CommandText: string);
```

C++

```
__fastcall PSSetCommandText(const AnsiString CommandText);
```

Description

If the provider's Options property includes poAllowCommandText, clients can supply an SQL command along with a call to GetRecords or Execute. This command is passed to the dataset by a call to PSSetCommandText, and subsequently executed by a call to PSExecute (see page 7578).

The value of the CommandText parameter replaces the dataset's SQL statement (if it has one), or replaces the name of an underlying database table or stored procedure.

See Also

CommandText (see page 8465)

PSExecute (see page 7578)

GetRecords (see page 18468)

Execute (see page 18466)

Options (see page 18440)

39.2.4.2.19 IProviderSupport.PSSetParams Method

Assigns the specified parameter values to the dataset.

Pascal

```
procedure PSSetParams(AParams: TParams);
```

C++

```
__fastcall PSSetParams(TParams AParams);
```

Description

PSSetParams assigns the parameter values specified by AParams to the parameters of the dataset.

See Also

Params (see page 8489)

PSGetParams (see page 7582)

39.2.4.2.20 IProviderSupport.PSStartTransaction Method

Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).

Pascal

```
procedure PSStartTransaction;
```

C++

```
__fastcall PSStartTransaction();
```

Description

The provider component applies updates within a transaction, if possible. To do so, it calls PSStartTransaction to start a transaction before applying updates, and calls PSEndTransaction (see page 7578) when all updates are applied or too many errors are encountered.

Note: TDataSetProvider only starts a transaction (Using PSStartTransaction) if the PSInTransaction (see page 7583) method indicates that there is no transaction already established. That is, it does not assume nested transaction support is available.

See Also

PSEndTransaction (see page 7578)

PSInTransaction (see page 7583)

applyupdates (see page 18459)

39.2.4.2.21 IProviderSupport.PSUpdateRecord Method

Applies a single update to the underlying database table or tables.

Pascal

```
function PSUpdateRecord(UpdateKind: TUpdateKind; Delta: TDataSet): Boolean;
```

C++

```
__fastcall Boolean PSUpdateRecord(TUpdateKind UpdateKind, TDataSet Delta);
```

Description

Before the provider generates SQL statements to apply an update, it calls PSUpdateRecord to let the dataset apply the update in some other fashion. For example, BDE-enabled datasets generate an OnUpdateRecord to allow the application to apply the update and, if the OnUpdateRecord event handler does not apply the update, uses any associated TUpdateSQL object to apply the update.

UpdateKind indicates whether the update is an insertion (ukInsert), deletion (ukDelete), or modification (ukModify).

Delta is the delta datapacket. The current record represents the record to be updated.

PSUpdateRecord returns true if it updates the record, false otherwise. If PSUpdateRecord returns false, the provider generates dynamic SQL to perform the update and calls PSExecuteStatement (see page 7579).

Note: PSUpdateRecord is only called if the provider's ResolveToDataSet property is false.

See Also

OnUpdateRecord (see page 9957)

TUpdateSQL (see page 10229)

applyupdates (see page 18459)

ResolveToDataSet (see page 18531)

PSExecuteStatement (see page 7579)

39.2.5 IProviderSupport2 Interface

Interface datasets use to enable providers to represent them with Unicode support.

Class Hierarchy

Pascal

```
IProviderSupport2 = interface;
```

C++

```
__interface IProviderSupport2;
```

File

DB

Description

IProviderSupport2 is similar to IProviderSupport (see page 7576) but provides Unicode support.

TWideDataSet (see page 7526) uses the IProviderSupport2 interface to interact with its associated dataset. Any dataset that implements the IProviderSupport2 interface can be connected to a client dataset or XML broker via a provider.

The TWideDataSet (see page 7526) class extends TDataSet (see page 6894) to support the Unicode string type. TWideDataSet (see page 7526) inherits the behavior of TDataSet (see page 6894) and TDataSet (see page 6894)'s IProviderSupport (see page 7576) interface, and TWideDataSet (see page 7526) supports IProviderSupport2.

BDE does not support a Unicode type, so TTable and TQuery are derived from TDataSet (see page 6894). However, TADODataSet and TSQLDataSet (dbExpress) derive from TWideDataSet (see page 7526), because ADO and dbExpress need to support Unicode data.

Determining the Source of Data

39.2.5.1 IProviderSupport2 Members

The following tables list the members exposed by IProviderSupport2.

Public Methods

	Name	Description
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7590)	Executes a specified SQL command.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 7591)	Gets the SQL command to be executed by PSExecute (see page 7590).
	PSGetCommandType (see page 7591)	Gets the command type to be executed by PSExecute (see page 7590).
	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7592)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7596)	Assigns a specified SQL command to be executed by PSExecute (see page 7590).
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.

39.2.5.2 IProviderSupport2 Methods

The methods of the IProviderSupport2 class are listed here.

Public Methods

	Name	Description
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7590)	Executes a specified SQL command.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 7591)	Gets the SQL command to be executed by PSExecute (see page 7590).
	PSGetCommandType (see page 7591)	Gets the command type to be executed by PSExecute (see page 7590).
	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7592)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7596)	Assigns a specified SQL command to be executed by PSExecute (see page 7590).
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.

39.2.5.2.1 IProviderSupport2.PSEndTransaction Method

Ends a transaction that was started by a call to PSStartTransaction (see page 7597).

Pascal

```
procedure PSEndTransaction(Commit: Boolean);
```

C++

```
__fastcall PSEndTransaction(Boolean Commit);
```

Description

The provider component applies updates within a transaction, if possible. To do so, it uses PSEndTransaction in conjunction with the PSStartTransaction (see page 7597) method.

The Commit parameter indicates whether the dataset should commit the current transaction (Commit is true), or roll it back (Commit is false).

Note: TDataSetProvider only starts a transaction (Using PSStartTransaction (see page 7597)) if the PSInTransaction (see page 7595) method indicates that there is no transaction already established. That is, it does not assume nested transaction support is available. Thus, there is no need to ensure that PSEndTransaction does not terminate a transaction that was not started by the provider.

See Also

PSStartTransaction (see page 7597)

PSInTransaction (see page 7595)

applyupdates (see page 18459)

39.2.5.2.2 IProviderSupport2.PSExecute Method

Executes the SQL command associated with the dataset.

Pascal

```
procedure PSExecute;
```

C++

```
__fastcall PSExecute();
```

Description

The provider component calls PSExecute to implement its Execute method. If the dataset represents a query or stored procedure that does not return a cursor, this method executes the query or stored procedure. If the provider Options includes poAllowCommandText and the dataset supports the PSSetCommandText (see page 7596) method, the statement specified by PSSetCommandText (see page 7596) may be executed instead.

If there is no statement to execute, PSExecute raises an EDatabaseError (see page 6731) exception.

See Also

PSSetCommandText (see page 7596)

Execute (see page 18466)

Options (see page 18440)

39.2.5.2.3 IProviderSupport2.PSExecuteStatement Method

Executes a specified SQL command.

Pascal

```
function PSExecuteStatement(const ASQL: WideString; AParams: TParams; ResultSet: Pointer =
nil): Integer;
```

C++

```
__fastcall int PSExecuteStatement(const BSTR ASQL, TParams AParams, void * ResultSet = nil);
```

Description

If the value of its ResolveToDataSet property is false, a provider component calls PSExecuteStatement (indirectly) to execute SQL statements that it generates for applying updates. Usually, the dataset passes these statements on to its database server for execution.

The ASQL parameter specifies the SQL command to execute.

AParams contains any parameter values that should be applied to ASQL before execution.

ResultSet allows PSExecuteStatement to return a dataset component that contains the results of a SELECT statement. If ResultSet is not nil (Delphi) or NULL (C++), PSExecuteStatement creates a new dataset component as the target of this pointer and fills it with the result set. The caller is responsible for freeing the dataset.

PSExecuteStatement returns the number of rows affected by executing ASQL.

See Also

PSUpdateRecord (see page 7598)

applyupdates (see page 18459)

ResolveToDataSet (see page 18531)

39.2.5.2.4 IProviderSupport2.PSGetAttributes Method

Returns information that is stored in data packets as Name/Value pairs.

Pascal

```
procedure PSGetAttributes(List: TList);
```

C++

```
__fastcall PSGetAttributes(TList List);
```

Description

The provider component calls PSGetAttributes to add information about the dataset to the metadata stored with generated data packets. This information is stored as Name/Value pairs that are added to the list specified by the List parameter.

See Also

DoGetProviderAttributes (see page 18521)

39.2.5.2.5 IProviderSupport2.PSGetCommandText Method

Gets the SQL command to be executed by PSExecute (see page 7590).

Pascal

```
function PSGetCommandText: WideString;
```

C++

```
__fastcall BSTR PSGetCommandText();
```

Description

If the provider's Options property includes poAllowCommandText, clients can supply an SQL command along with a call to GetRecords or Execute. This command is passed to the dataset by a call to PSSetCommandText (see page 7596), and subsequently executed by a call to PSExecute (see page 7590).

See Also

CommandText (see page 8465)

PSExecute (see page 7590)

PSSetCommandText (see page 7596)

GetRecords (see page 18468)

Execute (see page 18466)

Options (see page 18440)

39.2.5.2.6 IProviderSupport2.PSGetCommandType Method

Gets the command type to be executed by PSExecute (see page 7590).

Pascal

```
function PSGetCommandType: TPSCommandType;
```

C++

```
__fastcall TPSCommandType PSGetCommandType();
```

Description

PSGetCommandType gets the command type executed by PSExecute (see page 7590). The type may be a type of SQL command or other command types, such as stored procedures.

See Also

CommandText (see page 8465)

PSExecute (see page 7590)

PSGetCommandText (see page 7591)

Execute (see page 18466)

Options (see page 18440)

39.2.5.2.7 IProviderSupport2.PSGetDefaultOrder Method

Returns the definition of an index that imposes the default order on the data included in data packets.

Pascal

```
function PSGetDefaultOrder: TIndexDef;
```

C++

```
__fastcall TIndexDef PSGetDefaultOrder();
```

Description

The provider component calls PSGetDefaultOrder to generate a default index, called DEFAULT_ORDER, for the records that appear in data packets. This index defines the default sort order for records when they appear in the client dataset on the client.

PSGetDefaultOrder creates a TIndexDef (see page 7283) object to describe the default index. The provider that calls PSGetDefaultOrder subsequently frees this TIndexDef (see page 7283) object.

See Also

CreateDataPacket (see page 18518)

39.2.5.2.8 IProviderSupport2.PSGetIndexDefs Method

Returns the definitions of all specified indexes defined for the dataset.

Pascal

```
function PSGetIndexDefs(IndexTypes: TIndexOptions = [ixPrimary..ixNonMaintained]): TIndexDefs;
```

C++

```
__fastcall TIndexDefs PSGetIndexDefs(TIndexOptions IndexTypes = [ixPrimary..ixNonMaintained]);
```

Description

The provider component calls PSGetIndexDefs to locate an index that contains information it needs. For example, it uses PSGetIndexDefs to locate an index that contains the key fields returned by PSGetKeyFields (see page 7593). This information allows the provider to locate the records that need to change when it applies updates. The provider also calls this method to locate indexes that it adds to the metadata of data packets.

IndexTypes indicates the options required of the returned indexes. PSGetIndexDefs returns all indexes whose Options property

includes the specified flags.

PSGetIndexDefs returns a TIndexDefs (see page 7292) object that contains all the indexes of the dataset that match the IndexTypes parameter.

See Also

Options (see page 7291)

PSGetKeyFields (see page 7593)

PSGetDefaultOrder (see page 7592)

39.2.5.2.9 IProviderSupport2.PSGetKeyFields Method

Returns the names of all fields required to uniquely identify records in the data packet.

Pascal

```
function PSGetKeyFields: WideString;
```

C++

```
__fastcall BSTR PSGetKeyFields();
```

Description

The provider component calls PSGetKeyFields to determine what information is required to uniquely identify records in the data packet. This information allows it to locate the records that need to change when it applies updates.

PSGetKeyFields returns a semicolon-delimited string that lists the names of the key fields of the dataset. By default (as implemented by TDataSet (see page 6894)), these are the fields with pfInKey included in their ProviderFlags property.

See Also

PSGetDefaultOrder (see page 7592)

ProviderFlags (see page 7176)

PSGetIndexDefs (see page 7592)

39.2.5.2.10 IProviderSupport2.PSGetParams Method

Returns the current parameter values of the dataset.

Pascal

```
function PSGetParams: TParams;
```

C++

```
__fastcall TParams PSGetParams();
```

Description

The provider component calls PSGetParams to implement its GetParams method.

PSGetParams returns a TParams (see page 7434) object that describes the current values of all parameters of the dataset. If the dataset does not have any parameters, PSGetParams returns nil (Delphi) or NULL (C++).

Note: The PSGetParams method should not create a new instance of TParams (see page 7434) for the return value. The provider that calls PSGetParams does not free the returned value.

See Also

GetParams (see page 18467)

39.2.5.2.11 IProviderSupport2.PSGetQuoteChar Method

Returns the character or characters to use in generated SQL statements to enclose quoted strings.

Pascal

```
function PSGetQuoteChar: WideString;
```

C++

```
__fastcall BSTR PSGetQuoteChar();
```

Description

The provider component calls PSGetQuoteChar (indirectly) when generating the dynamic SQL statements that apply updates. These statements are subsequently executed by a call to PSExecuteStatement (see page 7590).

PSGetQuoteChar returns the character or characters that delimit quoted strings in the generated SQL. This string appears both before and after quoted strings.

See Also

applyupdates (see page 18459)

PSExecuteStatement (see page 7590)

ResolveToDataSet (see page 18531)

39.2.5.2.12 IProviderSupport2.PSGetTableName Method

Returns the name of the dataset table that appears in generated SQL statements.

Pascal

```
function PSGetTableName: WideString;
```

C++

```
__fastcall BSTR PSGetTableName();
```

Description

PSGetTableName returns the name of the underlying database table against which updates are applied when the provider's ResolveToDataSet property is false. This value is used for generating the SQL statements that apply updates. The generated SQL statements are subsequently executed by a call to PSExecuteStatement (see page 7590).

If PSGetTableName does not return a table name, the provider must have an OnGetTableName event handler to supply this value.

See Also

applyupdates (see page 18459)

PSExecuteStatement (see page 7590)

ResolveToDataSet (see page 18531)

ongettablename (see page 18542)

39.2.5.2.13 IProviderSupport2.PSGetUpdateException Method

Generates an EUpdateError (see page 6732) object based on another exception object.

Pascal

```
function PSGetUpdateException(E: Exception; Prev: EUpdateError): EUpdateError;
```

C++

```
__fastcall EUpdateError PSGetUpdateException(Exception E, EUpdateError Prev);
```

Description

The provider component calls PSGetUpdateException when the exception E occurs while applying updates. This method allows the provider to create a single EUpdateError (see page 6732) object that encapsulates all the exceptions that occur in an update operation.

PSGetUpdateError determines the error message, context string, and error code from the exception specified by E and creates a new EUpdateError (see page 6732) exception that includes that information as well as the information about a previous error as specified by Prev. The context string and error code for E may be specific to the Exception class associated with the dataset. By default, TDataSet (see page 6894) generates an EUpdateError (see page 6732) with an error code of 1 and an empty context string.

See Also

Create (see page 6733)

39.2.5.2.14 IProviderSupport2.PSInTransaction Method

Indicates whether actions against the dataset occur in the context of a transaction.

Pascal

```
function PSInTransaction: Boolean;
```

C++

```
__fastcall Boolean PSInTransaction();
```

Description

The provider component applies updates within a transaction, if possible. To do so, it first checks whether a transaction is already underway, and if not, generates one using PSStartTransaction (see page 7597). To determine whether a transaction is already underway, the provider calls PSInTransaction.

PSInTransaction returns true if there is a transaction underway, and false otherwise.

See Also

PSStartTransaction (see page 7597)

PSEndTransaction (see page 7589)

39.2.5.2.15 IProviderSupport2.PSIsSQLBased Method

Indicates whether the dataset includes native SQL support.

Pascal

```
function PSIsSQLBased: Boolean;
```

C++

```
__fastcall Boolean PSIsSQLBased();
```

Description

The provider calls PSIsSQLBased to determine whether the dataset supports some form of native SQL. This information is used

when generating SQL commands that are executed by PSExecuteStatement (see page 7590).

Note: The PSIsSQLSupported (see page 7596) method indicates whether the dataset can execute SQL commands at all, regardless of whether the dataset is SQL-based.

See Also

PSIsSQLSupported (see page 7596)

PSExecuteStatement (see page 7590)

39.2.5.2.16 IProviderSupport2.PSIsSQLSupported Method

Indicates whether the dataset can execute SQL statements.

Pascal

```
function PSIsSQLSupported: Boolean;
```

C++

```
__fastcall Boolean PSIsSQLSupported();
```

Description

PSIsSQLSupported indicates whether the provider can call PSExecuteStatement (see page 7590) to execute an SQL statement. When PSIsSQLSupported returns false, calling PSExecuteStatement (see page 7590) generates an exception. The provider can still work with a dataset that returns false from PSIsSQLSupported, but it must set the ResolveToDataSet property to true, or provide data on a read-only basis.

See Also

PSIsSQLBased (see page 7595)

PSExecuteStatement (see page 7590)

ResolveToDataSet (see page 18531)

39.2.5.2.17 IProviderSupport2.PSReset Method

Resets the dataset so that it is positioned on the first record.

Pascal

```
procedure PSReset;
```

C++

```
__fastcall PSReset();
```

Description

The provider calls PSReset to reposition the dataset on the first record before fetching records.

See Also

GetRecords (see page 18468)

AS_GetRecords (see page 16455)

39.2.5.2.18 IProviderSupport2.PSSetCommandText Method

Assigns a specified SQL command to be executed by PSExecute (see page 7590).

Pascal

```
procedure PSSetCommandText(const CommandText: WideString);
```

C++

```
__fastcall PSSetCommandText(const BSTR CommandText);
```

Description

If the provider's Options property includes poAllowCommandText, clients can supply an SQL command along with a call to GetRecords or Execute. This command is passed to the dataset by a call to PSSetCommandText, and subsequently executed by a call to PSExecute (see page 7590).

The value of the CommandText parameter replaces the dataset's SQL statement (if it has one), or replaces the name of an underlying database table or stored procedure.

See Also

CommandText (see page 8465)

PSExecute (see page 7590)

GetRecords (see page 18468)

Execute (see page 18466)

Options (see page 18440)

39.2.5.2.19 IProviderSupport2.PSSetParams Method

Assigns the specified parameter values to the dataset.

Pascal

```
procedure PSSetParams(AParams: TParams);
```

C++

```
__fastcall PSSetParams(TParams AParams);
```

Description

PSSetParams assigns the parameter values specified by AParams to the parameters of the dataset.

See Also

Params (see page 8489)

PSGetParams (see page 7593)

39.2.5.2.20 IProviderSupport2.PSStartTransaction Method

Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).

Pascal

```
procedure PSStartTransaction;
```

C++

```
__fastcall PSStartTransaction();
```

Description

The provider component applies updates within a transaction, if possible. To do so, it calls PSStartTransaction to start a transaction before applying updates, and calls PSEndTransaction (see page 7589) when all updates are applied or too many

errors are encountered.

Note: TDataSetProvider only starts a transaction (Using PSStartTransaction) if the PSInTransaction (see page 7595) method indicates that there is no transaction already established. That is, it does not assume nested transaction support is available.

See Also

PSEndTransaction (see page 7589)

PSInTransaction (see page 7595)

applyupdates (see page 18459)

39.2.5.2.21 IProviderSupport2.PSUpdateRecord Method

Applies a single update to the underlying database table or tables.

Pascal

```
function PSUpdateRecord(UpdateKind: TUpdateKind; Delta: TDataSet): Boolean;
```

C++

```
__fastcall Boolean PSUpdateRecord(TUpdateKind UpdateKind, TDataSet Delta);
```

Description

Before the provider generates SQL statements to apply an update, it calls PSUpdateRecord to let the dataset apply the update in some other fashion.

UpdateKind indicates whether the update is an insertion (ukInsert), deletion (ukDelete), or modification (ukModify).

Delta is the delta datapacket. The current record represents the record to be updated.

PSUpdateRecord returns true if it updates the record, false otherwise. If PSUpdateRecord returns false, the provider generates dynamic SQL to perform the update and calls PSExecuteStatement (see page 7590).

Note: PSUpdateRecord is only called if the provider's ResolveToDataSet property is false.

See Also

OnUpdateRecord (see page 9957)

TUpdateSQL (see page 10229)

applyupdates (see page 18459)

ResolveToDataSet (see page 18531)

PSExecuteStatement (see page 7590)

39.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	BuffersEqual (see page 7599)	This is function DB.BuffersEqual.
	DatabaseError (see page 7599)	Creates and raises an EDatabaseError (see page 6731) exception.
	DatabaseErrorFmt (see page 7600)	Creates and raises an EDatabaseError (see page 6731) exception with a formatted error message.
	DisposeMem (see page 7600)	This is function DB.DisposeMem.
	ExtractFieldName (see page 7601)	Returns the next name in a semicolon-delimited string of field names.
	ExtractFieldName (see page 7601)	Returns the next name in a semicolon-delimited string of field names.
	GetFieldProperty (see page 7602)	Returns a TField (see page 7115) object for a dataset and data control.
	RegisterFields (see page 7602)	Registers a set of field components so that they appear in the Dataset designer.
	VarTypeToDataType (see page 7603)	Returns the field type value that most closely corresponds to a Variant type.

39.3.1 DB.BuffersEqual Function

Pascal

```
function BuffersEqual(Buf1: Pointer; Buf2: Pointer; Size: Integer): Boolean;
```

C++

```
Boolean BuffersEqual(void * Buf1, void * Buf2, int Size);
```

File

DB

Description

This is function DB.BuffersEqual.

39.3.2 DB.DatabaseError Function

Creates and raises an EDatabaseError (see page 6731) exception.

Pascal

```
procedure DatabaseError(const Message: WideString; Component: TComponent = nil);
```

C++

```
DatabaseError(const BSTR Message, TComponent * Component = nil);
```

File

DB

Description

Call DatabaseError to raise an EDatabaseError (see page 6731) exception, using Message as the text for the exception. If a

component is provided as the second parameter, the message is prefixed by the name of the component to help in interpreting the error message. In C++, the second parameter can be NULL.

Calling DatabaseError rather than creating and raising the exception directly in code reduces the overall code size of the application.

See Also

DbiError

DatabaseErrorFmt

39.3.3 DB.DatabaseErrorFmt Function

Creates and raises an EDatabaseError (see page 6731) exception with a formatted error message.

Pascal

```
procedure DatabaseErrorFmt(const Message: WIdeString; const Args: array of const; Component:
TComponent = nil);
```

C++

```
DatabaseErrorFmt(const BSTR Message, const array of const Args, TComponent * Component = nil);
```

File

DB

Description

Call DatabaseError (see page 7599) to raise an EDatabaseError (see page 6731) exception. The error message for the exception is assembled from the format string specified by the Message parameter and applying the Args parameter. In C++, the Args_Size parameter specifies the index of the last argument in Args (one less than the number of arguments). If a component is provided as the final parameter, the message is prefixed by the name of the component to help in interpreting the error message.In C++, this parameter can be NULL.

Call DatabaseErrorFmt rather than creating and raising the exception directly in code to reduce the overall code size of the application.

See Also

DbiError

DatabaseError

39.3.4 DB.DisposeMem Function

Pascal

```
procedure DisposeMem(var Buffer; Size: Integer);
```

C++

```
DisposeMem( Buffer, int Size);
```

File

DB

Description

This is function DB.DisposeMem.

39.3.5 DB.ExtractFieldName Function

Returns the next name in a semicolon-delimited string of field names.

Pascal

```
function ExtractFieldName(const Fields: string; var Pos: Integer): string; overload;
deprecated;
function ExtractFieldName(const Fields: WideString; var Pos: Integer): WideString; overload;
```

C++

```
AnsiString ExtractFieldName(const AnsiString Fields, int Pos);
BSTR ExtractFieldName(const BSTR Fields, int Pos);
```

File

DB

Description

Use ExtractFieldName when parsing a semicolon-delimited string of names such as those used as parameters to many methods on database-specific objects.

Fields is a semicolon-delimited string of names.

Pos is the starting position of the next string in Fields. On exit from the function, Pos is updated to the starting position of the following string. If there is no following string, on exit, Pos is one more than the length of Fields.

ExtractFieldName returns a string with the single name that began at position Pos when the function was called.

ExtractFieldName is typically used in a loop, as follows:

Pos := 1;

```
while Pos <= Length(FieldNames) do
begin
  Name := ExtractFieldName(FieldNames, Pos);
  // do something with Name
end;
```

int Pos = 1;

```
while (Pos <= FieldNames.Length())
{
  AnsiString Name = ExtractFieldName(FieldNames, Pos);
  // do something with Name
}
```

See Also

TDataSet

TFields

39.3.6 DB.GetFieldProperty Function

Returns a TField (see page 7115) object for a dataset and data control.

Pascal

```
function GetFieldProperty(DataSet: TDataSet; Control: TComponent; const FieldName:
WideString): TField;
```

C++

```
TField GetFieldProperty(TDataSet DataSet, TComponent * Control, const BSTR FieldName);
```

File

DB

Description

GetFieldProperty returns a reference to a field given the dataset component that contains the field, the data-aware control that accesses the field, and the field name. GetFieldProperty returns a value of type TField (see page 7115).

DataSet is the dataset component containing the field.

Control is the data-aware control that accesses the field.

FieldName is the name of the field for which to return a TField (see page 7115).

See Also

TDataSet

TFields

39.3.7 DB.RegisterFields Function

Registers a set of field components so that they appear in the Dataset designer.

Pascal

```
procedure RegisterFields(const FieldClasses: array of TFieldClass);
```

C++

```
RegisterFields(const array of TFieldClass FieldClasses);
```

File

DB

Description

Call RegisterFields to allow custom descendants of TField (see page 7115) to appear in the field type drop down of the new field dialog box.

The FieldClasses parameter is an array of TField (see page 7115) descendants.In C++, the FieldClasses_Size is the index of the last class in the array (one less than the number of class types).

TField

TDataSetDesigner

TDataset

39.3.8 DB.VarTypeToDataType Function

Returns the field type value that most closely corresponds to a Variant type.

Pascal

```
function VarTypeToDataType(VarType: Integer): TFieldType;
```

C++

```
TFieldType VarTypeToDataType(int VarType);
```

File

DB

Description

Call VarTypeToDataType to infer the type of field component that should hold a value, given its Variant type. Use the VarType function to obtain a Variant type from a Variant.

VarType

39.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAutoRefreshFlag (see page 7604)	TAutoRefreshFlag Indicates whether the server provides field values, and if so, why.
	TBlobStreamMode (see page 7605)	TBlobStreamMode indicates how a BLOB stream can be used.
	TBookmarkFlag (see page 7606)	This is record DB.TBookmarkFlag.
	TDataAction (see page 7606)	TDataAction indicates how an application should respond to a database error condition.
	TDataEvent (see page 7607)	TDataEvent identifies an event that occurs to a dataset.
	TDataSetState (see page 7608)	TDataSetState indicates the current operating mode of a dataset component.
	TDBScreenCursor (see page 7610)	This is record DB.TDBScreenCursor.
	TFieldAttribute (see page 7611)	TFieldAttribute and TFieldAttributes (see page 7632) indicate various attributes of a field.
	TFieldKind (see page 7611)	TFieldKind indicates what type of information a field component represents.
	TFieldType (see page 7612)	TFieldType is a set of values that parallel the data types of fields in tables.
	TFilterOption (see page 7615)	TFilterOption and TFilterOptions (see page 7635) influence how filter strings are applied.
	TGetMode (see page 7615)	This is record DB.TGetMode.
	TGetResult (see page 7616)	This is record DB.TGetResult.
	TGroupPosInd (see page 7616)	TGroupPosInd and TGroupPosInds (see page 7636) indicate the position of the current record within its group.
	TIndexOption (see page 7617)	This is record DB.TIndexOption.
	TLocateOption (see page 7618)	This is record DB.TLocateOption.
	TParamType (see page 7619)	TParamType and TParamTypes (see page 7637) represent the use of parameters on datasets that represent queries or stored procedures.
	TProviderFlag (see page 7620)	TProviderFlag and TProviderFlags (see page 7638) indicate how a provider uses a field value when applying updates.
	TPSCommandType (see page 7621)	This is record DB.TPSCommandType.
	TUpdateAction (see page 7621)	TUpdateAction Indicates how an a dataset should proceed after an event handler has processed an update.
	TUpdateKind (see page 7622)	TUpdateKind defines the values for the UpdateKind parameter of OnUpdateError and OnUpdateRecord event handlers.
	TUpdateMode (see page 7623)	TUpdateMode indicates how to locate records so that they can be updated.
	TUpdateStatus (see page 7623)	TUpdateStatus indicates the update status of a record.

Records

	Name	Description
	TDateTimeRec (see page 7610)	This is record DB.TDateTimeRec.
	TLookupListEntry (see page 7618)	This is record DB.TLookupListEntry.
	TPacketAttribute (see page 7618)	This is record DB.TPacketAttribute.

39.4.1 DB.TAutoRefreshFlag Enumeration

TAutoRefreshFlag Indicates whether the server provides field values, and if so, why.

Pascal

```
TAutoRefreshFlag = (
```

```
  arNone,
  arAutoInc,
  arDefault
);
```

C++

```
enum TAutoRefreshFlag {
  arNone,
  arAutoInc,
  arDefault
};
```

File

DB

Description

TAutoRefreshFlag is the type of the AutoGenerateValue property of a field component. It indicates whether the server automatically supplies data for a field. TAutoRefreshFlag includes the following values:

Value	Meaning
arNone	The field does not have a default value and is not an autoincrement field. The server does not automatically supply values for this type of field.
arAutoInc	The field is an autoincrement field.
arDefault	The field has a default value maintained by the server.

See Also

TField

39.4.2 DB.TBlobStreamMode Enumeration

TBlobStreamMode indicates how a BLOB stream can be used.

Pascal

```
TBlobStreamMode = (
  bmRead,
  bmWrite,
  bmReadWrite
);
```

C++

```
enum TBlobStreamMode {
  bmRead,
  bmWrite,
  bmReadWrite
};
```

File

DB

Description

When a BLOB stream is first created, TBlobStreamMode is used to specify how that stream can be used. The following table lists the possible values.

Value	Meaning
bmRead	The stream is used to read from a BLOB field.
bmWrite	The stream is used to write from a BLOB field.
bmReadWrite	The stream is used to modify a BLOB field's value.

TDataSet

39.4.3 DB.TBookmarkFlag Enumeration

Pascal

```
TBookmarkFlag = (
  bfCurrent,
  bfBOF,
  bfEOF,
  bfInserted
);
```

C++

```
enum TBookmarkFlag {
  bfCurrent,
  bfBOF,
  bfEOF,
  bfInserted
};
```

File

DB

Description

This is record DB.TBookmarkFlag.

39.4.4 DB.TDataAction Enumeration

TDataAction indicates how an application should respond to a database error condition.

Pascal

```
TDataAction = (
  daFail,
  daAbort,
  daRetry
);
```

C++

```
enum TDataAction {
  daFail,
  daAbort,
  daRetry
};
```

File

DB

Description

TDataAction is the type of a parameter in certain dataset event handlers that indicates how the dataset should proceed after the event handler exits. The following table summarizes the possible values:

Value	Meaning
daFail	Abort the operation that led to an error and display an error message.
daAbort	Abort the operation that led to an error without displaying a message.
daRetry	Repeat the operation that led to an error. The cause of the error should be corrected within the event handler before returning this value.

39.4.5 DB.TDataEvent Enumeration

TDataEvent identifies an event that occurs to a dataset.

Pascal

```
TDataEvent = (
  deFieldChange,
  deRecordChange,
  deDataSetChange,
  deDataSetScroll,
  deLayoutChange,
  deUpdateRecord,
  deUpdateState,
  deCheckBrowseMode,
  dePropertyChange,
  deFieldListChange,
  deFocusControl,
  deParentScroll,
  deConnectChange,
  deReconcileError,
  deDisabledStateChange
);
```

C++

```
enum TDataEvent {
  deFieldChange,
  deRecordChange,
  deDataSetChange,
  deDataSetScroll,
  deLayoutChange,
  deUpdateRecord,
  deUpdateState,
  deCheckBrowseMode,
  dePropertyChange,
  deFieldListChange,
```

```
    deFocusControl,
    deParentScroll,
    deConnectChange,
    deReconcileError,
    deDisabledStateChange
  };
```

File

DB

Description

The following table describes the possible values:

Value	Meaning
deFieldChange	A field value changed.
deRecordChange	The contents of the current record changed.
deDataSetChange	A change occurred that affects the entire dataset (such as the insertion or deletion of records, changes to the key, or edits).
deDataSetScroll	The set of displayed records was scrolled.
deLayoutChange	The layout of data in a data-aware control changed.
deUpdateRecord	Edits to the current record were posted.
deUpdateState	The state of the dataset changed.
deCheckBrowseMode	The state of the dataset is about to change.
dePropertyChange	A property of the dataset or one of its fields changed.
deFieldListChange	The list of fields in the dataset changed.
deFocusControl	Focus needs to shift to the representation of a specified field.
deParentScroll	The parent for which the dataset is a nested detail scrolled.
deConnectChange	The connection to a remote dataset changed.
deReconcileError	The dataset encountered reconcile errors when applying updates.

39.4.6 DB.TDataSetState Enumeration

TDataSetState indicates the current operating mode of a dataset component.

Pascal

```
  TDataSetState = (
    dsInactive,
    dsBrowse,
    dsEdit,
    dsInsert,
    dsSetKey,
    dsCalcFields,
    dsFilter,
    dsNewValue,
    dsOldValue,
    dsCurValue,
    dsBlockRead,
    dsInternalCalc,
    dsOpening
  );
```

C++

```
enum TDataSetState {
  dsInactive,
  dsBrowse,
  dsEdit,
  dsInsert,
  dsSetKey,
  dsCalcFields,
  dsFilter,
  dsNewValue,
  dsOldValue,
  dsCurValue,
  dsBlockRead,
  dsInternalCalc,
  dsOpening
};
```

File

DB

Description

TDataSetState represents the values that may be in the State property of a dataset component. TDataSetState indicates the current operating mode of that dataset component. The following table lists all possible values in the TDataSetState type and describes what they indicate in the State property:

Value	Meaning
dsInactive	Dataset is closed, so its data is unavailable.
dsBrowse	Data can be viewed, but not changed. This is the default state of an open dataset.
dsEdit	Active record can be modified.
dsInsert	The active record is a newly inserted buffer that has not been posted. This record can be modified and then either posted or discarded.
dsSetKey	TClientDataSet only. Record searching is enabled, or a SetRange operation is under way. A restricted set of data can be viewed, and no data can be edited or inserted.
dsCalcFields	An OnCalcFields event is in progress. Noncalculated fields cannot be edited, and new records cannot be inserted.
dsFilter	An OnFilterRecord event is in progress. A restricted set of data can be viewed. No data can edited or inserted.
dsNewValue	Temporary state used internally when a field component's NewValue property is accessed.
dsOldValue	Temporary state used internally when a field component's OldValue property is accessed.
dsCurValue	Temporary state used internally when a field component's CurValue property is accessed.
dsBlockRead	Data-aware controls are not updated and events are not triggered when moving to the next record.
dsInternalCalc	Temporary state used internally when values need to be calculated for a field that has a FieldKind of fkInternalCalc.
dsOpening	DataSet is in the process of opening but has not finished.

TDataSource

39.4.7 DB.TDateTimeRec Record

Pascal

```
TDateTimeRec = record
  case TFieldType of
    ftDate: (Date: Longint;);
    ftDateTime: (DateTime: TDateTimeAlias;);
    ftTime: (Time: Longint;);
end;
```

C++

```
struct TDateTimeRec {
  Longint Date;
  Longint Time;
  TDateTimeAlias DateTime;
};
```

File

DB

Description

This is record DB.TDateTimeRec.

39.4.8 DB.TDBScreenCursor Enumeration

Pascal

```
TDBScreenCursor = (
  dcrDefault,
  dcrHourGlass,
  dcrSQLWait,
  dcrOther
);
```

C++

```
enum TDBScreenCursor {
  dcrDefault,
  dcrHourGlass,
  dcrSQLWait,
  dcrOther
};
```

File

DB

Description

This is record DB.TDBScreenCursor.

39.4.9 DB.TFieldAttribute Enumeration

TFieldAttribute and TFieldAttributes (see page 7632) indicate various attributes of a field.

Pascal

```
TFieldAttribute = (
  faHiddenCol,
  faReadonly,
  faRequired,
  faLink,
  faUnNamed,
  faFixed
);
```

C++

```
enum TFieldAttribute {
  faHiddenCol,
  faReadonly,
  faRequired,
  faLink,
  faUnNamed,
  faFixed
};
```

File

DB

Description

TFieldAttributes (see page 7632) is a set that describes the attributes of a physical field in an underlying database table. It can contain zero or more of the following TFieldAttribute values:

Value	Meaning
faHiddenCol	Internal flag for hidden columns
faReadonly	Indicates whether the physical field in the underlying table is read-only.
faRequired	Indicates whether a value for the physical field in the underlying table is required.
faLink	Internal flag for nested datasets.
faUnNamed	Internal use only. Indicates a TObjectField (see page 7372) in a nested table that has no name associated with it.
faFixed	Indicates that the field has a fixed size.

39.4.10 DB.TFieldKind Enumeration

TFieldKind indicates what type of information a field component represents.

Pascal

```
TFieldKind = (
  fkData,
  fkCalculated,
  fkLookup,
```

```
    fkInternalCalc,
    fkAggregate
  );
```

C++

```
  enum TFieldKind {
    fkData,
    fkCalculated,
    fkLookup,
    fkInternalCalc,
    fkAggregate
  };
```

File

DB

Description

TFieldKind can take one of the following values:

Value	Description
fkData	Field represents a physical field in a database table
fkCalculated	Field is calculated in an OnCalcFields event handler
fkLookup	Field is a lookup field. (Not implemented for fields on unidirectional datasets)
fkInternalCalc	Field is calculated but values are stored in the dataset.
fkAggregate	Field represents a maintained aggregate in a client dataset.

See Also

TField

39.4.11 DB.TFieldType Enumeration

TFieldType is a set of values that parallel the data types of fields in tables.

Pascal

```
  TFieldType = (
    ftUnknown,
    ftString,
    ftSmallint,
    ftInteger,
    ftWord,
    ftBoolean,
    ftFloat,
    ftCurrency,
    ftBCD,
    ftDate,
    ftTime,
    ftDateTime,
    ftBytes,
    ftVarBytes,
    ftAutoInc,
    ftBlob,
    ftMemo,
    ftGraphic,
    ftFmtMemo,
    ftParadoxOle,
```

```
    ftDBaseOle,
    ftTypedBinary,
    ftCursor,
    ftFixedChar,
    ftWideString,
    ftLargeint,
    ftADT,
    ftArray,
    ftReference,
    ftDataSet,
    ftOraBlob,
    ftOraClob,
    ftVariant,
    ftInterface,
    ftIDispatch,
    ftGuid,
    ftTimeStamp,
    ftFMTBcd,
    ftFixedWideChar,
    ftWideMemo,
    ftOraTimeStamp,
    ftOraInterval
  );
```

C++

```
  enum TFieldType {
    ftUnknown,
    ftString,
    ftSmallint,
    ftInteger,
    ftWord,
    ftBoolean,
    ftFloat,
    ftCurrency,
    ftBCD,
    ftDate,
    ftTime,
    ftDateTime,
    ftBytes,
    ftVarBytes,
    ftAutoInc,
    ftBlob,
    ftMemo,
    ftGraphic,
    ftFmtMemo,
    ftParadoxOle,
    ftDBaseOle,
    ftTypedBinary,
    ftCursor,
    ftFixedChar,
    ftWideString,
    ftLargeint,
    ftADT,
    ftArray,
    ftReference,
    ftDataSet,
    ftOraBlob,
    ftOraClob,
    ftVariant,
    ftInterface,
    ftIDispatch,
    ftGuid,
    ftTimeStamp,
    ftFMTBcd,
    ftFixedWideChar,
    ftWideMemo,
```

```
    ftOraTimeStamp,
    ftOraInterval
  };
```

File

DB

Description

TFieldType type is the set of values for the DataType property field objects, field definition objects, and parameter objects. Classes (see page 2685) in which TFieldType values are used include TField (see page 7115) (and descendants), TFieldDef (see page 7184), TParam (see page 7386), TParameter, and TAggregate. TFieldType values are also used in field-related functions and methods like the Add method of TFieldDefs (see page 7198). The following table describes each value:

Value	Description
ftUnknown	Unknown or undetermined
ftString	Character or string field
ftSmallint	16-bit integer field
ftInteger	32-bit integer field
ftWord	16-bit unsigned integer field
ftBoolean	Boolean field
ftFloat	Floating-point numeric field
ftCurrency	Money field
ftBCD	Binary-Coded Decimal field that can be converted to Currency type without a loss of precision.
ftDate	Date field
ftTime	Time field
ftDateTime	Date and time field
ftBytes	Fixed number of bytes (binary storage)
ftVarBytes	Variable number of bytes (binary storage)
ftAutoInc	Auto-incrementing 32-bit integer counter field
ftBlob	Binary Large OBject field
ftMemo	Text memo field
ftGraphic	Bitmap field
ftFmtMemo	Formatted text memo field
ftParadoxOle	Paradox OLE field
ftDBaseOle	dBASE OLE field
ftTypedBinary	Typed binary field
ftCursor	Output cursor from an Oracle stored procedure (TParam (see page 7386) only)
ftFixedChar	Fixed character field
ftWideString	Wide string field
ftLargeint	Int64 large integer field
ftADT	Abstract Data Type field
ftArray	Array field

ftReference	REF field
ftDataSet	DataSet field
ftOraBlob	BLOB fields in Oracle 8 tables
ftOraClob	CLOB fields in Oracle 8 tables
ftVariant	Data of unknown or undetermined type
ftInterface	References to interfaces (IUnknown)
ftIDispatch	References to IDispatch interfaces
ftGuid	globally unique identifier (GUID) values
ftTimeStamp	Date and time field accessed through dbExpress
ftFMTBcd	Binary-Coded Decimal field that is too large for ftBCD.

39.4.12 DB.TFilterOption Enumeration

TFilterOption and TFilterOptions (see page 7635) influence how filter strings are applied.

Pascal

```
TFilterOption = (
  foCaseInsensitive,
  foNoPartialCompare
);
```

C++

```
enum TFilterOption {
  foCaseInsensitive,
  foNoPartialCompare
};
```

File

DB

Description

TFilterOptions (see page 7635) is a set that specifies how filter expressions are applied to string fields. It can contain zero or more of the following values:

Value	Meaning
foCaseInsensitive	Literal strings in the filter are compared to string-valued fields case-insensitively.
foNoPartialCompare	Asterisks (*) in the filter are treated as literal characters rather than as wildcards. When filter options does not include foNoPartialCompare, strings that end in an asterisk signify a partial string match with the asterisk matching any number of characters.

39.4.13 DB.TGetMode Enumeration

Pascal

```
TGetMode = (
```

```
    gmCurrent,
    gmNext,
    gmPrior
  );
```

C++

```
  enum TGetMode {
    gmCurrent,
    gmNext,
    gmPrior
  };
```

File

DB

Description

This is record DB.TGetMode.

39.4.14 DB.TGetResult Enumeration

Pascal

```
  TGetResult = (
    grOK,
    grBOF,
    grEOF,
    grError
  );
```

C++

```
  enum TGetResult {
    grOK,
    grBOF,
    grEOF,
    grError
  };
```

File

DB

Description

This is record DB.TGetResult.

39.4.15 DB.TGroupPosInd Enumeration

TGroupPosInd and TGroupPosInds (see page 7636) indicate the position of the current record within its group.

Pascal

```
  TGroupPosInd = (
    gbFirst,
    gbMiddle,
    gbLast
  );
```

C++

```
enum TGroupPosInd {
  gbFirst,
  gbMiddle,
  gbLast
};
```

File

DB

Description

TGroupPosInds (see page 7636) is a set that indicates where the current record sits within a group of records. It is a set because if the group contains only one record, the current record is both first and last.

The following table lists the possible TGroupPosInd values:

Value	Meaning
gbFirst	The record is the first record in the group.
gbMiddle	The record is neither the first nor the last in the group.
gbLast	The record is the last record in the group.

39.4.16 DB.TIndexOption Enumeration

Pascal

```
TIndexOption = (
  ixPrimary,
  ixUnique,
  ixDescending,
  ixCaseInsensitive,
  ixExpression,
  ixNonMaintained
);
```

C++

```
enum TIndexOption {
  ixPrimary,
  ixUnique,
  ixDescending,
  ixCaseInsensitive,
  ixExpression,
  ixNonMaintained
};
```

File

DB

Description

This is record DB.TIndexOption.

39.4.17 DB.TLocateOption Enumeration

Pascal

```
TLocateOption = (
  loCaseInsensitive,
  loPartialKey
);
```

C++

```
enum TLocateOption {
  loCaseInsensitive,
  loPartialKey
};
```

File

DB

Description

This is record DB.TLocateOption.

39.4.18 DB.TLookupListEntry Record

Pascal

```
TLookupListEntry = record
  Key: Variant;
  Value: Variant;
end;
```

C++

```
struct TLookupListEntry {
  Variant Key;
  Variant Value;
};
```

File

DB

Description

This is record DB.TLookupListEntry.

39.4.19 DB.TPacketAttribute Record

Pascal

```
TPacketAttribute = record
  Name: string;
  Value: OleVariant;
  IncludeInDelta: Boolean;
end;
```

C++

```
struct TPacketAttribute {
  AnsiString Name;
  OleVariant Value;
  Boolean IncludeInDelta;
};
```

File

DB

Description

This is record DB.TPacketAttribute.

39.4.20 DB.TParamType Enumeration

TParamType and TParamTypes (see page 7637) represent the use of parameters on datasets that represent queries or stored procedures.

Pascal

```
TParamType = (
  ptUnknown,
  ptInput,
  ptOutput,
  ptInputOutput,
  ptResult
);
```

C++

```
enum TParamType {
  ptUnknown,
  ptInput,
  ptOutput,
  ptInputOutput,
  ptResult
};
```

File

DB

Description

TParamType indicates how a query or stored procedure parameter is used. TParamTypes (see page 7637) is a set of parameter types that can be used to filter parameters so that an application need only work with those parameters that are of interest.

The DbClient unit defines a constant, AllParamTypes, of type TParamTypes (see page 7637) that represents any possible parameter type:

const AllParamTypes = [ptUnknown, ptInput, ptOutput, ptInputOutput, ptResult];

#define AllParamTypes TParamTypes (see page 7637)() << ptUnknown << ptInput << ptOutput << ptInputOutput << ptResult)

TParamType includes the following values:

Value	Description
ptUnknown	Unknown or undetermined. Before executing a stored procedure, the application must set parameters of this type to another kind.
ptInput	Used to input a field value. Identifies a parameter used to pass values to a query or stored procedure for processing.
ptOutput	Used to output a field value. Identifies a parameter used by a stored procedure to return values to an application.
ptInputOutput	Used for both input and output.
ptResult	Used as a return value. Identifies a parameter used by a stored procedure to return an error or status value. A stored procedure can only have one parameter of type ptResult.

39.4.21 DB.TProviderFlag Enumeration

TProviderFlag and TProviderFlags (see page 7638) indicate how a provider uses a field value when applying updates.

Pascal

```
TProviderFlag = (
  pfInUpdate,
  pfInWhere,
  pfInKey,
  pfHidden
);
```

C++

```
enum TProviderFlag {
  pfInUpdate,
  pfInWhere,
  pfInKey,
  pfHidden
};
```

File

DB

Description

TProviderFlags (see page 7638) is a set of TProviderFlag values. The following table lists the TProviderFlag values:

Value	Meaning
pfInUpdate	The field can be included in UPDATE statements. (That is, it can be modified)
pfInWhere	The field is included in the WHERE clause when the provider's UpdateMode is upWhereAll or upWhereChanged.
pfInKey	The field is included in the WHERE clause when the provider's UpdateMode is upWhereKeyOnly.
pfHidden	The field is included in data packets to ensure the uniqueness of records so that they can be correctly updated. It can't be seen or used by the receiving client dataset.

39.4.22 DB.TPSCommandType Enumeration

Pascal

```
TPSCommandType = (
  ctUnknown,
  ctQuery,
  ctTable,
  ctStoredProc,
  ctSelect,
  ctInsert,
  ctUpdate,
  ctDelete,
  ctDDL
);
```

C++

```
enum TPSCommandType {
  ctUnknown,
  ctQuery,
  ctTable,
  ctStoredProc,
  ctSelect,
  ctInsert,
  ctUpdate,
  ctDelete,
  ctDDL
};
```

File

DB

Description

This is record DB.TPSCommandType.

39.4.23 DB.TUpdateAction Enumeration

TUpdateAction Indicates how an a dataset should proceed after an event handler has processed an update.

Pascal

```
TUpdateAction = (
  uaFail,
  uaAbort,
  uaSkip,
  uaRetry,
  uaApplied
);
```

C++

```
enum TUpdateAction {
  uaFail,
  uaAbort,
  uaSkip,
  uaRetry,
  uaApplied
};
```

File

DB

Description

TUpdateAction is the type of a parameter on event handlers that intervene when applying cached updates (without using a client dataset and provider). The following table lists the possible values:

Value	Meaning
uaAbort	Abort the update operation without displaying an error message.
uaApplied	The event handler applied the update (not used in error handling event handlers). Free the current record update from the cache.
uaFail	Abort the update operation and display an error message.
uaRetry	Repeat the update operation that originally raised the error condition (not used in OnUpdateRecord event handlers).
uaSkip	Skip updating the current record and leave the unapplied changes in the cache.

39.4.24 DB.TUpdateKind Enumeration

TUpdateKind defines the values for the UpdateKind parameter of OnUpdateError and OnUpdateRecord event handlers.

Pascal

```
TUpdateKind = (
  ukModify,
  ukInsert,
  ukDelete
);
```

C++

```
enum TUpdateKind {
  ukModify,
  ukInsert,
  ukDelete
};
```

File

DB

Description

The TUpdateKind type defines the possible values for the UpdateKind parameter of OnUpdateError and OnUpdateRecord event handlers, as described in the following table:

Value	Description
ukModify	The update to the record is a modification to the record's contents.
ukInsert	The update is the insertion of a new record.
ukDelete	The update is the deletion of a record.

39.4.25 DB.TUpdateMode Enumeration

TUpdateMode indicates how to locate records so that they can be updated.

Pascal

```
TUpdateMode = (
  upWhereAll,
  upWhereChanged,
  upWhereKeyOnly
);
```

C++

```
enum TUpdateMode {
  upWhereAll,
  upWhereChanged,
  upWhereKeyOnly
};
```

File

DB

Description

TUpdateMode is the type of the UpdateMode property. UpdateMode specifies how the records are located when the ApplyUpdates method is called. TUpdateMode includes the following values:

Value	Meaning
upWhereAll	All columns (fields) are used to locate the record.
upWhereChanged	Only key field values and the original value of fields that have changed are used to find the record.
upWhereKeyOnly	Only key fields are used to find the record.

UpdateMode

ApplyUpdates

39.4.26 DB.TUpdateStatus Enumeration

TUpdateStatus indicates the update status of a record.

Pascal

```
TUpdateStatus = (
  usUnmodified,
  usModified,
  usInserted,
  usDeleted
);
```

C++

```
enum TUpdateStatus {
  usUnmodified,
  usModified,
```

```
    usInserted,
    usDeleted
  };
```

File

DB

Description

TUpdateStatus is the return type of the UpdateStatus method. UpdateStatus indicates what change, if any, is cached for the current record. TUpdateStatus includes the following values:

Value	Description
usUnmodified	The current record has no unapplied updates.
usModified	The current record has unapplied modifications.
usInserted	The current record has been inserted but the insertion was not applied.
usDeleted	The current record represents a deleted record, where the deletion has not yet been applied.

UpdateStatus

39.5 Types

The following table lists types in this documentation.

Types

Name	Description
Largeint (see page 7626)	This is type DB.Largeint.
PBookmarkFlag (see page 7626)	This is type DB.PBookmarkFlag.
PLookupListEntry (see page 7626)	This is type DB.PLookupListEntry.
PPacketAttribute (see page 7627)	This is type DB.PPacketAttribute.
TBlobByteData (see page 7627)	TBlobByteData stores the contents of a Binary Large Object (BLOB) field.
TBlobData (see page 7627)	This is type DB.TBlobData.
TBlobType (see page 7628)	TBlobType indicates the type of a BLOB field.
TBookmark (see page 7628)	TBookmark identifies a record in a dataset for later navigation.
TBookmarkStr (see page 7629)	TBookmarkStr is a bookmark, represented as a string.
TBufferList (see page 7629)	This is type DB.TBufferList.
TConnectChangeEvent (see page 7630)	This is type DB.TConnectChangeEvent.
TDataChangeEvent (see page 7630)	This is type DB.TDataChangeEvent.
TDataOperation (see page 7630)	This is type DB.TDataOperation.
TDataSetClass (see page 7631)	TDataSetClass is the class type of a TDataSet (see page 6894) descendant.
TDataSetErrorEvent (see page 7631)	This is type DB.TDataSetErrorEvent.
TDataSetNotifyEvent (see page 7631)	This is type DB.TDataSetNotifyEvent.
TDateTimeAlias (see page 7632)	This is type DB.TDateTimeAlias.
TDefUpdateMethod (see page 7632)	This is type DB.TDefUpdateMethod.
TFieldAttributes (see page 7632)	This is type DB.TFieldAttributes.
TFieldChars (see page 7633)	TFieldChars indicates the set of characters that are valid for field.
TFieldClass (see page 7633)	TFieldClass is the class type of a TField (see page 7115) descendant.
TFieldGetTextEvent (see page 7633)	This is type DB.TFieldGetTextEvent.
TFieldKinds (see page 7634)	This is type DB.TFieldKinds.
TFieldNotifyEvent (see page 7634)	This is type DB.TFieldNotifyEvent.
TFieldRef (see page 7634)	This is type DB.TFieldRef.
TFieldSetTextEvent (see page 7635)	This is type DB.TFieldSetTextEvent.
TFilterOptions (see page 7635)	This is type DB.TFilterOptions.
TFilterRecordEvent (see page 7635)	This is type DB.TFilterRecordEvent.
TGroupPosInds (see page 7636)	This is type DB.TGroupPosInds.
TIndexOptions (see page 7636)	TIndexOptions describes the attributes of an index.
TLocateOptions (see page 7637)	TLocateOptions defines the values for the Options parameter of the Locate method of a dataset.
TParamTypes (see page 7637)	This is type DB.TParamTypes.
TProviderFlags (see page 7638)	This is type DB.TProviderFlags.
TResyncMode (see page 7638)	TResyncMode is a set of flags that indicate operations a dataset should perform when resynchronizing data.
TSQLCommandType (see page 7638)	This is type DB.TSQLCommandType.
TUpdateErrorEvent (see page 7639)	This is type DB.TUpdateErrorEvent.
TUpdateRecordEvent (see page 7639)	This is type DB.TUpdateRecordEvent.
TUpdateRecordTypes (see page 7639)	This is type DB.TUpdateRecordTypes.
TUpdateStatusSet (see page 7640)	This is type DB.TUpdateStatusSet.

39.5.1 DB.Largeint Type

Pascal

```
Largeint = Int64;
```

C++

```
Int64 Largeint;
```

File

DB

Description

This is type DB.Largeint.

39.5.2 DB.PBookmarkFlag Type

Pascal

```
PBookmarkFlag = ^TBookmarkFlag;
```

C++

```
^TBookmarkFlag PBookmarkFlag;
```

File

DB

Description

This is type DB.PBookmarkFlag.

39.5.3 DB.PLookupListEntry Type

Pascal

```
PLookupListEntry = ^TLookupListEntry;
```

C++

```
^TLookupListEntry PLookupListEntry;
```

File

DB

Description

This is type DB.PLookupListEntry.

39.5.4 DB.PPacketAttribute Type

Pascal

```
PPacketAttribute = ^TPacketAttribute;
```

C++

```
^TPacketAttribute PPacketAttribute;
```

File

DB

Description

This is type DB.PPacketAttribute.

39.5.5 DB.TBlobByteData Type

TBlobByteData stores the contents of a Binary Large Object (BLOB) field.

Pascal

```
TBlobByteData = array of Byte;
```

C++

```
array of Byte TBlobByteData;
```

File

DB

Description

TBlobByteData is the type for buffers that store information from a BLOB field.

39.5.6 DB.TBlobData Type

Pascal

```
TBlobData = string;
```

C++

```
AnsiString TBlobData;
```

File

DB

Description

This is type DB.TBlobData.

39.5.7 DB.TBlobType Type

TBlobType indicates the type of a BLOB field.

Pascal

```
TBlobType = ftBlob..ftWideMemo;
```

C++

```
ftBlob..ftWideMemo TBlobType;
```

File

DB

Description

TBlobType represents a range of TFieldType (see page 7612) values. These are the possible values of BlobType:

Value	Description
ftBlob	Binary Large Object field
ftMemo	Text memo field
ftGraphic	Bitmap field
ftFmtMemo	Formatted text memo field
ftParadoxOle	Paradox OLE field
ftDBaseOle	dBASE OLE field
ftTypedBinary	Typed binary field
ftOraBlob	BLOB fields in Oracle 8 tables
ftOraClob	CLOB fields in Oracle 8 tables

See Also

TBlobField

TFieldType

39.5.8 DB.TBookmark Type

TBookmark identifies a record in a dataset for later navigation.

Pascal

```
TBookmark = Pointer;
```

C++

```
void * TBookmark;
```

File

DB

Description

TBookmark is the type of the Bookmark parameter in the GetBookmark, GotoBookmark, and FreeBookmark methods of a dataset component.

Note: Different types of datsets can implement bookmarks differently. Do not use a TBookmark from one type of dataset (for example, a client dataset) with methods on another type of dataset (for example, an InterBase Express dataset).

See Also

GetBookmark (see page 6948)

GotoBookmark (see page 6957)

FreeBookmark (see page 6945)

Bookmark (see page 7009)

Marking and Returning to Records

39.5.9 DB.TBookmarkStr Type

TBookmarkStr is a bookmark, represented as a string.

Pascal

```
TBookmarkStr = string;
```

C++

```
AnsiString TBookmarkStr;
```

File

DB

Description

TBookmarkStr is the value of a bookmark in a dataset. Although this is a string type, it is not necessarily a string of text. The string can be any string of bytes. The format depends on the type of dataset.

39.5.10 DB.TBufferList Type

Pascal

```
TBufferList = array of PChar;
```

C++

```
array of PChar TBufferList;
```

File

DB

Description

This is type DB.TBufferList.

39.5.11 DB.TConnectChangeEvent Type

Pascal

```
TConnectChangeEvent = procedure (Sender: TObject; Connecting: Boolean) of object;
```

C++

```
(Sender: TObject; Connecting: Boolean) ( TConnectChangeEvent)();
```

File

DB

Description

This is type DB.TConnectChangeEvent.

39.5.12 DB.TDataChangeEvent Type

Pascal

```
TDataChangeEvent = procedure (Sender: TObject; Field: TField) of object;
```

C++

```
(Sender: TObject; Field: TField) ( TDataChangeEvent)();
```

File

DB

Description

This is type DB.TDataChangeEvent.

39.5.13 DB.TDataOperation Type

Pascal

```
TDataOperation = procedure of object;
```

C++

```
( TDataOperation)();
```

File

DB

Description

This is type DB.TDataOperation.

39.5.14 DB.TDataSetClass Type

TDataSetClass is the class type of a TDataSet (see page 6894) descendant.

Pascal

```
TDataSetClass = class of TDataSet;
```

C++

```
TDataSet TDataSetClass;
```

File

DB

Description

Use TDataSetClass to specify the type of a TDataSet (see page 6894) descendant.

See Also

TDataSet

39.5.15 DB.TDataSetErrorEvent Type

Pascal

```
TDataSetErrorEvent = procedure (DataSet: TDataSet; E: EDatabaseError; var Action: TDataAction)
of object;
```

C++

```
(DataSet: TDataSet; E: EDatabaseError; var Action: TDataAction) ( TDataSetErrorEvent)();
```

File

DB

Description

This is type DB.TDataSetErrorEvent.

39.5.16 DB.TDataSetNotifyEvent Type

Pascal

```
TDataSetNotifyEvent = procedure (DataSet: TDataSet) of object;
```

C++

```
(DataSet: TDataSet) ( TDataSetNotifyEvent)();
```

File

DB

Description

This is type DB.TDataSetNotifyEvent.

39.5.17 DB.TDateTimeAlias Type

Pascal

```
TDateTimeAlias = type TDateTime;
```

C++

```
type TDateTime TDateTimeAlias;
```

File

DB

Description

This is type DB.TDateTimeAlias.

39.5.18 DB.TDefUpdateMethod Type

Pascal

```
TDefUpdateMethod = procedure of object;
```

C++

```
( TDefUpdateMethod)();
```

File

DB

Description

This is type DB.TDefUpdateMethod.

39.5.19 DB.TFieldAttributes Type

Pascal

```
TFieldAttributes = set of TFieldAttribute;
```

C++

```
TFieldAttribute TFieldAttributes;
```

File

DB

Description

This is type DB.TFieldAttributes.

39.5.20 DB.TFieldChars Type

TFieldChars indicates the set of characters that are valid for field.

Pascal

```
TFieldChars = set of Char;
```

C++

```
Char TFieldChars;
```

File

DB

Description

TFieldChars is a set of characters that can be used to create a string that is the value of a field.

39.5.21 DB.TFieldClass Type

TFieldClass is the class type of a TField (see page 7115) descendant.

Pascal

```
TFieldClass = class of TField;
```

C++

```
TField TFieldClass;
```

File

DB

Description

Use TFieldClass to specify the type of a TField (see page 7115) descendant.

See Also

TField

39.5.22 DB.TFieldGetTextEvent Type

Pascal

```
TFieldGetTextEvent = procedure (Sender: TField; var Text: string; DisplayText: Boolean) of
object;
```

C++

```
(Sender: TField; var Text: string; DisplayText: Boolean) ( TFieldGetTextEvent)();
```

File

DB

Description

This is type DB.TFieldGetTextEvent.

39.5.23 DB.TFieldKinds Type

Pascal

```
TFieldKinds = set of TFieldKind;
```

C++

```
TFieldKind TFieldKinds;
```

File

DB

Description

This is type DB.TFieldKinds.

39.5.24 DB.TFieldNotifyEvent Type

Pascal

```
TFieldNotifyEvent = procedure (Sender: TField) of object;
```

C++

```
(Sender: TField) ( TFieldNotifyEvent)();
```

File

DB

Description

This is type DB.TFieldNotifyEvent.

39.5.25 DB.TFieldRef Type

Pascal

```
TFieldRef = ^TField;
```

C++

```
^TField TFieldRef;
```

File

DB

Description

This is type DB.TFieldRef.

39.5.26 DB.TFieldSetTextEvent Type

Pascal

```
TFieldSetTextEvent = procedure (Sender: TField; const Text: string) of object;
```

C++

```
(Sender: TField; const Text: string) ( TFieldSetTextEvent)();
```

File

DB

Description

This is type DB.TFieldSetTextEvent.

39.5.27 DB.TFilterOptions Type

Pascal

```
TFilterOptions = set of TFilterOption;
```

C++

```
TFilterOption TFilterOptions;
```

File

DB

Description

This is type DB.TFilterOptions.

39.5.28 DB.TFilterRecordEvent Type

Pascal

```
TFilterRecordEvent = procedure (DataSet: TDataSet; var Accept: Boolean) of object;
```

C++

```
(DataSet: TDataSet; var Accept: Boolean) ( TFilterRecordEvent)();
```

File

DB

Description

This is type DB.TFilterRecordEvent.

39.5.29 DB.TGroupPosInds Type

Pascal

```
TGroupPosInds = set of TGroupPosInd;
```

C++

```
TGroupPosInd TGroupPosInds;
```

File

DB

Description

This is type DB.TGroupPosInds.

39.5.30 DB.TIndexOptions Type

TIndexOptions describes the attributes of an index.

Pascal

```
TIndexOptions = set of TIndexOption;
```

C++

```
TIndexOption TIndexOptions;
```

File

DB

Description

TIndexOptions is a set of attributes that applies to a specific index. A TIndexOptions value can include zero or more of the following values:

Value	Description
ixPrimary	The index is the primary index of the table. (Not applicable to dBASE tables).
ixUnique	Each value in the index is unique; there are no duplicates. (Not applicable to all table types.)
ixDescending	The index imposes a descending sort order. (Not applicable to all table types.)
ixExpression	The index is based on a dBASE key expression. (Only applicable to dBASE tables).
ixCaseInsensitive	The index sorts records case insensitively. (Not applicable to all table types.)
ixNonMaintained	The index is not automatically updated when the data is edited. (Not applicable to all table types.)

Warning: Attempting to create an index using options that are not applicable to the table type causes AddIndex to raise an exception.

Not all table types support use of all of the above index options. Even within a particular table type, any given option may only be supported in certain versions of a table type. See the BDE Administrator or Database Explorer utility for information on local table levels.

dBASE tables only support primary indexes and true unique indexes when the table level is 7 or higher (concurrent with Visual

dBASE 7). dBASE tables do not support case-insensitive or descending indexes at all. Use the ixExpression constant when the index is based on multiple fields or uses dBASE data manipulation language functions (that is, for expression indexes). The ixExpression constant is only applicable to dBASE tables.

Paradox tables support the ixDescending for secondary indexes if the table level is 7 or higher and the ixUnique constant if the table level is 5 or higher. The ixDescending and ixCaseInsensitive constants are not applicable to primary indexes.

For SQL-based table types, see the vendor-supplied documentation for the particular database system for details on what index options are applicable.

39.5.31 DB.TLocateOptions Type

TLocateOptions defines the values for the Options parameter of the Locate method of a dataset.

Pascal

```
TLocateOptions = set of TLocateOption;
```

C++

```
TLocateOption TLocateOptions;
```

File

DB

Description

TLocateOptions is the type of the Options parameter to a dataset's Locate method. The following table lists the possible values:

Value	Description
loCaseInsensitive	Key fields and key values are matched without regard to case.
loPartialKey	Key values can include only part of the matching key field value; for example, 'HAM' would match both 'HAMM' and 'HAMMER.'

39.5.32 DB.TParamTypes Type

Pascal

```
TParamTypes = set of TParamType;
```

C++

```
TParamType TParamTypes;
```

File

DB

Description

This is type DB.TParamTypes.

39.5.33 DB.TProviderFlags Type

Pascal

```
TProviderFlags = set of TProviderFlag;
```

C++

```
TProviderFlag TProviderFlags;
```

File

DB

Description

This is type DB.TProviderFlags.

39.5.34 DB.TResyncMode Type

TResyncMode is a set of flags that indicate operations a dataset should perform when resynchronizing data.

Pascal

```
TResyncMode = set of (rmExact, rmCenter);
```

C++

```
(rmExact, rmCenter) TResyncMode;
```

File

DB

Description

TResyncMode is a set of zero or more of the following values:

Value	Meaning
rmExact	The dataset should raise an exception when the resync operation is initiated when the cursor is not positioned on a valid record.
rmCenter	The resync operation should position the active record in the center of all buffered records.

39.5.35 DB.TSQLCommandType Type

Pascal

```
TSQLCommandType = ctQuery..ctStoredProc;
```

C++

```
ctQuery..ctStoredProc TSQLCommandType;
```

File

DB

Description

This is type DB.TSQLCommandType.

39.5.36 DB.TUpdateErrorEvent Type

Pascal

```
TUpdateErrorEvent = procedure (DataSet: TDataSet; E: EDatabaseError; UpdateKind: TUpdateKind;
var UpdateAction: TUpdateAction) of object;
```

C++

```
(DataSet: TDataSet; E: EDatabaseError; UpdateKind: TUpdateKind; var UpdateAction:
TUpdateAction) ( TUpdateErrorEvent)();
```

File

DB

Description

This is type DB.TUpdateErrorEvent.

39.5.37 DB.TUpdateRecordEvent Type

Pascal

```
TUpdateRecordEvent = procedure (DataSet: TDataSet; UpdateKind: TUpdateKind; var UpdateAction:
TUpdateAction) of object;
```

C++

```
(DataSet: TDataSet; UpdateKind: TUpdateKind; var UpdateAction: TUpdateAction) (
TUpdateRecordEvent)();
```

File

DB

Description

This is type DB.TUpdateRecordEvent.

39.5.38 DB.TUpdateRecordTypes Type

Pascal

```
TUpdateRecordTypes = set of (rtModified, rtInserted, rtDeleted, rtUnmodified);
```

C++

```
(rtModified, rtInserted, rtDeleted, rtUnmodified) TUpdateRecordTypes;
```

File

DB

Description

This is type DB.TUpdateRecordTypes.

39.5.39 DB.TUpdateStatusSet Type

Pascal

```
TUpdateStatusSet = set of TUpdateStatus;
```

C++

```
TUpdateStatus TUpdateStatusSet;
```

File

DB

Description

This is type DB.TUpdateStatusSet.

39.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
DBApplication (see page 7641)	This is variable DB.DBApplication.
DBScreen (see page 7641)	This is variable DB.DBScreen.
DefaultFieldClasses (see page 7642)	This is variable DB.DefaultFieldClasses.
LoginDialogExProc (see page 7642)	This is variable DB.LoginDialogExProc.
LoginDialogProc (see page 7642)	This is variable DB.LoginDialogProc.
PasswordDialog (see page 7643)	Displays a dialog box that prompts the user for the password of a local password-protected table.
RemoteLoginDialogProc (see page 7643)	This is variable DB.RemoteLoginDialogProc.
ScreenCursorProc (see page 7644)	This is variable DB.ScreenCursorProc.

39.6.1 DB.DBApplication Variable

Pascal

```
DBApplication: IDBApplication;
```

C++

```
IDBApplication DBApplication;
```

File

DB

Description

This is variable DB.DBApplication.

39.6.2 DB.DBScreen Variable

Pascal

```
DBScreen: IDBScreen;
```

C++

```
IDBScreen DBScreen;
```

File

DB

Description

This is variable DB.DBScreen.

39.6.3 DB.DefaultFieldClasses Variable

Pascal

```
DefaultFieldClasses: array[TFieldType] of TFieldClass = ( nil, TStringField, TSmallintField,
TIntegerField, TWordField, TBooleanField, TFloatField, TCurrencyField, TBCDField, TDateField,
TTimeField, TDateTimeField, TBytesField, TVarBytesField, TAutoIncField, TBlobField,
TMemoField, TGraphicField, TBlobField, TBlobField, TBlobField, TBlobField, nil, TStringField,
TWideStringField, TLargeIntField, TADTField, TArrayField, TReferenceField, TDataSetField,
TBlobField, TMemoField, TVariantField, TInterfaceField, TIDispatchField, TGuidField,
TSQLTimeStampField, TFMTBcdField, TWideStringField, TWideMemoField, TSQLTimeStampField,
TStringField);
```

C++

```
array[TFieldType] of TFieldClass DefaultFieldClasses = ( nil, TStringField, TSmallintField,
TIntegerField, TWordField, TBooleanField, TFloatField, TCurrencyField, TBCDField, TDateField,
TTimeField, TDateTimeField, TBytesField, TVarBytesField, TAutoIncField, TBlobField,
TMemoField, TGraphicField, TBlobField, TBlobField, TBlobField, TBlobField, nil, TStringField,
TWideStringField, TLargeIntField, TADTField, TArrayField, TReferenceField, TDataSetField,
TBlobField, TMemoField, TVariantField, TInterfaceField, TIDispatchField, TGuidField,
TSQLTimeStampField, TFMTBcdField, TWideStringField, TWideMemoField, TSQLTimeStampField,
TStringField);
```

File

DB

Description

This is variable DB.DefaultFieldClasses.

39.6.4 DB.LoginDialogExProc Variable

Pascal

```
LoginDialogExProc: function (const ADatabaseName: string; var AUserName, APassword: string;
NameReadOnly: Boolean): Boolean;
```

C++

```
function (const ADatabaseName: string; var AUserName, APassword: string; NameReadOnly:
Boolean): Boolean LoginDialogExProc;
```

File

DB

Description

This is variable DB.LoginDialogExProc.

39.6.5 DB.LoginDialogProc Variable

Pascal

```
LoginDialogProc: function (const ADatabaseName: string; var AUserName, APassword: string):
```

```
Boolean;
```

C++

```
function (const ADatabaseName: string; var AUserName, APassword: string): Boolean
LoginDialogProc;
```

File

DB

Description

This is variable DB.LoginDialogProc.

39.6.6 DB.PasswordDialog Variable

Displays a dialog box that prompts the user for the password of a local password-protected table.

Pascal

```
PasswordDialog: function (const ASession: IDBSession): Boolean;
```

C++

```
function (const ASession: IDBSession): Boolean PasswordDialog;
```

File

DB

Description

Use PasswordDialog to allow the user to enter a password for a password-protected Paradox or dBase table.

ASession is the interface of a component that represents the session onto which the user logs in. Typically, this is the interface of a TSession component.

If the user clicks OK in the dialog box, PasswordDialog returns true. Otherwise it returns false.

Note: When an application opens a Paradox or dBASE table that requires a password, the user is prompted to enter a password unless the Session already has a valid password for that table.

See Also

TSession

39.6.7 DB.RemoteLoginDialogProc Variable

Pascal

```
RemoteLoginDialogProc: function (var AUserName, APassword: string): Boolean;
```

C++

```
function (var AUserName, APassword: string): Boolean RemoteLoginDialogProc;
```

File

DB

Description

This is variable DB.RemoteLoginDialogProc.

39.6.8 DB.ScreenCursorProc Variable

Pascal

```
ScreenCursorProc: procedure (const CurIndex : integer);
```

C++

```
procedure (const CurIndex : integer) ScreenCursorProc;
```

File

DB

Description

This is variable DB.ScreenCursorProc.

39.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
dsEditModes (see page 7645)	This is constant DB.dsEditModes.
dsMaxStringSize (see page 7645)	This is constant DB.dsMaxStringSize.
dsWriteModes (see page 7646)	This is constant DB.dsWriteModes.
FieldTypeNames (see page 7646)	This is constant DB.FieldTypeNames.
FieldTypeVarMap (see page 7646)	This is constant DB.FieldTypeVarMap.
ftFixedSizeTypes (see page 7647)	This is constant DB.ftFixedSizeTypes.
ftNonTextTypes (see page 7647)	This is constant DB.ftNonTextTypes.
ObjectFieldTypes (see page 7648)	This is constant DB.ObjectFieldTypes.
RegisterFieldsProc (see page 7648)	This is constant DB.RegisterFieldsProc.

39.7.1 DB.dsEditModes Constant

Pascal

```
dsEditModes = [dsEdit, dsInsert, dsSetKey];
```

C++

```
dsEditModes = [dsEdit, dsInsert, dsSetKey];
```

File

DB

Description

This is constant DB.dsEditModes.

39.7.2 DB.dsMaxStringSize Constant

Pascal

```
dsMaxStringSize = 8192;
```

C++

```
dsMaxStringSize = 8192;
```

File

DB

Description

This is constant DB.dsMaxStringSize.

39.7.3 DB.dsWriteModes Constant

Pascal

```
dsWriteModes = [dsEdit, dsInsert, dsSetKey, dsCalcFields, dsFilter, dsNewValue,
dsInternalCalc];
```

C++

```
dsWriteModes = [dsEdit, dsInsert, dsSetKey, dsCalcFields, dsFilter, dsNewValue,
dsInternalCalc];
```

File

DB

Description

This is constant DB.dsWriteModes.

39.7.4 DB.FieldTypeNames Constant

Pascal

```
FieldTypeNames: array[TFieldType] of string = ( 'Unknown', 'String', 'SmallInt', 'Integer',
'Word', 'Boolean', 'Float', 'Currency', 'BCD', 'Date', 'Time', 'DateTime', 'Bytes',
'VarBytes', 'AutoInc', 'Blob', 'Memo', 'Graphic', 'FmtMemo', 'ParadoxOle', 'dBaseOle',
'TypedBinary', 'Cursor', 'FixedChar', 'WideString', 'LargeInt', 'ADT', 'Array', 'Reference',

This is constant DB.FieldTypeNames.

39.7.5 DB.FieldTypeVarMap Constant

Pascal

```
FieldTypeVarMap: array[TFieldType] of Word = ( varEmpty, varString, varInteger, varInteger,
varInteger, varBoolean, varDouble, varCurrency, varCurrency, varDate, varDate, varDate,
varEmpty, varEmpty, varInteger, varEmpty, varString, varEmpty, varEmpty, varEmpty, varEmpty,
varEmpty, varEmpty, varString, varOleStr, varEmpty, varEmpty, varEmpty, varEmpty, varEmpty,
varEmpty, varEmpty, varVariant, varUnknown, varDispatch, varString, varEmpty, varEmpty,
```

```
varOleStr, varOleStr, varEmpty, varString);
```

C++

```
array[TFieldType] of Word FieldTypeVarMap = ( varEmpty, varString, varInteger, varInteger,
varInteger, varBoolean, varDouble, varCurrency, varCurrency, varDate, varDate, varDate,
varEmpty, varEmpty, varInteger, varEmpty, varString, varEmpty, varEmpty, varEmpty, varEmpty,
varEmpty, varEmpty, varString, varOleStr, varEmpty, varEmpty, varEmpty, varEmpty, varEmpty,
varEmpty, varEmpty, varVariant, varUnknown, varDispatch, varString, varEmpty, varEmpty,
varOleStr, varOleStr, varEmpty, varString);
```

File

DB

Description

This is constant DB.FieldTypeVarMap.

39.7.6 DB.ftFixedSizeTypes Constant

Pascal

```
ftFixedSizeTypes = [ftSmallint, ftInteger, ftWord, ftBoolean, ftFloat, ftCurrency, ftDate,
ftTime, ftDateTime, ftAutoInc, ftLargeint, ftTimeStamp];
```

C++

```
ftFixedSizeTypes = [ftSmallint, ftInteger, ftWord, ftBoolean, ftFloat, ftCurrency, ftDate,
ftTime, ftDateTime, ftAutoInc, ftLargeint, ftTimeStamp];
```

File

DB

Description

This is constant DB.ftFixedSizeTypes.

39.7.7 DB.ftNonTextTypes Constant

Pascal

```
ftNonTextTypes = [ftBytes, ftVarBytes, ftBlob, ftMemo, ftGraphic, ftFmtMemo, ftParadoxOle,
ftDBaseOle, ftTypedBinary, ftCursor, ftADT, ftArray, ftReference, ftDataSet];
```

C++

```
ftNonTextTypes = [ftBytes, ftVarBytes, ftBlob, ftMemo, ftGraphic, ftFmtMemo, ftParadoxOle,
ftDBaseOle, ftTypedBinary, ftCursor, ftADT, ftArray, ftReference, ftDataSet];
```

DB

Description

This is constant DB.ftNonTextTypes.

39.7.8 DB.ObjectFieldTypes Constant

Pascal

```
ObjectFieldTypes = [ftADT, ftArray, ftReference, ftDataSet];
```

C++

```
ObjectFieldTypes = [ftADT, ftArray, ftReference, ftDataSet];
```

File

DB

Description

This is constant DB.ObjectFieldTypes.

39.7.9 DB.RegisterFieldsProc Constant

Pascal

```
RegisterFieldsProc: procedure(const FieldClassess: array of TFieldClass) = nil;
```

C++

```
procedure(const FieldClassess: array of TFieldClass) RegisterFieldsProc = nil;
```

File

DB

Description

This is constant DB.RegisterFieldsProc.

40 DBActns Namespace

This is namespace DBActns.

Topics

Name	Description
Classes (see page 7650)	The following table lists classes in this documentation.

Classes

	Name	Description
	TDataSetAction (see page 7650)	TDataSetAction is the base class for action objects that act on dataset components.
	TDataSetCancel (see page 7657)	TDataSetCancel cancels the edits to the current record, restores record display to its condition prior to editing, and takes the dataset out of edit mode.
	TDataSetDelete (see page 7664)	TDataSetDelete deletes the current record, making the next record current.
	TDataSetEdit (see page 7671)	TDataSetEdit puts a target dataset into edit mode.
	TDataSetFirst (see page 7677)	TDataSetFirst moves a target dataset to its first record.
	TDataSetInsert (see page 7684)	TDataSetInsert inserts a new record into a target dataset.
	TDataSetLast (see page 7691)	TDataSetLast moves a target dataset to its last record.
	TDataSetNext (see page 7698)	TDataSetNext moves a target dataset to its next record.
	TDataSetPost (see page 7704)	TDataSetPost posts the edits in the current record of a target dataset.
	TDataSetPrior (see page 7711)	TDataSetPrior moves a target dataset to the previous record.
	TDataSetRefresh (see page 7718)	TDataSetRefresh refreshes the records in a target dataset.

40.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TDataSetAction (see page 7650)	TDataSetAction is the base class for action objects that act on dataset components.
	TDataSetCancel (see page 7657)	TDataSetCancel cancels the edits to the current record, restores record display to its condition prior to editing, and takes the dataset out of edit mode.
	TDataSetDelete (see page 7664)	TDataSetDelete deletes the current record, making the next record current.
	TDataSetEdit (see page 7671)	TDataSetEdit puts a target dataset into edit mode.
	TDataSetFirst (see page 7677)	TDataSetFirst moves a target dataset to its first record.
	TDataSetInsert (see page 7684)	TDataSetInsert inserts a new record into a target dataset.
	TDataSetLast (see page 7691)	TDataSetLast moves a target dataset to its last record.
	TDataSetNext (see page 7698)	TDataSetNext moves a target dataset to its next record.
	TDataSetPost (see page 7704)	TDataSetPost posts the edits in the current record of a target dataset.
	TDataSetPrior (see page 7711)	TDataSetPrior moves a target dataset to the previous record.
	TDataSetRefresh (see page 7718)	TDataSetRefresh refreshes the records in a target dataset.

40.1.1 TDataSetAction Class

TDataSetAction is the base class for action objects that act on dataset components.

Class Hierarchy

Pascal

```
TDataSetAction = class(TAction);
```

C++

```
class TDataSetAction : public TAction;
```

File

DBActns

Description

TDataSetAction implements the common behavior for actions that work with datasets. Each descendant class performs a specific database function. Do not use TDataSetAction directly in an application. Instead, use a TDataSetAction descendant such as TDataSetCancel (see page 7657), TDataSetDelete (see page 7664), TDataSetEdit (see page 7671), TDataSetFirst (see page 7677), TDataSetInsert (see page 7684), TDataSetLast (see page 7691), TDataSetNext (see page 7698), TDataSetPost (see page 7704), TDataSetPrior (see page 7711), or TDataSetRefresh (see page 7718).

TDataSetAction ensures that the action is only enabled to work with a TDataSource component as its target. This TDataSource is first located as the data source that connects an active data-aware control to its source dataset. TDataSetAction saves this data source as the DataSource (see page 7657) property, which descendants then use to perform their specific database

functions.

40.1.1.1 TDataSetAction Members

The following tables list the members exposed by TDataSetAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDataSet (see page 7655)	This is GetDataSet, a member of class TDataSetAction.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 7656)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 7656)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DataSource (see page 7657)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.

	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

40.1.1.2 TDataSetAction Methods

The methods of the TDataSetAction class are listed here.

Protected Methods

	Name	Description
	GetDataSet (see page 7655)	This is GetDataSet, a member of class TDataSetAction.
	Notification (see page 7656)	Responds when components are created or destroyed.

Public Methods

	Name	Description
	HandlesTarget (see page 7656)	Indicates whether the action can execute its function.

40.1.1.2.1 TDataSetAction.GetDataSet Method

Pascal

```
function GetDataSet(Target: TObject): TDataSet; virtual;
```

C++

```
virtual __fastcall TDataSet GetDataSet(TObject * Target);
```

Description

This is GetDataSet, a member of class TDataSetAction.

40.1.1.2.2 TDataSetAction.HandlesTarget Method

Indicates whether the action can execute its function.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object (such as a tool button or menu item) that is linked to this action. The HandlesTarget method provides the action object with an opportunity to indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

Target is the current target object.

HandlesTarget checks that the target of is a TDataSource component with a DataSet property that is not nil (Delphi) or NULL (C++). If so, it returns true. If not, it returns false.

See Also

ExecuteTarget (see page 2712)

TDataSource (see page 7070)

DataSet (see page 7078)

40.1.1.2.3 TDataSetAction.Notification Method

Responds when components are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation.

TBasicAction overrides the Notification method to check whether the component that is the value of the ActionComponent property is about to be freed. If so, it sets the ActionComponent property to nil (Delphi) or NULL (C++).

See Also

ActionComponent (see page 2715)

40.1.1.3 TDataSetAction Properties

The properties of the TDataSetAction class are listed here.

Public Properties

	Name	Description
	DataSource (see page 7657)	Provides access to the target of the action.

40.1.1.3.1 TDataSetAction.DataSource Property

Provides access to the target of the action.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource is the data source that represents the dataset on which the action performs its function. You can set this property to indicate the dataset that is the target of the action.

If you do not explicitly set the DataSource property, it is obtained from an active data-aware control when the action fires.

See Also

DataSet (see page 7078)

40.1.2 TDataSetCancel Class

TDataSetCancel cancels the edits to the current record, restores record display to its condition prior to editing, and takes the dataset out of edit mode.

Class Hierarchy

Pascal

```
TDataSetCancel = class(TDataSetAction);
```

C++

```
class TDataSetCancel : public TDataSetAction;
```

File

DBActns

Description

Add TDataSetCancel to an action list to allow users to cancel edits made to a dataset in the application. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to cancel edits, restore record display, and take the associated dataset out of edit mode.

TDataSetCancel is designed to work with a TDataSource component as its target. You can explicitly provide this target by setting the DataSource (see page 7663) property, or you can allow the action to infer the data source from an active data-aware control. TDataSetCancel automatically disables itself if it does not have a target data source attached to an active dataset that is in edit mode.

TDataSource (see page 7070)

40.1.2.1 TDataSetCancel Members

The following tables list the members exposed by TDataSetCancel.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDataSet (see page 7655)	This is GetDataSet, a member of class TDataSetAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.

	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7656)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.

	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 7662)	Cancels unposted edits and takes the dataset out of edit mode.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 7656)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 7663)	Enables or disables the action, depending on the state of the target dataset.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.

	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	DataSource (see page 7663)	Provides access to the target of the action.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

40.1.2.2 TDataSetCancel Methods

The methods of the TDataSetCancel class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 7662)	Cancels unposted edits and takes the dataset out of edit mode.
	UpdateTarget (see page 7663)	Enables or disables the action, depending on the state of the target dataset.

40.1.2.2.1 TDataSetCancel.ExecuteTarget Method

Cancels unposted edits and takes the dataset out of edit mode.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for

example, when the user selects a menu item or presses a tool button that is linked to this action).

ExecuteTarget checks that Target is a data source component that has an associated dataset. If the DataSource (see page 7663) property is set, Target must be the same data source.

If Target is a valid data source, ExecuteTarget calls the associated dataset's Cancel method to back out any unposted edits and take the dataset out of edit mode.

See Also

Cancel (see page 6916)

DataSource (see page 7657)

DataSet (see page 7078)

40.1.2.2.2 TDataSetCancel.UpdateTarget Method

Enables or disables the action, depending on the state of the target dataset.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TDataSetCancel (see page 7657), UpdateTarget checks whether the current target object (specified by the Target parameter) is a data source whose dataset is in edit mode. If so, it sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

40.1.2.3 TDataSetCancel Properties

The properties of the TDataSetCancel class are listed here.

Published Properties

	Name	Description
	DataSource (see page 7663)	Provides access to the target of the action.

40.1.2.3.1 TDataSetCancel.DataSource Property

Provides access to the target of the action.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource is the data source that represents the dataset on which the action performs its function. You can set this property to indicate the dataset that is the target of the action.

If you do not explicitly set the DataSource property, it is obtained from an active data-aware control when the action fires.

See Also

DataSet (see page 7078)

40.1.3 TDataSetDelete Class

TDataSetDelete deletes the current record, making the next record current.

Class Hierarchy

Pascal

```
TDataSetDelete = class(TDataSetAction);
```

C++

```
class TDataSetDelete : public TDataSetAction;
```

File

DBActns

Description

Add TDataSetDelete to an action list to allow users to delete records from a dataset. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to delete the current record of a dataset.

TDataSetDelete is designed to work with a TDataSource component as its target. You can explicitly provide this target by setting the DataSource (see page 7670) property, or you can allow the action to infer the data source from an active data-aware control. TDataSetDelete automatically disables itself if it does not have a target data source attached to an active, nonempty dataset that permits edits.

40.1.3.1 TDataSetDelete Members

The following tables list the members exposed by TDataSetDelete.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDataSet (see page 7655)	This is GetDataSet, a member of class TDataSetAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 7656)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.

	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 7669)	Deletes the current record in the target dataset.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 7656)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)

V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 7670)	Enables or disables the action, depending on the state of the target dataset.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.

	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	DataSource (see page 7670)	Provides access to the target of the action.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

40.1.3.2 TDataSetDelete Methods

The methods of the TDataSetDelete class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 7669)	Deletes the current record in the target dataset.
	UpdateTarget (see page 7670)	Enables or disables the action, depending on the state of the target dataset.

40.1.3.2.1 TDataSetDelete.ExecuteTarget Method

Deletes the current record in the target dataset.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

ExecuteTarget checks that Target is a data source component that has an associated dataset. If the DataSource (see page 7670) property is set, Target must be the same data source.

If Target is a valid data source, ExecuteTarget calls the associated dataset's Delete method to delete the current record and make the following record current.

See Also

Delete (see page 6924)

DataSource (see page 7657)

DataSet (see page 7078)

40.1.3.2.2 TDataSetDelete.UpdateTarget Method

Enables or disables the action, depending on the state of the target dataset.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TDataSetDelete (see page 7664), UpdateTarget checks whether the current target object (specified by the Target parameter) is a data source whose dataset is not empty and that permits edits. If so, it sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

40.1.3.3 TDataSetDelete Properties

The properties of the TDataSetDelete class are listed here.

Published Properties

	Name	Description
	DataSource (see page 7670)	Provides access to the target of the action.

40.1.3.3.1 TDataSetDelete.DataSource Property

Provides access to the target of the action.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource is the data source that represents the dataset on which the action performs its function. You can set this property to indicate the dataset that is the target of the action.

If you do not explicitly set the DataSource property, it is obtained from an active data-aware control when the action fires.

See Also

DataSet (see page 7078)

40.1.4 TDataSetEdit Class

TDataSetEdit puts a target dataset into edit mode.

Class Hierarchy

Pascal

```
TDataSetEdit = class(TDataSetAction);
```

C++

```
class TDataSetEdit : public TDataSetAction;
```

File

DBActns

Description

Add TDataSetEdit to an action list to allow users to put a dataset into edit mode. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to put a dataset into edit mode if it can.

TDataSetEdit is designed to work with a TDataSource component as its target. You can explicitly provide this target by setting the DataSource (see page 7677) property, or you can allow the action to infer the data source from an active data-aware control. TDataSetEdit automatically disables itself if it does not have a target data source attached to a dataset that permits edits.

See Also

TDataSetCancel (see page 7657)

TDataSetDelete (see page 7664)

TDataSetFirst (see page 7677)

TDataSetInsert (see page 7684)

TDataSEtLast

TDataSetNext (see page 7698)

TDataSetPost (see page 7704)

TDataSetPrior (see page 7711)

TDataSetRefresh (see page 7718)

TDataSource (see page 7070)

40.1.4.1 TDataSetEdit Members

The following tables list the members exposed by TDataSetEdit.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDataSet (see page 7655)	This is GetDataSet, a member of class TDataSetAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 7656)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.

	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 7676)	Puts the target dataset into edit mode.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 7656)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
	Update (see page 295)	Indicates whether the action updates itself.
	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

V	UpdateTarget (see page 7676)	Enables or disables the action, depending on the state of the target dataset.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	DataSource (see page 7677)	Provides access to the target of the action.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.

	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

40.1.4.2 TDataSetEdit Methods

The methods of the TDataSetEdit class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 7676)	Puts the target dataset into edit mode.
	UpdateTarget (see page 7676)	Enables or disables the action, depending on the state of the target dataset.

40.1.4.2.1 TDataSetEdit.ExecuteTarget Method

Puts the target dataset into edit mode.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

ExecuteTarget checks that Target is a data source component that has an associated dataset. If the DataSource (see page 7677) property is set, Target must be the same data source.

If Target is a valid data source, ExecuteTarget calls the associated dataset's Edit method to put the dataset into edit mode.

See Also

Edit (see page 6932)

DataSource (see page 7657)

DataSet (see page 7078)

40.1.4.2.2 TDataSetEdit.UpdateTarget Method

Enables or disables the action, depending on the state of the target dataset.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TDataSetEdit (see page 7671), UpdateTarget checks whether the current target object (specified by the Target parameter) is a data source whose dataset is permits edits and which is not already in edit mode. If so, it sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

40.1.4.3 TDataSetEdit Properties

The properties of the TDataSetEdit class are listed here.

Published Properties

	Name	Description
	DataSource (see page 7677)	Provides access to the target of the action.

40.1.4.3.1 TDataSetEdit.DataSource Property

Provides access to the target of the action.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource is the data source that represents the dataset on which the action performs its function. You can set this property to indicate the dataset that is the target of the action.

If you do not explicitly set the DataSource property, it is obtained from an active data-aware control when the action fires.

See Also

DataSet (see page 7078)

40.1.5 TDataSetFirst Class

TDataSetFirst moves a target dataset to its first record.

Class Hierarchy

Pascal

```
TDataSetFirst = class(TDataSetAction);
```

C++

```
class TDataSetFirst : public TDataSetAction;
```

File

DBActns

Description

Add TDataSetFirst to an action list to allow users to navigate to the first record in a dataset. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the target dataset to move to the first record.

TDataSetFirst is designed to work with a TDataSource component as its target. You can explicitly provide this target by setting the DataSource (see page 7684) property, or you can allow the action to infer the data source from an active data-aware control. TDataSetFirst automatically disables itself if it does not have a target data source attached to an active dataset that is not already on the first record.

TDataSEt

40.1.5.1 TDataSetFirst Members

The following tables list the members exposed by TDataSetFirst.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.

	AssignTo (see page 303)	Copies the properties of this action to a destination object.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDataSet (see page 7655)	This is GetDataSet, a member of class TDataSetAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7656)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 7683)	Navigates to the first record of the target dataset.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 7656)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 7683)	Enables or disables the action, depending on the state of the target dataset.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	DataSource (see page 7684)	Provides access to the target of the action.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

40.1.5.2 TDataSetFirst Methods

The methods of the TDataSetFirst class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 7683)	Navigates to the first record of the target dataset.
	UpdateTarget (see page 7683)	Enables or disables the action, depending on the state of the target dataset.

40.1.5.2.1 TDataSetFirst.ExecuteTarget Method

Navigates to the first record of the target dataset.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

ExecuteTarget checks that Target is a data source component that has an associated dataset. If the DataSource (see page 7684) property is set, Target must be the same data source.

If Target is a valid data source, ExecuteTarget calls the associated dataset's First method to move to the first record.

See Also

First (see page 6942)

DataSource (see page 7657)

DataSet (see page 7078)

40.1.5.2.2 TDataSetFirst.UpdateTarget Method

Enables or disables the action, depending on the state of the target dataset.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TDataSetFirst (see page 7677), UpdateTarget checks whether the current target object (specified by the Target parameter) is a data source whose dataset is active and which is not already on the first record. If so, it sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

40.1.5.3 TDataSetFirst Properties

The properties of the TDataSetFirst class are listed here.

Published Properties

	Name	Description
	DataSource (see page 7684)	Provides access to the target of the action.

40.1.5.3.1 TDataSetFirst.DataSource Property

Provides access to the target of the action.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource is the data source that represents the dataset on which the action performs its function. You can set this property to indicate the dataset that is the target of the action.

If you do not explicitly set the DataSource property, it is obtained from an active data-aware control when the action fires.

See Also

DataSet (see page 7078)

40.1.6 TDataSetInsert Class

TDataSetInsert inserts a new record into a target dataset.

Class Hierarchy

Pascal

```
TDataSetInsert = class(TDataSetAction);
```

C++

```
class TDataSetInsert : public TDataSetAction;
```

File

DBActns

Description

Add TDataSetInsert to an action list to allow users to insert new records in a dataset. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the target dataset to insert a new record above the current one and go into edit mode.

TDataSetInsert is designed to work with a TDataSource component as its target. You can explicitly provide this target by setting the DataSource (see page 7690) property, or you can allow the action to infer the data source from an active data-aware control. TDataSetInsert automatically disables itself if it does not have a target data source attached to an active dataset that permits edits.

See Also

TDataSetCancel (see page 7657)

TDataSetDelete (see page 7664)

TDataSetEdit (see page 7671)

TDataSetInsert

TDataSetFirst (see page 7677)

TDataSetNext (see page 7698)

TDataSetPost (see page 7704)

TDataSetPrior (see page 7711)

TDataSetRefresh (see page 7718)

TDataSource (see page 7070)

40.1.6.1 TDataSetInsert Members

The following tables list the members exposed by TDataSetInsert.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.

	GetDataSet (see page 7655)	This is GetDataSet, a member of class TDataSetAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7656)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 7689)	Inserts a new record above the current one in the target dataset.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.

	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 7656)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 7690)	Enables or disables the action, depending on the state of the target dataset.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.

	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	DataSource (see page 7690)	Provides access to the target of the action.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

40.1.6.2 TDataSetInsert Methods

The methods of the TDataSetInsert class are listed here.

Public Methods

	Name	Description
V	ExecuteTarget (see page 7689)	Inserts a new record above the current one in the target dataset.
V	UpdateTarget (see page 7690)	Enables or disables the action, depending on the state of the target dataset.

40.1.6.2.1 TDataSetInsert.ExecuteTarget Method

Inserts a new record above the current one in the target dataset.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

ExecuteTarget checks that Target is a data source component that has an associated dataset. If the DataSource (see page 7690) property is set, Target must be the same data source.

If Target is a valid data source, ExecuteTarget calls the associated dataset's Insert method to insert a new, empty, record above the current record and put the dataset in edit mode.

See Also

Insert (see page 6959)

DataSource (see page 7657)

DataSet (see page 7078)

40.1.6.2.2 TDataSetInsert.UpdateTarget Method

Enables or disables the action, depending on the state of the target dataset.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TDataSetInsert (see page 7684), UpdateTarget checks whether the current target object (specified by the Target parameter) is a data source whose dataset is active and which permits edits. If so, it sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

40.1.6.3 TDataSetInsert Properties

The properties of the TDataSetInsert class are listed here.

Published Properties

	Name	Description
	DataSource (see page 7690)	Provides access to the target of the action.

40.1.6.3.1 TDataSetInsert.DataSource Property

Provides access to the target of the action.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource is the data source that represents the dataset on which the action performs its function. You can set this property to indicate the dataset that is the target of the action.

If you do not explicitly set the DataSource property, it is obtained from an active data-aware control when the action fires.

See Also

DataSet (see page 7078)

40.1.7 TDataSetLast Class

TDataSetLast moves a target dataset to its last record.

Class Hierarchy

Pascal

```
TDataSetLast = class(TDataSetAction);
```

C++

```
class TDataSetLast : public TDataSetAction;
```

File

DBActns

Description

Add TDataSetLast to an action list to allow users to navigate to the last record in a dataset. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the target dataset to move to the last record.

TDataSetLast is designed to work with a TDataSource component as its target. You can explicitly provide this target by setting the DataSource (see page 7697) property, or you can allow the action to infer the data source from an active data-aware control. If you set DataSource (see page 7697), do not set it to a data source whose dataset is unidirectional. TDataSetLast automatically disables itself if it does not have a target data source attached to an active dataset that is not already on the last record.

TDataSetPost (see page 7704)

TDataSetPrior (see page 7711)

TDataSetRefresh (see page 7718)

TDataSource (see page 7070)

40.1.7.1 TDataSetLast Members

The following tables list the members exposed by TDataSetLast.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDataSet (see page 7655)	This is GetDataSet, a member of class TDataSetAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 7656)	Responds when components are created or destroyed.

	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 7696)	Navigates to the last record of the target dataset.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 7656)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 7697)	Enables or disables the action, depending on the state of the target dataset.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	DataSource (see page 7697)	Provides access to the target of the action.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

40.1.7.2 TDataSetLast Methods

The methods of the TDataSetLast class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 7696)	Navigates to the last record of the target dataset.
	UpdateTarget (see page 7697)	Enables or disables the action, depending on the state of the target dataset.

40.1.7.2.1 TDataSetLast.ExecuteTarget Method

Navigates to the last record of the target dataset.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

ExecuteTarget checks that Target is a data source component that has an associated dataset. If the DataSource (see page 7697) property is set, Target must be the same data source.

If Target is a valid data source, ExecuteTarget calls the associated dataset's Last method to move to the last record.

See Also

Last (see page 6968)

DataSource (see page 7657)

DataSet (see page 7078)

40.1.7.2.2 TDataSetLast.UpdateTarget Method

Enables or disables the action, depending on the state of the target dataset.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TDataSetLast (see page 7691), UpdateTarget checks whether the current target object (specified by the Target parameter) is a data source whose dataset is active and which is not already on the last record. If so, it sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

40.1.7.3 TDataSetLast Properties

The properties of the TDataSetLast class are listed here.

Published Properties

	Name	Description
	DataSource (see page 7697)	Provides access to the target of the action.

40.1.7.3.1 TDataSetLast.DataSource Property

Provides access to the target of the action.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource is the data source that represents the dataset on which the action performs its function. You can set this property to indicate the dataset that is the target of the action.

If you do not explicitly set the DataSource property, it is obtained from an active data-aware control when the action fires.

See Also

DataSet (see page 7078)

40.1.8 TDataSetNext Class

TDataSetNext moves a target dataset to its next record.

Class Hierarchy

Pascal

```
TDataSetNext = class(TDataSetAction);
```

C++

```
class TDataSetNext : public TDataSetAction;
```

File

DBActns

Description

Add TDataSetNext to an action list to allow users to navigate to the next record in a dataset. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the target dataset to move to the last record.

TDataSetNext is designed to work with a TDataSource component as its target. You can explicitly provide this target by setting the DataSource (see page 7704) property, or you can allow the action to infer the data source from an active data-aware control. TDataSetNext automatically disables itself if it does not have a target data source attached to an active dataset.

See Also

TDataSetCancel (see page 7657)

TDataSetDelete (see page 7664)

TDataSetEdit (see page 7671)

TDataSetInsert (see page 7684)

TDataSetFirst (see page 7677)

TDataSetLast (see page 7691)

TDataSetPost (see page 7704)

TDataSetPrior (see page 7711)

TDataSetRefresh (see page 7718)

TDataSource (see page 7070)

40.1.8.1 TDataSetNext Members

The following tables list the members exposed by TDataSetNext.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDataSet (see page 7655)	This is GetDataSet, a member of class TDataSetAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 7656)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.

	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 7703)	Navigates to the next record of the target dataset.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 7656)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

V	UpdateTarget (see page 7703)	Enables or disables the action, depending on the state of the target dataset.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	DataSource (see page 7704)	Provides access to the target of the action.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.

	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

40.1.8.2 TDataSetNext Methods

The methods of the TDataSetNext class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 7703)	Navigates to the next record of the target dataset.
	UpdateTarget (see page 7703)	Enables or disables the action, depending on the state of the target dataset.

40.1.8.2.1 TDataSetNext.ExecuteTarget Method

Navigates to the next record of the target dataset.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

ExecuteTarget checks that Target is a data source component that has an associated dataset. If the DataSource (see page 7704) property is set, Target must be the same data source.

If Target is a valid data source, ExecuteTarget calls the associated dataset's Next method to move to the next record.

See Also

Next (see page 6973)

DataSource (see page 7657)

DataSet (see page 7078)

40.1.8.2.2 TDataSetNext.UpdateTarget Method

Enables or disables the action, depending on the state of the target dataset.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TDataSetNext (see page 7698), UpdateTarget checks whether the current target object (specified by the Target parameter) is a data source whose dataset is active and which is not on the last record. If so, it sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

40.1.8.3 TDataSetNext Properties

The properties of the TDataSetNext class are listed here.

Published Properties

	Name	Description
	DataSource (see page 7704)	Provides access to the target of the action.

40.1.8.3.1 TDataSetNext.DataSource Property

Provides access to the target of the action.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource is the data source that represents the dataset on which the action performs its function. You can set this property to indicate the dataset that is the target of the action.

If you do not explicitly set the DataSource property, it is obtained from an active data-aware control when the action fires.

See Also

DataSet (see page 7078)

40.1.9 TDataSetPost Class

TDataSetPost posts the edits in the current record of a target dataset.

Class Hierarchy

Pascal

```
TDataSetPost = class(TDataSetAction);
```

C++

```
class TDataSetPost : public TDataSetAction;
```

File

DBActns

Description

Add TDataSetPost to an action list to allow users to post dataset records. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the target dataset to post any edits made to the current record.

TDataSetPost is designed to work with a TDataSource component as its target. You can explicitly provide this target by setting the DataSource (see page 7711) property, or you can allow the action to infer the data source from an active data-aware control. TDataSetPost automatically disables itself if it does not have a target data source attached to a dataset that is in edit mode.

See Also

TDataSetCancel (see page 7657)

TDataSetDelete (see page 7664)

TDataSetEdit (see page 7671)

TDataSetPost

TDataSetFirst (see page 7677)

TDataSetNext (see page 7698)

TDataSetPrior (see page 7711)

TDataSetInsert (see page 7684)

TDataSetRefresh (see page 7718)

TDataSource (see page 7070)

40.1.9.1 TDataSetPost Members

The following tables list the members exposed by TDataSetPost.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.

	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDataSet (see page 7655)	This is GetDataSet, a member of class TDataSetAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7656)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 7710)	Posts the current record in the target dataset.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 7656)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 7710)	Enables or disables the action, depending on the state of the target dataset.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	DataSource (see page 7711)	Provides access to the target of the action.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

40.1.9.2 TDataSetPost Methods

The methods of the TDataSetPost class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 7710)	Posts the current record in the target dataset.
	UpdateTarget (see page 7710)	Enables or disables the action, depending on the state of the target dataset.

40.1.9.2.1 TDataSetPost.ExecuteTarget Method

Posts the current record in the target dataset.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

ExecuteTarget checks that Target is a data source component that has an associated dataset. If the DataSource (see page 7711) property is set, Target must be the same data source.

If Target is a valid data source, ExecuteTarget calls the associated dataset's Post method to post all edits to the current record.

See Also

Post (see page 6977)

DataSource (see page 7657)

DataSet (see page 7078)

40.1.9.2.2 TDataSetPost.UpdateTarget Method

Enables or disables the action, depending on the state of the target dataset.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TDataSetPost (see page 7704), UpdateTarget checks whether the current target object (specified by the Target parameter) is a data source whose dataset is in edit mode. If so, it sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

40.1.9.3 TDataSetPost Properties

The properties of the TDataSetPost class are listed here.

Published Properties

	Name	Description
	DataSource (see page 7711)	Provides access to the target of the action.

40.1.9.3.1 TDataSetPost.DataSource Property

Provides access to the target of the action.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource is the data source that represents the dataset on which the action performs its function. You can set this property to indicate the dataset that is the target of the action.

If you do not explicitly set the DataSource property, it is obtained from an active data-aware control when the action fires.

See Also

DataSet (see page 7078)

40.1.10 TDataSetPrior Class

TDataSetPrior moves a target dataset to the previous record.

Class Hierarchy

Pascal

```
TDataSetPrior = class(TDataSetAction);
```

C++

```
class TDataSetPrior : public TDataSetAction;
```

File

DBActns

Description

Add TDataSetPrior to an action list to allow users to navigate to the previous record in a dataset. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the target dataset to move to the previous record.

TDataSetPrior is designed to work with a TDataSource component as its target. You can explicitly provide this target by setting the DataSource (see page 7717) property, or you can allow the action to infer the data source from an active data-aware control. If you set DataSource (see page 7717), do not set it to a data source whose dataset is unidirectional. TDataSetPrior automatically disables itself if it does not have a target data source attached to an active dataset that is not on the first record.

TDataSetCancel (see page 7657)

TDataSetDelete (see page 7664)

TDataSetEdit (see page 7671)

TDataSetInsert (see page 7684)

TDataSetFirst (see page 7677)

TDataSetNext (see page 7698)

TDataSetPost (see page 7704)

TDataSetPrior

TDataSetRefresh (see page 7718)

TDataSource (see page 7070)

40.1.10.1 TDataSetPrior Members

The following tables list the members exposed by TDataSetPrior.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDataSet (see page 7655)	This is GetDataSet, a member of class TDataSetAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.

	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7656)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.

	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 7716)	Navigates to the previous record of the target dataset.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 7656)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 7717)	Enables or disables the action, depending on the state of the target dataset.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.

	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	DataSource (see page 7717)	Provides access to the target of the action.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

40.1.10.2 TDataSetPrior Methods

The methods of the TDataSetPrior class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 7716)	Navigates to the previous record of the target dataset.
	UpdateTarget (see page 7717)	Enables or disables the action, depending on the state of the target dataset.

40.1.10.2.1 TDataSetPrior.ExecuteTarget Method

Navigates to the previous record of the target dataset.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for

example, when the user selects a menu item or presses a tool button that is linked to this action).

ExecuteTarget checks that Target is a data source component that has an associated dataset. If the DataSource (see page 7717) property is set, Target must be the same data source.

If Target is a valid data source, ExecuteTarget calls the associated dataset's Prior method to move to the previous record.

See Also

Prior (see page 6979)

DataSource (see page 7657)

DataSet (see page 7078)

40.1.10.2.2 TDataSetPrior.UpdateTarget Method

Enables or disables the action, depending on the state of the target dataset.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TDataSetPrior (see page 7711), UpdateTarget checks whether the current target object (specified by the Target parameter) is a data source whose dataset is active and which is not on the first record. If so, it sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

40.1.10.3 TDataSetPrior Properties

The properties of the TDataSetPrior class are listed here.

Published Properties

	Name	Description
	DataSource (see page 7717)	Provides access to the target of the action.

40.1.10.3.1 TDataSetPrior.DataSource Property

Provides access to the target of the action.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource is the data source that represents the dataset on which the action performs its function. You can set this property to

indicate the dataset that is the target of the action.

If you do not explicitly set the DataSource property, it is obtained from an active data-aware control when the action fires.

See Also

DataSet (see page 7078)

40.1.11 TDataSetRefresh Class

TDataSetRefresh refreshes the records in a target dataset.

Class Hierarchy

Pascal

```
TDataSetRefresh = class(TDataSetAction);
```

C++

```
class TDataSetRefresh : public TDataSetAction;
```

File

DBActns

Description

Add TDataSetRefresh to an action list to allow users to refresh a dataset with the most current data. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the target dataset to refetch its data.

TDataSetRefresh is designed to work with a TDataSource component as its target. You can explicitly provide this target by setting the DataSource (see page 7724) property, or you can allow the action to infer the data source from an active data-aware control. TDataSetRefresh automatically disables itself if it does not have a target data source attached to an active dataset.

TDataSetCancel (see page 7657)

TDataSetDelete (see page 7664)

TDataSetEdit (see page 7671)

TDataSetRefresh

TDataSetFirst (see page 7677)

TDataSetNext (see page 7698)

TDataSetPrior (see page 7711)

TDataSetInsert (see page 7684)

TDataSetPost (see page 7704)

TDataSource (see page 7070)

40.1.11.1 TDataSetRefresh Members

The following tables list the members exposed by TDataSetRefresh.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDataSet (see page 7655)	This is GetDataSet, a member of class TDataSetAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 7656)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).

	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 7723)	Refreshes the data of a target dataset.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 7656)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 7723)	Enables or disables the action, depending on the state of the target dataset.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	DataSource (see page 7724)	Provides access to the target of the action.

	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

40.1.11.2 TDataSetRefresh Methods

The methods of the TDataSetRefresh class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 7723)	Refreshes the data of a target dataset.
	UpdateTarget (see page 7723)	Enables or disables the action, depending on the state of the target dataset.

40.1.11.2.1 TDataSetRefresh.ExecuteTarget Method

Refreshes the data of a target dataset.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

ExecuteTarget checks that Target is a data source component that has an associated dataset. If the DataSource (see page 7724) property is set, Target must be the same data source.

If Target is a valid data source, ExecuteTarget calls the associated dataset's Refresh method to refetch the most current data.

See Also

Refresh (see page 6991)

DataSource (see page 7657)

DataSet (see page 7078)

40.1.11.2.2 TDataSetRefresh.UpdateTarget Method

Enables or disables the action, depending on the state of the target dataset.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TDataSetRefresh (see page 7718), UpdateTarget checks whether the current target object (specified by the Target parameter) is a data source whose dataset is active and permits edits. If so, it sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

40.1.11.3 TDataSetRefresh Properties

The properties of the TDataSetRefresh class are listed here.

Published Properties

	Name	Description
	DataSource (see page 7724)	Provides access to the target of the action.

40.1.11.3.1 TDataSetRefresh.DataSource Property

Provides access to the target of the action.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource is the data source that represents the dataset on which the action performs its function. You can set this property to indicate the dataset that is the target of the action.

If you do not explicitly set the DataSource property, it is obtained from an active data-aware control when the action fires.

DataSet (see page 7078)

41 DBAdapt Namespace

This is namespace DBAdapt.

Topics

Name	Description
Classes (see page 7728)	The following table lists classes in this documentation.
Interfaces (see page 8102)	The following table lists interfaces in this documentation.
Functions (see page 8110)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 8111)	The following table lists structs, records, enums in this documentation.
Types (see page 8113)	The following table lists types in this documentation.
Variables (see page 8116)	The following table lists variables in this documentation.
Constants (see page 8117)	The following table lists constants in this documentation.

Classes

	Name	Description
	TBaseDataSetAdapterField (see page 7729)	TBaseDataSetAdapterField is the common base class for objects that represent an adapter field for a field in a database.
	TBaseDataSetAdapterImageField (see page 7755)	TBaseDataSetAdapteImageField is the base class for the TDataSetAdapterImageField.
	TBaseDataSetAdapterInputField (see page 7756)	TBaseDataSetAdapterInputField is the common base class for adapter field objects that represent a dataset field of a type users can edit directly.
	TCustomDataSetAdapter (see page 7766)	TCustomDataSetAdapter is the base class for adapters that represent the information from a dataset.
	TCustomDataSetAdapterAction (see page 7811)	TCustomDataSetAdapterAction is the base class for adapter actions that can be added to a dataset adapter.
	TCustomDataSetAdapterField (see page 7823)	TCustomDataSetAdapterField is the common base class for adapter field objects that represent a dataset field of a type whose value can be displayed as a simple text element.
	TCustomDataSetAdapterMemoField (see page 7837)	The TCustomDataSetAdapterMemoField is the ancestor of TDataSetAdapterMemoField (see page 7996).
	TCustomDataSetAdapterRowAction (see page 7846)	TCustomDataSetAdapterRowAction is the base class for adapter actions that operate on the records of a dataset.
	TCustomDataSetValuesList (see page 7855)	TCustomDataSetValuesList is the base class for components that represent a set of name/value pairs taken from a dataset.
	TDataSetAdapter (see page 7872)	TDataSetAdapter defines a scriptable interface to a TDataSet component and allows it to operate properly in a stateless environment.
	TDataSetAdapterApplyRowAction (see page 7890)	TDataSetAdapterApplyRowAction applies the updates from an HTTP request to a single record of an adapter's dataset.

	TDataSetAdapterBrowseRowAction (see page 7903)	TDataSetAdapterBrowseRowAction applies the updates from an HTTP request to a single record of an adapter's dataset and changes the dataset adapter to browse mode.
	TDataSetAdapterCancelRowAction (see page 7916)	TDataSetAdapterBrowseRowAction (see page 7903) cancels edits made in an HTML form and changes the dataset adapter to browse mode.
	TDataSetAdapterDataLink (see page 7930)	<insert text here>
	TDataSetAdapterDeleteRowAction (see page 7934)	TDataSetAdapterDeleteRowAction deletes the current row from a dataset, as specified in an HTTP request.
	TDataSetAdapterEditRowAction (see page 7947)	TDataSetAdapterDeleteRowAction (see page 7934) puts the parent dataset adapter into edit mode.
	TDataSetAdapterField (see page 7960)	TDataSetAdapterField is the an adapter field object that represents a database field whose value can be displayed as a simple text element.
	TDataSetAdapterFirstRowAction (see page 7972)	TDataSetAdapterNextRowAction (see page 8030) posts any edits made in an HTML form and moves the dataset adapter to the first record.
	TDataSetAdapterLastRowAction (see page 7984)	TDataSetAdapterLastRowAction posts any edits made in an HTML form and moves the dataset adapter to the last record.
	TDataSetAdapterMemoField (see page 7996)	The TDataSetAdapterMemoField represents a memo field in a dataset.
	TDataSetAdapterMoveRowAction (see page 8008)	TDataSetAdapterMoveRowAction is the base class for adapter actions that change the current record of a dataset.
	TDataSetAdapterNewRowAction (see page 8016)	TDataSetAdapterNewRowAction places the parent dataset adapter in insert mode.
	TDataSetAdapterNextRowAction (see page 8030)	TDataSetAdapterNextRowAction posts any edits made in an HTML form and moves the dataset adapter to the next record.
	TDataSetAdapterPrevRowAction (see page 8042)	TDataSetAdapterPrevRowAction posts any edits made in an HTML form and moves the dataset adapter to the prior record.
	TDataSetAdapterRefreshRowAction (see page 8054)	TDataSetAdapterRefreshRowAction refetches the current field values for the dataset record specified in the current HTTP request.
	TDataSetAdapterRowAction (see page 8066)	TDataSetAdapterRowAction is a general-purpose action for dataset adapters.
	TDataSetValuesList (see page 8079)	TDataSetValuesList is an adapter component that provides a list of name/value pairs by retrieving values from a TDataSet.
	TLocateParams (see page 8090)	TLocateParams is a collection of the key fields and their corresponding values that can be used to locate a record of a dataset adapter.
	TLocateParamsList (see page 8096)	TLocateParamsList is a collection of TLocateParams (see page 8090) objects.

Constants

Name	Description
AllActionParamOptions (see page 8117)	This is constant DBAdapt.AllActionParamOptions.
AllImageParamOptions (see page 8117)	This is constant DBAdapt.AllImageParamOptions.
DataSetAdapterModeNames (see page 8117)	This is constant DBAdapt.DataSetAdapterModeNames.

Functions

	Name	Description
	AddLocateParamsString (see page 8110)	This is function DBAdapt.AddLocateParamsString.

Interfaces

	Name	Description
	IAdapterDataSetComponent (see page 8102)	This is class DBAdapt.IAdapterDataSetComponent.
	IDataSetAdapterFieldClass (see page 8104)	This is class DBAdapt.IDataSetAdapterFieldClass.
	IGetDataSetKeyName (see page 8104)	This is class DBAdapt.IGetDataSetKeyName.
	IKeyParams (see page 8105)	IKeyParams lists the names and values of the fields a dataset adapter uses to uniquely identify database records.
	IPrepareDataSet (see page 8109)	This is class DBAdapt.IPrepareDataSet.

Structs, Records, Enums

	Name	Description
	TDataSetAdapterFieldFlag (see page 8111)	This is record DBAdapt.TDataSetAdapterFieldFlag.
	TDataSetAdapterMode (see page 8111)	This is record DBAdapt.TDataSetAdapterMode.
	TDataSetAdapterRequestParamOption (see page 8112)	This is record DBAdapt.TDataSetAdapterRequestParamOption.

Types

Name	Description
TDataAdapterFieldValidateValueEvent (see page 8113)	This is type DBAdapt.TDataAdapterFieldValidateValueEvent.
TDataSetAdapterFieldFlags (see page 8113)	This is type DBAdapt.TDataSetAdapterFieldFlags.
TDataSetAdapterFieldGetStringEvent (see page 8114)	This is type DBAdapt.TDataSetAdapterFieldGetStringEvent.
TDataSetAdapterFieldGetValueEvent (see page 8114)	This is type DBAdapt.TDataSetAdapterFieldGetValueEvent.
TDataSetAdapterFieldValueEvent (see page 8114)	This is type DBAdapt.TDataSetAdapterFieldValueEvent.
TDataSetAdapterImageFieldClass (see page 8115)	This is type DBAdapt.TDataSetAdapterImageFieldClass.
TDataSetAdapterModes (see page 8115)	This is type DBAdapt.TDataSetAdapterModes.
TDataSetAdapterRequestParamOptions (see page 8115)	This is type DBAdapt.TDataSetAdapterRequestParamOptions.

Variables

Name	Description
DataSetAdapterImageFieldClass (see page 8116)	This is variable DBAdapt.DataSetAdapterImageFieldClass.

41.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TBaseDataSetAdapterField (see page 7729)	TBaseDataSetAdapterField is the common base class for objects that represent an adapter field for a field in a database.
	TBaseDataSetAdapterImageField (see page 7755)	TBaseDataSetAdapteImageField is the base class for the TDataSetAdapterImageField.
	TBaseDataSetAdapterInputField (see page 7756)	TBaseDataSetAdapterInputField is the common base class for adapter field objects that represent a dataset field of a type users can edit directly.
	TCustomDataSetAdapter (see page 7766)	TCustomDataSetAdapter is the base class for adapters that represent the information from a dataset.
	TCustomDataSetAdapterAction (see page 7811)	TCustomDataSetAdapterAction is the base class for adapter actions that can be added to a dataset adapter.
	TCustomDataSetAdapterField (see page 7823)	TCustomDataSetAdapterField is the common base class for adapter field objects that represent a dataset field of a type whose value can be displayed as a simple text element.
	TCustomDataSetAdapterMemoField (see page 7837)	The TCustomDataSetAdapterMemoField is the ancestor of TDataSetAdapterMemoField (see page 7996).
	TCustomDataSetAdapterRowAction (see page 7846)	TCustomDataSetAdapterRowAction is the base class for adapter actions that operate on the records of a dataset.
	TCustomDataSetValuesList (see page 7855)	TCustomDataSetValuesList is the base class for components that represent a set of name/value pairs taken from a dataset.
	TDataSetAdapter (see page 7872)	TDataSetAdapter defines a scriptable interface to a TDataSet component and allows it to operate properly in a stateless environment.
	TDataSetAdapterApplyRowAction (see page 7890)	TDataSetAdapterApplyRowAction applies the updates from an HTTP request to a single record of an adapter's dataset.
	TDataSetAdapterBrowseRowAction (see page 7903)	TDataSetAdapterBrowseRowAction applies the updates from an HTTP request to a single record of an adapter's dataset and changes the dataset adapter to browse mode.
	TDataSetAdapterCancelRowAction (see page 7916)	TDataSetAdapterBrowseRowAction (see page 7903) cancels edits made in an HTML form and changes the dataset adapter to browse mode.
	TDataSetAdapterDataLink (see page 7930)	<insert text here>
	TDataSetAdapterDeleteRowAction (see page 7934)	TDataSetAdapterDeleteRowAction deletes the current row from a dataset, as specified in an HTTP request.
	TDataSetAdapterEditRowAction (see page 7947)	TDataSetAdapterDeleteRowAction (see page 7934) puts the parent dataset adapter into edit mode.
	TDataSetAdapterField (see page 7960)	TDataSetAdapterField is the an adapter field object that represents a database field whose value can be displayed as a simple text element.
	TDataSetAdapterFirstRowAction (see page 7972)	TDataSetAdapterNextRowAction (see page 8030) posts any edits made in an HTML form and moves the dataset adapter to the first record.
	TDataSetAdapterLastRowAction (see page 7984)	TDataSetAdapterLastRowAction posts any edits made in an HTML form and moves the dataset adapter to the last record.
	TDataSetAdapterMemoField (see page 7996)	The TDataSetAdapterMemoField represents a memo field in a dataset.
	TDataSetAdapterMoveRowAction (see page 8008)	TDataSetAdapterMoveRowAction is the base class for adapter actions that change the current record of a dataset.
	TDataSetAdapterNewRowAction (see page 8016)	TDataSetAdapterNewRowAction places the parent dataset adapter in insert mode.
	TDataSetAdapterNextRowAction (see page 8030)	TDataSetAdapterNextRowAction posts any edits made in an HTML form and moves the dataset adapter to the next record.
	TDataSetAdapterPrevRowAction (see page 8042)	TDataSetAdapterPrevRowAction posts any edits made in an HTML form and moves the dataset adapter to the prior record.
	TDataSetAdapterRefreshRowAction (see page 8054)	TDataSetAdapterRefreshRowAction refetches the current field values for the dataset record specified in the current HTTP request.
	TDataSetAdapterRowAction (see page 8066)	TDataSetAdapterRowAction is a general-purpose action for dataset adapters.

	TDataSetValuesList (see page 8079)	TDataSetValuesList is an adapter component that provides a list of name/value pairs by retrieving values from a TDataSet.
	TLocateParams (see page 8090)	TLocateParams is a collection of the key fields and their corresponding values that can be used to locate a record of a dataset adapter.
	TLocateParamsList (see page 8096)	TLocateParamsList is a collection of TLocateParams (see page 8090) objects.

41.1.1 TBaseDataSetAdapterField Class

TBaseDataSetAdapterField is the common base class for objects that represent an adapter field for a field in a database.

Class Hierarchy

Pascal

```
TBaseDataSetAdapterField = class(TAdapterNamedField, IGetHTMLStyle, IUpdateValue,
ICheckValueChange, IDataSetAdapterFieldClass, IGetDataSetKeyName, IPrepareDataSet);
```

C++

```
class TBaseDataSetAdapterField : public TAdapterNamedField, public IGetHTMLStyle, public
IUpdateValue, public ICheckValueChange, public IDataSetAdapterFieldClass, public
IGetDataSetKeyName, public IPrepareDataSet;
```

File

DBAdapt

Description

TBaseDataSetAdapterField is the base class for all adapter field objects that represent database fields. TBaseDataSetAdapterField descendants are included as the fields of a dataset adapter (TDataSetAdapter (see page 7872)). Each TBaseDataSetAdapterField descendant represents a single field from a database table, and enables server-side script to refer to or update that field's value.

Do not use TBaseDataSetAdapterField directly. It is intended only as a base class, and the support for some actions (such as editing field values) consists of simple stubs that do nothing. Instead, use a TBaseDataSetAdapterField descendant that is appropriate to the type of the corresponding database field.

See Also

TDataSetAdapterImageField (see page 8138)

41.1.1.1 TBaseDataSetAdapterField Members

The following tables list the members exposed by TBaseDataSetAdapterField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckOrigValue (see page 7736)	Ensures that the current value of this field is the same as the original value.
	CheckValueChange (see page 7737)	Indicates whether the current value of this field is the same as the original value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 7738)	Indicates whether references to this field in HTML forms must be qualified with the name of the parent adapter.
	GetAdapter (see page 7738)	Returns the value of the Adapter (see page 7752) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7738)	Returns the dataset associated with this field's parent adapter.
V	GetDataSetFieldValue (see page 7739)	Returns the value of the associated dataset field.

	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 7739)	Returns a string value that suggests an HTML display style for this adapter field.
	GetDisplayStyleType (see page 7740)	Returns the HTML display style type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 7741)	Returns a string value that suggests an HTML editing style for this adapter field.
	GetInputStyleType (see page 7742)	Returns the style of the HTML control to use for editing this adapter field.
	GetKeyName (see page 7742)	Returns the name of the associated dataset field if it appears in the index (key) that the parent dataset adapter uses.
	GetKeyParams (see page 7743)	Returns a list of fields that the parent dataset adapter uses to locate records, along with their current values in that adapter's dataset.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetReadOnly (see page 7743)	Indicates whether the adapter field represents a read-only database field.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 7744)	Returns a string value that indicates what function a control that represents this field should perform.
	GetViewModeType (see page 7744)	Returns the view mode for the function a control that represents this field should perform.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 7745)	Provides the underlying implementation for the AsFormatted method.
	ImplCheckOrigValue (see page 7745)	Provides the underlying implementation for the CheckOrigValue (see page 7736) method.
	ImplCheckValueChange (see page 7746)	Provides the underlying implementation for the CheckValueChange (see page 7737) method.
	ImplGetDisplayLabel (see page 7747)	Provides the underlying implementation for the GetDisplayLabel method.
	ImplGetDisplayWidth (see page 7747)	Provides the underlying implementation for the GetDisplayWidth method.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 7747)	Provides the underlying implementation for the GetRequired method.
	ImplGetValue (see page 7748)	Provides the underlying implementation for the GetValue method.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 7748)	Provides the underlying implementation for the GetVisible method.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 7749)	Provides the underlying implementation for the SetFieldName method.
	ImplUpdateValue (see page 7749)	Provides the underlying implementation for the UpdateValue (see page 7751) method.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 7750)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	PrepareDataSet (see page 7750)	Responds when the parent dataset adapter prepares its dataset.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSetField (see page 7751)	Sets the value of the DataSetField (see page 7752) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 7751)	Updates the adapter field when the user assigns a new value.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7752)	Indicates the dataset adapter that uses this object to represent one of its fields.
	DataSetField (see page 7752)	Specifies the name of the dataset field that this adapter field represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 7754)	Occurs when the adapter field needs to supply its formatted value as a string that can appear in HTML forms.
	OnGetValue (see page 7754)	Occurs when the adapter field needs to supply its value as a Variant.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 7735)	Creates and initializes an instance of TBaseDataSetAdapterField (see page 7729).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 7737)	Returns the dataset field whose value this adapter field represents.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.

V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	FieldFlags (see page 7752)	Indicates various attributes of the adapter field.
	FieldModes (see page 7753)	Indicates what dataset adapter modes this field supports.

R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
R	KeyName (see page 8105)	This is KeyName, a member of class IGetDataSetKeyName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.1.2 TBaseDataSetAdapterField.Create Constructor

Creates and initializes an instance of TBaseDataSetAdapterField (see page 7729).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TBaseDataSetAdapterField(TComponent * AOwner);
```

Description

The TBaseDataSetAdapterField (see page 7729) constructor allocates memory for the adapter field object and initializes its properties.

AOwner is the component that is responsible for starting the streaming process when a module containing the adapter field is loaded or saved. It becomes the value of the Owner property. Typically, AOwner is the Web module.

See Also

Owner (see page 2807)

41.1.1.3 TBaseDataSetAdapterField Methods

The methods of the TBaseDataSetAdapterField class are listed here.

Protected Methods

	Name	Description
	CheckOrigValue (see page 7736)	Ensures that the current value of this field is the same as the original value.
	CheckValueChange (see page 7737)	Indicates whether the current value of this field is the same as the original value.
V	FullyQualifyInputName (see page 7738)	Indicates whether references to this field in HTML forms must be qualified with the name of the parent adapter.
	GetAdapter (see page 7738)	Returns the value of the Adapter (see page 7752) property.

	GetDataSet (see page 7738)	Returns the dataset associated with this field's parent adapter.
	GetDataSetFieldValue (see page 7739)	Returns the value of the associated dataset field.
	GetDisplayStyle (see page 7739)	Returns a string value that suggests an HTML display style for this adapter field.
	GetDisplayStyleType (see page 7740)	Returns the HTML display style type for this adapter field.
	GetInputStyle (see page 7741)	Returns a string value that suggests an HTML editing style for this adapter field.
	GetInputStyleType (see page 7742)	Returns the style of the HTML control to use for editing this adapter field.
	GetKeyName (see page 7742)	Returns the name of the associated dataset field if it appears in the index (key) that the parent dataset adapter uses.
	GetKeyParams (see page 7743)	Returns a list of fields that the parent dataset adapter uses to locate records, along with their current values in that adapter's dataset.
	GetReadOnly (see page 7743)	Indicates whether the adapter field represents a read-only database field.
	GetViewMode (see page 7744)	Returns a string value that indicates what function a control that represents this field should perform.
	GetViewModeType (see page 7744)	Returns the view mode for the function a control that represents this field should perform.
	ImplAsFormatted (see page 7745)	Provides the underlying implementation for the AsFormatted method.
	ImplCheckOrigValue (see page 7745)	Provides the underlying implementation for the CheckOrigValue (see page 7736) method.
	ImplCheckValueChange (see page 7746)	Provides the underlying implementation for the CheckValueChange (see page 7737) method.
	ImplGetDisplayLabel (see page 7747)	Provides the underlying implementation for the GetDisplayLabel method.
	ImplGetDisplayWidth (see page 7747)	Provides the underlying implementation for the GetDisplayWidth method.
	ImplGetRequired (see page 7747)	Provides the underlying implementation for the GetRequired method.
	ImplGetValue (see page 7748)	Provides the underlying implementation for the GetValue method.
	ImplGetVisible (see page 7748)	Provides the underlying implementation for the GetVisible method.
	ImplSetFieldName (see page 7749)	Provides the underlying implementation for the SetFieldName method.
	ImplUpdateValue (see page 7749)	Provides the underlying implementation for the UpdateValue (see page 7751) method.
	Notification (see page 7750)	Forwards notification messages to all owned components.
	PrepareDataSet (see page 7750)	Responds when the parent dataset adapter prepares its dataset.
	SetDataSetField (see page 7751)	Sets the value of the DataSetField (see page 7752) property.
	UpdateValue (see page 7751)	Updates the adapter field when the user assigns a new value.

Public Methods

	Name	Description
	FindField (see page 7737)	Returns the dataset field whose value this adapter field represents.

41.1.1.3.1 TBaseDataSetAdapterField.CheckOrigValue Method

Ensures that the current value of this field is the same as the original value.

Pascal

```
procedure CheckOrigValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall CheckOrigValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

Dataset adapter fields call CheckOrigValue internally when the field value must be the same as the original field value. The original value is stored as a hidden field on HTML forms when the FieldFlags (see page 7752) property includes ffInOrigValues. If the current value differs from the original value, CheckOrigValue raises an exception.

AActionRequest is interface of the action request object. CheckOrigValue can use this interface to obtain information about the current request (such as the value of the hidden field that contains the original value).

AFieldIndex is the index of this field in the set of field values that AActionRequest maintains.

CheckOrigValue calls the ImplCheckOrigValue (see page 7745) method, which performs the actual checking.

See Also

CheckValueChange (see page 7737)

ImplCheckOrigValue (see page 7745)

FieldFlags (see page 7752)

ActionOrigValue (see page 23943)

Value (see page 23945)

41.1.1.3.2 TBaseDataSetAdapterField.CheckValueChange Method

Indicates whether the current value of this field is the same as the original value.

Pascal

```
function CheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
```

C++

```
__fastcall Boolean CheckValueChange(IActionRequest AActionRequest, int AFieldIndex);
```

Description

CheckValueChange indicates whether the value of this adapter field has changed from its previous value.

AActionRequest is the interface of the action request object. CheckOrigValue (see page 7736) can use this interface to obtain information about the current request (such as the value of the hidden field that contains the original value).

AFieldIndex is the index of this field in the set of field values that AActionRequest maintains.

CheckValueChange returns true if the value has changed, false if it is the same as the original value.

CheckValueChange calls the ImplCheckValueChange (see page 7746) method, which performs the actual checking.

See Also

CheckOrigValue (see page 7736)

ImplCheckValueChange (see page 7746)

Value (see page 23945)

41.1.1.3.3 TBaseDataSetAdapterField.FindField Method

Returns the dataset field whose value this adapter field represents.

Pascal

```
function FindField: TField;
```

C++

```
__fastcall TField FindField();
```

Description

Call FindField to access the field component for the dataset field that this adapter makes available to server-side scripts.

FindField returns the field with the name specified by the DataSetField (see page 7752) property from the dataset that is associated with the parent adapter. If DataSetField (see page 7752) is an empty string, FindField returns nil (Delphi) or NULL (C++).

Note: Calling FindField can be more efficient than using the parent adapter to access the dataset and calling its FindField

method. This is because TBaseDataSetAdapterField (see page 7729) caches a reference to the field component when possible.

See Also

DataSetField (see page 7752)

FindField (see page 6938)

GetDataSet (see page 7738)

41.1.1.3.4 TBaseDataSetAdapterField.FullyQualifyInputName Method

Indicates whether references to this field in HTML forms must be qualified with the name of the parent adapter.

Pascal

```
function FullyQualifyInputName: Boolean; override;
```

C++

```
virtual __fastcall Boolean FullyQualifyInputName();
```

Description

The WebSnap application calls FullyQualifyInputName when generating an input name for this adapter field in an HTML document. Input names must be qualified by an adapter name when a single HTML form is used to input values for multiple adapters. This function returns true if the field name must be qualified with the name of the adapter to which it belongs, false otherwise.

FullyQualifyInputName calls the parent adapter's FullyQualifyInputNames method, which checks whether there are other dataset adapters in a master/detail relationship with it.

See Also

FullyQualifyInputNames (see page 7782)

Adapter (see page 7752)

41.1.1.3.5 TBaseDataSetAdapterField.GetAdapter Method

Returns the value of the Adapter (see page 7752) property.

Pascal

```
function GetAdapter: TCustomDataSetAdapter;
```

C++

```
__fastcall TCustomDataSetAdapter GetAdapter();
```

Description

GetAdapter is the protected read implementation of the Adapter (see page 7752) property.

See Also

Adapter (see page 7752)

41.1.1.3.6 TBaseDataSetAdapterField.GetDataSet Method

Returns the dataset associated with this field's parent adapter.

Pascal

```
function GetDataSet: TDataSet;
```

C++

```
__fastcall TDataSet GetDataSet();
```

Description

GetDataSet returns the value of the parent adapter's DataSet property. If the value of this field's Adapter (see page 7752) property is nil (Delphi) or NULL (C++), GetDataSet returns nil (Delphi) or NULL (C++).

See Also

FindField (see page 7737)

Adapter (see page 7752)

DataSet (see page 7807)

41.1.1.3.7 TBaseDataSetAdapterField.GetDataSetFieldValue Method

Returns the value of the associated dataset field.

Pascal

```
function GetDataSetFieldValue(Field: TField): Variant; virtual;
```

C++

```
virtual __fastcall Variant GetDataSetFieldValue(TField Field);
```

Description

GetDataSetFieldValue returns the value of the associated dataset field, given a field object. This method is called by the implementation of the Value property when there is no OnGetValue (see page 7754) event handler.

Field is the dataset field whose value this adapter field represents. It is the component that the FindField (see page 7737) method returns.

In TBaseDataSetAdapterField (see page 7729), GetDataSetFieldValue returns the Value property of the Field parameter. Descendant classes can override this method to derive the field value from the dataset field in some other way. For example, TCustomDataSetAdapterImageField uses the display text, because the field component's Value property is a binary encoding of the image. Similarly, if you create a custom descendant for encrypted fields, GetDataSetFieldValue could decrypt the value that is stored in the database table.

See Also

OnGetValue (see page 7754)

Value (see page 23945)

FindField (see page 7737)

Value (see page 7180)

41.1.1.3.8 TBaseDataSetAdapterField.GetDisplayStyle Method

Returns a string value that suggests an HTML display style for this adapter field.

Pascal

```
function GetDisplayStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall AnsiString GetDisplayStyle(const AnsiString AAdapterMode);
```

Description

GetDisplayStyle implements the DisplayStyle property of this adapter field. The DisplayStyle property can be used in server-side script to determine an appropriate control for displaying the field's value.

AAdapterMode indicates the current mode of the parent dataset adapter. It is one of the following values:

Value	Mode	The HTML control is used for
Insert	amInsert	Providing a field value on a newly inserted record.
Edit	amEdit	Modifying an existing field value.
Browse	amBrowse	Read-only viewing of an existing field value.
Query	amQuery	Entering a value to use for the field in a generated query.

GetDisplayStyle returns one of the following strings:

Value	Meaning
Text	Display the field as read-only text
Image	Display the field as an image
List	Display the field as a list of read only values

Note: Although GetDisplayStyle is not a virtual method, it uses the virtual GetDisplayStyleType (see page 7740) method to determine what value to return. To change the way the adapter field determines the display style, override the GetDisplayStyleType (see page 7740) method.

See Also

GetDisplayStyleType (see page 7740)

GetInputStyle (see page 7741)

TDataSetAdapterModes (see page 8115)

41.1.1.3.9 TBaseDataSetAdapterField.GetDisplayStyleType Method

Returns the HTML display style type for this adapter field.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterDisplayHTMLElementType;
virtual;
```

C++

```
virtual __fastcall TAdapterDisplayHTMLElementType GetDisplayStyleType(const AnsiString
AAdapterMode);
```

Description

GetDisplayStyleType returns the best way to display this field's value in HTML forms.

AAdapterMode indicates the current mode of the parent dataset adapter. It is one of the following values:

Value	Mode	Meaning
Insert	amInsert	The field value is to be used for entering a value in a newly inserted record.

Edit	amEdit	The field value is to be used for editing the current field value.
Browse	amBrowse	The field value is to be displayed in a read-only manner.
Query	amQuery	The field value represents a criterion to use in a generated query.

In TBaseDataSetAdapterField (see page 7729), GetDisplayStyleType always returns htmldText, indicating that the value should appear as read-only text. Descendant classes override this to allow other display styles when necessary.

See Also

GetDisplayStyle (see page 7739)

GetInputStyleType (see page 7742)

TDataSetAdapterModes (see page 8115)

41.1.1.3.10 TBaseDataSetAdapterField.GetInputStyle Method

Returns a string value that suggests an HTML editing style for this adapter field.

Pascal

```
function GetInputStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall AnsiString GetInputStyle(const AnsiString AAdapterMode);
```

Description

GetInputStyle implements the InputStyle property of this adapter field. The InputStyle property can be used in server-side script to determine an appropriate control for editing the field's value.

AAdapterMode indicates the current mode of the parent dataset adapter. It is one of the following values:

Value	Mode	The HTML control is used for
Insert	amInsert	Providing a field value on a newly inserted record.
Edit	amEdit	Modifying an existing field value.
Browse	amBrowse	Read-only viewing of an existing field value.
Query	amQuery	Entering a value to use for the field in a generated query.

GetInputStyle returns one of the following strings:

Value	Meaning
TextInput	Edit the field using a single line input field.
PasswordInput	Edit the field as a password field.
Select	Edit the field using a single selection list.
SelectMultiple	Edit the field using a multiple selection list.
Radio	Edit the field using radio buttons.
CheckBox	Edit the field using check boxes.
TextArea	Edit the field using a multi-line input field.
File	Edit the field using a file upload input field.

Note: Although GetInputStyle is not a virtual method, it uses the virtual GetInputStyleType (see page 7742) method to

determine what value to return. To change the way the adapter field determines the input style, override the GetInputStyleType (see page 7742) method.

See Also

GetInputStyleType (see page 7742)

GetDisplayStyle (see page 7739)

TDataSetAdapterModes (see page 8115)

41.1.1.3.11 TBaseDataSetAdapterField.GetInputStyleType Method

Returns the style of the HTML control to use for editing this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; virtual;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const AnsiString
AAdapterMode);
```

Description

GetInputStyleType returns the recommended type of control to use for editing this field's value in HTML forms.

AAdapterMode indicates the current mode of the parent dataset adapter. It is one of the following values:

Value	Mode	Meaning
Insert	amInsert	The control is to be used for entering a field value in a newly inserted record.
Edit	amEdit	The control is to be used for editing the current field value.
Browse	amBrowse	The control is to be used for read-only display.
Query	amQuery	The control is to be used for entering a criterion to use in a generated query.

In TBaseDataSetAdapterField (see page 7729), GetInputStyleType always returns htmliTextInput, indicating that the default control is a single-line edit control. Descendant classes override this to allow other control styles when appropriate.

See Also

GetInputStyle (see page 7741)

GetDisplayStyleType (see page 7740)

TDataSetAdapterModes (see page 8115)

41.1.1.3.12 TBaseDataSetAdapterField.GetKeyName Method

Returns the name of the associated dataset field if it appears in the index (key) that the parent dataset adapter uses.

Pascal

```
function GetKeyName: string;
```

C++

```
__fastcall AnsiString GetKeyName();
```

Description

The parent dataset adapter calls GetKeyName when assembling a list of the field names in the key it uses. GetKeyName returns the name of the underlying database field (the value of the DataSetField (see page 7752) property) if the FieldFlags (see

page 7752) property includes ffInKey. Otherwise, GetKeyName returns an empty string.

See Also

GetKeyParams (see page 7743)

DataSetField (see page 7752)

GetKeyFields (see page 7786)

FieldFlags (see page 7752)

41.1.1.3.13 TBaseDataSetAdapterField.GetKeyParams Method

Returns a list of fields that the parent dataset adapter uses to locate records, along with their current values in that adapter's dataset.

Pascal

```
procedure GetKeyParams(Params: TLocateParamsList);
```

C++

```
__fastcall GetKeyParams(TLocateParamsList Params);
```

Description

GetKeyParams fills out a TLocateParamsList (see page 8096) object with the current values of all fields that the parent dataset adapter uses to uniquely identify records, along with all similarly-used fields in any dataset adapter's linked to the parent dataset in a master/detail relationship.

Params is a collection of TLocateParams (see page 8090) objects, where each TLocateParams (see page 8090) object lists the key fields and their values for a single dataset adapter.

GetKeyParams calls the GetKeyParams method of the parent dataset adapter.

See Also

GetKeyName (see page 7742)

GetKeyParams (see page 7787)

GetKeyFields (see page 7786)

41.1.1.3.14 TBaseDataSetAdapterField.GetReadOnly Method

Indicates whether the adapter field represents a read-only database field.

Pascal

```
function GetReadOnly: Boolean;
```

C++

```
__fastcall Boolean GetReadOnly();
```

Description

GetReadOnly returns true if this adapter field represents a database field that is read-only, false otherwise (if the underlying database field is not read-only or if this adapter is not associated with a field object).

See Also

FindField (see page 7737)

ReadOnly (see page 7177)

41.1.1.3.15 TBaseDataSetAdapterField.GetViewMode Method

Returns a string value that indicates what function a control that represents this field should perform.

Pascal

```
function GetViewMode(const AAdapterMode: string): string;
```

C++

```
__fastcall AnsiString GetViewMode(const AnsiString AAdapterMode);
```

Description

GetViewMode implements the ViewMode property of this adapter field. The ViewMode property can be used in server-side script to determine an appropriate control for the field's value.

AAdapterMode indicates the current mode of the parent dataset adapter. It is one of the following values:

Value	Mode	The HTML control is used for
Insert	amInsert	Providing a field value on a newly inserted record.
Edit	amEdit	Modifying an existing field value.
Browse	amBrowse	Read-only viewing of an existing field value.
Query	amQuery	Entering a value to use for the field in a generated query.

GetViewMode returns one of the following strings:

Value	Meaning
Input	Display the adapter field as an input field, by default use the style returned by the GetInputStyle (see page 7741) method.
Display	Display the adapter field as a read-only field, by default use the style returned by GetDisplayStyle (see page 7739).
ToggleOnAccess	Display as an input field if the end-user has modify rights, otherwise displays as a read-only field.

Note: Although GetViewMode is not a virtual method, it uses the virtual GetViewModeType (see page 7744) method to determine what value to return. To change the way the adapter field determines the view mode, override the GetViewModeType (see page 7744) method.

See Also

GetInputStyle (see page 7741)

GetDisplayStyle (see page 7739)

TDataSetAdapterModes (see page 8115)

GetViewModeType (see page 7744)

41.1.1.3.16 TBaseDataSetAdapterField.GetViewModeType Method

Returns the view mode for the function a control that represents this field should perform.

Pascal

```
function GetViewModeType(const AAdapterMode: string): TAdapterDisplayViewModeType; virtual;
```

C++

```
virtual __fastcall TAdapterDisplayViewModeType GetViewModeType(const AnsiString AAdapterMode);
```

Description

GetViewModeType returns the recommended type of control (edit or display) to use for this field's value in HTML forms.

AAdapterMode indicates the current mode of the parent dataset adapter. It is one of the following values:

Value	Mode	Meaning
Insert	amInsert	The control is to be used for entering a field value in a newly inserted record.
Edit	amEdit	The control is to be used for editing the current field value.
Browse	amBrowse	The control is to be used for read-only display.
Query	amQuery	The control is to be used for entering a criterion to use in a generated query.

In TBaseDataSetAdapterField (see page 7729), GetViewModeType returns htmlvmDisplay if the associated field is read-only or AAdapterMode indicates that the parent adapter is in browse mode (amBrowse). Otherwise, it returns htmlvmInput.

See Also

GetInputStyle (see page 7741)

GetDisplayStyle (see page 7739)

TDataSetAdapterModes (see page 8115)

GetViewMode (see page 7744)

41.1.1.3.17 TBaseDataSetAdapterField.ImplAsFormatted Method

Provides the underlying implementation for the AsFormatted method.

Pascal

```
function ImplAsFormatted: string; override;
```

C++

```
virtual __fastcall AnsiString ImplAsFormatted();
```

Description

The AsFormatted method calls ImplAsFormatted to obtain a string to use as the value of the DisplayText property in server-side script.

ImplAsFormatted generates an OnGetDisplayText (see page 7754) event and returns the string the event handler returns. If there is no OnGetDisplayText (see page 7754) event handler, ImplAsFormatted returns the value of the associated dataset field's DisplayText property.

See Also

AsFormatted (see page 23931)

OnGetDisplayText (see page 7754)

DisplayText (see page 7162)

41.1.1.3.18 TBaseDataSetAdapterField.ImplCheckOrigValue Method

Provides the underlying implementation for the CheckOrigValue (see page 7736) method.

Pascal

```
procedure ImplCheckOrigValue(AActionRequest: IActionRequest; AFieldIndex: Integer); virtual;
```

C++

```
virtual __fastcall ImplCheckOrigValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

The CheckOrigValue (see page 7736) method calls ImplCheckOrigValue to raise an exception if the current value of this field is not the same as the original value.

AActionRequest is interface of the action request object. ImplCheckOrigValue can use this interface to obtain information about the current request (such as the value of the hidden field that contains the original value).

AFieldIndex is the index of this field in the set of field values that AActionRequest maintains.

In TBaseDataSetAdapter, ImplCheckOrigValue does nothing (acting as if the current value always matches the original value). Descendant classes override this method if they can compare the current field value with the original values stored in the action request.

See Also

CheckOrigValue (see page 7736)

FieldFlags (see page 7752)

ActionOrigValue (see page 23943)

Value (see page 23945)

41.1.1.3.19 TBaseDataSetAdapterField.ImplCheckValueChange Method

Provides the underlying implementation for the CheckValueChange (see page 7737) method.

Pascal

```
function ImplCheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
virtual;
```

C++

```
virtual __fastcall Boolean ImplCheckValueChange(IActionRequest AActionRequest, int
AFieldIndex);
```

Description

The CheckValueChange (see page 7737) method calls ImplCheckValueChange to determine whether the value of this adapter field has changed from the value it held when building the form from which the current request originates.

AActionRequest is the interface of the action request object. CheckOrigValue (see page 7736) can use this interface to obtain information about the current request (such as the value of the hidden field that contains the original value).

AFieldIndex is the index of this field in the set of field values that AActionRequest maintains.

ImplCheckValueChange returns true if the value has changed. In TBaseDataSetAdapterField (see page 7729), ImplCheckValueChange always returns false, indicating no change to the field value. Descendant classes override this method if they can compare the current field value with the original values stored in the action request.

See Also

CheckValueChange (see page 7737)

Value (see page 23945)

41.1.1.3.20 TBaseDataSetAdapterField.ImplGetDisplayLabel Method

Provides the underlying implementation for the GetDisplayLabel method.

Pascal

```
function ImplGetDisplayLabel: string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetDisplayLabel();
```

Description

GetDisplayLabel calls ImplGetDisplayLabel to obtain the label that can be used when generating HTML to display the value of this adapter field (in server-side script, the value of the DisplayLabel property).

ImplGetDisplayLabel calls FindField (see page 7737) to access the associated field component and returns the value of its DisplayLabel property. If FindField (see page 7737) returns nil (Delphi) or NULL (C++), ImplGetDisplayLabel returns an empty string.

See Also

DisplayLabel (see page 7160)

GetDisplayLabel (see page 23933)

FindField (see page 7737)

41.1.1.3.21 TBaseDataSetAdapterField.ImplGetDisplayWidth Method

Provides the underlying implementation for the GetDisplayWidth method.

Pascal

```
function ImplGetDisplayWidth: Integer; override;
```

C++

```
virtual __fastcall int ImplGetDisplayWidth();
```

Description

GetDisplayWidth calls ImplGetDisplayWidth to obtain the width (number of characters) to use for an HTML control that displays the value of this adapter field (in server-side script, the value of the DisplayWidth property).

ImplGetDisplayWidth calls FindField (see page 7737) to access the associated field component and returns the value of its DisplayWidth property. If FindField (see page 7737) returns nil (Delphi) or NULL (C++), ImplGetDisplayWidth returns –1, indicating that the default display width is undetermined.

See Also

DisplayWidth (see page 7162)

GetDisplayWidth (see page 23933)

FindField (see page 7737)

41.1.1.3.22 TBaseDataSetAdapterField.ImplGetRequired Method

Provides the underlying implementation for the GetRequired method.

Pascal

```
function ImplGetRequired: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplGetRequired();
```

Description

GetRequired calls ImplGetRequired to determine whether the end-user must supply a value for this field before submitting a form (in server-side script, the value of the Required property).

ImplGetRequired calls FindField (see page 7737) to access the associated field component and returns the value of its Required property. If FindField (see page 7737) returns nil (Delphi) or NULL (C++), ImplGetRequired returns false.

See Also

Required (see page 7177)

GetRequired (see page 23934)

FindField (see page 7737)

41.1.1.3.23 TBaseDataSetAdapterField.ImplGetValue Method

Provides the underlying implementation for the GetValue method.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

GetValue calls ImplGetValue to obtain the value of the adapter field as a Variant.

ImplGetValue first generates an OnGetValue (see page 7754) event, to allow an event handler to supply the value of the field. If there is no OnGetValue (see page 7754) event handler, ImplGetValue calls the GetDataSetFieldValue (see page 7739) method, which returns the value of the associated dataset field. If ImplGetValue can't locate the dataset field from which to obtain a value, it returns an unassigned Variant.

See Also

Value (see page 7180)

GetValue (see page 23935)

OnGetValue (see page 7754)

Value (see page 23945)

GetDataSetFieldValue (see page 7739)

41.1.1.3.24 TBaseDataSetAdapterField.ImplGetVisible Method

Provides the underlying implementation for the GetVisible method.

Pascal

```
function ImplGetVisible: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplGetVisible();
```

Description

GetVisible calls ImplGetVisible to determine whether this field should appear in HTML forms (in server-side script, the value of the Visible property).

ImplGetVisible first checks whether the FieldModes (see page 7753) property includes the current mode of the parent dataset adapter. If not, it returns false. If the current mode is supported, ImplGetVisible returns the value of the associated field component's Visible property.

See Also

Visible (see page 7181)

GetVisible (see page 23935)

FieldModes (see page 7753)

Mode (see page 7810)

41.1.1.3.25 TBaseDataSetAdapterField.ImplSetFieldName Method

Provides the underlying implementation for the SetFieldName method.

Pascal

```
procedure ImplSetFieldName(const Value: string); override;
```

C++

```
virtual __fastcall ImplSetFieldName(const AnsiString Value);
```

Description

The SetFieldName method calls ImplSetFieldName to assign the name by which server-side script can refer to this adapter field. ImplSetFieldName assigns the supplied name as the value of the DataSetField (see page 7752) property (binding this adapter field to a dataset field), and removes all illegal characters from the supplied name. Thus, the name for this field in server-side script may differ from the field-name only in omitting any illegal characters.

Value is the name of the field this adapter represents, and forms the basis of the resulting adapter field name.

See Also

DataSetField (see page 7752)

SetFieldName (see page 23942)

41.1.1.3.26 TBaseDataSetAdapterField.ImplUpdateValue Method

Provides the underlying implementation for the UpdateValue (see page 7751) method.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); virtual;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

The UpdateValue (see page 7751) method calls ImplUpdateValue to respond when the user assigns a new value to this field.

AActionRequest is interface of the action request object. ImplUpdateValue can use this interface to obtain information about the current request (such as the value the user assigned to this field).

AFieldIndex is the index of this field in the set of field values that AActionRequest maintains.

ImplUpdateValue does nothing. Descendant classes that support field updates override this method to assign a new value to the associated database field.

See Also

UpdateValue (see page 7751)

Value (see page 23945)

41.1.1.3.27 TBaseDataSetAdapterField.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification calls the inherited method and performs additional cleanup actions when necessary. For more information, see the documentation for TComponent's Notification method.

See Also

Notification (see page 2783)

41.1.1.3.28 TBaseDataSetAdapterField.PrepareDataSet Method

Responds when the parent dataset adapter prepares its dataset.

Pascal

```
procedure PrepareDataSet;
```

C++

```
__fastcall PrepareDataSet();
```

Description

The parent dataset adapter calls PrepareDataSet from its own PrepareDataSet method. This allows the adapter field to reset itself as necessary to reflect the newly initialized state of the parent adapter's dataset.

In TBaseDataSetAdapterField (see page 7729), PrepareDataSet releases its cached instance of the associated field component. That way, the next call to FindField (see page 7737) checks the parent adapter's dataset for the field, in case the newly initialized dataset no longer includes the same field component.

See Also

PrepareDataSet (see page 7799)

FindField (see page 7737)

41.1.1.3.29 TBaseDataSetAdapterField.SetDataSetField Method

Sets the value of the DataSetField (see page 7752) property.

Pascal

```
procedure SetDataSetField(const Value: string);
```

C++

```
__fastcall SetDataSetField(const AnsiString Value);
```

Description

SetDataSetField is the protected write implementation of the DataSetField (see page 7752) property. This method assigns the name of the adapter field (as referenced from server-side script) as a side effect. The new name for the adapter field is the same as the new value of DataSetField (see page 7752), with any illegal characters removed.

Value is the new value of the DataSetField (see page 7752) property.

See Also

SetFieldName (see page 23942)

DataSetField (see page 7752)

41.1.1.3.30 TBaseDataSetAdapterField.UpdateValue Method

Updates the adapter field when the user assigns a new value.

Pascal

```
procedure UpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall UpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

UpdateValue updates the associated database field to a value supplied in an incoming request, if possible.

AActionRequest is interface of the action request object. UpdateValue can use this interface to obtain information about the current request (such as the value the user assigned to this field).

AFieldIndex is the index of this field in the set of field values that AActionRequest maintains.

UpdateValue calls the ImplUpdateValue (see page 7749) method, which performs the actual update.

See Also

ImplUpdateValue (see page 7749)

Value (see page 23945)

41.1.1.4 TBaseDataSetAdapterField Properties

The properties of the TBaseDataSetAdapterField class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 7752)	Indicates the dataset adapter that uses this object to represent one of its fields.
	DataSetField (see page 7752)	Specifies the name of the dataset field that this adapter field represents.

Public Properties

	Name	Description
	FieldFlags (see page 7752)	Indicates various attributes of the adapter field.
	FieldModes (see page 7753)	Indicates what dataset adapter modes this field supports.

41.1.1.4.1 TBaseDataSetAdapterField.Adapter Property

Indicates the dataset adapter that uses this object to represent one of its fields.

Pascal

```
property Adapter: TCustomDataSetAdapter;
```

C++

```
__property TCustomDataSetAdapter Adapter;
```

Description

Use Adapter to access the parent adapter of this adapter field. This adapter is associated with the dataset whose database field this adapter field represents. This adapter field is one of the objects listed in its Data property.

See Also

Data (see page 24402)

TDataSet (see page 6894)

41.1.1.4.2 TBaseDataSetAdapterField.DataSetField Property

Specifies the name of the dataset field that this adapter field represents.

Pascal

```
property DataSetField: string;
```

C++

```
__property AnsiString DataSetField;
```

Description

DataSetField is the FieldName of the TField object whose value this adapter field represents. DataSetField can be the name of a simple field in a database table, the name of a subfield of an object field that has been qualified by the parent field's name, or the name of an aggregated field.

DataSetField is the same as the name of this adapter field in server-side script, except that the name of the adapter field omits any illegal characters (the only legal characters are the letters between a and z (or A and Z), digits, and the underline character).

If DataSetField is an empty string, this adapter field does not have a value, and the FindField (see page 7737) method returns nil (Delphi) or NULL (C++).

See Also

FieldName (see page 7164)

FindField (see page 7737)

41.1.1.4.3 TBaseDataSetAdapterField.FieldFlags Property

Indicates various attributes of the adapter field.

Pascal

```
property FieldFlags: TDataSetAdapterFieldFlags;
```

C++

```
__property TDataSetAdapterFieldFlags FieldFlags;
```

Description

FieldFlags indicates special uses of the value of this adapter field. This is a set that can indicate whether the value corresponds to a key field in the database (used to locate database records) and whether HTML forms store the original value of the field as a hidden field so that the application can detect changes to the field value.

See Also

IsIndexField (see page 7168)

DataSetField (see page 7752)

GetKeyName (see page 7742)

GetKeyFields (see page 7786)

41.1.1.4.4 TBaseDataSetAdapterField.FieldModes Property

Indicates what dataset adapter modes this field supports.

Pascal

```
property FieldModes: TDataSetAdapterModes;
```

C++

```
__property TDataSetAdapterModes FieldModes;
```

Description

FieldModes is a set of all the modes in which this adapter field can be used. If the parent dataset adapter is in a mode that is not included in this set, any forms generated using that adapter do not include a control to represent this field. Thus, for example, to make a field read-only, you can exclude amInsert and amEdit from FieldModes. Then, the field appears when the user is viewing or querying the dataset, but not when the user is editing or inserting a record.

See Also

CanModify (see page 7154)

Adapter (see page 7752)

Mode (see page 7810)

GetDisplayStyle (see page 7739)

GetInputStyle (see page 7741)

GetViewMode (see page 7744)

41.1.1.5 TBaseDataSetAdapterField Events

The events of the TBaseDataSetAdapterField class are listed here.

Public Events

	Name	Description
	OnGetDisplayText (see page 7754)	Occurs when the adapter field needs to supply its formatted value as a string that can appear in HTML forms.
	OnGetValue (see page 7754)	Occurs when the adapter field needs to supply its value as a Variant.

41.1.1.5.1 TBaseDataSetAdapterField.OnGetDisplayText Event

Occurs when the adapter field needs to supply its formatted value as a string that can appear in HTML forms.

Pascal

```
property OnGetDisplayText: TDataSetAdapterFieldGetStringEvent;
```

C++

```
__property TDataSetAdapterFieldGetStringEvent OnGetDisplayText;
```

Description

TBaseDataSetAdapterField (see page 7729) generates this event when supplying the read-only text representation of the field's value. This allows the WebSnap application to dynamically supply the formatted value of the field. Server-side script can access the resulting string using the DisplayText property.

Note: If you do not supply an OnGetDisplayText event handler, TBaseDataSetAdapterField (see page 7729) uses the field component's DisplayText property.

See Also

DisplayText (see page 7162)

Value (see page 23945)

OnGetValue (see page 7754)

41.1.1.5.2 TBaseDataSetAdapterField.OnGetValue Event

Occurs when the adapter field needs to supply its value as a Variant.

Pascal

```
property OnGetValue: TDataSetAdapterFieldGetValueEvent;
```

C++

```
__property TDataSetAdapterFieldGetValueEvent OnGetValue;
```

Description

TBaseDataSetAdapterField (see page 7729) generates an OnGetValue event when the WebSnap application reads its Value property. This allows the adapter field to dynamically supply the value for the field. For example, you can use this event to decrypt values that are stored in the database in an encrypted form.

Note: If you do not supply an OnGetValue event handler, TBaseDataSetAdapterField (see page 7729) uses the field component's Value property.

See Also

Value (see page 7180)

Value (see page 23945)

OnGetDisplayText (see page 7754)

41.1.2 TBaseDataSetAdapterImageField Class

TBaseDataSetAdapteImageField is the base class for the TDataSetAdapterImageField.

Class Hierarchy

Pascal

```
TBaseDataSetAdapterImageField = class(TBaseDataSetAdapterField);
```

C++

```
class TBaseDataSetAdapterImageField : public TBaseDataSetAdapterField;
```

File

DBAdapt

Description

To allow TDataSetAdapter (see page 7872) to have an image field but not require that all applications built with TDataSetAdapter (see page 7872) use jpeg (see page 15685) units, the TDataSetAdapter (see page 7872) has an indirect reference to the image field class. DBAdapt.pas contains a variable named DataSetAdapterImageFieldClass (see page 8116) that references the class of the image field, which must be derived from TBaseDataSetAdapterImageField.variable. When the DBAdaptImage.pas unit is initialized, DataSetAdapterImageFieldClass (see page 8116) is assigned a class

reference to TDataSetAdapterImageField.

41.1.3 TBaseDataSetAdapterInputField Class

TBaseDataSetAdapterInputField is the common base class for adapter field objects that represent a dataset field of a type users can edit directly.

Class Hierarchy

Pascal

```
TBaseDataSetAdapterInputField = class(TBaseDataSetAdapterField, IValidateValue);
```

C++

```
class TBaseDataSetAdapterInputField : public TBaseDataSetAdapterField, public IValidateValue;
```

File

DBAdapt

Description

TBaseDataSetAdapterInputField is the base class for adapter field objects that represent database fields of simple types that

users can edit directly. This is in contrast, for example, to TDataSetAdapterImageField, which represents a field type that users can only edit indirectly, by providing a file reference. TBaseDataSetAdapterInputField descendants are included as the fields of a dataset adapter (TDataSetAdapter (see page 7872)). Each TBaseDataSetAdapterInputField descendant represents a single field from a database table, and enables server-side script to refer to or update that field's value.

Do not use TBaseDataSetAdapterInputField directly. It is intended only as a base class, and the support for some actions (such as updating field values) consists of simple stubs that do nothing. Instead, use a TBaseDataSetAdapterInputField descendant such as TDataSetAdapterField (see page 7960) or TDataSetAdapterMemoField (see page 7996).

See Also

TDataSetAdapterImageField (see page 8138)

TDataSetAdapterField (see page 7960)

TDataSetAdapterMemoField (see page 7996)

TDataSetAdapter (see page 7872)

TField (see page 7115)

41.1.3.1 TBaseDataSetAdapterInputField Members

The following tables list the members exposed by TBaseDataSetAdapterInputField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckOrigValue (see page 7736)	Ensures that the current value of this field is the same as the original value.
	CheckValueChange (see page 7737)	Indicates whether the current value of this field is the same as the original value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 7738)	Indicates whether references to this field in HTML forms must be qualified with the name of the parent adapter.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 7738)	Returns the value of the Adapter (see page 7752) property.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7738)	Returns the dataset associated with this field's parent adapter.

	GetDataSetFieldValue (see page 7739)	Returns the value of the associated dataset field.
	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 7739)	Returns a string value that suggests an HTML display style for this adapter field.
	GetDisplayStyleType (see page 7740)	Returns the HTML display style type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 7741)	Returns a string value that suggests an HTML editing style for this adapter field.
	GetInputStyleType (see page 7742)	Returns the style of the HTML control to use for editing this adapter field.
	GetKeyName (see page 7742)	Returns the name of the associated dataset field if it appears in the index (key) that the parent dataset adapter uses.
	GetKeyParams (see page 7743)	Returns a list of fields that the parent dataset adapter uses to locate records, along with their current values in that adapter's dataset.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetReadOnly (see page 7743)	Indicates whether the adapter field represents a read-only database field.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 7744)	Returns a string value that indicates what function a control that represents this field should perform.
	GetViewModeType (see page 7744)	Returns the view mode for the function a control that represents this field should perform.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 7745)	Provides the underlying implementation for the AsFormatted method.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplCheckOrigValue (see page 7745)	Provides the underlying implementation for the CheckOrigValue (see page 7736) method.
	ImplCheckValueChange (see page 7746)	Provides the underlying implementation for the CheckValueChange (see page 7737) method.
	ImplGetDisplayLabel (see page 7747)	Provides the underlying implementation for the GetDisplayLabel method.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayWidth (see page 7747)	Provides the underlying implementation for the GetDisplayWidth method.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetEchoActionFieldValue (see page 7763)	Provides the underlying implementation for the GetEchoActionFieldValue method.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 7747)	Provides the underlying implementation for the GetRequired method.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 7748)	Provides the underlying implementation for the GetValue method.
	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 7748)	Provides the underlying implementation for the GetVisible method.

	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 7763)	Provides the underlying implementation for the SetEchoActionFieldValue method.
	ImplSetFieldName (see page 7749)	Provides the underlying implementation for the SetFieldName method.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplUpdateValue (see page 7749)	Provides the underlying implementation for the UpdateValue (see page 7751) method.
	ImplValidateValue (see page 7764)	Provides the underlying implementation for the ValidateValue (see page 7765) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7750)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	PrepareDataSet (see page 7750)	Responds when the parent dataset adapter prepares its dataset.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSetField (see page 7751)	Sets the value of the DataSetField (see page 7752) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	TestValueChange (see page 7764)	Checks whether a new value matches the current value of this field.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 7751)	Updates the adapter field when the user assigns a new value.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 7765)	Validates a new value for this field that appears in the current request.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7752)	Indicates the dataset adapter that uses this object to represent one of its fields.
R	Adapter (see page 23943)	Returns the parent adapter component.
	DataSetField (see page 7752)	Specifies the name of the dataset field that this adapter field represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 7754)	Occurs when the adapter field needs to supply its formatted value as a string that can appear in HTML forms.
	OnGetValue (see page 7754)	Occurs when the adapter field needs to supply its value as a Variant.
	OnValidateValue (see page 7766)	Occurs when the parent adapter wants to validate the new value for this field.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7735)	Creates and initializes an instance of TBaseDataSetAdapterField (see page 7729).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 7737)	Returns the dataset field whose value this adapter field represents.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKeyName (see page 8105)	This is GetKeyName, a member of class IGetDataSetKeyName.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PrepareDataSet (see page 8109)	This is PrepareDataSet, a member of class IPrepareDataSet.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.

	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	FieldFlags (see page 7752)	Indicates various attributes of the adapter field.
	FieldModes (see page 7753)	Indicates what dataset adapter modes this field supports.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
R	KeyName (see page 8105)	This is KeyName, a member of class IGetDataSetKeyName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
	OnUpdateValue (see page 7765)	Occurs when the WebSnap application updates this adapter field's value based on in incoming request.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.3.2 TBaseDataSetAdapterInputField Methods

The methods of the TBaseDataSetAdapterInputField class are listed here.

Protected Methods

	Name	Description
	ImplGetEchoActionFieldValue (see page 7763)	Provides the underlying implementation for the GetEchoActionFieldValue method.
	ImplSetEchoActionFieldValue (see page 7763)	Provides the underlying implementation for the SetEchoActionFieldValue method.
	ImplValidateValue (see page 7764)	Provides the underlying implementation for the ValidateValue (see page 7765) method.
	TestValueChange (see page 7764)	Checks whether a new value matches the current value of this field.
	ValidateValue (see page 7765)	Validates a new value for this field that appears in the current request.

41.1.3.2.1 TBaseDataSetAdapterInputField.ImplGetEchoActionFieldValue Method

Provides the underlying implementation for the GetEchoActionFieldValue method.

Pascal

```
function ImplGetEchoActionFieldValue: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplGetEchoActionFieldValue();
```

Description

The GetEchoActionFieldValue method calls ImplGetEchoActionFieldValue to determine whether the current field value represents the adapter field's value reflects the current value of the associated dataset field, or whether it reflects the value stored in the current HTTP request.

ImplGetEchoActionFieldValue returns true if reading this field's Value property yields the value for this field that appears in the current HTTP request. It returns false if reading the Value property yields the value of the associated dataset field.

See Also

GetEchoActionFieldValue (see page 23933)

EchoActionFieldValue (see page 23944)

Value (see page 23945)

41.1.3.2.2 TBaseDataSetAdapterInputField.ImplSetEchoActionFieldValue Method

Provides the underlying implementation for the SetEchoActionFieldValue method.

Pascal

```
procedure ImplSetEchoActionFieldValue(AValue: Boolean); override;
```

C++

```
virtual __fastcall ImplSetEchoActionFieldValue(Boolean AValue);
```

Description

The SetEchoActionFieldValue method calls ImplSetEchoActionFieldValue to specify how this adapter field should implement its Value property.

AValue is the new value of the field's EchoActionFieldValue property. If AValue is true, the Value property should reflect the value for this field that appears in the current HTTP request. If AValue is false, the Value property should reflect the value of the associated dataset field.

See Also

SetEchoActionFieldValue (see page 23942)

EchoActionFieldValue (see page 23944)

Value (see page 23945)

41.1.3.2.3 TBaseDataSetAdapterInputField.ImplValidateValue Method

Provides the underlying implementation for the ValidateValue (see page 7765) method.

Pascal

```
procedure ImplValidateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); virtual;
```

C++

```
virtual __fastcall ImplValidateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

The ValidateValue (see page 7765) method calls ImplValidateValue to validate a proposed new field value from the current request. This method raises an exception if the proposed new value is not valid.

AActionRequest is the interface of the action request object. ImplValidateValue uses this interface to obtain the new value for this field.

AFieldIndex is the index of this field in the list of fields that the action request object maintains.

ImplValidateValue looks up the appropriate value from the request. It then generates an OnValidateValue (see page 7766) event, supplying the value from the current request and a reference to the dataset field that is associated with this adapter field.

See Also

ValidateValue (see page 7765)

OnValidateValue (see page 7766)

41.1.3.2.4 TBaseDataSetAdapterInputField.TestValueChange Method

Checks whether a new value matches the current value of this field.

Pascal

```
function TestValueChange(AField: TField; const ANewValue: string): Boolean;
```

C++

```
__fastcall Boolean TestValueChange(TField AField, const AnsiString ANewValue);
```

Description

TestValueChange compares the current value of a field with a new value, which is typically taken from a request message. Dataset adapter fields use this method internally when checking for changes or when updating the field value.

AField is the field object whose value this adapter field represents.

ANewValue is the field value from the request message, formatted as a string.

TestValueChange returns true if ANewValue differs from the value of AField, false if it is the same as the value of AField.

See Also

Value (see page 7180)

41.1.3.2.5 TBaseDataSetAdapterInputField.ValidateValue Method

Validates a new value for this field that appears in the current request.

Pascal

```
procedure ValidateValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall ValidateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

When the parent adapter receives an update request, it calls ValidateValue so that this field can validate the new value from the request message. If ValidateValue raises an exception, the adapter adds the exception message to an Errors object, which can then be used to report the error back to the user.

AActionRequest is the interface of the action request object. ValidateValue uses this interface to obtain the new value for this field.

AFieldIndex is the index of this field in the set of fields that AActionRequest maintains.

ValidateValue calls the ImplValidateValue (see page 7764) method, which generates an OnValidateValue (see page 7766) event to perform the validation.

See Also

ImplValidateValue (see page 7764)

OnValidateValue (see page 7766)

UpdateFieldsValidateValues (see page 7805)

41.1.3.3 TBaseDataSetAdapterInputField Properties

The properties of the TBaseDataSetAdapterInputField class are listed here.

Public Properties

	Name	Description
	OnUpdateValue (see page 7765)	Occurs when the WebSnap application updates this adapter field's value based on in incoming request.

41.1.3.3.1 TBaseDataSetAdapterInputField.OnUpdateValue Property

Occurs when the WebSnap application updates this adapter field's value based on in incoming request.

Pascal

```
property OnUpdateValue: TDatasetAdapterFieldValueEvent;
```

C++

```
__property TDatasetAdapterFieldValueEvent OnUpdateValue;
```

Description

Write an OnUpdateValue event handler to provide your own mechanism for updating the corresponding database field when the WebSnap application updates this adapter field's value. If you supply an OnUpdateValue event handler, the dataset adapter field assumes you have handled the update and does not write the new value to the associated dataset field. If there is no OnUpdateValue event handler, the dataset adapter field writes the field value to the associated dataset field.

Note: TBaseDataSetAdapterInputField (see page 7756) defines but does not generate this event. Instead, descendant classes generate this event when updating the adapter field value. If you create your own TBaseDataSetAdapterInputField (see page 7756) descendant, you must generate this event from your implementation of the UpdateValue (see page 7751) method.

See Also

Value (see page 7180)

Value (see page 23945)

OnGetValue (see page 7754)

ImplUpdateValue (see page 7749)

41.1.3.4 TBaseDataSetAdapterInputField Events

The events of the TBaseDataSetAdapterInputField class are listed here.

Public Events

	Name	Description
	OnValidateValue (see page 7766)	Occurs when the parent adapter wants to validate the new value for this field.

41.1.3.4.1 TBaseDataSetAdapterInputField.OnValidateValue Event

Occurs when the parent adapter wants to validate the new value for this field.

Pascal

```
property OnValidateValue: TDataAdapterFieldValidateValueEvent;
```

C++

```
__property TDataAdapterFieldValidateValueEvent OnValidateValue;
```

Description

Write an OnValidateValue event handler to provide your own validation of new field values before the WebSnap application attempts to update this field's value. If the new Value is not valid, the OnValidateValue event handler should raise an exception.

The parent dataset adapter generates this event when it receives new field values from an update request message.

Adapter (see page 7752)

Value (see page 23945)

OnGetValue (see page 7754)

OnValidate (see page 7183)

41.1.4 TCustomDataSetAdapter Class

TCustomDataSetAdapter is the base class for adapters that represent the information from a dataset.

Class Hierarchy

Pascal

```
TCustomDataSetAdapter = class(TDefaultFieldsPagedAdapter, IAdapterMode,
IAdapterDataSetComponent, IGetDesigntimeWarnings, IGetAdapterModeNames, IGetRecordKeys,
IFullyQualifyInputNames);
```

C++

```
class TCustomDataSetAdapter : public TDefaultFieldsPagedAdapter, public IAdapterMode, public
IAdapterDataSetComponent, public IGetDesigntimeWarnings, public IGetAdapterModeNames, public
IGetRecordKeys, public IFullyQualifyInputNames;
```

File

DBAdapt

Description

TCustomDataSetAdapter is the base class for adapters that define a scriptable interace to TDataSet objects. It allows datasets to operate properly in a stateless environment, and contains field and action components for working with the fields and records of the dataset. Each field of the dataset adapter represents a field in the dataset, and the actions operate on the underlying TDataSet object.

Two important properties that TCustomDataSetAdapter introduces are DataSet (see page 7807), which specifies the associated dataset for this adapter, and Mode (see page 7810), which indicates how forms built from this adapter are to operate on the information it provides. TCustomDataSetAdapter also introduces support for master/detail relationships between dataset. Use the MasterAdapter (see page 7809) property to indicate master/detail relationships between TDataSetAdapter (see page 7872) components.

Do not instantiate TCustomDataSetAdapter directly. Use TDataSetAdapter (see page 7872) or create your own concrete descendant.

See Also

TDataSetAdapter (see page 7872)

41.1.4.1 TCustomDataSetAdapter Members

The following tables list the members exposed by TCustomDataSetAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 7778)	Adds the default action components to this adapter.
V	AddDefaultFields (see page 7779)	Adds the default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.

	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
	EndOfPage (see page 24412)	Indicates whether the record index has gone past the last record in the current page.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	FullyQualifyInputNames (see page 7782)	Indicates whether the HTML input names must be qualified with the name of the adapter.
V	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetAdapterMode (see page 7783)	Returns a string that represents the current value of the Mode (see page 7810) property.
	GetAdapterModeNames (see page 7783)	Retrieves the strings for all the possible modes of this adapter.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetDataSet (see page 7784)	Returns the value of the DataSet (see page 7807) property.
V	GetDefaultMode (see page 7784)	Returns the default mode for this adapter.
	GetDesigntimeWarnings (see page 7784)	Populates a design-time warnings object with any warnings that the dataset adapter needs to emit.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
V	GetEOF (see page 7785)	Indicates whether the adapter is positioned at the end of its dataset.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
V	GetFirstRecord (see page 7785)	Positions the adapter on the first record of its dataset.
V	GetHiddenFieldOptions (see page 7786)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetKeyFields (see page 7786)	Returns a string listing the fields that this adapter uses to locate records.
	GetKeyParams (see page 7787)	Retrieves a list of fields that the dataset adapter uses to locate records, along with their current values.
	GetKeyParamStrings (see page 7787)	Retrieves a list of fields that the dataset adapter uses to locate records, along with their current values.
	GetMasterDetailAdapters (see page 7788)	Returns a list of all dataset adapters, including this one, linked to this adapter in a master/detail relationship.
	GetNeedAdapterMode (see page 7788)	Indicates whether the adapter requires a Mode (see page 7810) value.
V	GetNextRecord (see page 7789)	Positions the associated dataset on the next record.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.

	GetPageCount (see page 24413)	Calculates the number of pages needed to display all adapter records.
	GetRecordCount (see page 7789)	Returns the value of the RecordCount property.
	GetRecordIndex (see page 7790)	Returns the value of the RecordIndex property.
	GetRecordKeys (see page 7790)	Retrieves a list of field values that the dataset adapter uses to locate records, along with information for formatting hidden parameters from this values.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 7790)	Provides the underlying implementation for the CanAddActionClass method.
	ImplCanAddFieldClass (see page 7791)	Provides the underlying implementation for the CanAddFieldClass method.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 7792)	Implements IteratorSupport's EndIterator method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 7792)	Provides the underlying implementation for the GetActionsList method.
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 7793)	Provides the underlying implementation for the GetFieldsList method.
	ImplGetIteratorIndex (see page 7793)	Provides the underlying implementation for the GetIteratorIndex method.
	ImplGetRecordKeys (see page 7794)	Retrieves a list of field values that the dataset adapter uses to locate records, along with information for formatting hidden parameters from this values.
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 7794)	Provides the underlying implementation for the InIterator method.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNextIteration (see page 24416)	Implements IteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 7795)	Provides the underlying implementation for the NotifyDeactivate method.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 7795)	Provides the underlying implementation for the SetEchoActionFieldValues method.
	ImplStartIterator (see page 7795)	Implements IteratorSupport.StartIterator to support iterating over the records of the adapter.

	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	LocateKeyParams (see page 7797)	Positions the dataset based on a specified set of field values.
	LocateRequestRecord (see page 7798)	Positions the dataset based on the parameters in the current request.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
V	Notification (see page 7798)	Responds when components are added to or deleted from the WebSnap application.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
V	OnDataSetStateChange (see page 7798)	Responds to changes in the associated dataset.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	PrepareDataSet (see page 7799)	Sets up the associated dataset for use by this adapter.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RestoreDefaultAdapterMode (see page 7801)	Returns the adapter to its default mode.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAdapterMode (see page 7801)	Sets the Mode (see page 7810) property based on a string that represents one of the available values.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDataSet (see page 7802)	Sets the value of the DataSet (see page 7807) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetMode (see page 7802)	Sets the value of the Mode (see page 7810) property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetPageSize (see page 24417)	Updates the pagesize variable.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SkipToPage (see page 24417)	Skips records until the current record is within the current page.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateFieldsExecuteValues (see page 7803)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 7804)	Indicates whether the values in the HTTP request change the value of any adapter fields.
V	UpdateFieldsUpdateValues (see page 7805)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 7805)	Validates the values passed in the current HTTP request for the adapter's fields.
V	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	AdapterRowNotFound (see page 7807)	Indicates the dataset adapter for which this adapter could not locate the current record.
	DataSetPrepared (see page 7808)	Indicates whether the associated dataset has been properly set up for use by this adapter.
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnGetEOF (see page 24420)	Implement this event to indicate when the current record index has exceeded the total record count.
	OnGetFirstRecord (see page 24420)	Implement this method to initialize the iteration index to zero.
	OnGetNextRecord (see page 24421)	Implement this method to increment the iteration index.
	OnGetRecordCount (see page 24421)	Implement this event to identify the total number of records that can be iterated.
	OnGetRecordIndex (see page 24421)	Implement this event to identify the zero-based current record.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.
	OnPrepareDataSet (see page 7810)	Occurs before the dataset adapter uses any information from its associated dataset.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	ApplyAdapterMode (see page 7780)	Sets the Mode (see page 7810) property to reflect the value that the current request specifies.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 7775)	Creates an initializes an instance of TCustomDataSetAdapter (see page 7766).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 7776)	Frees an instance of TCustomDataSetAdapter (see page 7766).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EncodeActionParams (see page 7780)	Writes name/value pairs that represent this adapter's state.
	EncodeActionParamsFlags (see page 7781)	Writes name/value pairs that represent a specified type of information.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExtractRequestParams (see page 7781)	Reads name/value pairs from the current HTTP request.
	ExtractRequestParamsFlags (see page 7782)	Reads name/value pairs that represent a specified type of information from the current HTTP request.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.

	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	Locate (see page 7796)	Positions the associated dataset on the record identified by the LocateParamsList (see page 7809) property.
	LocateAndApply (see page 7796)	Positions the dataset and updates the resulting record based on the parameters of the current request.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RaiseFieldChangedByAnotherUser (see page 7799)	Raises an EAdapterFieldException with a message indicating that another user changed a field value.
	RaiseFieldNotFound (see page 7800)	Raises an EAdapterException with a message indicating that a specified field could not be found.
	RaiseNilDataSet (see page 7800)	Raises an EAdapterException with a message indicating that the dataset is unassigned.
	RaiseRowNotFound (see page 7800)	Raises an EAdapterException with a message indicating that a dataset record could not be located based on the current set of key fields.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SilentLocate (see page 7802)	Positions the associated dataset on a specified record.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	StringToMode (see page 7803)	Converts a mode string to the corresponding TDataSetAdapterMode (see page 8111) value.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 24181)	Actions is the container for adapter actions components.

R	Actions (see page 24402)	Container for adapter actions components.
	AdapterMode (see page 19679)	This is AdapterMode, a member of class IAdapterMode.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	CurrentPage (see page 24418)	Sets or gets the current page index.
R	Data (see page 24181)	Data is the container for adapter field components.
R	Data (see page 24402)	Container for adapter field components.
	DataSet (see page 7807)	Specifies the dataset that this adapter represents.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DetailAdapters (see page 7808)	Lists the dataset adapters for all datasets that are details of this one.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
	InDefaultMode (see page 7808)	Indicates whether the dataset adapter is in its default mode.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	LocateParamsList (see page 7809)	Lists the parameters that identify the current record of this dataset and all other datasets linked to it in a master/detail relationship.
	MasterAdapter (see page 7809)	Indicates the dataset adapter, if any, to which this adapter is linked in a master/detail relationship.
	Mode (see page 7810)	Indicates how forms built from this dataset adapter operate on the information it provides.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	NeedAdapterMode (see page 19679)	This is NeedAdapterMode, a member of class IAdapterMode.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	PageCount (see page 24418)	Calculates the number of pages needed to display all adapter records.
	PageSize (see page 24419)	Sets or gets the page size variable.
R	RecordCount (see page 24419)	Returns the total number of records.
R	RecordIndex (see page 24419)	Returns the index of the current record.
	RefreshAfterPost (see page 7810)	Indicates whether the data set should be refreshed or not after posting..
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.4.2 TCustomDataSetAdapter.Create Constructor

Creates an initializes an instance of TCustomDataSetAdapter (see page 7766).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomDataSetAdapter(TComponent * AOwner);
```

Description

The TDataSetAdapterImageField constructor allocates memory for the adapter field object and initializes its properties.

AOwner is the component that is responsible for starting the streaming process when a module containing the adapter field is loaded or saved. It becomes the value of the Owner property. Typically, AOwner is the Web module.

See Also

Owner (see page 2807)

41.1.4.3 TCustomDataSetAdapter.Destroy Destructor

Frees an instance of TCustomDataSetAdapter (see page 7766).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomDataSetAdapter();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks whether the dataset adapter reference is nil before calling Destroy.

See Also

Free (see page 22300)

41.1.4.4 TCustomDataSetAdapter Methods

The methods of the TCustomDataSetAdapter class are listed here.

Protected Methods

	Name	Description
V	AddDefaultActions (see page 7778)	Adds the default action components to this adapter.
V	AddDefaultFields (see page 7779)	Adds the default field components to this adapter.
	FullyQualifyInputNames (see page 7782)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapterMode (see page 7783)	Returns a string that represents the current value of the Mode (see page 7810) property.
	GetAdapterModeNames (see page 7783)	Retrieves the strings for all the possible modes of this adapter.
	GetDataSet (see page 7784)	Returns the value of the DataSet (see page 7807) property.
V	GetDefaultMode (see page 7784)	Returns the default mode for this adapter.
	GetDesigntimeWarnings (see page 7784)	Populates a design-time warnings object with any warnings that the dataset adapter needs to emit.
V	GetEOF (see page 7785)	Indicates whether the adapter is positioned at the end of its dataset.
V	GetFirstRecord (see page 7785)	Positions the adapter on the first record of its dataset.
V	GetHiddenFieldOptions (see page 7786)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.

	GetKeyFields (see page 7786)	Returns a string listing the fields that this adapter uses to locate records.
	GetKeyParams (see page 7787)	Retrieves a list of fields that the dataset adapter uses to locate records, along with their current values.
	GetKeyParamStrings (see page 7787)	Retrieves a list of fields that the dataset adapter uses to locate records, along with their current values.
	GetMasterDetailAdapters (see page 7788)	Returns a list of all dataset adapters, including this one, linked to this adapter in a master/detail relationship.
	GetNeedAdapterMode (see page 7788)	Indicates whether the adapter requires a Mode (see page 7810) value.
V	GetNextRecord (see page 7789)	Positions the associated dataset on the next record.
V	GetRecordCount (see page 7789)	Returns the value of the RecordCount property.
V	GetRecordIndex (see page 7790)	Returns the value of the RecordIndex property.
	GetRecordKeys (see page 7790)	Retrieves a list of field values that the dataset adapter uses to locate records, along with information for formatting hidden parameters from this values.
V	ImplCanAddActionClass (see page 7790)	Provides the underlying implementation for the CanAddActionClass method.
V	ImplCanAddFieldClass (see page 7791)	Provides the underlying implementation for the CanAddFieldClass method.
V	ImplEndIterator (see page 7792)	Implements IteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ImplGetActionsList (see page 7792)	Provides the underlying implementation for the GetActionsList method.
V	ImplGetFieldsList (see page 7793)	Provides the underlying implementation for the GetFieldsList method.
V	ImplGetIteratorIndex (see page 7793)	Provides the underlying implementation for the GetIteratorIndex method.
V	ImplGetRecordKeys (see page 7794)	Retrieves a list of field values that the dataset adapter uses to locate records, along with information for formatting hidden parameters from this values.
V	ImplInIterator (see page 7794)	Provides the underlying implementation for the InIterator method.
V	ImplNotifyDeactivate (see page 7795)	Provides the underlying implementation for the NotifyDeactivate method.
V	ImplSetEchoActionFieldValues (see page 7795)	Provides the underlying implementation for the SetEchoActionFieldValues method.
V	ImplStartIterator (see page 7795)	Implements IteratorSupport.StartIterator to support iterating over the records of the adapter.
	LocateKeyParams (see page 7797)	Positions the dataset based on a specified set of field values.
	LocateRequestRecord (see page 7798)	Positions the dataset based on the parameters in the current request.
V	Notification (see page 7798)	Responds when components are added to or deleted from the WebSnap application.
V	OnDataSetStateChange (see page 7798)	Responds to changes in the associated dataset.
V	PrepareDataSet (see page 7799)	Sets up the associated dataset for use by this adapter.
	RestoreDefaultAdapterMode (see page 7801)	Returns the adapter to its default mode.
	SetAdapterMode (see page 7801)	Sets the Mode (see page 7810) property based on a string that represents one of the available values.
	SetDataSet (see page 7802)	Sets the value of the DataSet (see page 7807) property.
V	SetMode (see page 7802)	Sets the value of the Mode (see page 7810) property.
V	UpdateFieldsExecuteValues (see page 7803)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 7804)	Indicates whether the values in the HTTP request change the value of any adapter fields.
V	UpdateFieldsUpdateValues (see page 7805)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 7805)	Validates the values passed in the current HTTP request for the adapter's fields.

Public Methods

	Name	Description
	ApplyAdapterMode (see page 7780)	Sets the Mode (see page 7810) property to reflect the value that the current request specifies.
V	EncodeActionParams (see page 7780)	Writes name/value pairs that represent this adapter's state.
	EncodeActionParamsFlags (see page 7781)	Writes name/value pairs that represent a specified type of information.
V	ExtractRequestParams (see page 7781)	Reads name/value pairs from the current HTTP request.
	ExtractRequestParamsFlags (see page 7782)	Reads name/value pairs that represent a specified type of information from the current HTTP request.
	Locate (see page 7796)	Positions the associated dataset on the record identified by the LocateParamsList (see page 7809) property.
	LocateAndApply (see page 7796)	Positions the dataset and updates the resulting record based on the parameters of the current request.

	RaiseFieldChangedByAnotherUser (see page 7799)	Raises an EAdapterFieldException with a message indicating that another user changed a field value.
	RaiseFieldNotFound (see page 7800)	Raises an EAdapterException with a message indicating that a specified field could not be found.
	RaiseNilDataSet (see page 7800)	Raises an EAdapterException with a message indicating that the dataset is unassigned.
	RaiseRowNotFound (see page 7800)	Raises an EAdapterException with a message indicating that a dataset record could not be located based on the current set of key fields.
	SilentLocate (see page 7802)	Positions the associated dataset on a specified record.
	StringToMode (see page 7803)	Converts a mode string to the corresponding TDataSetAdapterMode (see page 8111) value.

41.1.4.4.1 TCustomDataSetAdapter.AddDefaultActions Method

Adds the default action components to this adapter.

Pascal

```
procedure AddDefaultActions(AComponents: TWebComponentList); override;
```

C++

```
virtual __fastcall AddDefaultActions(TWebComponentList AComponents);
```

Description

This method is called when the dataset adapter needs to generate the list of actions it supports by default (when you do not explicitly assign a set of actions to the adapter).

AComponents is an existing TWebComponentList object that this method fills with the default dataset actions.

This method adds the following action components to AComponents:

TDataSetAdapterDeleteRowAction (see page 7934)

TDataSetAdapterFirstRowAction (see page 7972)

TDataSetAdapterPrevRowAction (see page 8042)

TDataSetAdapterNextRowAction (see page 8030)

TDataSetAdapterLastRowAction (see page 7984)

TDataSetAdapterEditRowAction (see page 7947)

TDataSetAdapterBrowseRowAction (see page 7903)

TDataSetAdapterNewRowAction (see page 8016)

TDataSetAdapterCancelRowAction (see page 7916)

TDataSetAdapterApplyRowAction (see page 7890)

TDataSetAdapterRefreshRowAction (see page 8054)

TAdapterPrevPageAction

TAdapterGotoPageAction

TAdapterNextPageAction

Note: The last three actions are only added if the value of the PageSize property is positive.

See Also

PageSize (see page 24419)

TDataSetAdapterDeleteRowAction (see page 7934)

TDataSetAdapterFirstRowAction (see page 7972)

TDataSetAdapterPrevRowAction (see page 8042)

TDataSetAdapterNextRowAction (see page 8030)

TDataSetAdapterLastRowAction (see page 7984)

TDataSetAdapterEditRowAction (see page 7947)

TDataSetAdapterBrowseRowAction (see page 7903)

TDataSEtAdapterNewRowAction

TDataSetAdapterCancelRowAction (see page 7916)

TDataSetAdapterApplyRowAction (see page 7890)

TDataSetAdapterRefreshRowAction (see page 8054)

TAdapterPrevPageAction (see page 23979)

TAdapterGotoPageAction (see page 23849)

TAdapterNextPageAction (see page 23945)

41.1.4.4.2 TCustomDataSetAdapter.AddDefaultFields Method

Adds the default field components to this adapter.

Pascal

```
procedure AddDefaultFields(AComponents: TWebComponentList); override;
```

C++

```
virtual __fastcall AddDefaultFields(TWebComponentList AComponents);
```

Description

This method is called when the dataset adapter needs to generate the list of fields it supports by default (when you do not explicitly assign a set of fields to the adapter).

AComponents is an existing TWebComponentList object that this method fills with the default dataset fields.

AddDefaultFields iterates through the Fields and AggFields properties of the associated dataset, adding an adapter field component for each field. Each adapter field component is of type TDataSetAdapterField (see page 7960), TDataSetAdapterMemoField (see page 7996), or TDataSetAdapterImageField, depending on the data type of the corresponding dataset field.

See Also

DataSet (see page 7807)

Fields (see page 7023)

AggFields (see page 7006)

TDataSetAdapterField (see page 7960)

TDataSetAdapterImageField (see page 8138)

TDataSetAdapterMemoField (see page 7996)

41.1.4.4.3 TCustomDataSetAdapter.ApplyAdapterMode Method

Sets the Mode (see page 7810) property to reflect the value that the current request specifies.

Pascal

```
procedure ApplyAdapterMode(AActionRequest: IActionRequest);
```

C++

```
__fastcall ApplyAdapterMode(IActionRequest AActionRequest);
```

Description

ApplyAdapterMode ensures that the dataset adapter is in the correct mode for handling the current HTTP request. If the current request specifies a mode for this dataset adapter, ApplyAdapterMode sets the Mode (see page 7810) property to that value. If the current request specifies a mode for any adapter linked to this one in a master/detail relationship, ApplyAdapterMode sets that adapter's Mode (see page 7810) property as well. If the current request does not specify a mode for this adapter (or one linked to it in a master/detail relationship), ApplyAdapterMode restores the adapter to its default mode (amBrowse).

AActionRequest is an interface to the current request object. ApplyAdapterMode uses this to obtain the mode that the user requested, if any.

See Also

Mode (see page 7810)

MasterAdapter (see page 7809)

DetailAdapters (see page 7808)

InDefaultMode (see page 7808)

41.1.4.4.4 TCustomDataSetAdapter.EncodeActionParams Method

Writes name/value pairs that represent this adapter's state.

Pascal

```
procedure EncodeActionParams(AParams: IAdapterItemRequestParams); override;
```

C++

```
virtual __fastcall EncodeActionParams(IAdapterItemRequestParams AParams);
```

Description

This method assembles the parameters (name/value pairs) that the adapter needs to add to an HTML form so that request messages that originate from that form can correctly restore this adapter's state. This allows the dataset adapter to recapture dataset state information (such as the current record) as well as the current page when the adapter supports paging.

AParams is the interface for an object to which the adapter writes parameter values.

ExtractRequestParams (see page 7781) calls on the EncodeActionParamsFlags (see page 7781) method to fill the list with parameters for locating the current record and current page.

See Also

ExtractRequestParams (see page 7781)

EncodeActionParamsFlags (see page 7781)

41.1.4.4.5 TCustomDataSetAdapter.EncodeActionParamsFlags Method

Writes name/value pairs that represent a specified type of information.

Pascal

```
procedure EncodeActionParamsFlags(AParams: IAdapterItemRequestParams; AOptions:
TDataSetAdapterRequestParamOptions);
```

C++

```
__fastcall EncodeActionParamsFlags(IAdapterItemRequestParams AParams,
TDataSetAdapterRequestParamOptions AOptions);
```

Description

This method assembles the parameters (name/value pairs) that the adapter needs to add to an HTML form to perform the task indicated by the AOptions parameter.

AParams is the interface for an object to which the adapter writes parameter values.

AOptions indicates the type of parameters to add to AParams.

When AOptions includes poLocateParams, EncodeActionParamsFlags adds a set of name/value pairs that represent dataset fields and their current values. This set of parameters describe the values of all fields in the index that can be used to locate the current record.

When AOptions includes poCurrentPage, EncodeActionParamsFlags adds a parameter for the current page number.

See Also

ExtractRequestParams (see page 7781)

EncodeActionParams (see page 7780)

41.1.4.4.6 TCustomDataSetAdapter.ExtractRequestParams Method

Reads name/value pairs from the current HTTP request.

Pascal

```
procedure ExtractRequestParams(ARequest: IUnknown); override;
```

C++

```
virtual __fastcall ExtractRequestParams(IUnknown ARequest);
```

Description

ExtractRequestParams reads the name/value pairs from the current request that were added to the HTML form from which that request originated using the EncodeActionParams (see page 7780) method. ExtractRequestParams stores the parameters that represent information for locating to the current record to the LocateParamsList (see page 7809) property and uses the parameters that describe the current page to set the CurrentPage property.

ARequest is an interface to the current request object. ExtractRequestParams uses this interface to extract the parameter information.

ExtractRequestParams calls the ExtractRequestParamsFlags (see page 7782) method to read the parameter values and respond to them.

See Also

EncodeActionParams (see page 7780)

ExtractRequestParamsFlags (see page 7782)

LocateParamsList (see page 7809)

CurrentPage (see page 24418)

41.1.4.4.7 TCustomDataSetAdapter.ExtractRequestParamsFlags Method

Reads name/value pairs that represent a specified type of information from the current HTTP request.

Pascal

```
procedure ExtractRequestParamsFlags(ARequest: IUnknown; AOptions:
TDataSetAdapterRequestParamOptions);
```

C++

```
__fastcall ExtractRequestParamsFlags(IUnknown ARequest, TDataSetAdapterRequestParamOptions
AOptions);
```

Description

ExtractRequestParamsFlags reads the name/value pairs specified by AOptions from the current request. These parameters (name/value pairs) were initially generated by a call to the EncodeActionParams (see page 7780) method when this adapter was contributing to the HTML form from which the request originated.

ARequest is an interface to the current request object. ExtractRequestParamsFlags uses this interface to extract the parameter information.

AOptions indicates the type of parameters to read.

When AOptions includes poLocateParams, ExtractRequestParamsFlags reads the name/value pairs that represent dataset fields and their current values, and adds them to the LocateParamsList (see page 7809) property. This set of parameters describe the values of all fields in the index that can be used to locate the current record.

When AOptions includes poCurrentPage, ExtractRequestParamsFlags reads the parameter for the current page number and uses it to set the CurrentPage property.

See Also

EncodeActionParams (see page 7780)

ExtractRequestParams (see page 7781)

LocateParamsList (see page 7809)

CurrentPage (see page 24418)

41.1.4.4.8 TCustomDataSetAdapter.FullyQualifyInputNames Method

Indicates whether the HTML input names must be qualified with the name of the adapter.

Pascal

```
function FullyQualifyInputNames: Boolean;
```

C++

```
__fastcall Boolean FullyQualifyInputNames();
```

Description

FullyQualifyInputNames returns true if the names of input elements in generated HTML forms that represent the fields of this dataset adapter should include the name of this adapter. Field names must be qualified when the HTML form may contain multiple fields with the same name (that is, when the form contains input elements for multiple adapters).

This method checks whether this dataset adapter is part of a master/detail relationship (whether the MasterAdapter (see page

7809) or DetailAdapters (see page 7808) property indicates such a relationship). If so, it returns true. If this adapter is not part of a master/detail relationship, FullyQualifyInputNames returns false.

See Also

FullyQualifyInputName (see page 23932)

MasterAdapter (see page 7809)

DetailAdapters (see page 7808)

41.1.4.4.9 TCustomDataSetAdapter.GetAdapterMode Method

Returns a string that represents the current value of the Mode (see page 7810) property.

Pascal

```
function GetAdapterMode: string;
```

C++

```
__fastcall AnsiString GetAdapterMode();
```

Description

GetAdapterMode returns the string that corresponds to the current value of the Mode (see page 7810) property. If the mode for this adapter has not been explicitly set in response to a request message(that is, if InDefaultMode (see page 7808) is true), GetAdapterMode returns an empty string.

This method allows server-side script to read the Mode (see page 7810) property of this adapter.

See Also

Mode (see page 7810)

StringToMode (see page 7803)

GetAdapterModeNames (see page 7783)

InDefaultMode (see page 7808)

41.1.4.4.10 TCustomDataSetAdapter.GetAdapterModeNames Method

Retrieves the strings for all the possible modes of this adapter.

Pascal

```
procedure GetAdapterModeNames(AStrings: TStrings);
```

C++

```
__fastcall GetAdapterModeNames(TStrings AStrings);
```

Description

GetAdapterModeNames adds the names of all possible values of the Mode (see page 7810) property to the specified string list. At design time, this method is used to generate a drop-down list of adapter modes.

AStrings is an existing string list to fill with the names of the adapter modes.

GetAdapterModeNames adds the following names to AStrings:

Insert

Edit

Browse

Query

See Also

Mode (see page 7810)

StringToMode (see page 7803)

GetAdapterMode (see page 7783)

41.1.4.4.11 TCustomDataSetAdapter.GetDataSet Method

Returns the value of the DataSet (see page 7807) property.

Pascal

```
function GetDataSet: TDataSet;
```

C++

```
__fastcall TDataSet GetDataSet();
```

Description

GetDataSet is the protected read implementation for the DataSet (see page 7807) property. If necessary, GetDataSet calls the PrepareDataSet (see page 7799) method before returning the value of the DataSet (see page 7807) property. This ensures that any necessary initialization has occurred before the application tries to use DataSet (see page 7807).

See Also

DataSet (see page 7807)

PrepareDataSet (see page 7799)

41.1.4.4.12 TCustomDataSetAdapter.GetDefaultMode Method

Returns the default mode for this adapter.

Pascal

```
function GetDefaultMode: TDataSetAdapterMode; virtual;
```

C++

```
virtual __fastcall TDataSetAdapterMode GetDefaultMode();
```

Description

GetDefaultMode returns the value of the Mode (see page 7810) property when InDefaultMode (see page 7808) is true. This is the dataset adapter mode when the current request does not specify a mode for this adapter.

In TCustomDataSetAdapter (see page 7766), GetDefaultMode returns amBrowse.

See Also

InDefaultMode (see page 7808)

Mode (see page 7810)

41.1.4.4.13 TCustomDataSetAdapter.GetDesigntimeWarnings Method

Populates a design-time warnings object with any warnings that the dataset adapter needs to emit.

Pascal

```
procedure GetDesigntimeWarnings(AWarnings: TAbstractDesigntimeWarnings);
```

C++

```
__fastcall GetDesigntimeWarnings(TAbstractDesigntimeWarnings AWarnings);
```

Description

GetDesigntimeWarnings is called automatically at design time when the adapter page producer is assembling the current version of its HTML form. This gives the dataset adapter an opportunity to add messages to the version of the HTML form that appears at design time, describing problems that you can rectify.

AWarnings is the design-time warnings object that assembles design-time warning messages that appear in the HTML form.

If the DataSet (see page 7807) property has not been set, GetDesigntimeWarnings adds a message that indicates this omission. If DataSet (see page 7807) is set, but the dataset is not active, GetDesigntimeWarnings adds a message that indicates this problem. If DataSet (see page 7807) is set, the dataset is active, but you have not specified the key fields that should be used to locate records in that dataset, GetDesigntimeWarnings adds a message indicating this omission.

See Also

DataSet (see page 7807)

Active (see page 7004)

GetKeyFields (see page 7786)

41.1.4.4.14 TCustomDataSetAdapter.GetEOF Method

Indicates whether the adapter is positioned at the end of its dataset.

Pascal

```
function GetEOF: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetEOF();
```

Description

GetEOF indicates whether there are any more records after the current one. If the adapter's dataset is positioned on its last record (or if the DataSet (see page 7807) property is not set), GetEOF returns true. If the GetNextRecord (see page 7789) method can move to a new record, GetEOF returns false.

See Also

Eof (see page 7015)

RecordIndex

RecordCount

DataSet (see page 7807)

GetNextRecord (see page 7789)

41.1.4.4.15 TCustomDataSetAdapter.GetFirstRecord Method

Positions the adapter on the first record of its dataset.

Pascal

```
function GetFirstRecord: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetFirstRecord();
```

Description

GetFirstRecord calls the First method of the associated dataset and returns true if it successfully positions the dataset on its first record.

See Also

First (see page 6942)

DataSet (see page 7807)

41.1.4.4.16 TCustomDataSetAdapter.GetHiddenFieldOptions Method

Indicates the types of hidden fields that this adapter requires in a submitted HTML form.

Pascal

```
function GetHiddenFieldOptions: TAdapterHiddenFieldOptions; override;
```

C++

```
virtual __fastcall TAdapterHiddenFieldOptions GetHiddenFieldOptions();
```

Description

GetHiddenFieldOptions returns a set of flags that indicate what hidden information this adapter adds to HTML forms. The return value depends on the current value of the Mode (see page 7810) property. When Mode (see page 7810) is amEdit, GetHiddenFieldOptions returns the set [hoMode, hoOrigValue, hoRecordKeys]. For any other Mode (see page 7810), GetHiddenFieldOptions returns a set with only the hoMode flag.

See Also

listhiddenfields (see page 24173)

ListHiddenRecordFields (see page 24173)

Mode (see page 7810)

41.1.4.4.17 TCustomDataSetAdapter.GetKeyFields Method

Returns a string listing the fields that this adapter uses to locate records.

Pascal

```
function GetKeyFields: string;
```

C++

```
__fastcall AnsiString GetKeyFields();
```

Description

GetKeyFields generates the list of fields that are required to uniquely identify records in this adapter's dataset. These fields and their values are then used to create hidden parameters that are added to HTML forms. When the adapter receives requests from forms containing those hidden parameters, it assigns the parameters to the LocateParamsList (see page 7809) property.

GetKeyFields returns a semicolon-delimited list of fields that identify records in the adapter's dataset.

This method first queries all of its child field components, building a list of all fields that include the ffInKey flag in their FieldFlags property. If none of the child field components include the ffInKey flag, GetKeyFields obtains an IProviderSupport interface from the associated dataset and calls its PSGetKeyFields method.

See Also

FieldFlags (see page 7752)

PSGetKeyFields (see page 7581)

LocateParamsList (see page 7809)

GetKeyParams (see page 7787)

GetKeyParamStrings (see page 7787)

41.1.4.4.18 TCustomDataSetAdapter.GetKeyParams Method

Retrieves a list of fields that the dataset adapter uses to locate records, along with their current values.

Pascal

```
procedure GetKeyParams(AParams: TLocateParamsList; ARecurse: Boolean);
```

C++

```
__fastcall GetKeyParams(TLocateParamsList AParams, Boolean ARecurse);
```

Description

GetKeyParams fills out a TLocateParamsList (see page 8096) object with the current values of all fields that the adapter uses to uniquely identify records. These name/value pairs are then added as hidden fields to HTML forms. When the adapter receives requests from forms containing those hidden parameters, it assigns them to the LocateParamsList (see page 7809) property.

Params is a collection of TLocateParams (see page 8090) objects, where each TLocateParams (see page 8090) object lists the key fields and their values for a single dataset adapter.

ARecurse indicates whether GetKeyParams should return values for just this adapter, or to include values from all adapters linked to this one in a master/detail relationship as well.

If ARecurse is false, GetKeyParams calls the GetKeyParamStrings (see page 7787) method to obtain the key fields and their values for this dataset. It then adds these name/value pairs to Params. If ARecurse is true, GetKeyParams calls the GetKeyParams method (with ARecurse set to false) for this adapter and for every adapter linked to it in a master/detail relationship.

See Also

GetKeyParams (see page 7743)

LocateParamsList (see page 7809)

GetKeyParamStrings (see page 7787)

MasterAdapter (see page 7809)

DetailAdapters (see page 7808)

41.1.4.4.19 TCustomDataSetAdapter.GetKeyParamStrings Method

Retrieves a list of fields that the dataset adapter uses to locate records, along with their current values.

Pascal

```
procedure GetKeyParamStrings(AValues: TStrings);
```

C++

```
__fastcall GetKeyParamStrings(TStrings AValues);
```

Description

GetKeyParamStrings fills out a TStrings object with the current values of all fields in this adapter's dataset that are needed to uniquely identify records. These name/value pairs are then added as hidden fields to HTML forms. When the adapter receives requests from forms containing those hidden parameters, it assigns them to the LocateParamsList (see page 7809) property.

Unlike the GetKeyParams (see page 7787) method, GetKeyParamStrings retrieves only the key field names and values for this adapter's dataset, and not for any other datasets that may be linked to it in a master/detail relationship.

AValues is a string list to fill with the names and values of all key fields in this adapters dataset.

GetKeyParamStrings calls GetKeyFields (see page 7786) method to obtain a list of fields for which to create parameters. For each key field, it generates a string of the form 'name=value', where name is the field name and value is the value of the field's AsString property.

See Also

GetKeyName (see page 7742)

LocateParamsList (see page 7809)

GetKeyParams (see page 7787)

AsString (see page 7151)

41.1.4.4.20 TCustomDataSetAdapter.GetMasterDetailAdapters Method

Returns a list of all dataset adapters, including this one, linked to this adapter in a master/detail relationship.

Pascal

```
function GetMasterDetailAdapters: TComponentList;
```

C++

```
__fastcall TComponentList GetMasterDetailAdapters();
```

Description

GetMasterDetailAdapters allocates a new TComponentList object and fills it with every dataset adapter that is linked to this one in a master/detail relationship. The adapters are listed from the top-level adapter down, using a depth-first search.

DataSetAdapters use the returned list internally to guide processes that include all datasets linked to this one in a master/detail relationship.

Note: It is the callers responsibility to free the component list that this method returns.

See Also

Adapter (see page 7752)

DetailAdapters (see page 7808)

41.1.4.4.21 TCustomDataSetAdapter.GetNeedAdapterMode Method

Indicates whether the adapter requires a Mode (see page 7810) value.

Pascal

```
function GetNeedAdapterMode: Boolean;
```

C++

```
__fastcall Boolean GetNeedAdapterMode();
```

Description

GetNeedAdapterMode returns true, indicating that dataset adapters must always have a specific mode setting to operate properly. Note that this mode need not be explicitly assigned because Dataset adapters use the amBrowse mode setting if the application does not assign a value to the Mode (see page 7810) property.

See Also

Mode (see page 7810)

41.1.4.4.22 TCustomDataSetAdapter.GetNextRecord Method

Positions the associated dataset on the next record.

Pascal

```
function GetNextRecord: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetNextRecord();
```

Description

GetNextRecord calls the Next method of the associated dataset and returns true if it successfully moves to the next record in the dataset.

See Also

Next (see page 6973)

DataSet (see page 7807)

41.1.4.4.23 TCustomDataSetAdapter.GetRecordCount Method

Returns the value of the RecordCount property.

Pascal

```
function GetRecordCount: Integer; override;
```

C++

```
virtual __fastcall int GetRecordCount();
```

Description

GetRecordCount is the protected read implementation of the RecordCount property.

GetRecordCount first generates an OnGetRecordCount event, and returns the number of records that the event handler provides. If there is no OnGetRecordCount event handler, GetRecordCount returns the value of the associated dataset's RecordCount property.

See Also

OnGetRecordCount (see page 24421)

RecordCount

RecordCount (see page 7032)

41.1.4.4.24 TCustomDataSetAdapter.GetRecordIndex Method

Returns the value of the RecordIndex property.

Pascal

```
function GetRecordIndex: Integer; override;
```

C++

```
virtual __fastcall int GetRecordIndex();
```

Description

GetRecordIndex is the protected read implementation of the RecordIndex property.

This method returns an internally maintained index that indicates where the dataset is positioned.

See Also

RecordIndex

41.1.4.4.25 TCustomDataSetAdapter.GetRecordKeys Method

Retrieves a list of field values that the dataset adapter uses to locate records, along with information for formatting hidden parameters from this values.

Pascal

```
procedure GetRecordKeys(AValues: TStrings; var AFullyQualify: Boolean);
```

C++

```
__fastcall GetRecordKeys(TStrings AValues, Boolean AFullyQualify);
```

Description

GetRecordKeys fills out a TStrings object with the current values of all fields in this adapter's dataset that are needed to uniquely identify records. These name/value pairs are then added as hidden fields to HTML forms. GetRecordKeys also returns an indication of whether field names should be qualified by the name of the adapter when formatting the hidden fields for inclusion in the HTML form.

AValues is a string list to fill with the names and values of all key fields in this adapters dataset.

AFullyQualify returns true if the field names must be qualified by the name of this adapter.

GetRecordKeys delegates the task of providing values for AValues and AFullyQualify to the ImplGetRecordKeys (see page 7794) method.

See Also

ImplGetRecordKeys (see page 7794)

41.1.4.4.26 TCustomDataSetAdapter.ImplCanAddActionClass Method

Provides the underlying implementation for the CanAddActionClass method.

Pascal

```
function ImplCanAddActionClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddActionClass method calls ImplCanAddActionClass to determine whether a specified class of adapter action can be added as a child to an adapter of this type.

AParent is a dataset adapter to which a child action may be added. It must be a descendant of TCustomDataSetAdapter (see page 7766).

AClass is the class of an adapter action component that may be added to AParent.

ImplCanAddActionClass returns true if an action of type AClass can be added to AParent, false if AClass is not a valid action class for AParent.

In TCustomDataSetAdapter (see page 7766), ImplCanAddActionClass returns true if AClass descends from TCustomPagedAdapterAction or TCustomDataSetAdapterAction (see page 7811). These are the classes that the AddDefaultActions (see page 7778) method returns. For a complete list of action classes, see the topic for AddDefaultActions (see page 7778).

See Also

CanAddActionClass (see page 24150)

TCustomDataSetAdapterAction (see page 7811)

AddDefaultActions (see page 7778)

TCustomPagedAdapterAction (see page 24371)

41.1.4.4.27 TCustomDataSetAdapter.ImplCanAddFieldClass Method

Provides the underlying implementation for the CanAddFieldClass method.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddFieldClass method calls ImplCanAddFieldClass to determine whether a specified class of adapter field can be added as a child to an adapter of this type.

AParent is a dataset adapter to which a child field may be added. It must be a descendant of TCustomDataSetAdapter (see page 7766).

AClass is the class of an adapter field component that may be added to AParent.

ImplCanAddFieldClass returns true if a field of type AClass can be added to AParent, false if AClass is not a valid field class for AParent.

In TCustomDataSetAdapter (see page 7766), ImplCanAddFieldClass returns true if AClass supports the IDataSetAdapterFieldClass (see page 8104) interface. This includes the descendants of TBaseDataSetAdapterField (see page 7729) (TDataSetAdapterField (see page 7960), TDataSetAdapterMemoField (see page 7996), and TDataSetAdapterImageField).

See Also

CanAddFieldClass (see page 24150)

TBaseDataSetAdapterField (see page 7729)

TDataSetAdapterField (see page 7960)

TDataSetAdapterMemoField (see page 7996)

TDataSetAdapterImageField (see page 8138)

41.1.4.4.28 TCustomDataSetAdapter.ImplEndIterator Method

Implements IteratorSupport's EndIterator method to support iterating over the data records of the adapter.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer); override;
```

C++

```
virtual __fastcall ImplEndIterator(void * OwnerData);
```

Description

EndIterator is called when record iteration is complete.

See Also

enditerator (see page 19723)

41.1.4.4.29 TCustomDataSetAdapter.ImplGetActionsList Method

Provides the underlying implementation for the GetActionsList method.

Pascal

```
procedure ImplGetActionsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetActionsList(TStrings AList);
```

Description

The GetActionsList method calls ImplGetActionsList to obtain the names of all actions that can be added to this adapter. The action names are the names by which server-side script refers to this adapter's actions.

AList is an existing string list to fill with the names of valid actions.

GetActionsList adds the following strings to AList (with the corresponding action class references as associated objects):

- NextRow
- PrevRow
- LastRow
- FirstRow
- NewRow
- Cancel
- Apply
- RefreshRow
- EditRow
- BrowseRow
- PrevPage
- GotoPage

- NextPage

Note: The last three actions are only added if this adapter supports paging (if the value of the PageSize property is positive).

See Also

GetActionsList (see page 24156)

AddDefaultActions (see page 7778)

PageSize (see page 24419)

41.1.4.4.30 TCustomDataSetAdapter.ImplGetFieldsList Method

Provides the underlying implementation for the GetFieldsList method.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

The GetFieldsList method calls ImplGetFieldsList to obtain the names of all fields that can be added to this adapter. The field names are the names by which server-side script refers to this adapter's fields.

AList is an existing string list to fill with the names of valid fields.

GetFieldsList adds the names of all fields listed by the Fields and AggFields properties of the associated dataset. It adds class references for the appropriate adapter field components that represent each field as associated objects.

See Also

GetFieldsList (see page 24159)

AddDefaultFields (see page 7779)

Fields (see page 7023)

AggFields (see page 7006)

41.1.4.4.31 TCustomDataSetAdapter.ImplGetIteratorIndex Method

Provides the underlying implementation for the GetIteratorIndex method.

Pascal

```
function ImplGetIteratorIndex: Integer; override;
```

C++

```
virtual __fastcall int ImplGetIteratorIndex();
```

Description

The GetIteratorIndex method calls ImplGetIteratorIndex to obtain the current index that arises when server-side script uses an enumerator over the records of this adapter.

GetIteratorIndex returns the value of the RecordIndex property.

See Also

GetIteratorIndex (see page 24160)

RecordIndex

41.1.4.4.32 TCustomDataSetAdapter.ImplGetRecordKeys Method

Retrieves a list of field values that the dataset adapter uses to locate records, along with information for formatting hidden parameters from this values.

Pascal

```
procedure ImplGetRecordKeys(AValues: TStrings; var AFullyQualify: Boolean); virtual;
```

C++

```
virtual __fastcall ImplGetRecordKeys(TStrings AValues, Boolean AFullyQualify);
```

Description

The GetRecordKeys (see page 7790) method calls ImplGetRecordKeys to obtain the current values of all fields in this adapter's dataset that are needed to uniquely identify records and an indication of whether field names should be qualified by the name of the adapter when formatting hidden fields that describe this information.

AValues is a string list to fill with the names and values of all key fields in this adapters dataset.

AFullyQualify returns true if the field names must be qualified by the name of this adapter.

ImplGetRecordKeys calls the GetKeyParamStrings (see page 7787) method to fill AValues with the names and values of key fields. It then calls the FullyQualifyInputNames (see page 7782) method to set the value of AFullyQualify.

See Also

GetRecordKeys (see page 7790)

GetKeyParamStrings (see page 7787)

FullyQualifyInputNames (see page 7782)

41.1.4.4.33 TCustomDataSetAdapter.ImplInIterator Method

Provides the underlying implementation for the InIterator method.

Pascal

```
function ImplInIterator: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplInIterator();
```

Description

The InIterator method calls ImplInIterator to determine whether server-side script is using an enumerator to iterate over the records of this adapter.

InIterator returns true if the GetFirstRecord (see page 7785) method has been called. GetFirstRecord (see page 7785) is the first method that is called when an enumerator is applied to this adapter's records.

See Also

InIterator (see page 24172)

GetFirstRecord (see page 7785)

41.1.4.4.34 TCustomDataSetAdapter.ImplNotifyDeactivate Method

Provides the underlying implementation for the NotifyDeactivate method.

Pascal

```
procedure ImplNotifyDeactivate; override;
```

C++

```
virtual __fastcall ImplNotifyDeactivate();
```

Description

The NotifyDeactivate method calls ImplNotifyDeactivate to respond when the Web module that contains this adapter is deactivated.

ImplNotifyDeactivate clears any properties whose values should not affect the processing of the next request message. Typically, these properties have values that are set in response to parameters in the request message. By clearing them when the Web module is deactivated, the adapter ensures that the current settings do not contaminate the handling of the next request message if it does not include a parameter value for a specific property.

See Also

NotifyDeactivate (see page 24175)

41.1.4.4.35 TCustomDataSetAdapter.ImplSetEchoActionFieldValues Method

Provides the underlying implementation for the SetEchoActionFieldValues method.

Pascal

```
procedure ImplSetEchoActionFieldValues(AValue: Boolean); override;
```

C++

```
virtual __fastcall ImplSetEchoActionFieldValues(Boolean AValue);
```

Description

The SetEchoActionFieldValues method calls ImplSetEchoActionFieldValues to specify whether this adapter's fields should obtain their values from the current request message or from the associated dataset fields.

AValue indicates where this adapter's fields obtain their values. When AValue is true, the field values come from the current request message. When AValue is false, the field values come from the associated dataset fields.

ImplSetEchoActionFieldValues sets the EchoActionFieldValue property to AValue on every field that is a child of this adapter, plus every field that is a child of an adapter linked to this one in a master/detail relationship. The one exception is that the EchoActionFieldValue property is never set to true on fields whose parent adapter is in browse mode.

See Also

SetEchoActionFieldValues (see page 24176)

EchoActionFieldValue (see page 23944)

Mode (see page 7810)

41.1.4.4.36 TCustomDataSetAdapter.ImplStartIterator Method

Implements IteratorSupport.StartIterator to support iterating over the records of the adapter.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

ImplStartIterator locates the first record in the current page using the GetFirstRecord (see page 7785) and SkipToPage methods.

See Also

startiterator (see page 19724)

ImplNextIteration (see page 24416)

GetFirstRecord (see page 7785)

SkipToPage (see page 24417)

CurrentPage (see page 24418)

41.1.4.4.37 TCustomDataSetAdapter.Locate Method

Positions the associated dataset on the record identified by the LocateParamsList (see page 7809) property.

Pascal

```
function Locate: Boolean;
```

C++

```
__fastcall Boolean Locate();
```

Description

Locate tries to position this adapter's dataset, and the dataset of any adapter linked to this one in a master/detail relationship, to the record identified by the key fields that the LocateParamsList (see page 7809) property lists.

Locate returns true if it successfully positions all datasets on the specified record. Locate returns false if it was unable to position one or more datasets on the specified record. If Locate returns false, it adds a message to the Errors property describing the problem.

See Also

LocateParamsList (see page 7809)

Errors (see page 24182)

SilentLocate (see page 7802)

41.1.4.4.38 TCustomDataSetAdapter.LocateAndApply Method

Positions the dataset and updates the resulting record based on the parameters of the current request.

Pascal

```
function LocateAndApply(AActionRequest: IActionRequest): Boolean;
```

C++

```
__fastcall Boolean LocateAndApply(IActionRequest AActionRequest);
```

Description

LocateAndApply performs the following tasks:

1.Extracts the current request parameters from the current request, using them to set the Mode (see page 7810) and LocateParamsList (see page 7809) properties.

2.Positions the dataset (and any dataset linked to it in a master/detail relationship) on the record that the request parameters indicate.

3.If the request put the adapter in edit or insert mode, update fields to reflect the values in the request and post the current record.

4.If the adapter is in insert mode, change the mode to edit now that the new record has been inserted into the dataset.

AActionRequest is an interface to the current request object.

LocateAndApply returns true if it successfully positions the dataset and applies any specified edits. LocateAndApply returns false if it was unable to perform these tasks. If LocateAndApply returns false, it adds a message to the Errors property describing the problem.

See Also

Locate (see page 7796)

Errors (see page 24182)

LocateParamsList (see page 7809)

Mode (see page 7810)

41.1.4.4.39 TCustomDataSetAdapter.LocateKeyParams Method

Positions the dataset based on a specified set of field values.

Pascal

```
function LocateKeyParams(AParams: IKeyParams): Boolean;
```

C++

```
__fastcall Boolean LocateKeyParams(IKeyParams AParams);
```

Description

All other methods that position the associated dataset on a specified record call LocateKeyParams (directly or indirectly) to move to the specified record.

AParams is an interface from which to obtain the names and values of dataset fields to use when locating the desired record.

LocateKeyParams returns true if it successfully positions the dataset on the specified record, false if it was unable to perform this task.

This method generates a call to the associated dataset's Locate (see page 7796) method, based on the field values specified using AParams.

See Also

Locate (see page 7796)

SilentLocate (see page 7802)

LocateAndApply (see page 7796)

Locate (see page 6970)

41.1.4.4.40 TCustomDataSetAdapter.LocateRequestRecord Method

Positions the dataset based on the parameters in the current request.

Pascal

```
function LocateRequestRecord(AActionRequest: IActionRequest): Boolean;
```

C++

```
__fastcall Boolean LocateRequestRecord(IActionRequest AActionRequest);
```

Description

LocateRequestRecord tries to position this adapter's dataset on the record identified by parameters it extracts from the current request. Unlike the Locate (see page 7796) method, LocateRequestRecord does not use or set the LocateParamsList (see page 7809) property, nor does it concern itself with any datasets linked in a master/detail relationship.

AActionRequest is an interface to the request object from which LocateRequestRecord obtains key field parameters.

LocateRequestRecord returns true if it successfully positions the dataset on the specified record. LocateRequestRecord returns false if it was unable to position the dataset on the specified record. If LocateRequestRecord returns false, it adds a message to the Errors property describing the problem.

See Also

LocateParamsList (see page 7809)

Errors (see page 24182)

Locate (see page 7796)

41.1.4.4.41 TCustomDataSetAdapter.Notification Method

Responds when components are added to or deleted from the WebSnap application.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when components are created or destroyed. After calling the inherited method, Notification checks whether the object that that is the value of the DataSet (see page 7807) or MasterAdapter (see page 7809) property is about to be destroyed. If so, Notification sets the appropriate property to nil (Delphi) or NULL (C++) and performs any other adjustments to respond to the change.

See Also

MasterAdapter (see page 7809)

DataSet (see page 7807)

41.1.4.4.42 TCustomDataSetAdapter.OnDataSetStateChange Method

Responds to changes in the associated dataset.

Pascal

```
procedure OnDataSetStateChange(Sender: TObject); virtual;
```

C++

```
virtual __fastcall OnDataSetStateChange(TObject * Sender);
```

Description

OnDataSetStateChange is called automatically in response to changes in the associated dataset. It allows the adapter to clear any information (such as the set of default fields) that depend on the current state of the dataset.

Sender is a datalink object that handles the communication between the adapter and its dataset.

See Also

DataSet (see page 7807)

TDataLink (see page 6876)

41.1.4.4.43 TCustomDataSetAdapter.PrepareDataSet Method

Sets up the associated dataset for use by this adapter.

Pascal

```
procedure PrepareDataSet; virtual;
```

C++

```
virtual __fastcall PrepareDataSet();
```

Description

TCustomDataSetAdapter (see page 7766) calls PrepareDataSet before it reads the DataSet (see page 7807) property the first time after the dataset enters a new mode. This method performs any necessary tasks for initializing the dataset for use by the adapter in the current mode.

PrepareDataSet generates an OnPrepareDataSet (see page 7810) event to allow you to perform your own initializations. It then cancels any pending edits and informs any fields that are used in the current mode so that they can perform their own initializations.

Note: Do not confuse the PrepareDataSet property with the Prepare method of many dataset components. PrepareDataSet allows the adapter to performed any tasks it requires to set up the dataset for its own use in the current mode. The Prepare method of a dataset component instructs the underlying database engine to initialize itself to represent a database query.

See Also

OnPrepareDataSet (see page 7810)

DataSetPrepared (see page 7808)

DataSet (see page 7807)

Mode (see page 7810)

PrepareDataSet (see page 7750)

41.1.4.4.44 TCustomDataSetAdapter.RaiseFieldChangedByAnotherUser Method

Raises an EAdapterFieldException with a message indicating that another user changed a field value.

Pascal

```
procedure RaiseFieldChangedByAnotherUser(const AFieldName: string);
```

C++

```
__fastcall RaiseFieldChangedByAnotherUser(const AnsiString AFieldName);
```

Description

RaiseFieldChangedByAnotherUser raises an EAdapterFieldException for the situation where the values of this adapter's fields have changed and the WebSnap application expects them to be the same.

AFieldName is the name of the field that has changed. It is used to generate an error message for the exception.

See Also

EAdapterFieldException (see page 23698)

41.1.4.4.45 TCustomDataSetAdapter.RaiseFieldNotFound Method

Raises an EAdapterException with a message indicating that a specified field could not be found.

Pascal

```
procedure RaiseFieldNotFound(const AFieldName: string);
```

C++

```
__fastcall RaiseFieldNotFound(const AnsiString AFieldName);
```

Description

RaiseFieldNotFound raises an EAdapterException for the situation where the request needs to perform some action on a specified field in the dataset and can't locate the specified field. For example, this method is called when the current request tries to update a field and the dataset does not include a field with the specified name.

AFieldName is the name of the field that can't be located. It is used to generate an error message for the exception.

See Also

EAdapterException (see page 23696)

41.1.4.4.46 TCustomDataSetAdapter.RaiseNilDataSet Method

Raises an EAdapterException with a message indicating that the dataset is unassigned.

Pascal

```
procedure RaiseNilDataSet;
```

C++

```
__fastcall RaiseNilDataSet();
```

Description

RaiseNilDataSet raises an EAdapterException for the situation where the DataSet (see page 7807) property is found to be nil (Delphi) or NULL (C++).

See Also

EAdapterException (see page 23696)

DataSet (see page 7807)

41.1.4.4.47 TCustomDataSetAdapter.RaiseRowNotFound Method

Raises an EAdapterException with a message indicating that a dataset record could not be located based on the current set of

key fields.

Pascal

```
procedure RaiseRowNotFound;
```

C++

```
__fastcall RaiseRowNotFound();
```

Description

RaiseRowNotFound raises an EAdapterException for the situation where the adapter was unable to locate a record. This can arise, for example, when another user has deleted a record or changed a key field value. The problem record may belong to this adapter's dataset or to another dataset that is linked to it in a master/detail relationship. RaiseRowNotFound uses the AdapterRowNotFound (see page 7807) property to indicate the name of the adapter whose dataset could not be positioned on a specified row.

See Also

EAdapterException (see page 23696)

AdapterRowNotFound (see page 7807)

41.1.4.4.48 TCustomDataSetAdapter.RestoreDefaultAdapterMode Method

Returns the adapter to its default mode.

Pascal

```
procedure RestoreDefaultAdapterMode;
```

C++

```
__fastcall RestoreDefaultAdapterMode();
```

Description

RestoreDefaultAdapterMode sets the InDefaultMode (see page 7808) property to true, thereby restoring the Mode (see page 7810) property to its default value (amBrowse).

See Also

Mode (see page 7810)

InDefaultMode (see page 7808)

41.1.4.4.49 TCustomDataSetAdapter.SetAdapterMode Method

Sets the Mode (see page 7810) property based on a string that represents one of the available values.

Pascal

```
procedure SetAdapterMode(const AValue: string);
```

C++

```
__fastcall SetAdapterMode(const AnsiString AValue);
```

Description

SetAdapterMode interprets the specified string and uses it to set the Mode (see page 7810) property.

AValue is a string that indicates the desired mode.

If AValue is an empty string, SetAdapterMode sets the Mode (see page 7810) property to the default value (by setting InDefaultMode (see page 7808) to true). Otherwise, SetAdapterMode calls the StringToMode (see page 7803) method to

convert AValue into a Mode (see page 7810) value and assigns the result to the Mode (see page 7810) property.

This method allows server-side script to set the Mode (see page 7810) property of this adapter.

See Also

Mode (see page 7810)

StringToMode (see page 7803)

GetAdapterModeNames (see page 7783)

InDefaultMode (see page 7808)

41.1.4.4.50 TCustomDataSetAdapter.SetDataSet Method

Sets the value of the DataSet (see page 7807) property.

Pascal

```
procedure SetDataSet(ADataSet: TDataSet);
```

C++

```
__fastcall SetDataSet(TDataSet ADataSet);
```

Description

SetDataSet is the protected write implementation of the DataSet (see page 7807) property.

See Also

DataSet (see page 7807)

41.1.4.4.51 TCustomDataSetAdapter.SetMode Method

Sets the value of the Mode (see page 7810) property.

Pascal

```
procedure SetMode(const Value: TDataSetAdapterMode); virtual;
```

C++

```
virtual __fastcall SetMode(const TDataSetAdapterMode Value);
```

Description

SetMode is the protected write implementation of the Mode (see page 7810) property. As a side-effect, SetMode sets the InDefaultMode (see page 7808) and DataSetPrepared (see page 7808) properties to false.

See Also

Mode (see page 7810)

InDefaultMode (see page 7808)

DataSetPrepared (see page 7808)

41.1.4.4.52 TCustomDataSetAdapter.SilentLocate Method

Positions the associated dataset on a specified record.

Pascal

```
function SilentLocate(AParams: TLocateParamsList; ARecurse: Boolean): Boolean;
```

C++

```
__fastcall Boolean SilentLocate(TLocateParamsList AParams, Boolean ARecurse);
```

Description

SilentLocate tries to position this adapter's dataset on the record identified by a specified set of key field values.

Params is a collection of TLocateParams (see page 8090) objects, where each TLocateParams (see page 8090) object lists the key fields and their values for a single dataset adapter.

ARecurse indicates whether SilentLocate should position the dataset of just this adapter, or to position the datasets of all adapters linked to this one in a master/detail relationship as well.

SilentLocate returns true if it successfully positions all requested datasets on the specified records. SilentLocate returns false if it was unable to position one or more datasets on the specified record.

See Also

Locate (see page 7796)

TLocateParams (see page 8090)

41.1.4.4.53 TCustomDataSetAdapter.StringToMode Method

Converts a mode string to the corresponding TDataSetAdapterMode (see page 8111) value.

Pascal

```
function StringToMode(const AValue: string): TDataSetAdapterMode;
```

C++

```
__fastcall TDataSetAdapterMode StringToMode(const AnsiString AValue);
```

Description

StringToMode interprets the specified string to a value that can be applied to the Mode (see page 7810) property.

AValue is a string to convert.

If AValue is an empty string, StringToMode returns the default mode (amBrowse). Otherwise, StringToMode converts from one of the values in the list GetAdapterModeNames (see page 7783) supplies to the corresponding TDataSetAdapterMode (see page 8111) value. If AValue is not an empty string or one of the strings in the list that GetAdapterModeNames (see page 7783) supplies, StringToMode raises an EAdapterException.

See Also

Mode (see page 7810)

GetAdapterModeNames (see page 7783)

EAdapterException (see page 23696)

41.1.4.4.54 TCustomDataSetAdapter.UpdateFieldsExecuteValues Method

Executes the adapter's fields with values passed in the HTTP request.

Pascal

```
procedure UpdateFieldsExecuteValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); override;
```

C++

```
virtual __fastcall UpdateFieldsExecuteValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

UpdateFieldsExecuteValues first calls LocateRequestRecord (see page 7798) to position the associated dataset on the record identified by the parameters of the current request. It then loops through the specified adapter fields, calling on them to execute their value if they are executable. When a field is executable, the field value passed in the HTTP request is used to execute a command rather than update a value.

If any of the adapter fields encounters a problem while trying to execute the newly specified value, UpdateFieldsExecuteValues adds a message to the Errors property indicating what problem occurred before trying to execute the next field in the list.

AActionRequest is an interface to the current request object.

AAdapterFields is a list of fields to execute using values obtained from AActionRequest.

See Also

LocateRequestRecord (see page 7798)

Errors (see page 24182)

41.1.4.4.55 TCustomDataSetAdapter.UpdateFieldsGetAnyChanges Method

Indicates whether the values in the HTTP request change the value of any adapter fields.

Pascal

```
function UpdateFieldsGetAnyChanges(AActionRequest: IActionRequest; AAdapterFields:
TObjectList): Boolean; override;
```

C++

```
virtual __fastcall Boolean UpdateFieldsGetAnyChanges(IActionRequest AActionRequest,
TObjectList AAdapterFields);
```

Description

UpdateFieldsGetAnyChanges checks the specified adapter fields to see if the current request message causes any of them to change their values.

AActionRequest is an interface to the current request object.

AAdapterFields is a list of fields to check to see whether the request changes their values.

UpdateFieldsGetAnyChanges returns true if one or more field values changes as a result of the current request.

UpdateFieldsGetAnyChanges always returns true if the mode of the adapter is amQuery or amInsert, because queries and insertions always start with no field values and so any field values in the request represent a change.

If Mode (see page 7810) is not amQuery or amInsert, UpdateFieldsGetAnyChanges first calls LocateRequestRecord (see page 7798) to position the associated dataset on the record identified by the parameters of the current request. It then loops through the specified adapter fields, calling their CheckValueChange method to determine if they have changed. If the CheckValueChange method of any field returns true, UpdateFieldsGetAnyChanges returns true.

If any of the adapter fields encounters a problem in its CheckValueChange method, UpdateFieldsExecuteValues (see page 7803) adds a message to the Errors property indicating what problem occurred before trying to check the next field in the list.

See Also

Errors (see page 24182)

LocateRequestRecord (see page 7798)

CheckValueChange (see page 7737)

Mode (see page 7810)

41.1.4.4.56 TCustomDataSetAdapter.UpdateFieldsUpdateValues Method

Updates the adapter's fields with values passed in the HTTP request.

Pascal

```
procedure UpdateFieldsUpdateValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); override;
```

C++

```
virtual __fastcall UpdateFieldsUpdateValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

UpdateFieldsGetAnyChanges (see page 7804) applies the updates in the current request message to the specified adapter fields.

AActionRequest is an interface to the current request object.

AAdapterFields is a list of fields to update.

UpdateFieldsUpdateValues performs the following tasks:

1.It generates an OnBeforeUpdateFields event.

2.It calls LocateRequestRecord (see page 7798) to position the associated dataset on the record identified by the parameters of the current request.

3.It loops through the specified adapter fields, calling their UpdateValue method to update the value of the associated dataset field. If any of the adapter fields encounters a problem in its UpdateValue method, UpdateFieldsExecuteValues (see page 7803) adds a message to the Errors property indicating what problem occurred before trying to check the next field in the list.

4.If there were any errors updating field values, it cancels all edits to the current record, backing out the changes. Otherwise, it posts the current record to the dataset.

5. It generates an OnAfterUpdateFields event.

See Also

OnBeforeUpdateFields (see page 24187)

OnAfterUpdateFields (see page 24185)

Errors (see page 24182)

UpdateValue (see page 7751)

LocateRequestRecord (see page 7798)

41.1.4.4.57 TCustomDataSetAdapter.UpdateFieldsValidateValues Method

Validates the values passed in the current HTTP request for the adapter's fields.

Pascal

```
procedure UpdateFieldsValidateValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); override;
```

C++

```
virtual __fastcall UpdateFieldsValidateValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

UpdateFieldsValidateChanges screens the field values in the current request message to determine whether they appear valid.

AActionRequest is an interface to the current request object.

AAdapterFields is a list of fields to check.

UpdateFieldsUpdateValues (see page 7805) performs the following tasks:

1.If the adapter is in edit mode or browse mode, it calls LocateRequestRecord (see page 7798) to position the associated dataset on the record identified by the parameters of the current request and then loops through the specified adapter fields, calling their CheckOrigValue method to ensure that the field values on the specified record have not been changed by another user.

2.If any of the original field values have changed, UpdateFieldsUpdateValues (see page 7805) adds a message to the Errors property and returns.

3.It generates an OnBeforeValidateFields event.

4.It loops through the specified adapter fields, calling their ValidateValue method to validate the new value from the request message. If any of the adapter fields raises an exception its UpdateValue method (indicating an invalid value), UpdateFieldsValidateValues adds a message to the Errors property before trying to validate the next field value.

5. It generates an OnAfterValidateFields event.

See Also

OnBeforeValidateFields (see page 24187)

OnAfterValidateFields (see page 24186)

Errors (see page 24182)

ValidateValue (see page 7765)

LocateRequestRecord (see page 7798)

CheckOrigValue (see page 7736)

Mode (see page 7810)

41.1.4.5 TCustomDataSetAdapter Properties

The properties of the TCustomDataSetAdapter class are listed here.

Protected Properties

	Name	Description
	AdapterRowNotFound (see page 7807)	Indicates the dataset adapter for which this adapter could not locate the current record.
	DataSetPrepared (see page 7808)	Indicates whether the associated dataset has been properly set up for use by this adapter.

Public Properties

	Name	Description
	DataSet (see page 7807)	Specifies the dataset that this adapter represents.
R	DetailAdapters (see page 7808)	Lists the dataset adapters for all datasets that are details of this one.
	InDefaultMode (see page 7808)	Indicates whether the dataset adapter is in its default mode.
R	LocateParamsList (see page 7809)	Lists the parameters that identify the current record of this dataset and all other datasets linked to it in a master/detail relationship.
	MasterAdapter (see page 7809)	Indicates the dataset adapter, if any, to which this adapter is linked in a master/detail relationship.
	Mode (see page 7810)	Indicates how forms built from this dataset adapter operate on the information it provides.
	RefreshAfterPost (see page 7810)	Indicates whether the data set should be refreshed or not after posting..

41.1.4.5.1 TCustomDataSetAdapter.AdapterRowNotFound Property

Indicates the dataset adapter for which this adapter could not locate the current record.

Pascal

```
property AdapterRowNotFound: TCustomDataSetAdapter;
```

C++

```
__property TCustomDataSetAdapter AdapterRowNotFound;
```

Description

In the course of its normal operation, the dataset adapter often has to position this dataset on a specified record (such as the record to update in response to an update request). When the adapter positions itself in this way, it also positions all other dataset adapters that are linked to it in a master/detail relationship. If the adapter fails in its attempt to position all dataset adapters as specified, it sets AdapterRowNotFound to the first dataset adapter (starting at the master of all detail datasets) that can't be correctly positioned.

The RaiseRowNotFound (see page 7800) method uses this property to generate an error message when an attempt to position the dataset adapters fails.

See Also

RaiseRowNotFound (see page 7800)

MasterAdapter (see page 7809)

DetailAdapters (see page 7808)

41.1.4.5.2 TCustomDataSetAdapter.DataSet Property

Specifies the dataset that this adapter represents.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Set DataSet to associate this adapter with an existing dataset component. Read this property to access the dataset component that this adapter represents.

Note: Do not set DataSet to a unidirectional dataset. Unidirectional datasets do not work with the way dataset adapters position themselves on records.

41.1.4.5.3 TCustomDataSetAdapter.DataSetPrepared Property

Indicates whether the associated dataset has been properly set up for use by this adapter.

Pascal

```
property DataSetPrepared: Boolean;
```

C++

```
__property Boolean DataSetPrepared;
```

Description

TCustomDataSetAdapter (see page 7766) uses DataSetPrepared internally to keep track of whether it needs to prepare the dataset for use by this adapter. This property is initially false until the WebSnap application calls the PrepareDataSet (see page 7799) method. PrepareDataSet (see page 7799) changes this property to true, and it remains true until the Web module is deactivated or the Mode (see page 7810) of this adapter changes.

Note: Do not confuse the DataSetPrepared property with the Prepared property of many dataset components. DataSetPrepared indicates whether the adapter has performed any tasks it requires to accurately represent its corresponding dataset. (These tasks can include, for example, specifying and running a query on the underlying dataset, or checking which fields should be visible in the current mode.) The Prepared property of a dataset component indicates whether the underlying database engine has initialized itself to represent a database query.

See Also

PrepareDataSet (see page 7799)

OnPrepareDataSet (see page 7810)

DataSet (see page 7807)

Mode (see page 7810)

41.1.4.5.4 TCustomDataSetAdapter.DetailAdapters Property

Lists the dataset adapters for all datasets that are details of this one.

Pascal

```
property DetailAdapters: TComponentList;
```

C++

```
__property TComponentList DetailAdapters;
```

Description

DetailAdapters is a list of dataset adapters that are linked to this one in a master/detail relationship where this adapter represents the master dataset.

DetailAdapters is a read-only property. To set up a master/detail relationship between dataset adapters, set the MasterAdapter (see page 7809) property of the dataset adapter that acts as a detail dataset.

See Also

MasterAdapter (see page 7809)

41.1.4.5.5 TCustomDataSetAdapter.InDefaultMode Property

Indicates whether the dataset adapter is in its default mode.

Pascal

```
property InDefaultMode: Boolean;
```

C++

```
__property Boolean InDefaultMode;
```

Description

A newly-created dataset adapter has InDefaultMode true, indicating that the Mode (see page 7810) property has its default value (amBrowse). A dataset adapter in browse mode provides read-only access to the data in the corresponding dataset.

Changing the Mode (see page 7810) property sets InDefaultMode to false. Setting InDefaultMode to true restores the Mode (see page 7810) property to amBrowse.

See Also

Mode (see page 7810)

41.1.4.5.6 TCustomDataSetAdapter.LocateParamsList Property

Lists the parameters that identify the current record of this dataset and all other datasets linked to it in a master/detail relationship.

Pascal

```
property LocateParamsList: TLocateParamsList;
```

C++

```
__property TLocateParamsList LocateParamsList;
```

Description

TCustomDataSetAdapter (see page 7766) uses LocateParamsList to store the information it needs to position itself correctly on the current record. This information is taken from parameter values in the current request message. Those parameter values, in turn, originate from values added to an HTML form that were gathered using the GetKeyParams (see page 7787) method.

When you call the Locate (see page 7796) or LocateAndApply (see page 7796) method, TCustomDataSet uses the values in LocateParamsList to identify the target position in its associated dataset (and any datasets linked in a master/detail relationship).

See Also

ExtractRequestParams (see page 7781)

Locate (see page 7796)

LocateAndApply (see page 7796)

41.1.4.5.7 TCustomDataSetAdapter.MasterAdapter Property

Indicates the dataset adapter, if any, to which this adapter is linked in a master/detail relationship.

Pascal

```
property MasterAdapter: TCustomDataSetAdapter;
```

C++

```
__property TCustomDataSetAdapter MasterAdapter;
```

Description

Set MasterAdapter to link this adapter as a detail to another dataset adapter in a master/detail relationship. If MasterAdapter is

nil (Delphi) or NULL (C++), this adapter does not represent the detail set of another adapters dataset. If MasterAdapter is not nil (Delphi) or NULL (C++), this dataset adapter is listed by the master adapter's DetailAdapters (see page 7808) property.

See Also

DetailAdapters (see page 7808)

41.1.4.5.8 TCustomDataSetAdapter.Mode Property

Indicates how forms built from this dataset adapter operate on the information it provides.

Pascal

```
property Mode: TDataSetAdapterMode;
```

C++

```
__property TDataSetAdapterMode Mode;
```

Description

Mode controls what tasks forms built using this dataset adapter perform. By default, Mode is amBrowse, which indicates that the adapter supplies data for read-only forms. The default Web items you add to an adapter page producer, or code in server-side script, check Mode to determine how to build an HTML form that is sent in response to the current HTTP request mesaage. Mode controls:

The types of controls that are added to the HTML form.

The values of the fields in the HTML form.

The information that the HTML form stores as hidden fields.

41.1.4.5.9 TCustomDataSetAdapter.RefreshAfterPost Property

Indicates whether the data set should be refreshed or not after posting..

Pascal

```
property RefreshAfterPost: Boolean;
```

C++

```
__property Boolean RefreshAfterPost;
```

Description

RefreshAfterPost is used to determine whether or not the data set should be refreshed after it has been posted.

41.1.4.6 TCustomDataSetAdapter Events

The events of the TCustomDataSetAdapter class are listed here.

Public Events

	Name	Description
	OnPrepareDataSet (see page 7810)	Occurs before the dataset adapter uses any information from its associated dataset.

41.1.4.6.1 TCustomDataSetAdapter.OnPrepareDataSet Event

Occurs before the dataset adapter uses any information from its associated dataset.

Pascal

```
property OnPrepareDataSet: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPrepareDataSet;
```

Description

Write an OnPrepareDataSet event handler to set up the associated dataset before the WebSnap application uses this adapter. For example, you can use an OnPrepareDataSet event handler to dynamically generate and execute a query.

This event occurs when the Web module containing the dataset adapter is first activated, and whenever the WebSnap application changes the value of the Mode (see page 7810) property.

Note: Do not confuse the this event with the Prepared property of many dataset components. This event allows the adapter to perform any tasks it requires to accurately represent its corresponding dataset. The Prepared property of a dataset component indicates whether the underlying database engine has initialized itself to represent a database query.

See Also

PrepareDataSet (see page 7799)

DataSet (see page 7807)

Mode (see page 7810)

41.1.5 TCustomDataSetAdapterAction Class

TCustomDataSetAdapterAction is the base class for adapter actions that can be added to a dataset adapter.

Class Hierarchy

Pascal

```
TCustomDataSetAdapterAction = class(TImplementedAdapterAction);
```

C++

```
class TCustomDataSetAdapterAction : public TImplementedAdapterAction;
```

File

DBAdapt

Description

TCustomDataSetAdapterAction is the base class for all adapter action objects that perform functions for a dataset adapter. TCustomDataSetAdapterAction descendants are included as the actions of a dataset adapter (TDataSetAdapter (see page 7872)). Each TCustomDataSetAdapterAction descendant can be executed to perform a specific function on the dataset of the parent dataset adapter.

Do not use TCustomDataSetAdapterAction directly. It is intended only as a base class. Instead, use a TCustomDataSetAdapterAction descendant that represents the particular action you want.

See Also

TDataSetAdapterApplyRowAction (see page 7890)

TDataSetAdapterBrowseRowAction (see page 7903)

TDataSetAdapterCancelRowAction (see page 7916)

TDataSetAdapterDeleteRowAction (see page 7934)

TDataSetAdapterEditRowAction (see page 7947)

TDataSetAdapterFirstRowAction (see page 7972)

TDataSetAdapterLastRowAction (see page 7984)

TDataSetAdapterNextRowAction (see page 8030)

TDataSetAdapterPrevRowAction (see page 8042)

TDataSetAdapterRefreshRowAction (see page 8054)

TDataSetAdapterNewRowAction (see page 8016)

TDataSetAdapter (see page 7872)

TDataSetAdapterRowAction (see page 8066)

41.1.5.1 TCustomDataSetAdapterAction Members

The following tables list the members exposed by TCustomDataSetAdapterAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.
V	GetDefaultActionName (see page 24055)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.

	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
V	ImplExecuteActionRequest (see page 24063)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplExecuteActionRequest (see page 24195)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
V	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
V	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
V	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
V	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
V	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
V	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
V	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
V	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
V	ImplWebEnabled (see page 7820)	Provides the underlying implementation for the WebEnabled method.

	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 24075)	Called after the adapter action has executed.
	OnAfterExecute (see page 24198)	Called after the adapter action has executed.

	OnAfterGetResponse (see page 24075)	Called after the adapter action response is generated.
	OnAfterGetResponse (see page 24199)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24076)	Called before the adapter action is executed.
	OnBeforeExecute (see page 24199)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24076)	Called before the adapter action response is generated.
	OnBeforeGetResponse (see page 24200)	Called before the adapter action response is generated.
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.
	OnGetParams (see page 24077)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 7818)	Creates and initializes an instance of TCustomDataSetAdapterAction (see page 7811).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.

	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionModes (see page 7821)	Indicates what dataset adapter modes this field supports.
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 24073)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 24073)	Defines the rights required to execute this action.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.5.2 TCustomDataSetAdapterAction.Create Constructor

Creates and initializes an instance of TCustomDataSetAdapterAction (see page 7811).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomDataSetAdapterAction(TComponent * AOwner);
```

Description

The TCustomDataSetAdapterAction (see page 7811) constructor allocates memory for the adapter action object and initializes its properties.

AOwner is the component that is responsible for starting the streaming process when a module containing the adapter action is loaded or saved. It becomes the value of the Owner property. Typically, AOwner is the Web module.

See Also

Owner (see page 2807)

41.1.5.3 TCustomDataSetAdapterAction Methods

The methods of the TCustomDataSetAdapterAction class are listed here.

Protected Methods

	Name	Description
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.
V	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
V	ImplWebEnabled (see page 7820)	Provides the underlying implementation for the WebEnabled method.

41.1.5.3.1 TCustomDataSetAdapterAction.GetAdapter Method

Returns the value of the Adapter (see page 7822) property.

Pascal

```
function GetAdapter: TCustomDataSetAdapter;
```

C++

```
__fastcall TCustomDataSetAdapter GetAdapter();
```

Description

GetAdapter is the protected read implementation of the Adapter (see page 7822) property.

See Also

Adapter (see page 7822)

41.1.5.3.2 TCustomDataSetAdapterAction.GetDataSet Method

Returns the value of the DataSet (see page 7822) property.

Pascal

```
function GetDataSet: TDataSet;
```

C++

```
__fastcall TDataSet GetDataSet();
```

Description

GetDataSet is the protected read implementation of the DataSet (see page 7822) property.

See Also

DataSet (see page 7822)

41.1.5.3.3 TCustomDataSetAdapterAction.ImplGetVisible Method

Provides the underlying implementation for the GetVisible method.

Pascal

```
function ImplGetVisible: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplGetVisible();
```

Description

The GetVisible method calls ImplGetVisible to determine whether the HTML form should include a control or hyperlink for this action. (In server-side script, this returns the value of the Visible property).

ImplGetVisible returns true if the ActionModes (see page 7821) property includes the current mode of the parent dataset adapter. If not, it returns false.

See Also

GetVisible (see page 24061)

ActionModes (see page 7821)

Mode (see page 7810)

41.1.5.3.4 TCustomDataSetAdapterAction.ImplWebEnabled Method

Provides the underlying implementation for the WebEnabled method.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

The WebEnabled method calls ImplWebEnabled to determine whether the control or hyperlink for this action should appear enabled in the HTML form. WebEnabled returns true if controls should be enabled, false otherwise.

ImplWebEnabled generates an OnGetEnabled (see page 7823) event so that you can specify whether controls for this action are enabled. If there is no OnGetEnabled (see page 7823) event handler, ImplWebEnabled returns true unless the DataSet (see page 7822) property is not set.

See Also

WebEnabled (see page 24071)

OnGetEnabled (see page 7823)

DataSet (see page 7822)

41.1.5.4 TCustomDataSetAdapterAction Properties

The properties of the TCustomDataSetAdapterAction class are listed here.

Protected Properties

	Name	Description
	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.

Public Properties

	Name	Description
	ActionModes (see page 7821)	Indicates what dataset adapter modes this field supports.
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.

41.1.5.4.1 TCustomDataSetAdapterAction.ActionModes Property

Indicates what dataset adapter modes this field supports.

Pascal

```
property ActionModes: TDataSetAdapterModes;
```

C++

```
__property TDataSetAdapterModes ActionModes;
```

Description

ActionModes is a set of all the modes in which this adapter action can be used. If the parent dataset adapter is in a mode that is not included in this set, any forms generated using that adapter do not include a control for executing this action. Thus, for example, there is no sense in adding a control that applies edits to a form that presents a read-only view of the data. An apply action, then, should not include amBrowse in its action modes.

See Also

CanModify (see page 7154)

Adapter (see page 7752)

Mode (see page 7810)

GetDisplayStyle (see page 7739)

GetInputStyle (see page 7741)

GetViewMode (see page 7744)

41.1.5.4.2 TCustomDataSetAdapterAction.ActionName Property

Identifies the name of this action when using server-side script.

Pascal

```
property ActionName: string;
```

C++

```
__property AnsiString ActionName;__property AnsiString ActionName;__property AnsiString
ActionName;
```

Description

The ActionName property defines the name used to access the adapter action with server-side script.

See Also

ImplGetActionName (see page 24195)

ImplSetActionName (see page 24197)

41.1.5.4.3 TCustomDataSetAdapterAction.Adapter Property

Indicates the dataset adapter that uses this object to represent one of its actions.

Pascal

```
property Adapter: TCustomDataSetAdapter;
```

C++

```
__property TCustomDataSetAdapter Adapter;
```

Description

Use Adapter to access the parent adapter of this adapter action. This adapter is associated with the dataset on which this action operates. This adapter action is one of the objects listed in its Actions property.

See Also

Actions (see page 24402)

DataSet (see page 7822)

41.1.5.4.4 TCustomDataSetAdapterAction.DataSet Property

Indicates the dataset on which this action operates.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Read DataSet to access the dataset on which this action operates. DataSet is the value of the parent dataset adapter's DataSet property.

If this action is not the child of a dataset adapter, or if the parent dataset adapter has not been bound to a dataset component, DataSet is nil (Delphi) or NULL (C++).

See Also

DataSet (see page 7807)

41.1.5.5 TCustomDataSetAdapterAction Events

The events of the TCustomDataSetAdapterAction class are listed here.

Public Events

	Name	Description
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.

41.1.5.5.1 TCustomDataSetAdapterAction.OnExecute Event

Occurs when server-side script executes this action.

Pascal

```
property OnExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnExecute;
```

Description

Write an OnExecute event handler to provide your own implementation for the dataset adapter action. If you supply an event handler for this event, then the event handler replaces the default behavior of the action object. That is, when server-side script calls on this action to execute, the WebSnap application executes the OnExecute event handler instead of the built-in response of the action component.

Before the OnExecute event executes, the action fetches all parameter values from the current request and puts the parent adapter into the mode that the current request indicates.

See Also

OnGetParams (see page 24077)

OnBeforeExecute (see page 24076)

OnAfterExecute (see page 24075)

Mode (see page 7810)

41.1.5.5.2 TCustomDataSetAdapterAction.OnGetEnabled Event

Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.

Pascal

```
property OnGetEnabled: TActionGetEnabledEvent;
```

C++

```
__property TActionGetEnabledEvent OnGetEnabled;
```

Description

Write an OnGetEnabled event handler to indicate whether a control or hyperlink that represents this event in an HTML form should be enabled. If the event handler sets the Enabled parameter to false, controls or hyperlinks for this action always appear disabled. If the event handler sets the Enabled parameter to true, the TCustomDataSetAdapterAction (see page 7811) descendant determines whether controls and hyperlinks are enabled, based on its ability to perform its built-in task.

See Also

DataSet (see page 7822)

WebEnabled (see page 24071)

41.1.6 TCustomDataSetAdapterField Class

TCustomDataSetAdapterField is the common base class for adapter field objects that represent a dataset field of a type whose value can be displayed as a simple text element.

Class Hierarchy

Pascal

```
TCustomDataSetAdapterField = class(TBaseDataSetAdapterInputField, IWebGetFieldPrevValue,
IGetAdapterValuesList, ICheckOrigValue);
```

C++

```
class TCustomDataSetAdapterField : public TBaseDataSetAdapterInputField, public
IWebGetFieldPrevValue, public IGetAdapterValuesList, public ICheckOrigValue;
```

File

DBAdapt

Description

TCustomDataSetAdapterField is the base class for adapter field objects that represent database fields of simple types that can appear in single-line edit controls. This is in contrast, for example, to TDataSetAdapterMemoField (see page 7996), which typically is displayed in a multiline edit control. Because TCustomDataSetAdapterField descendants have values that can be displayed simply, this class adds support for maintaining a list of possible values from which users can choose. If you provide

such a list, HTML forms that include this field typically use a selection control such as a list box.

TCustomDataSetAdapterField descendants are included as the fields of a dataset adapter (TDataSetAdapter (see page 7872)). Each TCustomDataSetAdapterField descendant represents a single field from a database table, and enables server-side script to refer to or update that field's value.

Do not use TCustomDataSetAdapterField directly. It is intended only as a base class. Instead, use a TCustomDataSetAdapterField descendant such as TDataSetAdapterField (see page 7960).

See Also

TDataSetAdapterField (see page 7960)

TDataSetAdapter (see page 7872)

TField (see page 7115)

TDataSetAdapterMemoField (see page 7996)

41.1.6.1 TCustomDataSetAdapterField Members

The following tables list the members exposed by TCustomDataSetAdapterField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckOrigValue (see page 7736)	Ensures that the current value of this field is the same as the original value.
	CheckValueChange (see page 7737)	Indicates whether the current value of this field is the same as the original value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 7738)	Indicates whether references to this field in HTML forms must be qualified with the name of the parent adapter.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 7738)	Returns the value of the Adapter (see page 7752) property.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 7831)	Returns the value of the ValuesList (see page 7837) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7738)	Returns the dataset associated with this field's parent adapter.
V	GetDataSetFieldValue (see page 7739)	Returns the value of the associated dataset field.

	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 7739)	Returns a string value that suggests an HTML display style for this adapter field.
	GetDisplayStyleType (see page 7740)	Returns the HTML display style type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 7741)	Returns a string value that suggests an HTML editing style for this adapter field.
	GetInputStyleType (see page 7831)	Returns the default style of the HTML control to use for editing this adapter field.
	GetKeyName (see page 7742)	Returns the name of the associated dataset field if it appears in the index (key) that the parent dataset adapter uses.
	GetKeyParams (see page 7743)	Returns a list of fields that the parent dataset adapter uses to locate records, along with their current values in that adapter's dataset.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetNeedPrevValue (see page 7832)	Indicates whether an HTML form should include a hidden field that stores this field's value so that generated requests include the previous field value.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPrevValue (see page 7832)	Returns the value of this field, as it should appear in a hidden field in an HTML form.
	GetReadOnly (see page 7743)	Indicates whether the adapter field represents a read-only database field.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 7744)	Returns a string value that indicates what function a control that represents this field should perform.
	GetViewModeType (see page 7744)	Returns the view mode for the function a control that represents this field should perform.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 7745)	Provides the underlying implementation for the AsFormatted method.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplCheckOrigValue (see page 7833)	Provides the underlying implementation for the CheckOrigValue (see page 7736) method.
	ImplCheckValueChange (see page 7833)	Provides the underlying implementation for the CheckValueChange (see page 7737) method.
	ImplGetDisplayLabel (see page 7747)	Provides the underlying implementation for the GetDisplayLabel method.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayWidth (see page 7747)	Provides the underlying implementation for the GetDisplayWidth method.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetEchoActionFieldValue (see page 7763)	Provides the underlying implementation for the GetEchoActionFieldValue method.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetNeedPrevValue (see page 7834)	Provides the underlying implementation for the GetNeedPrevValue (see page 7832) method.
	ImplGetPrevValue (see page 7835)	Provides the underlying implementation of the GetPrevValue (see page 7832) method.

	ImplGetRequired (see page 7747)	Provides the underlying implementation for the GetRequired method.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 7835)	Provides the underlying implementation for the GetValue method.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 7748)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 7763)	Provides the underlying implementation for the SetEchoActionFieldValue method.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 7749)	Provides the underlying implementation for the SetFieldName method.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplUpdateValue (see page 7836)	Provides the underlying implementation for the UpdateValue (see page 7751) method.
	ImplValidateValue (see page 7764)	Provides the underlying implementation for the ValidateValue (see page 7765) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 7836)	Responds when components are added to or deleted from the WebSnap application.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	PrepareDataSet (see page 7750)	Responds when the parent dataset adapter prepares its dataset.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSetField (see page 7751)	Sets the value of the DataSetField (see page 7752) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	TestValueChange (see page 7764)	Checks whether a new value matches the current value of this field.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 7751)	Updates the adapter field when the user assigns a new value.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.

	ValidateValue (see page 7765)	Validates a new value for this field that appears in the current request.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7752)	Indicates the dataset adapter that uses this object to represent one of its fields.
R	Adapter (see page 23943)	Returns the parent adapter component.
	DataSetField (see page 7752)	Specifies the name of the dataset field that this adapter field represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 7754)	Occurs when the adapter field needs to supply its formatted value as a string that can appear in HTML forms.
	OnGetValue (see page 7754)	Occurs when the adapter field needs to supply its value as a Variant.
	OnValidateValue (see page 7766)	Occurs when the parent adapter wants to validate the new value for this field.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckOrigValue (see page 24569)	This is CheckOrigValue, a member of class ICheckOrigValue.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7735)	Creates and initializes an instance of TBaseDataSetAdapterField (see page 7729).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 7737)	Returns the dataset field whose value this adapter field represents.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKeyName (see page 8105)	This is GetKeyName, a member of class IGetDataSetKeyName.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PrepareDataSet (see page 8109)	This is PrepareDataSet, a member of class IPrepareDataSet.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)

V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	FieldFlags (see page 7752)	Indicates various attributes of the adapter field.
	FieldModes (see page 7753)	Indicates what dataset adapter modes this field supports.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
R	KeyName (see page 8105)	This is KeyName, a member of class IGetDataSetKeyName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	NeedPrevValue (see page 24587)	This is NeedPrevValue, a member of class IWebGetFieldPrevValue.
	OnUpdateValue (see page 7765)	Occurs when the WebSnap application updates this adapter field's value based on in incoming request.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	PrevValue (see page 24587)	This is PrevValue, a member of class IWebGetFieldPrevValue.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
	ValuesList (see page 7837)	Specifies the interface of an object that lists the possible values for this field.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.6.2 TCustomDataSetAdapterField Methods

The methods of the TCustomDataSetAdapterField class are listed here.

Protected Methods

	Name	Description
	GetAdapterValuesList (see page 7831)	Returns the value of the ValuesList (see page 7837) property.
V	GetInputStyleType (see page 7831)	Returns the default style of the HTML control to use for editing this adapter field.
	GetNeedPrevValue (see page 7832)	Indicates whether an HTML form should include a hidden field that stores this field's value so that generated requests include the previous field value.
	GetPrevValue (see page 7832)	Returns the value of this field, as it should appear in a hidden field in an HTML form.
V	ImplCheckOrigValue (see page 7833)	Provides the underlying implementation for the CheckOrigValue (see page 7736) method.
V	ImplCheckValueChange (see page 7833)	Provides the underlying implementation for the CheckValueChange (see page 7737) method.
V	ImplGetNeedPrevValue (see page 7834)	Provides the underlying implementation for the GetNeedPrevValue (see page 7832) method.
V	ImplGetPrevValue (see page 7835)	Provides the underlying implementation of the GetPrevValue (see page 7832) method.
V	ImplGetValue (see page 7835)	Provides the underlying implementation for the GetValue method.
V	ImplUpdateValue (see page 7836)	Provides the underlying implementation for the UpdateValue (see page 7751) method.
V	Notification (see page 7836)	Responds when components are added to or deleted from the WebSnap application.

41.1.6.2.1 TCustomDataSetAdapterField.GetAdapterValuesList Method

Returns the value of the ValuesList (see page 7837) property.

Pascal

```
function GetAdapterValuesList: IValuesListAdapter;
```

C++

```
__fastcall IValuesListAdapter GetAdapterValuesList();
```

Description

GetAdapterValuesList returns the interface of the adapter that lists the possible values for this field. If there is no such list, GetAdapterValuesList returns nil (Delphi) or NULL (C++).

See Also

ValuesList (see page 7837)

41.1.6.2.2 TCustomDataSetAdapterField.GetInputStyleType Method

Returns the default style of the HTML control to use for editing this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const AnsiString
AAdapterMode);
```

Description

GetInputStyleType returns the recommended type of control to use for editing this field's value in HTML forms.

AAdapterMode indicates the current mode of the parent dataset adapter. It is one of the following values:

Value	Mode	Meaning
Insert	amInsert	The control is to be used for entering a field value in a newly inserted record.
Edit	amEdit	The control is to be used for editing the current field value.
Browse	amBrowse	The control is to be used for read-only display.
Query	amQuery	The control is to be used for entering a criterion to use in a generated query.

GetInputStyleType returns htmliSelect (a single-selection list box) if the ValuesList (see page 7837) property provides a list of possible values for the field. Otherwise, GetInputStyleType returns htmliTextInput (a single-line edit control).

See Also

GetInputStyle (see page 7741)

TDataSetAdapterModes (see page 8115)

ValuesList (see page 7837)

41.1.6.2.3 TCustomDataSetAdapterField.GetNeedPrevValue Method

Indicates whether an HTML form should include a hidden field that stores this field's value so that generated requests include the previous field value.

Pascal

```
function GetNeedPrevValue: Boolean;
```

C++

```
__fastcall Boolean GetNeedPrevValue();
```

Description

GetNeedPrevValue returns true if the current value of this field should be included as a hidden field in HTML forms. This hidden field value then appears in requests that originate from that form so that if the form changes the field value, the previous value is still available. When GetNeedPrevValue returns true, the GetPrevValue (see page 7832) method supplies the current field value.

GetNeedPrevValue delegates the task of determining the need for a hidden field to the ImplGetNeedPrevValue (see page 7834) method.

See Also

ImplGetNeedPrevValue (see page 7834)

GetPrevValue (see page 7832)

41.1.6.2.4 TCustomDataSetAdapterField.GetPrevValue Method

Returns the value of this field, as it should appear in a hidden field in an HTML form.

Pascal

```
function GetPrevValue: Variant;
```

C++

```
__fastcall Variant GetPrevValue();
```

Description

When the GetNeedPrevValue (see page 7832) method returns true, GetPrevValue returns the value for this field that should appear as a hidden field in an HTML form. This hidden value is included in request messages that originate from that form. Thus, GetPrevValue returns a value that this field sends to itself, which is transparent to the end-user.

GetPrevValue delegates the task of providing the hidden value to the ImplGetPrevValue (see page 7835) method.

See Also

GetNeedPrevValue (see page 7832)

ImplGetPrevValue (see page 7835)

41.1.6.2.5 TCustomDataSetAdapterField.ImplCheckOrigValue Method

Provides the underlying implementation for the CheckOrigValue (see page 7736) method.

Pascal

```
procedure ImplCheckOrigValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplCheckOrigValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

The CheckOrigValue (see page 7736) method calls ImplCheckOrigValue to raise an exception if the current value of this field is not the same as the original value.

AActionRequest is interface of the action request object. ImplCheckOrigValue can use this interface to obtain information about the current request (such as the value of the hidden field that contains the original value).

AFieldIndex is the index of this field in the set of original field values that AActionRequest maintains.

ImplCheckOrigValue fetches the original value for this field from AActionRequest and compares it to the value of the associated field object. If the two values differ, or if this object is unable to locate the associated dataset field, ImplCheckOrigValue raises an exception. If the two values match, or if AActionRequest does not include an original value for this field, ImplCheckOrigValue does not raise an exception.

See Also

CheckOrigValue (see page 7736)

FieldFlags (see page 7752)

ActionOrigValue (see page 23943)

Value (see page 23945)

41.1.6.2.6 TCustomDataSetAdapterField.ImplCheckValueChange Method

Provides the underlying implementation for the CheckValueChange (see page 7737) method.

Pascal

```
function ImplCheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
override;
```

C++

```
virtual __fastcall Boolean ImplCheckValueChange(IActionRequest AActionRequest, int
AFieldIndex);
```

Description

The CheckValueChange (see page 7737) method calls ImplCheckValueChange to determine whether the value of this adapter field has changed from the value it held when building the form from which the current request originates.

AActionRequest is the interface of the action request object. CheckOrigValue (see page 7736) can use this interface to obtain information about the current request (such as the value of the hidden field that contains the original value).

AFieldIndex is the index of this field in the set of field values that AActionRequest maintains.

CheckValueChange (see page 7737) returns false if there has been no change, true if the value may have changed.

If the FieldFlags (see page 7752) property includes ffInOrigValues, ImplCheckValueChange fetches the original and current values from AActionRequest and compares them. If the current request does not include information about the original value, ImplCheckValueChange returns true, indicating that the value may have changed.

See Also

CheckValueChange (see page 7737)

Value (see page 23945)

FieldFlags (see page 7752)

41.1.6.2.7 TCustomDataSetAdapterField.ImplGetNeedPrevValue Method

Provides the underlying implementation for the GetNeedPrevValue (see page 7832) method.

Pascal

```
function ImplGetNeedPrevValue: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetNeedPrevValue();
```

Description

GetNeedPrevValue (see page 7832) calls ImplGetNeedPrevValue to determine whether an HTML form should include a hidden field that stores this field's value. This method returns true if the parent dataset adapter is in edit mode and this field's FieldFlags (see page 7752) property includes ffInOrigValues. Otherwise, ImplGetNeedPrevValue returns false.

By including the current field value as a hidden field when the dataset adapter is in edit mode, this field ensures that update requests from the HTML form include sufficient information for locating the record that should be updated. When the dataset adapter is in any other mode, there is no need to locate a particular record in the dataset.

See Also

GetNeedPrevValue (see page 7832)

GetPrevValue (see page 7832)

Mode (see page 7810)

FieldFlags (see page 7752)

41.1.6.2.8 TCustomDataSetAdapterField.ImplGetPrevValue Method

Provides the underlying implementation of the GetPrevValue (see page 7832) method.

Pascal

```
function ImplGetPrevValue: Variant; virtual;
```

C++

```
virtual __fastcall Variant ImplGetPrevValue();
```

Description

The GetPrevValue (see page 7832) calls ImplGetPrevValue to obtain the value of this field as it should appear in a hidden field on an HTML form.

ImplGetPrevValue checks the EchoActionFieldValue property, and if it is true, returns the value for this field that appears in the current request. If EchoActionFieldValue is false, ImplGetPrevValue returns the current value of the associated dataset field.

If ImplGetPrevValue is unable to obtain a value (if the current request does not include a value for this field or if this field can't locate the associated dataset field), it returns an unassigned Variant.

See Also

GetNeedPrevValue (see page 7832)

GetPrevValue (see page 7832)

EchoActionFieldValue (see page 23944)

Value (see page 7180)

41.1.6.2.9 TCustomDataSetAdapterField.ImplGetValue Method

Provides the underlying implementation for the GetValue method.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

GetValue calls ImplGetValue to obtain the value of the adapter field as a Variant.

If the value of the EchoActionFieldValue property is true, ImplGetValue uses the ActionValue property to obtain the value for this field that the user entered.

If EchoActionFieldValue is false (or if the user did not enter a value for this field), ImplGetValue first generates an OnGetValue (see page 7754) event, to allow an event handler to supply the value of the field. If there is no OnGetValue (see page 7754) event handler, ImplGetValue returns the value of the associated dataset field.

If ImplGetValue can't locate a value for this field, it returns an unassigned Variant.

See Also

Value (see page 7180)

GetValue (see page 23935)

OnGetValue (see page 7754)

Value (see page 23945)

EchoActionFieldValue (see page 23944)

ActionValue (see page 23943)

41.1.6.2.10 TCustomDataSetAdapterField.ImplUpdateValue Method

Provides the underlying implementation for the UpdateValue (see page 7751) method.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

The UpdateValue (see page 7751) method calls ImplUpdateValue to respond when the user assigns a new value to this field.

AActionRequest is interface of the action request object. ImplUpdateValue can use this interface to obtain information about the current request (such as the value the user assigned to this field).

AFieldIndex is the index of this field in the set of field values that AActionRequest maintains.

ImplUpdateValue generates an OnUpdateValue (see page 7765) event so that you can apply the update using an event handler. If there is no OnUpdateValue (see page 7765) event handler, ImplUpdateValue writes the current field value from AActionRequest to the associated dataset field.

If ImplUpdateValue can't locate the dataset field to update, or if the request contained multiple values or a file reference rather than a value, ImplUpdateValue raises an exception.

Note: ImplUpdateValue does nothing if the parent dataset adapter is in query mode.

See Also

UpdateValue (see page 7751)

Value (see page 23945)

OnUpdateValue (see page 7765)

Mode (see page 7810)

41.1.6.2.11 TCustomDataSetAdapterField.Notification Method

Responds when components are added to or deleted from the WebSnap application.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when components are created or destroyed. After calling the inherited method, Notification checks whether the object that implements the ValuesList (see page 7837) property is about to be destroyed. If the adapter that lists values for this field is going away, Notification sets the ValuesList (see page 7837) property to nil (Delphi) or NULL (C++).

See Also

ValuesList (see page 7837)

41.1.6.3 TCustomDataSetAdapterField Properties

The properties of the TCustomDataSetAdapterField class are listed here.

Public Properties

	Name	Description
	ValuesList (see page 7837)	Specifies the interface of an object that lists the possible values for this field.

41.1.6.3.1 TCustomDataSetAdapterField.ValuesList Property

Specifies the interface of an object that lists the possible values for this field.

Pascal

```
property ValuesList: IValuesListAdapter;
```

C++

```
__property IValuesListAdapter ValuesList;
```

Description

ValuesList is the interface of an adapter that lists a set of values. It can be the interface of any object that supports the IValuesListAdapter interface, such as TStringsValuesList or TDataSetValuesList (see page 8079). Each value in the list that this adapter maintains represents a possible value for this field. This is useful when you want to restrict the possible values a user can assign to the associated database field.

When you assign a value to the ValuesList property, the default control for editing this fields value changes to a single selection list box.

See Also

TStringsValuesList (see page 24540)

TDataSetValuesList (see page 8079)

GetInputStyleType (see page 7831)

41.1.7 TCustomDataSetAdapterMemoField Class

The TCustomDataSetAdapterMemoField is the ancestor of TDataSetAdapterMemoField (see page 7996).

Class Hierarchy

Pascal

```
TCustomDataSetAdapterMemoField = class(TBaseDataSetAdapterInputField);
```

C++

```
class TCustomDataSetAdapterMemoField : public TBaseDataSetAdapterInputField;
```

File

DBAdapt

Description

Derive from TCustomDataSetAdapterMemoField to define a field class that can be added to a TDataSetAdapter (see page 7872).

See Also

TDataSetAdapter (see page 7872)

TAdapterDisplayField (see page 25109)

TAdapterDisplayColumn (see page 25099)

TAdapterEditColumn (see page 25132)

41.1.7.1 TCustomDataSetAdapterMemoField Members

The following tables list the members exposed by TCustomDataSetAdapterMemoField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckOrigValue (see page 7736)	Ensures that the current value of this field is the same as the original value.
	CheckOrUpdateValue (see page 7845)	Called by ImplUpdateValue (see page 7846) and by ImplCheckValueChange (see page 7845).
	CheckValueChange (see page 7737)	Indicates whether the current value of this field is the same as the original value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 7738)	Indicates whether references to this field in HTML forms must be qualified with the name of the parent adapter.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 7738)	Returns the value of the Adapter (see page 7752) property.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7738)	Returns the dataset associated with this field's parent adapter.
V	GetDataSetFieldValue (see page 7739)	Returns the value of the associated dataset field.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 7739)	Returns a string value that suggests an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 7740)	Returns the HTML display style type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 7741)	Returns a string value that suggests an HTML editing style for this adapter field.
V	GetInputStyleType (see page 7845)	Returns htmliTextArea to indicate that this field should be represented by an HTML TextArea.
	GetKeyName (see page 7742)	Returns the name of the associated dataset field if it appears in the index (key) that the parent dataset adapter uses.

	GetKeyParams (see page 7743)	Returns a list of fields that the parent dataset adapter uses to locate records, along with their current values in that adapter's dataset.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetReadOnly (see page 7743)	Indicates whether the adapter field represents a read-only database field.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 7744)	Returns a string value that indicates what function a control that represents this field should perform.
	GetViewModeType (see page 7744)	Returns the view mode for the function a control that represents this field should perform.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 7845)	Returns the text that is used to display a read only representation of the dataset field.
	ImplCheckOrigValue (see page 7745)	Provides the underlying implementation for the CheckOrigValue (see page 7736) method.
	ImplCheckValueChange (see page 7845)	Indicates whether the data was changed by the user.
	ImplGetDisplayLabel (see page 7747)	Provides the underlying implementation for the GetDisplayLabel method.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayWidth (see page 7747)	Provides the underlying implementation for the GetDisplayWidth method.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetEchoActionFieldValue (see page 7763)	Provides the underlying implementation for the GetEchoActionFieldValue method.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 7747)	Provides the underlying implementation for the GetRequired method.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 7846)	Returns either the value of the associated dataset field as a Variant, or the last value entered by the end user.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 7748)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 7763)	Provides the underlying implementation for the SetEchoActionFieldValue method.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 7749)	Provides the underlying implementation for the SetFieldName method.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplUpdateValue (see page 7846)	Verifies that the field has modify access rights, and if so updates the value for this TCustomDataSetAdapterMemoField (see page 7837).
	ImplValidateValue (see page 7764)	Provides the underlying implementation for the ValidateValue (see page 7765) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.

V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 7750)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	PrepareDataSet (see page 7750)	Responds when the parent dataset adapter prepares its dataset.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSetField (see page 7751)	Sets the value of the DataSetField (see page 7752) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	TestValueChange (see page 7764)	Checks whether a new value matches the current value of this field.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 7751)	Updates the adapter field when the user assigns a new value.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 7765)	Validates a new value for this field that appears in the current request.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7752)	Indicates the dataset adapter that uses this object to represent one of its fields.
R	Adapter (see page 23943)	Returns the parent adapter component.
	DataSetField (see page 7752)	Specifies the name of the dataset field that this adapter field represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 7754)	Occurs when the adapter field needs to supply its formatted value as a string that can appear in HTML forms.
	OnGetValue (see page 7754)	Occurs when the adapter field needs to supply its value as a Variant.
	OnValidateValue (see page 7766)	Occurs when the parent adapter wants to validate the new value for this field.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7735)	Creates and initializes an instance of TBaseDataSetAdapterField (see page 7729).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 7737)	Returns the dataset field whose value this adapter field represents.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKeyName (see page 8105)	This is GetKeyName, a member of class IGetDataSetKeyName.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PrepareDataSet (see page 8109)	This is PrepareDataSet, a member of class IPrepareDataSet.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.

W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	FieldFlags (see page 7752)	Indicates various attributes of the adapter field.
	FieldModes (see page 7753)	Indicates what dataset adapter modes this field supports.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
R	KeyName (see page 8105)	This is KeyName, a member of class IGetDataSetKeyName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
	OnUpdateValue (see page 7765)	Occurs when the WebSnap application updates this adapter field's value based on in incoming request.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.7.2 TCustomDataSetAdapterMemoField Methods

The methods of the TCustomDataSetAdapterMemoField class are listed here.

Protected Methods

	Name	Description
	CheckOrUpdateValue (see page 7845)	Called by ImplUpdateValue (see page 7846) and by ImplCheckValueChange (see page 7845).
V	GetInputStyleType (see page 7845)	Returns htmliTextArea to indicate that this field should be represented by an HTML TextArea.
V	ImplAsFormatted (see page 7845)	Returns the text that is used to display a read only representation of the dataset field.
V	ImplCheckValueChange (see page 7845)	Indicates whether the data was changed by the user.
V	ImplGetValue (see page 7846)	Returns either the value of the associated dataset field as a Variant, or the last value entered by the end user.
V	ImplUpdateValue (see page 7846)	Verifies that the field has modify access rights, and if so updates the value for this TCustomDataSetAdapterMemoField (see page 7837).

41.1.7.2.1 TCustomDataSetAdapterMemoField.CheckOrUpdateValue Method

Called by ImplUpdateValue (see page 7846) and by ImplCheckValueChange (see page 7845).

Pascal

```
function CheckOrUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer; AUpdate:
Boolean): Boolean;
```

C++

```
__fastcall Boolean CheckOrUpdateValue(IActionRequest AActionRequest, int AFieldIndex, Boolean
AUpdate);
```

Description

The CheckOrUpdateValue function is called by ImplUpdateValue (see page 7846) and by ImplCheckValueChange (see page 7845).

41.1.7.2.2 TCustomDataSetAdapterMemoField.GetInputStyleType Method

Returns htmliTextArea to indicate that this field should be represented by an HTML TextArea.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const AnsiString
AAdapterMode);
```

Description

The GetInputStyleType returns htmliTextArea to indicate that this field should be represented by an HTML TextArea. TAdapterDisplayField and TAdapterInputColumn request the TAdapterInputHTMLElementType when generating the default HTML representation of an adapter field.

See Also

TAdapterInputHTMLElementType

41.1.7.2.3 TCustomDataSetAdapterMemoField.ImplAsFormatted Method

Returns the text that is used to display a read only representation of the dataset field.

Pascal

```
function ImplAsFormatted: string; override;
```

C++

```
virtual __fastcall AnsiString ImplAsFormatted();
```

Description

The ImplAsFormatted function returns the text that is used to display a read only representation of the dataset field.

41.1.7.2.4 TCustomDataSetAdapterMemoField.ImplCheckValueChange Method

Indicates whether the data was changed by the user.

Pascal

```
function ImplCheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
override;
```

C++

```
virtual __fastcall Boolean ImplCheckValueChange(IActionRequest AActionRequest, int
AFieldIndex);
```

Description

The ImplCheckValueChange indicates whether the data was changed by the user.

41.1.7.2.5 TCustomDataSetAdapterMemoField.ImplGetValue Method

Returns either the value of the associated dataset field as a Variant, or the last value entered by the end user.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

The ImplGetValue function returns either the value of the associated dataset field as a Variant, or the last value entered by the end user. The last value entered by the end user is returned when generating a HTTP response to adapter action in which an error occurred.

41.1.7.2.6 TCustomDataSetAdapterMemoField.ImplUpdateValue Method

Verifies that the field has modify access rights, and if so updates the value for this TCustomDataSetAdapterMemoField (see page 7837).

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

The ImplUpdateValue procedure first verifies that the field has modify access rights, and if so updates the value for this TCustomDataSetAdapterMemoField (see page 7837).

41.1.8 TCustomDataSetAdapterRowAction Class

TCustomDataSetAdapterRowAction is the base class for adapter actions that operate on the records of a dataset.

Class Hierarchy

Pascal

```
TCustomDataSetAdapterRowAction = class(TCustomDataSetAdapterAction);
```

C++

```
class TCustomDataSetAdapterRowAction : public TCustomDataSetAdapterAction;
```

File

DBAdapt

Description

TCustomDataSetAdapterRowAction is the base class for all adapter action objects that operate on the records of the dataset associated with a dataset adapter. TCustomDataSetAdapterRowAction descendants are included as the actions of a dataset adapter (TDataSetAdapter (see page 7872)). Each TCustomDataSetAdapterRowAction descendant can be executed to perform a specific function that affects the records of the parent adapter's dataset.

Do not use TCustomDataSetAdapterRowAction directly. It is intended only as a base class. Instead, use a TCustomDataSetAdapterRowAction descendant that represents the particular action you want.

See Also

TDataSetAdapterApplyRowAction (see page 7890)

TDataSetAdapterBrowseRowAction (see page 7903)

TDataSetAdapterCancelRowAction (see page 7916)

TDataSetAdapterDeleteRowAction (see page 7934)

TDataSetAdapterEditRowAction (see page 7947)

TDataSetAdapterFirstRowAction (see page 7972)

TDataSetAdapterLastRowAction (see page 7984)

TDataSetAdapterNextRowAction (see page 8030)

TDataSetAdapterPrevRowAction (see page 8042)

TDataSetAdapterRefreshRowAction (see page 8054)

TDataSetAdapterNewRowAction (see page 8016)

TDataSetAdapter (see page 7872)

TDataSetAdapterRowAction (see page 8066)

41.1.8.1 TCustomDataSetAdapterRowAction Members

The following tables list the members exposed by TCustomDataSetAdapterRowAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.
V	GetDefaultActionName (see page 24055)	Gets the default name used to reference this adapter action with server-side script.

	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 24063)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 24195)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 7854)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.

	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
V	ImplWebEnabled (see page 7855)	Provides the underlying implementation for the WebEnabled method.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 24075)	Called after the adapter action has executed.
	OnAfterExecute (see page 24198)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24075)	Called after the adapter action response is generated.
	OnAfterGetResponse (see page 24199)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24076)	Called before the adapter action is executed.
	OnBeforeExecute (see page 24199)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24076)	Called before the adapter action response is generated.
	OnBeforeGetResponse (see page 24200)	Called before the adapter action response is generated.
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 24077)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 7853)	Creates and initializes an instance of TCustomDataSetAdapterRowAction (see page 7846).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.

	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionModes (see page 7821)	Indicates what dataset adapter modes this field supports.
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 24073)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 24073)	Defines the rights required to execute this action.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.8.2 TCustomDataSetAdapterRowAction.Create Constructor

Creates and initializes an instance of TCustomDataSetAdapterRowAction (see page 7846).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomDataSetAdapterRowAction(TComponent * AOwner);
```

Description

The TCustomDataSetAdapterRowAction (see page 7846) constructor allocates memory for the adapter action object and initializes its properties.

AOwner is the component that is responsible for starting the streaming process when a module containing the adapter action is loaded or saved. It becomes the value of the Owner property. Typically, AOwner is the Web module.

See Also

Owner (see page 2807)

41.1.8.3 TCustomDataSetAdapterRowAction Methods

The methods of the TCustomDataSetAdapterRowAction class are listed here.

Protected Methods

	Name	Description
	ImplGetAdapterItemRequestParams (see page 7854)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
	ImplWebEnabled (see page 7855)	Provides the underlying implementation for the WebEnabled method.

41.1.8.3.1 TCustomDataSetAdapterRowAction.ImplGetAdapterItemRequestParams Method

Provides the underlying implementation for the GetAdapterItemRequestParams method.

Pascal

```
procedure ImplGetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams); override;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(AnsiString AIdentifier,
IAdapterItemRequestParams Params);
```

Description

The GetAdapterItemRequestParams method calls ImplGetAdapterItemRequestParams to obtain the parameters this action needs when it executes. The name/value pairs this method provides are added to the HTML form and passed back in any HTTP request that form generates.

AIdentifier returns a unique identifier for this action object, which the WebSnap application uses to dispatch requests from the generated form to this object.

Params is an interface that ImplGetAdapterItemRequestParams uses to write the name/value pairs it needs.

ImplGetAdapterItemRequestParams first generates an OnGetActionParams event on the parent adapter, and then an OnGetParams event on this action object.

See Also

GetAdapterItemRequestParams (see page 24055)

OnGetParams (see page 24077)

OnGetActionParams (see page 24187)

41.1.8.3.2 TCustomDataSetAdapterRowAction.ImplWebEnabled Method

Provides the underlying implementation for the WebEnabled method.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

The WebEnabled method calls ImplWebEnabled to determine whether the control or hyperlink for this action should appear enabled in the HTML form. WebEnabled returns true if controls should be enabled, false otherwise.

ImplWebEnabled generates an OnGetEnabled (see page 7823) event so that you can specify whether controls for this action are enabled. If there is no OnGetEnabled (see page 7823) event handler, ImplWebEnabled returns true if the parent adapter's GetKeyFields method returns a set of fields that can locate records in the associated dataset.

See Also

WebEnabled (see page 24071)

OnGetEnabled (see page 7823)

GetKeyFields (see page 7786)

41.1.9 TCustomDataSetValuesList Class

TCustomDataSetValuesList is the base class for components that represent a set of name/value pairs taken from a dataset.

Class Hierarchy

Pascal

```
TCustomDataSetValuesList = class(TBaseValuesListAdapter, IGetDesigntimeWarnings);
```

C++

```
class TCustomDataSetValuesList : public TBaseValuesListAdapter, public IGetDesigntimeWarnings;
```

File

DBAdapt

Description

Use TCustomDataSetValuesList as a base class for components that implement the ValuesList property of an adapter field. This class represents a set of name/value pairs, where the names and the values are taken from two columns of a dataset. Thus, this adapter acts like a lookup dataset, although it can be used with any adapter field that has a ValuesList property (it is not limited to dataset adapter fields).

Do not use TCustomDataSetValuesList directly in a WebSnap application. Instead, assign a TCustomDataSetValuesList descendant such as TDataSetValuesList (see page 8079) as the value of an adapter field's ValuesList property.

See Also

TDataSet (see page 6894)

TDataSetValuesList (see page 8079)

TCustomDataSetAdapterField (see page 7823)

TAdapterUpdateField (see page 24007)

41.1.9.1 TCustomDataSetValuesList Members

The following tables list the members exposed by TCustomDataSetValuesList.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.

	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetDesigntimeWarnings (see page 7864)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetListImage (see page 24128)	Returns an image associated with the current name/value pair.
	GetListImageOfValue (see page 24128)	Looks up an image for a value.
	GetListName (see page 24128)	Responsible returning the name of the name/value pair.
	GetListNameOfValue (see page 24128)	Looks up a name for a value.
	GetListValue (see page 24129)	Responsible for returning the value of the name/value pair.
V	GetNameFieldClass (see page 7865)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	GetValueFieldClass (see page 7865)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
V	GetWebSnapObjClass (see page 24130)	Returns the class type for this adapter field.
V	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 24130)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 24163)	Clears adapter state information.

	ImplEndIterator (see page 7866)	Provides the underlying implementation for the EndIterator method.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 24130)	Adds default field components to this adapter.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetListImage (see page 24131)	Responsible returning an image associated with the current name/value pair.
	ImplGetListImageOfValue (see page 24131)	Looks up an image for a value.
	ImplGetListName (see page 7866)	Provides the underlying implementation for the GetListName method.
	ImplGetListNameOfValue (see page 7867)	Provides the underlying implementation for the GetListNameOfValue method.
	ImplGetListValue (see page 7867)	Provides the underlying implementation for the GetListValue method.
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 7867)	Provides the underlying implementation for the NextIteration method.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 7868)	Provides the underlying implementation for the NotifyDeactivate method.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 7868)	Provides the underlying implementation for the StartIterator method.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 7869)	Responds when components are created or destroyed.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.

	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DataSetPrepared (see page 7870)	Indicates whether the OnPrepareDataSet (see page 7871) event has occurred.
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.
	OnPrepareDataSet (see page 7871)	Occurs before the dataset values list uses its associated dataset.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 7863)	Creates and initializes an instance of TCustomDataSetValuesList (see page 7855).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 7864)	Destroys an instance of TCustomDataSetValuesList (see page 7855).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.

	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	GetListImage (see page 19741)	Returns the image object associated with the current name/value pair.
	GetListImageOfValue (see page 19742)	Returns the image object associated with a specified value.
	GetListName (see page 19742)	Returns the name part of the current name/value pair.
	GetListNameOfValue (see page 19742)	Returns the name associated with a specified value.
	GetListValue (see page 19743)	Returns the value of the current name/value pair.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 24181)	Actions is the container for adapter actions components.
R	Actions (see page 24402)	Container for adapter actions components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 24181)	Data is the container for adapter field components.
R	Data (see page 24402)	Container for adapter field components.
	DataSet (see page 7869)	Specifies the dataset that stores the names and values for this list.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
	NameField (see page 7870)	Indicates the field in the associated dataset that supplies the name part of this list's name/value pairs.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ValueField (see page 7871)	Indicates the field in the associated dataset that supplies the value part of this list's name/value pairs.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.9.2 TCustomDataSetValuesList.Create Constructor

Creates and initializes an instance of TCustomDataSetValuesList (see page 7855).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomDataSetValuesList(TComponent * AOwner);
```

Description

The TCustomDataSetValuesList (see page 7855) constructor allocates memory for the TCustomDataSetValuesList (see page 7855) object and initializes its properties.

AOwner is the component that is responsible for starting the streaming process when a module containing the data set values list is loaded or saved. It becomes the value of the Owner property. Typically, AOwner is the Web module.

See Also

Owner (see page 2807)

41.1.9.3 TCustomDataSetValuesList.Destroy Destructor

Destroys an instance of TCustomDataSetValuesList (see page 7855).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomDataSetValuesList();
```

Description

Typically, applications do not need to explicitly free data set values list objects. These objects persist as long as the adapter field that uses them, and are freed when the Web module is destroyed.

Do not call Destroy directly. When you must delete a dataset values list at runtime, use the Free method, which first checks that the dataset values list reference is not nil.

See Also

Free (see page 22300)

41.1.9.4 TCustomDataSetValuesList Methods

The methods of the TCustomDataSetValuesList class are listed here.

Protected Methods

	Name	Description
	GetDesigntimeWarnings (see page 7864)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
V	GetNameFieldClass (see page 7865)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
V	GetValueFieldClass (see page 7865)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
V	ImplEndIterator (see page 7866)	Provides the underlying implementation for the EndIterator method.
V	ImplGetListName (see page 7866)	Provides the underlying implementation for the GetListName method.
V	ImplGetListNameOfValue (see page 7867)	Provides the underlying implementation for the GetListNameOfValue method.
V	ImplGetListValue (see page 7867)	Provides the underlying implementation for the GetListValue method.
V	ImplNextIteration (see page 7867)	Provides the underlying implementation for the NextIteration method.
V	ImplNotifyDeactivate (see page 7868)	Provides the underlying implementation for the NotifyDeactivate method.
V	ImplStartIterator (see page 7868)	Provides the underlying implementation for the StartIterator method.
V	Notification (see page 7869)	Responds when components are created or destroyed.

41.1.9.4.1 TCustomDataSetValuesList.GetDesigntimeWarnings Method

Populates a design-time warnings object with any warnings that the dataset values list needs to emit.

Pascal

```
procedure GetDesigntimeWarnings(AWarnings: TAbstractDesigntimeWarnings);
```

C++

```
__fastcall GetDesigntimeWarnings(TAbstractDesigntimeWarnings AWarnings);
```

Description

GetDesigntimeWarnings is called automatically at design time when the adapter page producer is assembling the current version of its HTML form. This gives the dataset values list an opportunity to add messages to the version of the HTML form that appears at design time, describing problems that you can rectify.

AWarnings is the design-time warnings object that assembles design-time warning messages that appear in the HTML form.

If the DataSet (see page 7869) property has not been set, GetDesigntimeWarnings adds a message that indicates this omission. If DataSet (see page 7869) is set, but the dataset is not active, GetDesigntimeWarnings adds a message that indicates this problem. Finally, if the ValueField (see page 7871) property is not set, GetDesigntimeWarnings adds a message indicating this omission.

See Also

DataSet (see page 7869)

Active (see page 7004)

ValueField (see page 7871)

41.1.9.4.2 TCustomDataSetValuesList.GetNameFieldClass Method

Returns the class of adapter field that is responsible for providing the value of the name/value pair.

Pascal

```
function GetNameFieldClass: TComponentClass; override;
```

C++

```
virtual __fastcall TComponentClass GetNameFieldClass();
```

Description

GetNameFieldClass returns TValuesListNameField. This is the class used to implement the adapter field called NameField (see page 7870). The value of the NameField (see page 7870) adapter field is the value of the dataset field specified by the NameField (see page 7870) property.

See Also

GetValueFieldClass (see page 7865)

NameField (see page 7870)

41.1.9.4.3 TCustomDataSetValuesList.GetValueFieldClass Method

Returns the class of adapter field that is responsible for providing the name of the name/value pair.

Pascal

```
function GetValueFieldClass: TComponentClass; override;
```

C++

```
virtual __fastcall TComponentClass GetValueFieldClass();
```

Description

GetValueFieldClass returns TValuesListNameField. This is the class used to implement the adapter field called ValueField (see page 7871). The value of the ValueField (see page 7871) adapter field is the value of the dataset field specified by the

ValueField (see page 7871) property.

See Also

GetNameFieldClass (see page 7865)

ValueField (see page 7871)

41.1.9.4.4 TCustomDataSetValuesList.ImplEndIterator Method

Provides the underlying implementation for the EndIterator method.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer); override;
```

C++

```
virtual __fastcall ImplEndIterator(void * OwnerData);
```

Description

The EndIterator method calls ImplEndIterator to respond when server-side script stops an enumeration of the name/value pairs in this list. ImplEndIterator clears the internal data that TCustomDataSetValuesList (see page 7855) maintains to keep track of the current record when iterating over the values in the list.

OwnerData is a pointer to adapter-specific information returned by the last call to the StartIterator or NextIteration method. TCustomDataSetValues does not use the OwnerData parameter.

See Also

EndIterator (see page 24152)

StartIterator (see page 24176)

NextIteration (see page 24173)

41.1.9.4.5 TCustomDataSetValuesList.ImplGetListName Method

Provides the underlying implementation for the GetListName method.

Pascal

```
function ImplGetListName: string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetListName();
```

Description

The GetListName method calls ImplGetListName to obtain the name part of the current name/value pair. This is the implementation of the ListName property that can be called from server-side script.

ImplGetListName returns the value of the field that the NameField (see page 7870) property specifies for the current record. The current record is determined by the current iteration on this object.

See Also

GetListName (see page 24128)

NameField (see page 7870)

41.1.9.4.6 TCustomDataSetValuesList.ImplGetListNameOfValue Method

Provides the underlying implementation for the GetListNameOfValue method.

Pascal

```
function ImplGetListNameOfValue(Value: Variant): string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetListNameOfValue(Variant Value);
```

Description

The GetListNameOfValue method calls ImplGetListNameOfValue to obtain the name that corresponds to a specified value.

Value is the value part of the name/value pair for which this method returns the name part.

ImplGetListNameOfValue searches the name/value pairs in the list. It returns the name part of the first pair it finds where the value part is equal to Value.

See Also

GetListNameOfValue (see page 24128)

41.1.9.4.7 TCustomDataSetValuesList.ImplGetListValue Method

Provides the underlying implementation for the GetListValue method.

Pascal

```
function ImplGetListValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetListValue();
```

Description

The GetListValue method calls ImplGetListValue to obtain the value part of the current name/value pair. This is the implementation of the ListValue property that can be called from server-side script.

ImplGetListValue returns the value of the field that the ValueField (see page 7871) property specifies for the current record. The current record is determined by the current iteration on this object.

See Also

GetListValue (see page 24129)

ValueField (see page 7871)

41.1.9.4.8 TCustomDataSetValuesList.ImplNextIteration Method

Provides the underlying implementation for the NextIteration method.

Pascal

```
function ImplNextIteration(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplNextIteration(void * OwnerData);
```

Description

The NextIteration method calls ImplNextIteration to move to the next name/value pair when server-side script enumerates the

name/value pairs in this list.

OwnerData is a pointer to adapter-specific information that the caller should supply to the next call to the NextIteration or EndIterator method. TCustomDataSetValues does not use the OwnerData parameter.

ImplNextIteration returns true if it successfully moves to the next name/value pair, false if there were no more name/value pairs in the list.

See Also

NextIteration (see page 24173)

StartIterator (see page 24176)

EndIterator (see page 24152)

41.1.9.4.9 TCustomDataSetValuesList.ImplNotifyDeactivate Method

Provides the underlying implementation for the NotifyDeactivate method.

Pascal

```
procedure ImplNotifyDeactivate; override;
```

C++

```
virtual __fastcall ImplNotifyDeactivate();
```

Description

The NotifyDeactivate method calls ImplNotifyDeactivate to respond when the Web module that contains this adapter is deactivated.

ImplNotifyDeactivate closes the dataset that is the value of the DataSet (see page 7869) property, and sets the protected DataSetPrepared (see page 7870) property to false. This ensures that the next time the WebSnap application activates the Web module (in response to a new HTTP request), the dataset values list must re-initialize and reopen its dataset, refreshing the name/value pairs in the list.

See Also

NotifyDeactivate (see page 24175)

DataSet (see page 7869)

DataSetPrepared (see page 7870)

41.1.9.4.10 TCustomDataSetValuesList.ImplStartIterator Method

Provides the underlying implementation for the StartIterator method.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

The StartIterator method calls ImplStartIterator to start the process of enumerating the name/value pairs in this list in response to server-side script.

OwnerData returns a pointer to adapter-specific information that should be passed to the next call to the NextIteration or EndIterator method. TCustomDataSetValues does not use the OwnerData parameter.

ImplStartIterator returns true if it successfully moves to the first name/value pair, false if there were no name/value pairs in the list.

See Also

StartIterator (see page 24176)

NextIteration (see page 24173)

EndIterator (see page 24152)

41.1.9.4.11 TCustomDataSetValuesList.Notification Method

Responds when components are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation.

TCustomDataSetValuesList (see page 7855) overrides the Notification method to check whether the component that is the value of the DataSet (see page 7869) property is about to be freed. If so, it sets the DataSet (see page 7869) property to nil (Delphi) or NULL (C++).

See Also

DataSet (see page 7869)

41.1.9.5 TCustomDataSetValuesList Properties

The properties of the TCustomDataSetValuesList class are listed here.

Protected Properties

	Name	Description
	DataSetPrepared (see page 7870)	Indicates whether the OnPrepareDataSet (see page 7871) event has occurred.

Public Properties

	Name	Description
	DataSet (see page 7869)	Specifies the dataset that stores the names and values for this list.
	NameField (see page 7870)	Indicates the field in the associated dataset that supplies the name part of this list's name/value pairs.
	ValueField (see page 7871)	Indicates the field in the associated dataset that supplies the value part of this list's name/value pairs.

41.1.9.5.1 TCustomDataSetValuesList.DataSet Property

Specifies the dataset that stores the names and values for this list.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify the dataset from which this adapter gets its name/value pairs. The names of the name/value pairs in this list are the values of the field that the NameField (see page 7870) property specifies. The values are the corresponding values of the field that the ValueField (see page 7871) property specifies.

Note: When the WebSnap application reads the value of DataSet for the first time, TCustomDataSetValuesList (see page 7855) generates an OnPrepareDataSet (see page 7871) event. This lets you perform any initializations that ensure the dataset contains the desired data.

See Also

NameField (see page 7870)

ValueField (see page 7871)

OnPrepareDataSet (see page 7871)

41.1.9.5.2 TCustomDataSetValuesList.DataSetPrepared Property

Indicates whether the OnPrepareDataSet (see page 7871) event has occurred.

Pascal

```
property DataSetPrepared: Boolean;
```

C++

```
__property Boolean DataSetPrepared;
```

Description

TCustomDataSetValuesList (see page 7855) uses DataSetPrepared internally to keep track of whether it has initialized the dataset for its own use. When the WebSnap application reads the DataSet (see page 7869) property, TCustomDataSetValuesList (see page 7855) checks DataSetPrepared, and if the dataset has not been prepared, it sets up the dataset for use and changes DataSetPrepared to true. When the Web module that contains this values list is deactivated, DataSetPrepared changes back to false.

DataSetPrepared is true if the dataset has been prepared (that is, if TDataSetValuesList (see page 8079) has generated an OnPrepareDataSet (see page 7871) event). DataSetPrepared is false if the dataset needs to be prepared before the values list can use it.

See Also

DataSet (see page 7869)

OnPrepareDataSet (see page 7871)

41.1.9.5.3 TCustomDataSetValuesList.NameField Property

Indicates the field in the associated dataset that supplies the name part of this list's name/value pairs.

Pascal

```
property NameField: string;
```

C++

```
__property AnsiString NameField;
```

Description

Set NameField to specify the dataset field that holds the names of this adapter's name/value pairs. Each entry in TCustomDataSetValuesList (see page 7855) is a name/value pair that corresponds to the values of the NameField and ValueField (see page 7871) fields of the associated dataset for a single record in the dataset. NameField is the same as the FieldName property of the dataset field that supplies the names.

See Also

DataSet (see page 7869)

FieldName (see page 7164)

ValueField (see page 7871)

41.1.9.5.4 TCustomDataSetValuesList.ValueField Property

Indicates the field in the associated dataset that supplies the value part of this list's name/value pairs.

Pascal

```
property ValueField: string;
```

C++

```
__property AnsiString ValueField;
```

Description

Set ValueField to specify the dataset field that holds the values of this adapter's name/value pairs. Each entry in TCustomDataSetValuesList (see page 7855) is a name/value pair that corresponds to the values of the NameField (see page 7870) and ValueField fields of the associated dataset for a single record in the dataset. ValueField is the same as the FieldName property of the dataset field that supplies the values.

See Also

DataSet (see page 7869)

FieldName (see page 7164)

NameField (see page 7870)

41.1.9.6 TCustomDataSetValuesList Events

The events of the TCustomDataSetValuesList class are listed here.

Public Events

	Name	Description
	OnPrepareDataSet (see page 7871)	Occurs before the dataset values list uses its associated dataset.

41.1.9.6.1 TCustomDataSetValuesList.OnPrepareDataSet Event

Occurs before the dataset values list uses its associated dataset.

Pascal

```
property OnPrepareDataSet: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPrepareDataSet;
```

Description

Write an OnPrepareDataSet event handler to prepare the associated dataset before this component fetches names and values from it. This lets you customize the data for each incoming request. For example, you can use this event to set query parameters based on parameters in the current HTTP request and then execute the query. (Use the global Web context to obtain information about the current HTTP request.)

TCustomDataSetValuesList (see page 7855) generates an OnPrepareDataSet event the first time the application reads the DataSet (see page 7869) property for a new HTTP request.

See Also

DataSet (see page 7869)

WebContext (see page 24687)

41.1.10 TDataSetAdapter Class

TDataSetAdapter defines a scriptable interface to a TDataSet component and allows it to operate properly in a stateless environment.

Class Hierarchy

Pascal

```
TDataSetAdapter = class(TCustomDataSetAdapter);
```

C++

```
class TDataSetAdapter : public TCustomDataSetAdapter;
```

File

DBAdapt

Description

Use TDataSetAdapter like TAdapter to define a custom interface to application logic. (See TAdapter for a general description of Adapters.) Add adapter field components to the TDataSetAdapter to define the dataset fields that a script can access. Set

properties of the adapter field components to augment the meta data provided by the dataset fields. For example, the ValuesList property defines name/value pairs that can be used to populate HTML elements for editing the field such as select lists and radio buttons. If you do not add any adapter fields, all adapter fields for all supported dataset field types are added by default. Default adapter fields are not shown in the object tree view but can be accessed with script and will be used when generating a form or grid with the TAdapterPageProducer.

Add adapter action components to the TDataSetAdapter to define the commands that can be executed on the dataset. TDataSetAdapter has built-in support for commands such as Delete, Next Row, and Edit. If you do not add any adapter actions, all actions are added by default. Default adapter actions are not shown in the object tree view but can be accessed with script and will be used when generating a form or grid with the TAdapterPageProducer.

The TDataSetAdapter has a mode. The mode values include Edit, Insert, Browse, and Query. The mode of the TDataSetAdapter will affect the adapter field values retrieved by script statements. The mode may also affect the HTML generated by the TAdapterPageProducer component. For example, a form field will be displayed using an input element when in Edit, Insert, or Query mode but displayed as read-only text when in Browse mode. The TDataSetAdapter mode is modified during the execution of adapter action components such as TDataSetAdapterEditRowAction (see page 7947). The mode can also be modified using server side script (for example; <% Adapter.Mode (see page 7810) = 'Edit' %>). To cause the TAdapterPageProducer to generate script to modify the mode, change the AdapterMode property of a TAdapterFieldGroup component.

The TDataSetAdapter supports master/detail relationships between datasets. You must associate a TDataSetAdapter with each master and detail dataset and use the MasterAdapter (see page 7884) property to indicate the master/detail relationship between the TDataSetAdapter components.

In a WebSnap application there is no guarantee that the same web module will be used to service consecutive requests from the same user. The TDataSetAdapter manages the state of the dataset component to ensure data integrity. TDataSetAdapter responsibilities include opening and closing the dataset, locating records, validating edits, posting changes, canceling changes, and handling exceptions.

41.1.10.1 TDataSetAdapter Members

The following tables list the members exposed by TDataSetAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 7778)	Adds the default action components to this adapter.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultActions (see page 24411)	Adds default action components to this adapter.
V	AddDefaultFields (see page 7779)	Adds the default field components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.

	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
V	EncodeActionParams (see page 24411)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
	EndOfPage (see page 24412)	Indicates whether the record index has gone past the last record in the current page.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
V	ExtractRequestParams (see page 24412)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	FullyQualifyInputNames (see page 7782)	Indicates whether the HTML input names must be qualified with the name of the adapter.
V	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetAdapterMode (see page 7783)	Returns a string that represents the current value of the Mode (see page 7810) property.
	GetAdapterModeNames (see page 7783)	Retrieves the strings for all the possible modes of this adapter.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetDataSet (see page 7784)	Returns the value of the DataSet (see page 7807) property.
V	GetDefaultMode (see page 7784)	Returns the default mode for this adapter.
	GetDesigntimeWarnings (see page 7784)	Populates a design-time warnings object with any warnings that the dataset adapter needs to emit.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
V	GetEOF (see page 7785)	Indicates whether the adapter is positioned at the end of its dataset.
V	GetEOF (see page 24412)	Indicates whether the record position has passed the last record.

	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetFirstRecord (see page 7785)	Positions the adapter on the first record of its dataset.
	GetFirstRecord (see page 24413)	Set the record position to the first record.
	GetHiddenFieldOptions (see page 7786)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetKeyFields (see page 7786)	Returns a string listing the fields that this adapter uses to locate records.
	GetKeyParams (see page 7787)	Retrieves a list of fields that the dataset adapter uses to locate records, along with their current values.
	GetKeyParamStrings (see page 7787)	Retrieves a list of fields that the dataset adapter uses to locate records, along with their current values.
	GetMasterDetailAdapters (see page 7788)	Returns a list of all dataset adapters, including this one, linked to this adapter in a master/detail relationship.
	GetNeedAdapterMode (see page 7788)	Indicates whether the adapter requires a Mode (see page 7810) value.
	GetNextRecord (see page 7789)	Positions the associated dataset on the next record.
	GetNextRecord (see page 24413)	Increments the record position.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPageCount (see page 24413)	Calculates the number of pages needed to display all adapter records.
	GetRecordCount (see page 7789)	Returns the value of the RecordCount property.
	GetRecordCount (see page 24414)	Returns the total number of records.
	GetRecordIndex (see page 7790)	Returns the value of the RecordIndex property.
	GetRecordIndex (see page 24414)	Returns the index of the current record.
	GetRecordKeys (see page 7790)	Retrieves a list of field values that the dataset adapter uses to locate records, along with information for formatting hidden parameters from this values.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 7790)	Provides the underlying implementation for the CanAddActionClass method.
	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddActionClass (see page 24415)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 7791)	Provides the underlying implementation for the CanAddFieldClass method.
	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 7792)	Implements IteratorSupport's EndIterator method to support iterating over the data records of the adapter.
	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplEndIterator (see page 24415)	Implements IteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 7792)	Provides the underlying implementation for the GetActionsList method.

	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetActionsList (see page 24415)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 7793)	Provides the underlying implementation for the GetFieldsList method.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 7793)	Provides the underlying implementation for the GetIteratorIndex method.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetRecordKeys (see page 7794)	Retrieves a list of field values that the dataset adapter uses to locate records, along with information for formatting hidden parameters from this values.
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 7794)	Provides the underlying implementation for the InIterator method.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNextIteration (see page 24416)	Implements IteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 7795)	Provides the underlying implementation for the NotifyDeactivate method.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplNotifyDeactivate (see page 24416)	Clears the current page variable.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 7795)	Provides the underlying implementation for the SetEchoActionFieldValues method.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 7795)	Implements IteratorSupport.StartIterator to support iterating over the records of the adapter.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	ImplStartIterator (see page 24416)	Implements IteratorSupport.StartIterator (see page 24176) to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	LocateKeyParams (see page 7797)	Positions the dataset based on a specified set of field values.
	LocateRequestRecord (see page 7798)	Positions the dataset based on the parameters in the current request.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.

	Notification (see page 7798)	Responds when components are added to or deleted from the WebSnap application.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	OnDataSetStateChange (see page 7798)	Responds to changes in the associated dataset.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PrepareDataSet (see page 7799)	Sets up the associated dataset for use by this adapter.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RestoreDefaultAdapterMode (see page 7801)	Returns the adapter to its default mode.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAdapterMode (see page 7801)	Sets the Mode (see page 7810) property based on a string that represents one of the available values.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDataSet (see page 7802)	Sets the value of the DataSet (see page 7807) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetMode (see page 7802)	Sets the value of the Mode (see page 7810) property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetPageSize (see page 24417)	Updates the pagesize variable.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SkipToPage (see page 24417)	Skips records until the current record is within the current page.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateFieldsExecuteValues (see page 7803)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 7804)	Indicates whether the values in the HTTP request change the value of any adapter fields.
	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 7805)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 7805)	Validates the values passed in the current HTTP request for the adapter's fields.
	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	AdapterRowNotFound (see page 7807)	Indicates the dataset adapter for which this adapter could not locate the current record.
	DataSetPrepared (see page 7808)	Indicates whether the associated dataset has been properly set up for use by this adapter.
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnGetEOF (see page 24420)	Implement this event to indicate when the current record index has exceeded the total record count.
	OnGetFirstRecord (see page 24420)	Implement this method to initialize the iteration index to zero.
	OnGetNextRecord (see page 24421)	Implement this method to increment the iteration index.
	OnGetRecordIndex (see page 24421)	Implement this event to identify the zero-based current record.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	ApplyAdapterMode (see page 7780)	Sets the Mode (see page 7810) property to reflect the value that the current request specifies.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7775)	Creates an initializes an instance of TCustomDataSetAdapter (see page 7766).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 7776)	Frees an instance of TCustomDataSetAdapter (see page 7766).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EncodeActionParams (see page 7780)	Writes name/value pairs that represent this adapter's state.
	EncodeActionParamsFlags (see page 7781)	Writes name/value pairs that represent a specified type of information.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExtractRequestParams (see page 7781)	Reads name/value pairs from the current HTTP request.
	ExtractRequestParamsFlags (see page 7782)	Reads name/value pairs that represent a specified type of information from the current HTTP request.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	FullyQualifyInputNames (see page 24577)	This is FullyQualifyInputNames, a member of class IFullyQualifyInputNames.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetAdapterMode (see page 19678)	This is GetAdapterMode, a member of class IAdapterMode.
	GetAdapterModeNames (see page 24579)	This is GetAdapterModeNames, a member of class IGetAdapterModeNames.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDataSet (see page 8103)	This is GetDataSet, a member of class IAdapterDataSetComponent.
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNeedAdapterMode (see page 19678)	This is GetNeedAdapterMode, a member of class IAdapterMode.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetRecordKeys (see page 24580)	This is GetRecordKeys, a member of class IGetRecordKeys.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.

	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	Locate (see page 7796)	Positions the associated dataset on the record identified by the LocateParamsList (see page 7809) property.
	LocateAndApply (see page 7796)	Positions the dataset and updates the resulting record based on the parameters of the current request.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RaiseFieldChangedByAnotherUser (see page 7799)	Raises an EAdapterFieldException with a message indicating that another user changed a field value.
	RaiseFieldNotFound (see page 7800)	Raises an EAdapterException with a message indicating that a specified field could not be found.
	RaiseNilDataSet (see page 7800)	Raises an EAdapterException with a message indicating that the dataset is unassigned.
	RaiseRowNotFound (see page 7800)	Raises an EAdapterException with a message indicating that a dataset record could not be located based on the current set of key fields.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
	RestoreDefaultAdapterMode (see page 19679)	This is RestoreDefaultAdapterMode, a member of class IAdapterMode.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAdapterMode (see page 19679)	This is SetAdapterMode, a member of class IAdapterMode.
	SetDataSet (see page 8103)	This is SetDataSet, a member of class IAdapterDataSetComponent.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SilentLocate (see page 7802)	Positions the associated dataset on a specified record.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	StringToMode (see page 7803)	Converts a mode string to the corresponding TDataSetAdapterMode (see page 8111) value.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
	AdapterMode (see page 19679)	This is AdapterMode, a member of class IAdapterMode.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	CurrentPage (see page 24418)	Sets or gets the current page index.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DetailAdapters (see page 7808)	Lists the dataset adapters for all datasets that are details of this one.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
	InDefaultMode (see page 7808)	Indicates whether the dataset adapter is in its default mode.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	LocateParamsList (see page 7809)	Lists the parameters that identify the current record of this dataset and all other datasets linked to it in a master/detail relationship.
	Mode (see page 7810)	Indicates how forms built from this dataset adapter operate on the information it provides.
R	NeedAdapterMode (see page 19679)	This is NeedAdapterMode, a member of class IAdapterMode.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	PageCount (see page 24418)	Calculates the number of pages needed to display all adapter records.
R	RecordCount (see page 24419)	Returns the total number of records.
R	RecordIndex (see page 24419)	Returns the index of the current record.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 7886)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 7886)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 7887)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 7887)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 7887)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 7888)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 7888)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 7888)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 7889)	Supplies name/value pairs needed to execute an adapter action.
	OnGetRecordCount (see page 7889)	Implement this event to identify the total number of records that can be iterated.
	OnPrepareDataSet (see page 7889)	Occurs before the dataset adapter uses any information from its associated dataset.

Published Properties

	Name	Description
	Actions (see page 7883)	Container for adapter actions components.
	Data (see page 7883)	Container for adapter field components.
	DataSet (see page 7884)	Specifies the dataset that this adapter represents.
	MasterAdapter (see page 7884)	Indicates the dataset adapter, if any, to which this adapter is linked in a master/detail relationship.
	ModifyAccess (see page 7884)	This is ModifyAccess, a member of class TDataSetAdapter.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	PageSize (see page 7884)	Sets or gets the page size variable.

	RefreshAfterPost (see page 7885)	Indicates whether the data set should be refreshed or not after posting..
	Tag (see page 2808)	Stores an integer value as part of a component.
	ViewAccess (see page 7885)	Identifies the rights required to view this adapter's fields.

41.1.10.2 TDataSetAdapter Properties

The properties of the TDataSetAdapter class are listed here.

Published Properties

	Name	Description
	Actions (see page 7883)	Container for adapter actions components.
	Data (see page 7883)	Container for adapter field components.
	DataSet (see page 7884)	Specifies the dataset that this adapter represents.
	MasterAdapter (see page 7884)	Indicates the dataset adapter, if any, to which this adapter is linked in a master/detail relationship.
	ModifyAccess (see page 7884)	This is ModifyAccess, a member of class TDataSetAdapter.
	PageSize (see page 7884)	Sets or gets the page size variable.
	RefreshAfterPost (see page 7885)	Indicates whether the data set should be refreshed or not after posting..
	ViewAccess (see page 7885)	Identifies the rights required to view this adapter's fields.

41.1.10.2.1 TDataSetAdapter.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterDefaultActions Actions;__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 23770)

41.1.10.2.2 TDataSetAdapter.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterDefaultFields Data;__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 23778)

41.1.10.2.3 TDataSetAdapter.DataSet Property

Specifies the dataset that this adapter represents.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;__property TDataSet DataSet;
```

Description

Set DataSet to associate this adapter with an existing dataset component. Read this property to access the dataset component that this adapter represents.

Note: Do not set DataSet to a unidirectional dataset. Unidirectional datasets do not work with the way dataset adapters position themselves on records.

41.1.10.2.4 TDataSetAdapter.MasterAdapter Property

Indicates the dataset adapter, if any, to which this adapter is linked in a master/detail relationship.

Pascal

```
property MasterAdapter: TCustomDataSetAdapter;
```

C++

```
__property TCustomDataSetAdapter MasterAdapter;
```

Description

Set MasterAdapter to link this adapter as a detail to another dataset adapter in a master/detail relationship. If MasterAdapter is nil (Delphi) or NULL (C++), this adapter does not represent the detail set of another adapters dataset. If MasterAdapter is not nil (Delphi) or NULL (C++), this dataset adapter is listed by the master adapter's DetailAdapters property.

See Also

DetailAdapters (see page 7808)

41.1.10.2.5 TDataSetAdapter.ModifyAccess Property

Pascal

```
property ModifyAccess: string;
```

C++

```
__property AnsiString ModifyAccess;
```

Description

This is ModifyAccess, a member of class TDataSetAdapter.

41.1.10.2.6 TDataSetAdapter.PageSize Property

Sets or gets the page size variable.

Pascal

```
property PageSize: Integer;
```

C++

```
__property int PageSize;
```

Description

If the page size variable is set to a value greater than zero and no actions have been explicitly added to the adapter then the NextPage, PrevPage, and GotoPage are automatically added. If the page size variable is changed back to zero then the these actions are removed.

See Also

TAdapterNextPageAction (see page 23945)

TAdapterPrevPageAction (see page 23979)

TAdapterGotoPageAction (see page 23849)

41.1.10.2.7 TDataSetAdapter.RefreshAfterPost Property

Indicates whether the data set should be refreshed or not after posting..

Pascal

```
property RefreshAfterPost: Boolean;
```

C++

```
__property Boolean RefreshAfterPost;
```

Description

RefreshAfterPost is used to determine whether or not the data set should be refreshed after it has been posted.

41.1.10.2.8 TDataSetAdapter.ViewAccess Property

Identifies the rights required to view this adapter's fields.

Pascal

```
property ViewAccess: string;
```

C++

```
__property AnsiString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view fields of this adapter. When server-side script accesses the CanView property, the ViewAccess property value is checked against the end user's rights.

TWebUserList (see page 25625)

HasViewAccess (see page 24162)

implhasviewaccess (see page 24169)

41.1.10.3 TDataSetAdapter Events

The events of the TDataSetAdapter class are listed here.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 7886)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 7886)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 7887)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 7887)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 7887)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 7888)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 7888)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 7888)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 7889)	Supplies name/value pairs needed to execute an adapter action.
	OnGetRecordCount (see page 7889)	Implement this event to identify the total number of records that can be iterated.
	OnPrepareDataSet (see page 7889)	Occurs before the dataset adapter uses any information from its associated dataset.

41.1.10.3.1 TDataSetAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description
